NSOU ? GE-ED-11 67 aided private management and there are only 4,300 government colleges [Agarwal 2006]. Consequently, during the past five years the increase in enrolment in the government and aided colleges is a mere 4 per cent compared to 77 per cent in private unaided colleges. Until the affiliation system is eliminated or contained severely, there is no scope for ensuring quality of higher education. The suggestions in the report to deal with this problem require deeper reflection on the enormous range of issues relating to their size, location, programmes, ownership and governance. Now is the opportunity to wipe out this problem in the higher education system within a fixed time frame, of say, five years. Most of our universities are of relatively recent origin – there were 120 in 1983 and as many as 367 in 2006 (see the figure). The increase during the last 20 years has been predominantly in the private sector. The table shows the different categories of the universities. The ambivalent status of the private institutions – permitted to operate under the cloak of “charitable” institutions, but in fact, are de facto profit-oriented commercial establishments—is inimical to national interest. The concerns about private participation relate to the collection of exorbitant capitation and other institutional fees, much of it as unaccounted money manipulation of entrance results and admission processes to maximise illicit payments and the absence of predictable norms in matters of faculty salary and service conditions. Hence in the expansion process care must be taken to avoid such trends. The NKC report suggests that “it is essential to stimulate private investments in higher education as a means of extending educational opportunities”. At the same time, it is necessary to make unambiguous, transparent and mandatory provisions for the establishment of private institutions, similar to the practices in advanced countries. They should be categorised as: private not-for-profit institutions, established and funded by truly charitable trusts and societies consisting of prescribed broad-based membership other than the members of the family of investors; and private for-profit institutions, established and funded as commercial ventures by individuals, their families and friends. The latter category may be free to follow their own norms for admission and fee structure. Their programmes should be accredited by one of the nationally recognised accreditation agencies.

NSOU ? GE-ED-11 68 Curricular Concerns The report contains a compendium of curricular concerns relating to the quality of higher education. This includes such aspects as a rigid and compartmental curricular structure, outdated teaching, learning and evaluation practices; obsolete course contents; lack of mobility within and outside the institutions; and so on. Despite widespread realisation of such maladies for decades, no significant improvement has taken place. This is the time to look at the impediments behind the laxity and ways to overcome them. Our premier institutions for half a century have effectively practised the credit system and yet only a very small number of institutions follow the system. This situation is mainly due to the absence of determined policy to transform the evaluation practices. The suggestion in the report to have central and state boards of undergraduate education ostensibly to separate the academic and administrative functions of colleges and provide quality benchmarks would unfortunately result in opposite effects such as regimentation of curriculum, rote learning for examinations, rigidity in the course and credit systems and massive increase in tutorial colleges. On the other hand, the Knowledge Commission can help persuade the policymakers to establish a national curricular framework for higher education dealing with the key curricular concerns enforceable with a time-bound implementation strategy. Such a framework will enhance the scope for “pluralism and diversity” rightly emphasised in the report. The universities and colleges should have the functional autonomy within the framework to innovate curriculum, forge links with other institutions and deal with the sponsoring and funding agencies. Erosion of University Autonomy At this point of time when the university system in India is subjected to harsh criticism, it would be worthwhile to examine the underlying processes that influence the functions of our universities. The Kothari Commission recognised the imperatives of university autonomy and cautioned that “only an autonomous institution, free from regimentation of ideas and pressure of party or power politics, can pursue truth fearlessly and build up in its teachers and students, habits of independent thinking and a spirit of enquiry unfettered by the limitations and prejudices of the near and the immediate which is so essential for the development of a free society”.

NSOU ? GE-ED-11 69 There is a high degree of propensity to put the blame on the university system itself for all the maladies. While the university system cannot absolve itself of the responsibilities for certain amount of deterioration in standards of teaching and research, it is indeed regrettable that there are clever and concerted efforts to hide the ill-effects of external interference. The report of the Knowledge Commission recognises this phenomenon. It states that "the autonomy of universities is eroded by interventions from governmental and intrusions from political processes". It further adds that, "experience suggests that implicit politicisation has made governance of universities exceedingly difficult and much more susceptible to entirely non-academic interventions from outside. This problem needs to be recognised and addressed in a systematic manner within universities but also outside, particularly in governments, legislatures and political parties." It stops short of elaborating the steps to reduce the non-academic interventions. Form and Mode of Interference The erosion of university autonomy is caused mainly through manipulating the two key instruments of governance, namely, the governing boards and appointment of key functionaries such as vice chancellors (VCs) and registrars. Further erosion is caused by competition to get political control of student and faculty bodies. The institutions in the country that are free from such intrusions have demonstrated their capability for superior performance. Unless the political and bureaucratic intrusions are eliminated, no amount of reforms in other functions will yield results. It can be seen that the best universities/institutes in India are those that have competent and autonomous governing boards. The Radhakrishnan Commission [Gol 1949] had suggested "the inclusion of wisely chosen external members of its governing body and then to leave it free from interference". The governing boards of centrally-sponsored and funded university-level institutions, such as the central universities, centrally-funded deemed universities and institutions of national importance such as IITs, IIMs, etc, consist of only two or three persons from the central bureaucracies in addition to outside experts who have sufficient academic and professional credibility, besides the institutional members. In the state-funded universities, the governance structure varies considerably from state to state and even within a state. With some rare exceptions they are all

NSOU ? GE-ED-11 70 faced with severe interference effects from the political system and bureaucracy. There are several known instances of incompetent persons, nominated to the governing boards/syndicates mainly on the basis of the personal relationships or political patronage or illicit financial consideration. In the case of private universities, those sponsored by respectable philanthropic or corporate organisations, interested in protecting their reputation, seek to constitute governing boards with well-known and respected persons. However, there are many private universities established by individuals or families with sole profit motivations, which seek to formulate the governing boards with docile persons. Presently political consideration dominates the process of selecting VCs in a majority of cases. For more than 50 years, there have been many discussions on the processes for appointing VCs [AIU 2000]. The Kothari Commission [Gol 1966] suggested appointment of persons who can stand for "the commitment of the university to scholarship and pursuit of truth and can ensure that the executive wing of the university is used to assist the academic community in all its activities". The University Grants Commission (UGC) has established detailed guidelines for selection of VCs [UGC 1993]. In violation of the spirit of these guidelines, there are recent trends whereby the state governments sanctify the deviations through legislative actions. Some states expressly mandate the chancellor (the governor of the state) to obtain the concurrence of the chief ministers before choosing the name from the panel of names for the VCs submitted. This situation is ignored whenever the quality and excellence of Indian universities are compared to world-class institutions abroad. The report laments the fact that "the gap between our universities and those in the outside world has widened. And none of our universities rank among the best, say fifty in the world". The relevance of many of the parameters, such as the presence of Nobel laureates in the faculty, enrolment of foreign students and foreign faculty, used for ranking universities by various foreign agencies are irrelevant in the Indian context. What is forgotten is that our universities have not been provided with the same functional environments as the eminent institutions elsewhere. On the contrary, they suffer from an extraordinary intensity of outside interferences.

NSOU ? GE-ED-11 71 It is time to establish a set of enforceable national norms for the constitution of governing boards and selection and appointment of vice chancellors/directors in public as well as private universities along with an indigenous system of ranking to promote competitiveness valid for our society. Regulatory Systems There is a tendency to blame the regulatory system exercised by the statutory bodies for the maladies of the higher education system. The NKC has proposed the stripping of the regulatory roles of the statutory bodies like the UGC, All-India Council for Technical Education (AICTE), Medical Council of India (MCI), etc, and establish a super regulatory body called Independent Regulatory Authority for Higher Education (IRAHE). When eminent persons occupied advisory and policy-making positions in these bodies, the regulatory system commanded a great deal of respect and dignity for contributions to higher and professional education. However, one main problem of the statutory bodies is the packing of their policy organs with persons, not quite suited for the job, based on political considerations. Financing Higher Education Compared to the centrally-funded institutions, the state universities are generally starved of funds. Consequently, they resort to running correspondence courses and self-financing programmes causing diversion of talents from the core functions. Some states have also put a ban on recruitment of teachers for a decade or more due to financial constraints resulting in accumulation of unfilled teaching positions and use of junior and inexperienced staff on ad hoc basis out of funds generated by correspondence and self-financing courses. Consequently, many state universities are unable to initiate any new programmes of study and research. There is insufficient recognition of the extraordinary commitment and dedication of the majority of the faculty in the universities, especially those in the non-metropolitan towns, to maintain the academic activities in the face of severe financial crunch. The NKC report advocates that "the government support for higher education should be at least 1.5 per cent, if not 2 per cent of GDP from a total of 6 per cent of GDP for education". Similar recommendations have been made earlier by several committees. It is important to realise that there should be a normative, rational and

NSOU ? GE-ED-11 72 predictable funding for higher education to plan ahead and not be stifled by vagaries for year-to-year funding. Similar norms for state funding should be established. The report emphasises that the "Universities must become the hub of research once again to capture synergies between teaching and research that enrich each other". The report of the NKC has prescribed approaches to revamp the higher education system. It has dealt with issues relating to expansion, curricular concerns, governance and financing. What is needed at this stage is to reflect on the causes for the disappointing results on these and similar suggestions by several eminent commissions and committees during the past decades, if this report may not see the same fate. 3.5 Rashtriya Uchchatar Shiksha Abhiyan or RUSA Keeping in view the recommendations of the Planning Commission, the need for reforms in the State Higher Education sector, using Central funds in a strategic

90%

MATCHING BLOCK 43/58

SA CHAPTER 1_Edu Compendium UK.docx (D109559634)

to ensure holistic planning at the State level and enhancement of allocations for the state

institution, a new Centrally Sponsored Scheme is proposed. The Scheme would be spread over the two plan period (XII and XIII), and would be an over-arching scheme for funding the State Universities and Colleges in order to achieve the aim of equity, access and excellence. The scheme is called the Rashtriya Uchchatar Shiksha Abhiyan (RUSA). The scheme has the following salient features: ? It is an umbrella mission mode project scheme that would subsume other existing scheme in the sector ? The Central funding would flow from MHRD to institutions, through the State Councils of Higher Education ?

100%

MATCHING BLOCK 38/58

W

The funding to States would be made on the basis of critical appraisal of

the State Plans for Higher Education. The

97%

MATCHING BLOCK 39/58

W

Plans would describe each State's strategy to address issues of equity, access and excellence in higher education ?

All funding under the RUSA would be norm based and future grants would be outcome dependent. Certain academic, administrative and governance reforms will be a precondition for receiving funding under RUSA.

NSOU ? GE-ED-11 73 The key objectives of RUSA are to

improve access, equity and quality in higher education through planned development of higher

education at the state level. Such planning will include creating new academic institutions, expanding and upgrading the existing ones, developing institutions that are self-reliant in terms of quality education, professionally managed, and characterized by greater inclination towards research and provide students with education that is relevant to them as well the nation as a whole.

The Approach to RUSA The project will require the project institutions to implement academic and non- academic reforms for their self-conceived development programmes that focus on quality and relevance, excellence, resource mobilization, greater institutional autonomy with accountability, research and equity. The project will lay major emphasis on

monitoring and evaluation. The primary responsibility of monitoring will lie with the institutions themselves. The management structure at the institutional level i.e. the Board of Governors (BoG) will monitor the

progress of institutional projects on a regular basis and provide guidance for improving the performance of the institutions in project implementation. The information from project institutions will be collected through a scalable web-based Management Information

System (MIS). State governments will also regularly monitor and evaluate the progress of institutions. The Project Appraisal Board (PAB) at the national level in MHRD will review the project annually. The monitoring will be based on action plans prepared by each project institution and achievements made with respect to a set of norms, which are defined in the Institutional Development Plans. Goal of

RUSA The objectives of RUSA would be to achieve the target of GER in Higher Education of 32% by the end of XIII Plan, which the central Government has set for itself. Government of India aims to improve the quality of State Universities and colleges and enhance their existing capacities so that they become dynamic, demand- driven, quality conscious, efficient and forward looking and responsive to rapid economic and technological developments occurring at the local, state, national and international levels. The salient objectives of the scheme can be enumerated as follows:

NSOU ? GE-ED-11 74 ? Improve the overall quality of existing state institutions by ensuring that all institutions conform

96%

MATCHING BLOCK 40/58

W

to prescribed norms and standards and adopt accreditation as a mandatory quality assurance framework. ? Usher transformative reforms in the state higher education system by creating a facilitating institutional structure for planning and monitoring at the state level, promoting autonomy in State Universities and improving governance in institutions. ? Ensure academic and examination

reforms in the higher educational institutions. ?

Enable conversion of some of the universities into research universities at par with the best in the world. ?
 Create opportunities for states to undertake reforms in the affiliation system in ? Order to ensure that the reforms and resource requirements of affiliated colleges are adequately met. ?

100%

MATCHING BLOCK 41/58

W

Ensure adequate availability of quality faculty in all higher educational institutions and ensure capacity building at all levels of employment. ? Create an enabling atmosphere in the higher educational institutions to devote themselves to research and innovations. ? Expand the institutional base by creating additional capacity in existing institutions and establishing new institutions, in order to achieve enrolment targets. ? Correct regional imbalances in access to higher education by

facilitating access to high quality
 institutions in urban & semi-urban
 areas, creating opportunities for students from rural areas to get access to better quality institutions
 and

98%

MATCHING BLOCK 42/58

W

setting up institutions in un-served & underserved areas. ? Improve equity in higher education by providing adequate opportunities of higher education to SC/STs and socially and educationally backward classes; promote inclusion of women, minorities, and differently-abled persons.

NSOU ? GE-ED-11 75 Scope of RUSA All State Universities and colleges (both 12B and 2(f) compliant and non-12B and non-2(f)) from all states and Union Territories (UTs) across the country would be eligible to be covered under RUSA. Subject to eligibility, an estimated 306 state universities and 850099 colleges will be covered under this initiative to improve the learning outcomes and employability of graduates and to scale-up research, development and innovations. The project will also support these institutions to improve their policy, academic and management practices.

RUSA will fund the institutions under a few key components. The yardstick for deciding the quantum of funds for the states and institution will be the norms that will reflect the key result areas (access, equity and excellence), in addition to other monitoring and capacity building functions. The State Higher Education Councils will be the key institution at the state level to channelize resources to the institutions from the state budget.

Strategic funding of state institutions must ensure that the issues of quality and access are addressed in an equitable manner. This would entail encouraging the states to prepare State Higher Education Plan duly keeping the following aspects in mind: ? Spatial and regional planning after due mapping ? Programme and discipline planning ? Mandatory accreditation and quality improvement ? Reforms – governance and academic ? Infrastructure saturation ? Review of the affiliation system ? Transparent and norm-based funding ? Outcome-based reimbursements ? Faculty planning ? Equity interventions ? Focus on research and innovation RUSA will be implemented through the Ministry of Human Resource Development (MHRD) of the Government of India as a “Centrally Sponsored Scheme” with matching contribution from the state governments and Union Territories (UTs).

NSOU ? GE-ED-11 76 3.5 Problems of Higher Education in India and Suggestions 3.5.1 Problems of Higher Education in India Higher Education in India has a long historical past. Universities like Taxkshila, Nalanda, Bikramshila were well known all over the world. These institutions of ancient India are also attested by significant developments in intellectual fields like literature, literary criticism, philosophy, logic, medicine, mathematics and astronomy. After the advent of British the aim and objectives of higher education in India have been changed. They imposed upon India a English model of education. Aims and objectives of higher education is British India was to produce English knowing Indians for doing the subordinate government service and clerical jobs. After independence the earlier institution could now become a part of the general system and the effort was now made to convert the entire system of education to the national pattern. Indian higher education system has undergone many important changes in the recent past and the most significant being its unprecedented growth and its consequent transformation from an elite system to a mass system. The fact that higher education is available to the masses, including the underprivileged and weaker sections of society, is an achievement. It is also creditable that we have been able to create some undoubted centres of excellence. In spite of these achievements, the higher education in India is groaning under very severe strains and stresses. After more than 70 years of independence, India's higher education system has still not been developed fully. It is evidenced by its poor performance in institutional rankings (not a single Indian university in top 100 universities of the world), the poor employment status of its students, poor track record in receiving national awards and recognition, poor share in research funding and so on. Moreover, the status of state public universities that produce over 90% of the graduates in India is more dismal. The following may be listed as the leading problems or issues of higher education in India:

NSOU ? GE-ED-11 77 ? Enrolment: ? According to the All-India Survey on Higher Education (AISHE) report 2018-19, the Gross Enrolment Ratio (GER) in Higher education in India is only 26.3%, which is quite low as compared to the developed as well as, other developing countries. ? With the increase of enrollments at the school level, the supply of higher education institutes is insufficient to meet the growing demand in the country. ? Quality: ? Ensuring quality in higher education is amongst the foremost challenges being faced in India today. ? However, the Government is continuously focusing on quality education. Still, a large number of colleges and universities in India are unable to meet the minimum requirements laid down by the UGC and our universities are not in a position to mark their place among the top universities of the world. ? Political Interference: ? Increasing interference of politicians in the management of higher education jeopardises the autonomy of HEIs. ? Also, students organise campaigns, forget their own objectives and begin to develop their careers in politics. ? Poor Infrastructure and Facilities: ? Poor infrastructure is another challenge to the higher education system of India, particularly the institutes run by the public sector suffer from poor physical facilities and infrastructure. ? Faculty shortages and the inability of the state educational system to attract and retain well-qualified teachers have been posing challenges to quality education for many years. ? Large numbers of NET/PhD candidates are unemployed even though there are a lot of vacancies in higher education.

NSOU ? GE-ED-11 78 ? Inadequate Research: ? There is inadequate focus on research in higher education institutes. ? There are insufficient resources and facilities, as well as limited numbers of quality faculty to advise students. ? Most of the research scholars are without fellowships or not getting their fellowships on time which directly or indirectly affects their research. Moreover, Indian Higher education institutions are poorly connected to research centres and to industries. ? Poor Governance Structure ? Management of Indian education faces challenges of over-centralization, bureaucratic structures and lack of accountability, transparency, and professionalism. ? As a result of the increase in the number of affiliated colleges and students, the burden of administrative functions of universities has significantly increased and the core focus on academics and research is diluted. ? Teaching Quality ? The first issue that higher education in India is facing is decreasing teaching quality. Teachers are not well trained and qualified for the job they are assigned to. ? Some colleges recruit young graduates as professors who have no experience or knowledge. So this is a big problem. ? Poor Remuneration: Poor remuneration has become a major problem for the Indian education system. In India teaching is not a lucrative job in terms of remuneration in comparison many corporate sector jobs. In fact, teaching is a very ill paid job at every stage of education and as such it fails to attract best of the brains in teaching profession. Many meritorious scholars from India even prefer to take up small time job in US rather than a job in India as teacher. This aspect needs serious attention on the part of our policy makers.

NSOU ? GE-ED-11 79 ? Invasion in Autonomy: Invasion on the university autonomy is another important challenge in higher education. University autonomy has to be distinguished from academic freedom which signifies freedom of expression for professionals. Autonomy has several aspects, namely, financial, administrative and academic. It is difficult for university of India to have full financial autonomy as they depend for 90 percent or more of their income on the Government grants moreover they were also required to get approval for specific scheme from the UGC. There are hardly any interference of the government in academic autonomy of the universities. ? Finance: Financing of Higher Education is a very acute problem in India. The report of the Education Commission (1964-66) strongly agreed devoting 6% of the GNP to education. The Majumdar Committee (MHRD. 1999) reiterated the same. The National Policy on Education 1968 and 1986 also categorically laid down and endorsed that the GNP allocation to education should be at least 6%. The NPE 1992 stated that the VIIF Plan onward the GNP share will uniformly exceed 6%. But the target could not be achieved. India spends around 3.7% of its GNP of which 0.56% is the share of higher education. Thus, there is a considerable decline in the state funding of higher education. Governments, both at the centre and in the states, are showing an increasing reluctance to support higher education. ? Privatization: This 'privatisation' of education is a matter of concern for many. While some of the colleges established under private initiative have a professional approach and are striving to impart high quality education, a depressingly large number lack proper facilities and are in effect business enterprises, established with the primary objective of securing financial profit and political power. Strict academic and administrative control of these colleges is essential.

NSOU ? GE-ED-11 80 ? Accreditation: As per the data provided by the NAAC, as of 02.07.2021, only 13719 of the total higher education institutions in the country were accredited. And among those accredited, only 210 of the universities and 1724 of the colleges were found to be of quality to be ranked at 'A' level. ? Research and Innovation: There are very nominal scholars in our country whose writing is cited by famous western authors. There is inadequate focus on research in higher education institutes. There are insufficient resources and facilities, as well as, limited numbers of quality faculty to advice students. Most of the research scholars are without fellowships or not getting their fellowships on time which directly or indirectly affects their research. Moreover, Indian Higher education institutions are poorly connected to research centres. So, this is another area of challenge to the higher education in India.

3.5.2 Opportunities in Higher Education India is a large country, with an estimated population of young people aged between 18 to 23 years to be around 150 millions. The sheer size of the market offers huge opportunities for development of the higher education sector in India. India now boasts of having more than 40,000 colleges and 1003 universities, which has been quite a remarkable growth during the last six decades. The year 2019-20 witnessed 38.5 million enrollments, which makes India the 3rd largest educational system in the world. Unfortunately, the educational infrastructure of India is inadequate to handle such huge volumes. In spite all the government spending in the educational sector, it is just too insufficient to meet the growing requirements. Therefore, higher Education sector has now been identified as one of the promising areas for private and foreign investments. It offers immense investment opportunities in both non- regulated and regulated segments. Indian higher education system is growing very fast irrespective of various challenges but there is no reason that these Challenges cannot be overcome. With the

NSOU ? GE-ED-11 81 help of new-age learning tools, it is easy for country like India to overcome these problems and bring a paradigm shift in the country's higher education sector. With such a vibrant country with huge population properly educated, the possibilities are endless. If knowledge is imparted using advanced digital teaching and learning tools, and society is made aware of where we are currently lagging behind, our country can easily emerge as one of the most developed nations in the world. There are opportunities for strategic engagement and capacity building in higher education leadership and management at the state level. There are opportunities for India to collaboration at national and international level on areas of systemic reform, including quality assurance, international credit recognition, and unified national qualifications framework. Equality of educational opportunity in higher education is considered essential because higher education is a powerful tool for reducing or eliminating income and wealth disparities. The idea of equalising educational opportunities also lies in the fact that "the ability to profit by higher education is spread among all classes of people. There are great reserves of untapped ability in the society; if offered the chance they can rise to the top. A great deal of talent of the highest level is, in fact, lost by an inegalitarian system of education" (Balachander, 1986). The need to enhance the employability of graduates is presenting entry points for collaboration in enterprise education and entrepreneurship, links with industry, research skills and the wide range of transferable skills, including English. The emerging interest in Indian higher education institutions in the vocational skills market provides areas for potential engagement with international partners. There is a need to build stronger relationships and increase mutual understanding in higher education by increasing support and participation in platforms (conferences, workshops, seminars) which enable debate and dialogue with other countries of the world. (British Council, 2014).

3.5.3 Suggestions Improving the System of Higher Education ? There is a need to implement innovative and transformational approach form primary to higher education level to make Indian educational system globally more relevant and competitive.

NSOU ? GE-ED-11 82 ? Higher educational institutes need to improve quality and reputation. ? There should be a good infrastructure of colleges and universities which may attract the students. ? Government must promote collaboration between Indian higher education institutes and top International institutes and also generates linkage between national research laboratories and research centres of top institutions for better quality and collaborative research. ? There is a need to focus on the graduate students by providing them such courses in which they can achieve excellence, gain deeper knowledge of subject so that they will get jobs after recruitment in the companies which would reduce unnecessary rush to the higher education. ? Universities and colleges in both public private must be away from the political interventions, ? There should be a multidisciplinary approach in higher education so that students' knowledge may not be restricted only up to his own subjects.

3.6 Summary At the end of this unit, the learners have come to know about the system of higher education in India. They have come to know that the higher education also needs to be expanded in our nation for the proper development of the nation. After the successful implementation of Sarva Shiksha Abhiyan and Rashtriya Madhyamik Shiksha Abhiyan, there was the introduction of Rashtriya Uchchatar Shiksha Abhiyan for the development of higher education in India. The target was to increase the enrolment ratio in higher education as well as imparting the quality higher education in India. But even after seventy five years of independence, there are several issues and challenges in the way of higher education in India in the form of enrolment, finance, quality education and research, political intervention, etc. The solutions and ways out have also been discussed in this unit to get rid of the problems of higher education.

NSOU ? GE-ED-11 83 3.7 Self Assessment Questions 1. What is meant by higher education in India? 2. Comment on the structure and system of higher education in India. 3. What was the background of introducing Rashtriya Uchchatar Shiksha Abhiyan? What are the scopes of RUSA? 4. What are the recommendations of the National Knowledge Commission? 5. What problems National Knowledge Commission identified in higher education system in India? 6. Comment on the goals and approach of RUSA. 7. What are the issues and challenges in front of higher education in India? 8. Discuss in detail the problem of finance in higher education in India? 9. How political invasion in the autonomy of the higher education system disturbed the development of higher education in India? 10. What are the probable solutions to the problems of expansions of quality higher education in India?

Objectives After going through this unit the learners will be able to ? realize the meaning of

peace education. ? understand the objectives and necessity of peace education. ? understand the role of education in establishing peace. ? know the concept of sustainable development. ? understand the role of education to bring sustainable development. ? discuss the concept of equity and equality ? discuss the concept of educational equity and educational equality. ? be aware of the problems of equity and equality. ? be aware of the role of education in bringing equality through educational equity.

4.2 Introduction

The world today, and since the beginning of civilization, has been carrying with it the concept of conflict in different forms. Conflict comes from disagreement and finally may lead to war. And to have a peaceful war-free or conflict-free world, there is the necessity to establish peace, nurture peace and to carry the truth of peace throughout life. But how can this peace be established, nurtured and carried through? Here there is role of peace education. The late 20 th century and the early 21 st century world felt the necessity to promote peace around the world to make either an end to conflict or at least to minimise the conflict. They believed that the education is the key to unite people, unite nations by bringing people closely together to each other. Sustainable development is another most discoursing factor in the 21 st century world. "Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs." It happens often that for the development in one area of life, we sometimes make harm to some other area or areas. And this harm may bring dark days for the future. And NSOU ? GE-ED-11 87 here comes the priority of the concept of sustainable development which may be termed as all round development of the world. And education plays an important role for this sustainable development too. Another important concept in the arena of education as well as in the arena of development is the concept of equity and equality. These two words are very closely articulated though, they are different in meaning. Equity is the process and equality is the result. For the education of all the backward people equity is very much needed a concept to bring equality of education and equality of opportunity of education. Only then, one day, the world will meet some moment when every people will have equal educational right and equal education too.

4.3 Peace Education: Meaning, Aims and Importance

4.3.1 Meaning of Peace Education

Education is the key to uniting nations, bringing human beings closely together. In many parts of the world, civil society suffers because of situations of violent conflicts and war. It is important to recognise the crucial role of education in contributing to building a culture of peace and condemning instances in which education is undermined in order to attack democracy and tolerance. A culture of peace and non-violence goes to the substance of fundamental human rights: social justice, democracy, literacy, respect and dignity for all, international solidarity, respect for workers' rights and core labour standards, children rights, equality between men and women, cultural identity and diversity, Indigenous peoples and minorities rights, the preservation of the natural environment to name some of the more obvious thematic. These are all issues of concern to Education International (EI) and its member organizations, as reflected in many resolutions endorsed at EI World Congresses as well as at regional EI supported events. EI affirms the right to peace and pledges its support for the peaceful resolution of conflicts and practice of non-violence through education, dialogue and cooperation.

NSOU ? GE-ED-11 88 In 2000, the then UNESCO Director General, Federico Mayor, stressed that "Education International is not only a vast repository of experience, it also has the know-how and talent to implement innovation and change far beyond what is normally found in government circles [...] Education International and UNESCO can work together to achieve the common goals of an educated, intellectually curious and participatory culture of peace and democracy." Education is a key tool in combating poverty, in promoting peace, social justice, human rights, democracy, cultural diversity and environmental awareness. Education for peace implies an active concept of peace through values, life skills and knowledge in a spirit of equality, respect, empathy, understanding and mutual appreciation among individuals, groups and nations. In its Constitution and resolutions, EI committed itself firmly to international peace activities linked to education promoting human rights and democracy and encouraging international understanding and solidarity. EI called on its member organisations to develop their advocacy in line with UNESCO's Charter and aims, the UN Charter,

68%

MATCHING BLOCK 44/58

SA Chapter 1 Final Draft for submission.docx (D122846612)

the Universal Declaration of Human Rights and the International Convention on the Rights of the Child.

The educational action for promoting the concept of peace concerns the content of education and training, educational resources and material, school and university life, initial and ongoing training for teachers, research, and ongoing training for young people and adults. A culture of peace must take root in the classroom from an early age. It must continue to be reflected in the curricula at secondary and tertiary levels. However, the skills for peace and non-violence can only be learned and perfected through practice. Active listening, dialogue, mediation, and cooperative learning are delicate skills to develop. This is education in the widest sense. It is a dynamic, long term process: a life-time experience. It means providing both children and adults with an understanding of and respect for universal values and rights. It requires participation at all levels-family, school, places of work, news rooms, play grounds, and the community as well as the nation. At the EI World Congress in 1998, EI and its affiliates placed on the record that they wanted "to take every opportunity to promote justice, world peace and education, in the interests of children of all countries." As a token of EI's commitment to a

NSOU ? GE-ED-11 89 culture of peace, General Secretary Fred van Leeuwen, was one of the first to sign the Manifesto 2000 appeal and to support the International Year for the Culture of Peace. In a resolution adopted in 2004, EI Resolution on Education for Peace, EI member organisations "pledged to promote education for peace and intercultural learning as the best antidote to racist and fundamentalist phenomena in order to prevent social conflict and the recourse to social violence." In 2007, teacher organizations were also invited to promote peaceful behaviour in school environments through dispute resolution and peer mediation. Peace education encompasses the key concepts of education and peace. While it is possible to define education as a process of systematic institutionalized transmission of knowledge and skills, as well as of basic values and norms that are accepted in a certain society, the concept of peace is less clearly defined. Many writers make an important distinction between positive and negative peace. Negative peace is defined as the absence of large-scale physical violence—the absence of the condition of war. Positive peace involves the development of a society in which, except for the absence of direct violence, there is no structural violence or social injustice. Accordingly, peace education could be defined as an interdisciplinary area of education whose goal is institutionalized and non-institutionalized teaching about peace and for peace. Peace education aims to help students acquire skills for non-violent conflict resolution and to reinforce these skills for active and responsible action in the society for the promotion of the values of peace. Therefore, unlike the concept of conflict resolution, which can be considered to be retroactive—trying to solve a conflict after it has already occurred—peace education has a more proactive approach. Its aim is to prevent a conflict in advance or rather to educate individuals and a society for a peaceful existence on the basis of non-violence, tolerance, equality, respect for differences, and social justice. Peace education activities promote the knowledge, skills and attitudes that will help people either to prevent the occurrence of conflict, resolve conflicts peacefully, or create social conditions conducive to peace. Core values of non-violence and social justice are central to peace education. Nonviolence is manifested through values such as respect for human rights, freedom NSOU ? GE-ED-11 90 and trust. Social justice is realised by principles of equality, responsibility, and solidarity. In order to achieve these ideals, peace education programmes across the world address a wide range of themes. These include non-violence, conflict resolution techniques, democracy, disarmament, gender equality, human rights, environmental responsibility, history, communication skills, coexistence, and international understanding and tolerance of diversity. Peace education can be delivered to people of all ages, in both formal and informal settings. Programmes exist at local, national, and international levels, and in times of peace, conflict, and post-conflict. To create public dialogue different factions of society are often brought together in peace education programmes – these typically include civil society groups, schools, tribal leaders and the media. Yet due to the many areas covered by peace education, initiatives are primarily determined by culture and context, as well as by the projects' scopes and objectives. Peace education and peacebuilding are therefore intrinsically linked. The UN's actions for peacebuilding include education as one of its principle components. For peacebuilding initiatives to remain sustainable it is vital that attitudes towards war and violence are transformed and translated into long-term behavioural change which seek alternative solutions to armed conflict.

4.3.2 Aims of Peace Education

The overall aim of Education for Peace is to help build a peaceful world. To do so we aim to: ? understand the nature and origins of violence and its effects on both victim and perpetrator; ? create frameworks for achieving peace and peaceful, creative societies; ? sharpen awareness about the existence of unpeaceful relationships between people and within and between nations; ? investigate the causes of conflicts and violence embedded within perceptions, values and attitudes of individuals as well as within social and political structures of society;

NSOU ? GE-ED-11 91 ? encourage the search for alternatives and possible nonviolent skills; ? equip children and adults with personal conflict resolution skills; ? show people that violence and war are learned and not an intrinsic part of human nature and that it is possible to resolve conflict peacefully; ? create a more peaceful world where all of us may become agents for change. Education for Peace gives us the skills that will assist in achieving peaceful societies; ? correct the limited understanding of peace held by many people that it is the absence, however contrived, of direct violence, of wounding and killing; ? create a better learning environment where conflict and relationships may be explored; ? appropriating intellectual and emotional development of the individuals; ? developing a sense of social responsibility and solidarity; ? observing the principles of equality and fraternity towards all; ? enabling the individual to acquire a critical understanding of the problems at national and international levels; ? creating willingness for continuous learning; ? accepting and participating in free discussions; ? taking decisions on a rational basis; ? appreciating other's cultures; and ? overcoming obstacles towards promotion of peace.

4.3.3 Importance of Peace Education

The humankind has been a witness to conflict in some form or other at all levels. Violence in all forms is on increase and has percolated even to the school levels. Violent expressions and aggression are increasingly being resorted to leading further to conflicts. Therefore, peace has become all the more imminent in such contexts. Efforts are now being made to inculcate the values related to harmony, respect and tolerance for better interpersonal relations. These are seen as seeds to ensure in the long-term a conflict-free world. As Meyerhof put it, 'peace studies encompass the

NSOU ? GE-ED-11 92 learning of nonviolent communication, tolerance, acceptance of diversity and love as the basic law of life'. Thus peace education, most importantly, helps in deconstructing the mindset and discourses of power struggle by the use of violence. It helps people to cooperate and negotiate problems at the individual as well as societal levels. In the 1950s and 60s, the definition of 'peace' was confined to the absence of war. The focus of studies on peace was mainly on interstate conflicts, wars and so on. Subsequently, there was a departure from this view of peace; the focus shifted to the aspects of structural violence and the inherent contradictions in social and societal structures. From this, the focus sharpened on the role of individual's moral and ethical disposition and is now zeroed down to the 'human values' that guide the conduct of individuals. The shift in this field has been gradual and steady. Therefore, 'presently character education, moral education and self-esteem development are considered aspects of aiding in the individual reaching this personal inner potential and becoming a valued citizen for peaceful coexistence' (Ibid). Peace education is thus not a history of peace-making as she says but to create peace in one's environment while standing for truth, justice and self-preservation. It is also more than learning about conflict resolution. If one has to mediate for establishing peace, it is necessary that one should be receptive to other's perception, viewpoint and adjust one's own perspectives in order to reach an understanding, compromise and consensus at a collective level. Peace education in UNICEF refers to the process of promoting the knowledge, skills, attitudes and values needed to bring about behaviour changes that will enable the children, youth and adults to prevent conflict and violence, both overt and structural; to resolve conflict peacefully; and to create the conditions conducive to peace, whether at an intrapersonal, interpersonal, intergroup, national or international level. Peace Education may be described as well as defined in various ways as there is no such universally accepted definition of peace education found. From peace literature a few well explained definitions are mentioned below to give a holistic meaning as well as concept of peace education, such as: (i) "Peace Education is grounded in active citizenship, preparing learners for assiduous participation in a democracy, through problem-posing and problem-solving education and a commitment to transformative action in our societies."—by John Dewey (1938).

NSOU ? GE-ED-11 93 (ii) "Peace Education, broadly defined, is the cornerstone of a culture of peace."—by MichealWessells (1994). (iii) "Peace Education is a mechanism for the transformation from a culture of violence to a culture of peace through a process of 'conscientization'."—by Freire (2006). (iv) According to Abebe et. al. (2006), Peace Education is a process of developing knowledge, skills, attitudes, behaviours and values that enable learners to identify and understand sources of local and global issues and acquire positive and appropriate sensitivities to these problems. It helps to resolve conflicts and to attain justice in a non-violent way and live by universal standards of human rights and equity by appreciating cultural diversity, respect for the earth and for each other. Peace Education means to learn about and to learn for peace. Learning about peace means obtaining knowledge and understanding of what contributes to peace, what damages it, what leads to war, what does 'peace' mean on each level anyway, what is one's role in it, and how are the different levels connected? Learning for peace means learning the skills, attitudes and values that one needs in order to contribute to peace and help to maintain it forever. For example, this means learning to deal with conflicts without the recourse to violence, learning to think creatively, learning to apply the methods of active non-violence or learning to deal with cultural differences in a constructive way (Space for Peace, 2010). Peace education can also be defined as the transmission of knowledge about requirements of, the obstacles to, and possibilities for achieving and maintaining peace; training in skills for interpreting the knowledge; and the development of reflective and participatory capacities for applying the knowledge to overcome problems and achieve possibilities (Reardon, 2000). Therefore, peace education is holistic. It embraces the physical, emotional, intellectual, and social growth of children within a framework deeply rooted in traditional human values. It is based on philosophy that teaches love, compassion, trust, fairness, co-operation and reverence for the human family and all life on our beautiful planet (Schmidt and Friedman, 1988, as cited in Abebe et. al., 2006). Peace education is an attempt to respond to problems of conflict and violence on scales

NSOU ? GE-ED-11 94 ranging from the global and national to the local and personal. It is about exploring ways of creating more justice and sustainable futures (R. D. Laing, 1978, as cited in Abebe, et. al., 2006) for all people i.e. both men and women. Towards Positive Peace Peace education is seen as leading to positive peace. Positive peace means state of tranquillity, calm, quietness, harmony and friendship. It flourishes in the presence of the feeling of brotherhood and in the absence of the ignorance in mind. As Dr.SarvepalliRadhakrishnan said, 'If we wish to achieve peace we must maintain that inner harmony, that poise of the soul, which are the essential elements of peace. It cannot be achieved by organizations. It can come only when our minds become endowed with generosity and goodwill towards all. We must be filled with the moral power of love and the vision of spiritual unity. We have to solve our problems through the help of our higher nature' (S.Radhakrishnan, Religion and Culture, p.135; 173). Positive peace is one of the most effective means to get the society rid of biases, structural violence which is mostly latent in nature and such negative traits that impede the progress of the individual in the real sense. Peace education is invariably linked with this concept that is designed in such a way as to 'alter attitudes regarding peace in the hope that this will stimulate changes in structure' (John Baylis, p.277). Similar views are echoed by Johan Galtung wherein he states that 'peace must not only be conceived of as the absence of war and direct violence (negative peace) but rather, working towards peace as the means to the realization of conditions leading to a maximal reduction of structural violence (positive peace)'. 4.3.4 Peace Education in Action Haavelsrud (1975) suggested that peace education, as in the case of all education, should be conducted in three areas: (1) Information; (2) Attitudes; and (3) Action. It consists of Awareness, Analysis and Action. Peace education is a part in the larger framework aiming at social change. It is a transformative change for better. In this scheme, the transformation of the individual is the primary requisite. This individual transformation gradually brings in a change in the system/structure. Individually and collectively, it becomes imperative to come together for 'learning to live together, creating awareness about others' tribulations, analysing the situation rationally and

NSOU ? GE-ED-11 95 taking action with willingness to produce the positive results'. It is important to note that peace education can be promoted only in an atmosphere of nonviolence. There is a crucial link between human nature and violence. As Gandhi believed, the evil can be overcome by a steadfast adherence to nonviolence. But, holistically, he believed that all human beings are inherently good. It is through this belief that he brought out the blueprint for development, 'Constructive Programme'. It aims at social change through nonviolence. Similarly, in the process of peace education, the individual is exposed to the stark realities of the world wherein there are severe disparities and makes him/her understand the ground realities in which millions of their brethren live. This develops the ability to understand others, and also the willingness to change things for better. This is what John Dewey termed as 'world patriotism', for creating a better world. Peace education is not an abstract concept or that which can be imparted only through classroom teaching. It is a continuous learning process. Peace education can begin from the family setting and move on to the other levels like school, institutions of higher education, workplace or areas where related projects take place. It is important to note the following points for an effective learning in the process: ? Emphasis should be on the participatory and self-initiated learning ? Preservation and advancement of peace should be integrated into discussions ? Development of curricula on peace and practical approaches ? Imparting of peace related knowledge through media ? Imparting of the knowledge through religious institutions ? Knowledge dissemination through social work projects ? Cooperation and collaboration in the fields of education ? Selection of information and evaluation ? Eliminating bias in conflict information ? Organising campaigns, conducting seminars and talks on peace ? Giving training to the educators of peace to cater to all sections of society ? Promoting volunteerism to provide learning opportunities ? Maintaining consistent motivation levels to promote peace

NSOU ? GE-ED-11 96 4.4 Education for Sustainable Development: Meaning, Aims and Role of education in Sustainable Development
4.4.1 Meaning of Sustainable Development Sustainable development has become a 21 st century buzzword in different forums, seminars, conferences, workshops. It is found much in environmental and economics literature these days. The concern for sustainable development is becoming increasingly louder with the rapidity of economic growth. Around the globe, throughout history, most modern human institutions have evolved in ways that are at best, oblivious, and, at worst, positively hostile to the health of environment. Economic development, till today, is based on two fallacious premises: i. It considers needs of mankind alone and ignores the interdependent ecosystem ii. It treats the environment as a commodity. Human being strives ceaselessly for riches as enslaved and obsessed by technological advancement and by obtaining higher GNP. This obsession has sullied the environment and is tending to ruin the carrying capacity that is, capacity of the ecosystem to support life of Mother Earth. The land lays scarred and eroded. The waters of rivers, lakes and oceans are contaminated with industrial waste, which is nearly unfit for either industrial use or for human consumption. The air is filled with gaseous and particulate pollutants that are toxic to life. Pesticides used to promote agricultural production and public health has severely poisoned the environment. Each agent of production and consumption regards the disposal cost of waste as zero and uses the environmental sector as long as it permits human being to improve their own welfare. They do not have to pay anything to anybody. The environment is still regarded as common property, each agent acting as if the human being owns it. The reckless use continues, without any heed to the damage inflicted, and causes degraded environmental standards, unhealthy and detrimental to all. "Our Common Future" marks the beginning of the sustainable development concept that has generated all the literatures. New books on sustainable development have been appearing with increasing rapidity since the United Nations Conference on

NSOU ? GE-ED-11 97 Environment and Development popularly known as the Earth Summit held in Brazil in 1992. Divergent economic theorists like E. F. Schumacher of Britain, environmentalists like Barry Commoner and Lester R. Brown, population analysts like Paul Ehrlich, politicians like Willy Brandt of Germany and Jimmy Carter of the United States, all played significant roles in formulating ideas. The era of modernisation has created an atmosphere of excitement of instant economic growth. In fact, all sectors of developing countries seem to be vibrating with economic buoyancy. There is expansion of trade, investment, market, and increase in Gross National product (GNP) productivity, per capita income, profit, efficiency, salary, etc, across the globe. The free trade system could more tellingly be called the free ride system. As the producers do not have to include in their product costs all the indirect costs they cause society. It includes pollution of the land, sea and air, ozone holes, disappearing topsoil, exploding health costs, allergies, global warming, destruction of species, pesticides in food, antibiotic resistant bacteria, crime, unemployment, escalating social costs, etc. Many of the most common and most damaging products on the market would never be manufactured if they were priced at their real costs to society as a whole. The road to success in global business today is to find a way to pass on as many of your costs as possible to the public, preferably to another country's public. The most profitable companies at this time are those that are most successful at getting someone else to pay the real costs of their doing business. Present economic process maximises only the profits to the shareholders, while all the other stakeholders are left bearing the costs, such as, cleaning up the environment and dealing with unemployment. The term, sustainable development, was coined by the Brundtland Commission, which defines sustainable development as development that "meets the needs of the present without compromising the ability of future generations to meet their own needs". Sustainable development is defined as balancing the fulfilment of human needs with the protection of the natural environment so that these needs can be met not only in the present, but in the indefinite future. Sustainable development is a pattern of resource use that aims to meet human needs while preserving the environment. The field of sustainable development is conceptually divided into four general dimensions: social, economic, environmental, and institutional. The first

NSOU ? GE-ED-11 98 three dimensions address key principles of sustainability, while the final dimension addresses key institutional policy and capacity issues. There is, now, a worldwide movement of environmentalism parallel to the more enthusiastic global movement of economic growth. Every section of people around the globe now expresses some amount of concern towards the deterioration of environmental standards. The rise in economic welfare is increasingly accompanied by a considerable decline in the quality of environment and loss of ecological stability. Some groups of environmentalist are very pessimistic while the other group of environmental scientists is very optimistic. But the fact remains that there is acid rain, global warming, the greenhouse effect, erosion and sterility of soil, degradation of land, environmental pollution and ozone layer depletion. There is widespread desertification in one hemisphere and deforestation in another hemisphere of the globe. Deeper and wider concern for environmental degradation springs from two major sources. i. Rise in material production effluents and use of synthetic materials ii. Increased demand for environmental goods. The first refers to the problems of environmental externality and the second, to depletion of natural resources. In addition to the increased supply of economic goods, there is also an increased demand for environmental goods. Environmental goods signify any external environmental conditions that affect human welfare. The following elements are connected with the human welfare: ? Absence of all types of pollution ? Availability of clean water and air ? Quality of natural environment (outdoor recreation, etc) ? Quantity of natural environment (forest, wildlife) ? Availability of public utility systems ? Average space availability for inhabitants 4.4.2 Objectives of Sustainable Development Global objectives for sustainable development are as follows: i. Eradicate poverty in all its forms, everywhere.

NSOU ? GE-ED-11 99 ii. Eradicate hunger, achieve food safety and improved diet and promote sustainable agriculture. iii. Ensure healthy lives and promote well-being for everyone of all ages. iv. Ensure inclusive and fair education of good quality and promote lifelong learning for everyone. v. Achieve gender equality and strengthen the position of all women and girls. vi. Ensure access to and the sustainable management of water and sanitation for everyone. vii. Ensure access to affordable, reliable, sustainable and modern energy for everyone. viii. Promote continuous, inclusive and sustainable economic growth, full and productive employment, and decent work for everyone. ix. Build resilient infrastructure, promote inclusive and sustainable industrialisation and promote innovation. x. Reduce inequalities within and between countries. xi. Make cities and settlements inclusive, safe, flexible and sustainable. xii. Ensure sustainable consumption and production patterns. xiii. Take urgent action to combat climate change and its effects. xiv. Preserve and make sustainable use of seas, lakes and marine resources for sustainable development. xv. Sustainable forestry, stop desertification, slow down and reverse soil degradation as well as halt the loss of biodiversity. xvi. Promote peaceful and inclusive communities for sustainable development, provide access to justice for everyone and build effective, responsible and inclusive institutions at all levels. xvii. Strengthen implementation tools and revitalise the Global Partnership for Sustainable Development. 4.4.3 Education for Sustainable Development Good quality education is an essential tool for achieving a more sustainable world. This was emphasised at the UN World Summit in Johannesburg in 2002

NSOU ? GE-ED-11 100 where the reorientation of current education systems was outlined as key to sustainable development. Education for sustainable development (ESD) promotes the development of the knowledge, skills, understanding, values and actions required to create a sustainable world, which ensures environmental protection and conservation, promotes social equity and encourages economic sustainability. The concept of ESD developed largely from environmental education, which has sought to develop the knowledge, skills, values, attitudes and behaviours in people to care for their environment. The aim of ESD is to enable people to make decisions and carry out actions to improve our quality of life without compromising the planet. It also aims to integrate the values inherent in sustainable development into all aspects and levels of learning. There are a number of key themes in ESD and while the dominant focus is on environmental concerns, it also addresses themes such as poverty alleviation, citizenship, peace, ethics, responsibility in local and global contexts, democracy and governance, justice, human rights, gender equality, corporate responsibility, natural resource management and biological diversity. It is generally accepted that certain characteristics are important for the successful implementation of ESD, reflecting the equal importance of both the learning process and the outcomes of the education process (adapted from 'UN Decade of Sustainable Development' UNESCO Nairobi Cluster, 2006). ESD should: ? Be embedded in the curriculum in an interdisciplinary and holistic manner, allowing for a whole-institution approach to policy making. ? Share the values and principles that underpin sustainable development. ? Promote critical thinking, problem solving and action, all of which develop confidence in addressing the challenges to sustainable development. ? Employ a variety of educational methods, such as literature, art, drama and debate to illustrate the processes. ? Allow learners to participate in decision-making on the design and content of educational programmes. ? Address local as well as global issues, and avoid jargon-ridden language and terms.

NSOU ? GE-ED-11 101 ? Look to the future, ensuring that the content has a long-term perspective and uses medium and long-term planning. To promote ESD, the United Nations Decade of Education for Sustainable Development, 2005-2014, (DESD) was adopted by the UN General Assembly with the United Nations Educational, Scientific and Cultural Organisation (UNESCO) designated as the lead agency for promotion throughout the decade. The decade pursues a global vision 'of a world where everyone has the opportunity to benefit from quality education and learn the values, behaviour and lifestyles required for a sustainable future and for positive societal transformation' (www.unesco.org/ education/desd). The goal of the decade, as outlined by UNESCO, is to integrate the principles, values and practices of sustainable development into all aspects of education and learning. This aims to encourage changes in behaviour that will create a more sustainable future. One of the most important aspects of the DESD is the recognition that ESD must engage a wide range of stakeholders from government, private sector, civil society, non-governmental organisations and the general public. In its International Implementation Scheme (IIS) for DESD, UNESCO states that ESD is fundamentally about values, particularly respect for others, including those of present and future generations, for difference and diversity, for the environment and for the planet's resources (UNESCO, 2006). Education enables us to understand ourselves and others and our links with the wider natural and social environment; this understanding serves as a durable basis for building respect. Along with a sense of justice, responsibility, exploration and dialogue, ESD aims to move us toward adopting behaviours and practices which will enable us all to live a full life without being deprived of basic human needs. 4.4.4 Education for Sustainable Development in India Traditionally India has been a sustainable society. A large part of the Indian population still has a lifestyle that is based on the principle of reuse, reduce and recycle. In some cases it is a matter of personal choice but for a large majority, it is necessitated by economic compulsions. The Government of India (GOI) has integrated the principle of 'sustainability' in its various policies and developmental programmes. India's developmental strategic

NSOU ? GE-ED-11 102 framework is based on a five year planning system. The first five year plan was rolled out in 1951. Presently, the soon-to-be concluded eleventh plan is underway which focuses in a big way on education. In order to promote the value of sustainable development in education, the Indian government directed its various education departments to actively work on an Environment Education (EE) component as part of the curriculum. This strategy was adopted post Stockholm conference in 1972 by setting up Centres of Excellence for Environment Education under Ministry of Environment and Forests (MoEF) in the early 1980s. For a very long time, most of these activities were restricted to the MoEF but gradually the government realized that the purview of education is very broad in a developing country like India and cannot be limited to the workings of one single ministry. As a result, the GOI recommended Ministry of Human Resource Development (MHRD) to integrate environmental concerns into all aspects and levels of education. India is the only country to have passed one of the landmark judgments passed by the Supreme Court of the country directing all education boards to include environmental education (EE) as part of the formal education system at all levels. Besides the different ministries of the GOI, a large number of government and non-government organizations are diligently working to promote ESD. Most notable amongst them are Centre for Environment Education (CEE) which is the nodal agency for implementing UNDESD in India; The Energy and Resources Institute (TERI); Bharati Vidya Peeth (BVP); Centre for Science and Environment (CSE); World Wide fund (WWF); National Council for Science Museums (NSCM) and National Council of Education, Research and Training (NCERT). These organizations work with schools, colleges, youth groups on ESD and conduct training programmes not just for students but teachers, principals, school administrators and policy makers. What is heartening is the fact that the ESD field in India is also occupied by young and passionate professionals who are working across the country to raise awareness on sustainable development issues. These professionals come from different

NSOU ? GE-ED-11 103 walks of life like media, architecture, medicine, education, social work, alternative art and literature. A lot of work is being done at the grassroots level involving local communities. The latest ICT (Information, Communication, Technology) tools are being employed to connect with the upwardly mobile urban youth and to reach out to a larger audience. The Multi-national corporations are also contributing by funding projects on ESD as part of their CSR strategy. The last five years have seen a notable increase in corporate spending on CSR in India and it has slowly but certainly helped the cause of developmental initiatives in the country. 4.5 Equity and Equality in Education 4.5.1 Equity and Equality Equal access to a high quality public education has been a top social justice issue for the past century. After all, it was only 67 years ago that the Brown vs. Board of Education ruling was made and "separate but equal" education was found to be decidedly unequal. One would hope that a landmark ruling of the US Supreme Court and the passage of time might heal an education system that was designed to limit access to students of color and benefit white students. Unfortunately, issues of educational equality and equity are still the most commonly raised issues in communities across the nation (See: McNeel, 2019; McMillan, 2019; Peetz, 2019; Wilson Phelan, 2019). This blog series seeks to answer the question: What does equity in education look like? Defining Equality According to Merriam Webster Dictionary, equality is the "quality or state of being equal," where equal is defined as having the same measurement in quality, nature or status. When applying this definition to social structures—like education, politics, and government—equality means that all segments of society have the same level of support and opportunity. This means that regardless of one's gender, race, sex, religion, etc., opportunities remain the same. It ensures that people in different social statuses or groups will not be discriminated against.

NSOU ? GE-ED-11 104 In the United States, equality in education was ensured in the 1954 Supreme Case of Brown vs. Board of Education, where the Court ruled that "separate is inherently unequal" with regards to having segregated schools between African American and white students. After this ruling, schools became integrated, and it led to the Civil Rights Act of 1964. Defining Equity The Merriam Webster Dictionary defines equity as, "something that is equitable," where equitable is defined as, "dealing fairly and equally with all concerned." In education and social structures, equity refers to the fact that different people have varying needs of support and assistance. Therefore, systems exist to be able to support individuals based on their specific needs. The goal of equity is to help achieve fairness in treatment and outcomes. It's a way in which equality is achieved. For example, the Americans with Disabilities Act (ADA) was written so that people with disabilities are ensured equal access to public places. For example, it means that public restrooms need to have ramps so that people in wheelchairs can enter. 4.5.2 Difference between Equity and Equality? Educational researchers, Cramer, Little, and McHatton (2018) explain that using the correct language to describe issues in education is critical. The words equity and equality are often used interchangeably, confused as having the same meaning. It is important to note that though the words sound and are spelled similarly, they have very different meanings. Equality is the provision of equal treatment, access, and opportunity to resources and opportunities (Gunn, 2018). Essentially, everyone gets the same thing, regardless of where they come from or what needs they might have. Equity is the provision of personalized resources needed for all individuals to reach common goals. In other words, the goals and expectations are the same for all students, but the supports needed to achieve those goals depends on the students' needs (Equity Education, 2019).

NSOU ? GE-ED-11 105 This popular cartoon illustrates the difference between equality and equity: Source: (Interaction Institute for Social Change, 2016) On each side of the picture, the goal for the three individuals is to see the baseball game. When provided with equal resources, the goal cannot possibly be achieved. However, when the resources are made equitable and adjusted based on the needs of the individuals, each person can successfully see the game. 4.5.3 Equity and Equality: Importance in Schools Public education is supposed to serve the public. What is known about the public is that there are a variety of experiences, cultures, and beliefs represented, all of which contribute to a unique and vibrant community. Similarly, different members in a community have different needs and resources (financial, emotional, and physical, to name a few). Schools are tasked with educating all members of the public regardless of income, level of ability, native language, or prior education. For this reason, equity is critically important to public education.

NSOU ? GE-ED-11 106 In school, equality is often associated with access and outcomes. Equality asserts that every student should have the same access to a high quality education regardless of where they come from. It also requires that all students be held to the same standards and objectives regardless of their circumstances, abilities, or experiences. Equity recognizes that different students need different resources to achieve the same goals as their peers. It takes into consideration the fact that a student with a disability requires different physical supports at school than a peer who does not have a disability. Similarly, a bilingual student who speaks a native language other than English needs different language supports than a monolingual English speaker. None of the children are better or worse than another, they just have different needs. Every child brings to school a unique set of needs, talents, and resources that prompt teachers to respond in different ways to each individual student. Equality focuses on what is fair within the group. Equity highlights what is fair for the individual. In public education, both group and individual needs are important. All students should have equal access to high quality education and once they get it, they should be afforded equitable supports to achieve success. 4.5.4 Promoting Equality of Educational Opportunities in India India is a democratic country. The success of democracy depends upon education of its citizens. Education should aim at total development of individual's personality. Modern education is a process of learning from real life and from the pulsating, dynamic society around us. So the learning from real life and from the pulsating, dynamic society around us. So the learning should be at the choice and pace of the learner. It is only in this way that education becomes relevant to life. So educational opportunities are to be provided to individuals to develop their personalities into the fullest extent. The Constitution of India also writes for the provision of educational opportunities to all peoples of the country. Since education is one of the most important means for development, it is through education that one can aspire to achieve higher status, position and emolument. So every individual should have similar opportunities for getting education. Ordinarily, equality of opportunity means to give equal chance to every individual for the development of his capacity. The concept of equality of opportunity can be NSOU ? GE-ED-11 107 interpreted in two ways such as horizontal equality and vertical equality. The horizontal equality treats all constituents in equal manner whereas the vertical equality requires special consideration to bring about equality of opportunity. There is a great need for emphasizing the equality of opportunity in education due to the following reasons: 1. It is needed for the establishment of an egalitarian society. 2. It is needed because it is through the education to all people in a democracy that the success of democratic institution is assured. 3. The equality of educational opportunities will ensure a rapid advancement of a nation. When the people have opportunities to get education, they will have a chance to develop their natural talent and thus enrich the society. 4. The equality of educational opportunity will extend the search of talent among all the people of a nation. 5. It will help to develop a close link between the manpower needs of a society and the availability of skilled personnel. 4.5.5 Problems of equality of Educational Opportunities In India there are some reasons which create inequality of educational opportunities. These reasons are: 1. Difference in economic status of home. 2. Gender disparities. 3. Regional Imbalance. 4. Physiological difference. 5. Difference in home conditions. 6. Disparity between backward and advanced classes. 7. Non-availability of adequate opportunities. 8. Difference in mental and physical abilities. 4.5.6 Measures taken for Equalisation of Educational Opportunity Equalisation of educational opportunities has been one of the major objectives of the successive Five-Year Plans. Considerable works in this respect has been done

NSOU ? GE-ED-11 108 through the programme of expansion of educational facilities at the elementary, secondary and university stages. For achieving the target of equality of educational opportunity in India our efforts must be directed in many directions for recognizing the educational system. Some of these directions are as follows: 1. Constitutional Provisions: On the basis of the constitutional provisions we must provide compulsory elementary education to all children of the country. Democracy, socialism, secularism, justice and equality are to be cultivated through the provision of equalizing educational opportunity for establishing an egalitarian society. 2. Debarring restriction on admission in educational institutions: Admission to educational institutions has been made available to all irrespective of caste and religion. 3. Wide distribution of Institutions: Educational institutions have been opened in large numbers in order to provide opportunity to all for getting education. 4. Provision of Pre-school education: In order to overcome wastage and stagnation in primary education, Pre- school education is to be given priority. Pre-school education centres like Balwadi, Anganwadi etc. have been opened and are to be set up in large scale. 5. Provision of scholarship and other facilities: Provision of free ship6 and scholarships are being made for the backward and disadvantaged groups. 6. Special treatment for S.C., S. T. and Other Backward Communities: Special treatment as being made for S.C., S.T and Other Backward Communities in relation to reservation of seats, provision of different types of scholarships to ensure equality in education. 7. Residential School: In tribal areas, residential schools or Ashram schools have been set up. Kanyashram schools have been commissioned in the tribal areas to facilitate education of girls.

NSOU ? GE-ED-11 109 8. Special education of the handicapped: Steps have been taken for the education and training of blind, deaf, orthopaedically handicapped and educable sub-normal children by the government and voluntary organisations. The New Education Policy, 1986 lays special emphasis on removing disparities and equalizing educational opportunity. To promote equality, it will be necessary

97%

MATCHING BLOCK 49/58

SA Balaram.docx (D141824621)

to provide for opportunity to all not only in access but also in the conditions for success. 1.

Major emphasis will be laid on women's participation in vocational, technical and professional education at different levels. 2. Numerous incentives, helps, benefits, facilities will be provided to SC and ST population to equalize them with other developed communities. 3. People of educational backward areas like rural areas, hill tracks and desert areas will be given adequate institutional and infrastructural facilities. 4. Minority community will be allowed to set up and administer their own educational institutions. 5. Education for physically and mentally handicapped children should be integrated with the general community as equal partner to prepare them for normal growth and to enable them to face with courage and confidence. Truly speaking in spite of all attempts in the direction of the national goal-quality of opportunity, the result is not satisfactory. Hence in order to accelerate in the progress of providing equality of opportunity, incentive measures are to be properly implemented and administrative structure has to be properly streamlined with a strong will and determination. Various media, methods and materials are to be utilized to fulfil the special needs of the deprived children of the country. 4.5.7 Educational Equity vs. Educational Equality Educational equity ensures that the needs of individuals from disadvantaged socioeconomic backgrounds, individuals with disabilities, and other disenfranchised minorities are provided with educational tools, resources, and support that are individualized to a student's educational needs. In juxtaposition, educational equality assumes that all students' educational needs are the same, and that individualized systems of educational resources are not warranted. Educational equality negates the

NSOU ? GE-ED-11 110 ability to transition into the next iteration of public education that focuses on education that is equitable. Educational equity allocates educational resources by equalizing the educational system for students whose low SES (socioeconomic status), ethnic background, family background, or geographic region impeded their academic growth. This would help close the gap between students from a low SES compared to those individuals from a high SES. Advancing Educational Equity The pursuit of educational equity is key to the sustainability and evolution of education systems across the world. To advance educational equity, equitable academic resources, programs, and opportunities must be available to students from all backgrounds. Each student's strengths need to be nurtured by specialty learning programs that are geared toward advancing academic success, closing the achievement gap, and eliminating inequities in education. Equity can be achieved in the education system by utilizing technology, preparing educators with the skills necessary to teach in diverse settings, developing inclusive methods of teaching students from different backgrounds, as well as celebrating diversity. Achieving educational equity requires educators to reflect on their implicit and explicit biases, and understand that the inequities within the education system are based on systemic biases. 4.5.8 How to Encourage Equity in Education Educational leaders can take concrete steps to introduce equity into their schools and classrooms. The following approaches can change teaching dynamics and improve outcomes for students of all backgrounds. ? Cultural Responsiveness: Culturally responsive teaching is a skill that all educators must implement within their classrooms. Students from diverse cultural backgrounds should be provided a safe environment in which to learn. Educators must also understand that a disproportionate number of students of color are expelled or held back each school year compared to their white counterparts. The key to culturally responsive teaching is to

NSOU ? GE-ED-11 111 dismantle systemic biases and provide high-quality education that is tailored to students' unique needs. ? Personalized Learning: Educators must develop the skills to understand the individual needs of students to excel academically. This typically entails implementing individualized lesson plans and advocating for individual students who may need tailored educational resources or opportunities. The ultimate goal is to ensure that no student falls behind academically, thus further closing the achievement gap. ? Early Intervention: Providing personalized, dedicated support at an early stage in the educational process is key to achieving equity. Early intervention can have a significant impact on the future success of a student by helping to cultivate strengths and develop vital skills for overcoming challenges. ? Community Engagement: Education extends beyond the classroom and into the communities and homes of students. Teachers should engage families and communities in the learning process. This will encourage diverse voices to assess and correct systemic inequities, further promoting educational equity for all students. 4.5.9 Benefits of Focusing on Equity in Education Equity in schools is the answer to supporting every student, not just those from disadvantaged backgrounds. When schools provide their students with resources that fit individual circumstances, the entire classroom environment improves. Not only that, but the importance of equity extends to our society as a whole. In equitable communities, everyone has the opportunity to succeed regardless of their original circumstances. On a surface level, the benefits of inclusive and equitable classrooms extend to academic achievement. Schools with the smallest achievement gaps between demographics have the highest overall test scores. This means that when the most disadvantaged student scores improve, students from more privileged backgrounds improve, too. When schools are mindful of different backgrounds and provide the right resources, all students are prepared to learn and help each other succeed. Equity can also strengthen a student's health and social-emotional development. In a study involving over 4,300 students in Southern California, the children who felt

NSOU ? GE-ED-11 112 safer, less lonely, and reported less bullying also had higher diversity levels in their classes. Being equipped to promote diversity and provide for students from all backgrounds makes for an environment where students feel comfortable and have better emotional regulation. Additionally, equitable communities are linked to better health and longer average lifespans. Surrounding communities benefit from equity in schools as well. Equity is linked to stronger social cohesion, meaning that individuals connect with each other better and are more compassionate. It also leads to long-term economic growth. This means that promoting equity in schools can be one of the best and most effective social investments. 4.6 Summary So, the learners have come to know about peace education, sustainable development and the concept of equity and equality in detail in the present unit. They have also come out with the fact that in all the cases, education is a key factor. So far peace education is concerned, education plays an important role too realize the cause of conflict and to wipe out the causes of conflict to establish and nurture peace. Peace education has been given utmost priority by the international organizations like UNESCO. Education brings development. But it happens often that to develop one area of life we put some other areas in such a situation that it will put negative impact for the future generation. Mainly the environment is affected mostly in this kind of development. And sustainable development addresses this area by pointing out the fact that all round development should be aimed at. We should also be aware of the affective factors of a particular development in one field. And education plays the most vital role to nurture the concept of sustainable development. The learners have also come to know about the concept of equity and equality. And these two have also been discussed in relation to education. Equity is to provide required level of opportunity to have access to something. And this equity is provided to bring equality in the world. Educational equity is also providing such opportunity to the backward people to reach the equal educational opportunity for all at a certain moment.

NSOU ? GE-ED-11 113 4.7 Self Assessment Questions 1. What is meant by peace education? Why is it necessary to reduce conflict in the world? 2. What are the objectives and importance of peace education? 3. What is positive peace? How is it nurtured through peace education? 4. How are education and peace related to each other? 5. What do you understand by the concept of sustainable development? 6. What are the objectives of sustainable development? 7. How can education promote sustainable development? 8. What is status of sustainable development in India? How is it nurtured through education? 9. What is equity? How is it different from equality? 10. "Equity is the process, and equality is the result."—discuss the concepts of equity and equality in the light of this statement. 11. What is educational equity? How does it pave the way for educational equality? 12. What are the problems of educational equity and educational equality in India? 4.8 References Allport, G.W. (1954). The nature of prejudice. India; ? understand the causes of unemployment;

NSOU ? GE-ED-11 116 ? know about the causes of educated unemployment in India; ? understand the role of education in relation to unemployment; ? define poverty in Indian society; ? understand the causes of poverty; ? understand how poverty affects education and education can wipe out poverty; ? discuss the problem of population growth in developing countries like India; ? describe the causes of population explosion; and ? understand the role of education in controlling population growth. 5.2 Introduction Where there is the discussion about education and development, a discussion about employment and unemployment is a must. And along with this also comes the discussion regarding poverty too. Another important fact is the concept of population explosion which also comes in the way of education and employment. This unit will have detail discussion regarding all these concepts. Unemployment has been an issue of discourse since long. After a certain period of life, every individual needs a suitable employment to earn the livelihood and live a better life according to the quality and capability of the individual. And when that individual lacks that opportunity, it is termed as unemployment. Once it was believed that unemployment was there mainly because of the lack of education. But with the course of time, it has been identified that education also generates unemployment, i.e. educated unemployment. So education is related to both employment and unemployment. There are some other causes of unemployment too. When there is the discussion of unemployment, a discussion of poverty is a must in that sector. Poverty means the lack of the minimum ability to live the minimum standard life without any material luxury. Employment helps an individual to live a life of standard, and unemployment leads to poverty. Education has a close relation with poverty. Generally it may be said that education can enkindle a lamp in the dark room of a poor individual. But this same poverty also appears to be an affective factor in the way of education. This unit will discuss both the angles of this concept.

NSOU ? GE-ED-11 117 And the above two concepts of unemployment and poverty is closely related to the concept of population explosion. Education and thereby the development of medical science and technology, on the one hand, has decreased the mortality rate to become a reason of population growth, and on the other hand, education may become the deciding factor of population control. 5.3 Unemployment and Education 5.3.1 Meaning of Unemployment In simple words a person, who is not gainfully employed in any productive activity, is called unemployed. Unemployment could be voluntary or involuntary. However, there is no scientific treatment with the help of which we can distinguish between voluntary and involuntary unemployment. Generally speaking people in the age group of 15-59 years are considered to be in the working population of a country and the concept of unemployment is restricted to this group of people only. That is, children and old persons are not included in the definition of unemployment. However, some economists suggest a broader definition. It should include (i) all persons (men, women and children) who are working and (ii) those not working, but are searching for work. There may be a section of society, which is not interested, in any gainful employment. There may be some people who may be interested in jobs at wage rates higher than those prevailing in the labour market. Persons falling in above two categories are called voluntarily unemployed. Involuntary unemployment is characterised by a situation in which people are prepared to work at prevailing wage rate but they are not able to get employment. In economics the term "unemployment" refers to only involuntary unemployment and not voluntary employment. The problem of unemployment in underdeveloped economies is different from that in developed economies. In developed economies generally unemployment takes the form of cyclical unemployment or frictional unemployment. Cyclical unemployment arises due to cyclical movements in economic activities. Frictional unemployment takes place because of shift to a new technology. Thus, cyclical and frictional unemployment are temporary in nature.

NSOU ? GE-ED-11 118 On the other hand, the nature of unemployment in underdeveloped economies is basically structural in nature. In an under-developed economy the demand for labour is less mainly due to agricultural backwardness, undeveloped industries and small size of the service sector. Although the type of unemployment found in underdeveloped economies fits into the definition of involuntary unemployment, is much different from the nature of unemployment found in developed economies. 5.3.2 Nature of Unemployment in India In India the problem of unemployment is much more serious than what we find in developed economies. India is an under-developed though a developing economy. It is important to emphasise that unemployment in underdeveloped economy like India is not the result of deficiency in effective demand but in fact a result of shortage of capital equipment and complimentary resources. In India there are various types of unemployment. Generally speaking it takes the forms of rural unemployment and urban unemployment. 5.3.2.1 Rural Unemployment Bulk of unemployment in India is found in the rural areas. There are two main aspects of rural unemployment: seasonal and chronic disguised unemployment. Agriculture is the principal occupation in rural India. By nature agriculture is a seasonal occupation. Therefore bulk of rural population remains seasonally unemployed in the absence of alternative employment opportunities. It has been estimated that a sizeable portion of population engaged in agriculture remains idle for at least 5-7 months in a year. Second aspect of rural unemployment is chronic disguised unemployment. As per the 1991 census report about two third of the population is engaged in the primary sector (agriculture and allied activities). Working population in agriculture is increasing consistently in absolute terms. While in 1951 over 100 million persons were engaged in agricultural sector, in 1997 their number rose to 237.31 million. Such a big increase in the working population engaged in this sector without there being a corresponding increase in the area of cultivation, has resulted in overcrowding in agriculture. This is a situation where even if surplus population is withdrawn from agriculture, production will not be affected (provided the remaining labour force works to the best of its abilities). Such a type of situation is described

NSOU ? GE-ED-11 119 as disguised unemployment or underemployment. In the words of Nurkse, marginal productivity of surplus labour so defined is zero. The main problem in this type of unemployment is that apparently all persons seem to be employed but enough work is not available to all. An example will make this concept of disguised unemployment more clear. Suppose there are 10 persons working on the farm, while less work is available. This work is shared by all persons working on the farms, as there exists no employment opportunity. If some workers are withdrawn from the farm, those remaining at farm are able to accomplish the work and farm output does not get affected, such a situation is called disguised unemployment. Another aspect of unemployment in rural areas, which needs special attention, is the educated unemployment. With the spread of education in rural areas, there has emerged a class in rural areas also which is literate and in some cases even highly educated. They find themselves misfit in usual agricultural operations. They remain idle in rural areas due to lack of employment opportunities outside rural areas. Concept of rural unemployment is important to understand the phenomenon of rural poor. Unemployed or underemployed in rural areas constitute mainly the class of rural poor. This class mainly consists of landless labourers and marginal farmers. Therefore, solution for eradication of rural poverty lies in eradication of unemployment. 5.3.2.2 Urban Unemployment Whereas most of the unemployment found in rural areas is disguised, most of the unemployment in urban areas is open. Urban unemployment is a source of severe social tensions. Urban unemployment can be of three types. First kind of unemployment found in urban areas is of unskilled industrial workers. Such unemployment may be termed as blue-collar unemployment. Although there has been a significant expansion of industrial sector, industrial unemployment has expanded over the years. Various factors have contributed to this phenomenon. Increase in economically active population in the country Population in urban areas has grown faster than in rural areas, because of migration from rural to urban areas. In addition during off-season, agricultural labour shifts to urban areas to seek employment. Concentration of industries in urban areas Unemployment. Decay of cottage and small-scale industries in rural areas.

NSOU ? GE-ED-11 120 Second kind of unemployment found in urban areas is that of educated middle class. Such unemployment may be called white-collar unemployment. There are many causes of educated unemployment. Firstly, whereas there has been a very fast increase in educated population, thanks to fast expansion of educational institutions, technical education and training has lagged behind. Secondly, economic growth has been at a very slow rate. This has resulted in a very inadequate growth of employment opportunities, including engineers, technical personnel along with arts and commerce graduates and post graduates. Number of educated unemployed was 2.44 lakh in 1951, which rose to 34.72 lakh in 1980, 47 lakh in 1985 and 68 lakh in 1992, 37.9% in 2019. While a high proportion of the literates among unemployed shows un-utilisation of scarce resources put in for education of the people, it also indicates a mismatch between the kind of job opportunities that are needed and those available in the job market. Clearly the increase of literates among the unemployed and further among the literate unemployed, of those with higher level of educational attainment points to the need for skilled jobs rather than the simple low productive manual labour that an illiterate has to resort to for a living". Thirdly, there are emerging trends of underemployment of those who are seeking job on part-time basis, while they pursue their studies. Such job seekers, if they do not get jobs of their satisfaction, could be called underemployed. There could be many others, who have completed their education, but are not able to get job to the best of their abilities and capacities. 5.3.3 Causes of Unemployment Foregoing analysis about trends and structure of unemployment in India, reveals the gravity of the problem. Now let us discuss the main causes of unemployment. These are : i. slow economic growth process, ii. rapid increase in labour force, iii. inappropriate technology, and iv. inappropriate education system and lack of manpower planning.

NSOU ? GE-ED-11 121 5.3.3.1 Slow Economic Growth Process It is no doubt that the problem of unemployment is found in both developed as well as underdeveloped economies. Despite high incomes of these developed economies, problem of unemployment is prevalent there too. But the kind of unemployment found in underdeveloped countries is basically due to its low levels of development and slow growth process. It is expected that as an economy grows, production expands and thus the employment opportunities. We find that in the past, after Independence there has been growth in production. As a result, absolute level of employment has also risen. But rate of growth in production has been less than the target. As a result, adequate number of employment opportunities could not be created. But we should also keep in mind that growth alone is not expected to solve the problem of unemployment. Some economists have hinted at a possible conflict between employment and economic growth, in the early phase of development. In India also this conflict has been very apparent. In the early plans till sixth five year plan this conflict was not recognized. As a result, although absolute level of employment increased, it was hardly sufficient to solve the problem of unemployment. 5.3.3.2 Increase in Labour Force There has been significant growth in the labour force in the last fifty years, due to fast growing population. Since Independence, death rate has been declining very fast, without a corresponding fall in birth rate. As a result, population is growing at a very high rate; at present rate of growth of population is around 2%. This is naturally followed by fast expansion in labour force. There is another factor, which has led to increase in labour force, due to urbanisation and changed attitude towards employment. After Independence, education among women has led to change in attitude of women towards employment. They now compete with men for employment. This phenomenon is more prevalent in urban areas. Thus rapid growth in labour force can be ascribed to (i) fast growing population, (ii) changed attitude of women towards employment, (iii) failure of growth process to create sufficient additional jobs. All these factors have increased the problem of unemployment.

NSOU ? GE-ED-11 122 5.3.3.3 Inappropriate Technology We understand that, in India labour is abundant while capital is a scarce factor of production. Therefore, to solve the problem of unemployment, we need to adopt such a technology, which makes use of more labour and less of capital to produce a given level of output. But, it is unfortunate that not only in industries, even in agricultural production capital is substituting labour very fast. Thus, capital labour ratio has increased in production process. Technological change has been labour- saving. While making a choice about technology, normally western model is adopted. We understand that in the west, labour is scarce and capital is abundant. Therefore, for them appropriate technology is capital intensive. But in India we cannot justify the use of more sophisticated and round about methods of production, which substitute capital for labour. But adoption of such a technology has led to larger unemployment. A pertinent question at this point is that why, despite abundance of labour, capital intensive technology is adopted in India. This happens because rate of return on capital and labour are not market determined. While on the one hand, labour is assured of minimum wages, rate of interest is kept low arbitrarily. As a result, people are inclined to make more use of capital-intensive technology, as it is economically more viable. According to W.A. Lions, investment in such a situation in capital equipment may be more profitable to individual capitalist but certainly not beneficial to society because it increases unemployment. Rigid labour laws in India have also contributed towards adoption of capital intensive production process. On the part of industries, it is quite difficult to reduce number of employees. Once a person is recruited, most likely he/she will be retained for life. In addition, labour-unrest and lack of work-culture has increased inefficiency of labour. These factors, again, have provided incentives for addition of labour- saving technology. 5.3.3.4 Inappropriate Educational System and Lack of Manpower Planning We inherited educational system from our colonial rulers. Macaulay, who designed educational policy during the colonial period, had in mind the interests of British government. Macaulay designed a system, which could merely produce clerks and lower cadre executives for the British Government. Even after Independence,

NSOU ? GE-ED-11 123 there has been a fast expansion in the number of institutions, which impart education in arts and commerce. There has been a very little expansion in educational and training institutions providing technical, engineering and medical education. As a result, there has been a fast growth of unemployment among educated men and women, while shortage of technical and specialised personnel remained. Therefore, there is a need to change our educational system to an appropriate one, which takes into account needs of the society and develops human resources accordingly. Moreover, there has been a total lack of manpower planning in India. For steady growth of any economy human resources play an important role. There should be long term planning for the provision of appropriate skills for meeting the requirements of development. No doubt there has been an increase in facilities for higher education, technical education, training in different fields, but they were not in accordance with development needs. The obvious result is surplus of manpower in some fields and deficit in others. We find widespread unemployment among graduates, postgraduates and even researchers in humanities while there is scarcity of physicians, engineers and technical personnel. NSOU ? GE-ED-11 124 5.4 Poverty in relation to Education 5.4.1 Poverty as a Social Problem There has been poverty in all societies over a long period. However the 'extent' of poverty is more in some countries than others. Every society, however, affluent, has people who are poor. In the USA more than 25 million are said to live in poverty (12-15%). It was only in the 60s that there was recognition of the prevalence of poverty. A programme of 'War on Poverty' was then started in USA. In England, the Poor Law was passed in 1601 A.D. The law provided for the establishment of a work-house to provide work to those who were without any means to meet their basic needs. The conditions and the pay in the work-house were depressing. However, this may be said to be the beginning of the idea of public assistance to the poor. For example USA an affluent society has poverty too. But by and large these countries prosperous. In India however poverty is a major problem. Thus the concept of poverty is relative. It has been so much with us that not much attention has been paid to it. It was considered a normal aspect of any society. Till recently there has been little sense of social responsibility for dealing with poverty. On the other hand there has been a rationalisation of poverty. The poor were believed to be responsible for their own plight. Unemployment was considered a sign of laziness. The Karma theory suggested poverty was a consequence of wrongs or sins committed in earlier births. When poverty has been voluntary it has been praised by society. In such a case one cannot call it poverty per se because it is part of a saint's life style. Mahatma Gandhi lived in 'voluntary poverty'. So did the Buddha. This is different from involuntary poverty where the necessities of life are in very short supply. In recent times there has been an acceptance of poverty as a social problem. India with the coming of independence has made some efforts to raise the level of income of people living in poverty. In 1960 the concept of poverty line was emphasised by Dandekar and Rath (1971). Specific programmes of poverty alleviation were initiated in the 4th plan. Systematic study of the poverty is a recent phenomenon. It has been suggested that there were four questions that need to be answered to understand poverty.

NSOU ? GE-ED-11 125 i. What is poverty? ii. What is the extent of poverty? iii. What are the causes of poverty? iv. What are the solutions? To the third question, one may also add what are the consequences of poverty? This unit will look at poverty using these questions as a framework. The effort will be to look at the sociological aspects.

5.4.2 Definition of Poverty

The approach to defining poverty has usually been in economic term – the levels of income, property and living standards. People are said to be poor when their income is such that it does not enable them to meet the basic needs such as food, shelter, and clothing. The concept of “poverty line” used both in India and USA fixed an income. If people fall below this line, they are considered to be poor. The poverty line is arbitrarily fixed, hence there can be questions about it. Nevertheless, it does provide one way of determining who the poor are. Sometimes, the word “pauperism” is used to denote extreme poverty. It describes a category of people who are unable to maintain themselves. In recent times there are many dimensions that are considered in looking at poverty. It is no longer seen as purely an economic phenomenon. It is now realised that there are sociological, political, psychological and geographical reasons as well as attitudes or value systems that need to be considered to understand poverty. We suggest that a minimum approach by government in any society which has significant inequality must provide for raising minimum levels not only of incomes but also self-respect and opportunities for social mobility and participation in many forms of decision-making. What is being stated here is that in dealing with poverty one is not only concerned with the income but also with the individual's political role, opportunities for his children and self-respect. Poverty is not only a condition of economic insufficiency; it is also social and political exclusion. Poverty is therefore to be seen not only merely in economic terms

NSOU ? GE-ED-11 126 but also in its social and political aspects. In the beginning of the development of human society human beings were at a low level of social organisation and technological development and that the state of poverty was general in nature, faced by all members of society. In the process of evolution of human society there have been enormous developments in social organisation and technology. However the fruits of this progress have not been equally shared by all sections of society. There have been the rich and there have been the poor. Thus poverty has been related to the prevailing socio-economic structure of the society. Experts on poverty have broadly used two approaches. First the nutritional approach. Here poverty is measured on the basis of minimum food requirements. Second, the relative deprivation approach. Here poverty is seen in terms of relative deprivation of a section of population against the pre-developed sections. We shall be discussing these matters in detail in our section on the measurement of poverty.

5.4.3 Causes of Poverty

There are many causes of poverty in India. Most of them may be cited as below:

- Heavy pressure of population:** Population has been rising in India at a rapid speed. This rise is mainly due to fall in death rate and more birth rate. India's population is almost 135 crore now-a-days. This pressure of population proves hindrance in the way of economic development.
- Unemployment and under employment:** Due to continuous rise in population, there is chronic unemployment and under employment in India. There is educated unemployment and disguised unemployment. Poverty is just the reflection of unemployment.
- Capital Deficiency:** Capital is needed for setting up industry, transport and other projects. Shortage of capital creates hurdles in development.

NSOU ? GE-ED-11 127

- Under-developed economy:** The Indian economy is under developed due to low rate of growth. It is the main cause of poverty.
- Increase in Price:** The steep rise in prices has affected the poor badly. They have become poorer everyday.
- Net National Income:** The net national income is quite low as compared to size of population. Low per capita income proves its poverty. The per capita income in 2019-20 was Rs. 94,566/- which proves India is one of the poorest nations.
- Rural Economy:** Indian economy is rural economy. Indian agriculture is backward. It has great pressure of population. Income in agriculture is low and disguised unemployment is more in agriculture.
- Lack of Skilled Labour:** In India, unskilled labour is in abundant supply but skilled labour is less due to insufficient industrial education and training.
- Deficiency of efficient Entrepreneurs:** For industrial development, able and efficient entrepreneurs are needed. In India, there is shortage of efficient entrepreneurs. Less industrial development is a major cause of poverty.
- Lack of proper Industrialisation:** Industrially, India is a backward state. 3% of total working population is engaged in industry. So industrial backwardness is major cause of poverty.
- Low rate of growth:** The growth rate of the economy has been 4.18% in 2019 and growth rate of population has been 1.8%. So compared to population, per capita growth rate of economy has been very low. It is the main cause of poverty.
- Outdated Social institutions:** The social structure of our country is full of outdated traditions and customs like caste system, laws of inheritance and succession. These hamper the growth of economy.

NSOU ? GE-ED-11 128

- Improper use of Natural Resources:** India has large natural resources like iron, coal, manganese, mica etc. It has perennial flowing rivers that can generate hydro-electricity. Man power is abundant. But these sources are not put in proper use.
- Lack of Infrastructure:** The means of transport and communication have not been properly developed. The road transport is inadequate and railway is quite less. Due to lack of proper development of road and rail transport, agricultural marketing is defective. Industries do not get power supply and raw materials in time and finished goods are not properly marketed.

5.4.4 Education and Poverty

Like a tree, poverty has many roots. But among the many causes of global poverty, one factor stands out: education. Not every person without an education is living in extreme poverty. But most of those living in extreme poverty do lack a basic education. Those living below the poverty line will also be more likely to keep their children out of school, which means that their children will also have a greater chance of living in poverty. Education is often referred to as the great equalizer: It can open the door to jobs, resources, and skills that a family needs to not just survive, but thrive. Access to high-quality primary education and supporting child well-being is a globally-recognized solution to the cycle of poverty. This is, in part, because it also addresses many of the other issues can keep communities vulnerable. Let's look at 3 ways education is the secret ingredient to ending extreme poverty. Education directly correlates with many solutions to poverty, including:

- ? Economic growth
- ? Reduced income inequality
- ? Reduced infant and maternal deaths
- ? Reduced stunting
- ? Reduced vulnerability to HIV and AIDS
- ? Reduced violence at home and in society

NSOU ? GE-ED-11 129 According to UNESCO, if all students in low-income countries had just basic reading skills (nothing else), an estimated 171 million people could escape extreme poverty. If all adults completed secondary education, we could cut the global poverty rate by more than half. The above points are some of the reasons that the United Nations named education its fourth Sustainable Development Goal. Let's put this into context: Here are 3 ways that education affects poverty. 1. Development of Skills and Abilities A quality education system supports a child's developing social, emotional, cognitive and communication skills. Education programs also support the development of knowledge and abilities (i.e., human assets). Children who receive quality primary education are more likely to develop these assets at a higher level. They can then use these abilities and skills to earn higher incomes or further develop other basic assets. 2. Fight Inequality Before giving people more opportunities to participate in society, we need to address some specific obstacles to participation. Often the most vulnerable people are not recognized as equals in their community. As a result, they lack representation, power, and status. But, at an individual level, education is a basic human right for all. One of the biggest inequalities that perpetuates the cycle of poverty is gender. When gender inequality in the classroom is addressed, this has a ripple effect on the way women are treated in their communities. When girls are welcomed into the classroom, they can build skills, gain knowledge, and socially grow during their formative years. This establishes a foundation for lifelong learning. 3. Reduce Risk and Vulnerability In many of the countries where we work, the lives and livelihoods of the extremely poor are often tethered to conflict, epidemics, and natural disasters. These can act as "force multipliers," or elements that increase the likelihood that poverty will continue for the poorest countries. But knowledge, as the old saying goes, is power. Besides reducing inequality, education can safeguard against vulnerability and risk. This also reduces inequality.

NSOU ? GE-ED-11 130 In situations like war and epidemics, there are also psycho-social barriers to education. Since education is so connected to many of the ways we can end extreme poverty, it's also an element that we integrate into a several areas of our work, including emergency response. The Effects of Poverty on Education Poverty is the most important factor that determines whether or not a girl can access education, according to the World Bank. If families cannot afford the costs of school, they are more likely to send boys than girls. Around 15 million girls will never get the chance to attend school, compared to 10 million boys. Gender inequality is more prevalent in low-income countries. Women often perform more unpaid work, have fewer assets, are exposed to gender-based violence, and are more likely to be forced into early marriage, all limiting their ability to fully participate in society and benefit from economic growth. When girls face barriers to education early on, it is difficult for them to recover. Child marriage is one of the most common reasons a girl might stop going to school. More than 650 million women globally have already married under the age of 18. For families experiencing financial hardship, child marriage reduces their economic burden, but it ends up being more difficult for girls to gain financial independence if they are unable to access a quality education. Lack of access to adequate menstrual hygiene management also stops many girls from attending school. Some girls cannot afford to buy sanitary products or they do not have access to clean water and sanitation to clean themselves and prevent disease. If safety is a concern due to lack of separate bathrooms, girls will stay home from school to avoid putting themselves at risk of sexual assault or harassment. An educated girl is not only likely to increase her personal earning potential but can help reduce poverty in her community, too. "Educated girls have fewer, healthier, and better-educated children," according to the Global Partnership for Education. When countries invest in girls' education, it sees an increase in female leaders, lower levels of population growth, and a reduction of contributions to climate change.

NSOU ? GE-ED-11 131 5.5 Education and Population Explosion 5.5.1 Meaning of Population Explosion Is population explosion a boon or a curse? For the European developed countries like Spain and Italy, where the population is decreasing, this might be considered as a boon. However, for the developing countries like India, population explosion is a curse and is damaging to the development of the country and its society. The developing countries already facing a lack in their resources, and with the rapidly increasing population, the resources available per person are reduced further, leading to increased poverty, malnutrition, and other large population-related problems. The literal meaning of population is the whole number of people or inhabitants in a country or region (Webster's dictionary), and the literal meaning of population explosion is a pyramiding of numbers of a biological population (Webster's dictionary). As the number of people in a pyramid increases, so do the problems related to the increased population. The main factors affecting the population change are the birth rate, death rate and migration. The birth rate is the ratio between births and individuals in a specified population and time (Miller, 253). The death rate is the ratio between the number of deaths and individuals in a specified population and time (Miller, 253). Migration is the number of people moving in (immigration) or out (emigration) of a country, place or locality. The population change is calculated by the formula: $\text{Population change} = (\text{Births} + \text{Immigration}) - (\text{Deaths} + \text{Emigration})$ The recent increase in the world population has been caused due to the following major reasons: 1. The increase in birth rates due to medical improvements 2. The decrease in death rates due to better medical facilities and advancements in the field of medicine. 3. Immigration to better developed countries due to several reasons like better job opportunities, war, and natural causes like hurricanes, earthquakes, and so forth. India, being a developing country, has had to face several economic and political challenges. One of the most important problems is the population explosion.

NSOU ? GE-ED-11 132 According to India's population hit 1 billion in May 2000, increasing the urgency for the country to moderate its population growth. Some of the reasons for this population explosion are poverty, better medical facilities, and immigration from the neighbouring countries of Bangladesh and Nepal. The population density of India in 1996 was about 287 persons per square kilometre (Encyclopaedia Britannica, Internet). Several solutions to decrease the rate of population increase have been tried by the government, some successful, some unsuccessful. Although the rate of increase has decreased, the rate has not reached the satisfactory level yet. The population in India continues to increase at an alarming rate. The effects of this population increase are evident in the increasing poverty, unemployment, air and water pollution, and shortage of food, health resources and educational resources.

5.5.2 Causes of Population Increase I. Birth Rate a. Poverty According to ABC News, India currently faces approximately 33 births a minute, 2,000 an hour, 48,000 a day, which calculates to nearly 12 million a year. Unfortunately, the resources do not increase as the population increases. Instead the resources keep decreasing, leading to making survival for a human being more and more competitive even for the basic necessities of life like food, clothing and shelter. India currently faces a vicious cycle of population explosion and poverty. One of the most important reasons for this population increase in India is poverty. According to Geography.com, More than 300 million Indians earn less than US \$1 everyday and about 130 million people are jobless. The people, who have to struggle to make two ends meet produce more children because more children mean more earning hands. Also, due to poverty, the infant mortality rate among such families is higher due to the lack of facilities like food and medical resources. Thus, they produce more children assuming that not all of them would be able to survive. The end result is a mounting increase in the population size of India. Due to the increase in population, the problems of scarce resources, jobs, and poverty increases. Thus the cycle continues leading to an ever-increasing population that we

NSOU ? GE-ED-11 133 see today. This cycle in fact might be considered as a positive feedback, in that the increase in one results in the increase of the other factor. As the poverty and the population both increase, the development of the country and the society seems even more far-fetched. b. Religious beliefs, Traditions and Cultural Norms India's culture runs very deep and far back in history. Due to the increased population, the educational facilities are very scarce. As a result, most people still strictly follow ancient beliefs. According to ABC News, the famous Indian author, Shobha De said, "God said, 'Go forth and produce' and we just went ahead and did exactly that. In addition, a lot of families prefer having a son rather than a daughter. As a result, a lot of families have more children than they actually want or can afford, resulting in increased poverty, lack of resources, and most importantly, an increased population. Another one of India's cultural norms is for a girl to get married at an early age. In most of the rural areas and in some urban areas as well, families prefer to get their girls married at the age of 14 or 15. Although child marriage is illegal in India, the culture and the society surrounding the girls in India does not allow them to oppose such decisions taken by their family. For many, giving a girl child in marriage is done not by choice, but rather out of compulsion. The poor economic status of tribal villagers is attributed as one of the primary factors responsible for the prevalence of child marriages in India. An example of one such incident was reported in Indiainfo.com. According to an article written by Syed Zarir Hussain on October 16 th , 2000, Forty-two-year-old RojoTok, a tribal peasant in Arunachal Pradesh, was all decked up in local finery to wed MepongTaku, a girl who will turn 14 this winter. I was brought up in a very different environment and never had to worry about getting married at the age of 14 or 15. However, my parents turned their eyes away, when my maidservant's daughter was being married off when she was only 13 years old. I was very young, but my parents simply said, That's just how things are with poor people and I did not have a say in it. Due to the young age of these girls, they have more potential of bearing

NSOU ? GE-ED-11 134 children, that is, since they start bearing children at a very early age, they can have more children throughout their lifetime. This results in the increase of the global fertility rate. Since these girls get married at a very early age, they do not have the opportunity to get educated. Therefore, they remain uneducated and teach the same norms to their own children, and the tradition goes on from one generation to the other. II. Death Rate: Although poverty has increased and the development of the country continues to be hampered, the improvements in medical facilities have been tremendous. This improvement might be considered positive, but as far as population increase is considered, it has only been positive in terms of increasing the population further. The crude death rate in India in 1981 was approximately 12.5, and that decreased to approximately 8.7 in 1999. Also, the infant mortality rate in India decreased from 129 in 1981 to approximately 72 in 1999 (Mapsindia.com, Internet). These numbers are clear indications of the improvements in the medical field. This development is good for the economy and society of India, but strictly in terms of population, this advancement has further enhanced the increase in population. The average life expectancy of people in India has increased from 52.9 in 1975- 80 to 62.4 in 1995-00. Although our near and dear ones would live longer, due to the increase in the population, the resources available per person would be much less, leading to a decrease in the curvature of the slope of development instead of a higher gradient. In addition, abortion is not allowed by several religions that are followed in India. In fact, in Islam, one of the leading religions of India, children are considered to be gifts of God, and so the more children a woman has, the more she is respected in her family and society. As a result, although the measures to control birth are either not available or known to the public, the facilities to increase birth through medical facilities are available. III. Migration: In countries like the United States (U.S.), immigration plays an important role in the population increase. However, in countries like India, immigration plays a very small role in the population change. Although people from neighbouring

NSOU ? GE-ED-11 135 countries like Bangladesh, Pakistan and Nepal, migrate to India; at the same time Indians migrate to other countries like the U.S., Australia, and the U.K. During the 1971 war between India and Pakistan over Bangladesh, the immigration rate increased tremendously. However, currently the migration in India is 0.08 migrants per 1000 population (AskJeeves.com, Internet), and is decreasing further. This is definitely good for India. This way, the population might eventually come close to being under control and more people may get better job opportunities and further education. For example, the students in my university from India, like myself, have better chances for job opportunities and better education outside India than we would have had in India. 5.5.3 Effects of Population Explosion The current rate of population growth in India is 1.58% and the total fertility rate is 3.11 (AskJeeves.com, Internet). Although the total fertility rate has decreased, due to the increase in the total number of women between the ages of 15 and 44 (reproductive ages), the total number of births has increased. This has led to the current enormous population size of approximately 1 billion. This has greatly hampered the development of the Indian economy. The amount of resources that could have been available to one person a few years ago now need to be shared between two people, which is not sufficient for either of them. The population increase has led to air and water pollution, unemployment, poverty, lack of educational resources, and even malnourished women and children. I. Air Pollution: The technological development of India has led not only to medical advancements, but also to an increase in the number of factories. That has led to air and water pollution. More energy needs to be produced to power these factories. When fossil fuels—the world's major source of energy—are burnt, gases are added to the atmosphere. Many cities in India have crossed the limits of suspended particulate matter, sulfur dioxide, and other pollutants due to vehicular and industrial emissions. According to an article by the World Bank Organization, Delhi, the capital of India is one of the world's most polluted cities. In fact, in 2020, the average total suspended particulate (TSP) level in Delhi was approximately ten times the World Health Organization's (WHO) annual average NSOU ? GE-ED-11 136 standard. Furthermore, TSP levels in Delhi exceeded the WHO 24-hour standard on 97 percent of all days on which readings were taken. As the population grows, more and more forests are cleared. The two most common reasons for deforestation are to make houses for increased number of people to live in, and to use wood as a fuel in the industries. As a result, the trees that help us in reducing the air pollution through the process of photosynthesis are not able to do so any more. The study titled "State of Global Air 2019" reported increasing air pollution level in the year 2020, caused 120,000 untimely deaths and millions had been reportedly suffering with air (polluted) borne diseases. Some of the diseases caused by air pollution are respiratory diseases, asthma, chronic obstructive pulmonary disease, cardiovascular disease and cancer of the lung (World Health Organization, Internet). Due to the tropical climate of India, air pollution also causes smog which may result in headaches, dizziness, breathing difficulties, or even mass illness due to carbon monoxide. This slow murder goes unnoticed because people die of diseases like cancer, asthma, and heart problems after long exposures to deadly air pollutants. Besides the untimely deaths of several thousands of people every year due to air pollution, the pollutants also have a deadly impact on our national heritage the historical monuments that have made India proud for centuries. A classic example of the air pollution effect is the Taj Mahal in India. The sulphur dioxide in the air because of the pollution caused by the neighbouring industries mixes with atmospheric moisture and settles as sulphuric acid on the surface of the tomb, making the smooth white marble yellow and flaky, and forming a subtle fungus that experts have named marble cancer (Central Pollution Control Board, Internet). Trying to save the monument might mean closing down several industries in the neighbourhood. However, this means that several thousands of people would lose their jobs, resulting in eventual poverty. This again brings us to the same problem that is the root of all the problems population increase. One of the major issues that have lately been bothering environmentalists all over the world is global warming. Like glass in a greenhouse, gases like carbon monoxide admit the sun's light but tend to reflect back downward the heat that is radiated from the ground below, trapping heat in the earth's atmosphere. This is called the greenhouse effect. However, due to the increase in pollution, especially due to carbon dioxide and chlorofluorocarbons, the ozone layer is NSOU ? GE-ED-11 137 getting depleted. This layer plays the major role in controlling the temperature of earth, saving it from the harmful effect of the ultraviolet radiation of the sun. However, with the depletion of the ozone layer on the rise, the temperature of the earth is increasing. This is global warming. As we know that India is mainly an agrarian country, temperature and climate plays an important role in the economy of the country. According to an article in Earthone news, global warming affects the main crops in India in 2 major ways: 1. Researchers have estimated that only a 2 O C increase in mean air temperatures will be enough to decrease the rice yield by 0.75 ton/hectare in high-yield areas like Punjab, Haryana and Uttar Pradesh. 2. It is also estimated that a drastic increase in greenhouse gases like carbon dioxide may cause wheat production to fall as much as 68%. 3. Additionally, the changing climatic conditions have the potential to significantly increase tropical disturbances like cyclones and storms in coastal regions. The effect on crops greatly hampers the economy of the country, especially for those farmers who solely depend on agriculture for their survival. For them, the loss of one crop would lead to a plunge into absolute poverty, and thus, the vicious cycle of poverty and population explosion continues. The effects of air pollution on the climatic conditions reveals that air pollution not only affects our environment, but it also greatly endangers the lives of everybody. This means that if the number of people increases the carrying capacity, the mere survival of human beings poses a threat to the lives of all human beings. II. Water Pollution: Air pollution is not the only environmental damage being done by the increasing population. Nowadays water pollution is also one of the increasing problems due to the population explosion. Water is considered the essence of life. There is no life without water. One might think that 70% of the earth is covered with water, so, why worry about the water problem? In fact, 3 sides of the Indian subcontinent is surrounded by water. And there are several rivers, lakes, and other sources of water within the country as well. However the fact is that less than 3 percent of that water we see can be used for human consumption and industrial uses. Nearly 10 percent of the world's population faces chronic freshwater shortage

NSOU ? GE-ED-11 138 (Geography.com.sg, Internet). This figure may rise if the population growth is uncontrolled. As in the case of air pollution, the increasing population calls for increasing numbers of factories. These factories lead to various kinds of pollution, including water pollution. Also, India being an agrarian country, the water pollution also comes from pesticides used for agriculture. Some of the major types of pollutants are: 1. Petroleum products required for automobiles, cooking, and other such human activities. 2. Pesticides and herbicides used for agriculture by the Indian farmers. 3. Heavy metals from industries, automobiles exhausts and mines. 4. Hazardous wastes. 5. Excessive organic matter like fertilizers and other organic matter used by farmers. 6. Sediments caused by soil erosion produced by strip mines, agriculture and roads. 7. Thermal pollution caused by deforestation. One of the classic examples of water pollution in India is the river Ganga. This river is considered sacred and incorruptible. People bathe in it for spiritual renewal and drink water from it. But people do not realize that along with washing off their sins in the river, they are also washing off their body wastes, leading to polluting the holy water of the river. Also, cremated and partially cremated bodies are dumped into the river. Although, dumping these bodies is a religious act in India among the Hindus, but at what cost? Thus, with the increasing population, the number of people dying is also increasing, and so is the pollution in the river Ganga. In addition, the nearby factories and human colonies dump sewage directly into the river. Recent studies show that there are more than 25,000 small-scale industries in just one of the states sharing the river and dispose off their waste in the river (Times of India, Internet). Also, according to the same article in the Times of India, just in Uttar Pradesh, one of the states sharing the river sewage containing excrete of about 3 million people from 34 sewage pipes is being released into the Gomti in the eight- km stretch from Gaughat to Hanuman Setu in Lucknow. Currently the river is so polluted that some experts believe such water should not even be exposed in nature without being treated.

NSOU ? GE-ED-11 139 As we can observe, the increased population size is leading to increased pollution, which in turn is leading to a more hostile environment for human beings themselves. III. Unemployment and Illiteracy: Suppose we forget about the environment, and only worry about ourselves. Nonetheless, with the increasing population, even that is not possible because with the increasing number of people, we have to share our resources with even more people. Resources of all types are limited, even employment, especially in India. India, being a developing country, has a limited number of jobs available. Due to the increasing number of people, the competition for the most menial jobs is also tremendous. According to EconomyWatch.com, in 1972-73, unemployment rates in rural areas were 1.2 for males and 0.5 for females, and in urban areas, it was 4.8 for males and 6.0 for females. This unemployment rate rose to 2.3 for males and 1.5 for females in rural areas and 4.9 for males and 8.2 for females in urban areas in 1998-99. With the increasing population, unemployment rates are bound to rise even further. Several highly educated people with Bachelors and Master's degrees in India sit at home, because they cannot find jobs. This, I believe, is the major reason for Indians like myself to migrate to developed countries like the U.S. Such unemployment and underemployment leads to corruption and exploitation of people by the richer classes of the society. This lack of resources further leads to lack of educational resources. Due to the unavailability of resources, parents cannot afford to educate their children to higher levels. Some parents simply cannot afford to teach their children further, and in some families, children need to work along with their parents in order to bring food to the table. According to the World Bank Group, about 32 million primary school-age children, mostly girls or those from the poorest households and disadvantaged groups, are not in school; more than half of rural students drop out before completing the primary cycle, and only one-third of females make it to the secondary level. In addition, nearly half the population over 15 years old and about 60 percent of all women over 15 years old is illiterate. Also, basic education has become a commodity that acts on the basis of supply and demand. Basic education has become too expensive in India for a commoner to afford for his/her children. Lack of education further leads to even more unemployment. Due to these reasons, a

NSOU ? GE-ED-11 140 major part of the population is either illiterate or has the most minimum education leading them to accept minimal work in which they cannot even support themselves. Unemployment, or underemployment, further leads to poverty. This again starts the vicious cycle of poverty and population explosion discussed above. Poverty leads to an increase in the population, because poverty leads people to produce more children to increase the earning members of the family. This increases the population size of India, which further increases the unemployment rate and lack of educational facilities leading to poverty that started this whole cycle. IV. Food Resources Resources are always limited. And in a developing and highly populous country like India, resources are even scarcer. Population explosion results in the shortage of even the most basic resources like food. According to an article by World Bank Group, more than half of all children under the age of four are malnourished, 30 percent of new borns are significantly underweight, and 60 percent of women are anaemic. Resources are limited everywhere. India spends approximately \$10 billion each year on malnutrition (World Bank Group), and even then the government of India cannot provide the everyday nutritional requirements to everybody in India. If you walk on the street of Calcutta or Delhi, you would notice several children fighting with each other for a small piece of bread that they found in a dumpster. While this might be shocking to most people, this is a daily routine and the only way to survive for many people in India. 5.5.4 Education and Population Explosion

100%

MATCHING BLOCK 45/58

W

The relationship between education and population has attracted the attention of both scholars and policymakers, especially since the mid-1970s. The rate of population growth and the number of people living on earth have both increased spectacularly since the beginning of the nineteenth century. During the twentieth century, the human population increased at an average annual rate that was about fifty times as fast as the rate over the previous 10,000 years. Between 1800 and 2000, the number of people alive increased nearly seven-fold. Following World War II, the rate of population growth exploded—during the 1970s it was about four times as great as it had been a century earlier. By 2000, the living population exceeded the entire

NSOU ? GE-ED-11 141

population born between the beginning of settled agriculture and the year 1900—a period of 10,000 years. The implications of this explosive growth for both the physical environment and human wellbeing alarmed many observers and prompted an intense public policy debate. Many scholars and policymakers noted that high levels of educational achievement were associated with more moderate rates of population growth, suggesting that important opportunities for alleviating population pressures might be found in ensuring greater access to education, particularly for females. The ensuing public policy debate has prompted an examination of how education affects the birth rate. The explosive growth of the human population in the nineteenth and twentieth centuries was the result of a historically unprecedented decline in the rate of mortality, rather than an increase in the birth rate. The proportion of children dying before reaching the age of five fell from nearly one in three in most of the world to less than one in one hundred in the most advanced societies over this period, and to one in ten in low-income countries. In the wealthiest countries, birth rates adjusted quickly to restore a balance between births and deaths and establish a rate of population growth of less than 1 percent a year. In economically advanced societies, the average number of children born to each woman over her reproductive life has fallen from about seven to less than two. However, in the poorest countries, a sharp drop in death rates has not been accompanied by a corresponding fall in birth rates. As a result, the rate of population growth—the difference between the average birth rate and the average mortality rate—has increased dramatically in most of the world. The growth of population has been greatest in countries that are both poorest and least able to invest in social and educational services. The combined effects of these forces seem to imply that the gulf between rich and poor is likely to widen over the foreseeable future if aggressive policy measures are not introduced. These facts suggest that the key to ensuring a sustainable rate of population growth lies in reducing the fertility rate. However, in a highly influential 1979 review of the research literature on the relationship between education and fertility, the economist Susan Hill Cochrane concluded that too little was known about the mechanisms through which education affects population growth to allow policy-makers to rely on improvements in educational opportunities to slow the rate of population growth. Since 1976 a large number of scholars have focused on the

NSOU ? GE-ED-11 142

impact of education—especially the education of the girl child—on fertility, mortality, and population growth. The central purpose of these studies has been to determine whether the nearly universal association of low fertility and high levels of educational attainment are causally linked or merely the result of their association with other forces that directly affect fertility. For example, the inverse relationship between female literacy and fertility might have nothing to do with education as such, but might instead simply reveal that societies that seriously attempt to educate females also care about the welfare of women and therefore seek to control fertility in order to protect their health.

Most of the people agree 'Population Education' with education of the population. If we go deep into the matter, we will find that population education is education about population matter, i.e., fertility, mortality, migration etc. It is an educational process which helps people to understand the nature, the causes, and consequences of population events. It is a factual knowledge about population dynamic. Population education is an educational process, which helps individual to learn about population and particularly the effect of population dynamic and the related problem on the individuals, family, community, nation and the world. "Population education is an exploration of knowledge and attitude about population, the family and sex. It includes population awareness, family living, reproduction education and basic values."—Burbson. "Population education is an educational programme which provides for a study of population situation of the family, the community, nation and world, with the purpose of developing in the students' rational and responsible attitudes and behaviour towards that situation."—UNESCO. Thus the idea of population education is based on the following assumptions: (i) Rapid growth of population is a constant threat to our economic development. (ii) Over-population affects the health and well-being of the younger generation. (iii) Population explosion creates an obstacle for raising the standard of living of the masses.

NSOU ? GE-ED-11 143 (iv) Population education is not to be mixed with sex education or the methods of family planning. Rather it should be a motivational force for creating the right attitude to family size. (v) Population education is not a "once for all affairs", rather, it should be continuous process. Hence, population education needs to be given top priority in the present scenario. The younger generation needs to be informed about India's population problems. They need to be properly educated with new ideas for leading a better adult life. The present situation needs population education because it is a new content area and is highly relevant to the lives of the people. It also encourages improvements in methods of teaching, in the structure of the system of education, in the value of the students and the teachers and in so many other areas. General Aims of Population Education: The aims of population education are as follows: (i) Population education aims at assisting the individual to understand the causes and consequences of population phenomena. (ii) It enables the individual to understand how does population situation affect the individual and society. (iii) It aims at recognizing the causes of demographic phenomena and to enable the people to make changes in order to remove those obstacles for social progress. (iv) It enables to acquire knowledge, skills, attitudes and values necessary to understand the concept of population education. (v) It enables the learner to take a conscious and right decision about the prevailing population situations. The research reinforces earlier findings that the level of formal education achieved by women is, in most cases, the single most important determinant of population growth. More educated women generally have fewer children, better

NSOU ? GE-ED-11 144 general health, and higher infant survival rates. Education also appears to be a more important determinant of child survival than household income and wealth. The study also found that if concerted efforts were made to fast track education, the global population could remain below 9 billion by 2050. Thus the global population outlook depends greatly on further progress in education.

5.6 Summary In this unit you have studied the detail account of unemployment, poverty and population explosion and the role of and relation of education with all these three important social issues. Unemployment has been one of the most discouraging issue in the last few decades. Unemployment means the absence of any employment which one needs to earn the livelihood for better living. There are several causes of unemployment in India such as illiteracy, population density, economic status of the nation, industrialization, etc. Education has also been identified as an important factor in relation to the concept of employment. On the one hand, education may increase the chances of employment, and on the other hand, there is the increase of educated unemployment. Poverty has also been discussed in detail. In a country like India, poverty is an age old issue to be discussed in relation to social science. And whenever poverty is discussed in relation to social development, education must be put into consideration. Here also, on the one hand, education may eradicate poverty by enhancing the labour force and employability, and on the other, poverty also works as an affective factor of education. And so far population explosion is concerned, it is really a serious issue for our country with a huge population of almost 1.37 billion people. Population education has become a necessary fact here in India as well as in the world. The development of medical science and technology has decreased the mortality rate effecting population growth. But on the other side, population education, or even basic education can be helpful to have concept of population control. So, here also education is discussed in relation to the social issue like population explosion.

NSOU ? GE-ED-11 145 **5.7 Self Assessment Questions**

1. What does the term unemployment mean in true sense? Is it just an opposite to employment simply?
2. Comment on the nature of unemployment in India with special reference to urban and rural unemployment.
3. What re the specific causes of unemployment? Discuss in special reference to the inappropriate educational system.
4. What is educated unemployment?
5. How is education related to both employment and unemployment?
6. What do you mean by poverty? Is it only a term to be discussed in relation to economics only?
7. Discuss about the specific causes of poverty. Put a special emphasis on education in relation to poverty.
8. How does poverty appear to be an affective factor in education of the mass?
9. Is education a full proof system to eradicate poverty from the nation as well as from the world?
10. What is meant by population explosion?
11. What are the specific reasons of population explosion?
12. How does the development of science and technology contribute to both the concepts-the concept of population growth and the concept of population control?
13. How can population education lead to keep up a balance of population growth?
14. What is mortality rate? How is it related to population education?
15. How is religious belief related to the study of population?
16. What are the general aims of population education?

Objectives After going through this unit, the learners will be able to: ? Understand the concept of Dalit in India ? Evaluate the role and status of Dalit Education in India ? Discuss the importance of Dalit Education in India ? Concept of Tribal community in India ? Understand the position of the tribal communities in India ? Discuss the Importance of Tribal Education in Indian Context, ? Discuss the problems Tribal Education in India and its probable solution ? Make an understanding about Government initiatives to address the contemporary social problems in Indian Perspective. 6.2 Introduction India is a multilingual and multicultural country with a huge variation in landscape, climate, foods, dresses, etc. The concept of Varnashram has given our nation the idea of different social class in the society even in a single religion. These classifications were made especially on the basis of the work culture of the people first, and then by birth. And the classification of the Brahmin, Kshatriya, Vaishya, and Shudra has been the most prominent classification in the society. In Constitution Dalit is defined especially as a Caste under Article 341, listed as the Scheduled Castes. It is evident from the history that the Dalit people were always forcibly kept away from the education so that they cannot achieve the equal status which they aspire to have in the society. The name of BhimraoAmbedkar comes in the very first list when we discuss about the education of the Dalit portion of India. He has always been with the idea that has always maintained that education is the weapon which could help Dalits to erase their Dalitness. After the independence, the constitution as well as different policies have created provisions for the educational rights of the Dalit people. Reservation was suggested

NSOU ? GE-ED-11 150 and maintained till to bring the Dalit people in the light of education and thereby to bring them in the main stream of the society. There are still so many challenges in the way of Dalit Education, Tribal Education in the form of poverty, lack of social awareness, cultural belief, social disgust, etc, but the time after independence has earned a satisfactory development in the concept of Dalit and Tribal Education. Government is continuously in effort to develop the status of Dalit Education in India. The present unit will have detail discussion regarding Dalit Education, Tribal education, the initiatives from the part of the government, and the challenges of the same. 6.3 Status of Dalit Education in India 6.3.1 Dalits in India The word 'Dalit' comes from the Hindi word dalan, meaning oppressed or broken. Alternatively, or legally, or as the Government of India may now have them called, Dalit is basically a caste defined in Constitution under Article 341, listed as the Scheduled Castes. Dalits are always forcibly kept away from the education so that they cannot achieve the equal status which they aspire to have in the society. BhimraoAmbedkar has always maintained that education is the weapon which could help Dalits to erase their Dalitness. The term dalitness incorporates all the social stigmas which are inflicted on Dalits since ages; such as poverty, exclusion from the society, and above all they are devoid of fundamental human rights-equality, fraternity and liberty. Through education, Dalits could have understood the importance of organization and struggle which are the important tools of the movement against the ordeals which are imposed on them. Promising and making it certain to entr  e education for the people from lower strata of Indian society have always been the uphill task for government of our country. Consequently, we have failed in reducing the 'evil' effects of the caste system which still remain deeply ingrained in our society. The caste system of India continues to play a pivotal role in ostracizing people from lower castes. The Dalits have endured consistent denial to access to education since the 1850s.

NSOU ? GE-ED-11 151 The term Dalit is a self-applied concept for those called the "untouchables" and others that were outside of the traditional Hindu caste hierarchy. Ambedkar said that untouchability came into Indian society around 400 AD, due to the struggle for supremacy between Buddhism and Brahmanism (an ancient term for Brahmanical Hinduism). Some Hindu priests befriended untouchables and were demoted to low- caste ranks. Eknath, another excommunicated Brahmin, fought for the rights of untouchables during the Bhakti period. In the late 1880s, the Marathi word 'Dalit' was used by Mahatma JotibaPhule for the outcasts and Untouchables who were oppressed and broken in the Hindu society. Dalit is a vernacular form of the Sanskrit (dalita). In Classical Sanskrit, this means "divided, split, broken, scattered". This word was repurposed in 19th-century Sanskrit to mean "(a person) not belonging to one of the four Brahminic castes". It was perhaps first used in this sense by Pune-based social reformer JyotiraoPhule, in the context of the oppression faced by the erstwhile "untouchable" castes from other Hindus. The term dalits was in use as a translation for the British Raj census classification of Depressed Classes prior to 1935. It was popularized by the economist and reformer B. R. Ambedkar (1891–1956), who included all depressed people irrespective of their caste into the definition of Dalits. It covered people who were excluded from the four-fold varna system of Hinduism and thought of themselves as forming a fifth varna, describing themselves as Panchama. It was popularized by the economist and reformer B. R. Ambedkar (1891–1956), himself a Dalit, and in the 1970s its use was invigorated when it was adopted by the Dalit Panthers activist group. Ensuring access to education for the Dalits of India has been the greatest challenge for the Indian government in diminishing the social effects of the caste system, which still remain entrenched in Indian society. There have been many different reasons proposed as to why the Dalits suffer from low rates of literacy and primary education enrolment, but the most realistic one describes history and unequal access as the causes. The ancient caste system of India, which has resulted in the social and economic oppression of the Dalits, continues to play a dominant role in India. The Dalits, also known as the scheduled caste or untouchables, have experienced consistent denial to access to education since the 1850s. This decade coincided with Britain's established control over India, which meant many of the improvements to Dalit education were coming from outside influences, rather than from the national government. Because of unchanging social norms and behaviour, incentives to

NSOU ? GE-ED-11 152 pursue education were minimal for the Dalits who were still physically and emotionally harassed. Increasing efforts to eliminate caste discrimination combined with additional attempts to increase the accessibility and appeal for education have contributed to the slow progression of Dalit education. The responsibility for social equalization fell fully upon the Indian government when it gained its independence from Britain in 1948. While some benefits of social programs and government policies designed to increase primary education rates can be noticed, the Dalit literate population still remains much lower than that of the rest of India. There remains still, hostility, oppression and flaws in social programs in Indian society that prevent an increase in education growth. Despite efforts to decrease caste discrimination and increase national social programs, the Dalits of India continue to experience low enrolment rates and a lack of access to primary education in comparison to the rest of India.

6.3.2 Demography of Dalit Population

India Scheduled Caste communities exist across India and comprised 16.6% of the country's population, according to the 2011 Census of India. Uttar Pradesh (21%), West Bengal (11%), Bihar (8%) and Tamil Nadu (7%) between them accounted for almost half the country's total Scheduled Caste population. They were most prevalent as a proportion of the states' population in Punjab, at about 32 per cent, while Mizoram had the lowest at approximately zero. Similar groups are found throughout the rest of the Indian subcontinent; less than two per cent of Pakistan's populations are Hindu and 70–75 per cent of those Hindus are Dalits, in Nepal, Bangladesh had 5 million Dalits in 2010 with the majority being landless and in chronic poverty, and Sri Lanka. They are also found as part of the Indian diaspora in many countries, including the United States, United Kingdom, Singapore, and the Caribbean. India is home to over 200 million Dalits. According to Paul Diwakar, a Dalit activist from the National Campaign on Dalit Human Rights, "India has 600,000 villages and almost every village a small pocket on the outskirts is meant for Dalits."

6.3.3 Social Status of Dalits

Dalits have had lowest social status in the traditional Hindu social structure but James Lochtefeld, a professor of religion and Asian studies, said in 2002 that the "adoption and popularization of [the term Dalit] reflects their growing awareness of NSOU ? GE-ED-11 153 the situation, and their greater assertiveness in demanding their legal and constitutional rights". India's National Commission for Scheduled Castes considers official use of Dalit as a label to be "unconstitutional" because modern legislation prefers Scheduled Castes; however, some sources say that Dalit has encompassed more communities than the official term of Scheduled Castes and is sometimes used to refer to all of India's oppressed peoples. A similar all-encompassing situation prevails in Nepal. In 1932, the British Raj recommended separate electorates to select leaders for Dalits in the Communal Award. This was favored by Ambedkar but when Mahatma Gandhi opposed the proposal it resulted in the Poona Pact. That in turn influenced the Government of India Act, 1935, which introduced the reservation of seats for the Depressed Classes, now renamed as Scheduled Castes. From soon after its independence in 1947, India introduced a reservation system to enhance the ability of Dalits to have political representation and to obtain government jobs and education. In 1997, India elected its first Dalit President, K. R. Narayanan. Many social organizations have promoted better conditions for Dalits through education, healthcare and employment. Nonetheless, while caste-based discrimination was prohibited and untouchability abolished by the Constitution of India, such practices are still widespread. To prevent harassment, assault, discrimination and similar acts against these groups, the Government of India enacted the Prevention of Atrocities Act, also called the SC/ST Act, on 31 March 1995. In accordance with the order of the Bombay High Court, the Information and Broadcasting Ministry (I&B Ministry) of the Government of India issued an advisory to all media channels in September 2018, asking them to use "Scheduled Castes" instead of the word "Dalit". George Kunnath claims that there "is and has been an internal hierarchy between the various Dalit castes". According to Kunnath, the Dusadhs are considered the highest while the Musahars are considered the lowest within the Dalit groups.

6.3.4 Economic status of Dalits

According to a 2014 report to the Ministry of Minority Affairs, over 44.8 per cent of Scheduled Tribe (ST) and 33.8 per cent of Scheduled Caste (SC) populations in rural India were living below the poverty line in 2011–12. In urban areas, 27.3 per cent of ST and 21.8 per cent of SC populations were below the poverty line.

NSOU ? GE-ED-11 154 Some Dalits have achieved affluence, although most remain poor. Some Dalit intellectuals, such as Chandra Bhan Prasad, have argued that the living standards of many Dalits have improved since the economic system became more liberalized starting in 1991 and have supported their claims through large surveys. According to the Socio Economic and Caste Census 2011, nearly 79 per cent of Adivasi households and 73 per cent of Dalit households were the most deprived among rural households in India. While 45 per cent of SC households are landless and earn a living by manual casual labour, the figure is 30 per cent for Adivasis. A 2012 survey by Mangalore University in Karnataka found that 93 per cent of Dalit families in the state of Karnataka live below the poverty line.

6.3.5 The Importance of Dalit Education

Before beginning to examine methods of improving enrolment in primary education and literacy rates, it is important to know why education is such an important topic in development studies. The past century has been characterized by a global expansion of education. Alongside this growth in education has also been an increase in the gap between different social strata (Desai & Kulkarni). Education can be a way to increase the incomes of impoverished people. Education helps to ensure that benefits of growth are experienced by all. Economic perspectives see education as a means to make individuals more productive in the workplace and at home. It can also be seen as a means of empowering socially and economically deprived groups into seeking political reform. By using any of these reasons as motivation to pursue educational development, governments are attempting to generate some form of social or economic equality for the population. Some of those who study development see education as a means of improving social welfare through economic means. When compared to secondary and university level education, rates of return are highest for primary education, which means that the costs associated with providing basic education are much lower than the benefits received from learning to read and write. About 17.2% of economic growth in Africa and 11.1% in Asia between the 1950s & 1960s have been credited to increases in education (Psacharopoulos 102). In addition to an increase in economic growth, primary education is also said to lead to greater income distribution. Providing primary education to 10% more people would equate to a decrease in the inequality index of 5% (Psacharopoulos 103). The economic advantages of increasing enrolment rates for primary education emphasize the importance of increasing education accessibility for the dalits of India.

NSOU ? GE-ED-11 155 An alternative reason to study education is for its ability to empower the individual to strive for an improved quality of life. A big factor impacted by education is that human beings often base their life goals and everyday actions on what they perceive to be feasible (Simon Wigley & Akkoyunlu-Wigley 290). Education expands the knowledge of possibility to poor individuals, and is often a necessary factor in providing incentive to escape poverty and social oppression. Development projects focused on increasing access to basic education, rather than ones that increase capital to improve current levels of education, ensure governments are able to know that the benefits of these programs are experienced by all, rather than a select few. As mentioned previously, the rates of return for primary education exceed those of secondary and university levelled education. It is therefore of greater value for governments to focus first on increasing access to primary education before moving onto to increase levels of education. By focusing development on a human-capabilities approach, governments and aid organizations are able to increase the number of people with the fundamental skills of reading writing and arithmetic (Simon Wigley & Akkoyunlu-Wigley 288). These skills allow individuals to communicate, argue, count, and problem solve so that they are able to become more aware and in control of their own lives. This allows them to better deal with problems in their everyday lives including taking a loan out from the bank, defending them in a court of law, escaping unhealthy personal relationships or avoiding jobs which would expose them to unsafe working conditions (Simon Wigley & Akkoyunlu-Wigley 293). Even the value of holding a basic education is in itself a frequently overlooked asset. Education has had an independent effect on life expectancy, increasing the age for educated individuals (Simon Wigley & Akkoyunlu-Wigley 290). One of the most important Dalit political activists who saw the value of social equity within India was Bhimrao Ramji Ambedkar, who became the chief architect of India's constitution after years of social activism. Throughout the first half of the twentieth century, Ambedkar dedicated a significant portion of his life to improving the quality of life and social status of Dalit Indians. He established the People's Education Society in 1945 which believed that increasing access to education to the Dalits would increase their empowerment. He thought that a higher level of education would cause the Dalits to realize their position so that they would aspire to the highest of Hindu positions, and that they would consequently use political power and influence as the means to an end to their oppression (Nambissan 1014).

NSOU ? GE-ED-11 156 Ambedkar believed that the value of education was in the empowerment of Dalits to pursue political action for social reform through informed lobbying. 6.3.6 A History of Dalit Education The 1991 census of India reported that Dalit communities were one of the least literate social groups in the country, with only 30% of Dalit children recognized to have basic reading and writing skills (Nambissan 1011). These high levels of illiteracy are a result of insufficient access to primary education. Reasons proposed for this low primary education rate amongst the Dalits have ranged from blaming family values to universal acceptance of social behaviour. In reality, it is a history of constant oppression and missing incentives that have been the reason why India's lowest caste has struggled to take advantage of public education programs. For centuries, the Dalit population of India were forbidden from gaining access to education. Originally reserved for upper castes only, the denial of conventional education to Dalits was designed to prevent them from increasing their quality of life and to highlight caste divisions. Caught in a colonial struggle between European nations, Indian society had no motivation to determine who should manage social programs until the British established control over India. Then, during the 1850s, the British began the long process of increasing the accessibility of education to all citizens on India. Dalit Education before Independence For centuries, the Dalit population of India were prohibited from gaining access to education. Formerly kept for upper castes only, the refutation of conventional education to Dalits was premeditated to avert them from escalating their worth of life and to put emphasis on caste divisions. Wedged in a colonial struggle between European nations, Indian society had no impulsion to verify who should administer social programs until the British established have power over India. Then, in 1850s, the British embarked on the stretched process of increasing the accessibility of education to all citizens of India. Signed in April of 1850, the Caste Disabilities Removal Act theoretically abolished all Indian laws which confronted the rights of those who are members of any caste or religion. This was the first step towards social equalization within India. It was also the inauguration for the sequence of attempts to increase accessibility to education for members of the Dalit caste. To concur with the signing of the act, the Indian education system became accessible to every member of society

NSOU ? GE-ED-11 157 However, after one hundred and sixty years the Dalits were approved authorization to attend schools, the primary education rates of the Dalit population compared to those of upper castes remain stumpy ever. There have been a number of proposition projected as to why the Dalits have yet to take benefit of open access to education. Some have suggested that Dalits acquire an apathetic attitude towards education, and so the contemplation of attending school appears unappetizing and inefficient contrasted to inflowing the workforce or doing nothing at all. Another submission for the cause of lower access to education among Dalits is that most families are trapped in a nasty succession of illiteracy and poverty. Therefore, not only do parents have no incentive to have their children attend school, but they also often lack the financial means to propel them to the fee-based schooling system of India. The ultimate and frequently most rational rationale for why the Dalits have botched to take lead of their access to education is a amalgamation of a history of coercion and a lack of access to local, quality education systems. A historical back-drop of maltreatment and class hierarchies has endowed little incentive for the Dalits to pursue education. Throughout the 1800s and into the mid 1940s, circumstances for Dalit children within the Indian education system were awfully underprivileged. Due to inequity from elevated castes, the Dalits did not experience easy on attending schools. Dalit children were obligatory to sit exterior of the school, listening on the porch while those in higher castes would be taught inside. Teachers, who repudiated to contact the Dalit children even with sticks, would hurl bamboo canes as unmerited chastisement while children of other castes were allowed to throw mud. The Dalit children, who knew retaliation would result only in amplified abuse, would be fundamentally frightened into not attending school.. Of the restricted number of Dalit children who were attending school, the bulk were male; a trait which persists even today. The lack of success in increasing primary enrolment rates for Dalits over the past one hundred and fifty years is evidence that very few projects have had any success in increasing social equality within the Indian Caste system. In the next section, the paper will look at some of the programs which have attempted to provide incentive for India's poorest to seek primary education. Dalit Education after Independence The 1948 independence of India provoked an increase in liability for the government to prop up the economic and educational wellbeing of the lower castes

NSOU ? GE-ED-11 158 and to shield the Dalits from social prejudice and exploitations. Over the next few decades, the Dalits see very little action to support the claims and progress made during the fifties to help improve their access to primary education. The 1950s saw subtle improvements in the number of schools being built in India, as well as the amount of money being allocated towards primary education programs. The efforts being put forward by the government lost momentum over the next few decades however, as the rate of primary schools being constructed slipped from 5.8% in the 1960s, to 2.1% during the 1970s, and eventually down to only 1.3% through the 1980s. This was complemented by a shift in funding from primary school education to middle school education. This transition exemplified the government's shifted focus from increasing primary enrolment rates to increasing the quality of the education provided to those already provided with sufficient access to education. The 1991 census of India details that Dalit communities were one of the least literate social groups in the country, with only 30% of Dalit children recognized to have basic reading and writing skills. These elevated altitudes of illiteracy are the consequence of inadequate access to primary education. Rationales projected for this stumpy primary education rate amid the Dalits range from blaming family values to common reception of social behavior. In veracity, it is a history of continuous domination and mislaid incentives that have been the motive why India's buck caste has struggled to acquire advantage of unrestricted education programs. Between 1983 and 2000, improvements in access to education for all of India have been made, although the difference between education rates for Dalits, especially females, and those in higher castes remained constant. In the seventeen year period, enrolment rates for Dalit boys grew from only 47.7% to a meagre 63.25%. When compared to those males in upper castes, enrolments jumped from an already relatively impressive 73.22% to 82.92%. Even poorer results were observed when looking at the female Dalit enrolment rate, which inched from 15.72% to 32.61%, when compared to their upper-caste counterparts whose enrolment climbed from 43.56% to 59.15%. The education gap can also be understood to translate through the entire schooling system, with the proportion of Dalit to non-Dalit success remaining at a constant low rate through primary, secondary, and post-secondary schooling. Although large improvements have been made to increase enrolment rates in India, statistics show that there has been little progress in decreasing the education gap between castes.

NSOU ? GE-ED-11 159 6.3.7 Dalits and Curriculum The treatment of the caste system in text-book and curriculums suggest that the official curriculum barely acknowledges the existence of Dalit and tribal communities, despite the fact that they form nearly a quarter of India's population especially at the district and local levels in many States in the country. The treatment of caste discrimination in text-books and curriculums can strengthen caste division and prejudice. Not only that the school text-books may fail to mention caste discrimination, but also some of them may even attempt to justify the origins of caste discriminations. There is another systemic problem in the Indian educational system. The authority of the teacher is unquestioned and children usually ask no questions, or are not encouraged to do so, even to clarify their doubts. Children listen to the teacher, copy lessons, memorize them and answer questions. In single- and two-teacher schools that predominate in the more backward regions, the situation is compounded as teachers are confronted with teaching children of many grades together, a situation that their training least prepared them for. They evolve their own coping strategies such as huddling children of two or more grades into one classroom, keeping students busy with writing work, and using punishment to maintain discipline. Learning becomes a casualty in the process. School processes and experience of education in Indian schools for Dalit students have not produced good results. Their performance and achievement is relatively poorer in competencies such as mathematics and language when compared to children in general. 6.3.8 Development Programme for access to Dalit Education When discussing about method which try to improve enrolment rates, it is essential to scrutinize which circumstances thwart Dalit children from attending school. A family's monetary condition plays a role in whether or not they are competent to afford to propel a child to school. This is a foremost contributor to low Dalit enrolment rates since Dalits have significantly subordinate earnings than those in upper castes, and therefore have a tough time paying for education. Remoteness also plays a key part in determining a child's capability to attend school. Because Dalit abodes are habitually sited remote from villages, it is more precarious for Dalit children to trek to and from school by themselves without risking assault, sexual abuse or abduction. In addition, teachers at the schools are habitually components of superior castes that lay down stumpy expectations for the Dalit children and seldom inquire about to endow them with an optimistic learning environment. There are

NSOU ? GE-ED-11 160 many aspects that operate as hindrance for Dalits attempting to achieve a primary education, and which various development schemes encompass to overcome. India has tried many special stratagems to assist in boosting the inducement to obtain education for Dalit children. Previous stratagem paid concentration on finding ways to give Dalit children an education devoid of divulging them to the ruggedness of upper castes. As time advances and the caste system commence to decline in India, there was a larger swing towards equalizing society so as to offer safer and more affirmative learning milieu. Since gaining its sovereignty, the Indian government has sustained to construct advancement on humanizing the quality of life for India's lowest caste. Contemporary revelation to global contemplation has amplified access to ideas and methods on how to augment education rates for the Dalits, providing for some of the superlative consequences in recent years. The rest of this segment will scrutinize some of the stratagem used over the past one hundred and fifty years, attempting to have a glance at how effectual they actually were. Following the establishment of the Caste Disabilities Removal Act, the British government tried to enhance Dalit school attendance through schemes which acquired into contemplation the sensitivity of the caste society. Because the Dalit children were regularly beleaguered when they attended schools, the British opted to offer optional teaching methods, rather than directly tackle the caste crisis. One planned substitute was the use of night schooling for Dalit children. In this mode, children would need not to be bothered regarding attending school with upper castes component, but would still mug the peril of travelling devoid of daylight to and from school. Another proposed resolution was the use of all-Dalit schools. This resolution eradicate the peril allied with night-time schooling, but also did not help to decrease aggression between the classes. These two methods collectively resulted in a 4% primary enrolment rate for Dalit children by 1931. Of these Dalit children, 93% were attending all-Dalit schools. A trouble crop up when there were inadequate all-Dalit schools at which children could pursue secondary education. Only 1% of all students at the time ever made it past primary education. It was because of this, that when the British handed over control of the country to India in 1948, the Indian government embarked on thinking of novel ways to amplify access to education. After Independence, governments strive to bring in global assistance in dealing with a nationwide calamity like sternly stumpy primary enrolment rates. Prescribed to the Indian government by the World Bank, the District Primary Education Program was intended to escalate primary enrolment rates within India. The objective of the

NSOU ? GE-ED-11 161 program is to trim down the divergence in enrolment between gender and social standing to 5%, and to shrink the dropout rate to 10%. The DPEP receives the bulk of its financial support from the World Bank. It calls for the configuration of local committees that supervise the hiring and administration of Para-teachers. These Para- teachers are trained teachers employed through the DPEP program to pack growing vacancies in primary schools. Since the introduction of the DPEP, India has truly managed to see declining primary enrolment rates. It is possible that national campaigns to increase enrolment in primary education fail to have a direct intended impact. Instead, the management of such programs focused on a top down approach to education development that they are not competent to ascertain and acknowledge specific issues. The principal concern which arises out of providing textbooks is that it will not increase enrolment rates. New textbooks provide little incentive for Dalit children to attend classes as they do not alleviate any of the impediments presently jamming them from access to education. Increasing access to text books has aided in escalating the excellence of education despite having little or no impact on enrolment rates.

6.4 Importance of Tribal Education in Indian Context

6.4.1 Concept of Tribal Education

India is a home to a large variety of indigenous people. The Scheduled Tribe population represents one of the most economically impoverished and marginalized groups in India. With a population of more than 10.2crores, India has the single largest tribal population in the world. This constitutes 8.6 per cent of the total population of the country (Census of India, 2011). Education is one of the primary agents of transformation towards development. Education is in fact, an input not only for economic development of tribes but also for inner strength of the tribal communities which helps them in meeting the new challenges of life. It is an activity, or a series of activities, or a process which may either improve the immediate living conditions or increase the potential for future living. It is the single most important means by which individuals and society can

NSOU ? GE-ED-11 162 improve personal endowments, build capacity levels, overcome barriers, and expand opportunities for a sustained improvement in their well-being. Professor Amartya Sen recently emphasized education as an important parameter for any inclusive growth in an economy. So, education is an important avenue for upgrading the economic and social conditions of the Scheduled Tribes. Education is in fact, an input not only for economic development of tribes but also for inner strength of the tribal communities which helps them in meeting the new challenges of life. Literacy and educational attainment are powerful indicators of social and economic development among the backward groups in India. Currently, the tribes lag behind not only the general population but also the Scheduled Caste population in literacy and education. This disparity is even more marked among Scheduled Tribe women, who have the lowest literacy rates in the country (Maharatna, 2005). The male-female gap in literacy and educational attainment among the scheduled tribes is significant. Education, especially in its elementary form, is considered of utmost importance to the tribals because it's crucial for total development of tribal communities and is particularly helpful to build confidence among the tribes to deal with outsiders on equal terms. Despite the sincere and concerted efforts by the government for the overall development of the scheduled tribes, they are still far behind in almost all the standard parameters of development. They are not able to participate in the process of development, as they are not aware of most of the programmes and policies made for their upliftment. This is mainly due to the high incidence of illiteracy and very low level of education among the tribal people. Hence, the educational status of the scheduled tribes and the role of governance in this direction are highly essential. It is well known that the educational background of tribes is very discouraging as compared to the rest of the population. So, education is an important avenue for upgrading the economic and social conditions of the Scheduled Tribes. It is proved that education is the sole means to establish peace and brotherhood in the world. India is a land of a multitude of culture, religion, language and races. Tribal community in India constitutes a small portion of the total population with their indigenous culture, language and their unique lifestyle. Tribal people in India are marginalized, underprivileged and deprived in some way or the other. They are still not able to relish the fruits of modernization and technological development. Only education could enable them to cast off their mold of oppression of centuries and bask in the sunshine of socio-economic development. With the help of education

NSOU ? GE-ED-11 163 they can empower themselves and build confidence and courage to overcome the barriers of their day to day life. The aboriginal tribes of India are the oldest inhabitants of the country. For millennia, tribal societies have been subjugated by more recently arrived groups; their land was taken away, they were pushed further into the hilly gorges and wilds, and they were forced to work for their oppressors often without payment. Today tribal groups, which number more than 40 million, require special attention from the government even though they live largely isolated from the national culture. In the past, many tribal groups were forced to assimilate into the dominant culture of the country. But some groups, such as the Bhils, Gonds, Santals, Oraons, Mundas, Khonds, Mizos, Nagas, and Khasis resisted change and assimilation to maintain their cultural identities and languages. According to many Indians, their continued isolation poses problems to national integration. Under the banner of national unity, the government is now bringing these minority groups into the national mainstream. The main question is whether tribal societies can enter the national mainstream while preserving their distinct social, cultural and political beliefs. 6.4.2 Tribal Education System Government planners see education as indispensable for helping tribal peoples cope with national integration. Education will also determine their prosperity, success and security in life. The tribes which remain either deprived of or negligent toward education will suffer the consequence. Compared with the literacy rates of 73.04% for the general population, literacy among tribal peoples in India is at most 59%. The Union and the state governments have spent considerable sums of money for tribal youths' education, but the results are meager. The Commissioner for Scheduled Castes and Scheduled Tribes asserts that unless exploitation among the tribal is combatted and eliminated through education, no improvement in tribal welfare will occur. Within tribal areas, education can be the basis for integrated development. Government reports indicate that there is no scarcity of schools, other facilities or scholarships for the implementation of tribal education schemes. Most tribal youth find these incentives unattractive, however. Consequently, the government's dream to assimilate the tribes remains unfulfilled and raises basic questions about the implementation of such policies and strategies.

NSOU ? GE-ED-11 164 The Relation between Tribal Students and Teachers Among the various important factors of tribal education that influence integration into the national mainstream of life are the students and their teachers. Tribal students have different backgrounds from their non-tribal schoolmates and even the teachers, who are normally outsiders, do not understand the tribal students. To the teachers, tribal students appear untidy, reinforcing their biases against tribals. These biases are expressed in various forms of discrimination. Tribal youths have complained that teachers did not teach them in the schools because they believed that if they did, the tribal students would no longer be dependent on them. Tribal youths also feel that teachers endeavor to undermine the attitudes toward their own customs, mannerisms, language, or, toward their cultural heritage in general. Tribal Festivals, Freedom and Youth vs. Education The educational schedule—the school year, daily classes and holidays—is organized with little understanding of tribal cultures. Tribal festivals and celebrations and the seasonal pursuit of agriculture and gathering are not taken into consideration in planning educational timetables. All too often teachers hold classes as they would in cities or towns, ignoring the daily or seasonal habits of tribal pupils. The Medium of Instruction Some tribes still speak their language. While adult males are often bilingual, the women and children speak tribal dialects almost exclusively. Yet, a tribal child, on entering school, is suddenly expected to understand the state language. Children cannot understand the teacher, let alone answer questions. Many teachers assume that tribal students are slow; even if the teachers are sympathetic, overcoming this language barrier requires a great deal of effort. It would help considerably if tribal pupils were taught, during their first years in school, in their tribal language. They could then be gradually encouraged to learn the regional language. The Constitution of India, under Article 350A, affirms that every state must provide adequate facilities for instruction of pupils in their mother tongues. Decades have passed and state governments have ignored this prescription for tribal people. Since initial instruction to the tribals is given in a foreign language, they understand and assimilate very little. Consequently, their response to education is poor. Had the instruction at the primary stage been in their own tongue, the progress of tribal students would have been better, and today there would be awareness of the

NSOU ? GE-ED-11 165 importance of literacy among the tribal populations. Some attempts are being made to educate Gonds, Bhils, Santals, and other groups in their own tongues. According to recent reports, tribal children are responding well to such programs. Content and Method of Tribal Education The content and the method of tribal education must be objectively evaluated. Tribal youth have unique historical and social backgrounds but need special attention and orientation in their attempts to bridge two cultures. Many school and college curricula which tribal youths encounter are either irrelevant to them and/or offer only negative views of tribal societies. While national and state governments, in theory, offer many benefits, concessions and facilities to tribal students, few of them reach the intended recipients. Integration of Tribal Youth in Their Own Culture Tribal youth, even while they Study at the secondary and college levels, should, be encouraged not to jettison their own cultures and to remain integrated in their own societies. Once they become culturally and socially alienated, it is impossible for them to protect and lead their own societies and maintain traditions that may be essential to the viability of tribal cultures. Furthermore, tribal leaders often begin to imitate non-tribal peoples' exploitive tactics, even looking down on their own people. In some cases they treat tribal populations worse than non-tribal populations. Development in tribal societies should focus on educational programs that encourage keeping tribal youth genuinely integrated in their own culture. Education of Tribal Leaders Tribal leadership has been subverted by outside influences and agencies such as the police, the courts and political parties. In the case of political parties, tribal leaders are often manipulated for the block of votes they can deliver rather than encouraged to take the initiative of leading their people to find locally derived solutions to local problems. As a result, village autonomy was destroyed, law and order has deteriorated, and respect for authority was lost. Tribal leaders began to exploit their own people politically, socially and economically. Tribal students, even while they are receiving their education, must be trained to be dedicated to the service of their own people. They must help to develop their people's inner resolve to resist exploitation and to safeguard their own rights.

NSOU ? GE-ED-11 166 6.4.3 Schemes for Promotion of Education There are several centrally sponsored schemes for this purpose: i) Free Education: The ST children are exempted from payment of any tuition fee for Entire education right up to the university level. ii) Free textbooks: At the elementary stage, they are entitled for free text books and Learning materials. iii) Free Mid-day meals: Under the new schemes, all children in primary schools are Covered under free midday meal programme, which covers the S children? iv) Free Uniforms: There is a scheme of providing two sets of free uniforms to the children Belonging to ST in elementary schools. v) Stipends: The ST children are entitled to stipends at varying scales at different stages of education. 6.4.4 Status of Tribal Population in India The tribal population constitutes a majority in the northeastern states of Mizoram and Lakshadweep (94.4 per cent), Meghalaya (86.1per cent), and Nagaland (86.5per cent). The states with no Scheduled tribe groups are Punjab, Chandigarh, Haryana, Delhi and Pondicherry. India has total tribal population of 10.43 crores (Table-1) which is 8.6 per cent (Table-2) of total population of India as per 2011 census. Table-1 : Scheduled Tribe population and decadal change by residence in 2011 Scheduled Tribe population 2011 Decadal change 2001-2011 India Total Rural Urban Total Rural Urban 104,281,034 93,819,162 10,461,872 23.7 21.3 49.7 Source—Census of India, 2011 During 2001 and 2011, the decadal change in the scheduled tribe urban population is 23.7 per cent where as it is 49.7 per cent in urban area and 21.3 per cent in rural area. The urban India has only 2.8 per cent ST population but Rural India has 11.3 per cent ST population. (Table-2)

NSOU ? GE-ED-11 167 Table-2 Percentage of Scheduled Tribes to total population in India: 2001-2011 Percentage of Percentage of Scheduled Tribes 2011 Scheduled Tribes 2011 India Total Rural Urban Total Rural Urban 8.2 10.4 2.4 8.6 11.3 2.8 Source—Census of India, 2011 6.4.5 Literacy Trends of tribes in India Literacy is an important indicator of development among tribal groups. The trend of literacy of tribes in India from 1961 to 2011 is shown in table – 3. The percentage of literacy of tribes was only 8.54 per cent in 1961 which has increased to 59 per cent in 2011. But female literacy of tribes is only 49.4 per cent compared to male literacy of 68.5 per cent. During the post-Independence period, the Indian government implemented legislation and allocated funds to facilitate access to enrollment in primary education (grades I-V) in India. As a result, both literacy rates and gross enrollment ratios of boys and girls across the general population have increased substantially during the past 50 years. (Source: National Commission for SCs & STs, Fifth Report & Census, 2011) Enrolment Ratio of ST students Gross enrolment ratio of ST boys is more than ST girls in all classes. The gross enrolment ratio is higher in class I to V which is 107.8 for ST boys and 105.7 for ST girls but it is only 95.4 and 98.2 in class VI to VIII. It implies that the tribal enrolment declines significantly in higher class. (Source-Ministry of Tribal Affairs Data 2017) 6.4.6 Problems of Tribal Education There are many critical issues and problems in the field of tribal education. They are as follows: i. Medium of language —Language is one of the important constraints of tribal children which prevents them access to education. ii. The Location of the Village—The physical barriers creates a hindrance for the children of a tribal village to attend the school in a neighboring village. NSOU ? GE-ED-11 168 iii. Economic Condition—The economic condition of tribal people is so poor that they do not desire to spare their children or their labour power and allow them to attend schools. iv. Attitude of the parents—As education does not yield any immediate economic return, the tribal parents prefer to engage their children in remunerative employment which supplements the family income. v. Teacher Related Problems—In the remote tribal areas the teacher absenteeism is a regular phenomenon and this affects largely the quality of education. vi. Lack of Proper monitoring—Proper monitoring is hindered by poor coordination between the Tribal Welfare Department and School Education Department. 6.4.7 Factors affecting Tribal Education Attitude of Other Students: Attitude of other student is one of the important factors for the promotion of tribal student's higher education i.e., environment factor is one of the crucial factors for the development. The negative attitude we can reflected in university and other higher educational centre mainly located in big cities. Social Factors: More allocation of funds and opening of schools do not go far in providing education to the tribal's. Formal education has not been necessary for the members of tribal societies to discharge their social obligations. Hence they should be prepared to accept education and it should be presented to them in such a way as to cut the barriers of superstition and prejudice. There is still a widespread feeling among the tribal's that education makes their boys defiant and insolent and alienates them from the rest of their society, while the girls turn modern or go astray. Since some of their educated boys felt alienated and cut off their bonds with their families and villages after getting education and good employment. Some of the tribal groups vehemently oppose the spread of education in their midst. Besides, some of their superstitions and myths also play their part. Some tribal groups believe that their gods shall be angry if they send their children to schools run by 'outsiders'. Economic Factors: Some economic factors too are responsible for lack of interest shown by the tribal people in getting education. Since most of the tribal people are living in poverty, it is not easy for most of them to send their children to schools.

NSOU ? GE-ED-11 169 Lack of Interest in Formal Education: In many states tribal children are taught through the same books which from the curriculum of non-tribal children of the urban and rural areas of the rest of the state. Obviously, the content of such books rarely appeals to the tribal children who come from different cultural backgrounds. Under the traditional tribal set up a child enters adulthood with confidence. He knows his environment thoroughly, knows how to construct his own house, cultivate his field, weave his cloth; in short he acquires all the skills to lead a reasonably comfortable life within the limitations of his culture. The simple skill of reading and writing acquired in an over formal school is no match for this. We cannot afford to push him back to his environment naked. Therefore, a curriculum should be framed in the welfare of tribal people. Certain tribal activities like agriculture, dancing, hunting, tribal games and archery must be allowed to find fullest expression in the extra-curricular activities of the school, thus providing some continuity of the traditional values and forms of organization. A scheme is to be worked out through which the school children will be able to link up the school and the teacher with their parents and the tribal activities. The school has to act as a centre of dispersal of simple technical know-how beyond the skills of reading and writing to become an effective agent of social change. This student-teacher-parent continuum should be able to generate a congenial atmosphere, so that the broad purpose of education, which is to enable an average citizen to comprehend the social, political, economic and other processes and forces around him, is fully served. Suitable Teachers: Lack of suitable teachers is one of the major reasons for the slow growth of education in tribal areas. Most of the teachers employed for imparting education to the tribal children show little appreciation of tribal way of life and value system. They approach tribal people with a sense of superiority and treat them as 'savage and uncivilized' and hence fail to establish proper rapport with their students. The Scheduled Areas and Scheduled Tribes Commission's report says that a teacher in the tribal areas must have a thorough knowledge of tribal life and culture. He must speak tribal language. Only so can he be in a position to act as a friend, philosopher and guide to the tribal people. Actually the gulf between teachers and taught can be best reduced by appointing teachers from the tribal community itself or a separate cadre of teachers for tribal areas, with some inducements, should be created to serve the educational needs of the tribal society. Lack of Facilities: One of the major problems in tribal education is that of language. Most of the tribal languages and dialects are in the most rudimentary stage

NSOU ? GE-ED-11 170 and there is hardly any written literature. Most of the states impart education to tribal and non-tribal children alike through the medium of the regional language, which makes the education uninteresting and also hurts tribal sentiments. Nature of habitat: Most of the tribal villages are scattered. This entails long travels to attend schools. Unless the school situated very close to their villages and its site approved by the local people the result shall not be encouraging. School building also plays an important role in the growth of education among the tribal folk. Due to mismanagement, bungling and sometimes financial constraints, the building and sometimes financial constraints, the building is seldom suitable to run an educational institution. Number of teachers: Most of the primary schools run in the tribal areas are "Single teacher-managed whose presence in the school is more an exception than a rule". The enthusiasm of tribal people in the education of their children also depends considerably on the timing of school hours in different seasons. It should not clash with their important socio-economic activities. To many observers of the situation, the problem of education in tribal areas is the problem of wastage. It is not that wastage and stagnation are peculiar to the tribal communities alone but the extent of wastage is much larger in their case. The problem of Absenteeism is a serious one in tribal areas. One sees a large number of students on the rolls but the actual attendance is really low, and the number of students passing out at the final examination is even lower. The real problem is to create such economic conditions as could be conducive to the students developing sufficient interest in their studies. Education being the most effective instrument of empowering the Socially Disadvantaged Groups, all out efforts should be made to improve the educational status of these groups, especially that of the women and the Girl Child. In fact, the educational backwardness, prevalent amongst these people, necessitates an added thrust on their education, training and skill up gradation, as it will bring forth not only social empowerment but also economic empowerment. Environment of family: Surrounding or environments is one of the importance factors influence for the development of a person generally and particularly in educational development. Most of the tribal parents are agricultures and labours; they have little knowledge relating to modern world and modern environment. Their environment narrows that created narrow mentality. And most of tribal fathers are

NSOU ? GE-ED-11 171 addicts to alcoholic and other beverage items that creating some problem in mentally and economically end result students will fail exams. Communication: Communication one of the key factor affecting the development of tribal education. Due to isolation tribal facing problem for expressing modern and regional languages. For understanding tribal language very difficult generally in the case of society and particularly in teachers. So the students facing problem for discussing their doubt with teachers. So their doubt continuing and automatically tribal students became the last in the class. Cooperation from Stake Holders: Cooperation is essentials for promoting education in the case of tribal students. Their funds are flowing a number of persons hand and at last that amount will get students hands. The delay of funds creating problem, so the respective authorities need to be responsible for providing funds at right time at right hand. And at last but not least the success of tribal education is completed only after getting the cooperation and help from their classmates. 6.5 Government Initiatives towards Implementing Educational Policies 6.5.1

Constitutional Provisions and Acts Gopal Baba Walangkar (c. 1840-1900) is generally considered to be the pioneer of the Dalit movement, seeking a society in which they were not discriminated against. Another pioneer was Harichand Thakur (c.1812-1878) with his Matua organization that involved the Namasudra (Chandala) community in the Bengal Presidency. Ambedkar himself believed Walangkar to be the progenitor. Another early social reformer who worked to improve conditions for Dalits was Jyotirao Phule (1827-1890). The 1950 Constitution of India, introduced after the country gained independence, included measures to improve the socioeconomic conditions of Dalits. Aside from banning untouchability, these included the reservation system, a means of positive discrimination that created the classifications of Scheduled Castes, Scheduled Tribes for Dalits. Communities that were categorised as being one of those groups were guaranteed a percentage of the seats in the national and state legislatures, as well as in government jobs and places of education. The system has its origins in the 1932 Poona Pact between Ambedkar and Gandhi, when Ambedkar conceded his demand

NSOU ? GE-ED-11 172 that the Dalits should have an electorate separate from the caste Hindus in return for Gandhi accepting measures along these lines. The notion of a separate electorate had been proposed in the Communal Award made by the British Raj authorities, and the outcome of the Pact – the Government of India Act of 1935 – both introduced the new term of Scheduled Castes in replacement for Depressed Classes and reserved seats for them in the legislatures. By 1995, of all federal government jobs in India – 10.1 per cent of Class I, 12.7 per cent of Class II, 16.2 per cent of Class III, and 27.2 per cent of Class IV jobs were held by Dalits. Of the most senior jobs in government agencies and government- controlled enterprises, only 1 per cent were held by Dalits, not much change in 40 years. In the 21st century, Dalits have been elected to India's highest judicial and political offices. In 2001, the quality of life of the Dalit population in India was worse than that of the overall Indian population on metrics such as access to health care, life expectancy, education attainability, and access to drinking water and housing. Scheduled Castes and Tribes (Prevention of Atrocities) Act, 1989 The Scheduled Castes and Tribes (Prevention of Atrocities)

100%

MATCHING BLOCK 50/58

SA Nandiya Singha.docx (D153038041)

Act, 1989 is an Act of the Parliament of India enacted

to prohibit discrimination, prevent atrocities and hate crimes against scheduled castes and scheduled tribes. The Act is popularly known as the SC Act and ST Act, POA, the Prevention of Atrocities Act, or simply the Atrocities Act. It was enacted when the provisions of the existing laws (such as the Protection of Civil Rights Act 1955 and Indian Penal Code) were found to be inadequate to check these crimes (defined as 'atrocities' in the Act). Recognising the continuing gross indignities and offences against Scheduled Castes and Tribes, the Parliament passed the 'Scheduled Castes and Schedule Tribes (Prevention of Atrocities) Act 1989. The preamble of the Act also states that the Act is: "to prevent the commission of offences of atrocities against the members of Scheduled Castes and Tribes, to provide for Special Courts for the trial of such offences and for the relief and rehabilitation of the victims of such offences and for matters connected therewith or incidental thereto".

NSOU ? GE-ED-11 173 Thus objectives of the Act clearly emphasized the intention of the government to deliver justice to these communities through proactive efforts to enable them to live in society with dignity and self-esteem and without fear or violence or suppression from the dominant castes. The practice of untouchability, in its overt and covert form was made a cognizable and non-compoundable offence, and strict punishment is provided for any such offence. The SCs and STs (Prevention of Atrocities) Act, 1989 with stringent provisions was enacted on 9 September 1989. Section 23(1) of the Act authorizes the Central Government to frame rules for carrying out the purpose of the Act. Drawing power from this section, the Scheduled Castes and the Scheduled Tribes (Prevention of Atrocities) Rules of 1995 were framed. The rules for the Act were notified on 31 March 1995. The purpose of the Act was to help the social inclusion of Dalits into Indian society, but the Act has failed to live up to its expectations admitted by the Union Minister for Home Affairs in parliament on 30 August 2010. A number of cases of misuse of this Act has been reported from different parts of the country as mentioned in the Supreme Court verdict of 20 March 2018. In this verdict, the Supreme Court of India banned immediate arrest of a person accused of insulting or injuring a Scheduled Caste/Scheduled Tribe member to protect innocents from arbitrary arrest. In August, 2018, the parliament of India passed the Scheduled Castes and Scheduled Tribes (Prevention of Atrocities) Amendment Bill, 2018, to bypass the ruling of the Supreme Court of India laying down procedures for arrests under the Act. The bill inserts section 18A (1) (a) in the 1989 Act, that says a "preliminary enquiry shall not be required for registration of an FIR against any person". The Bill also inserts Section 18A (1) (b), which says "the investigating officer shall not require approval for the arrest, if necessary, of any person against whom an accusation of having committed an offence under this Act has been made and no procedure, other than that provided under this Act or the Code, shall apply". The amendments rule out any provision for anticipatory bail for a person accused of atrocities against SC/STs, not with standing any court order.

NSOU ? GE-ED-11 174 6.5.2 Government Policies and Programmes for Tribal Education Starting from the First Five Year Plan Period (1951 1956) the government is steadily allocating financial resources for the purpose of tribal development. Towards, the end of the plan (1954), 43 Special Multipurpose Tribal Development Projects (MTDPs) were created. During the Third Five Year Plan Period (1961 1966), the government of India adopted the strategy of converting areas with more than 66 per cent tribal concentration into Tribal Development Blocks (TBDs). By the end of Fourth Five Year Plan (1969 1974), the number of TBDs in the country rose to 504. Additionally, in 1972 the Tribal Sub Plan Strategy (TSP) was implemented by the Ministry of Education and Social Welfare. TSP was based on twin objectives of socio economic development and protection against exploitation. It was generally implemented in the areas where the Scheduled Tribe population was more than 50 per cent of the total population. The PESA (The Panchayats Extension to Scheduled Areas) Act, 1996 in fact, has made it mandatory for the States having scheduled areas to make specific provisions for giving wide-ranging powers to the tribes on the matters relating to decision-making and development of their community. A centrally-sponsored government scheme of ashram schools exclusively for ST children from elementary to higher secondary levels was initiated in the 1970s. But the poor quality of education in ashram schools, however, has undermined confidence in education as a vehicle for social mobility. The Janshala Programme is a collaborative effort of the Government of India (GOI) and five UN Agencies— UNDP, UNICEF, UNESCO, ILO and UNFPA—a community based primary education programme, aims to make primary education more accessible and effective, especially for girls and children in deprived communities, marginalized groups, Scheduled Caste/Scheduled Tribes/minorities, children with specific needs. Our constitution laid down various provisions for uplift of tribal communities but still they are confronted with various challenges. Despite several initiatives taken by the Government to enhance educational status ever since independence, the literacy rate among Schedule Tribes has remained low. Objective of this paper is to analyse the status of tribal education and the government initiatives to promote education among tribals and the challenges faced by the tribals to achieve education.

NSOU ? GE-ED-11 175 Recognizing that the STs Count among the most deprived and marginalized sections of Indian society, a host of welfare and developmental measures have been initiated for their social and economic development. In this regard, particular reference has to be made to the tribal sub-plan approach which came into existence as the main strategy from the Fifth Five Year Plan. Along with core economic sectors, elementary education has been accorded priority in the tribal sub-plan approach. Elementary education is considered important, not only because of constitutional obligation, but as a crucial input for total development of tribal communities, particularly to build confidence among the tribes to deal with outsiders on equal terms. Since primacy was accorded to elementary education, a broad policy frame for education was adopted in the tribal sub-Plans according equal importance to quantitative and qualitative aspects of education. A second important development in the policy towards education of tribals came with recommendations of the National Policy on Education (NPE) in 1986 which specified, among other things, the following: ?

100%	MATCHING BLOCK 51/58	SA CHAPTER IV Policy perspective.docx (D18209267)
Priority will be accorded to opening primary schools in tribal areas. ?		

77%	MATCHING BLOCK 52/58	SA chapter_4.pdf (D54365087)
There is need to develop curricula and devise instructional material in tribal language at the initial stages with		

arrangements for switchover to regional languages. ? Promising ST

youths will be encouraged to take up teaching in tribal areas. ?		

Ashram schools/residential schools will be established on a large scale

100%	MATCHING BLOCK 54/58	SA CHAPTER IV Policy perspective.docx (D18209267)
in tribal areas. ? Incentive schemes will be formulated for the		

STs, keeping in view their special needs and lifestyle. The unique feature of the policy is its recognition of the heterogeneity and diversity of tribal areas. The policy also proposed the transformation of the structure of primary education with special emphasis on improving access in tribal areas. The policy has also underlined the importance of instruction through the mother tongue for effective teaching and encouraged incorporating locally relevant content and curriculum, besides emphasizing the localized production of textbooks in local dialects. Based on these considerations, the norms for establishing primary schools were relaxed to suit tribal areas in order to improve access to education. For instance, Andhra Pradesh has gone to the extent of establishing schools in habitations where there are even twenty school-age children; Madhya Pradesh has steadily decreased

NSOU ? GE-ED-11 176 population size norms in order to open schools in habitations with 200 populations. However, in spite of such relaxation of norms many tribal localities are still without school, as they do not meet even the relaxed criteria. 6.5.3 Suggestions for Improvement of Tribal Education Some suggestions for improvement of tribal education are as follows a) Literacy campaign—Proper awareness campaign should be organized to create the awareness about the importance of education. Extensive literacy campaign in the tribal dominated districts may be undertaken on a priority basis to literate the tribal. b) Attitude of the tribal parents—The attitude of the tribal parents toward education should be improved through proper counseling and guidance. c) Relevant study materials in local languages—All study materials should be supplied in local languages of tribes. d) Appointment of Local teachers and female teachers—It is suggested to appoint more tribal teachers and female teachers in the tribal areas. The ecological, cultural, psychological characteristics of tribal children should be considered carefully by the teachers in tribal areas. e) Stipends and various scholarships—Since higher education among the tribes is less, special ST scholarships should be provided to the tribal students perusing higher education, particularly in medical, engineering, and other vocational streams. f) Residential schools—More residential schools should be established in each states and districts and extended up to PG level in tribal areas. g) Social security—Social security of students, especially of adolescent girls is of great concern in residential schools. h) Proper Monitoring—Higher level officials should check the functioning of schools frequently relating to the teaching methods, working hours, and attendance registers. 6.5.4 Constitutional Safe Guard Framers of the Indian Constitution realized that certain marginalized section in India were excluded from the national main stream and suffered extremely from

NSOU ? GE-ED-11 177 social, educational and economic backwardness. They considered that this section needed special constitutional safeguard to protect their rights and interests as to enable them to join the national main stream. List of constitutional provision for Scheduled Caste are as follows: Educational, Social, Economic and Cultural safe guard: Article 46 of Indian constitution lays down that,

100%**MATCHING BLOCK 55/58****SA** Project work-Balaram.docx (D141814926)

the state shall promote, with special care, the educational and economic interests of weaker sections of the people, and in particular, of the scheduled caste and scheduled tribes, and shall protect them from social injustice and all forms of

exploitation. Article 154(4) empowers

71%**MATCHING BLOCK 56/58****SA** chapter_4.pdf (D54365087)

the state to make any special provision for the advancement of any socially and educationally backward classes of citizen or for

SCs or STs Article 29(1) provides distinct languages script or culture. This article has special significance for scheduled tribes Untouchability is abolished under Article 17, and its practice in any form is a punishable offence Article 275(1) provides Grants in-Aids to states (having scheduled tribes) covered under fifth and six schedules of the constitution. Article 350A states that „It shall be the endeavor

67%**MATCHING BLOCK 57/58****SA** Project work-Balaram.docx (D141814926)

of every state and every local authority within the state to provide adequate facilities for instruction in mother- tongue at the primary stage of education to

the children belonging to the minority group..... Article 243D, 330, and article 332 provides reservation of seats for STs in gram panchayat, house of people and state legislative assembly. Many other provisions are laid down in articles 15, 16, 335, 338A, 342 etc. 6.5.5 Scheme and programmes for tribal development Tribal Panchsheel: It was Pandit Jawaharlal Nehru, the first prime minister of free India who anticipated the necessity of the development of tribal people and for this sake he laid down five principles of tribal development which is called Tribal Panchsheel. It was ratified by Dhebar commission and enshrined in "A Philosophy for North Eastern Frontier Area" written by Verrier Elwin. These five principles are: 1. People should develop along lines of their own genius and we should avoid imposing anything on them. We should try to encourage in every way their own traditional arts and culture. NSOU ? GE-ED-11 178 2. Tribal rights on land and forests should be respected. 3. We should try to train and build up a team of their own people to do work of administration and development. Some technical personnel from outside will, no doubt be needed, especially in the beginning. But we should avoid introducing too many outsider into tribal territory. 4. We should not over-administer these areas or over-whelm them with multiplicity of schemes. We should rather work through, and not in rivalry to, their own social and cultural institutions. 5. We should judge results, not by statistics or the amount of money spent, but by the quality of human character that is evolved. (source : "A Philosophy for NEFA" by Verrier Elwin) Post-Matric Scholarship for Scheduled Tribe Students: This scheme was introduced to encourage the ST students pursuing Post-Matriculation, in professional, technical as well as non-professional courses in various recognized institution by providing them financial support. Students having family income not more than Rs.1,0800 per year, are entitled for this scheme. This scheme is in operation since 1944-1945, and implemented by state government and UTs administration with 100% central assistance. Hostel for ST students Girls' and Boys': A plan for providing hostel accommodation for ST girls was started during third five years plan period and for the boys this programme was launched in 1989-1990 and both these schemes merged in 10th five year plan. Aim of this scheme is to facilitate hostel accommodation to the peripheral ST students who are unable to pursue their education due to their financial condition and location of their residence. Rajiv Gandhi National Fellowship Scheme (RGNF): RGNF was introduced in the year 2005-2006 with the objective to encourage the students belonging to ST community to pursue higher education such as M.Phil and Ph.D by providing them financial assistance. University Grant Commission (UGC) took the responsibility to implement this scheme on the behalf of Ministry of Tribal Affairs. Vocational Training Center in Tribal Areas: Aim of this scheme is to develop the skill of ST students depending on their qualification and present market trends. This vocational training would enable them to get suitable employment or enable them to become self-sufficient.

NSOU ? GE-ED-11 179 National Overseas Scholarship Scheme for ST: This scheme provides financial support to those meritorious tribal students who wish to pursue their studies in abroad (Masters, Doctorate, Post-Doctorate) in specified field of Engineering, Technology, and Science. Scheme of Top Class Education for ST Students: A scheme of scholarship was introduced by Ministry of Tribal affairs in 2007-2008 to encourage brilliant students of tribal community for continuing their study at degree or post-degree level. Ashram School in Tribal Sub-Plan Area: This scheme was started in 1990- 1991 with a view to provide education with residential facility to ST students. Tribal Research Institute: Fourteen Tribal Research Institutes (TRIs) have been set up in Andhra Pradesh, Assam, Bihar, Gujarat, Kerala, Madhya Pradesh, Maharashtra, Rajasthan, Tamil Nadu, West Bengal, Uttar Pradesh, Manipur and Tripura. Book Bank: In order to reduce dropout rate among ST students from professional institutes/universities, funds are allotted for purchase of books under this scheme. Coaching for ST: Under this scheme free coaching classes are provided to ST students to enhance their skill and capabilities for various competitive examinations, so that they can compete with main stream students in all competitive examinations. Challenges: Despite constitutional provisions and safe guard with various government initiatives and programme, educating tribal children is still a major concern for the government. There are so many socio-cultural, economical, geographical, and administrative obstacle (report Ministry of Tribal Affairs, GOI, 2013) for which literacy rate of tribal people has never been at par with entire population. However the contemporary challenges faced by the tribal people in order to acquire education are as follows. Socio-economic and cultural: Most of the tribal community is economically backward. It is very difficult for them to fulfill their basic needs. Sending their children to school is much like a luxury to them. They prefer to send their children to work to supplement the family income. Reluctance of parents towards education: Illiteracy of parents and their attitude towards education is indifferent, as well as their community never encourages the pupils to pursue study. Besides parents are not willing to send their daughters to co-educational institutions. Infrastructural challenges: Most of the schools located in tribal areas have minimal infrastructural facilities. These schools are not equipped with teaching learning materials, study materials, even minimum sanitary provisions are not NSOU ? GE-ED-11 180 maintained. Lack of communication plays pivotal role in discouraging tribal children to come to school regularly. Language related challenges: In most of the states, official/regional languages are used for class room teaching and these are not understood by the tribal children at primary level. For them these languages seem to be a foreign tongue as they speak only in their mother tongue. Teacher related challenges: Irregularity of the teachers in school fail to establish communication bridge among the tribal students. Besides inadequacy of trained teachers is a big problem in imparting education to tribal children. Recommendations 1. Government should take some specific initiative through various programmes like awareness camp, street drama, counseling, etc which can create awareness among the tribals about the importance of education. 2. Emphasis should be given to career or job oriented courses. 3. Infrastructural requirement has always been neglected. It should be taken under consideration. School in tribal areas should be furnished with adequate class rooms, teaching aids, electricity, water supply, separate toilet for girls and boys, boundary walls, play ground etc. 4. Teachers should be locally recruited who understand and respect tribal culture and practices and most importantly are acquainted with the local language. 5. New teacher training institutes should be opened in tribal sub plan areas to meet the requirement of trained teachers. 6. Teaching and learning should be imparted in local language. 7. Representation of tribal students in higher education is very low; to counter this problem there must be some career counseling programmes at secondary level along with providing scholarship for pursuing higher education. 8. There is no sufficient higher secondary schools in tribal areas, so government needs to establish residential school in such areas under various governmental schemes. NSOU ? GE-ED-11 181 9. There must be strong machinery to protect students from abuse, neglect, exploitation, and violence. 10. In order to bring the tribal students in the main streams of national development, community involvement is necessary through panchayati raj institutions. 11. Establish separate school for girls in tribal areas, as some parents hesitate to send their daughters to co-educational institutions. 12. Proper monitoring by high level officials at regular interval is necessary for smooth functioning of school administration. 6.6 Summary Education is a driving force of history, no civilization could flourish without educating its people. Since the attainment of independence, government of India has taken several initiatives, schemes and programmes and allotted funds to different plans to spread education among the Dalit and Tribal Communities. No doubt all these efforts are significant and highly appreciable, but despite all these efforts, growth rate of education among the tribals is very sluggish. Representation of tribals in higher education does not meet its expected level. Education is the key to tribal development. Tribal children have very low levels of participation. Though the development of the tribes is taking place in India, but the pace of development has been rather slow. If govt. will not take some drastic steps for the development of tribal education, the status of education among tribes will be a story of distress, despair and death. Hence time has come to think it seriously about tribal education and inclusive growth. So, there is an urgent need for various govt. interventions, planners and policy makers to address this problem and allocate more funds in the central and state budgets for tribal education. Easy access and more opportunities should be provided to the tribal children in order to bring them to the mainstream of economic development. Now the time has come to take drastic decision and effective plan to reduce the obstacles in pursuance of education by tribal children. Apart from government's initiative, if various NGOs and local media play an important role in creating awareness among the tribals, only then can they bask in the auroral radiance

NSOU ? GE-ED-11 182 of economic development. Thus, this unit provides a fair idea about the status of dalit education and the importance of dalit and tribal education in Indian context. 6.7 Self-Assessment Questions 1. Who are called Dalit in India? Discuss the historical backdrop of Dalit people in India. 2. Comment on the social status and economic status of Dalit people in India. 3. Discuss the history of educational scenario of Dalit education in pre- independent India. 4. Comment on the constitutional provisions of Dalit Education in India. 5. What are the specific hindrances in the way of Dalit education and bringing them in the main stream of educational arena? 6. What should be the specialized factor in Dalit curriculum? 7. What are the development programmes taken for the development of Dalit education in India? 8. Discuss in detail the status of Tribal population in India and the status of their education system. 9. What are the major problems of Tribal education in India? 11. Comment on the government policies for the development of educational status of the tribal people. 12. How does Scheduled Castes and Tribes (Prevention of Atrocities) Act, 1989 promote Tribal Education in India? 13. What is Janashala Programme? 14. What are the constitutional safe guards for the Tribal education in India? 6.8 References Ambedkar, B.R. (1989). population born between the beginning of settled agriculture and the year 1900—a period of 10,000 years. The implications of this explosive growth for both the physical environment and human wellbeing alarmed many observers and prompted an intense public policy debate. Many scholars and policymakers noted that high levels of educational achievement were associated with more moderate rates of population growth, suggesting that important opportunities for alleviating population pressures might be found in ensuring greater access to education, particularly for females. The ensuing public policy debate has prompted an examination of how education affects the birth rate. The explosive growth of the human population in the nineteenth and twentieth centuries was the result of a historically unprecedented decline in the rate of mortality, rather than an increase in the birth rate. The proportion of children dying before reaching the age of five fell from nearly one in three in most of the world to less than one in one hundred in the most advanced societies over this period, and to one in ten in low-income countries. In the wealthiest countries, birth rates adjusted quickly to restore a balance between births and deaths and establish a rate of population growth of less than 1 percent a year. In economically advanced societies, the average number of children born to each woman over her reproductive life has fallen from about seven to less than two. However, in the poorest countries, a sharp drop in death rates has not been accompanied by a corresponding fall in birth rates. As a result, the rate of population growth—the difference between the average birth rate and the average mortality rate—has increased dramatically in most of the world. The growth of population has been greatest in countries that are both poorest and least able to invest in social and educational services. The combined effects of these forces seem to imply that the gulf between rich and poor is likely to widen over the foreseeable future if aggressive policy measures are not introduced. These facts suggest that the key to ensuring a sustainable rate of population growth lies in reducing the fertility rate. However, in a highly influential 1979 review of the research literature on the relationship between education and fertility, the economist Susan Hill Cochrane concluded that too little was known about the mechanisms through which education affects population growth to allow policy-makers to rely on improvements in educational opportunities to slow the rate of population growth. Since 1976 a large number of scholars have focused on the

	<p>impact of education—especially the education of the girl child—on fertility, mortality, and population growth. The central purpose of these studies has been to determine whether the nearly universal association of low fertility and high levels of educational attainment are causally linked or merely the result of their association with other forces that directly affect fertility. For example, the inverse relationship between female literacy and fertility might have nothing to do with education as such, but might instead simply reveal that societies that seriously attempt to educate females also care about the welfare of women and therefore seek to control fertility in order to protect their health.</p> <p>W https://education.stateuniversity.com/pages/2327/Population-Education.html</p>

PREFACE In a bid to standardise higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses: core, generic discipline specific elective, and ability/ skill enhancement for graduate students of all programmes at Elective/ Honours level. This brings in the semester pattern, which finds efficacy in tandem with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC Open and Distance Learning (ODL) Regulations, 2017 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English. Eventually, these will be translated into Bengali too, for the benefit of learners. As always, we have requisitioned the services of the best academics in each domain for the preparation of new SLMs, and I am sure they will be of commendable academic support. We look forward to proactive feedback from all stake-holders who will participate in the teaching-learning of these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

Unit 1 Perspectives of Special Education Structure 1.1 Objectives 1.2 Introduction 1.3 Historical Perspective of Special Education 1.3.1 Concept of Special Education 1.3.2 History of Special Education 1.4 Special Education: concept of exceptionality, disability and diversity 1.4.1 Concept of Exceptionality 1.4.2 Concept of Disability 1.4.3 Concept of Diversity 1.5 Perception of Society towards Individual with Disabilities 1.6 Summary 1.7 Self-Assessment Questions 1.8 References 1.1 Objectives After reading this unit, learners will be able to: Know the historical perspective of special education; Understand the concept of exceptionality, disability and diversity; Discuss Perception of society towards Individual with Disabilities. 1.2 Introduction Education in a democracy emphasizes the freedom, dignity of the individual, responsible

8 GE-ED-21 NSOU citizenship, economic efficiency, self-realization and equality of opportunities. Right To Education (RTE) is a universal human right as mentioned in Article 26 (I) of Universal declaration of Human Rights. From this point of view, on no ground can any individual be Denied the RTE. Moreover, the right of all children to develop to their maximum potential is inherent in the philosophy of democracy. The landmark passing of RTE Act 2009 marks a historic moment for children of India as it gives guarantee to their rights to quality elementary education by the state. RTE provides a ripe platform to reach the unreached, with specific provisions for disadvantaged groups including Children with Disability (CwD). The Indian Education Commission (1964-66) first officially recommended the education of CwD in regular schools. The National Policy on Education (NPE, 1986) focused special attention on the education of CwD for achieving the goal of Education for All (EFA). The urgency of the need to educate and rehabilitate the Persons with Disability (PwD) is not only based on altruistic and humanistic motive, but it also has economic and political dimensions. The uneducated and untrained CwD grow up into adults as economically dependent and that influences the quality of life. It becomes imperative, therefore to train them in some kind of vocations which may enable the PwDs to become economically independent. In order to understand the present status of the education of the CwD in India, it is essential to know the concept of disability, meaning, historical background and concept of 'Special Education'. 1.3 Historical perspective of Special Education 1.3.1 Concept of Special Education Special education, as its name suggests, is a specialized branch of education. Hallahan and Kauffman (2006) defined Special Education as specially designed instruction that meets the unusual needs of an exceptional learner. Special education means specially designed instruction to meet the unique needs of a child with a disability, including - (i) Instruction conducted in the classroom, in the home, in hospitals in institutions, and in other settings; and. (ii) Instruction in physical education. In 1975, the Education for All Handicapped Children Act (EHCA, PL 94-142) mandated that states should provide a "free and appropriate public education" (FAPE) to all students, including those with physical, mental, or behavioural disabilities. This special education must include a comprehensive screening and diagnosis by a multi-disciplinary team and the development of an annual Individualized Education Plan (IEP) for each of the students, outlining academic and behavioural goals, services to be provided, and methods

NSOU GE-ED-21 9 of evaluation. The parents of such students must provide consent for initial screening and must be invited to participate in all phases of the process. In 1997, the Individuals with Disabilities Education Act (IDEA) expanded the special education services by mandating that all children with disabilities - regardless of the type or severity of their disability - between the ages of three and 21 years are entitled to FAPE in the least restrictive environment. That is, children requiring special education must be educated with non-disabled children to the maximum extent possible in an appropriate program to meet their special needs. While the majority of children with disabilities are taught at least part-time in a general classroom setting, many children are segregated, most often due to a lack of staff and resources to support special needs students in general classrooms. This stipulation that special-needs children be educated in the least restrictive environment leading to the practice of mainstreaming, which is the policy of placing special education students in regular classrooms as much as possible and using separate resource rooms where the students receive special tutoring, review, and instruction. Special education can include a range of support services, depending on the special needs of the student. Support services may involve physical assistance and therapy, counselling and psychotherapy, modified learning environments and assistive learning devices, educational and psychological assessments, and behavioural modification techniques. Special Education has certain special objectives which are given below: Early identification and assessment of special needs of CwD. Early intervention to prevent a handicapping condition from becoming a serious one for remediation of learning problems and compensation by teaching the child new ways of doing things. Parent counselling about prevention and remediation of defects, care, and training of CwD in daily living skills, self-help skills, pre-academic skills and communication skills. Community mobilization and awareness of problems of CwD and their education. Rehabilitation of the CwD which is clearly stipulated by NPE (1986/1992). Effective living of CwD. 1.3.2 History of Special Education Researchers have conceptualized the history of special education in stages that highlight

10 GE-ED-21 NSOU the various trends that the field has been experienced. The history of Special Education has passed through a very turbulent phases and can be briefly summarized under the following (Chavan & Rozatkar, 2016):

- i) Pre-Industrialization Phase: From the dawn of civilization to the beginning of industrialization period, people born with "abnormal" physiognomy were treated with fear or ridicule (and perhaps continue to do so in many societies).
- ii) Industrialization Phase: Although industrial revolution is associated with increasing wealth and productivity, it also brought in many ill effects. Migration to bigger cities led to development of slums, poverty, diseases, and crimes. Families started valuing those with vocational ability and started neglecting members who were not able to work. The individual who had low intelligence were left out and were labelled as feeble-minded, degrading, and stigmatizing.
- iii) Humanitarian Approach: In 1846, Dr Samuel Gridley Howe from Boston persuaded Massachusetts Legislature to appoint a commission to inquire into the condition of 'idiots'. After survey and close study, he for the first time observed, "These are the proper subjects of education, they can be taught to do some kind of labour and they can be made self-sufficient". It led to many state run schools for these persons. However, these schools were a failure because Howe and his fellows (Sequin and Wilbur) were too optimistic, unrealistic in expectations as they expected to restore all 'idiots' to normal functioning.
- iv) Demonology of the Defectives: The scientific developments of Darwinism, sociological approach, Mendelian theory of genetics, and Binet psychometric tests advocated, directly or indirectly that feeble minded individuals, who could be easily identified and quantified, are risk to the society. Thus, the society started thinking ways to prevent feeble mindedness from occurring and working on ways how to control those in whom it did occur. The segregation seemed to be the best method where feeble minded could be cheaply and wisely cared for along with prevention and societal protection.
- v) Period of John F Kennedy: In 1963, based on recommendations of President's Panel on Mental Retardation, JF Kennedy made a speech to the Congress of United States and asked for new resources to address the needs for people with mental retardation. Soon, virtually every state launched special educational programs for these persons.

NSOU GE-ED-21 11 Universally in the past, PwD were viewed as bad omens, and were prevented from participating in the activities necessary for survival. They were excluded from the purview of normal educational experiences. They were treated as imperfect and hence unfit to profit from regular schools and facilities. In the early nineteenth century, the idea of democracy, individual freedom and egalitarianism that swept in the west and advances in learning theory and technology have contributed to the emergence of optimistic attitude towards these people. Globally, special education has evolved through five stages which are mentioned here:

- I. The first stage refers to the stage of neglect. Disability was viewed as punishment for past sins and nobody wanted to interfere in the justice meted out to PwD by God.
- II. The second stage refers to the stage of pity and compassion. During this stage, the PwD were protected and pitied especially, by the religious institutes to reduce misery and pain.
- III. The third stage refers to the stage of special school. The innovation of Braille and efforts of doctors, psychologists and educators for education and training of PwD encouraged establishment of schools for CwD. Segregation continued to be the watch word in special education.
- IV. The fourth stage refers to the stage of mainstreaming and integration. Mainstreaming and integration of CwD in general schools had received attention as a part of the normalization movement. As a reaction to categorization and labeling the artificial boundaries of general and special education came under the scrutiny in the fifth stage.
- V. The fifth stage refers to the stage of development of the concept of special needs.

History of Special Education in India (Source: Usha Ram, 2004)

The concept of mental retardation was first mentioned in the 'Arthava Veda'. A much older system of philosophy, the 'Sankhya', contains a statement on different types of intellectual disabilities. According to the 'Garba Upanishad', babies with birth defects were 'born to parents whose minds are distressed'.

12 GE-ED-21 NSOU The 'Pathanjali Yoga Sutras' deal with yoga as a therapy in which mental retardation has also been taken into consideration. The great physician Charaka had given various causes of mental retardation and discussed its different types and classifications. Clear references to persons with mental retardation can be traced in the Sangam literature (200 BC-AD 200) by Eryanar and Avviayar and more recently by Thiruvalluvar. In the fourth century BC, Kautilya banned the use of terms insulting persons with disabilities. He employed many people with disabilities in his spy-network. King Amarsakti had three sons, Vasusakti, Ugrasakti and Anekasakti, who were 'greater fools' or 'supreme blockheads'. This folly caused their father's courtier, Vishnu Sharma, to devise the world's, first special education text, Panchantantra, around the first century BC. Ancient Hindu, Buddhist and Sanskrit texts treat idiocy like other birth handicaps, occurring due to sins committed as a consequence of the guilt of former crimes in an earlier incarnation. According to Manu, the Law Giver, such persons are born idiots, dumb, blind, deaf and deformed and are all despised by the virtuous. Arthasastra mentions treatment and care given to people with disabilities at 'mattas' (monasteries) and in the time of Ashoka, at the hospitals at Pataliputra. Sinhalese asylums for people with disabilities were set-up by the fourth century in what is now Sri Lanka. Special education began in India in 1826 with Raja Kali Shankar Ghosal opening his blind asylum at Benaras. The first facility for the deaf was started in 1855 at the same place. In 1841, there was an asylum for idiots in Madras, separate from the lunatic asylum. In 1918, a school was opened in Kurseong in Bengal to train those children who through physical and mental defects are unable to profit by the instruction given in an ordinary school. Similar works began in Travancore in 1931 and in Chennai in 1936. The Government Mental Hospital, Madras, started a school for children with mental retardation in 1939.

NSOU GE-ED-21 13 The first home for children with mental retardation was opened in Bombay (1941) by the Children's Aid Society. Mrs Vakil, in 1944, started another school in Bombay. In the fifties, eleven more centres were started in various parts of the country. In 1954, Mr Srinivasan began the first special class in a regular school at Andheri in Bombay.

1.4 Special Education: Concept of Exceptionality, Disability and Diversity 1.4.1 Concept of Exceptionality All children differ from one another to varying degrees. However, in some students the learning difficulties are more serious, and the children deviate more significantly in one way or another. These are youth who are exceptional in that their learning and behaviour deviates significantly from the norm. They may show differences in the physical, intellectual, communicative, social, or emotional domains, or in some combination of these. As a child with an exceptionality is different from the average student in some or many areas of functioning, therefore, the study of children with exceptionalities is the study of differences. However, children with exceptionalities do not differ in every way from their normally developing peers, and it would be wrong to focus the study of these children solely on differences. Exceptional children are those who require special education and related services if they are to realize their full human potential. (Kauffman & Hallahan, 2005) They require special education because they are markedly different from most children in one or more of the following ways: they may have mental retardation, learning disabilities, emotional disturbance, physical disabilities, disordered speech or language, impaired hearing, impaired sight or special gifts or talents. Special Education One commonality found in children and youth with exceptionalities is the need for skilled intervention and special care from trained professionals. Intervention may take many forms including medical, technical, therapeutic, and educational.

14 GE-ED-21 NSOU Special education means specially designed instruction that meets the unique needs of an exceptional child. Special materials, teaching techniques, equipment and/or facilities may be required. For example, children with visual impairment may require reading materials in large print or children with hearing impairment may require hearing aids and/or instructions in non-verbal communication, children with physical disability need wheelchairs, ramps, and a variety of equipment and children with gifted or talented may require access to working professionals. Related services-special transportation, psychological assessment, 'physical and occupational therapy, medical treatment, and counselling - may be necessary if special education is to be effective. Categories of Exceptional Children and Adults Intellectual Disability/Mental Retardation Learning Disabilities Emotional or Behavioural Disorders Communication Disorders Hearing Impairment Visual Impairment Physical Disabilities Giftedness Others Two concepts are important to educational definition of exceptional children and youths; these are: (1) diversity of characteristics and (2) need for special education. The concept of diversity is inherent in the definition of exceptionality; the need for special education is inherent in an educational definition. Exceptional learners differ from most (typical or average) individuals in a particular way that is relevant to their education. Their particular educationally relevant difference demands instruction that differs from what most (typical or average) learners require. Students with exceptionalities are an extraordinarily diverse group in comparison to the general population, and relatively few generalizations apply to all exceptional individuals.

NSOU GE-ED-21 15 Their exceptionalities can involve sensory, physical, cognitive, emotional, or communication abilities or any combination of these. Furthermore, exceptionalities may vary greatly in cause, degree, and effect on educational progress, and the effects may vary greatly depending on the individual's age, sex, and life circumstances. Any individual presented as an example of an "exceptional learner" is likely to be representative of exceptional learners in some respects but unrepresentative in others. Medical Intervention Medical intervention includes surgery, treatment that is life saving, the controlled use of medication, and supportive therapy. Surgery includes a wide variety of procedures such as reconstructive surgery for cleft palates and orthopedic surgery for skeletal-system problems. Psychopharmacology, or drug therapy, is designed to manage problems of behaviour, activity, emotion, and epilepsy. Therapy The treatment of an illness or disabling condition is referred to as therapy. For children with exceptionalities, the major types employed are speech therapy, occupational therapy, and physical therapy. Educational Intervention Education for children and youth who are exceptional is provided through a variety of arrangements and alternatives. Programs vary, often quite dramatically, across the country, across provinces, and even across school districts. The two major dimensions of difference are the organizational context the legislation and policy underlying special education - and the service delivery models - plans for bringing together students, teachers, instruction, and learning that are individual to schools. 1.4.2

Concept of Disability Several terms and phrases related to disabilities and special needs create some amount of confusion, perhaps misunderstanding. Two terms related to special and inclusive education that are most commonly used, often interchangeably, are impairment and disability. While Impairment refers to a lesser degree of complexity in the way our bodies work, Disability refers to inability or not being able to perform a task. Most of us have felt inability at some time or other in our lives— during illness, following a physical injury or, when in an unfamiliar environment. For example, during illness, you may feel disabled from doing your regular work with usual rigour, energy and ability; during a physical injury like a

16 GE-ED-21 NSOU racture, or a severe sprain, disability would involve not being able to use your limbs effectively, such as to walk, run or write. Given that often these and related terms are used interchangeably, the following presentation offers explanations of pairs of terms we often hear involving persons with disabilities. Impairment: According to World Health Organisation (WHO, 1980), Impairment is any temporary or permanent loss or abnormality of a body structure or function, whether physiological or psychological. An impairment is a disturbance affecting functions that are essentially mental (memory, consciousness) or sensory, internal organs (heart, kidney), the head, the trunk or the limbs. Disability: (Nishkta) Disability is more than a problem or difficulty with how our body works. According to WHO, 1980, Disability is A restriction or inability to perform an activity in the manner or within the range considered normal for a human being, mostly resulting from impairment. A child with an impairment may experience disability when functioning in an environment that impacts the child's successful performance at a task. Thus, impairment alone may not cause inability to perform in a manner equal to others, but the systems within which one has to live, learn, work and operate can cause a child with impairment to be unable to perform successfully (for example, a child with hearing impairment may be able to successfully function within own immediate contexts of family and neighbourhood, and not experience any 'disability' in going through routine, day-to-day interactions, but may experience inability to perform with the same success as her regular classmates in a classroom setting involving expected expressions of learning). In 2001, WHO issued the International Classification of Functioning, Disability and Health (ICFDH) which distinguishes between body functions (physiological or psychological, e.g. vision) and body structures (anatomical parts, e.g., the eye and related structures). Impairment in bodily structure or function is defined as involving an anomaly, defect, loss or other significant deviation from certain generally accepted population standards, which may fluctuate over time (WHO, 2002). Since an individual's functioning and disability occur in a context, the ICFDH also includes a list of environmental factors. The ICFDH lists following nine broad domains of functioning which can be affected (WHO, 2002). Learning and applying knowledge General tasks and demands Communication

NSOU GE-ED-21 17 Mobility Self-care Domestic life Interpersonal interactions and relationships Major life areas Community, social and civic life International Classification of Functioning ICF Model Two major conceptual models of disability have been proposed. The Medical Model views disability as a feature of the person, directly caused by disease, trauma or other health conditions, which require medical care provided in the form of individual treatment by professionals. Disability, on this model, calls for medical or other treatment or intervention, to 'correct' the problem with the individual. The Social Model of disability, on the other hand, sees disability as a socially created problem and not at all an attribute of an individual. On the social model, disability demands a political response, since the problem is created by an unaccommodating physical environment brought about by attitudes and other features of the social environment. On their own, neither model is adequate, although both are partially valid. Disability is a complex phenomenon that is both a problem at the level of a person's body, and a complex and primarily social phenomena. A better model of disability, in short, is one that synthesizes what is true in the medical and social models, without making the mistake each makes in reducing the whole, complex notion of disability to one of its aspects. This more useful model of disability might be called the Bio-Psychosocial Model. ICF is based on this model, an integration of medical and social. ICF provides, by this synthesis, a coherent view of different perspectives of health— biological, individual and social. The following diagram is one representation of the model of disability that is the basis for ICF.

18 GE-ED-21 NSOU (Source: <https://www.who.int/classifications/icf/icfbeginnersguide.pdf>) Concepts of functioning and disability As the diagram indicates, in ICF disability and functioning are viewed as outcomes of interactions between health conditions (diseases, disorders and injuries) and contextual factors. Among contextual factors, there are external environmental factors (for example, social attitudes, architectural characteristics, legal and social structures, as well as climate, terrain and so forth); and internal personal factors, which include gender, age, coping styles, social background, education, profession, past and current experience, overall behaviour pattern, character and other factors that influence how disability is experienced by the individual. The diagram identifies the three levels of human functioning classified by ICF— functioning at the level of body or body part, the whole person, and the whole person in a social context. Disability, therefore, involves dysfunctioning at one or more of these same levels— impairments, activity limitations and participation restrictions. In sum, ICF is WHO's framework for health and disability. It is the conceptual basis for the definition, measurement and policy formulations for health and disability. It is a universal classification of disability and health for use in health and health-related sectors. 1.4.3 Concept of Diversity India is a land of various cultures, religions, regions, languages, caste, class, and ethnicity. It has been recognized that individuals differ in countless factors say psychological, skills, capacity, ability, communication, and learning Styles.

NSOU GE-ED-21 19

The Greek philosopher, Aristotle, once said that "things that are alike should be treated alike, whereas things that are unlike should be treated unlike in proportion to their un- likeness." The principle of respect for difference and acceptance of disability as part of human diversity and humanity is important, as disability is a universal feature of the human condition."

Diversity (world Bank) : Today classrooms are no longer homogenous and diversity is clearly emerging as the norm. Children from diverse socio economic and cultural backgrounds, besides children with disabilities, are now in regular schools. A typical classroom of an Indian school, will have children from diverse cultures, different socio-economic backgrounds, and different abilities, including those with a variety of disabilities. Thus, diversity in the classroom must be recognised, accepted and addressed as a reality, in order to realise the goal of EFA. Teachers are key to realising the potential of each child in their classroom. Concept of diversity encompasses acceptance and respect. It means understanding that each individual is unique, and recognising our individual differences. These can be along the dimensions of race, ethnicity, gender, sexual orientation, socio-economic status, age, physical abilities, religious beliefs, political beliefs, or other ideologies. It is the exploration of these differences in a safe, positive, and nurturing environment. It is about understanding each other and moving beyond simple tolerance to embracing and celebrating the rich dimensions of diversity contained within each individual. The pedagogic treatment should be according to the individual's needs, their personal learning styles and the environmental consequences they are facing. It gives the scope to think about new practices such as inclusion, integration, etc., as well as to face the challenges and make use of opportunities to be responsive to the individual needs of the diverse learners. Learners may broadly be classified on the basis of some of the most prominent categories of diversity. Some such types are - Linguistic Diversity, Cultural Diversity, Diversity Based on Socio-religious Background, Diversity based on Gender, Diversity due to Difficult Family Background, and Diversity based on Ability /Disability. (Source : World Bank Group, 2016) Various policies and laws have been enacted in India and throughout the world to address social diversity and diversity in the learning environment.

20 GE-ED-21 NSOU 1.5 Perception of society towards Individual with Disabilities Over the years, perceptions towards disability have varied significantly from one community to another. During the past 40 to 50 years there have been numerous changes in our society with respect to the management and treatment of individual with disabilities. In addition, there have been many advancements in medical care. As a result, most of these individuals reside in the community rather than institutions and depend upon community-based private practitioners for oral health care. Prior to the twentieth century, social attitudes reflected the view that persons with disabilities were unhealthy, defective and deviant. For centuries, society as a whole treated these people as objects of fear and pity. The prevailing attitude was that such individuals were incapable of participating in or contributing to society and that they must rely on welfare or charitable organizations. Generally speaking, prior to the late 1800's, people with mental retardation, cerebral palsy, autism, and/or epilepsy resided at home and were cared for by their families. Life expectancy for severely and profoundly disabled individuals was not as long as it is today. Beginning in the late 1800's, institutions were built by state and local administrative agencies to house people with developmental disabilities. These institutions were usually built on the outskirts of big towns. Societal attitudes fostered this segregating style of management. Unfortunately, segregating from society further stigmatizes people. Changing Attitudes Many legislative and societal changes occurred in the 1960's and 70's which had a great influence on the treatment of and attitudes toward people with disabilities. The Education for all Handicapped Children Act (PL 94-142) was passed in 1975. Finally, the Americans with Disabilities Act was passed in July 26, 1990. Essentially, this law is Civil Rights Legislation for persons with disabilities. The ADA attempts to guarantee the rights of full inclusion into the mainstream of American life for all persons with disabilities. As a result of these changes in the management of people with disabilities during the 1970's and 80's, there is a strong trend toward acceptance. These attitudes are in sharp contrast to the prevailing attitudes of the first half of this century. Changed Terminology The terminology used to describe people with disabilities has been changing along with NSOU GE-ED-21 21 changes in society's attitudes. Very old terms include; idiot, imbecile and moron. These terms were replaced with "mentally retarded" and "disabled" or "divyagan". In recent years, it has become important to emphasize the individual, not the person's disability; e.g., "individuals with mental retardation" rather than "mentally retarded people." People with disabilities want to be recognized for their abilities, not their disabilities. Some individuals prefer the term "differently abled" rather than disabled. Mental Retardation (MR), which was in use world over till late 20th century, has now been replaced with Intellectual Disability (ID) in most of the countries by Diagnostic and Statistical Manual 5th Revision (DSM-V).

1.6 Summary This unit has been introduced to understand the concept of Exceptionality, Special Education, Disability (as per WHO and ICF) and Diversity. Special education, as its name suggests, is a specialized branch of education. Hallahan and Kauffman (2006) defined Special Education as specially designed instruction that meets the unusual needs of an exceptional learner. Special education means specially designed instruction to meet the unique needs of a child with a disability. The history of Special Education has passed through different phases, viz., Pre-Industrialization Phase, Industrialization Phase, Humanitarian Approach, Demonology of the Defectives, Period of John F Kennedy. Perceptions towards disability have varied significantly from one community to another. Many legislative and societal changes occurred in the 1960's and 70's which had a great influence on the treatment of and attitudes toward people with disabilities.

1.7 Self-Assessment Questions 1) What is Special Education? 2) Briefly discuss the history of special education. 3) Define Disability. 4) Discuss about the changing attitude of the society towards CWSN. 1.8 References Hallahn, D. P., & Kauffman, J. M. (2006). Exceptional learners: An introduction to special education (10th ed.). Boston: Allyn & Bacon.

NSOU GE-ED-21 23 Unit 2 Status of Special Education Structure 2.1 Objectives 2.2 Introduction 2.3 International & National Commissions & Committees on Special Education. 2.4 Status of Special Education in India (Outline only) 2.5 Special Education: Laws & Legislations 2.6 Summary 2.7 Self-Assessment Questions 2.8 References 2.1 Objectives After reading this unit, learners will be able to: Discuss about different International & National Commissions & Committees on Special Education; Explain briefly about the status of Special Education in India; Know different Laws and Legislations for promoting Special & Inclusive Education. 2.2 Introduction

Historically, people with disabilities have often suffered, and in most parts of the world are still suffering, from a pervasive and disproportionate denial of the right to education. In many countries, children with disabilities are sent away to institutions where they receive no education and are isolated from society for their entire lives. In other countries, children with disabilities are forced to attend separate schools instead of general schools in the community. The vast barriers children with disabilities face in accessing education in most 23

24 GE-ED-21 NSOU societies has led to a low employment rate for persons with disabilities and a disproportionately high rate of poverty. In such context, International and National laws and different Commissions play as a facilitator for the realization of the right to education of people with disabilities throughout the world. As the most recent, integral and legally binding international instrument to protect the rights of persons with disabilities, the Convention on the Rights of Persons with Disabilities (CRPD) put steps forwards for the protection of their right to education. 2.3

International & National Commissions & Committees on Special Education.

Kothari Commission (1964) In the chapter 'Towards Equalization of Educational Opportunities', Kothari commission states (Wikipedia, 2021)

about handicapped children in the following lines, "Very little has been done in this field so far any great improvement in the situation does not seem to be practicable in the near future ... there is much in the field that could be learned from the educationally advanced countries" (Education Commission, 1966. P. 123). The commission recommended: i) 'the provision of educational facilities for about 10% of the total number of handicapped children by 1986; and ii) integrated education for handicapped children. National Education Policy (1968) The National Policy on Education (NPE) is a policy formulated by the Government of India to promote education amongst India's people. The policy covers elementary education to colleges in both rural and urban India. The first NPE was promulgated in 1968 by the government of Prime Minister Indira Gandhi, and the second by Prime Minister Rajiv Gandhi in 1986.

National Policy on Education (1986) NPE in its broad objective of education for equality proposed the following measures for the education of the disabled.

The objective should be to integrate the physically and mentally handicapped with the general community as equal partners, to prepare them for normal growth and to enable them to face the life with courage and confidence. The NSOU GE-ED-21 25

following measures will be taken in this regard(MHRD, 1986): i) Wherever it is feasible, the education of children with motor handicaps and other mild handicaps will be common with others. ii) Special schools with hostels will be provided, as far as possible at district headquarters, for severely handicapped children, iii) Adequate arrangement will be made to give vocational training to the disabled. iv) Teachers 'training programmes will be reoriented, in particular for teachers of primary classes, to deal with special difficulties of handicapped children, and v) Voluntary effort for the education of the disabled will be encouraged in every possible manner.

It included a full chapter on "Education of the Handicapped" and formulated guidelines for action. The NPE (1986) strongly emphasized the need for the expansion of integrated education programmes. Revised National Policy of Education (1992) The National Policy on Education, 1986 was modified in 1992. It is a comprehensive frame work to guide the development of education in the country. The principles included in the NPE-1968 are also included in the new policy with some modifications (MHRD, 1998). Modifications and Additions: The new education policy will give emphasis on retention of children in the schools at primary level. The cause of the drop out of the children from the school should be strategically handled by making plans. The network of Non-Formal education in the country to be introduced and also the education should be made compulsory up to the age of 14. Greater attention should be given to the backward classes, physically challenged and minority child for their development in education. Major emphasis will be laid on women's education to overcome the poor rate of illiteracy among female. They will be given priority in various educational institutes and special provisions will be made available for them in vocational, technical and professional education. Institutions will be provided with resources like infrastructure, computers, libraries.

26

GE-ED-21 NSOU

Accommodation for students will be made available especially for girl students. Teachers will have the rights to teach, learn and research. The Central Advisory Board of Education will play an important role in reviewing educational development and also to determine the changes required to improve the education in the country. State government may establish State Advisory Board of Education to look after the state's progress in education. Non-government organizations will be encouraged to facilitate the education in the country. At the same time steps will be taken to prevent establishment of institutions for commercialization of education.

National Curricular Framework (2005) The National Curricular Framework (NCF, 2005) is one of the

four National Curriculum Frameworks published in 1975, 1988, 2000 and 2005 by the National Council of Educational Research and Training NCERT in India. (Wikipedia, 2021) The Framework provides the framework for making syllabi, textbooks and teaching practices within the school education programmes in India. The NCF 2005 document draws its policy basis from earlier government reports on education as Learning Without Burden and

National Policy of Education 1986-1992 and focus group discussions. After wide ranging deliberations 21 National Focus Group Position Papers have been developed under the aegis of NCF-2005. The state of art position papers provided inputs for formulation of NCF-2005. The document and its offshoot textbooks have come under different forms of reviews in the press. Its draft document came under the criticism from the Central Advisory Board of Education (CABE). In February 2008 the director Krishna Kumar in an interview also discussed the challenges that

are faced by the document. The approach and recommendations of NCF-2005 are for the entire educational system. A number of its recommendations, for example, focus on rural schools. The syllabus and textbooks based on it are being used by all the CBSE schools, but NCF-based material is also being used in many State schools.

NCF 2005 has been translated into 22 languages and has influenced the syllabi in 17 States. The NCERT gave a grant of Rs.10 lakhs

to each State to promote NCF in the language of the State and to compare its current syllabus with the syllabus proposed,

so

NSOU GE-ED-21 27

that

99%

MATCHING BLOCK 2/46

W

a plan for future reforms could be made. Several States have taken up this challenge. This exercise is being carried out with the involvement of State Councils for Educational Research and Training [SCERT] and District Institutes of Education and Training [DIET]. National Policy for Persons with Disabilities (2006) The Government of India formulated the National Policy for Persons with Disabilities in February 2006 which deals with Physical, Educational

and

100%**MATCHING BLOCK 3/46****W**

Economic Rehabilitation of persons with disabilities. In addition the policy also focuses upon rehabilitation of women and children with disabilities, barrier free environment, social security, research etc. The National Policy recognizes that Persons with Disabilities (

PwD)

96%**MATCHING BLOCK 4/46****W**

are valuable human resource for the country and seeks to create an environment that provides them equal opportunities, protection of their rights and full participation in society. Focus of the Policy 1. Prevention of Disabilities — Since disability, in a large number of cases, is preventable, the policy lays a strong emphasis on prevention of disabilities. It calls for programme for prevention of diseases, which result in disability and the creation of awareness regarding measures to be taken for prevention of disabilities during the period of pregnancy and thereafter to be intensified and their coverage expanded. 2. Rehabilitation Measures — Rehabilitation measures can be classified into three distinct groups:

a)
Physical rehabilitation, which includes early detection and intervention, counseling & medical interventions and provision of aids & appliances. It will also include the development of rehabilitation professionals; b) Educational rehabilitation including vocational education and

c)
Economic rehabilitation for a dignified life in society. 3. Women with Disabilities — Women with disabilities require protection against exploitation and abuse. Special programmes will be developed for education, employment and providing of other rehabilitation services to women with disabilities keeping in view their special needs. Special educational and vocational training facilities will be setup. Programmes will be undertaken to rehabilitate abandoned disabled women/ girls by encouraging their adoption in families, support to house them and impart them training for gainful employment skills. The Government will encourage the projects where representation 28 GE-ED-21 NSOU of women with disabilities is ensured at least to the extent of twenty-five percent of total beneficiaries. 4. Children with Disabilities — Children with disabilities are the most vulnerable group and need special attention. The Government would strive to: Ensure right to care, protection and security for children with disabilities; Ensure the right to development with dignity and equality creating an enabling environment where children can exercise their rights, enjoy equal opportunities and full participation in accordance with various statutes. Ensure inclusion and effective access to education, health, vocational training along with specialized rehabilitation services to children with disabilities. Ensure the right to development as well as recognition of special needs and of care, and protection of children with severe disabilities. Barrier-free Environment — Barrier-free environment enables people with disabilities to move about safely and freely, and use the facilities within the built environment. The goal of barrier free design is to provide an environment that supports the independent functioning of individuals so that they can participate without assistance, in everyday activities. Therefore, to the maximum extent possible, buildings / places / transportation systems for public use will be made barrier free. Issue of Disability Certificates — The Government of India has notified guidelines for evaluation of the disabilities and procedure for certification. The Government will ensure that the persons with disabilities obtain the disability certificates without any difficulty in the shortest possible time by adoption of simple, transparent and client-friendly procedures. Social Security — Disabled persons, their families and care givers incur substantial additional expenditure for facilitating activities of daily living, medical care, transportation, assistive devices, etc. Therefore, there is a need to provide them social security by various means. Central Government has been providing tax relief to persons with disabilities and their guardians. The State Governments / U.T. Administrations have been providing unemployment allowance or disability pension. The State Governments would also

be encouraged to develop a comprehensive social security policy for persons with disabilities. Promotion of Non-Governmental Organizations (NGOs) - The National Policy recognizes the NGO sector as a very important institutional mechanism to provide affordable services to complement the endeavors of the Government. The NGO sector is a vibrant

NSOU GE-ED-21 29 and growing one. It has played a significant role in the provisions of services for persons with disabilities. Some of the NGOs are also undertaking human resource development and research activities. Government has also been actively involving them in policy formulation, planning, implementation, monitoring and has been seeking their advice on various issues relating to persons with disabilities. Interactions with NGOs will be enhanced on various disability issues regarding planning, policy formulation and implementation. Networking, exchange of information and sharing of good practices amongst NGOs will be encouraged and facilitated. Steps will be taken to encourage and accord preference to NGOs working in the underserved and inaccessible areas. Reputed NGOs shall also be encouraged to take up projects in such areas. Collection of regular information on Persons with Disabilities - There is a need for regular collection, compilation and analysis of data relating to socio-economic conditions of persons with disabilities. The National Sample Survey Organization has been collecting information on Socio-economic conditions of persons with disabilities on regular basis once in ten years since 1981. The Census has also started collection of information on persons with disabilities from the Census-2011. The National Sample Survey Organization will have to collect the information on persons with disabilities at least once in five years. The differences in the definitions adopted by the two agencies will be reconciled. Research - For improving the quality of life of persons with disabilities, research will be supported on their socio-economic and cultural context, cause of disabilities, early childhood education methodologies, development of user-friendly aids and appliances and all matters connected with disabilities which will significantly alter the quality of their life and civil society's ability to respond to their concerns. Wherever persons with disabilities are subjected to research interventions, their or their family member or caregiver's consent is mandatory. Sports, Recreation and Cultural life - The contribution of sports for its therapeutic and community spirit is undeniable. Persons with disabilities have right to access sports, recreation and cultural facilities. The Government will take necessary steps to provide them opportunity for participation in various sports, recreation and cultural activities. (

GE-ED-21 NSOU 2.4 Status of Special Education in India (Outline only) Education in India is primarily provided by public schools (controlled and funded by the government at three levels: central, state and local) and private schools. Under various articles of the Indian Constitution, free and compulsory education is provided as a fundamental right to children aged 6 to 14. Special education (also known as special-needs education, aided education, exceptional education, special education, SEN or SPED) is the practice of educating students in a way that provides accommodations that address their individual differences, disabilities, and special needs. India has enacted a landmark special education law, Persons with Disabilities Act of 1995, which provides schooling and services to all children. In India, data on disabled persons is collected through the Decennial Population Census and through NSSO surveys (periodicity not regular). The Census 2011, conducted by the Office of the Registrar General and Census Commissioner, India, is the source for latest data on disabled persons in India. The analysis of dimensions of disability in India in this chapter is based on the results of the Census 2011 and the discussions are on number of disabled, distribution of disabled by various types of disabilities, their age groups, educational level, work status and marital status. (Social Statistical Division, Gol, 2016)

NSOU GE-ED-21 31

32 GE-ED-21 NSOU (Source : http://mospi.nic.in/sites/default/files/publication_reports/Disabled_persons_in_India_2016.pdf)

NSOU GE-ED-21 33 2.5 Special Education: Laws & Legislations Few important Indian Acts and national Programmes which have a great impact on disability rehabilitation includes

IEDC (1974), RCI Act (1992), PWD Act (1995), National Trust Act (1999), SSA (2000), RTE (2009)

and Amendment (2012), RMSA (2009), IEDSS (2013). IEDC (1974) Integrated Education for Disabled Children Scheme namely IEDC, a centrally sponsored Scheme run by the Directorate of Education Aim of IEDC is to provide not only the Educational opportunities for disabled children in common schools so as to facilitate their retention in the school system

but

also

to

integrate them

with the general community at all levels as equal partners.

Need of IEDC: Population census gives the figure of about 10 million disabled in Indian population. Obviously such a vast percentage of people cannot be ignored while having any kind of vision or mission for our country. Integrating children in ordinary schools is the most effective and economical way of providing educational opportunities to them in large numbers. This also has the social and psychological advantages of giving a boost to their self-esteem to enable them to face life with courage and confidence.

Benefits of the scheme to the child:consists of

Books and Stationary Allowance, Uniform Allowance, Transport Allowance, Escort Allowance, Reader Allowance, Actual cost of Equipment (used by the disabled child) etc. Purpose of this Act: - is to elaborate the responsibility of the Central and State Govt., local bodies to provide services, facilities and equal opportunities to people with disabilities for participating as productive citizens of the Country. This is an important land mark.

RCI Act (1992)

The Rehabilitation Council of India (RCI) was set up as a registered society in 1986. On September, 1992 the RCI Act was enacted by Parliament and it became a Statutory Body on 22 June 1993. The Act was amended by Parliament in 2000 to make it

more broad-

based. The mandate given to RCI is to regulate and monitor services given to persons with disability, to standardize syllabi and to maintain

a Central Rehabilitation Register of all qualified professionals and personnel working in the field of Rehabilitation and Special

34

GE-ED-21 NSOU Education. The Act also prescribes punitive action against unqualified persons delivering services to persons with disability.

The Act with Amendments 2000 An Act to provide for the constitution of the Rehabilitation council of India for regulating the training of rehabilitation professionals and monitoring the training of rehabilitation professionals and personnel, promoting research in rehabilitation and special education and the maintenance of a Central Rehabilitation Register and for matters connected therewith or incidental thereto.

PWD

Act (1995) PWD

Act (1995),

The Person with Disabilities (Equal Opportunities, Protection of Right and Full Participation) Act,1995

Published in part II, Section I of the Extraordinary Gazette of India Ministry of Law, Justice and Company Affairs (Legislative Department) New Delhi, the 1st January, 1996.

The main provisions of the Act are: Prevention and early detection of disabilities Surveys, investigations and research shall be conducted to ascertain the cause of occurrence of disabilities. Various measures shall be taken to prevent disabilities. Staff at the Primary Health Centre shall be trained to assist in this work. All the Children shall be screened once in a year for identifying 'at-risk' cases . Awareness campaigns shall be launched and sponsored to disseminate information.

Measures shall be taken for pre-natal, peri-natal, and post-natal care of the mother and child. Education Every child with disability shall have the rights to free education till the age of 18 years in integrated schools or special schools.

Appropriate transportation, removal of architectural barriers and restructuring of modifications in the examination system shall be ensured for the benefit of children with disabilities.

NSOU GE-ED-21 35 Children with disabilities shall have the right to free books, scholarships, uniform and other learning material. Special Schools for children with disabilities shall be equipped with vocational training facilities. Non-formal education shall be promoted for children with disabilities. Teachers' Training Institutions shall be established to develop requisite manpower. Parents may move to an

appropriate forum for the redressal of grievances regarding the placement of their

children with disabilities. Employment 3% of vacancies in government employment shall be reserved for people with disabilities, 1% each for the persons suffering from: Blindness or Low Vision Hearing Impairment Locomotor Disabilities and Cerebral Palsy. Suitable Scheme shall be formulated for The training and welfare of persons with disabilities. The relaxation of upper age limit. Regulating the employment. Health and Safety measures and creation of a non-handicapping, environment in places where persons with disabilities are employed. Government Educational Institutes and other Educational Institutes receiving grant from Government shall reserve at least 3% seats for people with disabilities. No employee can be sacked or demoted if they become disabled during service, although they can be moved to another post with the same pay and condition. No promotion can be denied because of impairment. Affirmative Action Aids and Appliances shall be made available to the people with disabilities. Allotment of land shall be made at concessional rates to the people with disabilities for: House Business

36 GE-ED-21 NSOU Special Recreational Centres Special Schools Research Schools Factories by Entrepreneurs with Disability Non-Discrimination Public building, rail compartments, buses, ships and air-crafts will be designed to give easy access to the disabled people In all public places and in waiting rooms, the toilets shall be wheel chair accessible. Braille and sound symbols are also to be provided in all elevators (lifts). All the places of public utility shall be made barrier-free by providing the ramps. Research and Manpower Development Research in the following areas shall be sponsored and promoted: Prevention of Disability Rehabilitation including community based rehabilitation Development of Assistive Devices Job Identification On site Modifications of Offices and Factories Financial assistance shall be made available to the universities, other institutions of higher learning, professional bodies and non-government research-units or institutions, for undertaking research for special education, rehabilitation and manpower development Social Security Financial assistance to non-government organizations for the rehabilitation of persons with disabilities Insurance coverage for the benefit of the government employees with disabilities. Unemployment allowance to the people with disabilities who are registered with the special employment exchange for more than a year and could not find any gainful occupation Grievance Redressal

NSOU GE-ED-21 37 In case of violation of the rights as prescribed in this Act, people with disabilities may move an application to The Chief Commissioner for Persons with Disabilities in the Centre, or Commissioner for Persons with Disabilities in the State

National Trust

Act (1999)

The

National Trust for Welfare of persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities Act, 1999

No 44 of 1999 (30

th December 1999)

is an act to provide for the constitution of a body at

the

national level for the

Welfare of Persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities

and for matters connected therewith or incidental

there to. Overview of

NT

Act

The

National Trust for Welfare of Persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities

Act

was passed by Parliament in 1999. This Act

covers the following disability areas and is defined by the National Trust as follows: "

Autism means a condition of uneven skill development primarily affecting the communication and social abilities of a person, marked by repetitive and ritualistic behaviour." "Cerebral Palsy means a group of non-progressive condition of a person characterized by abnormal motor control posture resulting from brain insult or injuries occurring in the pre-natal, perinatal or infant period of development." "

Multiple disabilities means a combination of two or more disabilities as defined in clause (i) of section 2 of

the

Persons with Disabilities (Equal Opportunities, Protection of Rights and Full Participation)

Act, 1995." "

Severe Disability means disability with eighty percent or more of one or more multiple disabilities.

Objectives

of the Trust: The objectives of the National Trust are: To enable and empower persons with disability (persons covered by the National Trust)

83%

MATCHING BLOCK 9/46

Theoretical Overview..pdf (D40307079)

to live as independently and as fully as possible within and as close to the community to which they belong. To strengthen facilities to provide support to persons with disabilities to live within 38 GE-ED-21 NSOU their own families

and to help persons with disabilities who have no family support. To extend support to registered organizations 'that provide need-based services to family of persons with disabilities. To promote measures of care for persons with disabilities in the event of a death of their parent or guardian. To evolve procedure for the appointment of guardians and trustees for persons with disability requiring protection. To facilitate the realization of equal opportunities, protection of right, and full participation of persons with disability. To do any other act which is incidental to the objectives mentioned

above. (Source : The National Trust Act, 1995)

Sarva Shiksha Abhiyan (SSA) 2000 The role of Universal Elementary Education (UEE) for strengthening the social fabric of democracy through provision of equal opportunities to all has been accepted since the inception of our Republic with the formulation of NPE, India initiated a wide range of programmes for achieving the goal of UEE through several schematic and programme interventions. The Sarva Shiksha Abhiyan (SSA) is being implemented as India's main programme for universalizing elementary education. Its overall goals include universal access and retention, bridging of gender and social category gaps in education and enhancement of learning levels of children.

Sarva Shiksha Abhiyan provides for a variety of interventions, including inter alia, opening and construction of new schools, additional teachers, regular teacher in- service training, academic resource support to ensure free textbooks, uniforms and free support for improving learning outcomes. The Right to Free & Compulsory Education Act 2009 provides a justiciable legal framework that entitles all children between the ages of 6-14 years free and compulsory admission, attendance and completion of elementary education. It provides for children's right to an education of equitable quality, based on principles of equity and non-discrimination. Most importantly, it provides for children's right to an education that is free from fear, stress and anxiety. The programme set out with an objective to provide useful and elementary education

NSOU GE-ED-21 39

for all children in the 6-14 age group and to bridge social, regional and gender gaps with the active participation of community in the management of schools, among others. As per the goals set in 2015 the programme sought to open new schools in those habitations which do not have schooling facilities and strengthen existing school infrastructure

through provision of additional class rooms, toilets, drinking water, maintenance grant and school improvement grants. Key Features Programme with a clear time frame for universal elementary education. A response to the demand for quality basic education all over the country. An opportunity for promoting social justice through basic education. An expression

of political will for universal elementary education across the country. A partnership between the central, state and the local government. An opportunity for states to develop their own vision of elementary education. An effort at effective involving the Panchayati Raj Institutions, school management Committees, village and urban slum level Education Committees, parent— Teachers' Associations, Mother-Teacher Associations, Tribal Autonomous councils and other grassroots level structures in the management of elementary schools.

RTE (2009) and Amendment (2012)

Every child between the ages of 6 to 14 years has the right to free and compulsory education. This is stated as per the 86th Constitution Amendment Act via Article 21A. The Right to Education Act seeks to give effect to this amendment. The government schools shall provide free education to all the children and the schools will be managed by School Management Committees (SMC). Private schools shall admit at least 25% of the children in their schools without any fee. The National Commission for Elementary Education shall be constituted to monitor all aspects of elementary education including quality.

RMSA (2009)

Rashtriya Madhyamik Shiksha Abhiyan (

RMSA) (translation: National Mission for Secondary Education) is a centrally sponsored scheme of the Ministry of Human Resource Development, Govt. of India, for the development of secondary education in public schools throughout India. It was launched in March 2009. The implementation of the scheme has started from 2009-2010 to provide conditions for an efficient growth,

40 GE-ED-21 NSOU development and equity for all. The scheme includes a multidimensional research, technical consulting, various implementations and funding support. The principal objectives are to enhance quality of secondary education and increase the total enrollment rate from 52% (as of 2005-2006) to 75% in five years, i.e., from 2009-2014. It aims to provide universal education for all children between 15-16 years of age.

The funding from the central ministry is provided through State governments, which establish separate implementing agencies. The total budget allocated during the XI Five Year Plan (2002-2007) was Rs. 2,012 billion (US\$29 billion). The objectives of Rashtriya Madhyamik Shiksha Abhiyan can be summarized as follows: 1. To improve quality of education imparted at secondary level through making all secondary schools conform to prescribed norms. 2. To remove gender, socio-economic and disability barriers. 3. Universal access to secondary level education by 2017, i.e., by the end of the XII Five Year Plan. 4. Universal retention of students by 2020.

The Convention was adopted by the United Nations General Assembly on 13 December 2006 Opened for signatures on 30 March 2007 It came into force on 03 May 2008

after ratification by 20 parties The First Conference of States Parties on UNCRPD was held on 31 October and 3 November 2008 First session of the Committee on the Rights of Persons with Disabilities was held on 23 - 27 February 2008

NSOU GE-ED-21 41 As in April 2018, 161 countries have ratified UNCRPD. A total of 177 countries have signed this Convention. The purpose of UNCRPD is

100%

MATCHING BLOCK 8/46

W

to promote, protect and ensure the full and equal enjoyment of all human rights and fundamental freedoms by all persons with disabilities and to promote respect for their inherent dignity.

The Convention requires the signing countries to ensure that they take measures to ensure fulfilment of the objectives stated in the UNCRPD treaty.

The

Rights of Persons with Disabilities (RPWD) Act, 2016 The RPWD Act

was

enacted

in December 2016.

It promotes and protects the rights and dignity of people with disabilities in

various aspects of life - educational, social, legal, economic, cultural and political. It applies to government, non-

government and private organisations. It has mandates and timelines for establishments to ensure accessibility of infrastructure and services. It has been implementing mechanisms like Disability Commissioner's Offices at the Centre and State levels, District Committees, Boards and Committees for planning and monitoring the implementation of the Act, Special Courts at District level and so on. It has penalties in case of violation of any provisions of the Act.

The

96%

MATCHING BLOCK 11/46

SA

Chapter, I .doc (D110787435)

with the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD),

to

which

India is a signatory. This will fulfil the obligations on the part of India in terms of UNCRD. Further, the new law will not only enhance the Rights and Entitlements of Divyangjan but also provide effective mechanism for ensuring their empowerment and true inclusion into the Society in a satisfactory manner.

The RPWD Act, 2016 gives an exhaustive list which contains 21 disabilities (previously there were 7). This list includes blindness, low-vision, leprosy, hearing impairment, locomotors disability, dwarfism, intellectual disability, mental illness, autism, cerebral palsy, muscular dystrophy, chronic neurological conditions, specific learning disabilities, multiple sclerosis, speech and language

disability, thalassemia, haemophilia, sickle cell disease, multiple disabilities, acid attack

victim

and Parkinson's disease. If a person has 40% or more of any of these disabilities he/she will come under the category of persons with benchmark disabilities. Equality and non-discrimination is guaranteed under the UNCRPD and section 3 of the RPWD Act, 2016 deals with the same. As per section 3, the appropriate Government has ensured that

97%

MATCHING BLOCK 10/46

W

the persons with disabilities enjoy the right to equality, life with dignity and respect for his or her integrity equally with

the other members of the society, to establish this the appropriate Government has to provide the appropriate environment to them.

42 GE-ED-21 NSOU Persons with disabilities cannot be discriminated on the ground of disability unless it is the proportionate means of achieving the aim. Section 4 of the Act ensures that women and children with disabilities enjoy their rights equally with others. Section 13 of the Act ensures that all persons with disabilities enjoy legal capacity on equal basis. They have been ensured all rights that any person holds in the eyes of law like right to own and inherit movable and immovable property as well as control their financial affairs. It is provided under section 38 that a person with benchmark disability who needs high support, he/she or any other person or organization in his behalf may apply to the authority appointed by the Government for the same and the authority shall take steps to provide support accordingly. Under Chapter XI of the Act Central and State Advisory Boards on Disability are established, these Boards are to make policies at Central/State level for the persons with disabilities. Chapter XII covers establishment and functioning of Office of Chief Commissioner and State Commissioner and also an Advisory Committee comprising members drawn from experts in various disabilities. The Chief Commissioner for Persons with Disabilities and the State Commissioners will act as regulatory bodies and Grievance Redressal agencies and also monitor implementation of the Act. District level committees will be constituted by the State Governments to address local concerns of PwDs. Details of their constitution and the functions of such committees would be prescribed by the State Governments in the rules. Chapter XIV highlight on Creation of National and State Fund to provide financial support to the persons with disabilities. The existing National Fund for Persons with Disabilities and the Trust Fund for Empowerment of Persons with Disabilities will be subsumed with the National Fund. Under Chapter XVI of the RPWD Act, 2016 penalties and offences committed against persons with disabilities and also violation of the provision of the new law are given. As per section 89 of the Act if any person who violates the provisions of the Act, or any rule or regulation made under it, shall be punishable with imprisonment up to 6 months and/or a fine of Rs 10,000/-, or both. If there is a subsequent contravention then imprisonment for 2 years and/or a fine of Rs. 50,000/- to Rs. 5,00,000/- can be awarded. Section 92 of the Act gives a detailed list of offenses which are punishable with imprisonment for a term which shall not be less than six months but which may extend to five years and with fine.

NSOU GE-ED-21 43 Chapter XII establishes Special Courts designated in each district to handle cases concerning violation of rights of persons with disabilities (Akolawala, 2019). 2.6 Summary

International and National laws and different Commissions play as a facilitator for the realization of the right to education of people with disabilities throughout the world. As the most recent, integral and legally binding international instrument to protect

the

rights of persons with disabilities, the Convention on the Rights of Persons with Disabilities (

CRPD) put steps forwards for the protection of their right to education.

This chapter has been discussed about different International and National commissions & committees on Special Education viz. Kothari Commission, National Policy of Education, NCF 2005, National Policy for Persons with Disabilities 2006. As per Census 2011, the status of special education and disability is also discussed in brief. Few important Indian Acts and national Programmes which have a great impact on disability rehabilitation have been discussed which includes IEDC (1974), RCI Act (1992), PWD Act (1995), National Trust Act (1999), SSA (2000), RTE (2009) and Amendment (2012), RMSA (2009), IEDSS (2013). 2.7

Self-Assessment Questions 1) Write short notes on Kothari Commission and National Education Policy. 2) What are the focus of National Policy for Persons with Disabilities, 2006? 3) Write a short note on: RCI Act, PWD Act/ RPWD Act, National Trust Act. 4) Describe the Status of Special Education in India. 5) What are the key features of Sarva Shiksha Abhiyan? 2.8 References Akolawala Rozat. NSOU GE-ED-21 45 Unit 3 Instructional Models for CWN Structure 3.1 Objectives 3.2 Introduction 3.3 Diverse children & their needs 3.4 Children with Disabilities and their Special Needs 3.5 Instructional models: Developmental, Functional & Inclusion 3.6 Summary 3.7 Self- Assessment Questions 3.8 References 3.1 Objectives After reading this unit, learners will be able to: Understand needs of the diverse children Know the Children with disability and their special needs Discuss different Instructional Models 3.2 Introduction It is a well-known fact that education plays a vital role in a person's life to achieve a greater degree of social justice and it is the educational institutions which can develop a child to the best of his/her ability for securing meaningful place in the society thereby helping to create a developed society from all angles. However, a large number of children are still not getting the light of education due to which they cannot participate in the developmental process of our country in the field of economic, social, political and cultural activities. 45

46 GE-ED-21 NSOU 3.3 Diverse Children & their Needs India is a country of huge diversity and now with a population that is more and more mobile the students in the classroom will be diverse in many ways. Diverse not just in socio-economic background but diverse in their learning style also. And while it is true that fostering diversity is an idea which is consistent with some of our most enduring national ideals, such as respect for the rights of each individual to pursue life in their own fashion, promoting these ideals in the classroom can often prove very difficult. The difficulties which must be overcome stem from several sources: A basic lack of knowledge of the diverse people and the lifestyles. The prejudices, many of which are not acknowledged. Deep seated feelings of guilt, anger, frustration which are often stirred by the discussion of the diversity issue. A successful pedagogy must start with an awareness of these difficulties and some fundamental strategies for overcoming them Diversity in the classroom takes multiple forms. We often think of diversity in demographic or group terms, such as age, class, culture, disabilities, ethnicity, gender, or sexual orientation. But the most common involves individual difference: in background, levels of preparation, learning styles, interests, and abilities. To be effective teachers it is important to understand how individual children take in and process information. Not all children learn the same way. In a class of diverse students there are also individual differences amongst the children with disabilities. Developing an inclusive curriculum is a transformative process for the instructor and the students. It entails a paradigm shift in which basic assumptions are examined and changed. Thus, undertaking the project requires desire, curiosity, willingness to travel into unknown pedagogical terrain, and patience with oneself and with one's students.

In an inclusive education system, the aim is not to "fix" the child to fit in. It is more about adapting the educational environment so that the system is more supportive and responsive to a diverse group of learners. Inclusive education embraces and celebrates diverse groups and individuals.

Children with disabilities enter the class with diagnosis such as Autism, Specific learning disabilities, Down's syndrome, Cerebral Palsy, and teachers need to avoid making assumptions about students with a disability based solely on the diagnosis. The diagnosis

NSOU GE-ED-21 47 may help to give a broad understanding of the accommodation that might be required for that child, but may not give insight into more specific and individual difference. To avoid treating everyone as per their diagnosis teachers need to learn their student's individual strengths irrespective of the diagnosis. For example, a student with Autism may have difficulty with writing but another child in the same class who also has Autism may not. The diagnosis should not limit any child to full participation in their education. Teachers also need to keep in mind for children with disability like their typical classmates may belong to a specific socio-economic group or have issues at home and that can influence their learning. Teaching such diverse groups of students mean, teaching can be exciting and will require some amount of planning. 3.4 Children with Disabilities & their Special Needs The challenges faced by children with disability in learning are not due to their disability but the lack of effective participation in their educational life. The lack of participation can be for many reasons. A major reason for lack of participation is poverty. Where there is poverty with disability the situation is aggravated even more. Poverty is a cause and a consequence of disability. In a situation of poverty, Children with disability are even less likely to access schooling or any kind of therapy. The lack of participation can also be due to lack of or very little infrastructure, a shortage of skilled personnel's and most of all attitudinal barriers. Attitudinal barriers are the most difficult barriers to overcome yet a teacher can with sensitivity and skill bring about changes. The attitudinal barriers are not just in the education system and community but also at home and family. Attitudinal barriers can also exist in the school amongst different staff members, with other typical students and the parents of typical students. Again the teachers can bring about a change in attitude by her/his skill and own behaviour, towards the student with disability. A special educator in an inclusive school is a resource person for the school and has the important job of networking with other staff in administration, other teaching staff and nonteaching staff. A very important job of the special educator is to advocate for the children with disability. Advocate means to ensure the children's participation in school events and celebrating the children's success.

48 GE-ED-21 NSOU Addressing diversities in learning styles How students learn influences what they learn, how well they learn it, and how much they enjoy the learning experience. Just as no two students are exactly alike; no two students learn in exactly the same way. Everyone has preferred way of learning which needs to be kept in mind while teaching children in an inclusive class. Psychologists and educators have developed many theories of learning and identified an array of learning styles. In order to teach these groups, it is very necessary to understand different learning styles and tailor the teaching to meet the needs of all of the students. There are broadly five different learning styles: (i) Print Learner : Print learners prefer to see the data in print, preferably printed in words. When introducing course concepts or the steps of a process, print learners like to read about the information and then study an illustration or other visual aid. (ii) Visual Learner : Someone with a Visual learning style has a preference for learning by observing and seeing. Such persons prefer learning by looking at pictures, diagrams, videos and watching demonstrations. (iii) Auditory Learner : Someone with an Auditory learning style prefers to take in information by listening: to the spoken word, of self or others, of sounds and noises. They learn better when something is explained to them by spoken words. (iv) Tactile Learner : Tactile learners learn best by touching or handling objects. By fourth grade, tactile learners appreciate learning activities that use fine motor skills including writing. Manipulatives are particularly important for tactile learners. They also benefit from participating in hands-on activities, role playing, and creating displays. Tactile learners remember what they did and how they did it; they do not necessarily remember what they saw others do or what they heard. (v) Kinaesthetic learner : Kinaesthetic learners achieve best by taking an active part in classroom instructions. Motion is an important part of kinaesthetic learning including motion that is not specific to the learning process. Simply allowing students to move about the classroom can be particularly helpful to kinaesthetic learners. For example, walking to the board to work a problem involves the motions required to walk and write. No child has an exclusive learning style but preference for one. Children with a specific disability will have a very dominant learning style. For example, those with visual impairment NSOU GE-ED-21 49 will have strong preference for auditory and kinaesthetic learning. Those with Autism who can hear but may have difficulty with auditory processing are strong visual learners. They are off course those with hearing impairment. Therefore, teachers need have a multimodal way of teaching. Often their poor academic performances are related to some emotional issues which are either not acknowledged or are criticised. Each child has their own coping mechanism and not letting them express their emotions adequately or letting down their effort to cope with it can lead to severe psychological issues in future. Unaddressed emotional issues are the precursors of self-harming practices like wrist slashing, suicidal attempts, extreme concern with body-image etc. Interventions to promote mental health encompass not only strengthening individuals, but also enhancing nurturing and supportive conditions at school, at home, and in the neighbourhood. All this includes a particular emphasis on increasing opportunities for personal development and empowerment by promoting conditions that foster and strengthen positive attitudes and behaviours. The purpose of educating children with disability is not to "fix" them but to provide acceptance, support and an accommodating environment that will enable them to function and learn.

3.5 Instructional Models: Developmental, Functional & Inclusion Instructional Models (CEEDAR Center, 2015)

Historically, students with disabilities have also received instruction and been exposed to curriculum in a different manner than typically developing peers. Initially, special educators adhered to a developmental approach and focused on the need for students to learn prerequisite skills prior to moving on to new more advanced skills. A functional approach to curriculum has also been utilized to teach skills needed for daily living and future adult life. In practice, both approaches have lead to lowered expectations for students with disabilities. Best practices today focus on implementing instructional approaches that provide access to, meaningful participation in, and progress in age appropriate, grade-level curriculum. Both academic and functional skills that will lead to quality of life outcomes are to be taught.

50 GE-ED-21 NSOU Developmental Model Within the developmental model of instruction, students are expected to master specific developmental cognitive prerequisite skills before they progress learning new, more advanced skills. A hallmark of this approach was determining a person's mental age. A 5 year old girl has a mental age of 3-year-old due to the severity of her intellectual disability, that 14-year-old was taught skills like completing puzzles and stringing beads together, skills that a 3-year-old would learn. With this approach, while teaching literacy skills, students are often required to master the identification of letter sound correspondence before they are introduced to identifying whole words. They are required to identify individual letters before being taught that letters make words, words make sentences, and sentences convey communication of ideas. For students who are not able to master basic skills, such as alphabet recognition or decoding, they may remain stagnated at the lower level, continually being taught over a period of years with the same prerequisite skills. For some, this has limited the scope and range of literacy skills they are exposed to such as being taught to access books on CD, reading community sight words, and learning and using symbols to write via a communication device (Browder & Spooner, 2006; Copeland & Keefe, 2007). One undesired outcome of this model has been that students, particularly those with the most significant disabilities, were being taught age inappropriate skill using age-inappropriate materials. Furthermore, this model has resulted in the "readiness" approach which requires that students prove they have mastered a set of developmental skills, regardless of how age inappropriate and functionally inappropriate these may be. If we waited for any student with or without

NSOU GE-ED-21 51 disabilities to be "ready," we would be denying valuable educational opportunity (CEEDAR Center, 2015). Functional Model With the functional model of instruction and curriculum, the goal is to facilitate the student's ability to function as independently as possible in a variety of environments. The focus is to teach skills needed for daily living and future adult life. Although there is nothing inherently wrong with teaching functional skills, there have been a number of concerns with the implementation of this curriculum implementation model. First, one outcome has been a hyper-focus on cooking, cleaning, and money skills at the exclusion of other skills that lead to quality of life outcomes (e.g., employment opportunities, social relationships, durable friendships). Another concern is that functional skills are often taught in non-real world settings, and consequently, students may not generalize and employ these skills in real-life settings. Finally, the functional model of curriculum has often provided a rationale for continuing to provide educational services in separate, self-contained special education settings (Ryandak et. al., 2014). Special educators have expressed concerns that the functional skills needed for independence are incompatible within the content and contexts of general education curriculum. This reflects a misperception of functional curriculum and standards-based curriculum approaches being viewed as mutually exclusive (CEEDAR Center, 2015).

52 GE-ED-21 NSOU Inclusion Model: Access to and Participation in Standards-Based General Education Curriculum IDEA 2004 mandates that students with disabilities be involved in the general curriculum "in order to— (i) meet developmental goals, and to the maximum extent possible, the challenging expectations that have been established for all children, and (ii) be prepared to lead productive and independent lives, to the maximum extent possible". NCLB 2001 also requires that students with disabilities have access to the general education curriculum. Focus now is to teach meaningful, functional and academic, practical, chronologically age-appropriate skills in natural, inclusive contexts, including the standards based grad-level curriculum. IDEA 2004 requires that individual education program (IEP) goals and benchmarks be aligned to the appropriate grade-level standards. Specific evidence-based practices (EBPs) and strategies to create access to core/general education curriculum and settings (i.e., ecological assessment, person-centered planning, Universal Design for Learning (UDL), differentiated instruction, teaming between educators, and embedded instruction) will be discussed in detail in a later unit of this module (CEEDAR Center, 2015).

NSOU GE-ED-21 53 3.6 Summary India is a country of huge diversity and now with a almost 120 crore population that is more and more mobile the students in the classroom would be diverse in many ways.

In an inclusive education system, the aim is not to "fix" the child to fit in. It is more about adapting the educational environment so that the system is more supportive and responsive to a diverse group of learners. Inclusive education embraces and celebrates diverse groups and individuals.

Everyone has preferred way of learning which needs to be kept in mind while teaching children in an inclusive class. No child has an exclusive learning style but preference for one. Children with a specific disability will have a very dominant learning style. Therefore, teachers need have a multimodal way of teaching. Three types of Instructional models viz. Developmental, Functional & Inclusion are discussed in this unit. 3.7 Self- Assessment Questions 1) Discuss about the special needs of children with disabilities. 2) Explain different learning styles of the students. 3) Write short notes on different Instructional models, viz. Developmental, Functional & Inclusion Models. 4) Discuss the needs of diverse learners in an inclusive classroom. 3.8 References CEEDAR Center. (2015). NSOU GE-ED-21 55 Unit 4 Inclusive Education Planning Structure 4.1 Objectives 4.2 Introduction 4.3 Inclusive Education (IE): Concept, misconception & need 4.3.1 Concept of IE 4.3.2 Misconceptions about IE 4.3.3 Need & Importance of IE 4.4 Accessing the general education environment (ecological assessment, person-centered planning and embedded instruction) 4.4.1 Ecological Assessment 4.4.2 Person-Centered Planning 4.4.3 Embedded Instruction 4.5 Planning and collaborating for inclusive instruction 4.6 Summary 4.7 Self- Assessment Questions 4.8 References 4.1 Objectives After reading this unit, learners will be able to: Understand the Concept of IE, Misconceptions about IE and Need & Importance of IE 55

56 GE-ED-21 NSOU Know about Ecological Assessment, Person-Centered Planning and Embedded Instruction Understand the process of Planning and Collaborating for inclusive instruction 4.2 Introduction An estimated 93 million children worldwide live with disabilities. Like all other children, children with disabilities have ambitions and dreams for their futures. Like all children, they need quality education to develop their skills and realize their full potential. Yet, children with disabilities are often overlooked in policymaking, limiting their access to education and their ability to participate in social, economic and political life. Worldwide, these children are among the most likely to be out of school. They face persistent barriers to education stemming from discrimination, stigma and the routine failure of decision makers to incorporate disability in school services. Nearly 50 per cent of children with disabilities are not in school, compared to only 13 per cent of their peers without disabilities. Robbed of their right to learn, children with disabilities are often denied the chance to take part in their communities, the workforce and the decisions that most affect them. (UNICEF, N.A) Inclusive education is the most effective way to give all children a fair chance to go to school, learn and develop the skills they need to thrive. Inclusive education means all children in the same classrooms, in the same schools. It means real learning opportunities for groups who have traditionally been excluded, not only children with disabilities, but speakers of minority languages too. Inclusive systems value the unique contributions students of all backgrounds bring to the classroom and allow diverse groups to grow side by side, to the benefit of all. 4.3 Inclusive Education (IE): Concept, misconception & need 4.3.1 Concept of IE Inclusive education is a system of education in which children with diverse needs and different abilities are enrolled in regular schools and are provided with equitable learning opportunities based on their specific needs. It is based on the premise that all school children in a given community should learn together regardless of their socio-economic

NSOU GE-ED-21 57 backgrounds, gender, impairments and different abilities. Inclusive education acknowledges that all children have the ability to learn, recognises that childrens' learning abilities vary, provides space for learning and develops educational methods and teaching aids to meet the educational needs of all children. Schools recognize and take into account the diverse needs of children and barriers faced by their learners, adapt to different styles and rhythms of learning and provides quality education through the appropriate use of resources, entitlements, school organisation, study plans as well as partnership with the community (Karnataka Open Educational Resources, 2020). Inclusion has its perspectives both from the sociological as well as from the rights-based approach due to the changing scenario of society and the societal and national perceptions of including all. UNESCO (2008) recast inclusive education to include a social justice perspective: "Inclusive education is an ongoing process aimed at offering quality education for all, while respecting diversity and the different needs and abilities, characteristics and learning expectations of the students and communities, eliminating all forms of discrimination."

58 GE-ED-21 NSOU

NSOU GE-ED-21 59 4.3.2 Misconceptions about IE (Willowbee, 2021): The goal of education is to create opportunities for individuals to realise their true potentials. Teachers around the world work relentlessly towards helping our children participate in the cultural, political, social, and economic aspects of life by providing them the required tools. However, even today, our educational system has not been able to guarantee such opportunities for everyone. Unfortunately, this educational disparity becomes prevalent from the very early years of a child's life. Social inclusion has been a top priority for the policymakers across the world in the recent years. However, ensuring access to early childhood education for children from disadvantaged backgrounds has still remained a challenge. Inclusive Education is defined by UNESCO, 2008 as a process to help overcome obstacles that limits the presence and participation of learners. Experts believe, however, that the implementation of inclusive educational practices has been hampered significantly by a number of misconceptions. The most common misconception about inclusive education is that it only concerns learners with some kind of disability. It is true that this concept has been successful in addressing discrimination in education based on disability of a child. However, over a period of time, the idea was expanded to include discrimination on the basis of multiple factors, including social class, sexual orientation, gender, ethnicity, and linguistic, cultural, and religious association. Therefore, inclusive education looks to provide the right education to all by eliminating barriers to learning.

60 GE-ED-21 NSOU There is also a common perception about inclusive education being expensive. However, compared to segregated education, inclusive education has a lower instructional cost. Adoption of this system doesn't require a lot of resources. In fact, it is possible to cultivate an inclusive environment simply by redesigning practices and training. Some people have their apprehensions about inclusion because they believe that this may jeopardize the learning quality for other students. However, recent studies indicate that inclusive education benefits all students. It has been observed that participation in inclusive classrooms led to higher academic attainments, even for students without special educational needs. Another misconception people have about inclusive education is that it makes special educators redundant in the educational system, which is far from the truth. In fact, today, the entire world requires more special educators compared to ever before for the implementation of inclusive education. One may think that inclusion in education is only about our schools. However, this is a wrong perception because this concept demands significant efforts and changes in attitude from the society. In addition to accommodating learner differences, inclusive education is also about sharing a vision where the entire society has a role to play. Common Myths and facts about Inclusive Education:

NSOU GE-ED-21 61 Please remember that educational inclusion is a continuous process for the elimination of obstructions that deny quality education for some learners. These barriers can only be dismantled by making learning more inclusive from early ages. 4.3.3

HISTORY OF INCLUSIVE EDUCATION-2.docx (D139334471)

Need and Importance of IE There have been efforts internationally to include children with disabilities in the educational mainstream. In order to achieve truly inclusive education, we need to think about and incorporate children with special needs into regular schools. Especially, because these kids face some sort of barriers to learning and participation in the classroom. As general education classrooms include more and more diverse students,

teachers realize the value of accepting each student as unique.

HISTORY OF INCLUSIVE EDUCATION.docx (D138898504)

Researches show that most students learn and perform better when exposed to the richness of the general education curriculum. The growing body of research has shown that children do better academically when in inclusive settings and inclusion provides opportunities to develop relationships. Some of the benefits include: friendships, social skills, personal principles, comfort level with people who have special needs, and caring classroom environments.

The most important function of friendships is to make people feel cared for, loved, and safe.

Classmates of students with disabilities also experience growth in social cognition, often can become more aware of the needs of others in inclusive classrooms.

An interesting side effect is that these parents report that they also feel more comfortable with people with special needs because of their children's experiences.

Students with disabilities can create long-lasting friendships that would not be otherwise possible, and these friendships can give them the skills to navigate social relationships later on in life. 4.4

Accessing the general education environment (ecological assessment, person-centered planning and embedded instruction) 4.4.1 Ecological Assessment Purpose of Ecological/Contextually Based Assessment

62 GE-ED-21 NSOU Ecological/contextually based assessment assists in prioritizing student's needs and recognizing his/her strengths and abilities to determine what to teach and how to teach it. Ecological assessments involve observations of activities in a given context (e.g., morning circle in third-grade classroom) to determine what students are expected to do (i.e., the skills needed to perform and participate in the activity, routine, or task at hand); what the natural cues are that prompt this expected behavior/skill; and what supports or barriers may be present that may interfere with the demonstration of the expected behavior/skill. Next, observe the student in the actual context/activity and record his/her performance for each step of the activity (i.e., the student's ability to perform the skills expected). If the student does not perform a step/skill required in the activity, it must be determined if he/she can be taught the skill or if he/she needs an adaptation to support his/her participation. Ecological/Contextual Based Assessment Through ecological assessment of the student in his/her current school and community environments, educators are able to determine the demands of the activity and plan purposeful supports so that the student can meet these demands in a meaningful way. This process also prevents over-adapting and over-supporting a student, which could result in learned helplessness. An important focus of ecological assessment is capacity building versus deficit finding. "The most critical point is that these [standardized] measures often provide little useful data for educational programs, while no standardized, or alternative, assessment procedures, also referred to as environmental [ecological] assessment, provide more relevant and useful data regarding educational programs and a student's achievement of desired outcomes" (Snell & Brown, 2011, p. 88). An ecological assessment occurs in the natural context where a student is able to gain cues from the natural environment and routine of the activity (CEEDAR Center, 2015). Outcomes of Ecological/Contextually Assessment Ecological assessments can be conducted to assess student's independence and present levels of participation so that meaningful goals can be set to teach the necessary academic, communication, social, behavioral, and cognitive skills that the student needs to maximize performance in the current and future contexts. The outcomes of this form of assessment are student's goals that (1) potentially increase membership and participation with peers without disabilities in school and/or the community, (2) potentially increase access to more environments in school and/or the community, (3) increase meaningful skills that will improve quality of life, (4) are agreed upon as priorities by the whole team, and (5) are robust-that

NSOU GE-ED-21 63 is pivotal, non-trivial in the broader picture of the student's life. Clearly, the purpose is to maximize students' capabilities and participation. In addition, the use of ecological assessments can prevent providing unnecessary adaptations, supports, and prompts, which could lead to students' learned helplessness and prompt dependency 4.4.2

Person-Centered Planning (CEEDAR Center, 2015) Person-centered planning is an ongoing problem-solving approach that emerged in the 1980s to help people understand the experiences of people with disabilities, particularly those with developmental disabilities, and to respectfully and effectively support these individuals to achieve a desired quality of life. This approach takes a strengths-based perspective and helps ensure that resources and instruction are devoted to areas that support the student's preferences and strengths (Snell & Brown, 2011). Person-Centered Planning Defining Characteristics Traditional approaches to program planning has often focused on the use of tests to determine a student's deficit and then his/her diagnosis, which leads to treatment. Student was viewed as a client. With person-centered planning, the focus is on truly understanding who the student is as an individual and identifying capacity and strengths as well as connections to others. This approach to planning also invites the student, parents, and other invited team members to express their views, wishes, and feelings and also empowers them to be a part of the decision-making process. Key characteristics of the person-centered planning process include the following: It should facilitate self-determination and the individual's expression of choices for work, play, etc. through the process Activities that the individual can do are identified to contribute to his/her community and society Natural supports (e.g., peers) are tailored to the individual Action plan and goals developed build on the individual's strengths and capacities and focus on immediate preferred lifestyle changes as well as achieving one's dream for the future. Finally, an important outcome is to develop and maintain significant relationships.

64 GE-ED-21 NSOU Person-centered planning is not one defined process. There is a range of person-centered planning processes that have been developed over the last three decades to empower individuals from very early childhood to older adulthood. Often times, during the person-centered meeting, notes are taken in a graphic format. Additional visuals and information about person-centered planning are available at [http:// inclusive-solutions.com/person-centred-planning/](http://inclusive-solutions.com/person-centred-planning/)

4.4.3 Embedded Instruction (Source : University of Florida, 2021) What is embedded instruction? Embedded instruction is an approach used to promote child engagement, learning, and independence in everyday activities, routines, and transitions. This is accomplished by identifying times and activities when instructional procedures designed for teaching a child's priority learning targets are implemented in the context of ongoing [naturally occurring] activities, routines, and transitions in the classroom. This approach to embedded instruction emphasizes the use of complete learning trials to ensure sufficient, systematic, and intentional learning opportunities are provided in the context of everyday activities, routines, and transitions. Our definition also focuses on identifying the types of instructional procedures that might be used within or across these activities, routines, and transitions. Why use embedded instruction? Embedded instruction is used to meet children's needs without changing daily routines and activities by providing opportunities to learn and practice important skills in meaningful contexts. Instruction can occur during natural classroom activities, routines, and transitions using curriculum for all children. Embedded instruction maximizes children's motivation by following their interests and promotes generalization and maintenance by providing instruction within and across activities, routines, and transitions. What are the embedded instruction practices? Embedded Instruction for Early Learning focuses on key practices for planning, implementing, and evaluating embedded instruction. The practices are organized under the headings of what to teach, when to teach, how to teach, and how to evaluate.

NSOU GE-ED-21 65 Embedded instruction practices are organized under four primary components: 1. What to Teach 2. When to Teach 3. How to Teach 4. How to Evaluate (Source: [hps://i2.wp.com/live-ei-public.pantheonsite.io/wp-content/uploads/2015/08/Sequenal-Recursive-diagram-2.jpg](https://i2.wp.com/live-ei-public.pantheonsite.io/wp-content/uploads/2015/08/Sequenal-Recursive-diagram-2.jpg))

4.5 Planning & Collaborating for Inclusive Instruction collaboration takes place when members of an inclusive learning community work together as equals to assist students to succeed in the classroom. This may be in the form of lesson planning with the special needs child in mind, or co-teaching a group or class. The benefits of collaborative learning include: Development of higher-level thinking, oral communication, self-management, and leadership skills. Promotion of student-faculty interaction.

66 GE-ED-21 NSOU Increase in student retention, self-esteem, and responsibility. Exposure to and an increase in understanding of diverse perspectives. The following is a list of three different collaborative strategies that can be used by teachers as a guideline for how they wish to conduct the collaborative approach in their classrooms. In the 'Supportive Teaching' Model, the general education teacher is responsible for the content of the material, and the special education teacher decides how to adapt that material for the students ability. They work together on presentation, follow-up, and lecture. The 'Co-Teaching or Team-Teaching' Model incorporates shared planning, instruction, and monitoring of performance and evaluation. In this model regular and special education teachers are equal in the classrooms. The final strategy is the 'Complementary' Model. The special educator has the responsibility of intertwining different techniques and strategies into the general education curriculum. The special educator handles the majority of instruction for the student. With any instructional model it is important to remember that students will need constant monitoring. Students who are placed in a general education setting need to be monitored constantly and closely to ensure that the instruction is effective and continues to meet their needs. Responsibility for evaluation should be shared among the team members, with the general educator and the special education teacher consultant taking primary responsibility for this task. Student evaluation data should be gathered by direct observation of students in the inclusive setting as well as by review of the student's works and tests (Wood, 1998). (Tango Tammy, 1997)

The collaborative team approach has emerged as a model of addressing the curricular needs of special education children in the regular education classroom. Teachers have many important decisions to make concerning the way in which they are going to provide the best possible education for the disabled students. The collaborative approach offers many different options that can be considered. Disabled and regular education students deserve to receive the best possible educational services. The collaborative team approach is a strategy that can help the teacher to attain this goal. Inclusive education requires a commitment from the general education teacher and any other paraprofessional they are working with. It is a major challenge to both teachers and school administrators and requires new school and classroom practices. Every effort must be made by the teachers and the school administrators to accommodate the special needs student.

NSOU GE-ED-21 67 4.6 Summary Inclusive education is a system of education in which children with diverse needs and different abilities are enrolled in regular schools and are provided with equitable learning opportunities based on their specific needs. Inclusive Education is defined by UNESCO as a process to help overcome obstacles that limits the presence and participation of learners. Experts believe, however, that the implementation of inclusive educational practices has been hampered significantly by a number of misconceptions as follows: The most common misconception about inclusive education is that it only concerns learners with some kind of disability. There is also a common perception about inclusive education being expensive. Some people have their apprehensions about inclusion because they believe that this may jeopardize the learning quality for other students. Another misconception people have about inclusive education is that it makes special educators redundant in the educational system, which is far from the truth. Need and Importance of IE is briefly discussed in this unit. How to access the general education environment through ecological assessment, person-centered planning and embedded instruction have been mentioned? collaboration takes place when members of an inclusive learning community work together as equals to assist students to succeed in the classroom. This may be in the form of lesson planning with the special needs child in mind, or co-teaching a group or class. Three different collaborative strategies that can be used by teachers as a guideline for how they wish to conduct the collaborative approach in their classrooms are Supportive Teaching Model, Co-Teaching or Team-Teaching Model or Complementary Model. 4.7 Self-Assessment Questions 1) Define Inclusive Education. 2) Explain the advantages of Inclusive Education.

68 GE-ED-21 NSOU 3) What are the misconceptions associated with inclusive education? 4) What challenges do teachers face in implementing inclusive education? 5) Write short note on: Ecological Assessment, Person-Centered Planning and Embedded Instruction. 6) Discuss briefly the importance of Planning and collaboration for inclusive instruction. 4.8 References CEEDAR Center. NSOU GE-ED-21 69 Unit 5 Multi-tiered Support System Structure 5.1 Objectives 5.2 Introduction 5.3 Multi-Tiered System of Support (MTSS): Universal Design for learning (UDL), Differentiated Instruction (D.I), Accommodation, Adaptation, Modification-concepts only 5.3.1 Universal Design for learning (UDL); 5.3.2 Differentiated Instruction (D.I); 5.3.3 Accommodation, Adaptation, Modification 5.4 Educational Assessment of Children with Additional Needs 5.5 Adapted Physical Education & Recreation, Music & Health 5.6 Summary 5.7 Self-Assessment Questions 5.8 References 5.1 Objectives After reading this unit, learners will be able to: Understand the concept of Multi-Tiered System of Support (MTSS): Universal Design for learning (UDL), Differentiated Instruction (D.I), Accommodation, Adaptation, Modification Know about Educational Assessment of Children with Additional Needs Comprehend the Adapted Physical Education & Recreation, Music & Health 69

70 GE-ED-21 NSOU 5.2 Introduction Multi-Tiered System of Support (MTSS) is a comprehensive framework used to provide targeted support for all learners. It is rooted in supporting the "whole child", whether an advanced or struggling learner, through academic, behavioral, social and emotional services. The supports also extend to services such as improving chronic absenteeism and developing rigorous learning plans for high achievers. MTSS includes research-based principles and practices that increase the effectiveness of instruction for all students. Multi-Tiered System of Support is a school wide approach to student support. Teachers, counselors, psychologists and other specialists work as a team to assess and address student needs. 5.3 Multi-Tiered System of Support (MTSS): Universal Design for learning (UDL), Differentiated Instruction (D.I), Accommodation, Adaptation, Modification Multi-Tiered Framework for Instruction and Intervention (India King, 2018) (India King, 2018) MTSS is a multi-tiered system of instruction and support in which teachers provide quality instruction across three tiers. Tier 1 is core instruction aligned to content standards appropriate for all students, including Bilingual and English Language Learners. This is essentially "great teaching." The majority of learners should make sufficient growth in this tier.

NSOU GE-ED-21 71 Tier 2 is more strategic support that includes specialized services for 10-15% of the population. These students are in need of supplemental resources that extend beyond the range of Tier 1 services. Tier 3 includes the most intense support and is appropriate for about 1-5% of the student population. Here, students received more individualized support suited for their unique needs. MTSS emphasizes multiple levels of instruction. However, it focuses on all learners, including higher performing students and students that don't qualify for special education. MTSS may include a wider range of services within its tiers, focusing not only academics, but also behavioral, social and emotional supports. MTSS is a prevention framework that organizes building-level resources to address each individual student's academic and/or behavioral needs. MTSS allows for the early identification of learning and behavioral challenges and timely intervention for students who are at risk for poor learning outcomes. Multi-tiered system of support (MTSS) is a framework schools used to meet the diverse needs of students. All school personnel have a role in the implementation of MTSS, and some of the best practices for MTSS are discussed below: UDL and Differentiated Instruction Accommodation, Adaptation and Modification 5.3.1

Universal Design for Learning (UDL) "Universal Design" is an architectural concept that focuses on the design of products, buildings, or environments so that they can be used by all irrespective of their limitations. The term "universal design" was coined by the architect Ronald Mace to describe the concept of designing all products and the built environment to be aesthetic and usable to the greatest extent possible by everyone, regardless of their age, ability, or status in life (Wikipedia, 2017). It is mandated by Article 2 of the UNCRPD, 2006. It is the proactive design of products and physical environments to make them

usable by all people to the greatest extent possible --- without the need for adaptation or specialized design.

Within the field of architecture, the retrofitting of buildings with ramps or lifts in order to increase accessibility was often the primary --- and sometimes only --- modification made for broadening access. It was observed that retrofitting typically solves only one access issue: ramps ensure people can get to and from the building, but don't address how they will access features within the building itself. Here comes the Universal Design for Learning which extends this concept into the classroom and educational curriculum. It's the best

72 GE-ED-21 NSOU practice process of making our course concepts accessible and skills attainable regardless of learning style, physical, or sensory abilities. (Center for Teaching and Faculty Development, 2008). Concept of UDL: Universal Design for Learning (UDL) is a framework that provides all learners equal opportunities to learn. It encourages teachers to design flexible curricula that meet the needs of all learners. Using UDL principles in general education classrooms makes curriculum and instruction accessible and engaging. Curriculum barriers are reduced; learning is supported; learners gain knowledge, skills, and enthusiasm for learning; and their learning is validly assessed (Rose & Meyer, 2014). Focus of UDL: UDL focuses on the ability of teachers to meet the diverse learning needs of all learners, even those with impairments that affect their mobility, vision, hearing, and learning. Teachers must recognize that there are multiple and flexible ways of providing effective instruction while adhering to curricular standards and objectives. Thanks to technology, universal design enables learners to respond to and interact with curricula and achieve learning standards.

Principles of

Universal Design: Universal Design for Learning is about providing: Multiple means of Presentation to offer learners various ways of acquiring information and knowledge. Some of the examples of providing multiple means of representations are listed below (NCUDL, 2011): Read aloud, highlight phrases, listen to audio- tape, links to background knowledge, Braille converter, or a large print version.

Multiple means of Action and Expression- to provide Learner alternatives for demonstrating what they know. Some of the examples of providing multiple means of action and expression are listed below (NCUDL, 2011): Written responses, verbal responses, dramatic responses, response with visual art, Power Point, VoiceThread (a form of web-based tool for creating composition through different

NSOU GE-ED-21 73 modes of communication), single method of evaluation such as multiple choice questions (MCQs) or written assignment etc. Multiple means of Engagement to tap into Learner' interests, challenge them appropriately, and motivate them to learn.

Some of the examples of providing multiple means of engagement are listed below (NCUDL, 2011): Using archived resources, using Texthelp (which has learning supports such as a highlighter, option to use page navigation menu etc.), organizing information into a concept map, keeping a personal journal etc. These three attributes are considered as the backbone of UDL, according to the Center for Applied Special Technology (CAST, 2011) and is a widely accepted one.

5.3.2

Differentiated Instruction (D.I) Not all Learners are alike. Based on this concept, Differentiated Instruction applies an approach to teaching and learning that gives Learner multiple options for taking information and making sense of ideas (Willis and Mann 2000).

It encompasses the following facts: DI is a teaching principle based on the idea that teachers should adapt instruction to student differences because 'one size doesn't fit all' It is a way for teachers to recognize and react responsively to their Learner' background knowledge, readiness, learning styles, language and interests. It represents the rationale that all Learners can learn, and that educational activities will be much more successful when teachers purposefully plan and deliver lessons that address diverse learner. It also develops a curriculum aimed for the common student. Teachers are required to revise their instruction to meet individual student's readiness levels, preferences, and interests. The challenge lies in motivating each of the struggling, average and advanced learners and ensures that they are all equally engaged in a quality work. Definition of Differentiated Instruction (DI): Differentiated Instruction (DI) is a teaching theory based on the premise that instructional approaches should vary and be adapted in relation to individual and diverse Learner in classrooms (Tomlinson, 2001;

Guild & Garger, 1998).

74 GE-ED-21 NSOU

Role of the Teacher: The model of differentiated instruction requires teachers to be flexible in their approach to teaching and adjust the curriculum and presentation of information to learners rather than expecting Learner to modify them for the curriculum. Many teachers and teacher educators have recently identified differentiated instruction as a method of helping more Learners in diverse classroom settings. Differentiated Instruction and Implications for UDL Implementation Differentiated instruction recognizes

Learn with

varying background knowledge, readiness, language, preferences in learning and interests, and to react responsively. Differentiated instruction is a process to teaching and learning for Learner of differing abilities in the same class. The intent of differentiating instruction is to maximize each student's growth and individual success by meeting each student where he or she is, and assisting in the learning process. According to the authors of differentiated instruction, several key elements guide differentiation in the education environment. Tomlinson (2001) identifies three elements of the curriculum that can be differentiated: Content, Process, and Products. Differentiate Content: Of the three elements of the curriculum in a DI, the first one that comes in action is the content. In a differentiated classroom the teacher has a clear "destination for learning" in mind, but also understands that Learner will progress towards that destination on varying timetables, through differing routes, and needing a variety of support systems to continue making progress toward the designated learning goals. With this in mind, the differentiated classroom teacher plans on two levels- firstly, what learners must learn; and secondly, substitute routes for ensuring that learners who are not "a rendered set" Hence, Content includes- what is to be taught (the goals or outcomes), what level of understanding, knowledge, and proficiency Learners are to demonstrate; and what materials and options are available to give all Learner a point of entry to learning. NSOU GE-ED-21 75 Differentiate Process: Process identifies what teacher plans for instruction, how grouping/set of learners are constituted and how deliverables are presented to ensure maximum learning. These are carried out in some below stated lines: Several elements and materials are used to support instructional content - These include acts, concepts, generalizations or principles, attitudes, and skills. The variation seen in a differentiated classroom is most frequently in the manner in which Learner gain access to important learning. Access to the content is seen as crucial. Align tasks and objectives to learning goals - Designers/teachers of differentiated instruction view the alignment of tasks with instructional goals and objectives as essential. An objective- driven list of options makes it easier to find the next instructional step for learners entering at varying levels. Flexible grouping is consistently used - Strategies for flexible grouping are essential. Learners are expected to interact and work together as they develop knowledge of new content. Grouping of Learner is not fixed. As one of the foundations of differentiated instruction, grouping and regrouping must be a dynamic process, changing with the content, project, and on-going evaluations. Classroom management benefits Learners

and teachers. To effectively operate a classroom using differentiated instruction, teachers must carefully select organization and instructional delivery strategies (Tomlinson, 2000). Differentiate Product: It is the assessment of the content. It is characterized by - Initial and on-going assessment of student readiness and growth are essential. Meaningful pre-assessment naturally leads to functional and successful differentiation. Integrating pre and on-going assessment informs teachers so that they can better provide a menu of approaches, choices, and frameworks for the varying needs, interests and abilities that exist in classrooms of diverse Learner. Assessments may be formal or informal, including interviews, surveys, performance assessments, and more formal evaluation procedures.

76

GE-ED-21 NSOU

Differentiate Environment: Differentiating through the environment is important as it creates the conditions for optimal learning to take place. According to Tomlinson (2003), "Environment will support or deter the student's quest for affirmation, contribution, power, purpose, and challenge in the classroom," The learning environment includes the physical layout of the classroom, the way that the teacher uses the space, environmental elements and sensitivities including lighting, as well as the overall atmosphere of the classroom. The teacher's goal is to create an environment that is positive, structured, and supportive for each student. The physical environment should be a place that is flexible with varied types of furniture and arrangements, and areas for quiet individual work as well as areas for group work and collaboration. This supports a variety of ways to engage in flexible and dynamic learning. Teachers should be sensitive and alert to ways that the classroom environment supports Learner' ability to interact with others individually, in small groups, and as a whole class. They should employ classroom management techniques that support a safe and supportive learning environment. 5.3.3

Accommodation, Adaptation and Modification

NSOU GE-ED-21 77 Modifications should be considered for those students whose special needs are such that they are unable to access the curriculum (i.e., students with limited awareness of their surroundings, students with fragile mental/physical health, students medically and cognitively/ multiply challenged.) Using the strategy of modifications for students not identified as special needs should be a rare practice. In many cases, modifications need only form part of an educational program for a student with special needs, and they need not be a permanent or long-term solution. Whether to use modifications should be reviewed on a regular basis. Decisions about modifications should be subject or course specific wherever

78 GE-ED-21 NSOU possible. For example, a student with an intellectual disability may require modifications to a specific subject area such as mathematics; however, modifications may not be required to meet the provincial outcomes in physical education. 5.4 Educational Assessment of Children with Additional Needs What is an assessment? Assessment is the systematic process of documenting and using empirical data to measure knowledge, skills, attitudes and beliefs. By taking the assessment, teachers try to improve the student's path towards learning. What is Evaluation? Evaluation focuses on grades and might reflect classroom components other than course content and mastery level. An evaluation can be used as a final review to gauge the quality of instruction. It's product-oriented. This means that the main question is: "What's been learned?" In short, evaluation is judgmental. The term 'evaluation' is derived from the word 'value' which refers to 'usefulness of something'. Therefore, evaluation is an examination of something to measure its utility. (Source: <https://aputlock.wordpress.com/2015/05/06/hello-world/>)

NSOU GE-ED-21 79 Relationship between Assessment and Evaluation Besides the differences, there are also some similarities between assessment and evaluation. The both require criteria, use measures and are evidence-driven. So, what's the difference? Assessment is made to identify the level of performance of an individual, whereas evaluation is performed to determine the degree to which goals are attained. (Source: https://www.tes.com/lessons/WL_QF3DLF1cdCA/assessment-vs-evaluation) So, after reviewing the points above, it would be clear that assessment and evaluation are completely different. While evaluation involves making judgments, assessment is concerned with correcting the deficiencies in one's performance. Although, they play a crucial role in analysing and refining the performance of a person, product, project or process. Educational Assessment of Children with Special Needs Educational assessment of a student with special needs can be challenging and, if not administered correctly, can provide a misrepresentation of the child's actual academic abilities. For instance, a standardized written test would not be relevant for a disabled student who has delayed or inhibited language acquisition. In this hypothetical situation, seeking a verbal justification or response is also problematic. Subsequently, it is essential for the educator to understand the idiosyncrasies of the student's disability, and have a solid knowledge of his/her potential to ensure content is relevant whilst still being challenging. Although development may be delayed, it does not mean that some learning in the area is impossible, but rather that it is different to the expected ability at that chronological age. Most desired assessment is a combination of formative and summative Assessment, however,

80 GE-ED-21 NSOU sometimes this is not feasible for some students with a disability (Friend & Bursuck, 2002). After meeting with the student and parents, the initial in-class assessment is conducted by the teacher. This forms an understanding of the most appropriate ongoing assessment tools to be employed in evaluating the student's learning (Turnbull, 1995). It also provides an estimation of the student's current ability. Among different types of Assessment, Summative and Formative Assessment will be discussed here : Summative Assessment refers to the assessment of participants where the focus is on the outcome of a program. This contrasts with formative assessment, which summarizes the participants' development at a particular time (Wikipedia, 2019). Summative Assessment, however, is used to evaluate student's learning at the end of an instructional unit by comparing it against some standard or benchmark. Formative Assessment involves a continuous way of checks and balances in the teaching learning processes (Jeri, 2018). The method allows teachers to check their learners' progress as well as the effectiveness of their own practice, thus allowing for self-assessment of the student. Practice in a classroom is formative to the extent that evidence about student achievement is elicited, interpreted, and used by teachers, learners, or their peers, to make decisions about the next steps in instruction that are likely to be better, or better founded, than the decisions they would have taken in the absence of the evidence that was elicited (Wikipedia, 2019). Formative Assessment is used to monitor student's learning to provide ongoing feedback that can be used by instructors or teachers to improve their teaching and by students to improve their learning.

NSOU GE-ED-21 81 DIFFERENCES BETWEEN THE TWO TYPES OF ASSESSMENT The table below shows some basic differences between the two types of Assessment:

	Summative Assessment	Formative Assessment
When	At the end of a learning activity	During a learning activity
Goal	To make a decision	To improve learning
Feedback	Final judgement	Return to Teacher to modify the methods and analyse
Frame of Reference	Sometimes normative	Always criterion (comparing each student (evaluating students against all others); according to the sometimes criterion same criteria)

Source: <https://www.icbse.com> 5.5 Adapted Physical Education and Recreation, Music & Health Physical Education, Sports, Yoga for Benchmark Disabilities 'Education is the manifestation of the perfection already in man' - Swami Vivekananda The purpose of education is to foster all round development means intellectual, physical, and social development of the individual. Education plays a fundamental role but for an all- round development there is a need for striking a balance between classroom teaching and also co-scholastic activities. Co-scholastic activities are those which are undertaken side by side with the curricular activities. The most important thing to remember is that co- curricular activities should be fun and enjoyable. In this chapter Physical Education, Sports, Yoga for Benchmark Disabilities will be discussed as a component of Co-scholastic subjects. Importance of Physical Activities to Persons with Disabilities Students with disabilities are less physically active than students without disabilities. Students with disabilities may also have the secondary conditions like medial, social or emotional problems in nature. Many of these problems can be curved or controlled by physical

82 GE-ED-21 NSOU activities. In addition to that physical activities play an important role in the day to day life of students with disabilities. Through the physical education class, they can develop social skills, communication skills and emotional health. These skills are directly or indirectly helpful for independent living of students with disabilities. Problems faced by Persons with Disabilities in Sports and Games Inclusion is the practice of ensuring the participation of students with disabilities in the general education setting. Program activities should be selected to promote and enhance the skill development of the student. Teaching methods and instructional strategies must be designed to meet each student's unique learning style. Making developmentally appropriate adaptations and modifications to physical education activities such as exercises, games, rhythms and sports in order to provide the opportunity for students to be successful is the purpose of adapted physical education. The various research results showed that the following problems are the barriers for providing better adapted physical education programme for students with disabilities in India. The qualified physical education teachers are not aware about the process of adapting games and sport activities for disabled students. Most of the Indian schools are not having the adequate infrastructure and equipment to include students with disability in the physical activities. The curriculum prescribed for physical education contains very few information about the adapted physical education. Only one paper deals with curriculum adaptation for

NSOU GE-ED-21 83 students with disabilities. In many universities this paper is given as elective paper. After the school education, there is no provision to select physical education course for persons with disability. National Council for Teacher Education (NCTE) provides reservation of seats for handicapped persons as per the rules of the State Government concerned. But the actual scenario in most of the universities were not providing admission for handicapped persons in the B.P.Ed and Diploma courses in physical education. The concept of Adapted Physical Education evolves to address the needs of CWSN. Adapted Physical Education is the art and science of developing, implementing, and monitoring a carefully designed physical education. Instructional program for a learner with a disability, based on a comprehensive assessment, to give the learner the skills necessary for a lifetime of rich leisure, recreation, and sport experiences to enhance physical fitness and wellness. Principles and Methods of Adapted Physical Education and Recreation. Adapted physical education generally refers to school-based programs for students ages 3-21 years (Wikipedia, 2019). Adapted physical education is Physical Education that has been adapted or modified to meet the individual needs of each person with a disability enrolled in a regular or special physical education class. Adapted Games, Sports and Physical Activities Adapted games, sports and physical education imparts the skills necessary for rich experiences in leisure, recreation, and sporting to persons with unique needs and is aimed to enhance physical fitness and wellness. In combination to other physical activities, Yoga can bring holistic development and removal of misery among the disabled persons. Adapted physical education includes individuals from infants to elderly. Generally, impairments present in an individual disabled person are unique. The nature of the unique need may vary widely and thus the degree of alteration desired in physical education programme is also vast. Similarly, the set of yogic practice suitable for healthy individual may not be good for disabled persons. Adapted physical activity programs, yoga programmes or adapted sports include similar characteristics of the original sport but modified to suit the absence of capabilities due to impairment. Some examples of adapted physical education are the following: 1. Basketball converted to Wheelchair basketball

84 GE-ED-21 NSOU 2. Running replaced by wheelchair racing 3. Cricket rules modified to include sound producing large size balls. Yoga is a distinctly different kind of activity. It is one of the six orthodox systems of Indian philosophy. The great saint Patanjali has specified different stages of yogic practices as: Yama, Niyama, Asana, Pranayama, Pratyahara, Dharana, Dhyana, Samadhi. First four of these are the beginner's level through which human body is prepared for higher levels of yoga. It is known that only a sound body can hold a mind that can perform at a higher level and accept spiritual thoughts. Yoga has been applied for various purposes to alleviate the sufferings of the common man and promote all-round wellness. Application of yoga to promote wellness and improve the conditions of people with disability is a unique proposition and needs to be explored in a scientific manner. Adapting and modifying sport is to minimize or eliminate disadvantage caused by the environment in which a sport is played. Modifying sports also enables new rules and equipment to be introduced. All modifications should be continually reviewed and where appropriate phased out or changed. Modification may include: Reducing the size of the court or playing in an area shortened where boundary has been redrawn with chalk to reduce the area of play. Playing in a closed area that is surrounded by wall or fence also helps children with certain disabilities like visual impairment and Autism to play safely and comfortably. Practicing games indoor in a modified form and then taking it outdoors. Lowering heights of basketball hoops, badminton net & volleyball net. Using balls that may be easier to control. Using balls with bells inside or very bright so it is easier to track. Rhythmic music can make Yoga and free-hand exercises interesting and fun to do.

NSOU GE-ED-21 85 Visual cues, for example- the pictures of 'Ashanas' or exercise can be used as a visual instruction, so that the students can follow which 'Ashana' or exercise they are supposed to do next. Use of cut-out mount boards on the floor, so that the individual's disability will know where to place their head while lying down on the floor before starting the 'Ashanas'. Parallel Sports or Individual Sports For some children with disabilities playing in a team may be too demanding they may prefer individual sports like swimming, roller skating, trekking and athletics. Swimming and Athletics - children with disabilities may require skills to be enhanced to participate in such sports. They may need to build up strength and stamina like typical children. For some children with disabilities it can even lead to participating in Special Olympics. Use of technology With the development of new and improved technology with physical education, and especially adapted physical education, it is important for the Adapted Physical Education (APE) teacher to know and understand different ways to implement technology for increased success for their students. APE teachers can develop an updated website regarding a fitness workout plan, in which students can download and follow at home with a sibling or parent. Students can be taught how to keep track of their physical fitness goals and record the data on a spreadsheet. Video files can also be used to demonstrate proper technique. Teachers can easily create videos of students doing an activity. Video files can be utilized as report cards or as evidence of IEP goal attainment. Teachers can also play appropriate and motivating music for aerobic activities. New applications (Apps) are constantly being created to assist people with disabilities in numerous ways. With technology growing, APE teachers need to continue to develop as professionals in providing new ways to enhance their student's physical development. (Dheesha, J. B. 2017) Intellectual Disabilities There are a number of general modifications that can be applied in a physical education environment for students with intellectual disabilities. Modify your Communication : use shorter sentences, use gestures or demonstrations as supplement to verbal cues, repeat directions and have students repeat directions back to you, provide praise often, and give more feedback.

86 GE-ED-21 NSOU Modification in Practice: Give extra practice time, activities should be fun, reduce activities to deal with the problem of attention, allow choices, to accommodate for students with varying levels of intellectual disabilities a game may be designed with different levels. Modification in Curriculum: reduce the number of objectives that need to be mastered, frequent reinforcement in each stages of achievement, entirely modified curriculum based on individual's needs and strength. Modification in Environment: It should be structured and visually appealing, to reduce playing areas in order to eliminate distractions, structured environment to deal with behaviour problems. Learning Disabilities 1 in 5 students with learning disabilities will also have motor impairments. There are a number of ways to accommodate these students. Reduce class size: This allows the teacher extra one on one time with students. Often a class of 20-30 students proves to be more effective than double or triple that in general physical education classes. Use peer tutors: Peers can be trained in how to provide specific skill feedback as well as modify activities so the student has higher success. This can be effective when class size cannot be reduced. Offer learning strategies: Both teachers and peer tutors can provide strategies to help disorganized learners focus. This includes provided picture cues, video cues, and additional cues such as footprints on the floor to help a student understand what and how to perform an activity. Provide structured practice: Allow the student to get many practice opportunities. This will help them learn how to listen to and observe visual feedback for performance. Identify success: Reframe success for students in a way that does not focus on the end result. For example, using correct form in shooting should be a measure of success rather than making the basket. Use a variety of senses when giving instructions: Some students do better listening to instruction while others do better watching a demonstration. Others may do best when physically guided into the pattern. By incorporating many types of learning styles, students will be more likely to succeed.

NSOU GE-ED-21 87 ADHD Students with attention-deficit/hyperactivity disorder (ADHD) may experience motor learning delays. Many strategies are available to minimize learning delays in students with ADHD. Positive feedback: There is a relationship between positive feedback given by a physical education teacher and students applying corrective feedback. Task sheets: A task sheet provides a progression of activities to be completed by the students and requires them to record their results. Task sheets can be turned in at the end of class. This allows students to assess their performance while acknowledging their need to improve their skills. Token economy or point system: This is a structured agreement between the student and teacher in which the student earns rewards by meeting a minimum expectation. At the end of class both the student and teacher initial the points earned. At the end of the month, the student may earn a reward of his or her choice provided by the teacher. Autism Spectrum Disorder Various strategies exist to allow students with autism to be successfully included in a physical education setting. Preparing for inclusion: It is essential to know the student's needs, abilities, and preferences. It is also important to prepare the student. The physical education environment may be anxiety inducing for them. Because of this, educators can slowly introduce the student to the environment. They may also preview the class using visual organizers to describe the setting the student will be a part of. They may also make visual schedules prior to class. It is also important to prepare the peers by teaching them what autism is and behaviors associated with it. Instructing the student: There are a variety of methods for instructing students with autism. The first, environmental prompts. This involves the intentional use of equipment to encourage specific behaviors. The next is verbal prompts. This includes avoiding negative sentences. For example, instruction such as "step with your right leg" as opposed to "don't step with your left leg". Verbal prompts also include keeping phrases literal as well as provided concise instruction. It is also important to be consistent with language use. Peer tutors may also provide a lot of benefits for students in the physical education setting.[12] Hearing Impairment Being hearing impaired or hard of hearing typically has little impact on the development of

88 GE-ED-21 NSOU motor skills, fitness levels, and participation in sports. However, it is still important to accommodate students who are hearing impaired or hard of hearing in the physical education setting. Communicate using his or her preferred means of communication. When giving verbal instructions, make sure the student can see the instructors face clearly. Make sure you speak clearly and at a normal rate. Incorporate visual aids that have images or descriptive words. Repeat comments or questions made by the student's classmates. This helps all students alike. Check for understanding by asking students to repeat directions or demonstrate a skill. If an interpreter is involved, make sure to speak directly to the student, rather than the interpreter. Visual Impairments Children with visual impairments can play all of the same sports as their sighted peers, with some modifications. This may include a beeping ball or allowing blind player to walk around and feel the environment before they begin. Modifications can be made continuously until the best solution is found. Children with visual impairments and blindness may need more instruction and practice time to learn new concepts and movements. It is suggested that students receive pre-teaching before the start of a new unit. This can be done before school, after school, during orientation, or at home. Peer tutors may also be effective for students with visual impairments or blindness. Opportunities Available for Persons with Disabilities Deaflympics - The Deaflympics are an International Olympic Committee (IOC) sanctioned event at which deaf athletes compete at an elite level. The summer and Winter Deaflympics are among the world's fastest growing sports events. Special Olympics - Special Olympics is the world's largest sports organization for children and adults with intellectual disabilities, providing year-round training and competitions. Special Olympics competitions are held every day, all around the world-including local, national and regional competitions, adding up to more than 108,000 events a year. These competitions include the Special Olympics World Games, which alternate between summer and winter games. Special Olympics World Games are held every two years. Disability Commonwealth Games - The Commonwealth Paraplegic Games are international, multi-sport events involving athletes with a disability from the Commonwealth countries.

NSOU GE-ED-21 89 Paralympic Games - A multi-sport event for athletes with physical, mental and sensorial disabilities. This includes mobility disabilities, amputees, visual disabilities and those with cerebral palsy. The Paralympic Games are held every four years, following the Olympic Games, and are governed by the International Paralympic Committee. Physical education is an important component of school education meant for all children including students with disabilities. Educational institutions should provide appropriate adapted games and sports to students with disabilities to develop physical fitness. Students/ persons with disabilities must utilize the sport opportunities given by the government and private organizations. "You will be nearer to heaven through a game of football than through the study of Gita" - Swami Vivekananda

Visual and Performing Arts Art reflects human emotions and human beings spontaneously express their frame of mind through various art forms. Thus the intellectual mind merges with the artistic streak, giving birth to art. The expression is reflected in various styles like singing, dancing, drawing, Performing Arts: Music, Dance and Drama and Architecture painting, acting, sculpture. Some of these are expressed through live performances and others through visual arts. Sketching, painting, sculpture are visual arts. Singing, dancing, acting are attributes of performing art. Visual arts and performing arts play a significant role in the overall development of students with disabilities. Learning and then performing art allows children with opportunities to shine and perform and increase their self-esteem. Learning and performing art teaches self- control and discipline. But children with disabilities will need support and accommodation.

Meaning of visual arts: "Visual Arts" is a modern but imprecise umbrella term for a broad category of art which includes a number of artistic disciplines from various sub- categories. Visual art usually encompasses the following: 1. Fine Arts: All fine art belongs to the general category of visual arts. These include activities such as: Drawing, Painting, Printmaking and Sculpture, along with associated activities like Graphic art, Manuscript Illumination, Book Illustration, Calligraphy and Architecture.

90 GE-ED-21 NSOU 2. **Contemporary Arts** : The visual arts also include a number of modern art forms, such as: Assemblage, Collage, Mixed-media, Conceptual Art, Installation, Happenings and Performance art, along with film-based disciplines such as Photography, Video Art and Animation, or any combination thereof. 3. **Decorative Arts & Crafts**: In addition, the general category of visual arts encompasses a number of decorative art disciplines and crafts, including: ceramics and studio pottery, mosaic art, mobiles, tapestry, glass art (including stained glass), and others. 4. **Others**: Wider definitions of visual art sometimes include applied art areas such as graphic design, fashion design, and interior design. In addition, new types of body art may also fall under the general heading of visual arts. These include: tattoo art, face painting, and body painting.

Meaning of Performance Arts: The performing arts range from vocal and instrumental music, dance and theatre to pantomime, sung verse and beyond. They include numerous cultural expressions that reflect human creativity and that are also found, to some extent, in many other intangible cultural heritage domains. The different types of performing arts are theater, musical theater, dance, music, acting, magic and circus acts. As a form of performance art, acting involves impersonating a character. The different emotions and motivations of characters are displayed through various expressions, intonation and body movements. Often, actors must use empathic skills in order to convey the character in a convincing manner. Another closely related form of performing arts is musical theater. Musicals are plays that integrate songs in place of some spoken words and plot details. Performers often alternate between speaking and singing during the production.

Dance 1. Students who have difficulty in expressing themselves through writing & drawing may show amazing results when expressing themselves through dance. 2. With appropriate props, they may find it easier to show rhythmic movements with music. Props like pompoms, ribbons, long scarves etc. 3. Children can be supported by a prompter, who could be a teacher or a peer, hidden in the wings. Children with disability can imitate him /her if needed.

NSOU GE-ED-21 91 4. Visual cues can be put on the stage by drawing lines, foot-prints or arrows, then an individual can dance without any person's help. 5. Dance can be choreographed in such a way that children can participate. Example : hand movements for wheelchair users, visual cues for those with autism & hearing impairment.

Drama 1. Some children can have difficulty memorizing scripts; they can be helped with visual cues. Those with visual impairment can have Brail scripts or learn scripts by listening to recorded scripts. 2. Children with hearing impairment may do mimes very well. 3. Children with Autism, ADHD may need social stories and visual schedules to help them perform. 4. Like dance-drama, scripts can be adapted to different children can participate. 5. **Music** Musical instruments can also be adapted for those with motor impairments. And for those who want to sing they may need visual cues to remind them of word and timing. Some adapted musical instruments are as follows:

5.6 **Summary** Multi-Tiered System of Support (MTSS) is a comprehensive framework used to provide targeted support for all learners. MTSS is a multi-tiered system of instruction and support

92 GE-ED-21 NSOU in which teachers provide quality instruction across the three tiers. Tier 1 is core instruction aligned to content standard appropriate for all students, including Bilingual and English Language Learners. Tier 2 is more strategic support that includes specialized services for 10-15% of the population. These students are in need of supplemental resources that extend beyond the range of Tier 1 services. Tier 3 includes the most intense support and is appropriate for about 1-5% of the student population. Here, students received more individualized support suited for their unique needs. MTSS is a prevention framework that organizes building-level resources to address each individual student's academic and/or behavioral needs. MTSS allows for the early identification of learning and behavioral challenges and timely intervention for students who are at risk for poor learning outcomes.

The term "universal design" was coined by the architect Ronald Mace to describe the concept of designing all products and the built environment to be aesthetic and usable to the greatest extent possible by everyone, regardless of their age, ability, or status in life.

Universal Design for Learning is about providing: Multiple means of Presentation - to offer learners various ways of acquiring

information and knowledge;

Multiple means of Action and Expression - to provide Learner alternatives for demonstrating what they know and

Multiple means of Engagement - to

tap into Learner' interests, challenge them appropriately, and motivate them to learn.

Differentiated Instruction (DI) is a teaching model based on the premise that instructional approaches should vary and be adapted in relation to individual and diverse Learner in classrooms (Tomlinson, 2001; Guild & Garger, 1998).

Tomlinson (2001) identifies three elements of the curriculum that can be differentiated— Content, Process, and Products. Assessment is the systematic process of documenting and using empirical data to measure knowledge, skills, attitudes and beliefs. By taking the assessment, teachers try to improve the student's path towards learning. Assessment is made to identify the level of performance of an individual, whereas evaluation is performed to determine the degree to which goals are attained. Among different types of Assessment, Summative and Formative Assessment have been discussed in this unit. Students with disabilities are less physically active than students without disabilities. Through the physical education classes, they can develop social skills, communication skills and emotional health. These skills are directly or indirectly helpful for independent living of students with disabilities.

NSOU GE-ED-21 93 Opportunities Available for Persons with Disabilities includes Deaflympics, Special Olympics, Disability Commonwealth Games and Paralympic Games. 5.7 Self-Assessment Questions 1) Define Multi-Tiered System of Support. 2) Define UDL. Discuss the Principles of UDL. 3) What is Differentiated Instruction? 4) Explain the concept of Adaptation, Accommodation and Modification with suitable examples. 5) Write a brief note on "Educational Assessment of Children with Special Needs". 6) What are the differences between Formative and Summative Assessment? 7) Explain the Importance of Physical Activities to Persons with Disabilities. 8) Write short note on Physical Education, Sports, Yoga for Benchmark Disabilities. 5.8 References CAST (2011). NSOU GE-ED-21 95 Unit 6 Role of Governments & NGOs Structure 6.1 Objectives 6.2 Introduction 6.3 Social relationships and supports (Instructional Practices, Facilitating Social Membership and Relationship) 6.3.1 Instructional Practices 6.3.2 Facilitating Social Membership & Relationship 6.4 Leadership for Inclusive Education (Teacher-Parent-Family partnerships and Capacity building) 6.4.1 Teacher-Parent Partnership 6.4.2 Family Partnership 6.4.3 Capacity Building 6.5 Role of Indian Govt. in implementation of Inclusive Education. 6.6 Summary 6.7 Self-Assessment Questions 6.8 References 6.1 Objectives After reading this unit, learners will be able to: Understand Social relationships and supports (Instructional practices, facilitating social membership and relationship) Comprehend the concept of Leadership for Inclusive Education (Teacher-Parent, Family partnerships, Capacity building) 95

96 GE-ED-21 NSOU Discuss the role of Indian Govt. in implementating Inclusive Education. 6.2 Introduction It is an accepted notion that Every child is unique in his own ways. Some are bright, some are dull. But regardless of these differences, everyone has equal rights to develop their potentialities. Inclusive Education protects the rights of all disabled students by integrating disabled child with non-disabled in regular classrooms with provision for extra help for the disabled. One of the several factors which determine the success of inclusion is family support and involvement. Parents are known to be the first teacher of their children and they continue to influence their children learning and development during lifetime. Family involvement can have a major impact on student's learning, regardless of the social or cultural background of the family. The purpose of this unit is to describe the vibrant role of family and parents in success of inclusive education and discuss the role of Indian Govt. in promotion and implementation of Inclusive Education. 6.3 Social relationships and supports (Instructional Practices, Facilitating Social Membership & Relationship) Inclusive education of pupils with special educational needs (SEN) has become a global trend. However, a considerable number of studies have shown that mere enrolment in mainstream classrooms is not enough to support the social participation of pupils with SEN. These children are at risk of experiencing difficulties in their involvement with peers at school. Thus, the question arises of how social participation can be fostered in mainstream classrooms. Building an inclusive classroom community means implementing practices where all students, regardless of cognitive or academic level, have opportunities to be included in the general education classrooms, participating in standards-based curriculum. Inclusive school settings are characterized by: All students belonging and being valued as equal members of the school community. Intentionally and meaningfully engaging students with disabilities in a wide range of learning opportunities, activities, and environments that are available to all children, including participation in the general education curriculum, non-academic, and extracurricular activities. Implementing goals and objectives that are aligned with the state standards, as well

NSOU GE-ED-21 97 as implementing goals that are student specific in the general education classroom with the appropriate supplementary aids and services. Developing and implementing instructional strategies and methods that increase the participation and progress in the general education curriculum of students with disabilities. Components of Inclusive Classrooms and Schools Teachers must have an awareness of the components of inclusive classrooms and schools. These components provide the building blocks necessary for creating a safe and welcoming school community where individual differences are valued and embraced. These components are— Leadership, School Climate and Structure, Student Placement, Family and Community Involvement, Collaborative Practices, Instructional Practices, and Supplementary Aids and Services. 6.3.1 Instructional Practices Educators implement evidenced-based inclusive practices through multi-level instruction, multiple methods of assessment and modified outcomes in general education classrooms, when appropriate. It includes the following Inclusive Instructional practices: Providing modified curricular goals, Providing alternate ways for students to demonstrate learning, Providing test modification, Providing alternate materials and/or assistive technology (e.g., materials on tape, transcribe text into Braille, large print, alternate computer access), Providing instruction on functional skills in the context of the typical routines in the regular classroom, Changing method of presentation, Using reader services, Providing research-based supplementary materials Providing instructional adaptations (e.g., pre-teaching, repeating directions, extra examples and non-examples). (Commonwealth of Pennsylvania, N.A)

98 GE-ED-21 NSOU 6.3.2 Facilitating Social Membership & Relationship Climate in the classroom is one of the determining factors in the development of practices in Inclusive Education. Many factors contribute to the climate in the classroom. However, there are predominance on affective relational factors, with impact on action, norms and values, social interactions and learning processes. Effectively the inclusion of children with special educational needs in the classroom is a crucial goal, as it provides important factors that help them adapt: being taught together with other children, feeling part of the class and being recognized by it, with the resources it furnishes and the issues it entails. However, work in inclusive classroom requires a real deep acceptance of all individuals in their variety and diversity of needs, opportunities and difficulties. School Climate and Structure Educators must ensure that all students are welcome and seen as contributing and valued members of the school community, Collaborative relationships among staff, families and students are nurtured. Parents involvement in inclusive education programme builds positive relationships, encourages new behaviours, and increase self-satisfaction and optimism among themselves, their children and teachers. Such involvement of family is the key-component which leads to student's and school's success. When families and community members are involved in student learning, students improve their academic performance and gain advocates that promote their success, helping them feel more confident at school and in taking on more rigorous classwork. Research has shown that high levels of parental involvement correlate with improved academic performance, higher test scores, more positive attitudes toward school, higher homework completion rates, fewer placements in special education, academic perseverance, lower dropout rates and fewer suspensions. 6.4 Leadership for Inclusive Education (Teacher-Parent- Family partnerships and Capacity building) Inclusive Education is generally thought of as an approach to serving children with disabilities within general education settings. Internationally, inclusive education has broader aims and is defined as a reform that supports and welcomes diversity among all learners. Inclusion is increasingly seen as a key-challenge for educational leaders. Leadership can be defined as "the reciprocal processes that enable participants in an educational community to construct common meanings that lead toward a common purpose about schooling". From this

NSOU GE-ED-21 99 perspective, leadership involves an interactive process among teachers, students and their parents. 6.4.1 Teacher-Parent Partnership Teacher-parent partnerships are defined as relationships built on respect in which a parent and teacher have parity and a shared role in educational decision making. Although many professionals acknowledge the value of partnering with parents, most admit that effective parent-teacher partnerships are difficult to achieve. Although parent-teacher partnerships are not innate, both parties fortunately can be taught to be effective partners. The more focused the educational training is in providing teachers with multiple opportunities to interact with parents, the more likely they are to be equipped with the knowledge, ability, and confidence needed to partner with parents. If educators are not trained, they likely will engage in more hierarchical decision-making rather than in collaborative educational decision making in which everyone's contributions are equally valued. One important aspect of parent-teacher partnerships training is knowing how to value parents as equal partners in educating their children. Research indicates that parent-teacher partnerships are essential to teacher practice, optimally starting in the early years of teacher preparation programs. Unfortunately, research literature is sparse on teacher preparation programs in institutions of higher education (IHEs) that address the need for parent-teacher partnerships, especially given that teacher preparation standards call for parent-teacher partnerships to be an integral component of educator preparation curricula (Brinks et al., 2010; Council for Exceptional Children, 2015). Parental involvement in the education of children has been shown to increase student achievement, improve attendance, and reduce dropout rates (Barnard, 2004; Grundmeyer & Yankey, 2016; Sheldon, 2003). Specifically, parent-teacher partnerships have been shown to be an effective method of involving parents in the education of their children, and the benefits are well documented (Barnard, 2004; Collier, Keefe, & Hirrel, 2015; Lasater, 2016; Sheldon, 2003). When parents and teachers become partners, these partnerships have been associated with fewer student retentions and fewer referrals for unacceptable behavior. Moreover, parent-teacher partnerships have been identified as a stress reducer, which, in turn, can help students be ready and able to learn (Anderson- Butcher & Ashton, 2004; Barnard, 2004; Rouse & O'Brien, 2016; Talts, Piht, & Muldma, 2017). (Murray M; Munger M H; Colwell W B; Claussen A J, 2018) 6.4.2 Family Partnership Parental involvement and community participation in the total scheme of inclusive education is important. The involvement of families and local communities is essential in achieving

100 GE-ED-21 NSOU quality education for all. Most of the parents want their children to be welcomed into the real world and be given respect and resources which they need and deserve as is given to non-disabled children. Families and community groups can take an active role in promoting inclusive education by helping and cooperating the school authorities in making or providing necessary arrangements and accommodations for the education of special peers. When families get involved in their children's education, the students achieve more, stay in school longer and engage in school more completely. Parents involvement in inclusive education programme builds positive relationships, encourages new behaviours, and increase self- satisfaction and optimism among themselves, their children and teachers. Such involvement of family is the key-component which leads to student's and school's success. The participation of family members could be a mother, a father or both, grandparents, guardian or an older sibling in all spheres of child's life plays a vital role in shaping and determine his personality. Parents involvement in inclusive education programme builds positive relationships, encourages new behaviours, and increase self-satisfaction and optimism among themselves, their children and teachers. Such involvement of family is the key component which leads to student's and school's success. The main goal of parents is to see whether the child with special needs benefits from school experience or not. Children with lifelong, disabilities need educational opportunities that are appropriate for their age and abilities. Parents and teachers working together are the very best support for such special children. Jointly, they can ensure children acquire as many necessary skills and abilities to be successful in life are possible. Parents know their children best. They know their likes and dislikes, strengths and weakness, needs and desires, abilities, capacities, capabilities and challenges. This information shared with teachers is invaluable while developing an educational plan for the child. As a parent it is important that one is fully involved in all the aspects of decision-making that goes on during child's education. In some cases where the children are identified very early in their lives by family members, it becomes the responsibility of the parents or family to inform the school authorities for their child's special needs. Parents play an effective role in the education of their children with special needs. While special education teachers generally work hard to make a difference, they cannot be expected to educate these special children on their own. They need support from family members. Parents must encourage them in order to make children reach their potential. They should work on the goals at home as well as cooperate with teachers in schools. If parents will work with their children at home, not only they will progress more quickly and show better results, both will also realize how dedicated and committed their parents to their education. Time spent with children at home brings parents children closer to each other. Parents

NSOU GE-ED-21 101 should bear major force in helping children overcome adversity. (Monika, 2018) 6.4.3 Capacity Building Capacity building is the process by which individuals and organizations obtain, improve, and retain the skills, knowledge, tools, equipment, and other resources needed to do their jobs competently. It allows individuals and organizations to perform at a greater capacity. There are three essential components of Capacity building in inclusive education viz: 1. Increasing awareness and attitudinal change through advocacy; 2. Creating future trained professionals through pre-service training and 3. Build on existing human resource or in-service training. These three components are discussed below :

Attitudinal Changes and Awareness Raising For inclusive education to succeed, it is vitally important that teachers, principals and other education stakeholders maintain a positive attitude towards inclusion. They must be firmly convinced of the benefits that inclusive practices bring to all children. Even if inclusive education is mandated by law, it will never succeed without the enthusiastic support of its practitioners. Obtaining such support involves behavior and attitudinal change which is not a quick or easy process. There are a number of ways to accomplish such change for examples activities and strategies that have been used successfully in the CRS Vietnam program such as organizing training workshops for educators and key-community members on general inclusive education techniques. Pre-Service Training Programs In order to build human resources in the field of education, training must be done both at the pre-service and in-service levels. Pre-service training refers to training individuals before they become teachers. This includes training at teacher training colleges and universities at both the national and provincial levels. Ideally, inclusive education should be a compulsory subject for all teacher candidates and an integral part of teacher training curricula. Fundamental knowledge and skills of inclusive education, such as understanding needs and abilities of children with special needs and pedagogic skills such as instructional accommodation and activity differentiation, should be provided widely to teacher candidates. Countries with strong track records of implementing inclusive education, such as the United States and Australia have adopted this model for a long-time. As a long term goal, countries should work towards promoting inclusive education as a compulsory subject in pre-service training

102 GE-ED-21 NSOU programs . Nation wide efforts have been initiated in this direction in our country also. In C C S University , Meerut "Creating An Inclusive School", a new course has been introduced in B. Ed. 2nd year with this specific purpose. In-Service Training Programs In-service training includes professional development for teachers who are already working in the classroom. In addition to developing the skills of professionals before entering the workforce, it is essential that teachers already teaching be provided skills and techniques for inclusive education. Teachers in many countries are required to upgrade their professional skills on an annual or regular basis to enhance their teaching performance. Inservice training programs offer a particularly effective strategy to improve the quality of an entire educational system for all children regardless of their needs. Inclusive education methods are child- centered, employing active and participative learning techniques that improve teachers' capacity to teach children both with and without disabilities. Collaborative and participative techniques not only enhance learning outcomes, but also reduce prejudice and discrimination among children. The success of inclusive education in any context depends upon many factors. Teachers themselves are an essential component to ensure the quality of students' inclusion in the school environment. Teachers have direct interaction with students and play a critical role in determining students' experiences in the classroom on a daily basis. Special attention must be paid to ensure that classroom teachers have the skills and support needed to provide quality education to children with diverse learning needs. This requires the collaboration of classroom teachers, key-teachers, school principals, education officers and policy makers. Preparing teachers with essential knowledge and skills for inclusive education also requires the commitment of all teachers. When desired policies are not yet in place in a country, these teachers should explore different and alternative approaches to achieve the ultimate goal of providing quality education for all children. Preparing teachers does not simply mean providing prospective teachers with inclusive education skills; it is important to provide training and support for existing teachers as well. Building the capacity for inclusive education must include awareness raising activities as well as integrated pre- service and in-service teacher training programs to ensure that teachers are aware, ready and willing to bring inclusive education into action. Preparing teachers at the pre-service level to teach in inclusive settings is essential if our schools are to truly teach all students in inclusive, collaborative, and diverse settings. To accomplish that we must start designing and building an atmosphere of collaboration and inclusiveness at the pre service level, as NSOU GE-ED-21 103 well as practices that demonstrate to prospective teachers the possibilities and promise of an inclusive world. Hence, efforts must be continued to chase the dreams of capacity building of our teachers for inclusive education (Kaushik Neeta, 2016). 6.5 Role of Indian Govt. in implementation of Inclusive Education. Legislation and Policies in India The Constitution of India (26 November, 1949), clearly states in the Preamble that everyone has the

95%

MATCHING BLOCK 18/46

W

right to equality of status and of opportunity. The Article 41 of the Directive Principles of the Indian Constitution supports the 'right to work, education and public assistance' in certain cases including

disablement. Further, Article 45 commits to

100%

MATCHING BLOCK 22/46

W

the provision of 'free and compulsory education for all children up to the age of 14 years'.

Based on this, the
Constitution (86

95%

MATCHING BLOCK 19/46

W

th Amendment) Act 2002 has been enacted by the parliament making education a 'fundamental right' of all children in the age group of 6-14 years. Moreover, the 93rd Amendment to the Constitution of India (

now renumbered as the 86th), passed by the Lok Sabha on November 28, 2001,

95%

MATCHING BLOCK 20/46

W

makes it mandatory for the government to provide free and compulsory education to "all children of the age of 6-14 years", with its preamble clarifying that "all" includes children with disabilities as well.

Although many viewed this amendment as positive, others criticized the age restrictions. In addition, many thought that the type of education (inclusive, segregated, or other) should be specified within the law.

The Government of India created the Kothari Commission in 1964. This commission was created because the Government of India wanted to create a plan of action to improve the education system. The plan of action suggested by the Kothari Commission included people with disabilities, but unfortunately, the Government of India never implemented it. It reads, "We now turn to the education of handicapped children. Their education has to be organized not merely on humanitarian grounds of utility. Proper education generally enables a handicapped child to overcome largely his or her handicap and make him into a useful citizen. Social justice also demands it on an overall view of the problem, however, we feel that experimentation with integrated programmes is urgently required and every attempt should be made to bring in as many children in integrated programs." 104

The Integrated Education of Disabled Children (IEDC) 1974 The Ministry of Welfare created the Integrated Education of Disabled Children Scheme (IEDC) in 1974. The scheme provided children with disabilities "financial support for books, school uniforms, transportation, special equipment and aids," with the intention of using these aids to include children in mainstream classrooms. However, the government of India realized that providing structural changes to the classroom, such as adapted equipment, would not be enough to integrate children with disabilities into the classroom. Although it was encouraged and partly funded by UNICEF, fifty percent of the funding was supposed to go through the State Governments. The responsibility was transferred to the Department of Education in 1992. Despite the fact that this scheme was supposed to be nation-wide, it was implemented in only 10 out of 29 of the states in India. Sharma (2001) found three major problems with the IEDC. There was a lack of training and experience

37%

MATCHING BLOCK 26/46

The National Policy on Education (NPE, 1986), and the Programme of Action (1992) stresses the need for integrating children with special needs with other groups. The objective to be achieved as stated in the NPE (1986) is "to integrate the physically and mentally handicapped with general community as equal partners, to prepare them for normal growth and to enable them to face life with courage and confidence."

99%

MATCHING BLOCK 25/46

W

Although this policy was created in 1986, it was not implemented until the Plan of Action was created in 1992. The 1992 Program of Action (POA), created to implement the 1986 NPE, broadens the definition of who should be included in mainstream schooling, that "a child with a disability who can be educated in the general school should not be in the special school."

with disabilities have the right to access education in a "free and appropriate environment" until they are 18 years of age,

NSOU GE-ED-21 105 "promoting integration into normal schools." The PWD Act

95%**MATCHING BLOCK 31/46****W**

is supposed to provide transport facilities, remove architectural barriers, supply free books and other study materials, grant scholarships, restructure curriculum, and modify the examination system for the benefit of students with special needs. The Act also addresses teacher training, for special educators and mainstream educators, by requiring adequate teacher training programs to train teachers to work with students with disabilities. Another extremely important part of this act was the clause that requires all parts of the country, urban and rural, to have facilities that accommodate students with disabilities and ensure that they are in school. The People with Disabilities Act

functioned as a catalyst for several other development projects around inclusion and

the 'National Trust for Welfare of Persons with Autism, Cerebral Palsy, Mental Retardation and Multiple Disabilities Act'

for the economic rehabilitation of people with disabilities. These legislations have been instrumental in bringing about perceptible change in the attitudes of Government, NGOs and people with disabilities.

95%**MATCHING BLOCK 33/46****W**

The Government of India started collaborating with the UN and World Bank to put the People with Disabilities Act into action. One major initiative that was born out of the PWD Act was the District Primary Education Program (DPEP). A joint venture between the Indian Government's Department of Education and the World Bank. The goal of DPEP was "education for all" by the year 2000. As many of the initiatives in India regarding education and children with disabilities, the DPEP focused on inclusion of children with mild to moderate disabilities. Following the PWD Act, important parts of the initiative included teacher trainings through the District Institutes of Education and Training (DIETS), curriculum modifications, resource room, teacher support and integration or inclusion.

Inclusive Education in Sarva Shiksha Abhiyan Sarva Shiksha Abhiyan (

100%**MATCHING BLOCK 34/46****W**

SSA) was launched to achieve the goal of Universalisation of Elementary Education. This adopts a zero rejection policy and uses an approach of converging various schemes and programmes. The key-objective of SSA is Universalisation of Elementary Education (UEE). Three important aspect of UEE are access, enrolment and retention of all children in 6-14 years of age. A zero rejection policy has been adopted under SSA, which ensures that every Child with Special Needs (CWSN), irrespective of the kind, category and degree of disability, is provided meaningful and quality education. It covers the following components under education for children with special needs - Early 106

detection and identification, functional and formal assessment, Educational Placement, Aids and Appliances, Support services, Teacher training, Resource support, Individual Educational Plan (IEP), Parental training and community mobilization, Planning and management, Strengthening of special schools, Removal of Architectural barriers, Research, Monitoring and evaluation, Girls with disabilities.

The most recent initiative of Government of India to achieve the goal of universalisation of secondary education (USE) is 'Rashtriya Madhyamik Shiksha Abhiyan' (RMSA), aimed at expanding and improving the standards of secondary education, i.e., from class VIII to X. RMSA will work in line with revised scheme of Inclusive Education for the Disabled at Secondary Stage (IEDSS) which ensures that every child with disability will be identified at secondary level and his/her educational needs will also be assessed and supplied learning material, aids and appliances, assistive devices, support services, as per his/her requirement. Reforming past scheme:

99%**MATCHING BLOCK 36/46****W**

Inclusive education of the disabled at the secondary stage In 2008, the government reformed the Scheme of Integrated Education for Disabled Children (IEDC) and created the Inclusive Education of the Disabled at the Secondary Stage (IEDSS). It went into effect on April 1st, 2009. IEDC was reformed to take into account the resources provided for students with disabilities ages 6-14

under Sarva
Shiksha Abhiyan.

96%

MATCHING BLOCK 37/46

W

The objective of IEDSS is to enable the disabled children who have completed eight years of elementary education to continue their education at the secondary stage in an inclusive environment in regular schools. IEDSS provides students with disabilities ages 14-18, studying in public or government funded schools, Rs. 3000/- per school year from the central government to purchase the necessary materials to use to ensure inclusion of the student in the mainstream school system. This is the first policy that specifically acknowledges the importance of secondary education for persons with disabilities.

The National Policy for People with Disabilities The most recent policy specifically concerning education and people with disabilities is the Ministry of Social Justice and Empowerment's National Policy for People with Disabilities. Although this policy was created in 2006, after the 2005 Action Plan, and the two policies were created under separate ministries, they are very similar in both the ideologies that they were founded on, as well as the actual changes they are trying to make to the system. This policy echoes the 2005 plan of action and 2005 (made official in 2009) bill by changing special schools in resource centers for students with disabilities and teachers. In addition, the policy seeks to bridge the gap between rural and urban areas by creating more District

NSOU GE-ED-21 107 Disability and Rehabilitation Centers (DDRCs), which disseminate information in terms of availability of aids and appliances, ensure the mandated 3% coverage of persons with disabilities in poverty reduction programs and target girls with disabilities.

Persons with Disabilities (Equal Opportunity Protection of Rights and Full Participation) Act, 1995. The

number of disabilities recognized under the act has been increased from 7 (recognized under the Old Act) to 21, and have been elaborately defined. The law recognizes for the first time three blood disorders namely Thalassemia, Hemophilia, and Sickle cell disease, intellectual disability, disability caused due to neurological conditions, acid attack etc. as disabilities. Responsibility has been cast upon the appropriate governments to take effective measures to ensure that the persons with disabilities enjoy their rights equally with others. The Act focuses on multiple aspects such as education, skill development, employment, recreation, rehabilitation, health and social security of person with disability. The Act provides every child with benchmark disability between the age group of 6 and 18 years right to free education. Government funded educational institutions as well as the government recognized institutions will have to provide inclusive education

81%

MATCHING BLOCK 41/46

SA

Chapter, I .doc (D110787435)

to the children with disabilities. For persons with benchmark disabilities a reservation of not less than 5% in higher education, not less than 5% in government jobs and not less than 4 %, has been provided in allotment of agriculture and housing land, in poverty alleviation schemes

and in doing so priority has to be given to women. The law has become more gender sensitive as a separate provisions have been made for women suffering from disability. Private establishments have also been covered within the ambit of the new Act. Governments as well as private service providers are required to provide services in accordance with the rules on accessibility formulated by the Central Government. No building plan is to be approved unless it complies with the rules of accessibility. Special powers have been conferred on the Executive Magistrate and Police Officer to deal with complaints of abuse, violence or exploitation against the person with disabilities. The Act also requires the State Governments in concurrence with the Chief Justice of High Court to notify District Court/ Court of Session to be special courts for speedy trial of offences under the Act. The Act provides for setting up of National Fund for persons with disabilities. Thus, this new act will not only enhance the rights and entitlements of persons with disabilities but also provide

108 GE-ED-21 NSOU

effective mechanism for ensuring their empowerment and true inclusion into the society in a satisfactory manner. (Nagpal Rajni, 2018) National Education Policy, 2020 The National Education Policy 2020 (NEP 2020), which was approved by the Union Cabinet of India on 29 July 2020, outlines the vision of India's new education system. The new policy replaces the previous National Policy on Education, 1986. The policy is a comprehensive framework for elementary education to higher education as well as vocational training in both rural and urban India. The policy aims to transform India's education system by 2021.

100%

MATCHING BLOCK 42/46

W

The finalized policy incorporates several recommendations of disability organizations on the 2019 draft. The NEP asserts that children with disabilities will have opportunities for equal participation across the educational system. A major victory is the recognition of the Rights of Persons with Disabilities Act (RPWD), 2016 and its provisions for inclusive education, defined as a system of education where students with and without disabilities learn together. These recommendations include non-discrimination in schools, accessible infrastructure, reasonable accommodations, individualized supports, use of Braille and Indian Sign language in teaching, and monitoring among others. The policy has provisions for recruitment of special educators with cross-disability training and incorporates disability awareness within teacher education.

99%

MATCHING BLOCK 44/46

W

Children with disabilities in the policy are primarily viewed as recipients of welfare and care in the form of peer tutoring, open schooling, and one-on-one teaching. There is a need to go further, to recognize disability as an identity and as a form of diversity rather than solely a deficit - an example of this would have been to suggest the standardization of Indian Sign Language as a valuable language system for all students, not just for 'students with hearing impairments.' That is, the educational challenges of children with disabilities stem from a rigid curriculum, inaccessible schools and classrooms, absence of modified assessments, and deficit perspectives that place limits on what disabled children can achieve. India has ratified the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) in 2007, which envisions free, quality, inclusive education as the fundamental human right of every child with a disability. In line with the UNCRPD, there is a need to ensure that the NEP leads to renewed efforts towards greater budgetary allocation, a systems approach with co-ordination across Government departments, ending segregation of disabled children, and a focus on sustainable transitions to higher-education and employment. (

Sarkar Tanushree, 2020)

NSOU GE-ED-21 109 Initiatives undertaken by the Government of India cover a wide range of policies, plans, programmes,

58%

Chapter, I .doc (D110787435)

schemes and legal enactments related to persons with disabilities in the country. Although the Government of India has attempted to create numerous policies that are inclusive for people with disabilities since the country's independence in 1947, their implementation efforts have not resulted in an inclusive system of education, nor have they reached their goal of "Education for all" across the country.

Still, at present, the policies governing the education system are inclusive but, the problem is with implementation. The Government of India needs to bridge the gaps in their education system to build a strong system of inclusive education in India. 6.6 Summary Social relationships and supports (Instructional practices, facilitating social membership & relationship) have been discussed in this unit. Educators implement evidenced-based inclusive practices through multi-level instruction, multiple methods of assessment and modified outcomes in general education classrooms, when appropriate. Climate in the classroom is one of the determining factors in the development of practices in Inclusive Education. Many factors contribute to the climate in the classroom. Parents involvement in inclusive education programme builds positive relationships, encourages new behaviours, and increase self- satisfaction and optimism among themselves, their children and teachers. Such involvement of family is the key component which leads to student's and school's success. When families and community members are involved in student learning, students improve their academic performance and gain advocates that promote their success, helping them feel more confident at school and in taking on more rigorous classwork. Research has shown that high levels of parental involvement correlate with improved academic performance, higher test scores, more positive attitudes toward school, higher homework completion rates, fewer placements in special education, academic perseverance, lower dropout rates and fewer suspensions. Initiatives undertaken by the Government of India cover a wide range of policies, plans, programmes, schemes and legal enactments related to persons with disabilities in the country. 6.7 Self- Assessment Questions 1) Discuss on Leadership for Inclusive Education. 2) Write note on "Capacity Building of Teachers for Inclusive Education". 110 GE-ED-21 NSOU 3) Explain the Role of Indian Govt. in implementation of Inclusive Education. 4) Write the full forms of: RMSA, RCI, IEDC, UNCRPD, NEP. 5) Discuss the features of RPWD Act, 2016. 6.8 References Commonwealth of Pennsylvania. On an overall view of the problem, however, we feel that experimentation with integrated programmes is urgently required and every attempt should be made to bring in as many children in integrated programs.</p>

<p>The Integrated Education of Disabled Children (IEDC) 1974 The Ministry of Welfare created the Integrated Education of Disabled Children Scheme (IEDC) in 1974. The scheme provided children with disabilities "financial support for books, school uniforms, transportation, special equipment and aids," with the intention of using these aids to include children in mainstream classrooms. However, the government of India realized that providing structural changes to the classroom, such as adapted equipment, would not be enough to integrate children with disabilities into the classroom. Although it was encouraged and partly funded by UNICEF, fifty percent of the funding was supposed to go through the State Governments. The responsibility was transferred to the Department of Education in 1992. Despite the fact that this scheme was supposed to be nation-wide, it was implemented in only 10 out of 29 of the states in India. Sharma (2001) found three major problems with the IEDC. There was a lack of training and experience</p>		<p>the Integrated Education of Disabled Children Scheme (IEDC), not to be confused with the Integrated Child Development Scheme (above), in 1974. The program provided children with disabilities —financial support for books, school uniforms, transportation, special equipment and aids, with the intention of using these aids to include children in mainstream classrooms. However, the government of India realized that providing structural changes to the classroom, such as adapted equipment, would not be enough to integrate children with disabilities into the classroom. 	<p>Children with disabilities in the policy are primarily viewed as recipients of welfare and care in the form of peer tutoring, open schooling, and one-on-one teaching. There is a need to go further, to recognize disability as an identity and as a form of diversity rather than solely a deficit - an example of this would have been to suggest the standardization of Indian Sign Language as a valuable language system for all students, not just for 'students with hearing impairments.' That is, the educational challenges of children with disabilities stem from a rigid curriculum, inaccessible schools and classrooms, absence of modified assessments, and deficit perspectives that place limits on what disabled children can achieve. India has ratified the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) in 2007, which envisions free, quality, inclusive education as the fundamental human right of every child with a disability. In line with the UNCRPD, there is a need to ensure that the NEP leads to renewed efforts towards greater budgetary allocation, a systems approach with co-ordination across Government departments, ending segregation of disabled children, and a focus on sustainable transitions to higher-education and employment. CC-ED-05 Policy Perspective and Development of Indian Education (Pre-Independent)

D/Barun-2022/Netaji Subhas Open University/CC-ED-05 /Title New 2022/1/20.08.2022 PREFACE In a bid to standardise higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific, generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry acquired credits. I am happy to note that the University has been accredited by NAAC with grade 'A'. UGC (Open and Distance Learning Programmes and Online Learning Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor

NSOU ? CC-ED-05 11 1.2 Introduction In the earlier years of the nineteenth century, three parallel streams of education prevailed simultaneously in India, (1) the ancient indigenous system that used to be practiced in different forms down the ages, (2) education propagated by some Christian missionaries with the intention of spreading Christianity in India and (3) the newly introduced Western education brought in by the British to facilitate their administration and create skilled persons for industry. During that time, the hegemony of the British East India Company spread over the whole of Southern, Western and Northern India (with the exception of the Punjab and the Frontiers) gradually after they secured subsequent victories in Plassey (1757), Buxar (1764) and in the Anglo Mysore Wars (1766 to 1799) and Anglo Maratha Wars (1772 to 1818). The situation was such that no native power in India could pose a threat to the British company any longer. Thus being secured of their political dominance, the company gradually took steps to set up the new administration over the acquired territories. They had to take stock of the previous order of things. And slowly they realised that the field of education had to be brought under their administrative jurisdiction. These measures

54%

MATCHING BLOCK 1/233

W

of the East India Company gradually shaped the education system which came to be established in India during the British period

and thereafter.

71%

MATCHING BLOCK 2/233

W

The present system of education thus came to be established in India during the British Period in supersession of the traditional indigenous system

of education which had developed in the country through centuries past. We, therefore, propose to discuss, here, the character and extent of the indigenous system of education as it prevailed in India at the beginning of the nineteenth century (when the British Government may be said to have begun laying the foundation of the modern system of education), its merits and demerits and its potentialities to develop into a national system of education by suitable improvement and extension. Next we shall have a sneak peek into the nature of British educational policies in general so that we can understand their real objectives better when we study these policies in details in the later units. In the last part of this unit, we shall discuss the status of missionary activities towards spread of western education in Bengal and particularly look into the elaborate activities of the Serampore Trio and their various contributions in shaping up of Indian education system.

12 NSOU ? CC-ED-05 1.3 The Indigenous Education System in early 19th Century 1.3.1 Indigenous Education: Concept and Sources Human societies all across the globe have developed rich sets of experiences and explanations relating to the environments they live in. The prevalent education system of India has its roots in the British colonial period and their educational policies which discarded the traditional knowledge systems and confined formal education into the realms of western literature and sciences. These knowledge systems having their roots in old Indian philosophies and traditions which have been practiced by Indians from time immemorial and neglected by the British education policies are referred to as or Indigenous or local Knowledge. They encompass the sophisticated arrays of information, understandings and interpretation that guide human societies around the globe in their innumerable interactions with the natural milieu; in agriculture and animal husbandry; hunting, fishing and gathering; struggles against disease and injury; naming and explanation of natural phenomena etc. Concept of Indigenous Education The word 'indigenous' refers to something that is self acquired or self learnt and self owned, where the owner is also invested with the rights to use it according to his/her convenience and even make alterations in it. Indigenous Education stands for that 'local' knowledge which is the treasure of a given society and its culture. It is its cultural capital. Hence, it is passed on from one generation to another, chiefly or solely by word of mouth, practices, rituals, arts and crafts and a number of other aspects of daily life. Almost all aspects of life of the individuals in that society contribute to such accumulation of knowledge and learning. Local life experiences are used to learn survival and adaptation to the challenges of life. Sustainable life is the focus here. Indigenous Education is not informal learning alone but relates to the recognition and acquisition of traditional skills and knowledge that have been demolished or made redundant due to the introduction of modern systems of education. Sources of Indigenous Education It is fact that the sources of information regarding the character and extent of the indigenous system of education in the earlier half of the nineteenth century are extremely meagre. In the first place, the available sources refer only to British territories which, at that time, formed in a small part of India, and we have next to no data regarding the vast remaining area which was under the rule of several Indian potentates. Secondly,

NSOU ? CC-ED-05 13 our sources do not cover the whole of that area which was then under British rule. In Madras, an inquiry into indigenous education was ordered by Sir Thomas Munro in 1822 and the information obtained refers to all districts except that of Kanara. In Bombay, a similar enquiry was ordered by Mountstuart Elphinstone in 1823 and statistics were obtained through the Collectors for most of the Province while, in 1829, similar statistics for the Province- as a whole were collected through the Judicial Department. In Bengal, a special enquiry into indigenous education was conducted in 1835-38, under the orders of Lord William Bentinck, by William Adam — a missionary who had devoted himself to the cause of Indian education. Adam submitted three reports of which the first is a digest of the earlier reports on the subject, the second is a thorough enquiry of one Thana in the district of Rajshahi and the third gives statistics of five districts in Bengal and Bihar out of a total of nineteen. It will thus be seen that any conclusions regarding the indigenous system of education in India, as a whole, must be based on the assumption that the area covered by the three enquiries referred to above is a fair sample of the whole countryside. Such an assumption is obviously not very sound from the statistical point of view; but it becomes inevitable in the absence of any other data. What handicaps a student of history, however, is not so much the inadequacy of the area covered by these enquiries as their defects from the statistical or other points of view. The enquiries in Madras and Bombay were most unsatisfactory in so far as accuracy and thoroughness are concerned. Moreover, that they included neither all the schools in existence nor all the pupils under instruction. Adam's enquiries, on the other hand, were thorough and almost flawless. But they were conducted in a Province which had been- subjected to general anarchy for a very long time and where the system of indigenous education, as Adam himself pointed out, was everywhere in a state of decay. The observations of Adam, therefore, are not quite applicable to those parts of India which had the good fortune to enjoy a more or less settled Government. These defects in the investigation will, therefore, have to be duly allowed for in forming a fair picture of the indigenous system of education as it existed at the beginning of the nineteenth century.

1.3.2 Characteristics of Indigenous Education
 • Types of Institutions In the indigenous system, the Hindus and Muslims generally had separate schools of learning but there exceptions were seen too. However several important features were common to both the types of institutions. The indigenous educational institutions of this period were divided into five main types as under:

14 NSOU ? CC-ED-05 1. Pathshalas – These were meant to provide basic elementary education comprising the three R's –reading, writing and arithmetic to the children belonging to mostly Hindu family. 2. Maktabas – Similar institutions like Pathshalas but meant usually for the children belonging to mostly Muslim family. 3. Tols: They were the centres of higher learning and were involved in religious instructions through Sanskrit. 4. Madrasah - Centres of higher learning in Islamic theology and Arabic 5. Persian Schools – Largely secular institutions which taught Persian language as it Persian was the court language of the Mughals and was essential for getting roles in the administration. It is interesting to note that a Hindu teacher of Persian was not a rare phenomenon. Moreover, several Hindus attended Persian schools conducted by Muslims because Persian was then the Court language. In some of the Bengal districts, Adam even found that the majority of students in Persian schools were Hindus. Although Tols and Madrasahs, the centers of higher learning, were highly venerated by the people, they were really the weaker and less useful part of the educational system on account of their exclusive character, conservative tone and obsolete ideals and methods of instruction. The indigenous elementary schools like Pathshalas and Maktabas, the main agency for the spread of mass education, was a humbler but far more useful institution.

1.3.2.1 Learning in the Pathshalas and Maktabas • Students and Curriculum The instruction given in these schools was of a practical type, in local languages and mostly limited to the three R's. It catered, not to the needs of the priestly class, but to the mundane

73%

MATCHING BLOCK 4/233

SA chapter 1.docx (D29641812)

requirements of the petty zamindar, the bania, and the well-to- do farmer. The curriculum was very narrow and consisted of reading, writing, arithmetic (both written and oral)

and accounts. Unlike the Tols and Madrasahs, it is worthy of note that the pupils in these schools included a small percentage of girls and children of many

100%

MATCHING BLOCK 3/233

W

communities although the children of the upper classes formed the large majority. •

Teachers and teaching methods Its teachers were men of ordinary attainments and, very often, they knew no more than the little they taught in their schools. Their remuneration was much lower than

NSOU ? CC-ED-05 15 that of the teachers of Tols and Madrasahs, except in those cases, where the teacher was maintained by a rich person, consisted of small collections or occasional presents from parents of children who attended the school. Occasionally, some of the teachers in these schools followed some other profession or trade for their maintenance and conducted the school only as a side business. There was no fee in the modern sense, but each parent who sent his child to the school generally made some payment to the teacher — either in cash or in kind. The amount of the payment depended upon the capacity of the parent and even the time and mode of payment were left to his convenience. • Management of Institutions It had no religious veneration attached to it, and consequently, it had no endowments either from the State or from the public. Their equipment was extremely simple. They had no buildings and were held, sometimes, in the house of the teacher or the patron of the school, often in a local temple, and not infrequently under a tree. There were no printed books and the slates or pencils used by pupils were such as could be easily made in the locality.

90%

MATCHING BLOCK 5/233

SA chapter 1.docx (D29641812)

The hours of instruction and the days of working were finely adjusted to local requirements.

The size of the school was generally small — the number of pupils varying from one or two to ten or fifteen at the most. There were consequently no classes, no regular period of admission, etc. A pupil joined the school at any time, became a class by himself, followed his own pace of study, and left the school

100%

MATCHING BLOCK 7/233

SA chapter 1.docx (D29641812)

when he had acquired all that he desired to know

or the school had to teach. 1.3.2.2 Learning in the Tols and Madrashahs • Students and Curriculum These institutions of this period correspond to the colleges of modern type. They gave the highest instruction known, which, in those days, meant mostly religious instruction. Their chief object was to produce Maulavis and Pandits, and people were led to support them mainly by religious motives. Both were mediaeval in character, used a classical language as the medium of instruction (Sanskrit in one case and, Arabic in the other), and imparted instruction on traditional lines. The Tols were conducted almost exclusively by Brahmins and a very large majority of the students attending them were Brahmins. There were no women students nor any persons belonging to the large number of communities who were denied the right to study the sacred lore, i.e. the lower castes. In the Madrashahs, on the other hand, the teachers were generally Muslims.

16 NSOU ? CC-ED-05 • Teachers and teaching methods Both types of institutions were staffed by learned teachers, some of whom were authors of repute, but most of whom received very low remuneration. In both, instruction was mostly given gratis and no regular fees, as now understood, were charged. In both, the teachers were remunerated in one or more of the following ways, viz., grants of land made by rulers, occasional voluntary presents from pupils and members of the public, allowances paid by wealthy citizens, and payment in the form of food, clothes, or other articles. Lastly, both had a few teachers who not only taught gratis but also provided food and lodging to their pupils. • Management of Institutions Both kinds of institutions received pecuniary assistance from rulers, chieftains, and opulent or religious citizens. Generally speaking, the schools had no special buildings of their own. Where these existed, they were built either by the teachers themselves, or at the expense of patrons or friends, or by subscriptions from the people. In most cases, however, the schools were held in the local temple or mosque and not infrequently in the house of some local magnate or patron or of the teacher himself. The students entered the schools at a fairly early age and studied as long as they desired and often for as long as twelve years or more. It must be noted that the State had nothing to do with the day to day works of these schools. They were conducted by learned men individually who did so more for religious than for pecuniary considerations 1.3.2.3 The Monitorial System In bigger schools, there was in vogue a system under which the senior pupils were appointed to teach junior ones. It was this system that attracted the attention of Dr. Bell, the Presidency Chaplain at Madras, and which he

85%

MATCHING BLOCK 8/233

SA A186821001_Anjali Chawla_Thesis_Ph.D. History.docx (D154683600)

introduced in England as a cheap and efficient method of educating the poor. The system later came to be known as the Monitorial or Madras system in England.

Dr. Bell, the Presidency Chaplain at Madras, was the first Englishman to realise the value of the Indian system of teaching with the help of monitors — a system that prevailed extensively in the indigenous schools. Dr. Bell realised that the main advantage of the system was to enable the teacher to manage a large number of pupils at a time so that the spread of education could be effected at a very low cost. He, therefore, advocated the adoption of this system in England in a book entitled 'An Experiment in Education made at the Male Asylum at Madras, suggesting a system by which a school or a Family may teach itself under the superintendence of the Master or Parent' (1798). This book attracted great attention and eventually the Indian system was

NSOU ? CC-ED-05 17 almost universally adopted in England. This system, variously described as the Madras system, or the Monitorial system, was the chief method by which England achieved expansion of primary education at a very low cost between 1801 and 1845. 1.3.3 The Extent of Mass Education It appears that schools, particularly centres of domestic instruction, abounded in every part of the country and that some humble means of instruction or other was available even in very small villages where, for years together, the British administration found it difficult to establish and maintain even a primary school. The percentage of literacy was anything between 8 and 12 among the male adult population, or between 4 and 6 for the population as a whole. Certain of the higher castes were wholly literate in so far as the male adult population was concerned, while the women of all castes (with, a very few individual exceptions) and the entire population of several lower castes were wholly illiterate. 1.3.4 Merits and Defects The chief merits of the indigenous system of elementary schools were their adaptability to local environment and the vitality and popularity they had earned by centuries of existence under a variety of economic conditions or political vicissitudes. Their main defects were the exclusion of girls and Harijan pupils. To these may be added (although such a judgement suffers from the defect of imposing modern concepts of education upon an earlier period)

61%

MATCHING BLOCK 6/233

W

the lack of training or sound education among their teachers, their narrow and limited curriculum, and the severe form of punishment adopted.

Another feature that emerges from the study of the sources is that, at the beginning of the nineteenth century, the indigenous system of education was fast deteriorating on account of the prevailing anarchy or the growing impoverishment of the people under the British Rule.

1.3.5 Relevance of Indigenous Education

The preceding discussion regarding the character and extent of the indigenous system of education brings us to the final point, whether the system had potentialities which made it capable of being developed into a national system of education by suitable improvement and extension. In our opinion it certainly had these potentialities. We are led to this conclusion by two general considerations. Firstly, we find that, in most countries of the world which are now educationally progressive, the national system of education was built up on the foundations of "the traditional system— in spite of its admitted and numerous defects. In England, for instance, mass education was spread by gradual expansion and improvement of the defective voluntary schools which already existed. A great authority like Sir Michael Sadler justifies the wisdom of this step and pays a tribute to their valuable contribution to the development of mass education in England. He says, "Although the teachers were, as a rule, not trained, and often unable to impart knowledge, although the buildings were frequently not suitable for schools, the books deficient in numbers and quality, the attendance of the scholars very irregular, yet the first step not only had been taken but the children had been accustomed to school life". What the voluntary school did to the cause of mass education in England, the indigenous schools could certainly have done to the cause of education in India as a whole, if only those in authority had seen their way to help them to live, expand and improve. Secondly, our view is also supported by that of several British officers and workers. Adam, for instance, was thoroughly convinced that a national system of education could be built up in India on the foundation of the indigenous schools. He said "Existing native institutions from the highest to the lowest, of all kinds and classes, were the fittest means to be employed for raising and improving the character of the people, that to employ those institutions for such a purpose would be the simplest, the safest, the most popular, the most economical, and the most effectual plan for giving that stimulus to the native mind which it needs on the subject of education, and for eliciting the exertions of the natives themselves for their improvement, without which all other means must be unavailing". Other plans for the development of the indigenous institutions were prepared or suggested by several administrators and educationists, such as Munro, Elphinstone, Thomason, Leitner, and were described in detail in several documents on educational policy

88%

MATCHING BLOCK 9/233

SA Kaneez Aysha MEd .docx (D136863451)

such as the Despatch of 1854 or the Report of the Indian Education Commission, 1882-83.

These will be dealt with in due course. But these proposals mostly went unheeded; the officials of the Education Department allowed the indigenous system to die and spent their time and energy in creating a new system of education, ab initio. Before we end this discussion of the indigenous educational system of India, we would like to point out with pride that the indigenous schools of India contributed the idea of the monitorial system to England. Historians talk only of England's contribution to Indian Education and they generally ignore the great contribution which was made by India to the spread of education among the poorer classes of England herself. It is an irony of fate that the indigenous schools of India should thus

NSOU ? CC-ED-05 19 contribute to the spread of education in England and be of no avail in spreading mass education in India herself!

1.3.6 Measures of Improvement of indigenous schools

In his famous reports which is the primary source of information about education in this period, Adam described the proposed working of his plan for the improvement of indigenous schools in the following seven stages: — a. The first step was to select one or more districts in which the plan could be tried as an experiment. b. The second step was to hold a thorough educational survey of the district or districts selected more or less on the same lines on which he had conducted his investigations. c. The third step was to prepare a set of books in modern Indian languages for the use of teachers and pupils. d. The fourth step was to appoint an Examiner for each district as the chief executive officer of the plan. His duties would be to survey his area, to meet teachers, to explain the books, to conduct examinations, to grant rewards, and generally to be responsible for carrying out the plan successfully. e. The fifth step was to distribute the books to teachers and stimulate them to study them by the holding of examinations and the granting of rewards to those who passed the tests. Adam also recommended the establishment of Normal schools where teachers of indigenous schools could be encouraged to study from one to three months a year for about four years so that their qualifications could be improved without inconveniencing their pupils. f. The sixth step was to encourage the teachers to impart the newly acquired knowledge to their pupils by holding examinations for them and by granting rewards. g. The seventh step was to grant endowments of lands to village schools in order to encourage teachers to settle down in villages and to educate the rural children. Adam pointed out several sources from which such gifts of land could be made or secured by Government.

1.3.7 Critical Evaluation of Indigenous Education of the early 19th Century

The modern educational system in India should have been built upon the foundations of the indigenous system, and the efforts of our educational administrators should have been directed to the improvement of these institutions and to their incorporation

20 NSOU ? CC-ED-05 in the modern system of education. But this was never done. On the other hand, some attempts were made to encourage the schools of learning which were admittedly the weaker side of indigenous education, but even these were soon abandoned. The vast network of elementary schools never received the attention it deserved at the hands of Government. In spite of the exhortations of thinkers like Adam, Munro and Thomason, the directions of the Despatch of 1854 and the strong recommendations of the Indian Education Commission, indigenous elementary schools were either killed by ill-planned attempts at reform, or destroyed by deliberate competition, or allowed to die of sheer neglect. The results have been disastrous. It is time that attempts were made by the officers of the East India Company, and later by the Education Departments, to create a new system of education in India. For several reasons, the process was slow, and it could hardly compensate for the loss of the indigenous schools, with the result that the educational position of India in 1921 was hardly better than that in 1821. In the meanwhile, other nations of the East and West, whose educational advance was equal, or even inferior to that of India in 1821, made such rapid advances that India soon lost her position of vantage in the comity of nations and became one of the most educationally backward countries of the world!

1.4. British Government Policy on spreading Education in India

1.4.1 Education policy and British India

Thus indigenous education system was not patronized by the policies of the British East India Company and later on the British Government too followed similar attitude. These policies were many in number and were introduced one after the other over a long period that covered most of the nineteenth century. However if we look closely, we may find several inherent factors common to all these policies. Thus before proceeding further we should have a sneak peek into these policies and education policy in general, before studying each policy in details later on. Education policy consists of the principles and policy decisions that influence the field of education as well as the collection of laws and rules that govern the operation of education systems. Education policy analysis is the scholarly study of education policies. It seeks to answer questions about the purpose of education, the objectives (social and personal) NSOU ? CC-ED-05 21 that it is designed to attend, the methods for attaining them and the tools for measuring their success or failure. Research intended to inform education policy is carried out in a wide variety of institutions and in many academic disciplines. The academic disciplines draw from and influence theory, frameworks and analyses developed in the social sciences. An education policy helps to understand how education systems function. The tradition of Indian education system was for developing every aspects of life. This system talked about the concept of eternal, infinite, invisible principles which binds the whole universe, which is the source and fountainhead of all religions. This system tried to inculcate a religion which binds man with man, a regulated principle which govern each sphere of life, a total configuration of ideals, practices and conduct implying duties, morality, virtue etc. There was no specific educational policy in India before the colonial period. The concept of policy of education became popular with the help of Britishers. At first the Company's government was not willing bring about change in Indian education system. The basic objective was to stabilize the political authority. But after the permanent settlement and English Industrial revolution they had to adopt a new attitude to the Indian education system. Various initiatives were taken, new policies emerged. These steps changed the scenario of Indigenous education system of India.

1.4.2 Background of British Government policies

The Charter Act 1793 made only fairly minimal changes to either the system of government of India or British oversight of the Company's activities. This Act did not focus in the education system. The beginning of the policy of education in India under the British rule may be traced back to the year 1813.

1.4.2.1 Charter Act of 1813

In this Charter Act, East India Company was compelled by force of circumstances to accept responsibilities for education of Indians. The Charter Act of 1813 devised as well as extended the power of direction and superintendence of board of control. One of the most important steps of the Charter Act of 1813 was that a sum of rupees one lakh annually was to be provided by the company

100%

MATCHING BLOCK 10/233

SA Bijendra_AI&AS.docx (D116982346)

for "the revival and improvement of literature" and "encouragement of the learned natives of India".

This step was taken for acceptance of the principles of state responsibility of education. Missionaries got the full freedom to propagate Christianity and to expand education in India. The structure of indigenous education system lost its priority and popularity.

22 NSOU ? CC-ED-05 The main object of this Act was to extend the control of the company over India for another twenty years.

80%

MATCHING BLOCK 11/233

SA acc-111.pdf (D17251357)

The vagueness of Clause 43 of the Charter act of 1813 intensified the Oriental- Occidental controversy in India. Since the dawn of

the 19th Century there had emerged two groups - one of them comprised of the Orientalist or Classicists who wanted to promote the traditional education of India

100%

MATCHING BLOCK 12/233

SA acc-111.pdf (D17251357)

through the medium of Sanskrit, Arabic and Persian whereas the other group was of Anglicists or Occidentalists who were in favour of developing Western education in India through the medium of English.

This controversy helped to establish Western education system in India. 1.4.2.2 Charter Act of 1833 This act abolished the work of the East India Company as a commercial body and the company became purely an administrative body. Modern civil service in India was introduced by this Act. The Act separated the legislative functions of the Governor General in Council from the executive functions. By 1830 the General Committee of Public Instruction which consisted of 10 members, had among them some young men who were profoundly influenced by the utilitarian ideas of James Mill and Bentham and were in no mood to support the committee's work for promotion of Oriental culture and learning in India. With the departure of Horace Hayman Wilson from India in January 1833, the Orientalists lost one of their staunch supporters while the Charter Act of 1833 which

95%

W

was appointed president of the General Committee of Public Instruction by Lord William

Bentinck, the then Governor General of India. Macaulay presented his lengthy minutes to Lord Bentinck in 1835. In these minutes he advocated education of the upper classes in India and made a religious plea for spreading Western learning through the medium of English. Lord Macaulay thought that

74%

MATCHING BLOCK 18/233

SA acc-111.pdf (D17251357)

it was possible through English education to bring about a class of persons, Indian in blood but English in taste, in opinions, in morals and

intellect.

NSOU ? CC-ED-05 23 The minute was accepted by Lord William Bentinck and it opened a new chapter in the educational history of India. 1.4.2.3 Woods Despatch of 1854 Richter has described the Education Despatch of 1854 as the Magna Carta of Indian education in his 'A History of Missions in India'. An analysis of the objectives gave a concept of the aims of British Education Policy: 1. English education would be so bestowed as to develop the agricultural resources of India so that she might ensure a perennial supply of raw materials for British industries and might become an endless market for consumption of British industrial goods. Thus education must strengthen the colonial economic relationship. 2. The immediate and more concrete objective would be the preparation of servant personnel for employment. Clerk making education was thought of and a direct link established between education and clerical employment. 3. This Despatch made an explicit declaration in favour of secular instruction. The indigenous education system helped to inculcate moral values but this new education system did not pay attention to developing moral values. Education became mechanical or a system where a bunch of clerks would be produced. 1.4.2.4 Downward Filtration Theory The Despatch regretted the Downward Filtration Theory and declared that "upper classes can stand on their own legs". Hence the government's attention would be turned to the needs of the masses. This process was the process of specialization to Mass education. The ultimate aim of this theory can be traced in

94%

MATCHING BLOCK 19/233

SA

(D154683600)

the statement of Lord Macaulay "We must at present do our best to form a class who may be interpreters between us and the millions whom we govern - a class of persons Indian in blood and colour but English in taste, in opinions, in morals and in intellect. To that class we may leave it to refine the Vernacular dialects of the country, to enrich those dialects with terms of science borrowed from the Western nomenclature, and to render them by degrees, fit vehicles for conveying knowledge to the great mass of population"

Downward Filtration Theory, this policy is found stated in three different forms and these forms indicated the aims of the Britishers.

According to the first form the company desired on the analogy of aristocratic

24 NSOU ? CC-ED-05 classes in England to educate only the upper classes of the society with a view to create a governing class in India consisting of Sardars, Nawabs, Rajas and such other aristocratic classes. This attempt was hardly a correct interpretation of the early official attempts to spread education. But they did not realise the background of the society structure was completely different in India. Then the second form of the Downward Filtration Theory was that in which the upper or influential classes of society were proposed to be educated first because it was argued, their culture would later on naturally descend to the lower classes. This concept adoption by the officials of this period, 1830's did give a setback to educational progress. There was a third form of the Downward Filtration Theory which was of far greater importance to the students of history of education in India. The main aim of this form, the company was expected to give a good education (which then necessarily meant education through English) to only a few persons (these may or may not be from the upper classes) and left it to those persons to educate the masses (through modern Indian language). It was on this view, rather than on the idea of creating a governing class in India or of exclusively educating the upper classes that most of the early official attempts in education were based. It decided to educate a class of persons in English as a means of ultimately educating the masses. Britishers thought that English knowing class helped to assist Britishers to gain control over the colony. Their main aim was not to educate masses. The aim was totally political. The development of India was not a priority. They made educational policies for strengthening the power over the country. 1.4.2.5 The Hunter Commission After the war of 1857 the rule of the East India Company was ended and the rule of the British Crown was established. Thus, the policies and responsibilities of education got transferred from the company to the parliament. A Commission was formed in 1882 under the chairmanship of William Hunter who was the member of the Executive Council of Governor General in India. This Commission was commonly known as Hunter Commission. This Commission was appointed by Viceroy Lord Ripon with the objective

96%

MATCHING BLOCK 20/233

History of Education In India, Block-1.pdf (D161180427)

to look into the complaints of the non implementation of Wood's Despatch of 1854.

This Commission submitted its report in 1882. At this time Britishers tried to emphasize the growth of primary education as well as whole school education. They tried to evaluate the efficiency of the grant in aid system and private institutions. This policy encouraged the establishment of local

D:\Barun-2022\Netaji Subhas Open University\CC_ED_05\20.08.22\24 NSOU ? CC-ED-05 25 Boards, Councils in all the provinces of India. Primary education was declared to be an obligatory duty of these local bodies though Secondary and Higher Education was not excluded from their activities. This policy ensured that the majority of the indigenous schools were died. The revolt put a question mark in the enriching Indigenous system of education and new system of education was created. Girls' education, new methods of teaching, training of teachers etc. were introduced through this policy. The report of the Hunter Commission gave a new concept of the education system. Western education was emerged through the various policies of the government in the colonial period. 1.5. Serampore Trio: Missionary Activities and their contributions in spreading Education in the region 1.5.1 State of Missionary activities in 18th century India The above discussion on the salient features of the British educational policies was done to provide the students an insight into what they will study in details in the next sections. As said earlier in the early nineteenth century alongside the prevalent indigenous education system and the nascent stage of British policies of education, the third stream of education was provided by the missionaries. So let us go back into the start of missionary activities in India during 18th century and trace how that developed into a network of educational institutes, some existing today even. By the end of the 18th century the number of English residents increased to a considerable extent. Their children required to be educated in English schools. Indians also felt the urge for Indian education. But the Missionaries on account of their strained relation with the company when not enough position to fulfill the need. Private non Christian enterprise ventured into the field.

During the decade that followed the Charter act of 1793 the evangelicals in England focussed their attention towards finding some means of avoiding the restrictions imposed on the passage of Missionaries to India by the terms of the Act. William Carey a Baptist missionary and a Shoemaker by profession was sent to India in 1793 in a Danish ship by the London Baptist missionary society

under the inspiration of John Thomas. He appointed Ram Ram Bose and his Munshi.

in 1780. With the help of proper manufacturing and printing press which should begin to receive large commissions from the company's establishment in Bengal they carried on their work for dissemination of education among the people of Bengal.

William Carey, Ward, Joshua Marshman who worked together earned the epithet the 'The Serampore Trio'. 1.5.2 The Serampore Trio • Goals of Serampore Trio The background of Indian education before the Serampore Trio came to India should be discussed here.

88%

MATCHING BLOCK 26/233

Indian education had always been, since the Vedic age, of classical and spiritual nature rather than of

practical nature. The trio became an important part of introducing Western education in India. To trace the causes of their arrival the condition of education at the time should be scrutinized. In ancient India,

100%

MATCHING BLOCK 27/233

learning among the Hindus had been the monopoly of the high, especially of the priestly Castes. The learned Brahmins gathered students from various parts of the country and

taught them in the homely atmosphere of their Tols and Chotuspathis.

61%

MATCHING BLOCK 30/233

For primary education, there were in the villages Pathshalas and Maktabas where the Gurus and Moulavis imported a knowledge of the three 'R's to the boys of the locality. Madrasahs were known as higher education centres. The aristocracy did not send their children to

the school

90%

MATCHING BLOCK 31/233

SA chapter 1.docx (D29641812)

but preferred to educate them at home. There was no school for the education of the girls though the zamindars often had their daughters educated at home. The majority of the Indians were unwilling to educate their girls on account of social prejudices and superstition and lower classes

of the society could not afford the education. From the second half of the 16th century there was a spate of missionary activities throughout the world. The arrival of the Missionaries took place in India at the hands of the European powers. After the Battle of Plassey 1757 not only British sovereignty was established in India, but laid the surest foundation for that inevitable development. The rise of political responsibility after 1765 where increased and it influenced the work of the Missionaries freely the objects of the Missionaries were:

NSOU ? CC-ED-05 27 I. To provide education for Europeans and Anglo Indians. II. Observance of the religious rights of Company's employees. III. To develop mass contacts and thereby extend the influence among Indians. The Missionaries found it advantageous to adopt the traditional indigenous type of Elementary School best known to the masses of converts of course with necessary modifications. The Missionaries partially filled the vacuum caused by the decline of traditional education. The Missionaries schools were open to all comers and they tried to break down educational caste barriers. The nature of missionary work in these two phases differed from each other. The Missionaries tried to introduce some improvements and modern elements which became helpful to introduce Western education. They helped the transition of education from the medieval to the modern phase. The British government at first took but little interest

66%	MATCHING BLOCK 28/233	W
in the development of education. Warren Hastings adopted a distinctive policy to increase British influence		

with the people and to find access to the masses for establishing a bond. He encouraged the revival of Indian learning. The Company

100%	MATCHING BLOCK 29/233	W
adopted a policy of benevolent neutrality in social, religious and cultural affairs		

with the object of wooing Indian opinion. Warren Hastings established the Calcutta Madrasa in 1781 (the institution still exists) with Islamic theology, law, arithmetic as curricular subjects and Arabic as language. Inspired by the same spirit Sir William Jones founded the Asiatic Society of Bengal in Calcutta in 1784 and the Sanskrit college was established at Banaras by the Resident Jonathan Duncan in 1792. This was the early beginning of orientalism. But there was no proposal or even a remote suggestion of establishing a system of education under government supervision or control. The followers of orientalism believe that the company must not lend any support to missionary enterprise and to proselytizing. This view was influenced by political rather by educational considerations. The idea of setting up a network of schools for teaching English was first mooted by Charles Grant, a Civil Servant of the company. He wrote in 1792 a small propaganda treatise "

96%	MATCHING BLOCK 32/233	SA Sonia_Chap_123 (1).doc (D141132453)
Observations on the state of society among Asiatic subjects of Great Britain". In		

his 'observation' he made out a case for western education and freedom of missionaries. He tried to explain that Indians suffered from ignorance and Christianity and western education would rather bring enlightenment among Indians. These two factors also worked as a bridge between the rulers and the ruled. Grant, on his return to England tried to persuade the House of Commons and the Court of Directors to his view but without success. But his words created some impact upon the English mind. During renewal of the companies charter in 1793 Mr Wilberforce moved the parliamentary bill demanding free access of teachers and preachers to India on the

28 NSOU ? CC-ED-05 plea that it was the 'bounden duty of Englishmen to promote the happiness and interest of Indians by religious and moral improvement and the spread of useful knowledge'. The British Parliament however negated the Wilberforce motion on political and financial grounds. The honour of being the first protestant Missionaries to work in the territories of the East India Company goes to the Danish mission. The famous pioneers of this mission, Ziegenbalg and Plustschau started their activities at Tranquebar, a Danish station in the south in 1706. Ziegenbalg and his colleagues did various works related to missionary and education field. A printing press in Tamil was established in 1713. An institution for training teachers was opened in Tranquebar in 1716 and in the following years, two charity schools were open in Madras - one for Portuguese and the other for Tamil children. In 1742, Kiernander founded charity schools for Eurasians as well as Indians and in and near Fort St. David. His work became so popular that Clive invited him to Calcutta where in 1758 he established a charity school. Kiernander continued to work in Bengal for the rest of his life and gave some pioneer service to that province which Ziegenbalg did to Madras. Schwartz also played an important role in the education of Madras. He founded a school for European and Eurasian boys at Trichinopoly (about 1772) and an English charity school at Tanjore with the help of the purse presented to him by Haidar Ali of Mysore. With the assistance of John Sullivan, the Resident of Tanjore, he started three schools at Tanjore, Ramnad, Shivganga in 1785. The mission schools used Indian languages and English language as means of communication. These features made them special. Their works were very important for introducing printing press in India. Political equation changed rapidly day by day and this reflected on British attitude causing quick shifts in policy from cooperation to non cooperation and again to cooperation with the missionaries. Although official thought on education till the first decade of the 19th century was not tuned to the theme of Western education, socio- economic forces and cross current had been already operative in Indian life, gradually preparing the field for the same. Calcutta developed as an important centre of British Administration and after the Battle of Plassey enhanced importance. Important offices of the companies Government and the Supreme Court were located in Calcutta. Many people associated with these offices became residents of Calcutta. It became a great combination of castes, creeds and colours. Introduction of a new economy, particularly the permanent settlement created problems of employment. These people depended upon their intelligence and education.

NSOU ? CC-ED-05 29 Thus arose the intellectual Baboo societies and these people tried to learn English. They introduced a new culture pattern. The gradual introduction of new type education may be traced back to the early years of the 18th century. A start had been made by Captain Bellarmy in 1720. Kiernander founded his school at Mission Church Lane in 1758. The socio economic conditions made a situation for knowing English. Sri Ram Lochan Ghosh of Pathuriaghata was the first English knowing Bengalee. By the end of the 18th century the number of English residents increased to a considerable extent. Their children required to be educated in English schools. Indians resident in Calcutta and around and in close association with the English, and particularly the Baboos failed the urge for English education. Private non-Christian enterprises ventured into the field. In the opening years of the 19th Century the London Missionary Society established schools at Chinsurah and Visakhapatnam. The Wesbyan mission established schools at Agra, Surat, Meerut, Calcutta Tranquebar etc. In 1800 AD, the Fort William college was established. The changing situation of the political system in India triggered the change of the education system. These changes influenced the arrival of Carey in India. This situation help the trio to emerge as an influential power of introducing Western education system in Bengal. 1.5.3 Important Activities of the Trio Although Serampore trio came mainly for the purpose of preaching Christianity they dedicated themselves to the ailing and poor people in and around the town spreading education, social reforms and social reconstruction as well. • Establishing printing press The trio established the Serampore Press in 1800 AD. The first leaf of the Bengali New Testament was published in Serampore. A. D. Charles Wilkins had been skilled in printing and had been in search of Bengali blacksmith to develop Bengali types. Panchanan Karmakar gave such types and advanced the cause of the Bengali press. Earlier the letters were first printed by making wooden blocks in English. But later the English and Bengali fonts were made of metal. Iron printing press slowly was replaced by the wooden printing press with the help of The Trio. Manohar Karmakar, the son-in-law of Panchanan was exceptionally skilled in the works of foundry and within a very short period fonts of Maratha, Tamil, Telugu, Chinese, Arabic, Urdu, Persian etc. were being developed at Serampore Mission Press. Serampore Mission Press is the father of printing technology in Bengal. Though

30 NSOU ? CC-ED-05 printing press was available in Calcutta in the pre-mission period, printing technology had a surprising uplift with the efforts of the Serampore Mission. The Ramayana and the Mahabharata the epics were published from Serampore mission press in 5 and 3 volumes respectively. • Educational Institutes William Carey established a charity school for the boys at Mudnabutly. After moving to Serampore in 1800 he established a school with hostel facilities for foreign nationals on payment of fees and on the other hand in June 1800, he started a school to give free education to the natives. Carey and Marshman established the Calcutta Benevolent Institution in 1810. By 1812, at least 10 missionary orders were operating in India's educational field. By 1815, more than 20 schools were established by the trial alone (majority of them hybrid in 30 miles from Calcutta). By 1817 there were 115 schools. They encouraged girls to attend school. In 1822 a separate school for girls was established by them. In the north-east in 1829, a school at Guwahati was set up. In 1818 the trio founded Serampore College and they encouraged the college to instruct Christian and non Christian Indian youth in western arts and Sciences and to train teachers. One of the major objectives of the college was to offer secular higher education. This was the first English Missionary College in Bengal. It was raised to the status of deemed university in 1827 with the authority to award degrees. The privilege of awarding degrees in Divinity is still enjoyed by the college. • Literary works Translation and publishing of the Bible, mainly the New Testament, was one of the important works of the Trio. In 1801 Carey translated the New Testament into Bengali. Subsequently it was translated into 31 Indian languages. Carey's Bengali grammar came out that year. In 1801 was published the 'Kathopakathan' (Colloquies). The Old Testament the Krittivas Ramayan and Kashiram Das' Mahabharat where printed in 1802. In 1803, 1807 and 1809 came out parts of the Old Testament which were used as textbooks in Fort William College. Carey learnt the language of the people to understand the people and their culture. After he learnt Bengali he contributed to the development of Bengali literature 'Itihaasmala' (1812) was a collection of 150 popular anecdotes. Carey's Anglo-Bengali dictionary in 5 volumes with 80 thousand words was prepared between 1815 and 1825. Translation of the anatomy section of Encyclopaedia Britannica came out in 1820 as 'Vidyaharavali'. He also wrote Marathi and Hindi prose. Carey was also appointed Head of the department of Oriental languages at the Fort William College.

NSOU ? CC-ED-05 31 • Journalism The Trio also successfully worked in the field of journalism. The first newspaper Hickey's Bengal Gazette was brought out in 1780. This pathfinder encouraged the Missionaries of Serampore. They launched newspapers 'Samachar Darpan' and 'Friends of India' to fight against social injustice. Samachar Darpan, weekly newspaper in Bengali is the first ever newspaper to be printed in Oriental language. 'Friends of India' can be accredited as India's first ever for social journalism. In it eyewitness accounts of Sati were published. 'Dig Darshan' was published by the Serampore mission in 1818. Many articles like 'Discovery of America', 'The Geographical areas of Hindustan' and so on were published here. These initial successes in journalism opened the floodgates for publication of other journals in quick succession. Their work in the field of journalism was remarkable. • Contribution in Bengali literature With the help of the trio, Carey Sahib's Munshi Ram Ram Bose had written the 'hymns' and wrote the Gospel messenger (a 100 line poem). In 1803, he gave biographical sketch of the Christ. He also wrote Raja Pratapaditya Charita (historical biography) and Lipimala. On the other hand Joygopal Tarkalankar also served at Serampore. His literary contributions like Shiksha-Sar for boys (1818), Kavikankan Chandi (1819), Valmiki Ramayan (1830-39) Mahabharat (1836), Bengali Dictionary (1838) etc not only enriched the Bengali literature, most of works were printed in the Serampore Press. The trio gave important contribution in the growth of Bengali literature. • Social reforms

100%

MATCHING BLOCK 33/233

SA

INDIAN RENAISSANCE WOMEN IN HISTORICAL PERSPEC ...
(D113343803)

Not only in the field of education, but also in

the field of social reforms, the functions of the trio were important. In the first half of the 19th Century various social evils and age-old superstitions were practiced in the society. Carey played an important role in removing child infanticides. It is said that Lord Wellesley deputed William Carey to enquire into the sacrifice of children. And on the basis of his report in 1802 Wellesley passed a regulation prohibiting the practice of sacrificing children by throwing them into the sea. Carey also raised his voice for prohibiting Sati practices. Even though the government did not want to interfere in the religious affairs, Carey never gave up. He kept writing to the government and through newspapers, he tried to awaken the people. Later Raja

32 NSOU ? CC-ED-05 Ram Mohan Roy and other intellectuals raised their voices and William Bentinck issued an order in 1829 prohibiting Sati in the British territories in India. Carey also founded an asylum for lepers in Calcutta. ● Horticulture Carey was very much interested in Horticulture; he gave many botanical names to plants. The names which were given by him remain unchanged even today in the botanical scholar's circle. He was known all over England as a botanist and horticulturist. Some of the botanical names given by him or as follows: onion, garlic, clove etc. Carey was amazed at the agricultural potentials in India but disheartened to see the poor state of agriculture and poverty of the peasants in general. In 1811, he published his findings in a paper entitled 'State of agriculture in the district of Dinajpur' in Asiatic Researches. His concern led to the ultimate foundation of the Agri-horticultural Society of India in 1820. He started the Botanical Society of Calcutta, today it has grown to be the government organisation. The functions of the Serampore trio were various. They landed in Bengal which had barbaric practices like infanticide and Sati and it was their calling to adapt to the culture of the society by offering education and enlightenment to the people. Their functions in the field of education, journalism, social reforms were unforgettable. 1.5.4 Contributions of Serampore Trio The activities of Serampore Trio are one of the most inspiring activities in the era of 19th century Bengal. Educational facilitates an individual with an illumination of the world through the process of living and growing knowledge which inspires an atmosphere of creative activity. Overcoming social obstacles, the Serampore trio were able to spread education. Not only they established schools and colleges, they also introduced a new path in the history of Bengali literature. 1.5.4.1 Fort William College Fort William College and the Trio also played an important role in the field of education. William Carey became the head of the Bengali department of this college. He recruited a lot of famous persons like Mrityunjay Vidyalankar, Rajiv Lochan Mukherjee, Kashinath Tarkapanchanan, Tarini Charan Mitra, Ram Ram Bose etc. A number of books were supplied by the Serampore Press which set an example and influenced Bengali literature a lot. With the help of the Trio a new creation was observed in Bengali grammar and

NSOU ? CC-ED-05 33 dictionary, writings in Sanskrit, Marathi, Odia, Assamese, Punjabi, Karnat, the Bible in Bengali and other languages textbooks and other books of interest including agriculture, geography, botany, zoology etc The trio had initiated the publication of school and college textbooks; most of the books used in the college were printed at Serampore. 1.5.4.2 Women Education In the 19th century the condition of women's education was very poor. Women could not attend schools. Their education was very much neglected. But the Trio realised the pain in the situation. In 1819 Carey established a girls school at Serampore. The Serampore Mission was a Pioneer in promoting education for girls. Within 6 years, 12 schools were opened and 300 girls received education. Female Juvenile society was established. 1.5.4.3 Introduction of new type of education Trio's activities gave birth to a new beginning in the field of language literature and education. It affected the whole cultural life of Bengal and prepared the base of a new type of education. Their works influenced the other missionaries and later Macaulay's Minute was also influenced by their activities. So the base of Western education was introduced primarily by the trio's activities. Various private institutions emerged by the influence of the trio's work. Arratoon Peter School (1801), L Schnabel's School (1802), Anandiram's School for Hindus (1802), Ramnarayan Mitra School at Jorabagan, Khem Bose's school at Pathuriaghata, Nityanand Sen's School Koolootala (1808) were few of them. It is to be noted that many of the schools of the period were started by Indians. This tempo led to the establishment of Hindu Vidyalaya in 1817. New type of education system emerged slowly. 1.5.4.4 Secular Education The Trio tried to spread education among Indian masses. At that time illiteracy was at its peak. A majority of the Indian masses did not know even the basic 3 Rs (reading, writing, arithmetic). This situation was worse for the masses. Oppressors took advantage of the illiteracy of the masses. The first Bengali Medium School for boys was started in 1800. A large number of schools were established. They encouraged to spread secular education among these institutions. The Serampore trio's secular trends to the taste of time and was incorporated as one aspect of the government's educational policy.

34 NSOU ? CC-ED-05 1.5.4.5 Serampore College Serampore College, the oldest institution importing western education in India is a living memorial to William Carey Joshua Marshman and William Ward. This college was founded in 1818. The aim of the trio was to produce a class of enlightened men conversant with both the classical literature of India and the best western learning of the day, and in particular to raise educated men to serve and lead the Indian Church as ministers and teachers and the other walks of life. They proposed an Art and Science College with a Theological department. It was to be a place where Christian and non Christian students rubbed shoulders together. The curriculum was Sanskrit, Arabic, Bengali, English, medicine and natural science and in the early years of the college most of the subjects were taught in Bengali. In 1827 this college got the right to give degrees. This college was the milestone of Western education in Bengal. 1.5.4.1 Mass education and development of villages Before the arrival of the trio the education system was limited among the wealthy people like the Zamindars, Kings and the education of the masses was neglected. Carey and other Missionaries felt the pity of the people and they established various institutions in the villages. Previously there were seldom any institutions in the villages. So the villages began their journey towards development. The trio's contribution in Mass education was unforgettable. Trio's contribution is not only limited in the field of journalism, education, literature; the socio-political life was also influenced. That traditional Varnasramic society lost its popularity. Caste aristocracy was being fast replaced by monetary aristocracy. A 'Baboo' culture was fast developing in Calcutta. New trends of society and education prepared the stage for western education as well as the Bengal Renaissance. 1.8 Summary ♦ Indigenous education means the local and traditional knowledge systems that prevailed in India before the colonial period and has its roots in ancient Indian philosophies and ways of life. ♦ Sources of indigenous education in the early 19th century are very meagre. Primary three sources are the reports of three enquiries conducted by Sir Thomas Munro, Mountstuart Elphinstone and William Adam in Madras, Bombay and Bengal provinces respectively. They were entrusted to conduct these enquiries by the Company administration so that their efforts can help the British to know about features on Indian education systems.

NSOU ? CC-ED-05 35 ❖ Indigenous education was imparted in mainly two categories of institutions - Schools of learning which provided higher education and Elementary Schools. Schools of learning comprised of Pathshalas for Hindus and Madrasahs for Muslims whereas elementary schools included Tols, Maqtabs, Persian schools and schools teaching through modern Indian languages. ❖ In the schools of learning, usually the Hindu and Muslim boys chose to study and teach in respective institutions attached to their religion because the instructions provided were mostly religious and in either Sanskrit or Arabic or Persian. Neither fees were charged from students nor did teachers have any fixed salaries. Chief sources of educational finance were voluntary gifts from citizens in cash or kind and pecuniary assistance from rulers and the religious citizens. ❖ The elementary schools were the main agencies of mass education and the instruction given was of practical nature like arithmetic, reading, and writing in local languages. Some girls attended too. Neither were there any students' fees nor teacher's salaries. Teachers depended on occasional presents from the parents of the students and since they had no religious veneration, the state or the general public did not support them. Thus infrastructure and equipments were poor and minimal. Here, senior pupils were appointed to teach junior ones and this system was later on developed by Dr. Bell, the presidency chaplain of Madras and adopted in England as the Monitorial system. ❖ The percentage of literacy was 8-12% among the males and 4-6% for the entire population as females and the dalits were almost completely excluded. But the most important potential of this type of education was that it was connected to the country's roots, was adaptive to local needs and if it would have been properly nourished by the British administration, Indian education's foundations would have been much stronger and the country as a whole would have progressed much further. ❖ The next subunit tried to highlight the various aspects of British government policies on spreading education in India. ❖ The concept of Educational policy and the background of indigenous education system was discussed. Then the background of the policies were told in details where the Charter Act of 1813, Charter Act of 1833, Wood's Despatch, Downward Filtration Theory, Hunter Commission were highlighted. The brief idea of the main aims of British Educational policies were discussed chronologically. This unit will help to build a concept about government educational policies.

36 NSOU ? CC-ED-05 ❖ In the early nineteenth century three types of education were running in parallel in India. One was the indigenous institution as discussed earlier, the second was the education governed by various British policies and the third was that imparted by the Christian missionaries. The various British policies undertaken in the first half of the nineteenth century and their underlying objectives will give a understanding about the intentions of the British Company behind framing these policies. ❖ The first educational initiative of the British can be found in the Article 43 of The Charter Act 1813 in which a sum of rupees one lakh annually was to be provided by the company

100%

MATCHING BLOCK 34/233

SA Bijendra_AI&AS.docx (D116982346)

for "the revival and improvement of literature" and "encouragement of the learned natives of India. ❖

In 1823, the

General Committee of Public Instruction (GCPI) was formed to look into how the one lakh rupees earmarked by the Charter Act would be spent. However later debate arose there about whether the amount would be spent for promoting Western education in English medium or Oriental education in vernacular medium. Thus began the Anglicist-Orientalist controversy. ❖ The Charter Act of 1833 increased the amount from one lakh to ten lakhs per year. This spiked the controversy further and finally in 1835, Macaulay framed his famous Minutes which ruled for spending the money for spreading western education in English medium which was accepted by Lord Bentinck. ❖ Macaulay's Minute argued that the government should spend its resources in giving western education to the selected upper class elites from whom education will gradually reach the masses by Downward Filtration Theory. ❖ Next Hunter Commission tried to evaluate the efficiency of the grant in aid system and private institutions and encouraged the establishment of local Boards, Councils in all the provinces of India. Primary education was declared to be an obligatory duty of these local bodies though Secondary and Higher Education was not excluded from their activities. ❖ The Serampore Trio was the name given to three pioneering English missionaries, namely Joshua Marshman, William Carey and William Ward. They came to Bengal from England at 1792 and other two at 1800 to develop Baptist missionary in the 18th century. They selected a village Serampore at a distance of 13 kilometers from north of Calcutta as their center. So, for this reason they are called Serampore Trio. ❖ The trio's aim was to give an education in arts and sciences to students of every "caste, colour or country" and to train people for ministry in the growing church in

NSOU ? CC-ED-05 37 India. From its beginning the College has been ecumenical but this means that it has no automatic basis of support from any one branch of the Christian church. Prior to 1818, the Serampore Trio had worked together in providing education for their own children and the children, including females, of the native Indians. ❖ The trio established the Serampore Press in 1800 AD. It became the father of printing technology in Bengal and for the first time many Indian and Western classical texts were printed. ❖ In 1818 the trio founded Serampore College and they encouraged the college to instruct Christian and non Christian Indian youth in western arts and Sciences and to train teachers. One of the major objectives of the college was to offer secular higher education. ❖ The Trio also made significant literary contributions by translating the Bible into Bengali. They also wrote many classical books and Carey was also appointed Head of the department of Oriental languages at the Fort William College. ❖ The Trio also successfully worked in the field of journalism. The first newspaper Hickey's Bengal Gazette was brought out in 1780. They launched newspapers 'Samachar Darpan' and 'Friends of India' to fight against social injustice ❖

100%

MATCHING BLOCK 36/233

SA INDIAN RENAISSANCE WOMEN IN HISTORICAL PERSPEC ... (D113343803)

Not only in the field of education, but also in

the field of social reforms, the Trio made significant contributions like women education, making education secular and raising their voices against the practices of Sati and child sacrifice. Carey also gave many botanical names to plants.

1.9 Self-Assessment Questions

1. State the concept of Indigenous Education.
2. Which types of institutions were the seats of Indigenous education of early 19th century India?
3. Give the characteristics of teachers who taught in indigenous education institutions of all levels?
4. How did the indigenous institutions receive its funding?
5. Describe some measures by which the status of Indigenous education could be improved.
6. Briefly discuss relevance of Indigenous Education.
7. What do you mean by Educational policy?

38 NSOU ? CC-ED-05 8. Write a brief note on the educational recommendations of Charter Act of 1813 9. In which year Macaulay's Minute was presented? 10. What is Downward Filtration Theory? Explain the effect of this theory in the education system of British India. 11. Critically analyse the recommendations of Hunter commission 12. Who was William Carey? 13. Who were the Serampore Trio and what were their objectives? 14. State about the importance of Serampore Press in Bengali literature 15. How did Serampore trio have a contribution in higher education? 16. State how they have contributed in horticulture. 17. State the contributions of Serampore Trio in history of Indian Education.

2.1 Objectives After studying this unit, the learner will be able to :

- Know how the monopoly of the East India Company in India was ended
- Know the historical background behind the charter act, 1813
- Know What were the provisions behind the charter act, 1813
- Know What were the reasons behind the Orientalist-Occidentalists Controversy.
- Know What were the Bentinck's resolutions on spreading English education in colonial India.
- Understand the background of Macaulay's Minute
- Know about Macaulay's observations and interpretations on provisions of the Charter Act 1813
- Realise the contributions of Macaulay's Minute to modern Indian education
- Understand how William Adam undertook the responsibility of surveying the state of indigenous education in Bengal
- Know the background of William Adam
- Be aware of the contents of three reports of Adam
- Know the features if indigenous education would be prevalent in those times
- Realise the significance of Adam's Reports in the history of Indian Education

NSOU ? CC-ED-05 41 2.2 Introduction The East India Company initially was not much interested in the education of Indians and much later, reluctantly they took educational matters in hand. In the earlier years of the 19th century apart from the indigenous School of Sanskrit and Arabic learning through the pathshalas, tols, makhtabs and madrasas, there were private attempts by Christian missionaries as well as some Indians and European individuals in establishing a new type of education system. But the general attitude of the board of directors was initially opposing but gradually with the turn of events, opinion in England changed and the idea began to dawn that East India Company should be made to accept its legitimate duties for promotion of learning. In the beginning of the nineteenth century, different educational experiments were also going on simultaneously in India — Thomason trying to build up a system of mass education in the North-Western Province on the foundation of the indigenous schools, while the Bombay Board of Education condemned the indigenous schools and tried to build up a network of official schools instead; Bengal was neglecting the Indian languages and adopting English as a medium of instruction when Bombay was making an attempt to give even the highest education through the mother-tongue of the students ; and so on. On a superficial view, these appear as contradictory policies; but such experimentation was definitely essential. It helped materially in coming to final decisions on controversial issues. Thus there was a climate of general apathy, amateurish handling of problems, the utter neglect of an Indian viewpoint prevailing in India. Under these situations the Charter Act 1813 was passed which for the first time called for government responsibility in educational matters, but with time there arose a controversy as to how the governmental funds should be used for education and two distinct groups of people the Anglicists and Occidentalists emerged who had opposing view points on the matter. Lord Bentinck on the one hand entrusted Adam to conduct an enquiry into the existing state of education in Bengal but on the other hand did not wait for Adam's final reports but accepted Macaulay's recommendations which favoured Western education. Thus, this was an exciting phase in Indian education and all the details would be discussed hereunder.

2.3 Charter Act (1813): Perspective, Policy, Orientalist- Occidentalists Controversy and Bentinck's Resolution 2.3.1 About Charter Acts The Charter of the Company was renewed for 20 years and it was declared that

42 NSOU ? CC-ED-05 it would be allowed to continue with the possession of all territories for the next 20 years. This power had been given specially to Cornwallis in 1786. Governor General's control over the Presidencies was strengthened. He was allowed to issue orders and directions to any Government and Presidency of India during his absence from Bengal without previous consultation with his council. He could exercise all executive power vested in the Central Government. A regular code of all regulations that could be enacted for the internal Government of the British territory in Bengal was framed. The Regulation applied to the rights persons and property of the Indian people and it bound the Courts to regulate their decision by the rules and regulations contained therein. It also required that, "all laws relating to the rights of the person and property should be printed with translation in Indian languages and prefixed with statements of grounds on which they were enacted, "so that the people should become familiar with their rights , privileges and immunities. The Act of 1793 thus laid the foundation of government by written laws and regulations in British India in place of the personal rule of the past rulers.

The East India Company Act 1813, also known as the Charter Act 1813, was an Act of the Parliament of the United Kingdom which renewed the charter issued to the British East India Company, and continued the Company's rule in India. However, the Company's commercial monopoly was ended, except for the tea and opium trade and the trade with China, this reflecting the growth of British power in India. 2.3.2

Perspective of Charter Act (1813) The earlier charter act of 1793 had given the East India Company a monopoly to trade with East for a period of 20 years. However, the rise of Napoleon Bonaparte had brought hard days to the businessmen of England. Napoleon Bonaparte had put in place the Berlin decree of 1806 & Milan Decree of 1807, which forbade the import of British goods into European countries allied with or dependent upon France, and thus installed the so called Continental System in Europe. Due to these hardships, the British Traders demanded entry to the ports of Asia and dissolve the monopoly of the East India Company. Apart from these hardships, the theory of Free trade policy of Adam Smith had also become quite popular in those days. The supporters of this policy started giving arguments on how ending the monopoly of East India Company in trade with India could bring help the growth of British commerce and industry. However, East India Company opposed these arguments giving logic that its political authority and commercial privileges cannot be separated. The controversy was later

NSOU ? CC-ED-05 43 resolved by allowing all the British merchants to trade with India under a strict license system. The act also granted permission to the persons who wished to go to India for promoting moral and religious improvements. (Christian Missionaries). 2.3.2.1 Background of Charter Act 1813 Due to Napoleon Bonaparte's Continental System in Europe (which prohibited the import of British goods into French allies in Europe), British traders and merchants suffered. • So they demanded that they may be given a share in the British trade in Asia and dissolve the monopoly of the East India Company. • The company objected to this. • Finally, British merchants were allowed to trade in India under a strict licensing system under the Charter Act of 1813. • But in trade with China and the tea trade, the company still retained its monopoly. 2.3.3 Provisions under Charter Act (1813) • His Act asserted the Crown's sovereignty over British possessions in India. • The act provided for a financial grant towards the revival of Indian literature and the promotion of science. • The company was also to take up a greater role in the education of the Indians under them. It was to set aside Rs.1 Lakh for this purpose. • The company's rule was extended to another 20 years. Their trade monopoly was ended except for the trade in tea, opium, and with China. • It empowered the local governments to tax people subject to the jurisdiction of the Supreme Court. • Another important feature of this act was to grant permission to the missionaries to come to India and engage in religious proselytization. The missionaries were successful in getting the appointment of a Bishop for British India with his headquarters at Calcutta in the provisions of the Act. • The Crown's jurisdiction over British colonies in India was asserted by this Act. • The company's dividend was fixed at 10.5%. • The Act gave more powers for the courts in India over European British subjects. • The rule of the corporation was prolonged for another 20 years. Except for tea, opium, and trade with China, their trade monopoly was broken.

44 NSOU ? CC-ED-05 • It gave local governments the ability to tax those who were under the Supreme Court's jurisdiction, and it set the company's dividend at 10.5 percent. • The Act allowed Indian courts more authority over European British subjects. • This act regulated the company's territorial revenues and commercial profits. It was asked to keep its territorial and commercial accounts separate. • The company debt was to be reduced and dividend was fixed @10.5% per annum. • This act also empowered the local governments to impose taxes on the persons subject to the jurisdiction of the Supreme Court. • This act also gave missionaries freedom to enter India and engage in religious proselytization. In accordance with the Act, the missionaries were successful in obtaining the appointment of a Bishop for British India, with his headquarters in Calcutta. • The act called for a financial grant to support the rebirth of Indian literature and the advancement of science, as well as greater responsibility for the corporation in the education of the Indians under their control. It was decided to set aside one lakh rupees for this purpose. • Nothing substantial was changed in terms of governance in India except that the Charter Act 1813 for the first time explicitly defined the constitutional position of the British territories in India. The Act also empowered the Local Governments in India to impose taxes on persons and to punish those who did not pay them. 2.3.4 Orientalist-Occidental Controversy India had a great and glorious academic history even before the arrival of the Britishers in India. During the Vedic age, a comprehensive and residential educational system had been prevailing in India. During the Buddhist period, educational institutions consisting of thousands of teachers and students prevailed in India. During the medieval period thousands of Madrasas and Makthabs were built. These traditional or indigenous educational institutions were still existing even when Britishers took charge of administration in India. The orientalists were afraid that the great Indian culture would be brutally destroyed by the Britishers. They felt that there was some hidden agenda for the Britishers by starting modern educational institutions in India. The previous actions of Britishers in India was so. They had always pretended to be the friends of each and every kingdom in India, and whenever they had got a chance they had cheated these kingdoms by helping the enemy kingdom. They had always displayed their opportunism since their arrival in India. It was this opportunism that actually

NSOU ? CC-ED-05 45 made them capture the administrative power in India. This opportunistic tendency of Britishers made the orientalist think that everything would be anglicised gradually with the establishment of the modern educational system in India. At the same time, some Indians, who had already started enjoying the status they had had because of their capacity to speak in English language and tendency of behaving like Britishers, stood firmly for the promotion of English language in India. They had already started underestimating the eastern literature and culture. They believed that English education can bring progressive changes in India. Oriental-Occidental Controversy was an ideological conflict between two groups of people in India during the British colonial rule. The ideological quarrel was related to the organization of modern education India. Britishers started organizing the formal educational system in India only during the first half of the 19th century, though they had reached India during the first part of the 17th century. Their real intention behind their sailing to India was not administrative. They came to India just for trade. It was not a venture of the British Government. A company which had been started in Britain under the title of 'British East-India Company', wanted to spread their business, and opened an office and factory in the then Madras and now Chennai. They might not have even imagined in their distant dream that they would rule India. However, the dramatic events spread across two centuries caused for the commencement British colonial rule in India just after the War of Plassey in 1757. It was a turning point in the history of modern Indian Education. 2.3.4.1 Background of the controversy As they became the rulers of India, they wanted to implement the modern administrative system in India by following the British model of administration. They needed modern officials for the purpose. The newly emerged situation made them think about giving modern education to Indians by establishing modern educational institutions in India. The first step was declaring a charter act in 1813 which is known as the Charter Act of 1813. In this chart, they introduced a grant-in-aid programme of offering a financial aid of Rs.100000 to all the indigenous educational institutions in India. A new charter act was later announced in 1817 which is known as the Charter Act of 1817 in which the financial support was increased to Rs.200000. Meanwhile, an ideological clash emerged. The clash is known as Oriental-Occidental Controversy. Some people advocated that the educational system should be accepted the languages such as Arabic, Sanskrit and Urdu as the medium of instruction. They also wanted that eastern literature i.e. the literary pieces written in Arabic, Persian and Sanskrit should be taught in educational institutions. This group is known as the 46 NSOU ? CC-ED-05 Orientals. Another group which included Indians, too, argued that English should be the medium of instruction rather than using the languages such as Arabic, Persian and Sanskrit. They also stood for the teaching of the European literature in educational institutions. This group of people is known as the Occidentals. Hence, the clash is known as the Oriental-Occidental Controversy. During the first quarter of nineteenth century a great controversy was going on regarding

79%

MATCHING BLOCK 37/233

SA

Untitled document (18).docx (D143725658)

the nature of education and medium of instruction in schools and colleges. The Orientalists led by Dr. H. H. Wilson and H.T. Prinsep advocated in favor of Sanskrit, Arabic and Persian as the medium of

education. In the initial stage, the company officials patronized oriental learning. In this context, the establishment of the Calcutta Madrasa by Warren Hastings in 1781, the Benares Sanskrit College by Jonathan Duncan in 1791 and the Asiatic Society of Bengal by William Jones in 1784 are noteworthy. Those who were in favor of continuation of the existing institutions of oriental learning and promotion of Indian classical tradition were called Orientalists. Orientalists were guided by some practical considerations. They wanted to teach the British officials the local language and culture so that they would be better at their job. This was the prime objective behind the foundation of the Port William College at Calcutta in 1800. The other motive was to develop friendly relations with the elites of the indigenous society and to understand their culture. This was the main reason behind the establishment of the Calcutta Madrassa and the Benaras Sanskrit College. The Anglicists led by Charles Trevelyan, Elphinstone advocated the imparting of

94%

MATCHING BLOCK 38/233

SA

Untitled document (18).docx (D143725658)

western education through the medium of English. The Anglicists were supported by most advanced Indians of the time, like Raja Ram Mohan Roy who advocated

for

77%

MATCHING BLOCK 41/233

SA

Untitled document (18).docx (D143725658)

the study of western education as the "key to the treasures of scientific and democratic thought of the modern west."

They could not compromise the idea of grafting the new Western learning upon the old stock of Oriental learning. They argued the idea of diffusing Western sciences and literature amongst the Indians through the medium of English. As they were firm in their conviction, so they desired to utilize the entire educational grant for the purpose of diffusing Western Education. Countering these Orientalists, there was a strong opposition led by different groups in England, namely, the Evangelicals, the Liberals and the Utilitarians. The Evangelicals had a firm conviction in the superiority of Christian ideas and western institutions.

NSOU ? CC-ED-05 47 Two great exponents of the Evangelical view were Charles Grant and William Wilberforce. Also, others who did not share Evangelical faith also convinced of the superiority of western knowledge and one of the chief promoter of this idea was Macaulay. 2.3.5 Resolution of Orientalist-Occidental Controversy As the controversy hindered the progress of modern education in India, Lord Macaulay was brought to India to solve the problem. Thus he submitted a report to the governor general of the time. The report is known as Macaulay's Minutes of 1835. We would rather say he put an end to the Oriental-Occidental Controversy than solved the entire problem. Macaulay's Minutes contained more controversial recommendations like acceptance of English as the medium of instruction at all the levels of education, teaching of European literature in educational institutions, stopping the grant-in aid system for the indigenous educational institutions in India and adopting Downward Filtration Theory for educating the mass. Though the Macaulay's minutes were capable of stopping the Oriental - Occidental Controversy in the peripheral level, it widened the internal frustration among the major part of the society who supported the orientalist. The fuzz created by Macaulay's Minutes among the people of the society worsened the situation which led to the appointment of Charles Wood who later submitted his historic report called 'Wood's Dispatch'. The British East India Company officials wanted to maintain neutrality or non- intervention in the sphere of religion and culture of the Indian society, after the acquisition of political power in India in first half of 19th Century. The reason behind this policy was partly the fear of adverse reaction and opposition to their role by the indigenous people. However, due to certain constant pressure from different quarters, the Missionaries, the Liberals, the Orientalists, the Utilitarians compelled the company to give up its position of neutrality and to take up the responsibility of promotion of education. But, there was a conflict in the opinions which were divided on the issue that whether the company should promote western or oriental education, giving rise to the Orientalist-Anglicist controversy. 2.4.1 Clause 43 of The Charter Act of 1813 The Charter Act of 1813 in clause 43 had stated that the East India Company had partly undertaken the responsibility of education in India and a sum of Rupees 1 lakh per year (approximately) had been earmarked for the purpose. It specifically stated that a sum of rupees one lakh annually was to be provided by the Company

for “the revival and improvement of literature” and “encouragement of the learned natives of 48 NSOU ? CC-ED-05 India” and for the “instruction and promotion of knowledge of the sciences among the inhabitants of the British territories in India”.

Lord Macaulay later on took up for discussion the interpretation of this Section of the Charter Act in his Minute. But owing partly to the continuous agitation carried on by the missionaries and the Company's officials and partly to the influence of the liberal spirit which dominated the English life of this period, the work of organising a state system of education was begun almost simultaneously in all the three presidencies by about 1823 and continued to expand till when, following the English example of the first Parliamentary grant for education, the educational grant of India was also increased from one lakh to ten lakh of rupees per annum. 2.4.2 Background of Macaulay's Minute 2.4.2.1 Establishment of General Committee of Public Instruction (GCPI) The East India Company was new to problems of Indian education and, therefore, was trying to arrive at a workable formula through the usual method of trial and error. The Court of Directors kept an open mind on the subject and, in the initial stages, sanctioned every proposal that came up. To decide upon the course of action on proper expenditure of the one lakh rupees earmarked by the Charter Act 1813, the Presidency of Bengal took up the work of educational reorganisation which was made possible by the liberal attitude which the Court of Directors adopted by about 1823. In a Resolution dated 17th July 1823,

the Governor-General-in-Council appointed a General Committee of Public Instruction for the Bengal Presidency.'

The Committee consisted of ten members and included H. T. Prinsep who became famous later on by his opposition to Macaulay, and H. H. Wilson who was a great Oriental scholar. The grant of one lakh of rupees provided by the Charter Act of 1813 was also placed at the disposal of the Committee. Lord Macaulay (Thomas Babington

Macaulay) was concurrently Law Member in the Governor General's Executive Council

and also the President of this General Committee of Public Instruction. The Committee consisted mostly of persons who were great admirers of Sanskrit and Arabic literature and hence the decision of the Committee to follow the view of Lord Minto and encourage Oriental Learning can hardly be regarded-with a surprise. Between 1823 and 1833, the Committee (a) reorganised the Calcutta Madrasah and the Benaras Sanskrit College (b) established a Sanskrit College at Calcutta in 1824 (c) established two more

Oriental scholars to translate English books containing useful knowledge into

the Oriental classical languages. 2.4.2.2 Opposition to G. C. P. I. By Rammohan Roy and Court of Directors But very soon after its establishment the Committee found that its works had roused considerable opposition. The first attack came from a few enlightened Indians led by Raja Ram Mohan Roy. The Raja submitted a memorial to the Governor General on 11th December 1823 and urged that the proposals for establishing a Sanskrit College at Calcutta should be abandoned and Government should

97%

MATCHING BLOCK 45/233

SA CHAPTER WISE 2.pdf (D40463240)

promote a more liberal and enlightened system of instruction ; embracing mathematics, natural philosophy, chemistry, anatomy, with other useful sciences ; which may be accomplished with the sum proposed by employing a few gentlemen of talents and learning educated in Europe and providing a college furnished with necessary books, instruments, and other apparatus.

This memorial is a good indication of the direction in which the wind was beginning to blow and shows how the desire for English education was spreading among Indians. But no heed was paid to this memorial and the plan for establishing the Sanskrit College at Calcutta was carried out. A still more formidable attack on the Committee's work came from the Court of Directors themselves in 1824. They questioned if the expenditure for oriental learning was worthwhile. It may be noted that an educational movement was contemporaneously swaying England. And the new type officials of the 19th Century, unlike their predecessors were wedded to new ideas which supplied energy to occidentalism. Lastly, the Charter of 1833 opened up the scope of Govt. employment to educated Indians. English was growing in political importance as

84%

MATCHING BLOCK 46/233

the language of the rulers and persons desirous of obtaining lucrative posts under Government found that a capacity to speak and write English materially helped them in

their object.

93%

MATCHING BLOCK 47/233

SA Sonia_Chap_123 (1).doc (D141132453)

In fact, the study of English was rapidly becoming the royal road to a black-coated profession with a decent income and an important status in society. It is not to be wondered, therefore, if many Indians of that generation looked forward to English education as a panacea for all their ills. 2.4.2.3

Division in G. C. P. I. And Macaulay's Role This growing demand for English could not, therefore, be long neglected by the General Committee of Public Instruction and steps had to be taken to meet it to some extent at least. But its persistence in this policy in the face of a public demand to the 50 NSOU ? CC-ED-05 contrary led to a split in the Committee itself. Out of the ten members of the Committee, five supported the policy of giving encouragement to Oriental literature and were known as the Oriental party and the rest were in favour of the adoption of English medium of instruction and were known as the Anglicist party. Macaulay took no part in the controversy at the meetings of the General Committee of Public Instruction because he knew that the matter would again come before him as a member of the Executive Council. So, when the papers dealing with the dispute were placed before the Council, he wrote his famous Minute regarding the new educational policy. It is dated 2nd February 1835 and is a document of great historical importance which was accepted by Lord William Bentinck immediately. 2.4.3 Macaulay's Observations about Charter Act 1813 ❖ Meaning of terms 'Literature' and "a learned native of India" Macaulay argued that the word "literature" occurring in this section could be interpreted to mean English literature, that the epithet of "a learned native of India" could also be applied to a person versed in

86%

MATCHING BLOCK 49/233

SA History of Education In India, Block-1.pdf (D161180427)

the philosophy of Locke or the poetry of Milton, and that the object of promoting a knowledge of sciences could only be

accomplished by the adoption of English as the medium of instruction. If this interpretation were not accepted, Macaulay was willing to propose an Act rescinding Section 43 of the Charter. ❖ Support of Western Knowledge He opined that Oriental knowledge was a bundle of irrationality, superstition and mysticism. All the wealth of Indian and Arabic literature could not equal that which was contained in a single shelf of Western books. Moreover, Western learning alone was necessary for the reawakening and moral regeneration of Indians. No vernacular language of India was fit to carry Western knowledge. ❖ Medium of Instruction English must be the unavoidable choice to study western knowledge because English was the key to modern knowledge. It was the language of the rulers. It was the language of Commerce in India, and it was destined to be the language of Commerce in the whole of the Orient. Just as the classical European languages had contributed to the development of the modern European languages, so Indian languages would draw nourishment from English, and would one day become the competent media of education of Indians. ❖ Evidence of Indian's favouring English Referring to the question of the alleged prejudices of the Indian people against D:\Barun-2022\Netaji Subhas Open University\CC_ED_05\20.08.22\50 NSOU ? CC-ED-05 51 English education, Macaulay

argued that it was the duty of England to teach Indians what was good for their health, and not

what was palatable to their taste. He argued that Indians had given sufficient evidence of their love for English citing high sales of the English books of the Calcutta School Book Society and that while the students of the Madrasah and Sanskrit College had to be paid stipends, the pupils in the English schools were prepared to pay for the instruction received therein. ❖ Languages of the law and religion Regarding the argument that the Sanskrit and Arabic languages should be studied as the languages of the law and religion of the people. Macaulay pointed out that the best course for Government would be to codify Hindu and Muslim laws in English, and not to incur heavy expenditure on the maintenance of the Oriental institutions. On these grounds, among others, Macaulay strongly recommended that the object of educational policy in India should be the spread of western learning through the medium of the English language. He also suggested that the existing institutions, of Oriental learning should be closed forthwith and that funds thus released should be used for the promotion of English education. 2.4.4. Acceptance by Bentinck Lord William Bentinck, the Governor –General of India, accepted Lord Macaulay's Minutes and passed the resolution on March 7, 1835

89%
MATCHING BLOCK 48/233
W

to accept English language as a medium of instruction for the Indian education system.

Funds would be spent on English education only. Schools and colleges of native learning would not get funds. 2.4.5 Contributions of Macaulay's Minutes Some analysts regard Macaulay and his efforts as a "torch-bearer in the path of progress"; another section, which attributes the later discontent and political unrest in India to the spread of English education, blames him as the cause of all trouble. Some dislike him for his ignorant and violent condemnation of Indian languages, culture and religion; while others blame him for being responsible for the neglect of Indian languages that inevitably followed upon the use of English as the medium of instruction. A closer examination will, however, show that these opinions are both incorrect and unfair. To call Macaulay a "torch-bearer in the path of progress" gives an exaggerated account of the role that he actually played. "It must be remembered that Macaulay did not create the desire for English education — that desire was already there and it had its origin in the material advantages which were then inseparably connected with knowledge of English. He was not even the organiser of the English party, because it was already in existence when he arrived in India. , In fact, when

52 NSOU ? CC-ED-05 Macaulay came to India in 1834, the battle between the old and the new was already in full swing. The people desired English, education and being unable to get it from the Company, quenched their thirst in the missionary schools. The younger generation of civilians, led by its zeal for reform, was eager to introduce English education. But the rising tide of both these forces was held in check by the older politicians in service who believed that the policy of Hastings and Minto was good for all time and who, no doubt, were supported by the conservative and reactionary forces among the Indians themselves. It was at this time that Macaulay came upon the scene to burst open the locks of conservatism with the power of his rhetoric, and let in the flood of new ideas. He was only responsible for the quick decision of a controversy that would otherwise have dragged on for years but which, nevertheless, could never have been decided in favour of classical languages. 2.4.6. Downward Filtration Theory Actually, Macaulay and the Government wanted to educate a small section of the upper class Indians for profits in their own business. Their reasoning was that its effects would reach all Indians in due course of time by a process which Macaulay called the Downward Filtration Theory. The theory means that the education was to be provided to a small portion of the people, and through them, education would be conveyed to the masses in future. Hence, through this theory, the Minute had done partiality by giving education to some higher class people of the society as they liked to engage them in their business policy. But this policy was an utter failure in India. The elite people never wanted their lower class counter parts what they had already started enjoying. Day by day, the gap between the educated ones and the uneducated was widened. The educated ones started humiliating the common uneducated folk. So Downward Filtration theory caused for the emergence of a modern stratification of the society. By the time of independence of India, a huge majority of the country were uneducated. This status actually made the creators of the Indian Constitution think about including some positive discrimination policies in the Constitution 2.4.7. Critical Analysis of Macaulay's Minutes Depending on the perspective of the reader, one may interpret Macaulay's minute as the primary contributor to the entire positive or the negatives of modern Indian education. However his minute played a great role in establishing a definite policy of education and its medium and nature of curriculum. He has of course been successful in creating a class of Indians who have taken to the English language enthusiastically.

NSOU ? CC-ED-05 53 Many in the country use it as a first language although this number is small. Today's achievement of India in matters of science and technology would never have been possible if Macaulay not steered the direction of development of Indian education to the west. However, his total disregard for the Oriental education in Sanskrit or Arabic hand caused a setback to the natural flow in the evolution of Indigenous wisdom and knowledge systems. Tols and Madrasahs were closed and study of Sanskrit and Arabic was received no support. Thus the majority of the population were deprived of education and the country suffered as a whole because of overall decline in Mass education. In his minute, Macaulay had said that a day could come when the vernacular languages would die a natural death. Today, he has been proved wrong. The number of people who use these languages is increasing by the day. The literature in these languages is also expanding and evolving. Critics were not rare to say that by introducing Western education Macaulay helped the growth of political consciousness which, in its turn, undermined Britain's colonial mastery in India. In this case also the charge is unfounded. Political alertness of Indians had been steadily growing since the days of Rammohan, and the Young Bengal supplied a great impetus to it. What is distinctly condemnable is the extent of Macaulay's ignorance exhibited in respect of Indian culture, literature. Also Macaulay was treading on slippery ground in his interpretations of the words 'literature' and 'Educated Indians'. His interpretation is certainly far-fetched, if not actually inaccurate. Question, may also be raised on his interpretation of the word 'revival'. The charter clause had desired 'revival' and improvement of literature. The word 'revival' could apply only to a moribund literature and not to a vigorous literature as English literature was. Lord Macaulay has been acclaimed by some historians as a pioneer in English education in India. His Minute was acclaimed as prophetic. A diametrically opposite school of thought condemned him outright. Things to be noted in this connection are that Macaulay was not the creator of the urge for western knowledge. Opinions in favour of Western education had been developing in official as well as non-official circles from long before. Also, Macaulay was not the introducer of a new system of education. A section of Indians had been demanding modern education, and English schools (including Hindu Vidyalyaya) had been existent. Whether Macaulay was able to make Englishmen out of Indians is debatable, but the English language has been conveniently Indianised and altered to such an extent that sometimes it is hardly discerned by the native English. This is one major outcome of Macaulay's minute.

54 NSOU ? CC-ED-05 2.5.1. Lord Bentinck and his role We have earlier studied that the sum of Rs 1 lakh per year was earmarked for development of the Indian education system by Charter Act 1813 was raised from 1 lakh to 10 lakh in 1833. This larger amount magnified the difficulties already being faced by the GCPI. The differences on the issue of whether the money should be spent for promotion of Western education or Oriental learning and what should be the preferred medium of instruction created an impasse on the working of the Committee. At this juncture entered Lord Bentinck who as the Governor General of India entrusted the task of interpreting the education related Clause of the Charter Act 1813 on Macaulay whom he made the president of the Committee. We have seen that in the course of time the famous Macaulay's Minute would lay down that all funds appropriated for educational endeavours in India would be spent for western education alone and seal the fate of oriental learning through the vernaculars. In parallel to this line of efforts with Macaulay, Lord Bentinck also appointed another zealous missionary of the Scottish Church named William Adam almost concurrently to enquire into the state of indigenous education in the Bengal province about whom and whose efforts we shall study next. It is worthy pointing out that Bentinck did not wait for Adam to finish his commissioned work and study his report before giving final approval to recommendations of Macaulay's minute. Thus though much of Adam's efforts went in vain, it still holds an extreme significance in the history of Indian education. 2.5.2 About William Adam and his earlier efforts

100%

MATCHING BLOCK 51/233

SA acc-111.pdf (D17251357)

A Christian priest of Scotland, William Adam came to India in 1818 and spent about 27 years here. He came into contact with Raja Ram Mohan Roy and both of them influenced each other. He was greatly impressed by Indian views regarding the existence of one almighty god. In due course he renounced Christian priesthood. Lord William Bentinck, the governor general of India appointed Adam in 1835 to survey the state of education in Bengal and Bihar and to suggest reforms.

However, it is interesting to note that only after 6 weeks of entrusting Adam for conducting the enquiry into indigenous education Lord Bentinck accepted and approved Macaulay's Minute without waiting for the arrival of Adam's Reports. Adam was in touch with the languages, the cultures and traditions of all classes of the native Indians. He was convinced that the masses wanted education in their own tongue and public money should be spent to permeate education among all Indians not a few handful. In 1829 he address the memorandum to Lord Bentinck on the subject of popular education and suggested that a survey be undertaken to understand that but nothing came out of it. Again in 1834, he made a similar attempt with success NSOU ? CC-ED-05 55 and in 1835 and he finally sent his outline and procedural details to the governor general after obtaining his approval. So Adam began his momentous enquiries. For nearly three years he was engaged in this work. He travelled through hamlets and villages in the districts of Bengal, mixed with the high and the low, came in close contact with the people and saw the actual condition of things. In the course of his enquiries he collected a mass of valuable materials at infinite password, labour and patience and the results of his researches were embodied in what has been called " one of the ablest reports ever written in India." Macaulay, as the President of the General Committee, to whom Adam officially submitted his Reports, did not fail to appreciate his work. He said that these full and exhaustive reports were the best sketches on the state of education that had been submitted before the public. Adam submitted all three Reports at different times. The first report is dated 1st July, 1835. The second report 23rd December, 1835 and the third report the 28th April, 1838. 2.5.3 Adam's Reports Adam submitted 3 reports (1835-1838). Adam's first report is a mere digest of the earlier reports on the subject and of all the educational data then available. It is neither comprehensive nor reliable like his two later reports.

58%
MATCHING BLOCK 52/233
SA
acc-111.pdf (D17251357)

The second and third reports were based on the survey he conducted. The second report is a thorough enquiry of one Thana (Natore police station) in the district of Rajshahi,

now in Bangladesh. It is, however, much more comprehensive and detailed. The third report presents statistics of five districts in Bengal and Bihar. The system of indigenous education as revealed in these reports is a fair sample of the whole country. It also contains his valuable

100%
MATCHING BLOCK 53/233
SA
acc-111.pdf (D17251357)

recommendations for the reform of indigenous schools. 2.5.3.1 Adam's First Report

Adam's first report contains educational data. Some scholars like Sir Philip termed the report as a 'myth', and other scholars like R.V. Parulekar considered this report as a reality. Adam had described indigenous elementary schools in this report as "

96%
MATCHING BLOCK 54/233
SA
acc-111.pdf (D17251357)

By this description are meant those schools in which instruction in the elements of knowledge is communicated, and which have been originated and are supported by the natives themselves, in contradiction from those that are supported by religious or philanthropic societies".

According to the other's point of view, a school was a place where instructions were

100%
MATCHING BLOCK 57/233
SA
acc-111.pdf (D17251357)

given to one student or more students either by the teacher or

even by the father himself or any other member of the family.

56 NSOU ? CC-ED-05 In this report, Adam says that there were at least one lakh schools in operation in Bengal itself, which means that there was a school for every 400 students. Some education experts have described this report as a myth and false while some others believed that it is substantially correct. The two sides differ chiefly in relation to their interpretation of the word 'school'. One group defines schools in its modern sense, viz. an institution of permanent nature conducted by a person or persons who teach a certain number of children of the locality in return for fees. If we define schools like this at that time, definitely, there were not one lakh schools functioning then. But, according to other definitions, a family where a teacher was employed to give education to its children or where the father taught his own children or where the father taught his own children with or without children of the locality was also considered a school. If this definition of the school had been accepted, then there would have been certainly one lakh schools functioning in Bengal. Among many other interesting information contained in the First Report mention may be made here of the following:- (i) A discussion on the population of Calcutta in the early years of the nineteenth century (ii) A description of the indigenous elementary schools and of the courses of instruction followed in them (iii) A short history of the early missionary and private efforts in Calcutta and its vicinity including the activities of the Calcutta School Society, Church Missionary Society and similar other bodies (iv) A brief description of the early efforts in the field of girls' education (v) A description of tols and the courses of instruction followed in them. The details of the tols of Nadia are given in p. 75 and the following pages. (vi) A description of the Serampore College (vi) A description of early educational activities in the- Garo Hills 2.5.3.2 Adam's Second Report Adam's second report is about the findings of the study conducted from the data collected from Rajshahi district Nattore Thana. According to this report, the total population of Nattore Thana was 1,95,296 out of which 1,29,640 were Muslims and 65,656 were Hindus. There were 485 villages in Nattore Thana.

NSOU ? CC-ED-05 57 In the Second Report Adam adopted a new classification for elementary schools. He divided such schools in the following categories :- (i) elementary Bengali schools, (ii) elementary Persian schools; (iii) elementary Arabic schools and (iv) elementary Persian and Bengali schools. In the First Report Adam had nothing to say about that type of instruction which in the Second Report he called domestic instruction.' While reporting about elementary instruction in Rajshahi he divided this type under two categories, public and private, as it is communicated in public schools or private families. There were 27 elementary schools where only 262 students studied. Out of these schools, 10 were Bengali schools where 167 students were studying, 4 were Persian schools with 23 students, 11 were Arabic schools with 42 students. In connection with elementary schools Adam had made a significant observation about how the growing poverty of the people was responsible for closing down of regular schools. Unable to pay for school instruction people had to opt for domestic instruction, scope of which was much narrower and restricted. Also, there were 1588 families which provided education to 2342 students in 238 villages. The average age of admission to these schools was 8 years while that of leaving the school was 14 years. The average pay of the teacher was Rs. 5-8 per month. According to Adam's report, there were no indigenous colleges among Muslims, but there were 38 Sanskrit colleges with 397 students. The average age of admission to such colleges was 11 years and the average age of completing the course was 27 years. Although it was thought that female education adults in Nattore was 6121. And as per the report, the male literacy rate was 6.1 percent while the overall literacy rate was 3.1 percent. However Adam did not only point out the declining state of education in that district. He used his experiences to ponder upon what remedies could and should be applied to improve the state of education and the intellectual and model level of the people. 2.5.3.3 Adam's Third Report Adam's Third Report contains two chapters, the first embodying the results of his survey conducted by him for 5 districts of Murshidabad, Birbhum, Burdwan, South Bihar and Tirhut and the second his conclusions, remarks and suggestions based on that and the two previous reports. The first chapter has twenty sections and the second nine sections. Whereas in his investigation in the district of Rajshahi he concentrated his attention to a single thana, in his third report Adam obtained complete statistics of several districts in Bengal and Bihar. This completed his survey; but Adam

58 NSOU ? CC-ED-05 was not content with making a survey. He went further. In the last one hundred and nineteen pages of his report which make the second chapter entitled "Considerations of the means adapted to the improvement and extension of Public Instruction in Bengal and Bihar," he examines the educational policy of the Government, criticizes the "Filtration" theory with ability and insight and makes certain recommendations. In certain respects this second chapter is the most remarkable portion of these reports. In the beginning of the first chapter Adam gives some particulars of his journeys and describes in detail the plan of his investigation which he elaborated as the work progressed. He then proceeds to make an up-to-date survey of the materials he had gathered in the course of his investigations. survey he deals with each type of school separately. There are sections on (i) Bengali and Hindi Schools, (ii) Sanskrit Schools, (iii) Persian and Arabic Schools, (iv) English, Orphans', Girls' and Infants' Schools, (v) Domestic instruction and (vi) Adult instruction. Each of the above sections is followed by a section containing general remarks on the state of instruction in the schools mentioned in the previous section. These sections give a general summary of the results of Adam's investigations in these particular branches of education. Then follows an interesting section entitled the state of crime viewed in connection with the state of instruction where Adam draws some parallelism between the prevalence of crime and the absence of means of instruction among the people. In the section on Bengali and Hindi schools Adam shows how in the indigenous elementary schools teachers were recruited from all classes and castes and communities. Adam also notes the wide prevalence especially in Bengal of the custom of giving gratuitous instruction. Adam's analysis of the castes of scholars shows that the indigenous elementary schools were by no means the preserves of the children of the upper classes of society. We find that pupils from even the so-called depressed and suppressed classes like Chandal, Muchi, Hadi, Dulia, Bagdi, etc., found place there. However the upper classes naturally sent the largest there. number of scholars. Adam's remarks about the mutual disposition of Hindus and Musalmans towards each other in the matter of giving and receiving instruction show the toleration between the two communities. In the section on Sanskrit schools there are many interesting details about the courses followed in the tols and the textbooks used there. Adam also gives a list of contemporary Sanskrit authors and their works. In the following two sections he gives similar details about Persian and Arabic schools, their teachers and scholars.

NSOU ? CC-ED-05 59

The second part provides proposals put forward by Adam for the reform of education

where he stated how in his judgment the best course would be to employ the existing institutions and organisations as the instruments of national education, for the improvement and furtherance of education among the people of this country. The chapter begins with some preliminary considerations of the qualifications which should characterise the most feasible plan for the promotion of general education. Such a plan, in Adam's views, should be "simple in details and thereby easy of execution; cheap and thereby capable of extensive or general application". In this connection he examines among others the idea of the Government making education compulsory and enacting that every village should have a school. Adam then goes on to examine the feasibility of the "Filtration theory" advocated by Macaulay criticizing that it overlooks entire systems of native educational institutions, Hindu and Mohammedan. So Adam suggests "the simplest, the safest, the most popular, the most economical and the most effectual" plan by building on the foundations which the people themselves have laid and just provide necessary scaffolding and outworks so that when the superstructure gets finally complete, Indians should believe it to be the work of their own hands. The plan will thus maintain the perfect congruity with existing national institutions and at the same time admit of the gradual expansion and improvement which European civilisation demands. The execution of the plan would require the preparation of a small series of useful school books and this is the next question that Adam examines and he prefaces his opinions on this subject suggesting that there should be a graded series of four text books for use in schools. Adam's next proposal was to appoint Examiners whose duties would be to induce the existing schoolmasters or those who desired to take up that profession to read and master the school books one after another and to appear at examinations to be conducted by the Examiners to prove that they have mastered the contents of these books and were in a position to teach these to their own pupils. Rewards were to be offered to those who would be successful in these examinations. Adam also discusses the idea of making endowments of lands to village schools and made interesting suggestions regarding levying contributions from zamindars, utilisation of the existing religious endowments and appropriation of khasmahal lands for the creation of new endowments. Adam hoped that from the above sources sufficient funds will be available to maintain the schools on an improved standard. Adam then works out the details of his plan and its financial implications. Finally he examines the advantages of his plan and tries to answer the objections that might

60 NSOU ? CC-ED-05 possibly be raised against it. He also calculated that the total expenditure for one district will be approximately ten thousand rupees per annum. In connection with his plan Adam further suggests the appointment of Inspectors to Supervise the work of Examiners and also the reorganisation of the General Committee of Public Instruction. Incidentally Adam points out how the imparting of English education to the natives had resulted in creating a class of deracines out of sympathy equally with the people and the Government. Adam concludes his discussions by stating that giving effect to his proposals would lead to the establishment of a national system of instruction through the medium of the vernacular tongue. In the following sections Adam discusses the application of his plan to the improvement of Sanskrit instruction, female instruction, instructions of the Mohammadan population, and aboriginal tribes, and other types of instruction. 2.5.4 Features of Indigenous Education as in Adam's Reports On studying Adam's Reports many features of indigenous education system in India during the colonial period can be highlighted. Through this report, the British company became familiar with the Indian educational scenario and took appropriate steps for its development. Adams' report enlightened a clear idea of the educational condition of Bengal. These three reports gave attention to the different types of indigenous institutions in the educational field in India. The main features of Adam's Reports are as follows: Adam had identified the following types of indigenous educational institutions: • Pathshalas • Madrassas • Arabic Schools • Vernacular Schools • Persian Schools • The schools didn't have any buildings. The classes were held often in the local temples, mosques, or under a tree. • There was a lack of printed books and other stationery. Pencils and slates etc. were used as instructional material which was easily available in the locality. • The curriculum was also not well-defined. It generally consisted of reading, writing, arithmetic and accounts. • The report had not prescribed any fee system. The parents of the students paid the teachers either in the cash or in kind. The mode, the time, and the amount of the payment were left to the convenience of the parents of the students.

NSOU ? CC-ED-05 61 • The report did not mention any predetermined admission period, the students could join the schools at any time and could study according to their own pace. The students could leave the school at his or her convenience. • The hours of the institution and days of work were adjusted according to local requirements. • In bigger schools, the senior students were appointed to teach junior students. • The size of the schools was generally small. • The number of students in the school varied from one student to fifteen students. • The main advantages of indigenous elementary schools were adaptability to the local environment, their vitality, and popularity among local people. • The exclusion of girls and Harijans was the main defect of those people. •

The lack of training of teachers, narrow and limited curriculum, and severe form of punishment were

other important demerits of this system. 2.5.5 Significance of Adams Reports Adam desired that his proposal be tested in a few key places before being fully implemented. However, Macaulay had already made his decision that education would be supplied primarily to the upper classes in English, therefore Adam's plan for public education fell on deaf ears. The proposal was deemed unworkable, and Adam was compelled to quit in displeasure. One of the most able reports ever produced on Indian education met this fate. A good opportunity to construct a national education system was squandered. It would be interesting, though idle, to speculate what course Indian education would have taken if Bentinck were there as the Governor-General when Adam's reports were finally placed before the Government. Perhaps he would have paid the attention the reports justly deserved; perhaps he would have accepted some of the recommendations Adam made. There is no doubt that if Adam's recommendations were given effect to, foundation would have been laid of what might justly be called (and was actually called by Adam) a truly national system of education for India. But the die had been cast. Macaulay's championship won for the new type of education the precedence and weightage which rightfully belonged to the existing indigenous system. Auckland was averse to revise the decision and the General Committee called Adam's scheme "impracticable".

62 NSOU ? CC-ED-05 2.6 Summary •

93%

MATCHING BLOCK 56/233

W

The East India Company Act 1813, also known as the Charter Act 1813, was an Act of the Parliament of the United Kingdom which renewed the charter issued to the British East India Company, and continued the Company's rule in India •

This Act asserted the Crown's sovereignty over British possessions in India. The act provided for a financial grant towards the revival of Indian literature and the promotion of science. The company was also to take up a greater role in the education of the Indians under them. It was to set aside Rs.1 Lakh for this purpose. • Another important feature of this act was to grant permission to the missionaries to come to India and engage in religious proselytization. The missionaries were successful in getting the appointment of a Bishop for British India with his headquarters at Calcutta in the provisions of the Act. • Meanwhile, an ideological clash emerged which led to the Oriental-Occidental Controversy. Orientals advocated that the educational system should teach eastern literature in Indian languages such as Arabic, Sanskrit and Urdu. Occidentals which included Indians, too, argued that English should be the medium of instruction and stood for the teaching of the European literature in educational institutions. •

SA History of Education In India, Block-1.pdf (D161180427)

was a turning point in the history of education in

British India. The Govt. had in 1835, adopted the policy of English education, but there was yet no firm policy in regard to the objective of such education. While the missionaries dreamt of 'moral and religious rebirth' through education, cultural and political viewpoints differed among widely. Downward filtration theory talked about educating the aristocracy who were expected to be interpreters of the West. But this policy was found ineffective and its reversal was called for. The once condemned indigenous schools had again to be brought into the focus. The Muslims had so long boycotted western education. But now the Muslim leadership began to think anew and the govt considered it worthwhile to forge a link with the Muslim masses through education. The social reform movement initiated by Rammohan, Bentinck, Bethune, and carried forward by Vidyasagar had been breaking through the conservative wall. The question of women's education became a practical proposition. In 1835, a decision had been made in favour of English education, but the question of agency had remained untackled. The missionaries had begun with a new burst of enthusiasm with emphasis shifted to secondary and collegiate education. The Govt. had also simultaneously entered into the field through the G.C.P.I. (subsequently the

NSOU ? CC-ED-05 69 Council of Education). Private Indian enterprise had started. A clash of interests, therefore, became inevitable. The missionaries demanded that Bentinck's award had been practically a blank cheque for them and they must be given monopoly agency to provide education. They not only condemned the costly and godless education in the Govt. school, but also questioned the propriety of competitive examinations on the basis of secular courses and demanded monopoly right to produce text books. On the other hand a strong Indian opinion had developed in favour of secular western education and there was a great demand for English education because it was attached with employment, The Govt. had, therefore, to decide upon the object of education, the place of religion in it, the agency and machine for educational provisions and extent, form and method of Govt. control. With industrial advancements in Britain, in India too mines were dug out and investments made in Tea, Textile and Jute industries. The beginning of Public Work and Irrigation undertakings required the services of Civil Engineers. Lawyers were required for a full implementation of the new legal system. Obviously the question of professional and vocational education became a practical proposition. Indians were now admitted into administrative and judicial services. The principle of equal opportunity for equal calibre was announced (at least in theory). Urge for English education had grown. Competitive examinations had been introduced. It was, therefore, necessary to establish a complete "system" of education with proper gradations and with a University at the top as an examining and certifying body, whose certificates might be accepted by the appointing authorities. All these considerations led to a rethinking. The British Parliament again discussed things during renewal of Charter in 1853. The total policy was incorporated in a Despatch received in India in 1854. The Despatch became famous as Wood's Despatch of 1854. In this Unit we shall study how the Wood's Despatch made significant provisions that expanded the nature and structure of Indian education system. Afterwards when Lord Ripon became the Governor General, he also constituted a Commission under W. W. Hunter to enquire into the status of implementation of the Despatch's recommendations and made a major contribution in the domain of primary education, which will be dealt with in the next section. Lastly we shall see how under Lord Curzon, Indian education underwent important transformations that paved the way to modern system of education in many ways.

70 NSOU ? CC-ED-05 3.3 Wood's Education Despatch (1854) 3.3.1 Background of Wood's Despatch As stated earlier, since the Charter Act of 1813, several educational experiments had been tried; a number of agencies had been at work, in their own ways, to spread education among the people; several controversies had been raised and some of them still needed a final decision; various policies for action had been proposed and they involved controversial issues which needed careful consideration. The occasion for the Despatch was provided by the renewal of the Company's Charter in 1853. At this time, as at earlier renewals of the Charter in 1813 and 1833, a Select Committee of the House of Commons held a very thorough enquiry into educational developments in India. On the basis of this enquiry Court of Director sent down their greatest Educational Despatch because it was probably written at the instance of Charles Wood who was then The President of the Board of Control. It is a long document of hundred

87%	MATCHING BLOCK 72/233	W
paragraphs and deals with several questions of great educational importance. 3.3.2. Why it		

is called Despatch It was Northbrook, Charles Wood's Secretary who

100%	MATCHING BLOCK 74/233	SA Bijendra_AI&AS.docx (D116982346)
drafted the Education Despatch of 1854 which was submitted to the court		

of Directors for onwards transmission to India. The whole policy was incorporated in a despatch received in India in 1854. Hence it is called as 'Wood's Despatch' after Charles Wood who undertook to prepare a general scheme of education for "the whole of British India". 3.3.3. Recommendations of Wood's Despatch 3.3.3.1. Objectives of Education according to Wood's Despatch The objectives of English education as enunciated in the Despatch included (i) bestowal of "

88%	MATCHING BLOCK 75/233	SA A186821001_Anjali Chawla_Thesis_Ph.D. History.docx (D154683600)
moral and material blessings that flow from the general diffusion of useful knowledge", (

ii) Improved intellect and morality would ensure the supply of "servants of doubtless probity" (iii) Such knowledge would

86%	MATCHING BLOCK 77/233	SA A186821001_Anjali Chawla_Thesis_Ph.D. History.docx (D154683600)
teach the 'natives the marvellous results of the employment of labour and capital and rouse them to emulate 'us' in the development of the vast resources of their country and (iv) Confer upon them all the advantages which accompany the healthy increase of wealth and commerce, and at the same time secure to us a large and more certain supply of many articles necessary for our manufactures and extensively consumed by all classes of our population as well as an almost inexhaustible demand for the produce of		

our British labour".

NSOU ? CC-ED-05 71 3.3.3.2. Content, Medium and Method An analysis of the objectives bring out the following components — (i) English education would be so bestowed as to develop the agricultural resources of India so that she might ensure a perennial supply of raw materials for British industries and might become an endless market for the consumption of Britain's industrial goods. Thus education must strengthen the colonial economic relationship. (ii) The immediate and more concrete objective would be the preparation of servile personnel for employment. A clerk-making education was thought of, and a direct link established between education and clerical employment. The content of the education would be an improved academic study of European arts, science, philosophy and literature, i e. Western knowledge. The medium for such improved knowledge would be English although the vernaculars might be accepted on account of their traditional and social values, and also as the media for mass education. Anglo-Vernacular schools and (if necessary) Vernacular High Schools might be established. Indigenous primary schools would be encouraged and text books printed in Indian languages. As for method, the Despatch regretted the Filtration Theory and declared that 'upper classes can stand on their own legs.' Hence Govt's attention would be turned to the needs of the masses. The policy would be to impart "useful and practical knowledge suited to every station of life". These two statements deserve a bit of analysis. The two together meant a denial of equal opportunities and ultimately led to the creation of a gulf between 'Educated Baboos' and "uneducated millions". The Despatch simultaneously incorporated the principle of granting 'merit scholarships' to ensure upward rise of the deserving, by the educational ladder. But niggardly grants made scholarships mere gifts of fortune for the few, and the majority could not go up the ladder. Yet, the references to "useful and practical knowledge" were pregnant with future possibilities of development in vocational education. 3.3.3.3 Secular Education On one question of religion, the Despatch made an explicit declaration in favour of secular instruction. Govt. schools would be non-denominational as would be the non-official schools enjoying grants-in-aid. This was a clear negation of missionary claim for monopoly and denominational instruction simultaneously, however, it was announced that non-official agencies might impart religious instruction at their own cost, and this would be kept off the margin of Govt's attention. It was, thus, a 72 NSOU ? CC-ED-05 compromise solution, with the object of pleasing both the missionaries and the secular Indian opinion. 3.3.3.4. State Control of Education As for administration of this system, the Despatch suggested (i) autonomous administration of universities under acts of incorporation and the university's own rules and regulations, (ii) for administration at the lower stages it suggested the establishment of a Department of Education

85%

MATCHING BLOCK 76/233

W

in each of the five provinces of the time, under a Director of Public Instruction (

D. P. I.) helped by a platoon of School Inspectors. The Department would control Govt's educational endeavour. The Govt, however, would not maintain all the schools. A big role of non-official enterprise was recognised. The non-official (private) schools would be given grants-in-aid under Salary, house building or development heads (as the practice even to-day is). The grants would, however, be subject to conditions viz. good secular education, local initiative and management, realisation of tuition fees, subjection to official inspection etc. 3.3.3.5. Grant-in Aid system Despatch introduced Grant-in-aid system to boost up Indian mass education system. They believe that a policy of giving Grant-in-aid to private effort would solve the difficulties in Indian education as it has solved those of mass education in England. It suggested some general consideration of grant-in aid, on the basis of the consideration each of the Provincial Government should frame their own rule to provide grant-in aid to schools. The aid has to be given to all the schools which- • Impart a good secular education, religious institutions will be ignored; • Process good local management; • Agree to submit to inspection by the Government • Levy a fee, however small, from the pupils. Besides this, the report also advised to follow the England's Grant-in aid system. The Despatch gave a great importance to the teachers and suggested to increase salary of them also suggested to the Provincial Government focus on the providing scholarships and infrastructural condition of the building. 3.3.3.6. Create Education Department The report focused on the public instructional system and for the development of public education they proposed to create

59%

MATCHING BLOCK 78/233

Department of Public Instruction in each of the five provinces of British India as Bengal, Madras, Bombay, the North-Western Province and

the Punjab.

According to the policy an eminent DPI officer shall be

NSOU ? CC-ED-05 73 appointed for each of the presidency and an adequate number of qualified inspectors will be appointed for the assistance of the DPI. An annual report was required to submit by

40%

MATCHING BLOCK 79/233

SA

History of Education In India, Block-1.pdf (D161180427)

the DPI on the progress of education in his province to the government. 3.3.3.7. Establishment of Universities The despatch made recommendation of establishing Universities in Presidency towns of Calcutta, Bombay and Madras

because of the rapid spread of liberal education among the Indian citizen and the requirement of an increasing European and Anglo-Indian population. Despatch also recommended that all the

87%

MATCHING BLOCK 82/233

SA History of Education In India, Block-1.pdf (D161180427)

Universities were to be established based on the model of London University

which was then an examining body. The report also mentioned that the proposed Universities were to have a chancellor, Vice-Chancellor, and Fellows who would constitute a Senate. All the members were to be nominated by the Government. Mainly the functions of the University were to conduct examination and to provide degrees to the qualified candidates. Despatch also recommended promoting exclusively secular education. 3.3.3.8. Establishment of a Network of Graded Schools all over India The Despatch regretted that the adoption of the Downward Filtration theory led to the nation in a direction where the Government was providing a very high degree of education to a very small number of students and most of them belongs in higher class. As a result, the mass education was totally been neglected since 1835. In this regard the Despatch recommended to increase the number of High schools, Middle school and indigenous primary schools and they include the Anglo-Vernacular and Vernacular Schools in the same class. The report also recommended to the directors to propose Grant-in-aid to encourage the High and Middle schools to come indigenous with the elementary schools. They proposed to institute scholarships to be awarded for the promising students. 3.3.3.9. Religious Education, Women education and Vocational Education The despatch also recognised the practice of religious education in government institutions, emphasizing the contribution of missionary in the spread of mass education and did not totally prevent it, but it made religious instructions a voluntary affair between the student and teacher outside school hours. The report laid great emphasis on the development of women education. It observed that the many of the native India wanted to provide a quality education to their daughter and recommended to provide grant-in-aid to the female schools and expressed their cordial sympathy with the efforts which are being made in this direction. In matters of vocational education, it recommended to promote professional training in Law, Medicine and Civil

74 NSOU ? CC-ED-05 Engineering. They stressed upon the need to establish vocational colleges and schools for the industry and teaching practical agriculture at school level. 3.3.3.10. Teacher Training and Curriculum The Despatch called for stress on teachers' training at all levels according to the system of teacher training prevalent in Britain and further recommended for the scholarship and stipend for the teachers in their training period. The Despatch desired to involve the natives of India to this profession or any other branches of public service. It also recommended to translate English books in the local languages because English information are the subject to be taught and further, they suggested to adopt Indian history of people and those teaching material should be adopted which develop the feeling of sympathy and brotherhood. 3.3.4 Wood's Despatch as 'Magna Carta' of Indian Education The Wood's Despatch started a new era in the Indian education system. It defined the objectives of education. It defined the objectives of education and led to the establishment of the present education system at all levels primary, secondary and higher education and all major branches of educational establishments, be it teacher training colleges, medical Engineering and other institutes of professional education in India had their origin in this document. Universities in Bombay, Madras and Calcutta were established in 1857 based on the provisions of the Wood Despatch. Separate educational departments were established in all provinces. J. E. D. Bethune established the Bethune School to promote women education in India by receiving grants under the provisions of the Wood Despatch. It also paved the way for the establishment of

87%

MATCHING BLOCK 80/233

W

an Agricultural Institute at Pusa (Bihar) and an Engineering Institute at Roorkee,

United Province (now, Uttarakhand) European Headmasters and principals were also appointed in the schools and colleges of India in large numbers which led to rapid westernization of the education system in British India. The introduction of Private Indian Educators also started under the provisions of the Wood Despatch. The Woods Despatch was called as Magna Carta of Indian education system by Richter. Actually, Magna Carta is a Great Charter of English liberties granted by King John on June 15, 1215, under threat of civil war and reissued, with alterations, in 1216, 1217 and 1225. By declaring the sovereign to be subject of the liberties held by "free men" the Magna Carta provided the foundation for individual rights in Anglo American jurisprudence. Charles

88%

MATCHING BLOCK 83/233

SA History of Education In India, Block-1.pdf (D161180427)

Wood's Despatch is popularly known as the Magna Carta of Indian Education

mainly for two reasons. The first reason is that the report

NSOU ? CC-ED-05 75 was passed in the British parliament because it was the first time in Indian history a report on education passed in the parliament just as Magna Carta in which the requests of the barons were agreed and passed in the parliament by king John. Also, Despatch report stressed a great emphasis on the spread of mass education, Vernacular language as the medium of instruction in the primary level of education, grant-in-aid, establishment of universities for encouraging the citizens of India towards higher education, spreading women education and etc. are the major recommendation of the report which was a really great attempt to develop Indian education system. 3.3.5. Criticism of Wood's Despatch However, it was criticized for the centralized system of education it introduced in India. Also it was not implemented in letter and spirit due to which the backwardness and neglect of Indian languages and culture under British rule continued despite the introduction of Wood Despatch. It is matter for regret that some of the most important recommendations of the Despatch were not carried out for a long time; some were given effect to in a mutilated form; while some more have yet to be acted upon. The encouragement of Indian languages which it promised remained a pious wish for a long time to come and the languages spoken and understood by the masses continued to languish. The desire of the Despatch to evolve a policy of Grant-in- aid which would enable government completely to withdraw from the field of educational activities was more observed in breach than in fulfilment. 3.3.6 Significance of Wood's Despatch India acquired freedom a century later than the time of the Despatch. Yet, the effort of the Despatch was alive throughout the period and we are even today not free from its influences. The influence of University education firmly established by the Despatch still holds good. The pattern of examination-dominated intellectual, academic and bookish education introduced in those days swallowed the nation's intrinsic merit. The Universities have not yet won the battle to be centres of 'learning'. The domination of the Entrance examination prefixed the curricula and methods. Teacher's freedom of experimentation was destroyed. University-oriented secondary education blocked the path of professional, vocational or elementary education. The mother tongue was accorded recognition. But the monopoly of English in higher education ensured its monopoly in secondary education also. A duality of control (between Govt, and 76 NSOU ? CC-ED-05 University) was initiated. The bureaucratic system of inspection not only made external discipline rigid and stereotyped, but also caused the loss of internal freedom. Yet the positive features of the Despatch cannot be denied. It was the first authoritative Parliamentary document of its nature. Even if Govt, 'responsibility' was not admitted, its "duty" was squarely recognised. In spite of a hundred weaknesses, it incorporated the objectives of education, however much we may condemn them. It enunciated a secular principle, abandoned the filtration policy and adopted a positive attitude towards mass education. Scope of higher education was created for the meritorious poor student in spite of all its limitations. An educational ladder was created in an integrated system. A vast scope was created for private enterprise. Above all, the anarchic efforts of non-official and official agencies during the preceding 50 years were now consolidated in a system of education under centralised control. From this consideration we may accept Lord Dalhousie's characterisation that the Despatch offered

72%

MATCHING BLOCK 81/233

W

a scheme of education for all India, far wider and more comprehensive than the local or supreme Govt, could have even ventured to suggest. 3.4.

Hunter Commission (1882-83): Background and Policy Issues 3.4.1. Genesis of Hunter Commission The administration of India by East India Company came to an end in 1857 and the power of administration was transferred to the British Crown by The Queen's proclamation in 1858. The Wood's Despatch had not accorded monopoly agency to the missionaries, but they were the strongest entrepreneurs in the field; so they opposed the policy of secular education. But, they had now to face a growing intransigence of Indians. Controversies about contents of text books, school inspection, grant-in- aid principle featured as conflicting issues. It was felt that the grant -in-aid system as suggested by the Wood's Despatch was not properly carried out. Because of all these reasons, the missionaries started an agitation and an organisation known as the "General Council of Education in India" was constituted in London by the British Government. As against this, Indian opinion now found a shape. These problems together with others discussed earlier created the need for a thorough survey of the Indian field of Primary and Secondary education.

33%

SA

Bijendra_AI&AS.docx (D116982346)

When Lord Ripon was appointed the viceroy of India, a deputation of the General Council of Education requested him to institute an enquiry into Indian Education. On their request, he constituted Indian Education Commission.

Thus in 1882, Lord Ripon, NSOU ? CC-ED-05 77 appointed this Commission under the chairmanship of W.W. Hunter, officially known as the Indian Education Commission and popularly

75%

MATCHING BLOCK 84/233

W

known as Hunter Commission. It was the first Education Commission in the history of modern India.

It consisted of 20 members including representation by the Indian like Syed Ahmed Khan, Anand Mohan Bose, Justice K T Telang, Babu Bhudev Mukherjee, Haj Ghulam from Amritsar, P. Ranganand Mudliyar and the missionaries being represented by W. Miller. Mr B. L. Rice, the DPI of Mysore was appointed secretary of the commission. 3.4.2 Objectives of Hunter Commission

100%**MATCHING BLOCK 85/233****W**

The Hunter Commission was entrusted with the charge to review the state of education,

especially the implementation aspects of Wood's Despatch's recommendations. Its main aims were : 1.

91%**MATCHING BLOCK 86/233****W**

To study the problem of primary education and to suggest measures for its reforms. However the Commission

made valuable observations in regards to secondary and certain areas of higher education too. 2. To enquire if recommendations of Wood's Despatch in India were being properly followed and test the propaganda carried on by the English missionaries that it was not. 3. To assess the importance and position of Govt., Missionary and Indian enterprise in education 4. To consider the problems of religious instruction, text book, language and teacher preparation 5. To formulate a policy on woman's education, Muslims' education and the fate of indigenous schools and recommend necessary measures for further progress

100%**MATCHING BLOCK 87/233****W**

in such a way that the different branches of public education could move forward together and with equal importance. 6.

To formulate principles in regard to financing and administration of education and assess how Grant-in system and private Indian enterprises could be allowed to function with encouragement from government. The commission toured throughout the country for eight months and appointed provincial committees which gave reports from which the final report was compiled. 3.4.3 Recommendations of Hunter Commission Overall the Hunter Commission criticized the government Educational policy which it found going against the directives of the Despatch. It said that the policy of 1854 78 NSOU ? CC-ED-05 had not been implemented in letter and spirit in all toe provinces. It offered fresh advice that Govt. should gradually withdraw from the field of secondary education in favour of non-official enterprise, and primary education should immediately be transferred to the care of non-official agencies. Tie Grant in-aid Code should be amended on a more liberal basis. 3.4.3.1 For Primary Education The Hunter Commission made 36 elaborate recommendations

90%**MATCHING BLOCK 89/233****W**

in the field of Primary education on the lines of Council Act of England with regard to its policy, objectives, curriculum, methods of teaching, teachers training, finance and administration etc. 1.

93%**MATCHING BLOCK 90/233****W**

It was declared by the Commission that the primary education was essentially aimed for the masses and hence should be provided in the vernacular language. 2. The subjects of education should fit them for their position in life.

For the qualitative improvement of primary education the commission recommended a reorganised curriculum including Mathematics, Accountancy, Mensuration, Natural Science, Agriculture, Handicraft, Physical Exercise etc. so that primary education might be life-oriented education through vernacular medium. Practical lessons should be imparted in agriculture and the sciences. There should be flexibility in the selection of text books, the school time-table and standards. The schools should be adjusted with Vocal life. More Normal Schools should be provided. 3.

100%**MATCHING BLOCK 91/233****W**

While the private enterprise was to be hailed at all stages of education, primary education was to be provided without reference to the local co-operation. 4. The commission

redefined indigenous schools as those established by Indians and conducted by them in Indian style. The popularity of these schools made them worthy of state benefaction. In return for state-aid, these schools should open their doors to all, irrespective of caste or creed. 5. More aid and an Indian Inspectorate were prominent recommendations. Aid should be reciprocal to 'result'. As a method of financing these indigenous schools, thus the system of payment by result was advocated by the commission. 6. Planning, management, maintenance and administration of primary schools should vest in Local Self Govt Bodies and Municipal boards. Local funds from cess should be earmarked for primary education alone and one-third of total expenditure should come as subsidy from state exchequer. To guard against preferential treatment of urban areas, the Commission suggested separate funds NSOU ? CC-ED-05 79 for urban and rural areas. The entire cost of inspection and teacher-training should be borne by the state. 3.4.3.2. For the secondary and collegiate education 1. Very positive suggestions were made in regard to the nature and curricular organisation of secondary schools. It proposed two equivalent and parallel courses — 'A' course for academic studies and 'B' course for practically oriented studies. This would include 'commerce' courses also. Thus,

90%**MATCHING BLOCK 92/233****W**

there should be two divisions - literary education leading to the Entrance examination of the university and the other is the practical kind of vocational training leading the students to build up their career in the commercial field. 2.

Then there came forth a suggestion for termination of the 100 year long tradition of the monopoly of Academic studies Practical effects, however, were negligible. Yet, this was the dawn of 'diversification in secondary education. The Commission could not take stock of higher education. Yet, its suggestion about diversified secondary education it suggest is the introduction of diverse studies in Universities 3.

98%**MATCHING BLOCK 93/233****W**

The commission made that an effort should be made to encourage the private enterprise in the field of education. The Commission to achieve this objective recommended the extension and liberalization of the grants in aid system, recognition of the aided school as equal to Government institutions in matters of status and the privileges. 4. It was also declared by the Commission that the Government should as early as possible withdraw from the direct management of the secondary and the collegiate education. 5.

Nothing explicit was stated about the medium of instruction in secondary schools. Managers of Middle Schools might elect either English or mother tongue. Obviously English continued to be the medium. And predominance of English at collegiate and secondary levels made the option allowed for the middle- school stage practically infructuous. Hence, the domination of English remained as before. 3.4.3.3 Other Significant Recommendations In matters of women education, it recommended

98%**MATCHING BLOCK 94/233****W**

that curriculum for girls should be different from that of boys, because of the different nature of their life duties. Subjects useful in their life should be included in their curriculum

which is to be decided by the local bodies and lady teachers to be appointed for the purpose.
80 NSOU ? CC-ED-05

100%**MATCHING BLOCK 95/233****W**

Moreover the education Commission drew attention to the inadequate facilities for the female education outside the Presidency towns and also made recommendations for its spread

in rural and suburban areas. In matters of educational administration,

100%**MATCHING BLOCK 96/233****W**

the practice of appointing Indian as school inspectors in education departments was adopted.

With regards to religious education in schools the Commission recommended that the Government should detach itself from looking after religious education in schools and it should be left to the Managers of the non-government schools. Education should be secular in Govt schools. No aids should be given to non-official schools for religious instruction. Attendance of students would not be compulsory if any school provided religious instruction. As an alternative to religious instruction there should be provisions for moral instruction about the duties of man and citizen. The 'School Book Society' should be responsible for text books. Thus the missionary claims were defeated. Moreover, the Commission opined that non-official enterprise should mean, non official Indian enterprise which should have the greatest claim to Govt. finances .

100%**MATCHING BLOCK 97/233****W**

The Commission recommended that in Government schools special facilities should be provided for

the Muslims and Backward classes. In the domain of Teacher education, it wanted to make professional training a precondition to permanent appointment to teaching posts. 3.4.4. Impacts of Hunter Commission Short Term Effects The Government of India accepted almost all the recommendations and also accept the recommendation regarding complete religious neutrality in the educational institutes.

100%**MATCHING BLOCK 98/233****W**

The recommendations of the Hunter commission (1882) gave a great set back to the efforts of Christian missionaries. The individual efforts and local cooperation got due impetus and encouragement.

Hunter Commission's recommendations included both positive and negative features. Recognition of the priority of Indian enterprise meant an attempt to narrow down state responsibility. Patronage to indigenous schools remained a pious wish. The Local Bodies with responsibilities, but without sufficient resources, were destined to fail. The scope of vernacular education remained still limited. The principle of payment by result operated against the cause of mass education. But positive features were many. Diversified studies at university stage and parallel courses in secondary education were new concepts. Positive recommendations for the education of women, Muslims etc. were worthy. The principle of secular education

NSOU ? CC-ED-05 81 was unequivocally restated. Improvements in primary education were concretely suggested. Local Control crested the scope of mass education. And recognition of the priority of Indian enterprise created the scope of rapid expansion of education. Hunter Commission removed the last obstacles to the expansion of Western education. Its recommendations, combined with political consciousness of Indians, led to rapid expansion of education so that by 1901-02, the number of colleges conducted by Indians became 42, as against 37 conducted by missionaries. The urge for higher education expanded. The universities swelled. But the absence of practical education made higher education simply one-sided education in the Humanities. There was a rapid expansion of women's education too. The numbers of girls' colleges, schools, primary schools and training institutions became 12, 422, 5305 and 45 respectively in 1991-02. The Aligarh Movement facilitated the expansion of Muslim education. At the secondary stage, the 'B' course was introduced in various provinces, but it attained only limited success. While 'A' course candidates in 1901-02 were 23000, 'B' course candidates were only 2000. This failure had some objective causes. 'Indian' investments in industry and commerce had still been negligible. Moreover the 'B' course was not a genuine course for industrial vocations. Even Indian opinion in those days had not been free from the illusion of academic studies and black-coated professions. 'B' course education was scarcely considered as 'real' education. That is why general education at, secondary stage recorded rapid progress. In 1901-02, there were 5214 schools against 3916 in 1891. Indian enterprise led the field. In face, the Missionaries had to admit defeat. They continued to nurse the previously establishes institutions. But their attention was now turned more to the tribal areas. The 'Missionary problem' was thus solved. Sufficient change ensued in the field of primary education. The Self-Govt bodies formed in pursuance of Lord Ripon's Local Self-Govt. Act of 1882 were given responsibility of primary education. Their resources were earmarked and grant-in-aid rules were changed. Improvements were effected in school buildings, curriculum and methods. Girls were admitted as also were some Harijans. Better teachers were recruited. But the indigenous schools were not patronised in practice. Moreover, the principle of payment by results affected the expansion of primary education. The teachers began to pay more attention to examinations and strict promotions. Wastage and stagnation increased. Moreover, the Self-Government bodies had their inherent weakness. Lord Ripon himself had declared that local self-Government did not mean decentralisation of

82 NSOU ? CC-ED-05 power. The powers and resources of these bodies were limited. The public representatives were in experienced. These institutions, born through 'concessions' could not attain genuine popularity. In many provinces, the powers delegated were very limited in span and depth and the State Grants were insufficient. Sometimes, the budget for primary education was diverted to other purposes. Despite these limitations, it must be admitted that although the Indian Education Commission could not initiate any new education policy, it removed the obstacles, untied many knots and created conditions for very rapid expansion of education by supplementing the Despatch of 1854. Some new light was thrown on some issues of public interest. And it will be no exaggeration go say that modern primary education owes a great debt to the commission led by W. W. Hunter. It must at the same time be admitted that the growth of national spirit generated a new consciousness which influenced the deliberations and suggestions of the Commission.

94%

MATCHING BLOCK 99/233

W

One of the principal impacts of this expansion was the massive participation of the Indian philanthropists in the system of education. A number of denominational institutions,

developed according to the principles of a particular religion were set up in all parts of the country. Long Term Effect The policy called for gradual withdrawal of the government from the educational field . It recommended that responsibility of Mass education should be entrusted to the Indian people and the lead to development of a number of Indian Institutions of learning.

90%

MATCHING BLOCK 100/233

W

This led to Indianisation of education. The result was an increased number of schools and colleges.

As traditional schools died out from lack of funding and enrolment, the government school system became more and more overburdened, resulting in systemic problems in primary education that affect the society even today.

91%

MATCHING BLOCK 101/233

very high expectations from the Education Departments. • Grant-in-aid rules on the 'basis of results' was not a healthy practice. 3.5.

Curzon's Policy: Perspectives, Policies on Primary, Secondary and Higher Education (1904) 3.5.1. Arrival of Lord Curzon in India Lord Curzon came to India as Viceroy in 1899. In the beginning of 20th century there was severe famine and social lives of the people were in a terrible state. Also, the establishment of the Indian National Congress had infused an awakening spirit among the masses. The recommendations of the Indian Education Commission (Hunter Commission) had outlived their utility. During his vice-royalty, various steps were taken to improve different levels of education. He was, no doubt, one of the ablest Viceroys endowed with many qualities. Yet he was an arrogant Imperialist without any soft corners for Indian sentiments that had been proceeding towards an explosion. A clash between imperialist arrogance and revivalist extremism of Indians was inevitable. The field of education was not spared, more so because it was most sensitive. The recommendations of the Indian Education Commission (Hunter Commission) had outlived their utility. The recommendation of the Commission that Government should withdraw from direct educational enterprise and introduction of laissez faire to private enterprise, which was adopted by the Education Departments in later years, had brought in various evils; for instance, most of the institutions conducted by private agencies were inefficient, poorly staffed, and poorly equipped. The only remedy for these evils was to replace the policy of laissez faire and expansion by one of control and improvement. 3.5.2 Nationalist Sentiments and Lord Curzon On the other hand, nationalists like Gokhale and others believed that the most crying need of India was quantitative advance. They felt Indians challenged the wisdom of the policy which put quality first and quantity next. They pointed out that this

84 NSOU ? CC-ED-05 policy might suit England where expansion of education was already complete, but that it had no place in India where expansion had not even begun in right earnest. The official desire to control and improve secondary and collegiate education was ascribed to political motives and it was said that the real motive was not the improvement of educational standards, but the sabotaging of the development of national feeling in the minds of educated Indians. The official attempt to expand primary education was generally appreciated, but it was felt that the rate of expansion visualised by the Education Departments ' was quite out of proportion to the needs of the situation. It was held that there must be a still greater expansion of secondary and collegiate education; and that in primary education, the principle of compulsion must be accepted. Complete and speedy Indianisation of the Education Department was demanded. Education, to be worthy of its name, must develop love for the mother-country and not loyalty to British Rule. Nationalist sentiment also revolted against the exaggerated importance attached to English and claimed that the modern Indian languages should be adopted as media of instruction. It is obvious that the differences of opinion were fundamental and a conflict was inevitable. Had Lord Curzon and his advisers made an attempt to appreciate the Indian point of view and to meet it half-way, the history of education in India would have taken an entirely different turn. Lord Curzon, however, pushed forward his favourite plan of reform and thereby greatly alienated Indian public opinion. His policy was kept up by his successors as well, so that a conflict between the official and non-official points of view dominated the history of education during the period as a whole. The continuous and mostly fruitless struggles over several issues ultimately led Indians to think that real improvement in education was impossible unless they obtained the right to control educational policies. This feeling gathered strength as time passed, until it resulted ultimately in the transfer of the Education Department to Indian Ministers under the Government of India Act, 1919. 3.5.3. Simla Conference The first step in the educational reform that Lord Curzon initiated was the holding of a national conference at Simla in September 1901, attended by the Provincial Directors of Public Instruction, representatives of the Christian Missionaries and a few selected educationists, but the representatives of the Indian people were conspicuously absent. All total 150 resolutions were passed, which were mostly unanimous and which

NSOU ? CC-ED-05 85 covered all the stages of Indian education from primary to university level. These resolutions formed the basis of the Government Resolution of 1904 on Education Policy. The Government identified the shortcomings of Indian education decided to spend more money to fully control all stages of education, establish Government schools so that it could serve as models to private schools. The conference opined that there had been an unbalanced development of education in a top-heavy pattern. 80% villages were without school. Three-fourth of boys had no provisions made for them, and only two and half percent of girls had been provided for, while secondary and higher education had advanced far. Salaried employment had been the aim of education. This had caused an overemphasis upon examination, which again was intrinsically defective. University Senates composed of varied elements, and ad-hoc nature of Syndicates made university administration only farcical. The colleges had turned into coaching institutions preparing candidates for examinations. Teaching and Research at the highest levels had been lacking. The discontent and indiscipline of the younger generation turned the schools and colleges into a good breeding ground for political extremism. • Indian University Commission 1902 On the basis of these preliminary findings, Curzon appointed the first "Universities Commission" in 1902 (with the inclusion of some Indian members). The Commission spoke against the establishment of new universities and suggested a re-delimitation of the territorial jurisdictions of the universities. The Commission was appointed under the Chairmanship of Sir Thomas Raleigh

86%

3. Education during pre independent india- ang ... (D76294186)

to enquire into the conditions of the Universities established in British India and to consider and report upon

the proposals for improving their constitution and working. • Indian University Act 1904 In pursuance of these recommendations, the Indian Universities Act was passed in 1904. The territorial jurisdictions were redelimited, and University administration was reformed. Financial assistance to Universities was squarely promised. This Act, formulated

100%

MATCHING BLOCK 109/233

SA

History of Education In India, Block-1.pdf (D161180427)

on the basis of the recommendations of the Indian University Commission

of 1902 which accordingly, enlarged the scope of University education in India. 3.5.4. Curzon Policy on Primary Education Primary education had not expanded to the desired degree after 1882.

100%

MATCHING BLOCK 105/233

W

Curzon declared that expansion of primary education was a major responsibility of the State and

primary education

70%

MATCHING BLOCK 106/233

W

had a major claim to Provincial and District Board budgets for 86 NSOU ? CC-ED-05 education. Together with this announcement he adopted a policy to improve the curriculum, introducing physical education and nature study, linking primary education with village life

and two-year teacher-training (including agricultural training) etc. Govt aids to primary schools were increased, school buildings and equipment bettered. Instead of one-third of the educational expenses of local bodies, the Govt. began to bear as much as 50%. The policy of 'payment by result' was abandoned. Thus, in the field of primary education; Lord Curzon combined quantitative expansion with qualitative improvement. The freedom of local bodies was to some extent compromised (on the plea of inefficiency) and administration of primary education was bureaucratised. Yet, the increase in Govt attention was reflected in the increase in

100%

MATCHING BLOCK 107/233

W

the number of primary schools which rose from 93604 in 1901 to 118262 in 1911-12.

Lord Curzon took the following steps in regards to Primary Education ■ Liberal grant-in-aid : Because of limited funds allocated earlier, he directed the provincial Governments to spend larger amounts on primary education by giving necessary recurring grants to the local boards and the Municipalities. He raised the Government grant to local authorities from one third to one half of the total expenditure. He also sanctioned special grants for the diseased and famine stricken people. ■ Abolition of the system of payment by results :

37%

MATCHING BLOCK 110/233

SA

History of Education In India, Block-1.pdf (D161180427)

Curzon stopped the system of aiding primary schools on the basis of examination results, introduced by the Hunter Commission 1882 and introduced more scientific and liberal methods of paying grant in aid. ■

Training of Teachers : To enhance quality of education, steps were taken to establish training centres for primary teachers. Training should not be less than two years and involved agricultural education for rural centres. ■ Improvement of Teacher's Salary : Lord Curzon observed that there were differences in pay scales of the teachers in different states and so recommended to restructure their pay scale but could not fully equalise it. ■ Reform in curriculum : Besides teaching three R's, Curzon directed to include Agriculture and Physical education as subjects in the primary school curriculum as it should cater to the needs of the local children. NSOU ? CC-ED-05 87 ■ Method of Teaching : Curzon also advocated for introduction of scientific methods of teaching like the kindergarten system based on availability of suitable teachers. 3.5.5 Curzon Policy on Secondary Education The inevitable corollary of the policy in higher education was Curzon's intervention in Secondary education, because the secondary schools were feeders of the Universities. It cannot but he admitted that the rapid expansion of secondary education after 1882 had considerably undermined the nature and standard of secondary education. Curzon adopted some positive measures enunciated in the form of a Govt. Resolution in 1904. Curzon's Secondary Education Policy can be divided into two parts— Policy of control and Policy of improvement. 3.5.5.1. Policy of control In the interest of the community, Curzon decided to uptake the responsibility of education provided in schools, whether government, aided or private as Hunter Commission of 1882 had decided to withdraw from expansion of secondary education and left it to the private bodies as he found most schools to be inefficiently and poorly staffed equipped. For controlling private schools, government envisaged that managing committee of the school should be properly constituted and all schools should receive recognition from the Director of Public Instruction, Education Department and University (for purpose of Matriculation Examination) of the concerned state, and all grants scholarships and student transfers are to be based on these recognitions. 3.5.5.2. Policy of Improvement Curzon encouraged provincial governments to provide grants to private school for qualitative improvement of the overall secondary school system and government secondary schools were set up to serve as a model for private ones. He also tried to enhance quality by increasing teacher training centres and encouraged all teachers to receive training, and to ensure rigorous implementation of the policy he increased number of inspectors. In curricular aspects, he advocated mother tongue as the medium of instruction without compromising the study of English. He also included practical and vocational subjects and physical education in the curriculum. Study of the vernacular throughout the secondary course, application of the Direct Method in the teaching of English, Science courses, improved teacher preparation at University level, diversified curriculum with more emphasis upon the 'B' course at 88 NSOU ? CC-ED-05 school leaving stage were some of the positive aspects of Curzon policy. But here too, a policy to weed out the substandard schools by stricter rules of administration and recognition was adopted. A strict control of the University upon secondary education was proposed. And above all, the practice of Govt. recognition of schools in addition to university affiliation was insisted upon. Right to send up candidates was given only to affiliated schools, and right to enjoy Govt. grants was reserved for the recognised schools only. Recognition was subjected to strict inspection and severe rules. Thus the policy of qualitative improvement by quantitative control of Secondary education was the essence Curzonian policy. 3.5.6. Curzon Policy on Higher Education Lord Curzon, as said earlier set up the Indian University Commission. In its report it stressed the need for reorganisation of the Universities with fixed jurisdiction of each University and no new Universities to be established. He also introduced teaching in the Universities by changing their constitution and formed undergraduate and postgraduate curriculums also raising the standards of Matric examination. Syndicate of Universities should have about 9-15 members and conditions for recognising colleges should be stern. He also gave importance to the study of classical languages also ensuring best possible arrangements for teaching of English. 3.5.6.1. Indian Universities Act, 1904 Indian Universities Act, 1904 which was the result of the commission's finding, conferred upon universities

100%

History of Education In India, Block-1.pdf (D161180427)

The Government reserved the right to make amendments and reforms and give approval to

the rules framed by the Senates of the University and also it can frame regulations itself if the Senate fails to frame these regulations in time. For academic affairs the Commission suggested Boards of NSOU ? CC-ED-05 89 Studies with teacher's representation and acceptance of teaching duty by the University itself, especially at the post-graduate level. In regard to Undergraduate Colleges, the Commission recommended an improvement of standards by rigidity of affiliation and recognition. Rules in regard to granting recognition were made more strict. The colleges were required to abide by stringent terms in respect of buildings and equipment, library, laboratory and teaching staff as well as hostels and students' welfare service.

82%

MATCHING BLOCK 115/233

SA History of Education In India, Block-1.pdf (D161180427)

In order to raise the standards of education, the Syndicate could call for the inspection of colleges imparting higher education.

The number of degree colleges reduced from 192 in 1902 to 170, within a span of 10 years. Prior to this Act, the territorial jurisdiction of universities was not fixed. As a result some colleges were affiliated to two universities while others were situated in the jurisdiction of one university but affiliated to another.

71%

MATCHING BLOCK 116/233

SA History of Education In India, Block-1.pdf (D161180427)

This Act, made it clear that the Governor General will by his ordinary or extraordinary orders fix the territorial jurisdiction of the Universities and according to this provision the relations between colleges shall be established and maintained.

Curricula and standards of teaching (particularly English) were to be improved and examinations reformed. A stiff Entrance Examination would make it impossible for anyone other than the meritorious to get admitted to higher studies. In short, the Commission's recommendations amounted to a suggestion that second grade colleges should wither away. No candidate should be allowed to appear at a university examination without being sent up by a recognised college. This would mitigate against the unhealthy race to establish sub-standard private colleges. The affiliated and good colleges should provide also for the meritorious poor and they be amply rewarded with grants. A high standard, thus attained, would help the university become a centre of learning and research conducted by efficient teachers.

3.5.7 Other Educational Reforms of Lord Curzon Lord Curzon carried out several important reforms some of which have been noticed below

- Schools of Art The name of Lord Curzon is connected with the reforms of the Schools of Art, the great impetus given by him to the growth of agricultural education and with the institution of scholarships for technological studies abroad. Ever since 1893, controversies were going on regarding the future of Art schools in India. There was a section of opinion which believed that these schools had failed in their primary

90 NSOU ? CC-ED-05 object of promoting Indian arts and industries and should, therefore, be closed. There was another section which recommended that they should be continued with certain modifications. This controversy was closed by Lord Curzon who directed that the schools should be continued with certain modifications in their objects, methods and organisation.

- Agricultural education Agricultural education had hardly developed in India before the days of Lord Curzon. There were a few Agricultural Colleges but they had not proved much of a success, either in theory or in practice, because they had neither produced scientific experts nor succeeded in producing practical agriculturists. Lord Curzon enunciated a new and bold policy in this respect. It was under him that the Agricultural Departments came to be organised. He also created a Central Research Institute at Pusa with the object of giving the highest training in agriculture in India itself ; secondly, he laid down the principle that every important province in India must have its own Agricultural College which should be properly staffed and equipped ; thirdly he directed that an attempt should be made to broadcast agricultural education among the people by introducing agriculture as a subject at the Middle and High School stage and by conducting special classes for the training of agriculturists.
- Foreign Scholarships The third achievement of Lord Curzon was to institute scholarships for sending Indian students for technological studies abroad. The necessity of technological education had long been felt; but the number of students, likely to be attracted to technological institutions, was so small that it was not considered economic to organise them in India. Lord Curzon, therefore, instituted scholarships to be given to selected students to enable them to pursue technological studies abroad. The courses selected for the purpose were generally such as would be of material use in developing Indian Industries.
- Moral Education The question of religious education was discussed again at the Simla Conference. That the State schools should remain secular was so established a tradition now that it was not challenged at all. On the other hand, the suggestion made by the Indian Education commission, 1882-83 to the effect that a moral primer or text-hook should be prescribed in colleges was also brushed aside as inadequate. 'If pupils can cram Euclid', said Curzon, 'there is nothing to prevent them from cramming ethics The Conference, therefore, took up the consideration of a very practical issue, viz., how

NSOU ? CC-ED-05 91 moral and spiritual values can be realised in an educational system that is bound to be secular. On the other hand, Curzon believed that aided schools should preferably give religious education. • Creation of the Department of Archaeology A really great contribution of Curzon to India was the creation of the Department of Archaeology. He found that the ancient monuments in India were not properly being cared for and, therefore, created a special department for the purpose. He was also responsible for passing the Ancient Monuments Preservation Act of 1904. This was a very valuable piece of work and the Department has done yeoman service to Indian culture by its archaeological studies and by the efficient preservation of all important ancient monuments. • Appointment of a Director-General of Education in India One of the greatest contributions of Curzon was to create the post of a Director- General of Education in India. The first official to hold it was H. W. Orange. The Despatch of 1854, it will be recalled, created Departments of Education in the Provinces; the credit of creating the first nucleus of such a Department in the Government of India goes to Curzon. 3.5.8. Critical Observations on Curzon's Policy Lord Curzon had not basically changed the nature or objectives of education, nor did he overhaul the structure or system of education. His efforts were limited to qualitative improvement through administrative control. But, his attempt at improvement of curricula, recognition of the vernaculars, introduction of the sciences etc. sowed the seeds of subsequent developments. Improvement of university administration, and attention to agricultural, technological, medical and commercial courses was pregnant with future possibilities. The acceptance of teaching responsibility directly by the university laid the real foundation of higher education. In fact, Govt, attention to all aspects and stages of education was a productive contribution of Lord Curzon. A rational and judicious analysis of Curzon's policy justifies praise. Had the Curzonian policy been thoroughly implemented since then, many of our present educational problems might not have been born with their present intensity and extensity. Today we propose many things which Curzon had proposed more than hundred years ago. But, the present standards cannot be applied to an assessment of the past. The past must be assessed in the historical perspective. That perspective leads us to conclude that Curzon's policy out across the nation's aspirations. Curzon had bypassed not only

92 NSOU ? CC-ED-05 the Indian sentiments, but also the opinion of the educated leadership which was considered a 'microscopic minority'. Curzon wanted to centralise educational administration and to combine Govt, aids with Govt, control. Improvement of university administration was mixed up with Governmentalisation. Sadler Commission itself had to remark a decade later that Calcutta University was the most Governmentalised one. Total Govt responsibility in education was not admitted. The policy of control simply obstructed non-official enterprise to spread education. This amounted to squeezing and limiting higher education. This could not be admitted by nationalist India. Curzon's logic was that the "expansionist policy" of 1881 had outlived itself. Haphazard expansion not only undermined the standards, but made education politically motivated. Hence Govt must not withdraw from the field of education. (This was a reversal of the previous policy of gradual withdrawal). Bather, a more extensive Govt effort and intensive control should be combined. Such a policy could not be admissible to India which was seething with discontent and enthused with revivalism. Indian attention had been drawn to Indology, study of the vernaculars, nationalistic history and geography, mass education and Indianisation of educational administration. Expansion of education was more desired. In short, discontent against British rule became correlated with discontent against the British- given system of education. Curzon's arrogant, egotist and unsympathetic methods had injured the nation's feeling. He had not given any recognition to enlightened Indian opinion in the Simla Conference of 1901. He had slighted the educated gentry in his Calcutta University Convocation Address in 1905. He adopted a bureaucratic method of reform. Such things at a time when political extremism was a growing feature in the national movement were sure to lead to a clash. Partition of Bengal during Curzon-administration crowned everything. The partition question supplied the fuse to the explosive situation. Anti-Partition Movement produced its corollary in the National Education Movement. 3.6 Summary During the renewal of The Charter Act 1853, a Select Committee of the House of Commons in England held a very thorough enquiry into the educational developments in India. It was sent as a Despatch to India in 1854 and came to be known as Wood's Despatch after Charles Wood who was the President of the Board of Control of the British East India Company. The Despatch of made numbers of recommendations for the development of Indian education system.

NSOU ? CC-ED-05 93 Among the various recommendations of Despatch expansion of European knowledge throughout all classes of people, establishment of universities in the model of London University, establishment of department of education, recruitment of DPI and inspector for the progress of primary education, for medium of instruction they proposed to introduced English language and also suggested Vernacular language at primary level of education. It introduced new schemes in the field of education like Grant-in-aid, training of teachers, awards and scholarships for the student, normal schools for teacher training, provisions of text books in vernacular schools, religious secularity, vocational training, education for women, employment for educated persons and expansion of education among the masses

83%

MATCHING BLOCK 117/233

SA

of India. It is known as the 'Magna Carta' of Indian education

because it was for the first time, a report on Indian educational system was passed in the parliament and addressed important issues like mass education, medium of instruction, educational administration and financing etc. This report formed the basis of University education as examination dominated system and gave recognition to mother tongue as medium of instruction and thus played a significant role in the history of development of Indian education. To review the status of recommendations of the Wood's Despatch, Lord Ripon appointed the Hunter Commission which made important provisions on Primary and Secondary education. It recognized Primary education as the education of the masses and advocated use of mother tongue as the medium of instruction, provision of primary education in backward areas. • It also recommended Transfer of control of primary education to local bodies, introduction of the system of payment by result, freedom in selecting text books, adjusting school hours and holidays according to local needs, • Other main recommendations for primary education were establishment of normal schools in each division, maintenance of separate fund for primary education, assisting local body by grant-in-aid system, inclusion of more practical subjects and various co-curricular activities, opening of night schools etc. • It recommended leaving the expansion of secondary education to efficient private bodies, gradual withdrawal of the Government from direct enterprise, maintenance of some secondary schools by the Govt. as model to aided schools. • In matters of Secondary education, it also advocated charging lower rate of fees

94 NSOU ? CC-ED-05 in the aided school, introduction to commercial and non-literary courses in the curriculum, sanctioning grant-in-aid to improve secondary education etc. • However, some of these recommendations had adverse effects on the progress of Primary education in subsequent period. • Lord Curzon came to India in a very crucial period of Indian history. This was the beginning of 20th century and severe famine and epidemic of Plague had crippled the social life of the people. Primary education was in a very bad shape. • But with the establishment of the Indian National Congress in 1885 there was a revival of a national spirit in the field of education. The people of the country started realising the need for a system of education that would represent our national character. • The first step in the educational reform that Lord Curzon initiated was the holding of a conference at Simla in September 1901. Lord Curzon realised the poor condition of primary education in India in terms of quality and quantity. • Curzon's Secondary Education Policy can be divided into two parts— Policy of control and Policy of improvement. • Lord Curzon was the first person to appoint a commission on University education. On January 27, 1902, the Indian University Commission was appointed under the Chairmanship of Sir Thomas Raleigh

on the basis of the recommendations of the Indian University Commission

of 1902. • Lord Curzon who started the movement for educational reconstruction in India. He laid the foundation of the reforms of Indian universities and tried to raise the standard of Indian higher education. • He recognised the responsibility of education by the central Govt. Standards of secondary education was also raised through rigid and regular inspection and stricter condition of recognition. • Due to his patronage expansion of primary education was striking. Technical and vocational education received impetus in his hands. Reforms were also introduced in agriculture education, department of Agriculture was established

NSOU ? CC-ED-05 95 and arrangement was made for agricultural research. His attempt to preserve the ancient monuments of India and creation of a department of Archaeology was praiseworthy. 3.7 Self-Assessment Questions • Describe the genesis of Wood's Despatch • What were the major guidelines given by Charles Wood regarding objectives of education, Grant-in-Aid system and higher education • What were the impacts of Wood's Despatch on Teacher Training system in India • What were the conditions of Grant-in-Aid according to the guidelines of Charles Wood (1954). • Write Notes on : (i) Teachers' training according to Charles Wood's guidelines (ii) Long term effect of Wood's Despatch • Why were the guidelines given by Charles Wood's called a 'Despatch' • Who was Charles Wood? • What were the reasons for the appointment of Hunter commission? • Write a short note on 'Payment by result'. • Discuss the recommendations of the Hunter Commission of 1882 to improve Primary education in India. • Discuss the contributions of Hunter Commission of 1882 for the development of secondary education in India. • What were the significance of the Hunter Commission of 1882 in the context value of the Indian education system? • Write briefly on the Simla Education Conference. • Do you think Lord Curzon was successful in improving the condition of secondary education in India? • Why was the University Education Commission of 1902 instituted? • List briefly the main provisions of the Indian Universities Act of 1904. • List the other reforms that Lord Curzon introduced in India.

Elucidate the educational policy of the Government of India, 1913. • Understand the main recommendations of Sadler Commission. • Realise Contribution of Sadler Commission in University Education. • Know about Sadler Commission recommendations on Secondary Education. • Know about Sadler Commission recommendations about University Administration 4.2 Introduction The arrival of Vasco da Gama in Calicut in 1498 opened the sea route from Europe to East Asia. After that India became the centre of attraction for Europe's trade. At

NSOU ? CC-ED-05 101 first the British entered the Indian subcontinent as traders. Gradually the British eclipsed the other European trading companies and over the years they saw a massive expansion of their trading operation in India. Finally they established colonial rule in India. The Western educational system was introduced through the recommendations of Wood's Dispatch (1854). After the Sepoy mutiny the Government of India introduced various committees and commissions on education. But the main aims of these were only to make clerks who helped Britishers to gain control over the country. The idea of nationalism, patriotism emerged at the end of the 19th Century. These ideas give birth to the concept of national education movement. This movement was a tribute to India's diverse culture. The national education movement thus set the background for future education policies which we shall study later on. Like Gokhale's Bill on Primary education which was passed in 1910 played a great role in shaping the structure of primary education in India. Later on Sadler Commission was appointed to reform the University education sector and it made a plan which formed the basis for organization of Calcutta University and other universities of India. We shall study these one by one. 4.3 National Education Movement: Cause and Effect 4.3.1 Concept of National Education Education means not only to gain bookish knowledge and pass examinations. In its true sense education should be that training, both mental and physical, of children which will enable them to reveal their internal capabilities as well as introduce them with the knowledge of all things belonging to this vast world. India is a multicultural country. Different nations have invaded India since ancient times. Some have stayed in India or some have left. Thus an assimilated culture is developed in India.

MATCHING BLOCK 124/233

SA Bijendra_AI&AS.docx (D116982346)

Indian education had always been, since the Vedic age, of a classical and spiritual rather than a practical nature.

After the

Battle of Buxar (1764) the rule of the company was established in the Bengal Presidency. They paid little attention about the education system. Warren Hastings encouraged the revival of Indian learning. Macaulay's minute and later the Woods Despatch introduced the western education system in India. The purpose of this education system was to control the country with the help of some people of India.

102 NSOU ? CC-ED-05 Through this education the idea of nationalism, universalism, fraternity, patriotism developed gradually. National education means not an uniform structure of the education system. National education was that education where various philosophies of India like Buddhism, Jainism, Islam, Hinduism etc were reflected; heterogeneous cultures got their equal value. The main aim of this education was to revive the past glory of India, to recreate a sense of pride among Indians by learning the traditions, culture, and religion of India and to rediscover the value of using Indian languages as a medium of education. It was not a concept of a single structure of education. It has multi cultural aspects. Late 19th century the educated Indians began to feel the pinch that the wrong lay in the British system of education and pattern of education planted by a foreign ruler and unrelated to the real life of the nation and its aspirations. The importance of national education is relevant nowadays also which we can see in the recommendations of the new education policy 2020. 4.3.2 Background of National Education Movement The concept of national education emerged from the last decade of 1880s. The political scenario changed rapidly in 1885 when the Indian National Congress was established. Everywhere it evoked great enthusiasm among the local public and attracted gradually increasing number of delegates from different parts of India. Throughout the 19th Century the Congress chiefly concerned itself with criticism of government policy and demand for reforms. As with all great national movements e.g. the French Revolution where was an intellectual background to this political regeneration. By the study of English literature and European history, educated Indians imbibed the spirit of democracy and national patriotism which England unequivocally declared to be her political ideals. The pronouncement of Queen Victoria acquired a special significance for Indians in view of the democratic constitution. At the very beginning the government looked upon the Congress movement with favour at least without any dislike. But the official world soon changed its view. Gradually the government officers kept aloof from the Congress movement. As regards the other proposals of the Congress, little was done by the government. Year after year the Congress passed nearly the same resolutions but without much effect on the government. This brought about a feeling of dependency and gradually a spirit of opposition against the government gained ground. A new concept of nationalism emerged. Tilak tried to create a strong national feeling among the Indians by an appeal to their historic past. He organised annual festivals in commemoration

NSOU ? CC-ED-05 103 of Shivaji. Through his paper Kesari, he preached his new political ideals of self help and national revival among the masses. His speeches and articles are greatly held to have been responsible for the growth of a radical section which soon became a powerful wing of the Congress. The Congress had since its foundation been led by the moderates pursuing prayer-petition-please policy. Before long it was realised that prayer politics must end and the policy of mass agitation and movement be adopted. The concept of political extremism became popular. It was natural for a country with rich traditions, smarting under a foreign rule and with a bleak future, to look back and draw inspiration from past achievements for its endeavours to break through. This new thought in politics represented mostly by younger leaders from Bengal, Maharashtra and Punjab came to be known as extremism. The challenge of extremism prepared the ground for a movement of educational reforms. The Despatch of 1854 continued to be the basis of Educational policy for India even after it was transferred to the Crown and was confirmed by the Secretary of State in 1859. The introduction of Western education changed the scenario of society. The second half of the 19th century was marked by a strong wave of reforming activities in religion and society, the path of which has been paved by Raja Ram Mohan Roy. There was a general recognition of the existing evils and abuses in society and religion. But as usual the reforming zeal followed diverse channels. The consciousness had a gradual growth since the days of Hindu Mela or national Mela. Cultural Revivalism helped to awake the concept of nationalism. The Arya Samaj (1875) established by Dayananda Saraswati propagated the ideal of life and culture as had been rooted in Vedic civilization. The Theosophical Society (1878) propagated Indian ideals of life. Rajendra Lal Mitra's Saraswat Samaj, Keshav Chandra Sen's Vidyalaya, Dayananda Saraswati's Anglo-Vedic College, Shradhdhanand Gurukul at Haridwar propagated the ideal of ancient Indian education. From its inception in 1885 the National Congress demanded educational reforms. Sir Syed Ahmed Khan devoted himself to the promotion of English education among the Muslims and in 1875 founded a school which soon developed into the Mohammedan Anglo Oriental College of Aligarh. His efforts were crowned with success. This institution played an important role in spreading the idea of national education. On the other hand in response to the call of Vivekananda, the Ramakrishna Mission (1897) took up the cause of man making education. And Rabindranath's 'Shishu Herfer' condemned the lifeless system of Western education. The Dawn Society of Satish Mukherjee propagated the cause of education according to India's legacy. It was widely felt that a foreign system of education, unrelated with Indian traditions and life was inimical to India's system of values. Renowned personalities like Raja Rammohan Roy, Vidyasagar, H. L. V. Derozio

104 NSOU ? CC-ED-05 and others put a question mark on the British education system. It created a new Class contradiction in society and the idea of nationalism became popular. National education movement was the fruit of cultural revivalism associated with political extremism. This new trend of education was associated with the related issues of various social aspects. 4.3.3 Causes of National Education Movement Due to so many difficulties, Indians started a movement known as Indian national education movement which took place side by side with the Indian freedom movement. National education movement is not the creation of a particular cause, it was a cumulative result of a large number of factors which are summarised below. • Structural change of society Education system of the British was a privilege in the hands of a particularly upper strata of the society. The masses or common people were not benefited by the then system of education; it was only made for the so called 'Bhadraloks'. The existing system of education was not national in character and failed to fulfill the needs and aspirations of the nations as a whole. Educational administration was entirely in the hands of the European bureaucrats which affected it so much. The increasing demand of white coloured jobs in government service influenced the structural change of Indian society. • Change in Indigenous Education system The system of education introduced by the foreign ruler had no connection with Indian tradition and culture. Education system was purely theoretical, narrow, bookish and impractical. The main aim of the education system was to make associate clerks of British so that they could have control over the country. The medium of education was English and as such, mother tongue was utterly neglected. • Political influence

Towards the end of the 19th Century and in the beginning of

this century the character of the Indian National Congress was changed. It was marked by the rise of extremist politics. The Moderates lost their hold in the Congress organisation as well as in the public mind. Congress was no longer a Congress of 'prayer and petition'. The Indian Nationalist opinion became very strong and national consciousness was at its peak.

NSOU ? CC-ED-05 105 • Influence of international events Some International events like the Boer war, the Young Turk Movement, the French Revolution, the Burmese war, the Russo-Japanese war, the First World War (1914 to 18) and the Morley-Minto reforms also influenced the national education movement. • Immediate causes Lord Curzon's partition policies supplied the spark. Curzon was an imperialist. He failed to enlist cooperation and sympathy of the Indian people in carrying out his educational reforms. Indian Nationalist opinion scented some imperialist design behind his educational reforms. It came to a headlong collision with the Curzonian bureaucracy. Indian nationalists opposed the policy of Curzon. This partition could not admit the administrative measure; it was characterised as a device to cripple the National Movement by territorial dismemberment and communal disharmony. The nation's reply was 'Boycott' and 'Swadeshi' which triggered the road of national education movement. 4.3.4 Phases of National Education Movement 4.3.4.1 First Phase (1905-1910) A very important change with far-reaching consequences took place in civil administration in 1905. Until then Bengal, Bihar and Orissa had formed one province ruled by a Lieutenant Governor. Lord Curzon thought this territory comprising 1,89,000 sq. miles was too large a unit for efficient administration and decided to rearrange the provincial boundaries. It was ultimately decided to separate the divisions of Dacca, Chittagong and Rajshahi from the province. These were joined to Assam, which was then under a Chief Commissioner and the new province was constituted called East Bengal and Assam with Dacca as its capital. The proposal was carried into effect in 1905 in spite of strong protest from the public and this partition of Bengal caused a tremendous political agitation which stirred national feeling in India to its very depths. The partition of Bengal was an insult to the sense of unity and pride developed among the Bengalees ever since the beginning of 19th century Bengal renaissance, when the partition of Bengal was effected on 16th October 1905. The people observed the day by fasting and Rakhi ceremony. In the presidential address at the Annual Congress session of that year, Gopal Krishna Gokhale expressed support for the anti- partition movement. The movement was transformed into a militant mass movement not by the official Congress, but the young leaders of extremism like Bipin Chandra

106 NSOU ? CC-ED-05 Pal, Aurobindo Ghosh, Aswini Dutta and many other leaders. The first phase was mainly dominated by emotion and sentiment. The movement was associated with two important terms 'Swadeshi' and 'Boycott'. Swadeshi would mean 'of one's own country'. A sentiment had been growing in favour of Swadeshi things, nationally or locally made commodities in preference to imported foreign commodities. Various associations were established with the object of propagating among and habituating the people to use Swadeshi goods. 'Boycott' was a negative call not to use British goods, official schools and colleges law courses etc. The first phase was associated with establishment of the National Council of Education at Jadavpur and similar other national educational institutions in the country. The birth of the National Council of Education was facilitated by the previous establishment of other educational Institutes in Bengal and outside. Bhagabat Chatuspathi was founded by Satish Chandra Mukherjee, an eminent advocate of national education at Bhawanipur in 1895. The Dawn Society was set up by him in 1902. It had a tremendous influence on the youth of Bengal in those days. Benoy Sarkar was its chief organiser. The Dawn magazine was published in 1904 and became the mouthpiece of the Dawn Society. In 1901 the Bramhacharya school was set up at Bolpur. Kangra Gurukul was set up in Haridwar by Swami Shraddhananda in 1903, Dayanand Saraswati founded Arya Samaj and laid emphasis on Gurukul system of education. He established the Anglo Vedic college at Lahore in 1886. First National School was set up at Rangpur on 9th November 1995. On the same day Raja Subodh Chandra Mallick generously contributed 1 lakh of rupees for the establishment of national school. For the same cause Brojendra Kishore Raychaudhuri, noted Zamindar of Gouripur, now in Bangladesh and Maharaja Suryakanta Acharya of Muktagacha contributed rupees 5 lakhs and rupees 2.5 lakhs respectively The national school started functioning in a rental house on Bowbazar Street from 15th August 1906 with Aurobindo Ghosh as principal. Rashbehari Ghosh was the first president of the Council. Ashutosh Chaudhary and Hirendra Nath Dutta, the Joint Secretaries and Satish Chandra Mukherjee the first Treasurer. The National Council of Education was organised in March 1906. It was registered in June 1906. On 16 March 1906, the Dawn Society was converted into the National Council of education. It was claimed that national education would produce such men as would be equivalent to men of parts in other countries. Through national education the nation would develop.

NSOU ? CC-ED-05 107 4.3.4.2 Second Phase (1911-22) The Martial Law atrocities in Punjab and the inadequacies of Mont-Ford reforms 1919 kindled the flame. The Indian National Congress which had denounced the Montague-Chelmsford reform proposals when published in 1918 as unsatisfactory, was persuaded by Gandhi who emerged as the unquestioned leader of the National Movement in December 1999 at Amritsar to give the Act of 1919 a fair trial. Jallianwala Bagh massacre, the publication of harsh terms of Treaty of Sevres with Turkey on 14th May 1920 changed Gandhi's stand. In the first week of June 1920 the Central Khilafat Committee meeting at Allahabad decided to begin Non-Cooperation movement against the British Raj. The second phase of the movement was more extensive and white spread. The whole of India including Bengal, Maharashtra, Punjab, Gujarat, Andhra and Bihar was practically involved in this phase of the movement. The second phase of the national education movement originated in Aligarh. Both the teachers and students jointly protested against the non-national curriculum and anti-national attitude of the British government towards the Aligarh College. They set up Jamia Millia Islamia which was national in character in 1920. The second phase was characterized by the origin of different theories of national education. Mrs Annie Besant, a great theorist of the time said that national education must create love for the motherland and live in an atmosphere of proud and glorious patriotism. It must meet the national temperament at every point and develop national character. mother tongue should be the medium of instruction. Shri Gopal Krishna Gokhale opined that the first necessary condition for the national system of education was the indianisation of the official system of education which imposed foreign culture, language, habits, customs, manners, dress and religion. The liberal leaders wanted to establish a balance between tradition and progress. They asserted that neither wholesome condemnation nor eulogization of the national past was healthy for the nation. Apart from this Gokhale also made significant contributions for unoversalization of primary education in India, which we shall study in the sections later on. The 1906 congress session at Calcutta approved of the efforts. Some schools and colleges were founded outside Bengal under the inspiration of Tilak and Lajpat. The Samarth Vidyalaya, Maharashtra Vidyalaya, Andhra National University, Rajahmundry School, Marulipatnam school were the echoes of the Bengal Movement. But differences cropped up in the leadership. One school represented by Sri Gurudas, Satish Chandra, Subodh Mallick etc. wanted cessation of links with Calcutta University

108 NSOU ? CC-ED-05 and building a rival institution. Another School Taraknath Palit, Nilratan Sarkar desired that national education be supplied with what was wanting in the state system of education. Hence they stood only for technical and vocational education. The technical education group formed the society for the promotion of technical education and established the Bengal Technical Institute at a place where the Raja Bazar science college of Calcutta University is located at present. The teaching staff included Europeans together with Indians who were experts in their respective subjects. By 1908 however, the momentum of the national education movement waned and both the groups had to fight for existence. After 1908 the Indian National Congress was again dominated by the Moderates who were less militant than the Extremists. In 1910 Bengal partition was revoked and the capital of the British Empire in India was shifted from Calcutta to Delhi. The heat and emotion generated by the Bengal partition was over. Thus after 1910 the national political movement waned and with it the national education movement also waned. That two institutions merged in 1910. The National College conducted the Arts and general Science department. Although the N.C. A. was apparently considered victorious the said Arts and Sciences departments did not survive. The Bengal Engineering and Technical College founded by the society for the promotion of technical education survived as the embryo of the present Jadavpur University.

The National School movement came to a sudden end when Gandhi stopped the Non-Cooperation movement following the Chauri Chaura incident on 5

th February 1922. This movement was significant in preparing alternative courses suited to national needs, aspirations and in adopting modern Indian languages as medium of instructions. 4.3.4.3 Third Phase (1930-38) The third phase of the national education movement coincided with the Civil Disobedience movement launched by Gandhiji 1930. The national education movement

NSOU ? CC-ED-05 109 during the Non Cooperation movement terminated in 1922 with the realisation that a national system of education must await the birth of a national government. Yet the freedom of educational thoughts achieved by the movement gave a rich crop in the subsequent years. No educational movement typically coincided with the Civil Disobedience agitation excepting students absenteeing from classes. The third phase, if it is called a phase of the National educational movement was more academic than practical came in 1937 when Gandhiji propounded his basic education scheme. The third phase was characterized by educational schemes and plans. In the face of the expected freedom of the country, the national consciousness in education was employed constructively in determining the nature and pattern of future national education. Gandhi's scheme and deliberations of the National Planning Committee 1938-39 (Unofficial committee under the auspices of the National Congress) may be called the third phase of the national education movement. The third phase was characterized by consciousness in respect of technical and vocational education. This is evident in the Wood-Abott report of 1937. Again during this phase the national planning committee chalked out a national plan for education in 1938. It was initiated by the National Congress as it came to power in 9 provinces under the new constitutional arrangement of 1935. The committee was presided over by Jawaharlal Nehru. The plan was of course not implemented due to the outbreak of the Second World War in 1939, but it undoubtedly influenced the later educational developments in India. This phase was important because the concept of a structural education system emerged from this time.

the Indian National Congress which met at Haripura in February 1938 under the presidentship of Subhash Chandra Bose accepted Gandhi's scheme and it was immediately implemented in 7 provinces with Congress Ministries.

Not only that, 'Post-War Education Development in India' popularly known as Sargent Report was the fruit of this phase. Although this national education movement could not reach the peak of success, many Institutions like Jamia Millia Islamia, Vishwa Bharti, Gujarat Vidyapeeth etc deserve special attention; these Institutions work well nowadays. Thus the movement left its legacy behind it. 4.3.5 Effect of National Education Movement National education movement gave an impact on the education system of India. Absence of a uniform understanding regarding the nature of a national education

110 NSOU ? CC-ED-05 weakened the movement from within. But the effects of the movement were far- reaching. 1. It created an impact upon official education policy too. The quinquennial report for 1917-22 admitted that the movement had expressed the suppressed feelings of the nation. Hence the aim of education should be to help the citizen adjust with his environment. With this perspective the pattern of education should be reformed. 2. This movement forced the nation to think of mass education and mass literacy. It paved the way for making primary education free, universal and compulsory. Gokhale introduced two bills on primary education in 1910 and 1911 in the Imperial Legislative Council. His main intention was to make primary education free, universal and compulsory for the boys in the age group 6 to 10 in towns and cities. though the scope of the bills was very much limited yet they suffered defeat in the imperialist hands. Although Gokhale's bills were rejected but it left an impact. A large number of primary education Acts were in different provincial legislatures to make it free Universal and compulsory. Of these the Patel Act in Bombay 1918, Bengali Primary Education Act 1919, Madras Primary Education Act 1920, Bengal (Rural) Primary Education Act 1930 can be mentioned. 3. Attachment to the mother tongue, attention to classical languages and literature, consciousness of one all-India language were contributions of the movement. The national education movement lead stress on the development of a national language. The question of making Hindi the national language originated in this period. 4. Patriotic atmosphere invaded the schools and drove away the loyalist climate. The concept of social service and national reconstruction through education found strong roots. Vande Mataram prayer was introduced in different schools which became patriotic. Portraits of national leaders were found on the walls of school buildings. These initiatives were fruits of the movement. 5. The creation of an urge for women education and technical education together with the urge for indianisation of educational administration were some of the most prominent effects of the movement. The pathetic plight of women, particularly the young Hindu widows had led professor D K Karve to think of such education for women as would equip the women to earn a respectable living. Karve had established a girls' school at Pune in 1889. Under the impact of national consciousness this institution became growingly popular. Later this institution became the first women's university. Concepts of the society gradually changed.

NSOU ? CC-ED-05 111 6. A positive attitude towards industrialisation and industrial education to roots. 7. The scheme of basic education, the last precious gift of Gandhiji to the nation, is the product of the national education movement. It gave new and practical orientation to education. 8. Leaders of the national education movement urgently felt the need of spreading education among women as a precondition for National emancipation. It increased the percentage of literacy among women. Gandhi's Basic education was based on complete development. That was

100%

MATCHING BLOCK 131/233

would be self supporting, leading to all round development of pupils. 9.

National education movement opened the door of liberalism. The Nation's genius' was employed in researches. British Education Policy was also influenced by this movement. The report of Sargent Committee was influenced by the third phase of this movement. After Independence, the new education system was also influenced. 10. National education movement again led to the establishment of a large number of permanent National Educational Institutes like the central school at Benaras established by Annie Besant and Madan Mohan Malaviya, upgraded to a University in 1915 and it started functioning as such in 1917. The Gurukul of Haridwar experienced real growth during these days. Rabindranath's Shantiniketan Ashram outgrew into Visva-Bharati the Anglo-Oriental College at Aligarh became a university in 1920 and many others. The first phase of this movement was emotionally toned, it was not based on reason and the nature of this movement at this phase was narrow. Comparatively the second phase was more successful. But this phase coincided with the broad national movement for freedom. In the third phase the execution of Ideas did not work properly. Although this movement was not so successful, the effect was unforgettable. It led a track of ideas to pursue. The persistent movement for educational reforms that developed thereafter drew its inspiration from the national education movement. 4.4 Impact of Gokhale's Bill on Primary Education (1911) 4.4.1 Emergence of Gokhale in the field of Indian education Thus as an impact of rising nationalist sentiments

95%

MATCHING BLOCK 132/233

W

in the beginning of the twentieth century Indian people started realising that the country needs a nationalistic system 112 NSOU ? CC-ED-05 of education based on the cultural heritage and tradition of the nation. At the Calcutta conference of the Congress in 1906, Annie Besant declared that throughout the country a national education should be organised. Gopal Krishna Gokhale was a nationalist leader and the active member of the Indian National Congress. He was also elected as the President of the Indian National Congress in 1905. Gokhale became a non-official member of the British Imperial Legislative Council in 1902. Till that time, he was a professor and Principal of Fergusson College, Poona. As a nationalist leader Gokhale visualised the importance of primary education for the socio-political awakening of India. He made heroic efforts to make the Government accept the principle of compulsory primary education. The demand for compulsory primary education was strengthened by the fact that the Maharaja Sayaji Rao Gaikwad of Baroda had made primary education free and compulsory within the territories of his state. This attempt inspired Gokhale. This unit deals with Gokhale's attempt to introduce compulsory primary education in India, its impact and the Government of India Resolution of 1913.

Gopal Krishna Gokhale (1866-1915) best known as "the Political Guru of Gandhi", was born in May 9, 1866 in a middle class Chitpavan Brahmin family at Kolhapur in Maharashtra. He graduated from Elphinstone College, Mumbai in 1884. At the young age of 20, he became Professor of History and Economics at the Fergusson College, Poona. For four years he edited the 'Sudharak', a quarterly journal of the Poona Sarvajanik Sabha. In 1904 he was awarded the title of CIE (Companion of the Indian Empire). During his visit to England in 1905, he tried to persuade the British statesmen not to give effect to the Partition of Bengal. He, however, failed in his efforts. 4.4.2

Provisions in Gokhale's Bill 4.4.2.1 Gokhale's

MATCHING BLOCK 134/233

W

Resolution (1910) As a member of the Legislative Council Gokhale put forward a proposal for compulsory primary education in 1910. The proposal was as follows— "A beginning should be made in the direction of making elementary education free and compulsory throughout the country, and that a mixed commission of officials and non-officials be appointed at an early date to frame definite proposal." Following were the important points of the resolution: • Primary education should be made free and compulsory in the area where 33% of boys were receiving education. • This provision should apply to the age group of 6-10 years.

NSOU ? CC-ED-05 113 •

100%

MATCHING BLOCK 135/233

W

The cost of compulsory primary education should be shared by the provincial Government and the Local Bodies in the ratio of 2:1.

- A separate Department of education shall be opened under the Central Government to draw up a scheme for the expansion of primary education.
- A secretary should be appointed to organise, supervise and look after the primary education.
- A statement describing the progress of education should be included in the budget statement.

As a reaction to Gokhale's resolution, the Government assured him that the subject would receive careful consideration. Consequently, Gokhale withdrew his resolution. Later on, the Government accepted only the last three resolutions of Gokhale. A department of Education was established under the Central Government and the secretary was also appointed. The record of the progress of primary education also started to be published by the Government. But the main issue of making primary education free and compulsory remained neglected and unattended by the Government. 4.4.2.2

Gokhale's Bill (1911)

98%

MATCHING BLOCK 136/233

W

Already you are familiar with the resolution of 1910 put forward by Gokhale for making primary education compulsory in our country and also with the reaction of the Government shown towards these resolutions. Now we will discuss the major clauses of Gokhale's Bill of 1911. Gokhale was aware of the intention of the Government. He made further attempt to draw the attention of the people of India as well as in England towards the condition of education. On 16th March of 1911, Gokhale presented a Bill in the Legislative Council to make a stronger fight against the Government. The Bill, however, was more liberal and humble than the resolutions placed before and the main objective of the bill was to make primary education free and compulsory in a phased manner. The Bill was basically based on the compulsory Education Acts of England of 1870 and 1876. Important clauses of the Bill may be placed below—

- Compulsory primary education should be introduced in those areas where a certain percentage of boys and girls of school-age (6-10) was already receiving instructions.
- The percentage of attendance should be fixed by the Governor General in Council.
- It should be left to the discretion of local bodies whether to apply the Act to certain areas under their jurisdiction or not.
- 114 NSOU ? CC-ED-05
- Local bodies should be given the right to levy educational cess to meet the cost of compulsory primary education.
- Expenditure on education was to be shared by the local bodies and Provincial Government in the ratio of 1:2.
- For the introduction of compulsion, the previous sanction of the Viceroy and the Governor respectively were necessary.
- Compulsory primary education is intended to apply in the first instance only to boys, though later on a local body may extend it to girls also.
- Guardians whose income is less than Rs. 10/- per month should not be asked to pay any fee for their wards.

4.4.2.3

100%

MATCHING BLOCK 137/233

W

Reasons for Rejection of the Bill Now we know the main clauses of the Bill and how the first move for introducing compulsory primary education in our country was defeated. But we have observed that the defeat was a heroic defeat and with this we must also understand the reasons put forward by the Government for the rejection of the Bill. The Government put forth several arguments and they are the following—

- There was no popular demand for introducing compulsory primary education in the country.
- As such, the people of the country were not prepared to accept compulsion.
- The local Governments were not in favour of it.
- The local bodies were not willing to levy educational cess.
- A section of the educated Indians were not supporting the Bill.

There was still scope for extension of primary education on voluntary lines based on the system of grants-in-aid. 4.4.3 Impact of Gokhale's Bill 4.4.3.1

Impact of Gokhale's Bill on

98%

MATCHING BLOCK 138/233

W

Primary Education It was during the days of Swadeshi movement that an intensive agitation was launched for spreading education among masses. The new political consciousness strongly attracted the attention of people for education. The shocking fact was even after 150 years of British rule, only 6% of Indian people became literate. This created a ground of criticism against the existing system of education which found expression in a constructive manner with the attempts of Gopal Krishna Gokhale to force government to implement the concept of free and compulsory primary education.

NSOU ? CC-ED-05 115

In this section of the unit, we will discuss the impact of Gokhale's Bill on the development of primary education of India. Gokhale's Bill, the first ever attempt to introduce free and compulsory primary education in our country, is a landmark in the history of education in India. Although the Bill was rejected, it focused the attention of the entire country on education. The Government could not entirely ignore the growing popular demand for the spread of mass education. Fortunately, King George V came to India in 1912 and declared a donation of 50 lakh rupees for the development of education in India. When he came to know about Gokhale's Bill, he expressed his dissatisfaction for rejecting the Bill. As a result the Government had to modify the previous policy and declared a new policy with several reforms. Gokhale's Bill created a flutter in the British Parliament also. In the course of the discussion on the Indian budget, the Under Secretary of State for India admitted the need for paying more attention to Indian education. The Government of India passed the resolution on educational policy on February 21, 1913. Between 1910 and 1917 there was an unprecedented expansion of primary education on a voluntary basis (Mukerji, S.N., 1976). The outbreak of the First World War, however, delayed the development planned in the resolution. It brought in its train many disasters, but also a promise of political reform culminating in the Government of India Act of 1919 which incidentally stimulated interest in education. Before that some administrative changes in the policy of the Government had been accepted. In 1917 the policy of autonomous administration was declared by the secretary of states for India, Edwin Montague. The Provincial Government formed in different states had felt the necessity of primary education. In 1918 Bethal Bhai Patel had for the first time raised a Bill for making primary education compulsory in the province of Bombay and the bill passed to an Act. Similar Acts were passed in Bengal, Punjab, Uttar Pradesh, Bihar and Orissa. Madras and Central Province passed their Acts in 1920. In Assam compulsory Primary Education Act was passed in 1926. Thus, all these were the outcome of Gokhale's attempt to make primary education compulsory in India. His struggle for compulsion formed an important part of the country's struggle of independence during the British Rule. 4.4.3.2 Government of India Resolution of 1913 on Education Now we shall discuss the Government of India Resolution of 1913, which was an attempt of the British Government to compensate the demand raised for compulsory primary education by Gokhale. While rejecting Gokhale's bill of 1911, the Government promised to extend recurring and non-recurring grants to primary education as it could not ignore the growing popular demand for the spread of primary education. 116

NSOU ? CC-ED-05

The education department had declared the new policy in the form of Government of India Resolution on February 21, 1913 covering primary, secondary, higher and women education. The major provisions of the Resolution may be summarised below—

- Primary Education :
 - There should be sufficient expansion of lower primary schools, where along with instruction in the three R's children should be taught drawing, knowledge of the village map, nature study and physical exercises.
 - Simultaneously, upper primary schools should be opened at the proper places and if necessary, lower primary schools should be raised to the status of upper primary schools.
 - Local Boards schools should be established in place of private aided schools.
 - Mokhtabs and Pathshalas should be adequately subsidised.
 - The inspection and management of private schools should be made more efficient.
 - In most parts of India, it may not be practicable to prescribe a separate curricula for rural and urban, but in the urban schools there is sufficient scope

for teaching

98%

MATCHING BLOCK 141/233

W

geography and organising school excursions etc. • The teacher should have passed vernacular middle examination and received one years' training. • Provision be made for refresher courses for the teachers of primary education during vacations. • A trained teacher should get a salary not less than Rs. 12 per month. • The number of students under one teacher should generally range between 30 and 40. • Improvement should be made in the condition of middle and secondary vernacular schools and their number should be increased. • Schools should be housed in sanitary, spacious but in inexpensive buildings. • Secondary Education • The state should not completely withdraw from the sphere of secondary education. • Further establishment of state institutions was proposed to be stopped. • Existing institutions should continue to serve as models and proper grants-in-aid should be sanctioned to private institutions. • Improvement in the mode of examination and curriculum was also recommended. NSOU ? CC-ED-05 117 • University Education: • The Resolution provided for the expansion of university education. The existence of 5 universities and 185 Colleges was considered to be insufficient in view of the vast needs and demands of the country. • The Resolution suggested that universities and high schools should be assigned distinct spheres of activities. • The universities should be relieved of the responsibility of granting recognition to high schools and they should be kept under provincial Governments. • The establishment of teaching universities was suggested by emphasizing the separation of the two functions of the universities— teaching and examining. • Recommendations were made concerning the inclusion of subjects of industrial importance in the curriculum and provision of facilities to the students desirous of prosecuting research work. • The Resolution put forth certain valuable suggestions pertaining to the character formation of students and hostel life. • Women Education • Emphasis was laid on the education of woman too. Suggestion were put forth concerning special curriculum of practical utility for girls and it was also suggested that too much importance should not be attached to examination in the examination of girls. • Number of women teachers and inspectors also should be increased. Thus, through the resolution, the Government of India desired the widest possible extension of primary education on a voluntary basis. The resolution also took a liberal attitude towards secondary and university education. But the outbreak of the First World War in 1914 delayed the implementation of the resolution of 1913. 4.5

Calcutta University Commission (1917-19): Perspective and Policy Issues 4.5.1 State of University Education at the beginning of Twentieth century The Indian Universities Act 1904 could not achieve much and it was felt necessary to broaden Government Policy in the matter of University education conserving the work done by the 1904 Act. During the period 1903-13 many British Universities 118 NSOU ? CC-ED-05 were reconstituted and London University was also reorganised and reformed as per recommendation of the Royal Commission under the Chairmanship of Lord Halden. In 1914 a similar proposal was taken to reform the Indian Universities under the leadership of Lord Halden. On 21st February 1913, a Government Resolution on Educational Policy was passed which declared that a University would be established for each province, that teaching activities of universities would be encouraged and that the colleges located in mofussils, towns would be developed into teaching universities in due course. But that proposal was not carried into effect partly because it was felt that expert enquiry into the matter should be conducted before taking any steps and also due to the outbreak of the 1st World War. Towards the fag end of the war, Govt. of India took the matter again. 4.5.2 Background of

52%

MATCHING BLOCK 143/233

SA before ind.docx (D121539046)

the Calcutta University Commission (1917-19) In 1917, Government appointed the Calcutta University Commission to study and report on the problem of university

education. It was mainly entrusted with the duty "to enquire into the condition and prospects of the University of Calcutta and to consider the question

95%

MATCHING BLOCK 144/233

SA chapter 1.docx (D29641812)

of a constructive policy in relation to the question it presents"

and to make recommendations on the question of the proposed University of Dhaka. Presided over by M E Sadler, Vice-Chancellor of the University of Leeds, the Commission had other distinguished members like J W Gregory, P J Hartog, Professor Ramsay Muir, Sir Asutosh Mukherjee, W W Hornwell (the then DPI of Bengal) and Ziauddin Ahmad (a teacher of Aligarh College). G Anderson (Assistant Education Secretary of India) was to act as the Secretary of the Commission. The Sadler Commission (as it was called) assembled during the first week of November 1917. On the advice of the President, the members toured India extensively, visiting most of the educational centres, colleges and schools and presented a monumental report to the government of India on 18 March 1919. Many think that the commission was greatly influenced by the opinions of up Sir Ashutosh. After a labour of 17 months, the commission submitted its report in 1919. It is a very long and significant report. The commission was precluded from reporting on primary education as the University had no relation with it. The Report consists of 13 parts and presents a comprehensive scheme of Secondary, Collegiate and University education in India. "The report of the Commission is a document of inter-provincial importance. Although it deals with the Calcutta University only, the problems that it has studied are more or less common to the other Indian Universities. Hence, the report of the commission had far-reaching consequences upon the development of University education in India as a whole".

NSOU ? CC-ED-05 119 4.5.3 Recommendations of the Calcutta University Commission: 4.5.3.1 Recommendations regarding Secondary Education: The question of Secondary education was discussed in detail in the report of the Commission. The Commission of 1882 and 1902 could not do full justice to the subject of higher education and Secondary education respectively because the first was precluded from reporting on the universities and the second was precluded from studying the problems of secondary education. The Calcutta University Commission, on the other hand, studied the problems of secondary education as well as those of university teaching because it held the view

55%

MATCHING BLOCK 145/233

SA History of Education In India, Block-1.pdf (D161180427)

that improvement of secondary education was an essential foundation for the improvement of university teaching itself. The Commission therefore, made radical recommendations regarding the reorganisation of secondary schools. "No satisfactory reorganisation of University system of Bengal will be possible unless and until a radical reorganisation of the system of Secondary education upon which University work depends, is carried into effect".

After reviewing the existing defects in the Field of Secondary Education the Commission made the following recommendations : - • The Commission highly praised the sincerity and love for learning of the students of Bengal. • It also mentioned that a large number of students are unable to receive education due to financial difficulties. • The fundamental defect of secondary education is the want of suitable teachers. • The teachers are paid very poorly and it is difficult to procure efficient teachers at the cost of indecent salary. • Most of the teachers are untrained. • The secondary education was almost at the breaking point under double control – the University and the Department of Education. • The first essential thing for the improvement of Secondary education is the supply of necessary money. The commission recommended sanctioning of 40 lacs of rupees annually for the purpose. • The education in the first two years of the Degree Colleges is almost similar to the Secondary education. Hence these two years may conveniently be dropped from the University and attached to

76%

MATCHING BLOCK 146/233

SA History of Education In India, Block-1.pdf (D161180427)

the Secondary system. The dividing line between the University and Secondary Courses should properly be drawn at the Intermediate examination than at the

Matriculation. Government, therefore, should
120 NSOU ? CC-ED-05 create new type of institutions called

67%

MATCHING BLOCK 147/233

SA History of Education In India, Block-1.pdf (D161180427)

the Intermediate colleges. These colleges may either be run as independent institutions or may be attached to selected schools. • The

admission test for universities should be the passing of the Intermediate examination and not of the Matriculation. • A Board of Secondary and Intermediate Education consisting of

90%

MATCHING BLOCK 148/233

SA History of Education In India, Block-1.pdf (D161180427)

the representatives of Government, the University, the Secondary Schools and the Intermediate colleges should be

of physical training should also be appointed to pay attention to the health and physical welfare of the students. • The

Department of Education in the universities should be established and education included as a subject for B.A. (Pass) and intermediate courses. • It also

95%

MATCHING BLOCK 156/233

SA Bijendra_AI&AS.docx (D116982346)

recommended the establishment of an inter-university board coordinating the activities of

the various Indian universities. • Court, Executive Council and Academic Council : In places of the Senate and Syndicate of the older universities, whose constitution and functions were describe in the last Quinquennial Review, there are three main university bodies: I. A large body called the Court, on which are represented the chief interests of the community, either by election or by nomination. The functions of the Court are to make statutes and to pass recommendations on the financial accounts and the annual report, submitted by the Executive Council. They also have power to cancel ordinances made by the Executive Council. Thus, every important change made in the University is brought to the notice of the Court and can be discussed by them, while in matters of university legislation they have important powers not only of discussion but of check. II. The Executive Council, in whom the executive authority in regard to finance and university appointments and also all residual powers are vested. III. The Academic Council, who are responsible for the control, general regulation and maintenance of standards of instruction, education and examination within the University, and for the initiation of all changes in academic matters and without whose consent no changes in such matters can be made. The Academic Council consists almost entirely of university teachers and is designed so as to secure the representation of the various departments of study undertaken by the university.

122 NSOU ? CC-ED-05 • Provision for diversified curricula for imparting instructions in Engineering, Medicine, Law, Education, Agriculture and Technological courses etc. should be made. • Keeping in view the requirements of India, the commission recommended for closer co-operation and relationship between colleges and university, the commission recommended the establishment of two types of colleges : a. Such affiliated colleges that are situated outside the area of university. b. Such colleges that are situated within the specified radius of the university and in a way shall be treated as a part and parcel of society. • Oriental studies should be cultivated in the university. • Less rigid control: Government control over the universities should be flexible and less rigid. In academic matters, universities to be freed from excessive official control. It was suggested that the regulations governing the work of the universities should be made less rigid. The teachers should be allowed to have greater participation in it. The vice-chancellor instead of being honorary ones, should be salaried persons. • Selection of teachers: University teachers should be appointed by selection committees including external experts. 4.5.3.3 Other recommendations: • Recommendations Relating to Muslim Education: • The Muslims should be provided all education facilities in view of their backward state in this field. • Having regard to the comparatively backward condition of the Muslim community in regard to education, every reasonable means should be taken to encourage Muslim students and to safeguard their interests. • Purdah Schools should be organised for Hindu and Muslim girls whose parents are willing to extend their education to 15 or 16. • Recommendations about Education of women: The commission made two recommendations for the expansion of women's education. •

89%

MATCHING BLOCK 158/233

SA History of Education In India, Block-1.pdf (D161180427)

A special Board of women's education should be created in the Calcutta University.

It should organise special courses for women and should offer them special facilities for teacher training, medical education and a special curriculum should be provided according to the educational needs of women. Women should be given training in medicine and teachers' training.

NSOU ? CC-ED-05 123 • Recommendations about Training of Teachers: In this regard, the commission made the following recommendations : • Education should be a subject of study for the intermediate and B.A. examinations. Education departments would be opened in Universities to fulfil the need for training of teachers. • At the universities of Calcutta and Dacca, Department of Education should be created. • The output of trained teachers should be increased without delay. • Recommendations about Technological Education: The commission felt that education should not only prepare boys for government posts, it should also encourage them to have technological and vocational education. This was recommended with a view to bring about technological and industrial development in India. The commission realised the importance of technical education and felt that it was necessary for the boys to have education of this type. In this regard the commission made the following recommendations: a. Applied science and technology should be included in the university courses. b. Successful candidates should be awarded degrees and diplomas. • Recommendations about professional and vocational education: The commission made the following recommendations concerning professional and vocational Education. a. The commission stressed that the scheme of education must be amended and professional and vocational courses should be introduced in universities. b. Courses of Intermediate colleges should be revised and given a vocational bias. • Inter-University Board : In order to establish co-ordination in the working of various Indian Universities, Sadler recommended the establishment of Inter-University Board. The Inter-University Board was formed on the recommendation of the Sadler Commission. Inter-University Board is an organisation and association of major universities in India. It is based in Delhi. It evaluates the courses, syllabi, standards, and credits of foreign Universities pursued abroad and equates them in relation to various courses offered by Indian Universities.

124 NSOU ? CC-ED-05 • Recommendations Relating to Modern Indian Leagues: • The Calcutta University Commission (1917) stated: "We are emphatically of opinion that there is something unsound in the system of education which leaves a young man, at the conclusion of his course, unable to speak or write his own mother tongue fluently and correctly. It is thus beyond controversy that a systematic effort must be henceforth be made to promote the serious study of the vernaculars in secondary school, intermediate colleges and the university. The elaborate scheme recently adopted by the university for the critical, historical and comparative study of the Indian vernaculars for the M.A. examination is but the capping stone of an edifice of which the base has yet to be placed on a sound foundation, and it is only when such a structure has been completed that Bengal will have a literature worthy of greatness and civilization of its people." 4.5.4 Features of Sadler Commission in India • Establishment of the board of secondary Education in every province. • All the subjects except English and mathematics to be taught in mother-tongue at the secondary level. • To liberate the schools from excessive Government management and supply autonomy to them. • Establishment of the Court and the Executive Council in the universities with proper representation of teachers in them. • Establishment of the Board of Studies and the Academic Councils in the universities. • Establishment of the departments in the universities. • Organisation of vocational courses, agriculture, law, medical, engineering and teacher training, etc. in the universities. • Establishment of the Department of Physical Education and the appointment of the Director of Physical Education in the universities. 4.5.5 Impact of the Calcutta University Commission (1917-19) 4.5.5.1. Results/Effects The Government of Bengal accepted all the recommendations of the commission and commended to the provincial Government for their consideration and implementation. The commission's main recommendation regarding the opening of Intermediate colleges was accepted by Punjab, U.P., C.P., Dacca, Central India and

NSOU ? CC-ED-05 125 RajPutana. Some of the universities even remodelled their constitution on Calcutta University pattern. Some fifty universities sprang up in the country after 1917. With the good network of the universities, it was felt that there should be some organisation which could co- ordinate the work of the universities. The newer ones should gain from the modern method of the former. In 1925, a Board of inter-universities was set up. Since then, it was carrying on its activities. Besides participation in the academic field, the Board has been organising healthy contacts between the universities by having Inter-University Sports Tournaments. 4.5.5.2. Effect of Sadler's Report on University Education in India: Proposal was made for the appointment of commission in 1914, but it could not be done due to the First World War. The Government of India's decision to appoint a commission in order to enquire into the affairs of Calcutta University was first announced by the Governor-General in his annual convocation address in 1917 as the Chancellor of the said university. This resulted in the appointment of Sadler Commission. 4.6 Summary • The British wanted to educate only a few number of people required to run the affairs of the Government. On the other hand, a section of conservative Indians were against women education as well as British system of education as they involved in controversy with various renowned persons like Raja Rammohan Roy, Vidyasagar, H.L.V. Derozio and others. Swadeshi movement also influenced Indians to avoid the British system of education as it made them realize the anti- Indian character of the British system . • A movement known as Indian National Education Movement thus started the causes of which, is not particular, rather the cumulative result of a large number of factors. • The Indian nationalist opinion became very strong at this time. National consciousness was at its peak. It was not at all in a mood to tolerate any imperialist design in the arena of education. The immediate cause of the National Education Movement was the anti-national educational policy followed by Lord Curzon. • Some international events such as the Boer War, the Young Turk Movement, the French Revolution, the Burmese War, the RussoJapanese War, the 1st World War (1914-18) and the Morley-Minto Reforms also influenced the National Education Movement. • First Phase (1905 -1910): It coincided with the Swadeshi Movement or Boycott Movement or Bengal Partition Movement. It was limited within the boundary of Bengal. Of course it had its echoes outside Bengal particularly in Maharashtra and Punjab which were sympathetic to the cause of Bengal. It was related with the extremist movement in politics. • Until the end of the 19 th century it was liberal in character. Educational upsurge was the result of political upsurge. It was the age of extremism and extremist leaders like Lala Lajpat Roy, Balgangadhar Tilak and Bipin Chandra Pal dominated the political arena. • In the first phase of the National Education Movement there was no clear-cut objectives, no clarity of thought. Absence of rationality was one of its peculiar characteristics. The first phase was dominated by emotion and sentiment. • It was related with the Boycott Movement – boycott of British goods, official schools and colleges, law courts etc. This led to the suppression of the National Education Movement. It was negative by the anti-Indian policy of Lord Curzon. • Second Phase (1911 -1922): The second phase of the movement was more extensive and widespread than the first phase as it was not limited to the Bengal Presidency only. It coincided with the Hind Swaraj-Khilafat and Non-violent Non-cooperation Movement launched by Gandhiji. • The whole of India including Bengal, Maharashtra, Punjab, Gujrat, Andhra and Bihar was practically involved in this phase of the movement. The 2nd phase was more rational than the first one. It was more productive and fruitful than the 1st phase. During the 2nd phase a large number of schools, colleges and universities came into being. • The 2nd phase came to an end with the withdrawal of the Non- cooperation Movement by Gandhiji in 1922 after the violent Chauri Chaura incident in the district of Gorakhpur in Uttar Pradesh. • Third Phase (1930-1938): The Third phase of the National Education Movement coincided with the Civil Disobedience Movement launched by Gandhiji in 1930. During this phase Gandhiji enunciated his famous scheme of Basic education. • The Third phase was characterised by consciousness in respect of technical and vocational education. NSOU ? CC-ED-05 127 • Again, during this phase the National Planning Committee chalked out a National Plan for education in 1938. It was initiated by the National Congress as it came to power in nine provinces under the new constitutional arrangement of 1935. • The movement was not totally successful. The causes are numerous. The movement was emotionally toned. It was not based on reason, particularly in its first phase. It was directly related with political ups and downs of the country. Finance was a great hurdle before the movement. Difference of opinion among national leaders with regard to the concept and pattern of national education gave a rude shock to the survival of the movement. • Leaders of national education movement urgently felt the need of spreading education among women which increased the percentage of literacy among women. National education movement again led to the establishment of a large number of permanent national educational institutions. • Gopal Krishna Gokhale was

94%

MATCHING BLOCK 157/233

W

one of the great nationalist leaders of our country, who first attempted to introduce free and compulsory primary education. Gokhale raised a Resolution in 1910 as a member in the Imperial Legislative Council. Important provision of this Resolution were- (i) primary education should be made compulsory in those areas where at least 35% of the boys, 6 to 10 years were receiving instruction, (ii) cost of education should become by state Governments and the local authorities together, (iii) a separate department of education should be established under central Government for taking necessary steps to introduce compulsory education and a secretary be appointed for education to monitor the progress and prepare budget report. • Gokhale withdrew it when the Government assured that the subject would receive careful consideration. • The Government had established the education department under the central Government and the secretary was also appointed but the main demand for free and compulsory primary education remained unattended. • As such Gokhale raised the issue again in the form of a Bill in 17 March, 1911, to make primary education free and compulsory in phased manner. The Bill was referred to a select committee for discussion in 1912 and it was put into vote and rejected by 38 to 13 votes. • The arguments put forward by the Government said that as the people of India 128 NSOU ? CC-ED-05 were not prepared to accept compulsion, that there was no popular demand to make primary education compulsory and the state Government and the educated class of the Indian people were not supporting the bill. • We have also discussed the impact of Gokhale's Bill on the development of primary education in India and observed that the bill focused the attention of the entire country on education. The Government was bound to modify the previous policy and declare a new policy with several reforms. This policy is known as the Government of India Resolution of 1913 on Education. It covers primary, secondary, higher and women education. •

In 1917, Government appointed the Calcutta University Commission to study and report on the problem of university education. This is also known as the Sadler Commission from its President, Dr. M. E. Sadler. • The report it deals with the Calcutta University only, but the problems that it has studied are more or less common to the other Indian universities. Hence, the report of the Commission had far-reaching consequences upon the development of university education in India as a whole. • The main recommendations of the Commission have been noted below: (a) The Commission held the view

96%

5.2 Introduction The educational system of India, as a whole, underwent drastic changes throughout the 19th century which we have studied in the earlier units. Simultaneously the socio-political conditions of the country was also continuously changing under the forces of freedom struggle, international events and various British policies which inevitably impacted the education sector in many ways. From the earlier units, we know that the government refused to adhere to the demand by leaders of the national movement to introduce compulsory primary education in British India; they did not want the responsibility of mass education, but announced a future policy for the removal of illiteracy. Provincial governments were asked to take responsibility to provide free elementary education to poorer and backward classes, quality of secondary education and private efforts to be improved and one university is to be established in each province so that status of higher education improves. During 1917-19, Sadler Commission studied and reported the causes behind the poor performance of Calcutta University and overall higher education, in general. In 1919, the Government announced further constitutional reforms in July 1918, known as Montagu-Chelmsford Reforms which formed the basis of the Government of India Act 1919. It introduced the system of Dyarchy or Provincial governments and administrative subjects were divided into two lists: "reserved" which included subjects such as law and order, finance, land revenue, irrigation, etc., and "transferred" subjects such as education, health, local government, industry, agriculture, excise, etc which meant that the responsibility of education now relied on provincial governments instead of the Britishers due to which it suffered from lack of funds. Also in 1919 happened the massacre at Jalianwala Bagh which proved to be a turning point in Indian national movement because since then, it was a slow but sure downward slide for British rule in India. Subsequently in 1920 the nation witnessed the first national movement under

NSOU ? CC-ED-05 135 Gandhiji's leadership, the Non-Cooperation Movement of which Boycott of government affiliated schools and colleges was an important part. The educational boycott was particularly successful in Bengal, where the students in Calcutta triggered off a province-wide strike to force the managements of their institutions to disaffiliate themselves from the Government. The next country-wide movement under Gandhiji, the Civil disobedience called for active, professed refusal of a citizen to obey certain laws, demands, orders or commands of a government. It also stressed on the need for the inclusion of more Indians in the administration of their own country. All these formed the basis of the passing of the Government of India Act, 1935 which gave the main structure in all administrative matters including education. The educational reforms in the late 18th century and the early 19th century that we studied in earlier chapters saw the establishment of institutions like the Asiatic Society (1784), Fort William College (1800), Serampore College (1817), Hindu College (1817), Sanskrit College (1824) in and around Calcutta and others which were exclusively meant for the elite Bengalis in order to educate them according to the European idea of education, learning and value judgement. This socio-political change in the educational scenario of Bengal quite naturally gave birth to a new intellectual class of Bengalees who perceived the idea of European education as the ideal form of learning and who would later give birth to the Bengal Renaissance and in turn change the scenario of the literary and cultural traditions of the 19th century Bengal. This period also saw the important educational reforms brought in by Hartog Committee which made significant recommendations for school education sector. Also the first comprehensive policy of education for India was presented during this period as documented by Sargent Plan. Thus this period forms an important chapter in the history of Indian education which we shall deal with in details in the following pages.

5.3 Bengal Renaissance : Perspective and National Education Movement

5.3.1 What is Renaissance The term 'Renaissance,' sometimes 'Renascence,' is derived from a French / Latin word meaning 'rebirth'. It refers to an experience of the European world that began from the 14th century and was characterised by a rebirth of learning, arts and culture. The people of this period felt that there was a sharp break between their own age and the 'Dark Ages' that had preceded them, and moreover, that there were similarities between their own civilisation and that of the Greeks and Romans who had flourished

136 NSOU ? CC-ED-05 between 400 B.C.E and 300 C.E. Later historians have sometimes agreed and sometimes disagreed with this point of view. Jules Michelet in his book 'La Renaissance' held that the two most significant features of this epoch were 'the discovery of the world, and the discovery of man'. The Bengal Renaissance is a movement by the Bengalees which is characterized by a social awakening in the field of art, culture, science, intellect and society (as a whole). The movement was carried out from the nineteenth century to the early twentieth century, which is during the period of British rule in India. Bengal and its neighbouring areas are where the movement was largely carried out. The movement questioned the existing state of affairs in the society that is the orthodox rituals and customs prevailing in the society, which were mainly framed by the upper-class Brahmins. It focussed mainly upon regaining the respect of women in the society. Among other things, the movement questioned the dowry system, the caste system, the practice of sati, Brahmin supremacy and a few other vague religious practices. The contact between certain sympathetic British officials and missionaries on one hand and the Hindu intelligentsia on the other made the movement possible. As a result of this movement and also due to the British invasion, the educational system of Bengal, as a whole, underwent a drastic change during the 19th century. The educational reforms saw the establishment of educational institutions like the Asiatic Society (1784), Fort William College (1800), Serampore College (1818), Hindu College (1817), Sanskrit College (1824) and others which were mainly meant for the elite class Bengalis to educate them according to the European idea of education, learning and value judgement.

● Concept of Renaissance The Renaissance is a period in European history marking the transition from the Middle Ages to modernity and covering the 15th and 16th centuries, characterized by an effort to revive and surpass ideas and achievements of classical antiquity. It occurred after the Crisis of the Late Middle Ages and was associated with great social change. In addition to the standard periodization, proponents of a "long Renaissance" may put its beginning in the 14th century and its end in the 17th century. The traditional view focuses more on the early modern aspects of the Renaissance and argues that it was a break from the past, but many historians today focus more on its medieval aspects and argue that it was an extension of the Middle Ages. However, the beginnings of the period – the early Renaissance of the 15th century and the Italian Proto-Renaissance from around 1250 or 1300 – overlap considerably with NSOU ? CC-ED-05 137 the Late Middle Ages, conventionally dated to c. 1250–1500, and the Middle Ages themselves were a long period filled with gradual changes, like the modern age; and as a transitional period between both, the Renaissance has close similarities to both, especially the late and early sub-periods of either. The intellectual basis of the Renaissance was its version of humanism, derived from the concept of Roman *humanitas* and the rediscovery of classical Greek philosophy, such as that of Protagoras, who said that "man is the measure of all things". This new thinking became manifest in art, architecture, politics, science and literature. Early examples were the development of perspective in oil painting and the revived knowledge of how to make concrete. Although the invention of metal movable type sped the dissemination of ideas from the later 15th century, the changes of the Renaissance were not uniform across Europe: the first traces appear in Italy as early as the late 13th century, in particular with the writings of Dante and the paintings of Giotto. As a cultural movement, the Renaissance encompassed innovative flowering of Latin and vernacular literatures, beginning with the 14th-century resurgence of learning based on classical sources, which contemporaries credited to Petrarch; the development of linear perspective and other techniques of rendering a more natural reality in painting; and gradual but widespread educational reform. In politics, the Renaissance contributed to the development of the customs and conventions of diplomacy, and in science to an increased reliance on observation and inductive reasoning. Although the Renaissance saw revolutions in many intellectual and social scientific pursuits, as well as the introduction of modern banking and the field of accounting, it is perhaps best known for its artistic developments and the contributions of such polymaths as Leonardo da Vinci and Michelangelo, who inspired the term "Renaissance man". The Renaissance began in the Republic of Florence, one of the many states of Italy. Various theories have been proposed to account for its origins and characteristics, focusing on a variety of factors including the social and civic peculiarities of Florence at the time: its political structure, the patronage of its dominant family, the Medici, and the migration of Greek scholars and their texts to Italy following the Fall of Constantinople to the Ottoman Turks. Other major centers were northern Italian city-states such as Venice, Genoa, Milan, Bologna, and Rome during the Renaissance Papacy. From Italy, the Renaissance spread throughout Europe in Flanders, France, the British Isles, Spain, Portugal, Germany and elsewhere. The Renaissance has a long and complex historiography, and, in line with general scepticism of discrete periodizations, there has been much debate among historians reacting to the 19th-century glorification of the "Renaissance" and individual cultural

138 NSOU ? CC-ED-05 heroes as "Renaissance men", questioning the usefulness of Renaissance as a term and as a historical delineation. Some observers have called into question whether the Renaissance was a cultural "advance" from the Middle Ages, instead seeing it as a period of pessimism and nostalgia for classical antiquity, while social and economic historians, especially of the *longue durée*, have instead focused on the continuity between the two eras, which are linked, as Panofsky observed, "by a thousand ties". The term *rinascita* ('rebirth') first appeared in Giorgio Vasari's *Lives of the Artists* (c. 1550), anglicized as the Renaissance in the 1830s. The word has also been extended to other historical and cultural movements, such as the Carolingian Renaissance (8th and 9th centuries), Ottonian Renaissance (10th and 11th century), and the Renaissance of the 12th century.

5.3.2. Bengal Renaissance The Bengal Renaissance also known as the Bengali Renaissance, was a cultural, social, intellectual, and artistic movement that took place in the Bengal region of the British Raj, from the late 18th century to the early 20th century. Historians have traced the beginnings of the movement

100%

MATCHING BLOCK 169/233

SA Ph.D. thesis - Somasree Datta Dept.of Educati ... (D158964556)

to the victory of the British East India Company at the 1757 Battle of Plassey,

as well as the works of reformer Raja Rammohan Roy, considered the "Father of the Bengal Renaissance," born in 1772. NitishSengupta stated that the movement "can be said to have ... ended with Rabindranath Tagore," Asia's first Nobel laureate. For almost two centuries, the Bengal renaissance saw the radical transformation of Indian society, and its ideas have been attributed to the rise of Indian anticolonialist and nationalist thought and activity during this period. The philosophical basis of the movement was its unique version of liberalism and modernity. According to Sumit Sarkar, the pioneers and works of this period were revered and regarded with nostalgia throughout the 19th and 20th centuries, however, due to a new focus on its colonialist origins, a more critical view emerged in the 1970s. The Bengali renaissance was predominantly led by Bengali Hindus. Well-known figures include the social reformer Raja Rammohan Roy, writer Rabindranath Tagore, and the physicist Satyendra Nath Bose. The main Muslim figures in the movement include poet and musician Kazi Nazrul Islam and writer Rokeya Sakhawat Hussain. 5.3.2.1 Background The Bengal Renaissance was a movement characterised by a socio-political awakening in the arts, literature, music, philosophy, religion, science, and other fields of intellectual inquiry. The movement questioned the existing customs and rituals in

NSOU ? CC-ED-05 139 Indian society – most notably, the caste system, the dowry system, and the practice of sati – as well as the role of religion and colonial governance. In turn, the Bengal Renaissance advocated for societal reform – the kind that adhered to secularist, humanist and modernist ideals. From Rabindranath Tagore to Satyendra Nath Bose, the movement saw the emergence of important figures, whose contributions still influence cultural and intellectual works today. Although the Bengal Renaissance was led and dominated by upper caste Hindus, Bengali Muslims played a transformative role in the movement, as well as the shaping of colonial and postcolonial Indian society. Examples of Bengali Muslim renaissance men and women include Kazi Nazrul Islam, Rokeya Sakhawat Hussain and Sake Dean Mahomed. Some Muslim figures significantly influenced the development of the various national identities across the Indian subcontinent, and in particular, post- partition and post-independence, Bangladesh. When it came to cultural and religious reform, the Freedom of Intellect Movement was established in 1926 to challenge the social customs and dogmas in Bengali Muslim society. From the mid-eighteenth century, the Bengal Province, and more specifically, its capital city of Calcutta, was the centre of British power in India. The region was the base for British imperial rule until the capital was moved to Delhi in 1911. Prior to Crown control, British power was in the hands of the East India Company (EIC), which in course of time, became increasingly profitable and influential, politically, establishing diplomatic relations with local rulers as well as building armies to protect its own interests. During this time, partly through the 1757 Battle of Plassey against the Nawab of Bengal and his French allies, and in part through the fall of the Mughal Empire, the Company was able to acquire extensive territory in the Bengal and Ganges basin. The expense of these wars, however, threatened the Company's financial situation, and in 1773, the Regulating Act was passed to stabilise the EIC as well as subject it to some parliamentary control. Further legislation over the next several decades progressively brought about tighter controls over the Company, but the Indian Rebellion of 1857 forced the British parliament to pass the Government of India Act 1858, which saw the liquidation of the EIC and the transfer of power to the British Crown. 5.3.2.2 Origins The Bengal Renaissance originated in the Bengal Presidency of the British Indian Empire, but more specifically, its capital city of Kolkata, then known as Calcutta. This colonial metropolis was the first non-Western city to use British methods of teaching in their school system. In 1817, the urban elite led by Raja Ram Mohan Roy cofounded

140 NSOU ? CC-ED-05 the Hindu or Presidency College in Kolkata, now known as the Presidency University, the only European-style institution of higher learning in Asia at the time. The city was also home to a public library, the Imperial Library, now the National Library of India, and newspapers and books were being published regularly in both Bengali and English. "Print language and literature played a vital role in shaping ideas and identities in colonial Bengal from the 18th century onwards," writes Anindita Ghosh, continuing that "... commercial print cultures that emanated from numerous cheap presses in Calcutta and its suburbs disseminated wide-ranging literary preferences that afforded a space to different sections of the Bengali middle classes to voice their own distinctive concerns." The Bengal Province was the base for British East India Company rule until the overthrow of the Nawab of Bengal at the Battle of Plassey in 1757, which marked the Crown's consolidation of power in India. Many postcolonial historians source the origins of the Bengal Renaissance to these events, arguing that the movement was both a reaction to the violence and exploitation by the British Raj, as well as a product of the Empire's promotion of English education in the region as part of its "civilising missions". For instance, Sivanath Sastri notes that Charles Grant, a British politician influential in Indian affairs who also served as Chairman of the East India Company, "moved "that a thorough education be given to the different races inhabiting the country, [and] that the Gospel be preached to them... ." Moreover, Arabinda Poddar contends that the English education of Bengalees was intended to create "mere political slaves," arguing that, "the civilising role of English education, stressed the need of creating a class of Anglophiles who would have a somewhat in-between existence between the rulers and the ruled." Other historians cite the works of "Father of the Bengal Renaissance," Raja Rammohun Roy, as the start of the Bengal Renaissance. Roy was the cofounder of the Brahmo Sabha movement in 1828, which produced the Brahmo Samaj, an influential socio-religious reform movement that made significant contributions to the renaissance, as well as the makings of modern Indian society. The Brahmo Samaj was also founded and developed by Debendranath Tagore and Dwarkanath Tagore, the father and grandfather of Rabindranath Tagore, respectively. 5.3.2.3 Education Among the many changes brought about by the Bengal Renaissance in India was the development of education, both in the Bengali language and in English. Colonial provisions at the time consisted mainly of village schools teaching literacy and numeracy, Arabic and Islamic studies being taught to Muslims in madrasas, and tols, where

NSOU ? CC-ED-05 141 pundits instructed Sanskrit texts to Brahmins, which were supported by endowments. These institutions were exclusively male, and in the rare cases where girls could get an education, it was in the home. The work of Christian missions also had more of an influence on Indian students than the initiatives of the government. While the East India Company Act of 1813 allotted 100,000 rupees from the government's surplus to be "

100%

MATCHING BLOCK 167/233

W

applied to the revival and improvement of literature, and the encouragement of the learned natives of India, and for the introduction and promotion of a knowledge of the sciences,"

it did not lead to any coherent provision of public education. According to Dermot Killingley, the surplus mentioned in this Charter Act was “an aspiration, not a budget item,” and even if the money had been provided for, there was uncertainty about how it should be spent. Recurring questions arose over whether to invest on a few advanced institutions or to promote widespread elementary education, what language to use, and particularly whether to support traditional methods of learning in India, which had declined due to the loss of patronage, or to introduce a new system based on Western education. Rammohan Roy contributed to this last debate by writing to the Governor-General in 1823 expressing his opposition to the establishment of a Sanskrit College that would foster traditional learning and advocating for Western scientific education; this effort failed without effect. Missionaries began teaching young women in 1816, but a systematic education policy was not established until 1854. However, Sengupta and Purkayastha point out that even during the 1860s and 1870s, “the project of female education was wholly tied to the purpose of enabling women to better discharge their domestic duties.” Despite the East India Company’s initial hostility to missionaries, the colonial government later saw the advantages of their contribution for educating and training the local population. This was especially because, as Killingley noted, “in the innovations of the early nineteenth century, government initiative had less impact than the work of Christian missions, and of individuals ... who responded to the demand for literacy, numeracy and related skills created by growing commercial and administrative activity.” In 1800, the Baptist Missionary Society established a centre in Srirampur, West Bengal, from which it ran a network of schools that taught literacy, mathematics, physics, geography and other so-called “useful knowledge.” Other missionary societies followed soon after, working along similar lines. These missionaries, which were largely dependent on local, indigenous teachers and families, and the colonial government, which sometimes supported them with grants, were also cautious about introducing Christian teachings or the Bible.

142 NSOU ? CC-ED-05 Education was also believed to be necessary in reversing the apparent moral decline many colonial administrators saw in Bengal society. To give an example, a British judge in Bengal recommended the London Missionary Society’s schools, “for the dissemination of morality and general improvement of society among natives of all persuasion without interfering with their religious prejudices.” Missionaries, however, were not the only channels through which education was promoted. For instance, individuals in Calcutta such as Rammohan Roy, the conservative Hindu scholar, Radhakanta Deb to the atheist philanthropist, David Hare, and other British officials often collaborated in

100%

MATCHING BLOCK 170/233

SA Bijendra_AI&AS.docx (D116982346)

the Calcutta School Book Society and the Calcutta School Society.

Some of the other institutions of learning established during this period include the Chittagong College; Indian Statistical Institute; the Hindu School, the oldest modern educational institution in Asia; Jadavpur University; Presidency University, Kolkata; the University of Calcutta, the University of Dhaka, the oldest university in Bangladesh; and Visva-Bharati University. 5.3.2.4 Science During the Bengal Renaissance science was also advanced by several Bengalee scientists such as Satyendra Nath Bose, Anil Kumar Gain, Prasanta Chandra Mahalanobis, Prafulla Chandra Ray, Debendra Mohan Bose, Jagadish Chandra Bose, Jnan Chandra Ghosh, Gopal Chandra Bhattacharya, Kishori Mohan Bandyopadhyay, Jnanendra Nath Mukherjee, Sisir Kumar Mitra, Upendranath Brahmachari and Meghnad Saha, Surendranath Dasgupta. Jagadish Chandra Bose (1858–1937) was a polymath : a physicist, biologist, botanist, archaeologist, and writer of science fiction. He pioneered the investigation of radio and microwave optics, made very significant contributions to botany, and laid the foundations of experimental science in the Indian subcontinent. He is considered one of the fathers of radio science, and is also considered the father of Bengali science fiction. He also invented the crescograph. 5.3.2.5 Arts The Bengal School of Art was an art movement and a style of Indian painting that originated in Bengal and flourished throughout British India in the early 20th century. Also know as 'Indian style of painting' in its early days, it was associated with Indian Nationalism (Swadeshi) and led by Abanindranath Tagore. Following the influence of Indian spiritual ideas in the West, the British art teacher Ernest Binfield Havell attempted to reform the teaching methods at the Calcutta School of Art by encouraging students to imitate Mughal miniatures. This caused

NSOU ? CC-ED-05 143 controversy, leading to a strike by students and complaints from the local press, including from nationalists who considered it to be a retrogressive move. Havell was supported by the artist Abanindranath Tagore. 5.3.2.6 Literature According to historian Romesh Chunder Dutt : The conquest of Bengal by the English was not only a political revolution, but ushered in a greater revolution in thoughts and ideas, in religion and society ... From the stories of gods and goddesses, kings and queens, princes and princesses, we have learnt to descend to the humble walks of life, to sympathise with the common citizen or even common peasant ... Every revolution is attended with vigour, and the present one is no exception to the rule. Nowhere in the annals of Bengali literature are so many or so bright names found crowded together in the limited space of one century as those of Ram Mohan Roy, Akshay Kumar Dutt, Isvar Chandra Vidyasagar, Isvar Chandra Gupta, Michael Madhusudan Dutt, Hem Chandra Banerjee, Bankim Chandra Chatterjee and Dina Bandhu Mitra. Within the three quarters of the present century, prose, blank verse, historical fiction and drama have been introduced for the first time in the Bengali literature. 5.3.2.7 Religion The Renaissance also embraced the religious sphere, bringing forward spiritual figures such as Ram Mohan Roy, Debendranath Tagore, Bijoy Krishna Goswami, Ramakrishna, Sarada Devi, Swami Vivekananda, Aurobindo, Paramahansa Yogananda, Anandamayi Ma as well as following related to them new reformist movements and organizations. • Brahmoism (BrahmoSamaj) • Adi Brahmo Samaj • Sadharan Brahmo Samaj • Gaudiya Math • Mahanam Sampraday • Ramakrishna Mission • Ramakrishna Math • Sri Aurobindo Ashram

144 NSOU ? CC-ED-05 • Yogoda Satsanga Society of India • Self-Realization Fellowship 5.3.3 Emergence of Calcutta as the center of Renaissance Before 1830, earlier than any other Asian city, Calcutta already had a school system using European methods of instruction and textbooks. On their own initiative, the urban elite had founded Hindu College, the only European-style institution of higher learning in Asia. Newspapers, periodicals, and books were being published regularly in English and Bengali. The city had a public library in European style. Calcutta also boasted a native intelligentsia conversant with events in Europe, aware of its own historical heritage, and progressively alert about its own future in the modern world. The representatives of the British in India who were mainly responsible for these positive aspects of modernization were a group of "acculturated" civil, military, and judicial officials (and some missionaries) historiographically identified as Orientalists. They were neither nationalists nor imperialists in the late nineteenth-century Victorian sense. On the contrary, they were products of the eighteenth-century world of rationalism, classicism, and Enlightenment. Unlike later Europeans serving in British India, they mastered at least one Indian language and used it as a vehicle for scholarly research. Many Orientalists-notably William Jones, HT Colebrooke, William Carey, HH Wilson, and James Prinsep- made significant contributions to the fields of Indian philology, archeology, and history. Moreover, these Orientalists did not ensconce themselves in clubs or build a Chinese wall of racial privilege to keep the "inferior races" they ruled at a distance. On the contrary, the Orientalists formed enduring relations with members of the Bengali intelligentsia to whom they served as sources for knowledge of the West and with whom they worked to promote social and cultural change. It was the Orientalist training centre for British civil servants in India known as the College of Fort William, established in Calcutta by Governor General Wellesley in 1800, which seemed to offer the most perfect institutional setting for studying the results of British Indian contact and accommodation. The College was the first European-created institution of higher learning in India to welcome Indians as faculty members and to encourage cultural exchange between Europeans and South Asians. By enlisting the support of qualified Orientalist scholars to improve its education program, this College also transformed the famed Asiatic Society, Calcutta and William Carey's Serampore Mission into highly effective agencies for the revitalisation of Indian culture. Thus, between 1800 and 1830, in Calcutta, as a consequence of the Orientalist impact, a good rapport was established between Europeans and Indians.

NSOU ? CC-ED-05 145 5.3.4 Bengal Renaissance and genesis of National Education Movement In the early 20th-century, Bengal emerged as the epicenter of the Bengali Renaissance, as well as a hotbed of the Indian independence movement. Bengal witnessed an intellectual awakening and people severely questioned the existing orthodox customs, especially with respect to women (sati for instance), marriage, the dowry system, the caste system and religion. One of the earliest social movements that emerged during this time was

56%

MATCHING BLOCK 182/233

SA

Dolanchanpa Ganguly Phd.pdf (D128753583)

the Young Bengal movement, that adopted rationalism and atheism as the common attributes of civil conduct among upper caste cultivated Hindus. In

the pre-independence political scenario, a huge number of debating societies and newspapers appeared. Personalities like Kashi Prasad Ghosh (1809-1873), Kristo Pal and Sisir Kumar Ghosh explicitly expressed their political opinions and would not hesitate to exercise their newspapers to achieve political ends, often in direct defiance to British rule. Pioneers like Vidyasagar, Tagore, Swami Vivekananda in their own ways tried to reawaken the ideals of sacrifice, love for motherland and service to the nation. Thus, many roots of Indian independence can be traced back to the Bengal Renaissance. Revolutionary nationalism emerged as a potent political force in Bengal in the wake of the Swadeshi Movement in the first decade of the 20th century The Swadeshi Movement was the expression of the outrage triggered in Bengal by the partition of the province of Bengal in 1905. Thus Bengal made immense contributions to Indian Independence Movement. 5.4 Hartog Committee Report (1929) 5.4.1 Background of Hartog Committee In 1919, the Indian people found the Government of India Act to be insufficient in satisfying their clamour for social reform and in order to appease the masses it was necessary to appoint a commission under the leadership of Simon. Likewise it was the aim to address pressing issues confronting the educational system in the Indian subcontinent. Armed with a strong determination to implement educational reforms, the Simon Commission asked the chairmanship of Sir Philip Hartog in the Auxiliary Committee. Sir Philip Hartog served as a Sadler Commission member then in 1921 became the Vice Chancellor of Dacca University. Because he was at the forefront of this commission, the commission came to be known as the Hartog Committee. The task at hand is to inquire into all facets of the Indian educational system and present the results in September 1929.

This Committee was formed to examine the development of education in British India. It placed far more emphasis on mass education than on secondary and university education.

68%

MATCHING BLOCK 172/233

W

Increase in the number of schools and colleges led to deterioration of education standards across the

country. The committee was formed to recommend changes to strengthen the education system in the country. 5.4.2 Challenges faced by The Hartog Committee before recommendation The Committee identified numerous gaps and challenges in primary education and they are the following: majority of Indians are villagers, poverty, illiteracy, conservativeness, poor health of villagers, lack of teacher training, adoption of stereotype-laden and unscientific teaching methods, and lack of regulatory measures in schools. The Committee jointly recommended appointment of well-trained and highly qualified teachers and provision of security of teacher service (Jayapalan 2005). In the area of higher education, the most glaring problems faced were: low educational standard, unhealthy competition among universities, wastage, defeat of purpose, low standards of English proficiency, overpopulation, lack of well-organised Honours degree programs, and ill-equipped libraries. As remediation efforts, the Committee has put forward the following measures: Department examinations to be implemented in the recruitment of administrative services graduates, spreading political and social science to the common Indian, provision of employment opportunities for tertiary level graduates, promotion of efforts in raising higher education standards, building of extensive libraries, and establishment of affiliated, unitary residential and teaching universities (Jayapalan 2005). Due to the heavy demand on occupational, industrial, and technological development among the Indian populace, the Hartog Committee has been advancing the improvement in these fields (Jayapalan 2005). 5.4.3 Recommendations of Hartog Committee 5.4.3.1 Higher Education Reforms • The Committee praised the growth in number of affiliated colleges and it also hinted at the fall of standard in university education due to the worsening of its environment because of growth of affiliated colleges. • The Committee criticized the introduction of Honors courses in some universities and pointed out that they were outmoded. NSOU ? CC-ED-05 147 • Higher education could not be possible through Honors courses, as only increasing the duration by one year for these was not enough. • The Indian public opinion, too, felt that the universities had failed to meet the needs of the people. The country was undergoing political upheavals and it needed young men with a spirit of sacrifice and hard work. • The universities in India were unable to contribute anything in this sphere. Hence a discontent against them spread in the people. • Many universities were conducting only examinations, although the teaching and research work had already been started in some universities. There were no good libraries in any university. • In the opinion of the Hartog Committee it was the duty of universities to produce such individuals who were tolerant, liberal and suitable to undertake great responsibilities. • The universities in India were not equal to this task. • Hence the Committee gave the following suggestions for their reforms- •

69%

MATCHING BLOCK 173/233

W

The Committee recommended the establishment of some affiliating universities keeping in view the great demand for higher education. • The Committee admitted that the standard of education in the affiliated colleges of these universities would be poorer than in teaching universities, but under the circumstances affiliated colleges alone could meet the demand for higher education of the people. • The teachers for affiliated colleges should be appointed by universities. • The admission, in universities should be controlled on the basis of abilities and aptitudes of students. • The Honors course should be of more advanced nature than the pass courses and these courses should be instituted only at the universities. • Provision should be made for technical education by the universities.

The universities have to control the problem of unemployment by opening employment opportunities. 5.4.3.2 Primary Education Reforms

100%

MATCHING BLOCK 174/233

MATCHING BLOCK 176/233

W

Adoption of the policy of consolidation in place of multiplication of schools; • Fixation of the duration of primary course to four years; • Improvement in the quality, training, status, pay, service condition of teachers; • Relating the curricula and methods of teaching to the conditions of villages in which children live and read; • Adjustment of school hours and holidays to seasonal and local requirements; • Increasing the number of Government inspection staff. 5.4.3.3

Secondary Education Reforms •

100%

MATCHING BLOCK 177/233

W

In the sphere of secondary education the Committee indicated a great waste of efforts due to the immense number of failures at the Matriculation Examination. • It attributed that the laxity of promotion from one class to another in the earlier stages and persecution of higher education by incapable students in too large a number were the main factors of wastage. • So it suggested for the introduction of diversified course in middle schools meeting the requirements of majority of students. • Further it suggested the diversion of more boys to industrial and commercial careers at the end of the middle stage. • Besides, the Committee suggested for the improvement of University Education, Women Education, Education of Minorities and Backward classes etc. • The Committee gave a permanent shape to the educational policy of that period and attempted for consolidating and stabilising education. • The report was hailed as the torch bearer of Government efforts. •

100%

MATCHING BLOCK 178/233

W

However, the suggestions of the Committee could not be implemented effectively and the educational progress could not be maintained due to worldwide economic depression of 1930-31. • Most of the recommendations remained mere pious hopes.

The main findings of the committee are as follows : The Committee was primarily concerned with primary education but it made far-reaching recommendations for teacher training as well. It suggested that teachers for rural areas should be inducted from persons who were close to rural society. It also suggested that journals for teacher in the vernacular, refresher courses, conferences and meetings of teacher associations can do much to brighten the lives of the teachers and improve their work. For the secondary schoolteachers too, the committee had the same suggestions.

NSOU ? CC-ED-05 149 The committee recommended the introduction of diversified courses in the middle schools, which met the requirements of majority of the students. It also emphasised industrial and commercial careers for boys,

82%

MATCHING BLOCK 179/233

of Hartog Committee • The Committee investigated various aspects of education and presented its report to the commission in 1929. It made comprehensive recommendations regarding various aspects of education in India. • First, the Committee made some broad observations about India's educational situation. The committee observed that education had made significant progress by the time. • People generally saw education as a matter of national importance. Increased primary school enrolment indicates that

people's apathy toward education was fading, and that people's social and political consciousness was growing. •

48%

MATCHING BLOCK 181/233

W

Women, Muslims, and the lower classes had also awakened, and there had been rapid growth in numbers. Although there was widespread interest in education, the Committee was dissatisfied with the country's literacy rate. • The Committee presented a comprehensive report with these ideas in mind. It was valuable in that it attempted to gauge the pulse of education in India. • It made recommendations for primary, secondary, and

higher education, as well as some other aspects of education. 5.5 Sargent Report (1944) 5.5.1 Background of Sargent Report The work on educational planning in India had already started in 1938 when a National Planning Committee had been set up to take up educational restructure at the national level. However, the Second World War interrupted the work. The Central Advisory Board of Education took up the work in 1938 but the finalisation of the reports of various Committees could be done only in 1943-44. It

100%

MATCHING BLOCK 184/233

SA

History of Education In India, Block-1.pdf (D161180427)

was the first comprehensive educational plan formulated by the Central Advisory Board of Education.

It is popularly known as the Sargent Report, after the name of John Sargent, Educational Advisor to the Government of India. The plan aimed at tackling the problems of education as a whole. A committee of 22 members was set up.

150 NSOU ? CC-ED-05 They submitted their report in 1944 to the Central Advisory Board of Education who accepted the report and agreed to its implementation. This report was the first attempt towards the development of the Indian national education system. The Report envisaged that India would reach the educational standard of the England of 1939 in a period of not less than 40 years. The title of this memorandum was, "Post war Educational Development in India." This report is also known as Sargent's scheme or Sargent report and post-war educational development scheme. 5.5.2 Proposal of Sir John Sargent on School Education 5.5.2.1 Pre-Primary Education The report recommended that nursery schools should be started for the children from 3-6 years of age. Free education should be given in these schools. In rural areas these schools should be attached with junior basic schools while as in urban areas these schools should have separate existence. Trained lady teachers should be appointed in these schools. The main aim of these schools is to give social experiences and training of behaviour. 5.5.2.2 Primary Education Sir John Sargent recommended free and compulsory primary education for the

52%

MATCHING BLOCK 185/233

SA

Untitled document (18).docx (D143725658)

children in the age group of 6-14 years. He further recommended that primary education should be based on some craft.

Primary or basic schools were divided into two types, junior basic schools for children of 6-11 years and senior basic schools for children of 11-14 years age. The report did not give any place to English as medium of instruction at junior basic level. The scheme left the decision of medium of instruction in senior basic schools to respective provincial governments. The teacher pupil ratio should be 1:30 and 1:25 in junior basic and senior basic schools respectively. The aim of primary education should be training cooperative living. Internal examination should be given importance than external examinations and certificates should be given after the completion of course. 5.5.2.3 Secondary Education The scheme recommended that secondary education should be for the children in the age group of 11-17 years. Students have to study up to the age of 14 years and should not be allowed to leave school before 14 years of age. The report suggested that fee should be charged at this stage and only 50% of students should be given free education. Sir John Sargent recommended that mother tongue should be medium of

NSOU ? CC-ED-05 151 instruction at secondary level and English should be taught as second language. It was recommended that the purpose of secondary education should be to make students self reliant and self dependent. • Types The proposed High Schools should be of two main types the Academic and the Technical. The Academic High School will impart instruction in the Arts and pure sciences; while the Technical High School will provide training in the applied sciences and industrial and commercial subjects. In both types the course in the Junior stages will be very much the same and there will be a common core of the 'humanities' throughout. Art and Music should form an integral part of the curriculum in both and all girls should take a course in domestic science. The curriculum should be flexible so that transfer from one type to the other should be made as easy as possible. In rural areas an agricultural bias should be given to the curriculum. Subjects common to both the types : i. The mothertongue, ii. English, iii. Modern languages, iv. History (Indian and World), v. Geography (Indian and World), vi. Mathematics, vii. Science, viii. Economics, ix. Agriculture, x. Art, xi. Music, xii. Physical Training. In the Academic High School classical Languages and civics are added to the common list. In the Technical High Schools the science subjects are to be studied more intensively. Technological subjects such as wood and metal work, and commercial subjects like book-keeping, shorthand, typewriting and accountancy are also to be added to the common list.

152 NSOU ? CC-ED-05 5.5.2.4 Health Education In order to look after the health of school children health-committees can be set- up in schools. Every student should be medically checked up and if any defect is found appropriate follow-up measures should be taken. Minor treatment can be provided in school clinics. Physical training should be compulsory. 5.5.2.5 Special Education Provision for special education should be made for physically handicapped and mentally retarded children. The former group includes the blind, the deaf, the cripples and speech defectives, and the latter includes the feeble-minded, imbecile, dull and backward children. 5.5.3 Proposal of Sir John Sargent on Higher Education 5.5.3.1 Defects of existing system The Sargent Report points out certain defects in the then affairs of Indian Universities • The gravest of these is their failure to relate their activities sufficiently closely to the practical needs of the community as a whole. There is no systematic attempt on their part to adjust the output to the capacity of the employment market to absorb it. • A great deal of (too much) importance is attached to examinations. The examinations put a premium on book learning and narrow cramming. They do not help original thinking and real scholarship. • In the absence of suitable selection (for admission) machinery a large number of incapable students get entry into universities, On the other hand many poor but really meritorious students are prevented by poverty from seeking admissions to universities. The result is disastrous. • Probably nowhere among the universities of the world are there so large a proportion of failures in examinations as in Indian Universities. • Indian Universities do

53%

MATCHING BLOCK 183/233

W

not fully satisfy the requirements of a national system of education. 5.5.3.2 Recommendations on University Education • The standard of University education must be raised. The conditions of admission must be revised

so that only capable students can take full advantage of the University Course. The proposed reorganisation of the High School system will

NSOU ? CC-ED-05 153 facilitate this. Only 10/15 percent of the successful candidates of entrance examinations will get the chance of admission in Universities. • Adequate financial assistance must be provided for poor students. • The present Intermediate Course should be abolished. The first year of the course should be transferred to High School and the second to Universities. • The minimum length of a University Course should be three years. • The tutorial system should be widely extended for closer personal contacts between teachers and students. • Emphasis should be given of establishing a high standard in post-graduate studies and in pure and applied research. • Steps should be taken to improve the conditions of service, including remuneration of University and College Teachers to attract men and women of high calibre. • For co-ordination in the activities of the different Universities an All-India Organisation like the University Grants Committee of England should be set up. 5.5.3.3. Technical and Vocational Education The Sargent Report divides the workers needed by Indian Arts and Industries, trade and commerce into four categories : i) Chief Executives and Research Workers of the Future : They will have their preliminary training in a Technical High School and will then pass to the Technological Department of a University or to a full-time course in a Technical Institution. The admissions to these higher courses should be the outcome of a very strict process of selection. They will not be many. ii) Minor Executives, Foremen, Charge-Hands, etc. : It is the main aim of the Technical High School to satisfy this need; but the Technical High School pupil will be required to continue his technical education on full-time or part-time basis in a Diploma or Certificate Course. iii) Skilled Craftsmen : These may be recruited from Technical High School pupils or Senior Basic Schools or Junior Technical Trade or Industrial Schools. iv) Semi-skilled and Unskilled Labour : They will be recruited mostly directly from Senior Basic Schools where they will have done some craft work. These persons should get facilities both for continuing their general education and for improving their skill, so that the best of them may ultimately be converted into skilled labour.

154 NSOU ? CC-ED-05 Part-time day classes (or the sandwich system) constitute an important factor in any modern scheme for technical education. The paid workers in factories, industrial or commercial concerns should be given due facilities for improving their knowledge and skill in these classes. 5.5.3.4. Adult Education • The role of Adult Education, according to the Sargent Report, is to make every possible member of a state an effective and efficient citizen. The problem of adult education in India connotes adult literacy. • The normal age range of adult education should be 10 plus to 40. Separate classes should be organised; preferably during the daytime, for boys between ten and sixteen years. It would also be preferable to have separate classes for young girls. • In order to make adult education interesting and effective, it is necessary to make fullest possible use of visual and mechanical aids such as pictures, charts, the magic-lantern, the cinema, the gramophone, the radio, folk dancing and music etc. 5.5.4. The Recruitment and Training of Teachers The Sargent Report assumes that one teacher will be required for every 30 pupils in Junior Basic Schools, for every 25 pupils in Senior Basic Schools and for every 20 pupils in High Schools. The minimum qualification for a teacher who has completed the High School Course should be two years' training in Junior Basic Schools and three years' training in Senior Basic Schools. The non-graduate teachers in High Schools are expected to undergo a training course for two years and the graduates would receive one year's training. Refresher Courses should be provided at frequent intervals in order to keep trained teachers up-to-date. In order to attract the proper type of persons to the teaching profession, the Sargent Report proposes to revise the scales of pay to be given to all grades of teachers – particularly to the teachers at the primary stage who are paid very low salaries at present. 5.5.5 Criticism of the Sargent Report • "It is the first comprehensive and all embracing scheme of national education". It is the most thorough and detailed educational document after the Despatch

NSOU ? CC-ED-05 155 of 1854. The Report is not narrowly conceived; it has rather been formulated with broad vision and outlook. It laid the foundation of a national system of education. "We get in it, in the words of Shri AnathnathBasu, for the first time a Comprehensive plan for national educational reconstruction". In the words of Shri K. G. Saiyidain, the educational adviser to the Government of India, "It is the first comprehensive scheme of national education". • Secondly, it is inspired by the desire to provide equality of educational opportunity at different stages of education. • Thirdly, it stresses in clear terms the importance of the teaching profession and makes proposals for increasing its miserable standard of salaries and poor conditions of service. It lays down a minimum national scale of salaries which has been accepted and given effect to in many provinces. 5.5.6 Defects of the Sargent Report • The Sargent Report placed a very tame ideal before the country. The Report outlined an educational development in India which would require 40 years to be implemented. This time-limit did not satisfy any ardent educationist. An acceptable plan of educational development in India had been spread over a much shorter range of time, not exceeding 15 years. • The Sargent Report fixed the period for implementing the plan at 40 years. The main reason for such fixation was the impossibility of obtaining the necessary number of qualified and trained teachers in a shorter time. The Report assumed that no one should be appointed as a teacher under the scheme until he had received the prescribed minimum of general and professional education. This was an idealistic conception. A programme of educational development in India should commence with the immediately available teaching personnel of the country and this was actually done. A war against ignorance and illiteracy should start immediately and teaching personnel required for the purpose should be conscripted. • The programme of an eight-year universal education was too ambitious a target to aim at in the first instance; a shorter period of elementary education might be visualised and achieved over a shorter period. • It was pointed out that the scheme merely described the ideal to be reached and does not give a detailed programme of development. Such a programme with different stages of development was absolutely needed. A mere statement of the ideal to be reached is a comparatively simple matter in educational planning.

156 NSOU ? CC-ED-05 • It has been pointed out that the only ideal held up by the Report is that of the educational system of England. But as a matter of fact

100%

MATCHING BLOCK 189/233

SA

Bijendra_AI&AS.docx (D116982346)

England could not very well serve as a model to India, because

the social, political and economic conditions in the two countries are vastly different. Eastern countries like China or Japan or Egypt or Turkey or Western countries like Germany or Denmark or Soviet Russia could really serve as a model to India. • The proposal for selective admission in schools, colleges and Universities is undemocratic. • The financial implications of the Report were highly criticised. The cost of working out the scheme would come to about Rs. 313 crores annually. This cost might rise to about Rs. 1,000 crores within the time-limit of 40 years per annum. It appeared doubtful if a poor country like India could afford this huge expenditure. It was, therefore, opined that, on financial grounds, the scheme is too Utopian to be practicable. Despite the shortcomings and limitations of the Report, it is a big epoch-making plan. 5.6 Summary • The Bengal Renaissance is a movement by the Bengalis which is characterized by a social awakening in the field of art, culture, science, intellect and society (as a whole). • The movement was carried out from the nineteenth century to the early twentieth century, which is during the period of British rule in India. Bengal and its neighbouring areas are where the movement was largely carried out. • 'Renaissance' means 'rebirth'. This period (from the 14th to the 16th centuries) saw the rebirth of classical patterns in art, architecture and literature in Europe. It is sometimes called the 'Early Modern' period. • Historians have traced the beginnings of the movement

100%

MATCHING BLOCK 190/233

SA Ph.D. thesis - Somasree Datta Dept.of Educati ... (D158964556)

to the victory of the British East India Company at the 1757 Battle of Plassey,

as well as the works of reformers like Raja Rammohan Roy and the like. • Bengal Renaissance was led and dominated by upper caste Hindus like Raja Rammohan Roy, writer Rabindranath Tagore, and the physicist Satyendra Nath Bose but Muslim many Muslim like Kazi Nazrul Islam, Rokeya Sakhawat Hussain and Sake Dean Mahomed. • It saw major advancements in the cultural arena of Bengal which encompasses literature, science, arts, education and even foundation of new religions.

NSOU ? CC-ED-05 157 • The crucial achievements of the Bengal Renaissance were : a) a secular grapple for rational freethinking b) broadening of modern Bengali literature c) expansion of Western education & ideas d) vehement & diverse intellectual inquiry e) hike of nationalistic ideas f) jumping up of the nationalism challenged the foreign subjugation of country. • Apart from the above, Indians started a movement known as Indian National Education Movement which happened in parallel way of Indian Freedom Movement. The pioneers of this movement were those people who initiated this movement during the end of eighteenth century. The National Education Movement play a major role in the Bengal Renaissance movement. •

In 1929, the Hartog Committee submitted its report. This Committee was appointed to survey the growth of education in British India. It "devoted far more attention to mass education than Secondary and University Education". • The committee was not satisfied with the scanty growth of literacy in the country and highlighted the problem of 'Wastage' and 'Stagnation' at the primary level. It mentioned that the great waste of money and efforts which resulted because of the pupils leaving their schools before completing the particular stage of education. • Its conclusion was that "out of every 100 pupils (boys and girls) who were in class I in 1922-23, only 18 were reading in class IV in 1925-26. Thus resulted in a relapse into illiteracy. • So, it suggested the following important measures for the improvement of primary education. • Adoption of the policy of consolidation in place of multiplication of schools; • Fixation of the duration of primary course to four years; • Improvement in the quality, training, status, pay, service condition of teachers; • Relating the curricula and methods of teaching to the conditions of villages in which children live and read; • Adjustment of school hours and holidays to seasonal and local requirements; • Increasing the number of Government inspection staff. 158

In the sphere of secondary education the Committee indicated a great waste of efforts due to the immense number of failures at the Matriculation Examination. It attributed that the laxity of promotion from one class to another in the earlier stages and persecution of higher education by incapable students in too large a number were the main factors of wastage. • So it suggested for the introduction of diversified course in middle schools meeting the requirements of majority of students. Further it suggested "the diversion of more boys to industrial and commercial careers at the end of the middle stage". • Besides, the Committee suggested for the improvement of University Education, Women Education, Education of Minorities and Backward classes etc. • The Committee gave a permanent shape to the educational policy of that period and attempted for consolidating and stabilizing education. The report was hailed as the torch bearer of Government efforts. • It attempted to prove that a policy of expansion had proved ineffective and wasteful and that a policy of consolidation alone was suited to Indian conditions. However, the suggestions of the Committee could not be implemented effectively and the educational progress could not be maintained due to worldwide economic depression of 1930-31. Most of the recommendations remained mere pious hopes. •

Central Advisory Board of Education prepared a comprehensive report on educational development after the world war-II, known as the Sargent Report in 1944. • It visualized a system of education with pre-primary education for children between 3 to 6

Questions 6.8 References 6.1 Objectives After going through this unit, the students will be able to : • Discuss about the contribution of

Raja Rammohan Roy as social reformist. • Describe about the contribution of Pt. Iswar Chandra Vidyasagar as social reformist. • Elaborate about the contribution of Raja Rammohan Roy in the field of education. • Elucidate the educational contribution of Pt. Iswar Chandra Vidyasagar. • Enumerate the role of Henry Derozio in the field of education. • Understand Gandhi's concept of basic education • Understand strategy of Nai Talim • Learn about Gandhi's philosophy and educational goals • Know features of Gandhiji's basic education • Know Gandhi's efforts towards imparting basic education • Understand the Philosophy of Tagore. • Enumerate the Concept of Education as per Tagore. • Discuss the Aims/Objectives of Education as stated by Tagore. • Elucidate the experiments with Santiniketan & Sriniketan.

NSOU ? CC-ED-05 165 6.2 Introduction This unit discusses about the fresh review of the phenomenon known as The Bengal Renaissance. During the early 19th century the Bengali intellect learned to upraise questions about issues & beliefs under the influence of British rule in the Indian subcontinent. Bengal had evidenced an intellectual arousing that deserves to be called a Renaissance in European style. The new intellectual avalanche of European knowledge, especially philosophy, history, science & literature through the medium of education in English may be said to have affected contemporary mind & life very radically. Renaissance minds included Raja Rammohan Roy (1774-1833), Henry Louis Vivian Derozio (1809-1831) & his radical disciples Debendranath Tagore (1817- 1905) & his followers, Akshay Kumar Datta (1820-1826), Iswar Chandra Vidyasagar (1820-91), Michael Madhusudan Dutt (1824-73), Bankim Chandra Chattopadhyay (1838-94), & Swami Vivekananda (1863-1902). Here will focus on the contributions of Raja Rammohan Roy (1774-1833), Henry Louis Vivian Derozio (1809-1831) & Iswar Chandra Vidyasagar (1820-91) only. Specifically we shall focus on the roles palyed by Raja Rammohan Roy, Derozio and Vidyasagar in reform of education. Also we shall study what Gandhiji thought about education and what was the scheme of Basic education given by him. Tagore was also another educational visionary who had a different take on education and founded institutions like Sriniketan and Santiniketan. The contributors of these great educators will be studied here in details. 6.3 Contributions of Rammohan Roy, Vidyasagar and Derozio 6.3.1 Contributions of Rammohan Roy 6.3.1.1 As a Social Reformer

Ram Mohan Roy FRAS (22 May 1772 – 27 September 1833) was an Indian reformer who was one of the founders of the Brahmo Sabha in 1828, the precursor of the Brahmo Samaj, a social-religious reform movement in the Indian subcontinent. He was given the title of Raja by Akbar II, the Mughal emperor. His influence was apparent in the fields of politics, public administration, education and religion. He was known for his efforts to abolish the practices of sati and child marriage. Roy is considered to be the "Father of

the Bengal

Renaissance" by many historians. In 2004, Roy was ranked number 10 in BBC's poll of the Greatest Bengalee of All Time. 166

NSOU ? CC-ED-05 The Bengal society was weighed down with an array of evil customs and regulations. There was a huge prevalence of intricate rituals and scrupulous moral codes which were largely modified and badly elucidated ancient traditions. He was against traditional Hindu practices and echoed his voice against Sati system, polygamy, caste rigidity and child marriage. His biggest achievement was the prohibition of the "sati pratha", a practice in which a widow was made to immolate herself at the funeral pyre of her deceased husband. He struggled for years to get this evil legally eradicated. He established the Brahmo Samaj along with the other enlightened Bengalis. The samaj was a highly influential socio-religious reform movement which raised its voice against evils like caste system, dowry, ill-treatment of women, etc. During the late 18th century (known as the Dark Age), Bengali society was burdened with several wicked rituals and regulations. Extensive rituals and rigid moral codes were imposed, which were mostly adapted and translated wrongly from ancient cultures. Child marriage, polygamy, and Sati were common practices that harmed women in society. The Sati Pratha was the vilest of these traditions.

SA 12.aswathy-sa.pdf (D148066380)

The ritual involved widows self-immolating at their husband's funeral pyre. While the tradition in its original form gave women the option to participate, it eventually developed into a necessary custom, especially for Brahmin and higher caste families. Young girls were married to much older men in exchange for

a dowry so that these men could gain the karmic rewards of their wives' Sati sacrifice. Much of the time, the women did not volunteer to be exposed to

Ram Mohan's contributions to other aspects of social and literary life were highly valuable. True it is that, Mrityunjoy Vidyalankar, Ram Mohan Bose, Rajiblochan, Carey etc. had preceded him in the field of Bengali prose literature, yet it must be admitted that Ram Mohan contributed a style and standard which facilitated the development of Bengali prose as a vehicle of stories, novels as well as polemical literature (Banerjee, J. P., 2004). The great contribution of Ram Mohan Roy to the system of modern education was his emphasis on the study of modern Indian languages. He himself gave a great lead in the matter by writing books in Bengali on Grammar, Geography, Astronomy and Geometry and he is considered as the father of modern literary Bengali prose. His advocacy of the study and development of modern Indian languages. •

Contributions of Vidyasagar 6.3.2.1 As a Social Reformer Ishwar Chandra Vidyasagar CIE (26 September 1820 – 29 July 1891), born Ishwar Chandra Bandyopadhyay, was an Indian educator and social reformer of the 19th century. His efforts to simplify and modernise Bengali prose were significant. He also rationalised and simplified the Bengali alphabet and type, which had remained unchanged since Charles Wilkins and

100%**MATCHING BLOCK 214/233****SA** Dolanchanpa Ganguly Phd.pdf (D128753583)

Panchanan Karmakar had cut the first (wooden) Bengali type in 1780.

He is considered the "Father of Bengali prose". He was the most prominent campaigner for Hindu widow remarriage, petitioning the Legislative council despite severe opposition, including a counter petition (by Radhakanta Deb and the Dharma Sabha) which had nearly four times as many signatures. Even though widow remarriage was considered a flagrant breach of Hindu customs and was staunchly opposed, Lord Dalhousie personally finalised the bill and the Hindu Widows' Remarriage Act, 1856 was passed. Somprakash a weekly newspaper started on 15 November 1858, (1 Agrahayan 1265 BS) by Dwarakanath Vidyabhusan. Dwarakanath (1819-1886) was a professor of Sanskrit college in Calcutta. The original plan was mooted by Iswar Chandra Vidyasagar (1820-1891), who continued to advise Dwarakanath in editorial matters.

170 NSOU ? CC-ED-05 He so excelled in his undergraduate studies of Sanskrit and philosophy that Sanskrit College in Calcutta, where he studied, gave him the honourable title "Vidyasagar" ("Ocean of Knowledge"; from Sanskrit, Vidya "knowledge" and Sagar "ocean"). • Upliftment of status of women : Vidyasagar championed the upliftment of the status of women in India, particularly in his native Bengal. Unlike some other reformers who sought to set up alternative societies or systems, he sought to transform society from within. Unable to tolerate the ill-treatment, many of these girls would run away and turn to prostitution to support themselves. Ironically, the economic prosperity and lavish lifestyles of the city made it possible for many of them to have successful careers once they stepped out of the sanction of society and into the demi-monde. In 1853 it was estimated that Calcutta had a population of 12,700 prostitutes and public women. Many widows had to shave their heads and don white saris, supposedly to discourage attention from men. They led a deplorable life, something Vidyasagar thought was unfair and sought to change. • Campaign against polygamy Alongside the campaign for widow remarriage, Vidyasagar campaigned against polygamy. In 1857, a petition for the prohibition of polygamy among Kulin Brahmins was presented to the government with 25,000 signatures, led by the Maharaja of Burdwan. The mutiny of the sepoys resulted in the postponement of action on this petition, but in 1866, Vidyasagar inspired another petition, this time with 21,000 signatures. In the 1870s, Vidyasagar, the great rationalist, wrote two brilliant critiques of polygamy, arguing to the government that since polygamy was not sanctioned by the sacred texts, there could be no objection to suppressing it by legislation. • Ambush on child marriage Vidyasagar followed in the great reformist tradition of Raja Ram Mohun Roy (1772-1833), and argued, on the basis of scriptures and old commentaries, in favour of the remarriage of widows in the same way as Roy did for the abolition of Sati. His earliest effort at social reform, however, came in the second half of 1850 when, in a paper on the evils

73%**MATCHING BLOCK 215/233****SA** Ph.D. thesis - Somasree Datta Dept.of Educati ... (D158964556)

of child marriage, he launched a powerful attack on the practice of marrying off girls aged 10 or even younger, pointing to

social, ethical, and hygiene issues, and rejecting the validity of the Dharma Shastras that advocated it.

NSOU ? CC-ED-05 171 • Widow Remarriage Act In January and October 1855, Vidyasagar wrote his two famous tracts on the Marriage of Hindu Widows, basing his argument entirely on reason and logic, and showing that there was no prohibition on widows remarrying in the entire body of 'Smriti' literature (the Sutras and the Shastras). In the second tract, he gave a crushing reply to his critics who had sought to counter him after the first tract. Underlining the rationalism of his thought and the difficulties of his reformist project, Vidyasagar wrote : "But how is this to be done? By reasoning alone? No. For it will not be admitted by our countrymen that mere reasoning is applicable to such subjects. The custom must have the sanction of the Sastras; for in matters like this, the Sastras are the paramount authority among Hindus, and such acts only as are conformable to them are deemed proper." While stating that he did feel compassion for "our miserable widows", Vidyasagar stressed "that I did not take up my pen before I was fully convinced that the Sastras explicitly sanction their remarriage. This conviction I have come to after a diligent, dispassionate and careful examination of the subject and I can now safely affirm that in the whole range of our original Smritis there is not one single text which can establish anything to the contrary." From a high moral pedestal, he implored the people of India to end this cruel and illogical custom: "Countrymen! How long will you suffer yourselves to be led away by illusions? Open your eyes for once and see that India, once the land of virtue, is being overflowed with the stream of adultery and foeticide... Dip into the spirit of your Sastras, follow its dictates, and you shall be able to remove the foul blot from the face of your country...Habit has so darkened your intellect and blunted your feelings, that it is impossible for you to have compassion for your helpless widows." 6.3.2.2 Contributions to education

W

Ishwar Chandra Bandhopadhyay, popularly known as Ishwar Chandra Vidyasagar, is considered as one of Bengal renaissance. He continued the reforms movement that was started by Raja Ram Mohan Roy. Vidyasagar was well known writer, intellectual and above all a staunch follower of humanity. He brought a revolution in the education system of Bengal. Born on 26th September 1820 in a village called Veerasingha of 172 NSOU ? CC-ED-05 the then Hooghly (now part of Midnapore) district of West Bengal. Vidyasagar spent his childhood in extreme poverty. He commenced primary education at the village pathsahaala– an indigenous Indian school where language, grammar, arithmetic and other shastras were taught to youngsters. Later he accompanied his father to Calcutta. Within a short while, Ishwar was admitted to the Sanskrit College. As a student of the Sanskrit College, he witnessed the religious controversy between the reformists like Ram Mohan; radicals like Derozio (who denounced Hinduism as obsolete) and the conservatives who wanted to preserve and protect the basic character of Hinduism. Vidyasagar maintained religious neutrality. To him there was one religion that was welfare to humanity. Young Ishwar applied himself to learning with full discipline, diligence and perseverance and passed successive annual examinations with exemplary brilliance. It is here he came in close contact with half a dozen Sanskrit scholars, who would have left an indelible mark on his young impressionable mind. In 1839 he graduated in law examination conducted by the Hindu Law Committee. His well-rounded education at Sanskrit College saw him amassing considerable knowledge and mastery in a number of shastras, and in 1839 at a tender age the title Vidyasagar was endowed to him. On 29th December Vidyasagar joined Fort William College (FWC) as a Principal Lecturer (or Pundit). G.T. Marshall who was the Secretary of the College at the time acted as the catalyst for gaining this prestigious position for him at the age of 21. Vidyasagar started learning English and Hindi here. Marshall had been thoroughly impressed by Ishwar's scholastic achievements. • Saviour of Sanskrit College After a five year stint with the FWC Vidyasagar joined the Sanskrit College as Assistant Secretary in 1846. He wanted to improve the teaching system in the college. In the first year of service with Sanskrit College, he brought out a report to the authorities outlining and recommending a number of changes to the curricula and the education system. This report attracted criticisms from the College Secretary Rashamoy Dutta but it generated keen interest of authorities and a tremendous amount of favourable comments and praises from the Education department, particularly from G.T. Marshall. Because of irreconcilable differences with Dutta on this subject Vidyasagar resigned. Ishwar Chandra's principles, determination and courage were unparalleled in every detail. He never deviated from his goals in the face of all adversities. He knew not how to compromise on any matter of substance neither in fear nor for favour. He

NSOU ? CC-ED-05 173

resigned from the college, after the skirmish with Dutta. In 1850 Vidyasagar came back to Sanskrit College as a Professor at Sanskrit College with one condition that he should be allowed to do the redesign of the education system. In 1851 he became the Principal of this college. His well-documented protestations against Education department officials of the day testify to the degree of intensity with which he pursued the course of education reform. He favoured English and Bengali as a medium of learning alongside Sanskrit and wanted to offer to students a wider range of subjects and thus broaden their horizons in examining European and Indian concepts and practices side by side so they could apply their own judgement in discovering the truth for themselves. He was not afraid of discarding erroneous beliefs of Indian shastras and in preferring European science in its place where appropriate. Similarly he did not accept everything that Europe had to offer. His mind was open only to discovering the truth and reality. In these matters his determination was unmistakable and his resolve unshakable. In his famous "Notes on the Sanskrit College". Vidyasagar put forward a comprehensive scheme through which he aimed at creating an elegant Bengali style based on a combination of sound knowledge of both Sanskrit and English languages. He wrote books on Sanskrit grammar in Bengali in simple ways- Upakramonika and ByakaranKoumudi. He laid equal stress on learning the three branches in English- History, Mathematics and Natural Philosophy. Vidyasagar also achieved another success when the gates of the Sanskrit College were made open to castes other than the Brahmins. He also introduced admission fee and tuition fee. He prevailed upon the government to select as deputy magistrates some of the graduates of this college and established the Normal School for training Bengali teachers at the College thereby broadening the prospect of career opportunities as well as the range of academic interests that could be pursued on its campus. Vidyasagar took several such measures to expand enrolment and strengthen student commitment in Sanskrit College. In this way, he rescued classical education from medieval scholasticism. • Collegiate Education In 1853, Vidyasagar established an Anglo Sanskrit free school in Virsingha village. Vidyasagar was an ardent advocate of non-official secular and popular institutions for higher education with a purely Indian teaching staff. This is evident from his zeal to establish the Metropolitan Institution (which was originally founded in 1859 under the name of the Calcutta Training School under the management of the natives). In 1864 the management devolved entirely on Vidyasagar and he maintained this college out of its own resources. Its object was to find means of higher collegiate education for 174 NSOU ? CC-ED-05 the youths of Bengal. This college was administered by the Indians with no financial aid from the government. The teaching staff too consisted of Indians. It became a first grade college in 1879. From 1884 it introduced courses in Law,

B.A. Honours and M.A.

course. He was appointed to the board of Examination for the selection of ICS candidates in 1854 and in 1855 he was made a member of the University Committee. In 1857 he became a fellow of the Calcutta University. • Women's Education Education of girls was one of the prime objectives of Vidyasagar's plans. He realized that unless women of the land could be educated it was impossible to emancipate and liberate them from the terrible burden of inequalities and injustice imposed on them by the cruel society of the day. However, the conservatives in the society were against education of the girls. Vidyasagar had to fight these conservatives with quotations from the Sanskrit scriptures that clearly prescribed care and education of the daughters. The credit for explaining the true meaning of the Hindu shastras upholding the women's right to education and the propagation of this truth among his countrymen entirely goes to Vidyasagar who utilized his literary talent for writing books, pamphlets and articles in support of female education. From submitting reports about the curriculum taught to girls in schools which included reading, writing, arithmetic, biography, history of Bengal, reading of passages on different subjects, needlework and sewing, to opening of 35 schools for girls in Bengal with an enrolment of 1300 girls; making door-to-door calls, requesting parents to send their daughters to school; giving financial support to some schools; appealing the government to extend grant-in-aid benefits towards the maintenance of girls' schools; initiating a fund "NARI SHIKSHA BHANDAR" for rendering financial help to the girls' education, Vidyasagar did it all. • Mass Education Another significant contribution of Vidyasagar was the spread of mass education. On witnessing the pervading darkness and superstitions in which people of Bengal lived in the absence of education, Vidyasagar explored local popular support and participation in the spread of mass education. He appealed to the people who responded positively and it was decided that schools would be set up at chosen localities where the financial burden of erecting school buildings were to come from the locality. Vidyasagar got quite a number of schools constructed in this way in areas under his official jurisdiction. NSOU ? CC-ED-05 175 • Journalism Vidyasagar had his contribution in journalism as well. He published his article on widow marriage in the Sarbashubhankari Patrika. Akshay Kumar Dutta often got his articles examined by Vidyasagar, who was on the Paper Committee of the Tattwabodhini Patrika. He was directly associated with the Somprakash, a distinguished journal of the time (1855). The responsibility of properly learning the Hindu Patriot also fell on him when it fell on difficult ways days after the death of Haris Chandra Mukherjee. 6.3.3

Contributions of Derozio on Education 6.3.3.1 As a Social Reformer • The Young Bengal Henry Louis Vivian Derozio was born on 18 April 1809 in Kolkata. He was a fiery Indian teacher and poet and as a lecturer at the Hindu College of Calcutta, he invigorated a large group of students to think independently. His students came to be known as Derozians. He encouraged students to read Thomas Paine's Rights of Man and other free-thinking texts and infused rationalism and patriotism and, he encouraged questioning the orthodox Hindu customs. He was there from 1827 until he was expelled from the college by the Hindu dominated management in 1831. His contributions were: • He gave a profound intellectual backbone to the youth in the college. • His ideas had a profound influence on the social movement that came to be known as the Bengal Renaissance in early 19th century Bengal. • He also educated on the key social issues such as women upliftment, abolition of sati and widow remarriage. • He also established the 'Young Bengal' movement which instilled spirit of free thought and rationalism. It included members such as Krishna Mohan Banerjee, Peary Chand Mitra, Ramgopal Ghosh etc. • These and many other Derozians later managed forerunners of later organisations such as the Landholders' Society, British India Society, and British Indian Association. Also many of them were involved in Brahmo Samaj. 6.3.3.2 Contributions to education In May 1826, at age 17, he was appointed teacher in English literature and history at the new Hindu College. Derozio's intense zeal for teaching and his interactions

176 NSOU ? CC-ED-05 with students created a sensation at Hindu College. He organized debates where ideas and social norms were freely debated. In 1828, he motivated students to form a literary and debating club called the Academic Association. This was a time when Hindu society in Bengal was undergoing considerable turmoil. In 1828, Raja Ram Mohan Roy established the Brahmo Samaj, which kept Hindu ideals but denied idolatry. This resulted in a backlash within orthodox Hindu society. Derozio helped discuss the ideas for social change already in the air. Despite his youth, he was considered a great scholar and a thinker. Within a short period, he drew around him a group of intelligent boys in college. He constantly encouraged them to think freely, to question, and not to accept anything blindly. His teachings inspired the development of the spirit of liberty, equality, and freedom. They also tried to remove social evils, improve the condition of women and peasants, and promote liberty through freedom of the press, trial by jury, and so on. His activities brought about the intellectual revolution in Bengal. It was called the Young Bengal Movement and his students, also known as Derozians, were fiery patriots. Due to backlash from conservative parents who disliked his wide-ranging and open discussion of religious issues, Derozio was dismissed from his post in April 1831, shortly before his death. In 1838, after his death, members of the Young Bengal movement established a second society called the Society for the Acquisition of General Knowledge. Its main objective was to acquire and disseminate knowledge about the condition of the country. • Writing Derozio was generally considered as an Anglo-Indian, being of mixed Portuguese, Indian, and English descent, but he considered himself Indian. He was known during his lifetime as the first 'national' poet of modern India, and the history of Anglo-Indian poetry typically begins with him. His poems are regarded as an important landmark

The Fakeer of Jungheera: A Metrical Tale and Other Poems (1828)

NSOU ? CC-ED-05 177 • The Fakeer of Jungheera • "To India - My Native Land" • The Poetical Works of Henry Louis Vivian Derozio, ed. B.B. Shah (1907) • "To the Pupils of the Hindu College" • Influence Derozio's ideas had a profound influence on the social movement that came to be known as the Bengal Renaissance in early 19th century Bengal, despite being viewed as something of an iconoclast by Alexander Duff and other (largely evangelical) Christian Missionaries. In Duff's Assembly's Institution, Derozio's ideas on the acceptance of the rational spirit were accepted, as long as they were not in conflict with basic tenets of Christianity, and as long as they critiqued orthodox Hinduism. Derozio is generally believed to be partly responsible for the conversion of upper- caste Hindus like Krishna Mohan Banerjee and Lal Behari Dey to Christianity. Samaren Roy, however, states that only three Hindu pupils among his first group of students became Christians, and asserts that Derozio had no role to play in their change of faith. He points out that Derozio's dismissal was sought not only by Hindus such as Ramkamal Sen, but also by Christians such as H. H. Wilson. Many other students like Tarachand Chakraborti became leaders in the Brahmo Samaj. Derozio's political activities have also been seen as crucially important to the development of a public sphere in Calcutta during British rule. A commemorative postage stamp of Derozio was issued on December 15, 2009. Literary Legacy of Derozio Nothing proves Derozio's influence over his students at Hindu College, Calcutta, soconvincingly than the fact that he had to be dismissed from the service of Hindu College barely three years after he joined its service, allegedly because he motivated his students to be "hostile to Hinduism and to the established customs of the country." Some conservative Bengali gentfolk brought the charges against Derozio, but his prosecution under these charges must equally have gladdened the conscientious British officialdom. For Derozio preached a secular nationalism and preached it so passionately that he won innumerable converts to his cause. His converts included upcoming young men such as Krishna Mohun Bannerjee, Mahesh Chandra Ghose, Ram Gopal Ghose, Gobin Chunder Bysack, Amrita Lal Mitra and Duckinarunjun Mukherjee. Many of them took to intellectual pursuits and produced literary writings inspired by their mentor. But unfortunately, not many of these writings have survived, although most of the young men in question had tremendous influence in their own chosen sphere of activities.

178 NSOU ? CC-ED-05 Derozio's inspiration came from the English Romantic poets who castigated the orthodox, restrictive nature of the neo classicists. Derozio applied the radical English thoughts to the existing views in India. In the individual case of Derozio, the secular notions of behaviour posed a threat to what was considered the native Indian ethos. 6.4 Nai Talim and Wardha Scheme on Mahatma Gandhiji's Concept of Basic Education 6.4.1 Background of Gandhiji's Basic Education The most significant contribution of Gandhiji to education was the basic education scheme. His long experience and experiment in the field of education help him to devise a new scheme of education suitable for his native country India. When Gandhiji was in South Africa, he used to teach his children with other students and illiterate in the Tolstoy farm of the transversal. Manual work was given top priority by him while educating the children. It was a novel attempt and he was successful in his experiment. After returning to India in 1919 he set up Sabarmati Ashram. In the Ashram, there was a school for children and illiterates. Emphasis on manual work with Charakha and Khadi. In 1935, Gandhiji shifted to Sevagram Ashram, 11 kilo meters away from Wardha. There he published a journal called 'The Harijan', by name where he Expresses his educational ideas and practices. In June 31, 1937 in "Harijan", Gandhiji expresses his view of his basic education. He says the present scenario of education is not only wasteful but positively harmful. So, Gandhiji decided a new type of education which enhance the mind and soul of society. For this an all Indian Education Conference was held in Wardha on 22nd and 23rd October 1937. They discussed on different aspects of the proposed new scheme of education. The eminent of educationists, congress leaders and

They submitted their report on December 1937 and revised on April 1938. It presents a new way of education. Since than Basic Education is known as "Nai Talim". Nai Talim is a radical and important revolution in social and economic structure in Indian education. The name of this education is basic education as it forms the basis of social and economic NSOU ? CC-ED-05 179 development. This education system is also known as "Nai Talim" as it provides new training system to the students. 6.4.2 Concept of Basic Education "Basic Education" is the contribution of Mohan Das Karamchand Gandhi (Mahatma Gandhi). According to Mahatma Gandhi, basic education is education for life and through life, basic education is also called Nai Talim or Buniyadi Shiksha. Some name Basic Education as Wardha scheme of Education in Wardha Ashram. The term 'Basic' is significant in Basic Education. Basic comes from the term "Base" which means bottom or foundation. So in the literary sense, Basic education (Wardha scheme of Education), is the foundation of education or education at the primary level on which the edifice of the Superstructure of Higher Education can be built. 6.4.3 Philosophy and aims Gandhiji had two major aims of education – Immediate aim of education : • Vocational aim – Learning of a productive craft for self – reliance and earning one's livelihood. • Cultural aim – All types of human activities should bare the imprint of culture and refinement and considered it as the main foundation more important than academic aspect. • Perfect development aim - Education to develop body, mind and soul of a child in perfect harmony. • Moral development – He gave top position to culture of heart and character development. • Liberation – from economic, social, political and mental slavery and from worldly pursuits. • Sociological aim – i.e. citizenship training. Ultimate aim of education – Realize God through self- realization and develop virtues of truth and ahimsa. 6.4.4 Curriculum and Teaching Methodology • The curriculum should be activity – centred. • The medium of teaching should be the mother – tongue. 180 NSOU ? CC-ED-05 • Some craft or vocational training should be there. • He encouraged subjects like Sociology, Medicine, Hindi, General Science, History, Geography, Mathematics, he also promoted physical activities. • The curriculum for student's 1 to 5 for both boys and girls was to be the same and after that, boys were encouraged to take up some craft or vocation and girls were taught home science. • He believed in a pragmatic approach where children should learn by doing and correlation method. • Reading should precede writing, and they should draw before learning alphabets. • Craft learning should be included along with training of senses and parts of body. • Teaching Methods should be activity based. • Value education should be included. 6.4.5 Principles and Structure of Basic Education • Medium of instruction should be mother tongue. • Education of each child from 7 to 14 years should be free, compulsory and universal. • Education should achieve harmonious development of mind, body and soul. • Education should develop human values in the child. • Education of all subjects should be imparted through some local craft or productive work. • Education should create useful, responsible and dynamic citizens. • Structure of Basic Education : Stages of Education Student Age Pre-basic education Less than 7 years Lower basic education Less than 7-10 years Upper basic education Less than 10-14 years 6.4.6 Wardha Scheme The Basic Education Scheme is largely credited to be the brainchild of Gandhi, whose Nai Talim philosophy, emphasized in the newspaper, 'Harijan', developed over experiments at Sevagram and Sabarmati, serves as the basis for the revolutionary NSOU ? CC-ED-05 181 change in Indian Education. Gandhi was inspired by his political mentor, Gokhale, who in a moving resolution on March 18, 1910, in the Imperial Legislative

88%**MATCHING BLOCK 220/233****SA** History of Education In India, Block-1.pdf (D161180427)

Council, recommended that a beginning be made in the direction of making elementary education free and compulsory throughout the country, and that a mixed commission of officials and non-officials be appointed to frame definite proposals.

In October 1937, an all- India National Educational Conference was held at Wardha and the conference resolved to accept the proposal made by Mahatma Gandhi that free and compulsory education be provided for seven years through mother tongue on a nation-wide scale and

89%**MATCHING BLOCK 221/233****SA** History of Education In India, Block-1.pdf (D161180427)

the process of education throughout this period should centre around some form of manual

and productive work. By

71%**MATCHING BLOCK 222/233****SA** Kaneez Aysha MEd .docx (D136863451)

education, he meant all-round development of a person's body, mind, and spirit. He proposed

a system of self-supporting education. 6.4.7 Strategy of Nai Talim 1. Free, compulsory and universal education – Free and compulsory education up to 7 to 14 years has been provided to child on a nation- wide scale. 2. Scheme – Scheme of primary education based on Indian traditional culture must be circulate. 3. Medium – The medium of instruction to be the mother tongue. 4. Productive work – Self-supporting by imparting education through a useful and productive craft. 5. Trained tutor – The tutor should be the best character, well- trained and the knower of the subject. 6. Organisation of schools – The school should be managed properly. The administration and inspection part done periodically. 7. Co- related – Subjects has to be correlated with each other. 8. Industrious – Knowledge and work are not separate. Hard work is mandatory for the success of education. 9. Practical knowledge – Education must be based on real life knowledge where one can get a chance to make new discoveries. 10. Child- centred – Education should develop harmony of the child's personality, body, heart, brain and soul, in short child-oriented education must be given for the betterment of the child. 11. Holistic process – Nai Talim is a holistic process of tutor-tutee-tuition.

182 NSOU ? CC-ED-05 12. Equity- equality – It is based on creating a sense of brother-hood, co-operation and social service among the children. 6.4.8 Important features of Gandhiji's Basic Education According to Gandhiji and his philosophy, the important features of basic education may be listed as below. Aims of Education- If the aims of education as determined by Gandhiji are analysed carefully it would become evident that all these aims are universal and perennial. He considered man as the sum total of body, mind, and spirit and emphasized on the development of all these three aspects of man. Curriculum- If the curriculum as suggested by Gandhiji carefully observed, it makes out two features- first, it is quite broad, and second, special emphasis on handicrafts. The same curriculum was meant for both boys and girls. This curriculum was mainly implemented in Basic education. This curriculum is an activity- centred. The brain must be educated through hand. It appears that he wanted to make India a country of industries. Method of Teaching- Gandhiji did not study psychology, yet his thoughts about teaching are fully psychological. He has laid foremost emphasis on learning by doing, in the place of traditional telling and book method which is indicate the self- learning. He emphasized mother tongue as the method of teaching. Now a days it has become a common feature of the modern education system. Teacher- According to Gandhiji teacher should be an ideal person of the society, he should be a man of ideal conduct and should be a social worker. In his view, no person should take up this job as a profession, rather it should be taken by the spirit of social service. Such people can bring the children on the right path. Similarly, in modern education teacher is not only for give knowledge to the children, he is a friend, philosopher and guide. Students - Gandhiji focuses on child- centred education. He believed that child brings his own experience to the school and they have to be reconstructed. There is a lot of scope for the child to unfold its creative abilities and develop originality. He wanted the children to cultivate purity in thought, word and deed along with pursuit of knowledge. This concept is the central point of modern education system all over world. Discipline- Gandhiji believed that, discipline should not be imposed from outside. There should be self- discipline or an inner urge of the individual to obey the laws and regulations prescribed by the group, community or society. He wanted the children

NSOU ? CC-ED-05 183 to have sufficient freedom so that they may develop and grow. But they accept that the discipline and training will be must if they wanted to develop their powers to the fullest. No school can be run without discipline. He opposed corporal punishment. This concept also relevant to modern education system. Rural University –Rural universities have been established in India based on Gandhiji’s basic education. Free and compulsory education for all- Gandhiji wanted the basic education should be free and compulsory for all boys and girls between the ages of seven to fourteen. According to Gandhiji, “I am a firm believer in the principle of free and compulsory primary education for India. I also hold that we shall realize this only by teaching the children a useful vocation and utilizing it as a means for cultivating their mental, physical and spiritual faculties. Let no one consider these economic calculations in connection with education as sordid or out of place. There is nothing essentially sordid about economic calculations.”

Mother tongue as medium of instruction- Gandhiji, believed that the medium of basic education should be the mother tongue. Strong mother tongue foundation leads to a much better understanding of the curriculum as well as a more positive attitude towards school. Language and mother tongue play an important role in the development of personal, social and cultural identity of a child. Children with a strong foundation in mother tongue can have deeper understanding of the curriculum and develop confidence to tackle any situation. When children develop their mother tongue, they will develop other essential skills, love towards mother tongue and incline towards motherland.

Craft centred education -Gandhiji emphasised on craft-centred education which had great importance in Indian scenario. In Indian scenario, craft would make education self-supportive as it is not possible to educate all citizens and provide them government jobs. So, the craft centred education would help to provide employment opportunity to all citizens and make them self-sufficient. According to Gandhiji, the method of training the mind through village handicraft from the beginning would develop disciplined mind. Such practical productive work in education would to break down the existing barriers of discrimination between manual and intellectual workers. The scheme would increase the productive capacity and utilise their leisure profitably also (Maheswari). According to Gandhiji (Prabhu) “Craft, art, health and education should all be integrated into one scheme. NaiTalim is a beautiful blend of all the four and covers the whole education of the individual from the time of conception to the

184 NSOU ? CC-ED-05 moment of death. Instead of regarding craft and industry as different from education, I will regard the former as the medium for the latter.”

6.4.9 Important values of Gandhiji’s education plans Development of creativity and critical thinking - Gandhiji emphasised on the principle of ‘learning by doing’ which stimulates the individual’s mind to think creatively and critically. His great emphasis on work-culture to the students from initial stage was to enable the students to start producing while learning. So, his primary aim of basic education was to utilise head, heart and hand rather than concentrating on reading or writing only. In July 1937, Ghandiji wrote in the Harijan, “

91%	MATCHING BLOCK 224/233	SA	A186821001_Anjali Chawla_Thesis_Ph.D. History.docx (D154683600)
By education I mean an all-round drawing out of the best in child and man-body, mind and			

spirit. Literacy is not the end of education nor even the beginning. It is only one of the means whereby man and woman can be educated. Literacy in itself is no education. I would therefore begin the child’s education by teaching it a useful handicraft and enabling it to produce from moment it begins its training. Thus, every school can be made self-supporting, the condition being that the State takes over the manufactures of these schools.”

Emphasis on collaborative learning - True education is a lifelong process which helps in cultivating the spirit of co-operation, tolerance, collaboration and a sense of responsibility. All these qualities are required for the development of human personality which can create the pleasant balance between the individuals and social aim of education. Gandhiji always emphasised on collaborative learning. Craft work helps a child to acquire collaborative learning skills and to realize the value of honest labour.

Importance on moral education- Gandhiji thought that the peace is essential for human life which can be attained through education. Peace can be attained only through morality and ethics. According to him, education must be based on ethics and morality. Gandhiji advised to all students to consider morality and honesty as essential parts of their education. He said, “Our system of education leads to the development of the mind, body and soul. The ordinary system cares only for the mind.” “I attach far more importance to the cultural aspect of education than to the literary.”

Emphasis on character building - Education is the most powerful weapon which helps to build genuine characters of a student. The goal of education should consist of character-building. The character-building includes the moral, intellectual and

NSOU ? CC-ED-05 185 social behaviour of a student under all circumstances. A student should develop personality, compassion, kindness, fair-mindedness and the spirit of dedication by virtue of education. Gandhiji said, "When it is remembered that the primary aim of all education is, or should be, the moulding of the character of pupils, a teacher who has a character to keep need not lose heart." Development of self-reliance and patriotism- The main purpose of basic education was to achieve an integral development of children and to create a sense of patriotism through practice of handicraft. Gandhiji desired that the basic education system should be self-supporting for every child by learning a craft or occupational skill for livelihood. He wanted education to ensure employment. He told "My Nai Talim is not dependent on money. The running expenses should come from the educational process itself. Whatever the criticisms may be, I know that the only education is that which is 'self-supporting'." He also said, "The teachers earn what they take. It stands for the art of living. Therefore, both the teacher and the pupil have to produce in the very act of teaching and learning. It enriches life from the commencement. It makes the nation independent of the search for employment". Development of faith on Truth & Non-violence- Gandhiji was always considered that non-violence is an important and essential part of education. Truth & Nonviolence was the fundamental formula of Gandhiji's philosophy. Basic education too was also based upon the principle of truth and Non-violence. As he said "I want to see God face to face. God, I know, is Truth. For me the only certain means of knowing God is non-violence-ahimsa-love. I live for India's freedom and would die for it, because it is part of Truth. Only a free India can worship the true God. But my patriotism is not exclusive; it is calculated not only not to hurt any other nation, but to benefit all in the true sense of the word. India's freedom as conceived by me can never be a menace to the world". Awareness on Social Services- Students should be involved in different community services to develop responsibility and create awareness on social services. Education must be based on social good, welfare for all and must uplift the human aspect. The basic education by Gandhi aimed at encouraging the spirit of service and self-sacrifice. Addressing the college students once he said (Shah) "Your education, if it is a vital thing, must shed its fragrance in your surroundings. You must devote a certain portion of your time daily to serving the people around in a practical manner. You must therefore, be prepared to take the spade, the broomstick and the basket. You must

186 NSOU ? CC-ED-05 become voluntary scavengers of this holy place. That would be the richest part of your education, not learning by heart literary thesis." Mahatma Gandhi was a true social worker fighting against the evils of society. He always said, if we want to do social work, we should start it by ourselves. Sensitise on Cleanliness and Untouchability- Students should be sensitised on merits and demerits of cleanliness and the evils of untouchability. Gandhiji had been opposing untouchability and caste system from very beginning and putting relentless efforts to eradicate. He was arguing that Brahmins and untouchables were equal in his eyes. He was publicly rejecting the notion of high and low caste feeling. At the age of twelve, Gandhiji had disagreed his mother's warnings on not to touch an untouchable who used to clean their latrines in their house. He tried his best to break the centuries old caste system and to remove the mark of untouchability from Hinduism. Gandhiji described (Prabhu) on his conception on Samagra Gramaseva in Harijan that "I will inculcate in them the importance of hygiene and sanitation, and when they come and ask me for a sweeper, I will tell them: 'I will be your sweeper and I will train you all in the job.'" 6.4.10 Criticism of Basic Education Scheme : Gandhiji's scheme of basic education has been criticised on the following grounds: I. School will require so many crafts according to the local needs and specific interests of children. It will require a number of teachers trained in specific crafts to teach in the school. This is actually a real challenge before this scheme because the cost of this type of education will be very high. II. It is very difficult to correlate a craft with other crafts and to give all necessary information to the child through the crafts only. III. This scheme takes eight years to get completed. Skills obtained during this period may be out dated after the completion of education. IV. It is very difficult to prepare study materials of this scheme. Organisation of materials is another difficulty before a teacher. V. It is almost impossible to provide work experiences of so many crafts especially in schools located in big cities. VI. Developing character and personality through crafts alone is only a theoretical proposition. No school in India has got any success in this regard. VII. This Scheme of education may be suitable for the children of poor class

NSOU ? CC-ED-05 187 families but those who are interested in higher studies will not be benefitted after receiving this type of education. VIII. This scheme of education is very costly for a poor country like India 6.5 Tagore's Thoughts on Humanistic Education and Experiments with Santiniketan-Sriniketan 6.5.1 Background of Rabindranath Tagore and Indian education Rabindranath Tagore is the world famous poet- Vishwakavi and is popularly known as "Gurudev", the respected teacher. He was awarded the Nobel prize for his book "Geetanijali". Santiniketan and Visva-Bharti are the renowned contributions of Tagore to the field of education. Tagore was the apostle of Truth, Virtue and Beauty (Satyam, Shivam, Sundaram). He believed in close affinity between man and nature, and pleaded for realizing such a relationship. Emphasizing the relationship between nature and man, he eulogized the ideal of the 'Tapovana' (Hermitage) in which teachers and pupils lived together with nature: He felt that in order to make education meaningful, the child should be in touch with economic, intellectual, social, aesthetic, and spiritual life of people. Rabindranath Tagore was a great philosopher, visionary, social reformer, great preacher of Indian culture and tradition. A multidimensional personality endowed with versatile genius and untiring zeal. The contributions of Tagore on Indian education was immense and his educational thoughts were based upon the following : Harmony with all things- One of the basic principles of the philosophy of Tagore is 'harmony with all things'- harmony with nature, harmony with human surroundings and harmony in international relations. According to him, the highest education is that which makes our life in harmony with all existence. Principles of Freedom- Tagore was the ardent exponent of freedom for children. He believed that children should be brought up and educated in an atmosphere of freedom and liberty. Restrictions should not be imposed on children. Tagore remarked, "Education has its only meaning and object in freedom- freedom from ignorance about the laws of universe and freedom from passion and prejudice in our communication with the human world".

188 NSOU ? CC-ED-05 Principle of creative Self-expression- Tagore held that education should promote creative self-expression. He stated, "Handwork, music and arts are the spontaneous overflows of our deeper nature and spiritual significance". Active communication with Nature and Man- Tagore finds a fundamental unity between man and nature. The child's education must be organized in natural surroundings. He remarked, "We should have the gift to be natural with nature and human society". 6.5.2 Idea of Education according to Tagore • Concept of Education according to Tagore Tagore's theory of education is marked by naturalistic & aesthetic values. He had a belief that "The widest road leading to the solution of all our problems is education." According to him, "Education means enabling the mind to find out that ultimate truth which emancipates us from the bondage of dust and gives us wealth not of things but of inner light, not of power but of love. It is a process of enlightenment. It is divine wealth. It helps in realization of truth". Education can develop a new pattern of life. Culminating in the realization of Universal man. Tagore's system of education emphasizes the intellectual, physical, social, moral economic and spiritual aspects of human life. By which a man can develop an integrated personality. 6.5.2.1 Aims/Objective of Education according to Tagore The aims of education as reflected in educational institution founded by Rabindranath Tagore in Santiniketan are as follows: • Self Realization Spiritualism is the essence of humanism; this concept has been reflected in Tagore's educational philosophy. Self-realization is an important aim of education. Manifestation of personality depends upon the self-realization and spiritual knowledge of individual. • Intellectual Development Tagore also greatly emphasized the intellectual development of the child. By intellectual development he means development of imagination, creative free thinking, constant curiosity and alertness of the mind. Child should be free to adopt his own way learning which will lead to all round development.

NSOU ? CC-ED-05 189 • Physical Development Tagore's educational philosophy also aims at the physical development of the child. He gave much importance to sound and healthy physique. There were different kinds of exercises. Yoga, games & sports prescribed in Santiniketan as an integral part of the education system. • Love for humanity Tagore held that the entire universe is one family. Education can teach people to realize oneness of the globe. Education for international understanding and universal brotherhood is another important aim of his educational philosophy. • Establishment of relationship between man & God Man bears the diverse qualities and potentialities offered by God. These qualities are inborn and innate. The relationship between man and God is strong and permanent. • Freedom Freedom is considered as an integral aspect of human development. Education is a man- making process, it explores the innate power exists within the man. It is not an imposition rather a liberal process that provides utmost freedom to the individual for his all-round development. • Co-relation of Objects Co-relation exists with God, man and nature. A peaceful world is only possible when correlation between man and nature will be established. Moral and Spiritual Development Tagore emphasized moral and spiritual training in his educational thought. Moral and spiritual education is more important than bookish knowledge for an integral development of human personality. Social Development According to Tagore, "Brahma" the supreme soul manifests himself through men and other creatures. Since He is the source of all human-beings and creatures, so all are equal. Rabindranath Tagore therefore said, "service to man is service to god". 6.5.2.2 Curriculum according to Tagore Tagore advocated broad-based curriculum catering the needs of individual and the society that means he argued for wholesome development of the curriculum. He stressed upon following subjects:

190 NSOU ? CC-ED-05 Language, literature, Maths, Natural Sc. Include Biology, Physics, Chemistry, Social Sc. Include History, Civics, Economics, Agriculture, art, music etc, Apart from this, he stressed on dancing, music, games, dramatics, agriculture, gardening, excursion, regional study etc. 6.5.2.3 Method of Teaching Tagore emphasized the following methods of teaching: Teaching through Tours and Trips Tagore believed that the subjects like history, geography, economics and other social sciences can be effectively taught through excursions and tours to important spots. By this students will get an opportunity to observe numerous facts and gain first-hand knowledge through direct experience. • Learning by activities Rabindranath Tagore said that for the development of child's body and mind, learning through activity is essential. Therefore he included activities like climbing tree, drama, jumping, plucking fruits, dancing etc. in his educational programmes. • Narration-cum-discussion and debate method : Narration-cum-discussion and debating activities were organized Tagore's education centre to develop oratory abilities of the students. Students were encouraged to solve problems of various areas through rational debate and thorough discussion. • Heuristic Method Rabindranath Tagore introduced heuristic method as an important method of teaching in his educational institution. In this method first, the students, are asked questions to clarify their doubts on topics and teachers try to satisfy them by their correct answers. • Mother tongue as the medium of Instruction Language is the true vehicle of self-expression. Man can freely express his thought in his mother-tongue. Tagore has emphasized mother tongue as the medium of instruction for the child's education. 6.5.3 Experiments at Santiniketan It was built by Maharshi Devendranath Tagore, and later expanded by his son Rabindranath Tagore whose vision became what is now a university town with the creation of Visva- Bharati. Santiniketan, popularly known today as a university town, a hundred miles to the north of Kolkata, was originally an ashram built by Debendranath Tagore, where anyone, irrespective of caste and creed, could come and spend time

NSOU ? CC-ED-05 191 meditating on the one Supreme God. The area is flanked on two sides by the rivers, the Ajay and the Kopai. Rabindranath Tagore first visited Shantiniketan in 1873 when he was 12 years old. In 1888, Debendranath dedicated the entire property for the establishment of a Brahmavidyalaya through a trust deed. In 1901, Rabindranath started a Brahmacharyaashrama and it came to be known as PathaBhavana from 1925 Rathindranath Tagore was one of the first five students at the Brahmacharyaashrama at Santiniketan Santiniketan embodies Rabindranath Tagore's vision of a place of learning that is unfettered by religious and regional barriers. Rabindranath founded a school for children at Santiniketan and it was around this nucleus that the structure of an unconventional university developed Tagore was one of the first to support and bring together different forms of arts at Santiniketan. Tagore encouraged artists such as Nandalal Bose to take up residence at Santiniketan and devote themselves full-time to promoting a national form of art Shantiniketan was established with the aim of helping education go beyond the confines of the classroom, Santiniketan grew into the Visva Bharati University in 1921. 6.5.4 Experiments at Sriniketan The Institute of Rural Reconstruction was founded in 1922 at Surul at a distance of about three kilometres from Santiniketan. It was formally inaugurated on February 6, 1922 with Leonard Elmhirst as its first Director. Thus the second but contiguous campus of Visva- Bharati came to be located in 1923 at a site which assumed the name of Sriniketan. The chief object was to help villagers and people to solve their own problems instead of a solution being imposed on them from outside. In consonance with the ideas about reconstruction of village life, a new type of school meant mainly for the children of neighbouring villages who would eventually bring the offering of their acquired knowledge for the welfare of the village community was also conceived. This school, Siksha-Satra, was started in Santiniketan in 1924 but was shifted to Sriniketan in 1927. The Lok-Siksha Samsad, an organization for the propagation of non-formal education amongst those who had no access to usual educational opportunities, was started in 1936. Siksha-Charcha for training village school teachers followed next year.

SA 12.aswathy-sa.pdf (D148066380)

Raja Ram Mohan Roy is hailed as "the Father of Modern India". He

attempted to combine the western and eastern philosophy. His writings and ideas are an example of a synthesis of ancient Indian ideas with modern Western Political Principles.

192 NSOU ? CC-ED-05 • A review and revaluation of religion was Roy's primary concern for which he established the Brahmo Samaj in 1828. The Samaj provided a forum for religious and philosophical contemplation and discussion. • Roy was familiar with diverse languages, cultures and philosophies and all these influences shaped his writing and ideas. He conducted a deep study and analysis. Hinduism in order to re-interpret the basic tenets of religion. In doing this, Roy wanted to prove that blind faith and superstitious beliefs and practices had no basis in the original Hindu religion. • According to Roy, another factor responsible for the deteriorating political and social milieu was the social decadence of the Indian society. He wanted to build a new Indian society where principles of tolerance, sympathy, reason, liberty, equality and fraternity would be honoured. In all this, he believed that the support of the British government was essential. • Roy opposed the caste system and the practice of Sati. He was one of the greatest champions of women's rights. He believed in the efficiency of a clearly limited constitution that could control the state and safeguard the rights and liberties of the individuals. • He was one of the first Indians to accept and popularize the idea of internationalism. A multi-faceted personality. Roy carried on a relentless crusade against all kinds of injustices, exploitative practices and superstitions. •

Vidyasagar may be regarded as the first architect of national education. He strongly advocated education through mother tongue, which leads to mass education. • He contributed in fields like Sanskrit studies, women education and education through the medium of mother tongue. Being a man of action Vidyasagar took all necessary measures to concretize his plans of educational reform. •

This Unit also focused upon the life and works of Henry Derozio, undoubtedly the most renowned among the early Indian English authors after Raja Rammohun Roy. Henry Louis Vivian Derozio may be considered one of the first Indian English poets. • His father was of mixed Portuguese and Indian descent, and his mother was English. • Born and educated in Calcutta and belonging to such an ancestry, he was

NSOU ? CC-ED-05 193 compelled to choose a community to which he could be associated with, to which he could closely relate. • His was an unusual dilemma. He was neither full Portuguese, nor English, nor Anglo or even Indian for that matters. At one level, identity mattered a great deal to him. The institution expected him to adhere to a specific point of view, call it 'Indian' if you like. Being of Eurasian stock he was obviously critical of various Hindu customs and mores but at the same time he was also a Lecturer at the Calcutta Hindu College. • He was however, dismissed on the grounds of having corrupted and negatively influenced Hindu youth. As mentioned earlier he was a teacher not because of any ulterior motive but because he was genuinely interested in the intellectual wellbeing of his students and he also wanted to be able to identify with them as an Indian. • Derozio was a radical thinker and launched the Young Bengal movement who disseminated western learning and science among his students who were called Derozians. He arranged debates and discussions on literature, history, philosophy, and science which unfolded a intellectual revolution among young students • They cherished the ideals of French Revolution and the liberal thinking of England. The very strong radical views of this group and their unconventional practices like not showing respect to religious idols alarmed the orthodox Hindus of Calcutta. • The Young Bengal Movement continued even after Derozio's dismissal and his sudden death in 1831. • At the second round table conference in London in 1931, Mahatma Gandhi pointed out the ineffectiveness of primary education under the British rule. • He held the British policy responsible for the painful situation of mass education in India. He criticized English education as it had created a permanent bar

in his weekly Harijan. • By education, he meant all-round development of a person's body, mind, and spirit. He proposed

a system of self-supporting education.

194 NSOU ? CC-ED-05 • On July 31, 1937, Gandhi had published an article in the Harijan. Based upon this article, an all India National Education Conference was held on October 22 and 23, 1937. • The conference is called Wardha Educational Conference and the president of this conference was Gandhi himself. The resolutions passed were as follows: • Free and compulsory education to be provided for 7 years at a nationwide scale. • The mother tongue should be the medium of instruction. • Throughout this period of 7 years, education should be around some forms of manual and productive work and for this purpose, a handicraft must be chosen, based upon the environment of the child. • This would generate the remuneration of teachers ? A committee was appointed under the chairmanship of Dr. Zakir Hussain to formulate the scheme of basic education in India. • The report submitted by the committee and

Adam wanted that his plan may be first tried in some selected areas before final adoption. But Macaulay had pronounced his verdict already that education was to be given through English medium to the upper classes only and hence Adam's scheme for mass education fell on deaf ears. • The plan was considered as impracticable and Adam was forced to resign. Such was the fate of one of the ablest reports ever written on Indian education. A golden opportunity for building up a national system of education was lost. 2.7

<p>in the beginning of the twentieth century Indian people started realising that the country needs a nationalistic system 112 NSOU ? CC-ED-05 of education based on the cultural heritage and tradition of the nation. At the Calcutta conference of the Congress in 1906, Annie Besant declared that throughout the country a national education should be organised. Gopal Krishna Gokhale was a nationalist leader and the active member of the Indian National Congress. He was also elected as the President of the Indian National Congress in 1905. Gokhale became a non-official member of the British Imperial Legislative Council in 1902. Till that time, he was a professor and Principal of Ferguson College, Poona. As a nationalist leader Gokhale visualised the importance of primary education for the socio-political awakening of India. He made heroic efforts to make the Government accept the principle of compulsory primary education. The demand for compulsory primary education was strengthened by the fact that the Maharaja Sayaji Rao Gaikwad of Baroda had made primary education free and compulsory within the territories of his state. This attempt inspired Gokhale. This unit deals with Gokhale's attempt to introduce compulsory primary education in India, its impact and the Government of India Resolution of 1913.</p>

<p>Gopal Krishna Gokhale (1866-1915) best known as "the Political Guru of Gandhi", was born in May 9, 1866 in a middle class Chitpavan Brahmin family at Kolhapur in Maharashtra. He graduated from Elphinstone College, Mumbai in 1884. At the young age of 20, he became Professor of History and Economics at the Fergusson College, Poona. For four years he edited the 'Sudharak', a quarterly journal of the Poona Sarvajanik Sabha. In 1904 he was awarded the title of CIE (Companion of the Indian Empire). During his visit to England in 1905, he tried to persuade the British statesmen not to give effect to the Partition of Bengal. He, however, failed in his efforts. 4.4.2</p>

Already you are familiar with the resolution of 1910 put forward by Gokhale for making primary education compulsory in our country and also with the reaction of the Government shown towards these resolutions. Now we will discuss the major clauses of Gokhale's Bill of 1911. Gokhale was aware of the intention of the Government. He made further attempt to draw the attention of the people of India as well as in England towards the condition of education. On 16th March of 1911, Gokhale presented a Bill in the Legislative Council to make a stronger fight against the Government. The Bill, however, was more liberal and humble than the resolutions placed before and the main objective of the bill was to make primary education free and compulsory in a phased manner. The Bill was basically based on the compulsory Education Acts of England of 1870 and 1876. Important clauses of the Bill may be placed below—

- Compulsory primary education should be introduced in those areas where a certain percentage of boys and girls of school-age (6-10) was already receiving instructions.
- The percentage of attendance should be fixed by the Governor General in Council.
- It should be left to the discretion of local bodies whether to apply the Act to certain areas under their jurisdiction or not.

114 NSOU ? CC-ED-05

- Local bodies should be given the right to levy educational cess to meet the cost of compulsory primary education.
- Expenditure on education was to be shared by the local bodies and Provincial Government in the ratio of 1:2.
- For the introduction of compulsion, the previous sanction of the Viceroy and the Governor respectively were necessary.
- Compulsory primary education is intended to apply in the first instance only to boys, though later on a local body may extend it to girls also.
- Guardians whose income is less than Rs. 10/- per month should not be asked to pay any fee for their wards.

4.4.2.3

W <https://neeraj2468.files.wordpress.com/2017/10/gopal-krishan-gokhale.pdf>

- Compulsory primary education is intended to apply in the first instance only to boys, though later on a local body may extend it to girls also.
- Guardians whose income is less than Rs. 10/- per month should not be asked to pay any fee for their wards.

Reasons for Rejection of the Bill Now we know the main clauses of the Bill and how the first move for introducing compulsory primary education in our country was defeated. But we have observed that the defeat was a heroic defeat and with this we must also understand the reasons put forward by the Government for the rejection of the Bill. The Government put forth several arguments and they are the following—

- There was no popular demand for introducing compulsory primary education in the country.
- As such, the people of the country were not prepared to accept compulsion.
- The local Governments were not in favour of it.
- The local bodies were not willing to levy educational cess.
- A section of the educated Indians were not supporting the Bill.

There was still scope for extension of primary education on voluntary lines based on the system of grants-in-aid. 4.4.3 Impact of Gokhale's Bill 4.4.3.1

Primary Education It was during the days of Swadeshi movement that an intensive agitation was launched for spreading education among masses. The new political consciousness strongly attracted the attention of people for education. The shocking fact was even after 150 years of British rule, only 6% of Indian people became literate. This created a ground of criticism against the existing system of education which found expression in a constructive manner with the attempts of Gopal Krishna Gokhale to force government to implement the concept of free and compulsory primary education.

In this section of the unit, we will discuss the impact of Gokhale's Bill on the development of primary education of India. Gokhale's Bill, the first ever attempt to introduce free and compulsory primary education in our country, is a landmark in the history of education in India. Although the Bill was rejected, it focused the attention of the entire country on education. The Government could not entirely ignore the growing popular demand for the spread of mass education. Fortunately, King George V came to India in 1912 and declared a donation of 50 lakh rupees for the development of education in India. When he came to know about Gokhale's Bill, he expressed his dissatisfaction for rejecting the Bill. As a result the Government had to modify the previous policy and declared a new policy with several reforms. Gokhale's Bill created a flutter in the British Parliament also. In the course of the discussion on the Indian budget, the Under Secretary of State for India admitted the need for paying more attention to Indian education. The Government of India passed the resolution on educational policy on February 21, 1913. Between 1910 and 1917 there was an unprecedented expansion of primary education on a voluntary basis (Mukerji, S.N., 1976). The outbreak of the First World War, however, delayed the development planned in the resolution. It brought in its train many disasters, but also a promise of political reform culminating in the Government of India Act of 1919 which incidentally stimulated interest in education. Before that some administrative changes in the policy of the Government had been accepted. In 1917 the policy of autonomous administration was declared by the secretary of states for India, Edwin Montague. The Provincial Government formed in different states had felt the necessity of primary education. In 1918 Bethal Bhai Patel had for the first time raised a Bill for making primary education compulsory in the province of Bombay and the bill passed to an Act. Similar Acts were passed in Bengal, Punjab, Uttar Pradesh, Bihar and Orissa. Madras and Central Province passed their Acts in 1920. In Assam compulsory Primary Education Act was passed in 1926. Thus, all these were the outcome of Gokhale's attempt to make primary education compulsory in India. His struggle for compulsion formed an important part of the country's struggle of independence during the British Rule. 4.4.3.2 Government of India Resolution of 1913 on Education Now we shall discuss the Government of India Resolution of 1913, which was an attempt of the British Government to compensate the demand raised for compulsory primary education by Gokhale. While rejecting Gokhale's bill of 1911, the Government promised to extend recurring and non-recurring grants to primary education as it could not ignore the growing popular demand for the spread of primary education.

116

In this section of the unit, we will discuss the impact of Gokhale's Bill on the development of primary education of India. Gokhale's Bill, the first ever attempt to introduce free and compulsory primary education in our country, is a landmark in the history of education in India. Although the Bill was rejected, it focused the attention of the entire country on education. The Government could not entirely ignore the growing popular demand for the spread of mass education. Fortunately, king George V came to India in 1912 and declared a donation of 50 lakh rupees for the development of education in India. When he came to know about Gokhale's Bill, he expressed his dissatisfaction for rejecting the Bill. As a result the Government had to modify the previous policy and declared a new policy with several reforms. Gokhale's Bill created a flutter in the British Parliament also. In the course of the discussion on the Indian budget, the Under Secretary of State for India admitted the need for paying more attention to Indian education. The Government of India passed the resolution on educational policy on February 21, 1913. Between 1910 and 1917 there was an unprecedented expansion of primary education on a voluntary basis (Mukerji, S.N., 1976) The outbreak of the First World War, however, delayed the development planned in the resolution. It brought in its train many disasters, but also a promise of political reform culminating in the Government of India Act of 1919 which incidentally stimulated interest in education. Before that some administrative changes in the policy of the Government had been accepted. In 1917 the policy of autonomous administration was declared by the secretary of states for India, Edwin Montague. The Provincial Government formed in different states had felt the necessity of primary education. In 1918 Bethal Bhai Patel had for the first time raised a Bill for making primary education compulsory in the province of Bombay and the bill passed to an Act. Similar Acts were passed in Bengal, Punjab, Uttar Pradesh, Bihar and Orissa. Madras and Central Province passed their Acts in 1920. In Assam compulsory Primary Education Act was passed in 1926. Thus, all these were the outcome of Gokhale's attempt to make primary education compulsory in India. His struggle for compulsion formed an important part of the country's struggle of independence during the British Rule. GOVERNMENT OF INDIA RESOLUTION OF 1913 ON EDUCATION Now we shall discuss the Government of India Resolution of 1913, which was an attempt of the British Government to compensate the demand raised for compulsory primary education by Gokhale. While rejecting Gokhale's bill of 1911, the Government promised to extend recurring and non-recurring grants to primary education as it could not ignore the growing popular demand for the spread of primary education.

The education department had declared the new policy in the form of Government of India Resolution on February 21, 1913 covering primary, secondary, higher and women education. The major provisions of the Resolution may be summarised below—

- Primary Education : • There should be sufficient expansion of lower primary schools, where along with instruction in the three R's children should be taught drawing, knowledge of the village map, nature study and physical exercises. • Simultaneously, upper primary schools should be opened at the proper places and if necessary, lower primary schools should be raised to the status of upper primary schools. • Local Boards schools should be established in place of private aided schools. • Moktabs and Pathshalas should be adequately subsidised. • The inspection and management of private schools should be made more efficient.
- In most parts of India, it may not be practicable to prescribe a separate curricula for rural and urban, but in the urban schools there is sufficient scope

The education department had declared the new policy in the form of Government of India Resolution on February 21, 1913 covering primary, secondary, higher and women education. The major provisions of the Resolution may be summarised below—

Primary Education: • There should be sufficient expansion of lower primary schools, where along with instruction in the three R's children should be taught drawing, knowledge of the village map, nature study and physical exercises. • Simultaneously, upper primary schools should be opened at the proper places and if necessary, lower primary schools should be raised to the status of upper primary schools. • Local Boards schools should be established in place of private aided schools. • Moktabs and Pathshalas should be adequately subsidised. • The inspection and management of private schools should be made more efficient.

- In most parts of India, it may not be practicable to prescribe a separate curricula for rural and urban, but in the urban schools there is sufficient scope

geography and organising school excursions etc. • The teacher should have passed vernacular middle examination and received one years' training. • Provision be made for refresher courses for the teachers of primary education during vacations. • A trained teacher should get a salary not less than Rs. 12 per month. • The number of students under one teacher should generally range between 30 and 40. • Improvement should be made in the condition of middle and secondary vernacular schools and their number should be increased. • Schools should be housed in sanitary, spacious but in inexpensive buildings. • Secondary Education • The state should not completely withdraw from the sphere of secondary education. • Further establishment of state institutions was proposed to be stopped. • Existing institutions should continue to serve as models and proper grants-in-aid should be sanctioned to private institutions. • Improvement in the mode of examination and curriculum was also recommended. NSOU ? CC-ED-05 117 • University Education: • The Resolution provided for the expansion of university education. The existence of 5 universities and 185 Colleges was considered to be insufficient in view of the vast needs and demands of the country. • The Resolution suggested that universities and high schools should be assigned distinct spheres of activities. • The universities should be relieved of the responsibility of granting recognition to high schools and they should be kept under provincial Governments. • The establishment of teaching universities was suggested by emphasizing the separation of the two functions of the universities— teaching and examining. • Recommendations were made concerning the inclusion of subjects of industrial importance in the curriculum and provision of facilities to the students desirous of prosecuting research work. • The Resolution put forth certain valuable suggestions pertaining to the character formation of students and hostel life. • Women Education • Emphasis was laid on the education of woman too. Suggestion were put forth concerning special curriculum of practical utility for girls and it was also suggested that too much importance should not be attached to examination in the examination of girls. • Number of women teachers and inspectors also should be increased. Thus, through the resolution, the Government of India desired the widest possible extension of primary education on a voluntary basis. The resolution also took a liberal attitude towards secondary and university education. But the outbreak of the First World War in 1914 delayed the implementation of the resolution of 1913.

	<p>one of the great nationalist leaders of our country, who first attempted to introduce free and compulsory primary education. Gokhale raised a Resolution in 1910 as a member in the Imperial Legislative Council. Important provision of this Resolution were- (i) primary education should be made compulsory in those areas where at least 35% of the boys, 6 to 10 years were receiving instruction, (ii) cost of education should become by state Governments and the local authorities together, (iii) a separate department of education should be established under central Government for taking necessary steps to introduce compulsory education and a secretary be appointed for education to monitor the progress and prepare budget report. • Gokhale withdrew it when the Government assured that the subject would receive careful consideration. • The Government had established the education department under the central Government and the secretary was also appointed but the main demand for free and compulsory primary education remained unattended. • As such Gokhale raised the issue again in the form of a Bill in 17 March, 1911, to make primary education free and compulsory in phased manner. The Bill was referred to a select committee for discussion in 1912 and it was put into vote and rejected by 38 to 13 votes. • The arguments put forward by the Government said that as the people of India 128 NSOU ? CC-ED-05 were not prepared to accept compulsion, that there was no popular demand to make primary education compulsory and the state Government and the educated class of the Indian people were not supporting the bill. • We have also discussed the impact of Gokhale's Bill on the development of primary education in India and observed that the bill focused the attention of the entire country on education. The Government was bound to modify the previous policy and declare a new policy with several reforms. This policy is known as the Government of India Resolution of 1913 on Education. It covers primary, secondary, higher and women education. •</p> <p>one of the great nationalist leaders of our country, who first attempted to introduce free and compulsory primary education. <p>Ram Mohan's contributions to other aspects of social and literary life were highly valuable. True it is that, Mrityunjay Vidyalankar, Ram Mohan Bose, Rajiblochan, Carey etc. had preceded him in the field of Bengali prose literature, yet it must be admitted that Ram Mohan contributed a style and standard which facilitated the development of Bengali prose as a vehicle of stories, novels as well as polemical literature (Banerjee, J. P., 2004). The great contribution of Ram Mohan Roy to the system of modern education was his emphasis on the study of modern Indian languages. He himself gave a great lead in the matter by writing books in Bengali on Grammar, Geography, Astronomy and Geometry and he is considered as the father of modern literary Bengali prose. His advocacy of the study and development of modern Indian languages. ●</p> <p>SA 12.aswathy-sa.pdf (D148066380)</p>

Ishwar Chandra Bandhopadhyay, popularly known as Ishwar Chandra Vidyasagar, is considered as one of Bengal renaissance. He continued the reforms movement that was started by Raja Ram Mohan Roy. Vidyasagar was well known writer, intellectual and above all a staunch follower of humanity. He brought a revolution in the education system of Bengal. Born on 26th September 1820 in a village called Veerasingha of 172 NSOU ? CC-ED-05 the then Hooghly (now part of Midnapore) district of West Bengal. Vidyasagar spent his childhood in extreme poverty. He commenced primary education at the village pathsahaala – an indigenous Indian school where language, grammar, arithmetic and other shastras were taught to youngsters. Later he accompanied his father to Calcutta. Within a short while, Ishwar was admitted to the Sanskrit College. As a student of the Sanskrit College, he witnessed the religious controversy between the reformists like Ram Mohan; radicals like Derozio (who denounced Hinduism as obsolete) and the conservatives who wanted to preserve and protect the basic character of Hinduism. Vidyasagar maintained religious neutrality. To him there was one religion that was welfare to humanity. Young Ishwar applied himself to learning with full discipline, diligence and perseverance and passed successive annual examinations with exemplary brilliance. It is here he came in close contact with half a dozen Sanskrit scholars, who would have left an indelible mark on his young impressionable mind. In 1839 he graduated in law examination conducted by the Hindu Law Committee. His well-rounded education at Sanskrit College saw him amassing considerable knowledge and mastery in a number of shastras, and in 1839 at a tender age the title Vidyasagar was endowed to him. On 29th December Vidyasagar joined Fort William College (FWC) as a Principal Lecturer (or Pundit). G.T. Marshall who was the Secretary of the College at the time acted as the catalyst for gaining this prestigious position for him at the age of 21. Vidyasagar started learning English and Hindi here. Marshall had been thoroughly impressed by Ishwar's scholastic achievements. • Saviour of Sanskrit College After a five year stint with the FWC Vidyasagar joined the Sanskrit College as Assistant Secretary in 1846. He wanted to improve the teaching system in the college. In the first year of service with Sanskrit College, he brought out a report to the authorities outlining and recommending a number of changes to the curricula and the education system. This report attracted criticisms from the College Secretary Rashamoy Dutta but it generated keen interest of authorities and a tremendous amount of favourable comments and praises from the Education department, particularly from G.T. Marshall. Because of irreconcilable differences with Dutta on this subject Vidyasagar resigned. Ishwar Chandra's principles, determination and courage were unparalleled in every detail. He never deviated from his goals in the face of all adversities. He knew not how to compromise on any matter of substance neither in fear nor for favour. He

was fixed by the Governor General in council.

W <https://bnsatnalikafoundation.wordpress.com/2014/04/09/educational-contributions->

resigned from the college, after the skirmish with Dutta. In 1850 Vidyasagar came back to Sanskrit College as a Professor at Sanskrit College with one condition that he should be allowed to do the redesign of the education system. In 1851 he became the Principal of this college. His well-documented protestations against Education department officials of the day testify to the degree of intensity with which he pursued the course of education reform. He favoured English and Bengali as a medium of learning alongside Sanskrit and wanted to offer to students a wider range of subjects and thus broaden their horizons in examining European and Indian concepts and practices side by side so they could apply their own judgement in discovering the truth for themselves. He was not afraid of discarding erroneous beliefs of Indian shastras and in preferring European science in its place where appropriate. Similarly he did not accept everything that Europe had to offer. His mind was open only to discovering the truth and reality. In these matters his determination was unmistakable and his resolve unshakable. In his famous "Notes on the Sanskrit College". Vidyasagar put forward a comprehensive scheme through which he aimed at creating an elegant Bengali style based on a combination of sound knowledge of both Sanskrit and English languages. He wrote books on Sanskrit grammar in Bengali in simple ways- Upakramonika and ByakaranKoumudi. He laid equal stress on learning the three branches in English- History, Mathematics and Natural Philosophy. Vidyasagar also achieved another success when the gates of the Sanskrit College were made open to castes other than the Brahmins. He also introduced admission fee and tuition fee. He prevailed upon the government to select as deputy magistrates some of the graduates of this college and established the Normal School for training Bengali teachers at the College thereby broadening the prospect of career opportunities as well as the range of academic interests that could be pursued on its campus. Vidyasagar took several such measures to expand enrolment and strengthen student commitment in Sanskrit College. In this way, he rescued classical education from medieval scholasticism. • Collegiate Education In 1853, Vidyasagar established an Anglo Sanskrit free school in Varsingha village. Vidyasagar was an ardent advocate of non-official secular and popular institutions for higher education with a purely Indian teaching staff. This is evident from his zeal to establish the Metropolitan Institution (which was originally founded in 1859 under the name of the Calcutta Training School under the management of the natives). In 1864 the management devolved entirely on Vidyasagar and he maintained this college out of its own resources. Its object was to find means of higher collegiate education for 174 NSOU ? CC-ED-05 the youths of Bengal. This college was administered by the Indians with no financial aid from the government. The teaching staff too consisted of Indians. It became a first grade college in 1879. From 1884 it introduced courses in Law,

course. He was appointed to the board of Examination for the selection of ICS candidates in 1854 and in 1855 he was made a member of the University Committee. In 1857 he became a fellow of the Calcutta University. • Women's Education Education of girls was one of the prime objectives of Vidyasagar's plans. He realized that unless women of the land could be educated it was impossible to emancipate and liberate them from the terrible burden of inequalities and injustice imposed on them by the cruel society of the day. However, the conservatives in the society were against education of the girls. Vidyasagar had to fight these conservatives with quotations from the Sanskrit scriptures that clearly prescribed care and education of the daughters. The credit for explaining the true meaning of the Hindu shastras upholding the women's right to education and the propagation of this truth among his countrymen entirely goes to Vidyasagar who utilized his literary talent for writing books, pamphlets and articles in support of female education. From submitting reports about the curriculum taught to girls in schools which included reading, writing, arithmetic, biography, history of Bengal, reading of passages on different subjects, needlework and sewing, to opening of 35 schools for girls in Bengal with an enrolment of 1300 girls; making door-to-door calls, requesting parents to send their daughters to school; giving financial support to some schools; appealing the government to extend grant-in-aid benefits towards the maintenance of girls' schools; initiating a fund "NARI SHIKSHA BHANDAR" for rendering financial help to the girls' education, Vidyasagar did it all. • Mass Education Another significant contribution of Vidyasagar was the spread of mass education. On witnessing the pervading darkness and superstitions in which people of Bengal lived in the absence of education, Vidyasagar explored local popular support and participation in the spread of mass education. He appealed to the people who responded positively and it was decided that schools would be set up at chosen localities where the financial burden of erecting school buildings were to come from the locality. Vidyasagar got quite a number of schools constructed in this way in areas under his official jurisdiction. NSOU ? CC-ED-05 175 • Journalism Vidyasagar had his contribution in journalism as well. He published his article on widow marriage in the Sarbashubhankari Patrika. Akshay Kumar Dutta often got his articles examined by Vidyasagar, who was on the Paper Committee of the Tattwabodhini Patrika. He was directly associated with the Somprakash, a distinguished journal of the time (1855). The responsibility of properly learning the Hindu Patriot also fell on him when it fell on difficult ways days after the death of Haris Chandra Mukherjee. 6.3.3

PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, generic elective, discipline Specific, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the university has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English/Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor

After familiarizing you with basic concepts we lead to the art of science of teaching with exemplifications. Pedagogy of teaching learning is further discussed as a scientific procedure. After the end of this unit, you should be able to ● Explain Pedagogical studies as academic discipline ● Comprehend concept and nature of Pedagogy ● Explain scope of application of Pedagogy in authentic context ● Explain the philosophical bases of Pedagogy ● Justify why sociological foundation is necessary for designing Pedagogy ● Explain psychology is always create the basic framework of Pedagogy ● Differentiate Pedagogy Vs Andragogy MODULE – 1

8 NSOU ? CC-ED-06 1.2 Introduction The term course includes more than a subject matter and content for appropriate level of the conventional mode. It is used to describe the teaching materials and other components of study. A course outline shows how these components of course are used with allotment of specific time. It also indicates how the sequence of teaching is maintained from a numbered unit of course titles. In distance education we have to consider methods to be used alongside the subject to be taught. We present you here with a number of ideas to understand the concept & issues of pedagogy and how it is different from andragogy.

1.3 Pedagogy : Concept Nature and Scope

1.3.1. Concept of Pedagogy

'The most important school-related factor in student learning is teaching' (Schwartz, 2009). There is a viable consensus among academicians at global scale that the performance of any education system is exclusively dependent on the quality of teaching. 'The quality of an education system cannot exceed the quality of its teachers' (Barber & Mourshed, 2007). Any institution that has the best teachers is always best in ranking. Recent UK research concluded that 'having a very effective, rather than an average teacher raises each pupil's attainment by a third of grade' (Machin & Murphy, 2011). It is time to focus on what constitutes effective teaching, or, put differently, on the behaviours and actions of good teachers: what it is that good teachers do to promote good learning. In this context the term Pedagogy is relevant and it is needed to understand pedagogy in the light of students' learning. But single out any pedagogical approach in the 21st century is not logical in any way. Therefore, we need to focus on pedagogies instead of pedagogy. Let's discuss the concept of pedagogy. Pedagogy is dealing with ideation and techniques of teaching. The main concern of pedagogy lies in setting up an environment where the needs and dreams of a student are being understood by the teacher. And the teacher is also trained in such a manner that he/she delivers the best attitude towards students. The broader sense is the transfer of knowledge on a global rate and the micro details cover the basic etiquette development. Johann Herbert was the first one to establish the relationship between pedagogy and its effect on society. Education was the basic step for transformations and pedagogy was learning the techniques to imply it. He emphasized how five key factors of this concept viz. preparation, presentation, association, generalization, and application can

9 NSOU ? CC-ED-06 turn a normal citizen into the most productive asset for the economy and society. The main focus was to keep a goal and by practicing it in society one can achieve it too. Pedagogy is the way the curriculum is transacted. Therefore, pedagogy encompasses how teachers think and how teachers act, that is teacher thinking and teacher doing, the one impacting on the other, and with the third dimension of the visible, observable and measurable impact of the teachers' pedagogy on the learners. Therefore, these three aspects of teacher thinking, doing and their impact on student learning outcomes make up 'effective pedagogy', as illustrated in the following conceptual framework model which reflects the relationship of curriculum and its assessment modes and teacher education to teachers' thinking and doing within a specific context are part of this conceptual framework, and can be conceptualized as enabling or disabling teachers' thinking and doing (Westbrook J et. al., 2013.). In other words, pedagogy refers to that set of instructional techniques and strategies which enable learning to take place and provide opportunities for the acquisition of knowledge, skills, attitudes and dispositions within a particular social and material context'. More clearly speaking, Pedagogy (or teaching) is the interactive process that takes place between the educator and the child to enable learning to take place. Pedagogy is distinct from and complementary to the curriculum. In alternative words, we can say that curriculum describes the 'what', that is, the learning opportunities on offer while pedagogy describes the 'how', that is, how the educator can assist the child to learn. The pedagogical interactions between the educator and the child will be greatly influenced by the early childhood curriculum model in place within the early childhood service. Let's have a discussion to further illustrate the concept of pedagogy for a comprehensive idea about pedagogy. Pedagogical practice, may be interpreted through three main approaches: Structured Approach : This approach describes a highly adult directed curriculum and largely didactic pedagogical techniques, providing for little initiative on behalf of the child. The rationale for this method is based on development theory where children are expected to learn skills and concepts in sequence. This approach sees curriculum objectives very clearly defined and the educator in control of the child's learning. Open Framework Approach : This approach provides the educator with a broad framework for learning, the ability to use endless pedagogical techniques and strategies. As curriculum classification within this approach is less structured, the child has the freedom and flexibility to make choices between the various learning opportunities on offer. As learning opportunities provided span across all areas of learning and development, a balanced range of experiences is encouraged over a period of time.

10 NSOU ? CC-ED-06 This enables a process of 'active learning' where the child constructs his own understandings within a social and physical environment. Child-led Approach : A Child-led Approach is where the educator responds entirely to the child's interests and activities. Topic or project themes are adopted based on the child's interests. The main curriculum emphasis is based on developing the child's independence, social and emotional growth, creativity and self-expression. The learning environment is designed to open-ended exploration and discovery. At this juncture of understanding, it can be useful to explore the following few issues relating to our current understandings of pedagogy. From the outset it is important not to confuse pedagogy with either curriculum or simply 'teaching'; pedagogy informs both. In the context of early year's education where learning through exploration, creativity and play is key, any construct of pedagogy must be broadly based and seen as an evolving process. We need an understanding that fits with the new vision for the contemporary world, which sees children as central to everything that affects them as citizens and as people with rights and responsibilities. We need an understanding of the questions 'what?', 'how?', 'why?', 'where?' and 'when?' can be asked in relation to learning and teaching, in order that whatever decisions we make as educators, we have something that guides our actions in the many different situations in which we work. Taking all of this into account, could the following represent our current understanding of pedagogy? It is useful to consider the elements at the heart of the pedagogical decisions that we make. We need to consider what we mean when we talk about learning, teaching and development, to be enquiring about the role of interactions and environment as integral features supporting learning, teaching and development, and to be aware of the values and principles that underpin all that we do. Therefore, pedagogy is about learning, teaching and development, influenced by the cultural, social and political values and principles we have for children in global perspectives, and underpinned by a strong theoretical and practical base. Types of Pedagogy : Social Pedagogy : Social pedagogy suggests that education is critical to a student's social development and wellbeing, and thus must be understood broadly as a way to support a person's growth throughout his/her entire life. Thus, social and educational questions must be considered as one, since students are, by nature, social beings. But they require education in order to communicate effectively as such. The way social pedagogy is approached can vary in different countries, and based on different social and cultural traditions. In Germany, for example, educators typically view social

11 NSOU ? CC-ED-06 pedagogy in the same vein as social work. In Norway, the emphasis is on working with children and young people. An example of how social pedagogy could be used includes emphasizing the importance of things like compassion and being kind-hearted, and using dialogue to communicate lessons; studying concepts in the context of modern lifestyles; or looking at common issues within society that relate to our desires and needs to be social beings, such as social exclusion, its causes and consequences. Critical Pedagogy : Critical pedagogy is a reflection of Frankfurt school's ideas and principles in education. Critical theory was initially started in Europe and then was developed by theorists such as Habermas, Horkheimer, Adorno, and Gramsci. To engage in critical pedagogy is to break down and deconstruct typical world views about topics and learning. It often involves more critical theories, and even radical philosophies. The goal is to continuously challenge students to question their own thoughts and ideas, beliefs, and practices, to think critically and gain a deeper understanding. Forget the dominant beliefs and paradigms - try and figure out things on your own, and in your own way. Educators can adopt critical pedagogies by asking students to look for deep meaning and root causes of everything from religion to war and politics; or to explore and analyze relationships and issues of power within their own families. They might also look for underlying messages or biases in popular culture and mass media. Culturally Responsive Pedagogy : In a culturally diverse society, three functional dimensions - institutional, personal, and instructional - are used together to recognize and respond to cultural differences among various students, and celebrate different approaches and methods of learning. To adopt such a style, an educator must be willing to accept the different needs of a multicultural classroom, and create an equally comfortable and enriching learning environment for all students. This pedagogical method often relies on a student centered approach to teaching, whereby educators identify different cultural strengths of students, and nurture those to ensure that students have a positive sense of self, and can achieve their goals. To apply culturally responsive pedagogy requires teachers to adapt their practices to accommodate the different cultural needs of students. It can also mean that an institution has to reform its school policies and procedures to encourage more community involvement. A culturally responsive approach should respect and encourage the sharing of different ethnicities, races, and beliefs, and be aware of the backgrounds of students. In a culinary course, that could mean including knowledge of cultural dishes in course work. In a political course, it might involve debates and analyses of different political

12 NSOU ? CC-ED-06 topics, approaching them from different cultural angles. In law, it could be respecting various religious beliefs, or cultural differences in how families might view the same legal issues. Socratic Pedagogy : Following a more philosophical approach, Socratic pedagogy involves a process whereby students can develop their social and intellectual skills in order to live more actively as part of a democratic society so it leads to active citizenship education. Students are encouraged to challenge traditional assumptions about knowledge, look for alternatives, and create knowledge through their own thoughts and experiences, as well as via meaningful dialogue with others. Thus, curriculum will often involve collaborative and inquiry-based teaching and thinking as students test established ideas against others to open their minds and gain a deeper understanding of concepts. An example is the community of inquiry by C.S. Peirce and John Dewey, which, instead of basing knowledge on fixed scientific facts, looks for social context to learn more about a topic. Another is Bohm Dialogue, which involves group conversations where participation happens without judgment in order to come to an understanding on a topic. Students in a science or math course, for example, might look beyond the hard facts to determine why and how a particular scientific or mathematical principle is what it is, and what that means for society. 1.3.2 Nature of Pedagogy : From the above discussion it is understandable that pedagogy is an encompassing term concerned with what a teacher does to influence learning in others. As the importance of high quality education for children has become more clearly understood, so has the educator's role in the provision of these services. This demands a clear understanding of the meaning of 'pedagogy' and how it plays out in individual educators and services. Most of the interpretations show a range of thinking around the term pedagogy, all of which have what a teacher does and how they do it at their core. The function or work of teaching is to adapt the art or science of teaching and accordingly design education instructional methods. The instructional techniques and strategies that allow learning to take place. It refers to the interactive process between teacher/practitioner and learner and it is also applied to include the provision of some aspects of the learning environment (including the concrete learning environment, and the actions of the family and community) (Siraj-Blatchford, Sylva, Muttock, Gilden& Bell, 2002). Quality teaching is defined as pedagogical practices that facilitate for diverse children their access to knowledge, activities and opportunities to advance their skills

13 NSOU ? CC-ED-06 in ways that build on previous learning, assist in learning how to learn and provide a strong foundation for further learning in relation to the goals of the early childhood curriculum and cultural, community and family values. (Farquhar, 2003) Over the time a new term was being introduced known as "critical pedagogy". Many observed that the conservative technique does not guarantee overall development; instead it gave empowerment to some students over others. This created a social imbalance which needed to be cleared out. Thus it is in which a student association is made and their complaints are heard. And if their complaints are found logical, necessary changes are made in the institution. The authority is given to teachers and students and altogether they work in a direction to provide a better platform for students for learning. Chris Husbands and Jo Pearce (2012) in their article, 'What makes great pedagogy? Nine claims from research', had explicitly tried to interpret the nature of pedagogy. To justify that pedagogy is instrumental in learning, they used the term 'Effective Pedagogy'. We can list up their advocacy about the nature of pedagogy as follows: 1. Pedagogies give serious consideration to pupil voice. 2. Pedagogies depend on behaviour (what teachers do), knowledge and understanding (what teachers know) and beliefs (why teachers act as they do). 3. Pedagogies involve clear thinking about longer term learning outcomes as well as short-term goals. 4. Pedagogies build on pupils' prior learning and experience. 5. Pedagogies involve scaffolding pupil learning. 6. Pedagogies involve a range of techniques, including whole-class and structured group work, guided learning and individual activity. 7. Pedagogies focus on developing higher order thinking and metacognition, and make good use of dialogue and questioning in order to do so. 8. Pedagogies embed assessment for learning. 9. Pedagogies are inclusive and take the diverse needs of a range of learners, as well as matters of student equity, into account. The finding of ongoing research suggests that outstanding pedagogy is far from straightforward. Classrooms are complex, multi-faceted and demanding places in which to work and successful pedagogies are correspondingly sophisticated. Highly successful pedagogies develop when teachers make outstanding use of their understanding of the research and knowledge-base for teaching in order to support high-quality planning and practice. The very best teaching arises when this research base is supplemented by a personal passion for what is to be taught and for the

14 NSOU ? CC-ED-06 aspirations of learners. There is a robust evidence base which helps to identify the ingredients of outstanding pedagogic practices. However, truly effective practices depend on teachers making active connections between the ideas from research. The most effective successful classroom practices work these ideas together in systematic and sophisticated ways, and the best teachers are active in building relationships between them. Understanding the ways in which these relationships are built - what Leahy et al. (2005) have called 'minute-by-minute classroom practices' - is itself a fruitful area for both further research and improving practice.

1.3.3 Scope of Pedagogy : The discussion about the concept and the very nature of pedagogy has already given substantial hints about the broader scope of the application of pedagogy or how meaningful the study and research of pedagogy is. Some theoreticians considered pedagogy as educators' professional practice, especially those aspects that involve nurturing relationships, curriculum decision-making, teaching and learning. (Deewr, 2009). Pedagogy develops from a range of factors including theories and research evidence, political drivers, evidence from practice, individual and group reflection, educators' experiences and expertise, and community expectations and requirements. It informs both curriculum (all the interactions, experiences, activities, routines and events planned and unplanned) and teaching in a service. It reflects and supports the principles of and outcomes sought by a teaching profession. Pedagogy is an extremely complex phenomenon comprising a wide variety of practices underpinned by principles acquired through training and as a result of professional experiences and personal understandings. Because of its complexity 'effectiveness' has to be viewed as a whole rather than as particular aspects taken in isolation. (Moyles, Adams & Musgrove, 2002). Today's classrooms are structured by multiple layers of complexity. Critical pedagogy explores the relationship between power and knowledge, a complex relationship that stems from extreme forms of heterogeneity characterizing today's educational and social settings. This understanding compels a pedagogue to interrogate issues of privilege, notions of neutrality and objectivity, and the notion that politics should be kept out of education. By focusing on the margins of society, this pedagogy seeks to throw light on communities, voices, texts, and perspectives that have been traditionally excluded. By providing a safe space for marginalized bodies to come to voice, it challenges the Euro centric, patriarchal, and elitist ways of seeing, teaching-learning.

W

Having a well thought-out pedagogy can improve the quality of teaching and the way students learn, helping them gain a deeper grasp of fundamental material. Being 15 NSOU ? CC-ED-06 mindful of the way your teacher can help you better understand how to help students achieve deeper learning. And it can, in turn, impact student perception, resulting in cooperative learning environments. The proper approach helps students move beyond simple forms of thinking as defined in the Bloom's taxonomy pyramid, like basic memorization and comprehension, to complex learning processes like analysis, evaluation, and creation. Students can leverage their preferred learning styles with a teaching process that supports them, and the way they like to learn.

The scope of Pedagogy is wide and instrumental and is ever-growing due to constant research in this field. The following areas may indicate the scope of Pedagogical study :

A. Understanding Child : To support the vision of every child as an 'active agent' in society, we need to be aware of the experiences that children have in their early years that help them to develop as confident, powerful, competent individuals. We know that children are born with powerful motivations to learn and that in order to learn effectively, they need people to interact with. How can we be sure that we are engaging with young children appropriately and, most importantly, engaging in meaningful ways? Pedagogy helps us to understand that children need active support from adults who:

- are well informed about child development
- are respectful of and interested in children
- are knowledgeable about and value the importance of play and the powerful contribution it makes to children's development and learning
- understand the importance of relationships with other children and with adults
- recognize learning contexts that are real and meaningful to the child.

B. Instructional strategy of teaching learning for outcomes-based learning : Research on teaching, learning and outcomes shows that quality pedagogy is identified as a key lever for improving children's outcomes. Sound research evidence, discussed later, shows what educators can do to provide children with strong foundations for ongoing learning and development in all aspects of life. This evidence must be reflected in educators' pedagogy if children's learning and development is to be optimized.

C. Inclusive Learning and Development Services: The importance of a shared understanding of high-quality pedagogy in its early childhood education and care services in ensuring it meets the mission statement of

16 NSOU ? CC-ED-06 the organization and that the values of the organization are embedded in everyday practice. This statement aims to ensure that Child the professionals we collaborate with, the communities we operate in and the broader community are aware of the pedagogy enacted within our services. D. Deeper understanding of what is informing our practice : It will provide the educators within our services with an understanding of the evidence base behind this pedagogy and an awareness of how they can contribute to the development of pedagogy. The statement will assist in ensuring educators are aware of the impact they have on children and to articulate not only what they do, but why and how they do what they do to parents, careers and the wider community. E. Policy context that focuses on quality and continuous improvement of teaching- learning : In continuation of the previous policy the NEP- 2020 has emphasized on expected national standards of teacher professionalism. So, the process of building a National Quality Framework is essential. Such a framework includes state legislation underpinning a National Quality Standard. Such a standard requires services to enhance each child's learning and development through the development of curriculum informed by an approved learning framework. Child Inclusive Learning and Development services subscribe to the principles, practice and outcomes of child learning. The approach of these frameworks supports the mission to develop the capacity of the early childhood education and care sector, families and community to support children's wellbeing, learning and development and reflects our values of integrity, respect, recognition, collaboration, commitment and innovation. F. Spirit of enquiry and professional dialogue for teacher Pedagogy creates interest about why we do what we do, that learning through play and intentional teaching are key to optimizing children's learning and development and that children are people with agency. Effective pedagogy not only produces outcome results in relation to input, but also represents a common core of values and objectives to which all those involved can subscribe. (Moyle, Adams & Musgrove, 2002) Further to the above areas, the more specific scopes of pedagogical studies though not limited, but may be instrumental in following areas : 1. Designing Learning : a. Structuring learning : Pedagogy provides a model for the process of designing learning. It starts by considering factors affecting learning design,

17 NSOU ? CC-ED-06 including the influence of the type of learning objective on the choice of approach. It goes on to explore effective methods of sharing learning objectives with pupils. There is guidance on how to structure learning by splitting the learning unit into a series of episodes, and on choosing from a range of strategies and techniques to motivate pupils. Finally, there is an examination of three pedagogic approaches - direct interactive, inductive and exploratory - to show how they can help pupils develop tools for learning, such as inductive thinking or enquiry skills. b. Teaching models : Pedagogical study helps to determine principles and practice of teaching. It explores a range of teaching models and encourages teachers to review their teaching practice against the models described. For each teaching model pedagogy helps to select the model that might be applied in classrooms. c. Lesson design for inclusion : The principles for ensuring the inclusion of all pupils in lessons, and how to hold them all into the learning process is a major challenge that can be addressed by pedagogical understanding. It provides a first insight into the needs of many groups that need to be included, such as lower attainers, gifted and talented and CWSN etc. pupils. 2. Teaching Repertoire : a. Modeling Teaching : Modeling is a powerful strategy that can be used across all subjects to help pupils to learn and to develop confidence in a new skill or procedure. This unit sets out the principles of this strategy and provides guidance on how to introduce modeling into lessons and make it effective. b. Art of Questioning : Different types and purposes of questioning are guided by pedagogy. It explains how to organize questioning for whole-class and group work, and offers strategies such as providing 'wait time' for making it effective. c. Explaining Concept : The purpose of explanations in teaching and the characteristics, features and skills of successful explanations is a major focus of pedagogical studies. It explores different types of explanation, how to plan for them, which strategies are effective - particularly for those involving abstract ideas. It also provides guidance on how to support pupils in planning and articulating their own successful explanations. d. Guided Learning : What kind of principles and approaches involved in guided reading and writing can be used to support guided learning in subjects across the curriculum which is determined by pedagogical understanding.

18 NSOU ? CC-ED-06 The instructional sequence for the teacher working with small groups, which is integrated into lessons to act as a bridge between whole-class teaching and independent work. e. Group work in Teaching Learning : Pedagogy determined Effective group work can help to improve pupils' speaking, listening, thinking, and problem- solving and social skills. It emphasizes the need for establishing clear rules and procedures and sets out a range of techniques to ensure pupil engagement and cooperation, such as allocating roles and setting group targets. f. Ensuring Active engagement : Pedagogy helps teachers to understand what is meant by engagement and why it is important. A range of strategies to motivate and engage pupils is examined, for example directed activities related to text to promote active reading, strategies to promote active listening, thinking strategies etc. 3. Creating Effective Learners : a. Assessment for learning : Pedagogy creates scope to understand what is meant by assessment for learning and its importance. It explains how good assessment practice can contribute to better learning and higher achievement. b. Developing reading and writing : Improving pupils' ability to understand and to respond to subject-specific written texts is the task of the teacher. Pedagogy may empower the teacher to support pupils by clarifying the approach they need and how the teacher can use shared and guided reading to enable pupils to develop more independence and skill as readers. Similarly teachers with their pedagogical knowledge only can improve the quality of pupils' writing through actively. Teacher can guide the student on what, how and why they have to write. c. ICT integration in learning : The use of ICT in classrooms enhances learning and teaching. The T-PCK or Teacher's Techno Pedagogical Content Knowledge is key elements of integration of ICT in enhancing learning. So overall pedagogical knowledge helps to understand the kind of blending of ICT is needed in teaching specific subjects. d. Leading in learning : The aim of 21st century learning is enhancing learner's critical thinking skills. This could be done by clarifying the nature of higher- order thinking and different approaches to 'teaching' thinking. It also provides practical guidance for improving the teaching of aspects of thinking skills lessons, such as improving the teaching of the plenary, helping pupils to see the relevance of thinking in everyday contexts and developing their use of

19 NSOU ? CC-ED-06 'thinking words'. The entire task is determined by the pedagogical understanding of the teacher. 4. Creating conditions for learning : a. Improving the climate for learning : The physical environment can make a significant difference to learning, and therefore, pedagogy helps us to explore how even small changes to the classroom can help. The sound pedagogy only can determine the starting from physical arrangements to teacher-student relationships are another important factor in classroom climate to motivate students to learn. b. Identifying Learning styles : Pedagogy provides a basis on how to identify different learning styles and more importantly helps teachers to understand the need to provide a variety of activities to suit different styles, over time. There is guidance on how to plan and adapt activities to accommodate visual, auditory and kinesthetic learners. c. Classroom management : Classroom management is a key factor in teaching learning. Appropriate pedagogy helps us to understand the concept of teaching behavior that is conducive to learning. Pedagogy guides teachers to interpret pupil's response to structures and routines, and guides them as the teacher's verbal and non-verbal language is pivotal in securing and maintaining relationships for learning. 1.4 Bases of Pedagogy—Philosophical, Sociological and Psychological Any interpretation of pedagogy is intimately bound up with definitions of learning, orientation and application in classroom contexts. An emphasis on learning as an individual process of social interaction, and imitation of an expert other is clearly upheld within developmental and psychological domains that have a stronghold in contemporary formative year's scholarship and practice of the learners. For example, Vygotsky's Marxist orientation (philosophy) positions learning as a dialectical process that leads the learner into higher psychological thinking and sets the scene for intervention as advancing knowledge: a process that Fleer (2010) describes as 'pedagogical framing'. As the child learns in a socio-cultural context, therefore the sociological belief system impacts pedagogical practices in a given social context. From this viewpoint, the developing child is led into a more sophisticated way of thinking in the world. Therefore, philosophical, sociological and psychological bases hold importance in influencing pedagogical understanding and practices.

20 NSOU ? CC-ED-06 1.4.1 Philosophical Bases of Pedagogy The philosophical foundation of pedagogy helps to determine the driving purpose of education, as well as the roles of the various participants. While all foundations propose to set goals of education in general, philosophy presents the manner of thinking from which those goals are created. One's driving philosophy suggests if pedagogy should develop the individual or enforce group norms; if it is to enforce group norms, it further defines if that should be the norms of the current set or a move towards changing those norms. Philosophies vary in perception of truth, ranging from absolute to relative, and from moralistic to scientific. In all of this, one's philosophy defines the role of the teacher, ranging from all-knowing authoritarian to that of a mentor, and the role of the student, ranging from an obedient vacant vessel to an individual worthy of actively engaging in one's own educational process. As we look through the lens of history, we see how philosophies have gained and waned in popularity in society, and how even psychological research is embraced, ignored, or even rejected based on philosophical standings of the time. On the basis of research by Farquhar & White (2014), we can say that the literature shows that philosophical ideas constantly expands and shifts in approaches to teaching and learning for last few decades. Philosophical thoughts locate pedagogy across private and public space; in and outside of traditional forms of constructivism beyond instrumental imperatives and beyond dominant paradigms. Pedagogy might be viewed as more relational: democratically oriented towards what is held in common and, from a dialogical standpoint, what is not. Emphasis is also given to perception, disaffection, dialogue and wonder and 'unconsciousness' as a pedagogical state for learners and teachers alike. The subjective and intersubjective nature of pedagogy is keenly felt in philosophy and practice for pre-adolescent and adolescent learners. All children are not necessarily identical and typical in their thinking and developmental pattern, hence pedagogy should encompass those who do not necessarily share the same replicative approaches and therefore requires a sophisticated engagement within the wider world beyond the immediate contexts that determine its value. In this era of pedagogical certainty and on the cusp of standards-based agendas, such philosophical inquiry is a welcome to the pedagogical alternative for pre-adolescent and adolescent education. In contrast to romanticism, the new philosophy invites new ways of conceptualizing pedagogy. James Stillwaggon, expanding on this dilemma and highlighting the divided nature of pedagogy in romantic and modern visions of the ideal childhood. Here, a central pedagogical conflict between rationalism and sentimentality is unleashed.

21 NSOU ? CC-ED-06 Certain premises of philosophy approves pedagogy of intervention, such pedagogy carefully establishes as a prevalent emphasis on pedagogical duty where learning 'problems' are identified and addressed accordingly. In such a view, pedagogies consist of certainty, based on 'experts' who know what is needed, claim legitimacy. While some educationists consider early intervention as an issue of inequality-one where the child is placed within deficit paradigms, exacerbated by the knowledgeable interrogation of the expert who seeks solutions to the 'problem' that they themselves have identified. In this position, the teacher must drive the learner's will; in the case of early intervention this means both child and parent who must be shown the error of their ways in order to escape their deficiencies. A pedagogical orientation offered by Jayne White also calls for teachers to trust in the agency of the child and their innate potential and, as a consequence, to attend to the ethical implications of seeing in pedagogical encounters. This timely addition to the issue directs pedagogical attention to the cultural significance of the learner, challenging strongholds of certainty across time and space. Therefore, for developing any relevant pedagogical framework it is needed to consider the relevant contemporary philosophical thoughts. 1.4.2 Sociological Bases of Pedagogy Society is a reflection of the governing philosophies of the masses, requiring that studying the sociological foundation of pedagogy to include consideration of philosophical foundations. Society is dynamic, with the changing popularity of a particular philosophy mirroring factors such as environmental and economic needs: war or peace time, recession or time of abundance, changing technology, and so on. For example, if a nation is at war, greater emphasis will be placed on sacrificing for the greater good, moralistic principles, and adhering to group norms. During such times, however, there will be dissension based on counter philosophical ideas; the strength of one's philosophical convictions will determine one's perception of the current events, including those impacting education. The man is born in society and has to develop his personality in the society According to Ross `` Individuality is of one value and personality is meaningless apart from social environment. In the social environment an individual interacts with forces which influence him and he also influences the society. An individual can learn very little by himself. In his learning society contribute very significantly. Man lives in the society, acquires socialization through his contact with family, his relatives, friends. He learns basic things with mutual behaviour through this contact. If an individual is left alone without any companions and society then his learning will not take place, therefore for education the presence of other people, means society is very necessary. Education and society are interdependent and complementary to each other. No

22 NSOU ? CC-ED-06 educational system can be understood without looking at the canvas of society. Society can never progress without the sound system of education. Education should enable the pupil to be a useful member of society. Therefore, pedagogical understanding and practices are intrinsically related and evolving from sociological ideas. Such interaction of teaching learning and sociology is well documented in the body of educational research. Thus, educational sociology is meant for finding out ways and means to manipulate the educational process to ensure learning which is socially relevant and appropriate. All societies have their own ways and means of meeting this need. Education as a process has come to stay as an effective means of meeting this need. Education does not only transmit the past cultural heritage; it is meant to help in the reconstruction of our modes of living. It may help in developing new social patterns in the areas of health, leisure, vocation and family life. Reconstruction and adaptation are necessary but of scientific developments, industrialization and technological advancements, which are disturbing the urban as well as rural pattern of living. Therefore, sociological thoughts help us to understand the constant and dynamic interaction of the individual and his/her cultural environment, it enables us to understand the child from the point of view of social milieu. Sociology influences pedagogy to evolve to prepare educators for their future tasks. It uses the results of sociological research in developing teaching learning activities. Education preserves the social and cultural heritage which is owned by sociology. Society is the prime factor in determining the educational patterns so that its sociocultural needs may be satisfied and continue to grow. Emile Durkhiem who first clearly indicated the need for a sociological approach to the study of education. He considered that education to be something essentially social in character in its origins and its functions and that as a result the theory of education relates more clearly to sociology than any other science. As the teacher is himself/herself a member of the social community therefore, they should be committed to society. He/she should know the main institution and powers that mainly influence a student. He should know the instruments of social development, available in an extramural environment. He should have the capacity to use this knowledge in school Education. A teacher should know about the process of socialization among students, the method of interaction and programs for social development. As Sociological ideas/thoughts largely impact the kind of pedagogy we should design and practice in the school system. Social thoughts advocate majorly the use of project method, socialized techniques, Group discussion and techniques of group

23 NSOU ? CC-ED-06 dynamics. Sociological foundations also encourage cooperative learning, problem solving and democratic methods of teaching learning in practicing pedagogy. Those educational methods are good which gives knowledge to the individual, which will enable the students to adapt and adjust to different social situations. Sociology gives importance to group methods of teaching. Methods which are able to develop democratic attitudes among children should be a good method of teaching. According to sociological point of view following are major area of implications on pedagogical discourse: a. The method of instruction is effective only when the skill and knowledge acquired in the classroom are actually used by the individual in the adjustment to social situations. An individual should be able to achieve social correlation by use of knowledge and skill received in the school. b. The method of teaching should stress on the social behaviour outside the class while teaching. c. The method of teaching should make use of all possible social resources and social operative force in the social life in order to develop the capacity in every individual for social adjustment. d. The social power currents in the society should be used in the teaching system for increasing the social co-relationship. e. Sociologists suggest that teaching should be done through cultural and social programs. f. In teaching, teachers will develop problem solving and constructive thinking. For this socialized techniques, project and group methods fulfill most of the conditions. g. Students react better to co-operative learning in which there is sharing in the teaching learning process. co-operative group patterns of learning lay emphasis on group interaction.

1.4.3 Psychological Bases of Pedagogy The psychological foundation of pedagogical practices has continued to expand, especially with exponential growth in neuroscience research. The 1990s had been titled the Decade of the Brain, and great strides have been made in the psychology of learning. One might argue that it is the psychological foundations of approach and method of teaching learning which hold the greatest importance because it is here that we understand how students learn; how to increase student motivation and satisfaction; how to achieve outcome-based learning. However, current pedagogical practices in many schools' systems may not yet fully embrace the current research due to the prevailing rigid philosophies held by authorities in power. To gain acceptance of

24 NSOU ? CC-ED-06 research-based educational practices, we must not just show the success of those practices, but also work toward changing the prevailing philosophies that influence the attitudes of society. Also, reaching back to the historical foundation of pedagogical discourse, we should caution ourselves that current research is just that: current. Future psychological research may yield new information. By adopting a guiding philosophy, one does not become fixed and single out to a particular psychological foundation of thought, which history reminds us is ever-changing, and one can instead remain fluid in how one's philosophically-based goals are met. The different psychological foundations which are potentially impacting pedagogical practices could be broken down into four categories: behaviourism, constructivism, social constructivism, and liberationism. A. Behaviourism : A behaviourist pedagogy uses the theory of behaviourism to inform its approach towards pedagogical practices. The most important school of thought of educational psychology in the first half of the 20th century was behaviourism. Behaviorism is a perspective on learning that focuses on changes in individuals' observable behaviors- changes in what people say or do. At some point we all use this perspective, whether we call it "behaviorism" or something else. It described learning as the acquisition, strengthening and application of stimulus-response connections through reinforcement. Teaching was thought to influence this through providing adequate reinforcement. According to behaviourist views, positive rewards following a correct response automatically strengthen the connection to the stimulus. Even complex behavior can be taught by reinforcing spontaneous behaviours step by step, until the whole behavior sequence is built together. Exercise and repetition are seen as crucial to develop and maintain stimulus-response connections. Behavior is learned and can be unlearned; unacceptable behaviour can be replaced by acceptable behaviour and changes in children's behaviour occur due to the responses they get to their behaviour. Pedagogical practices associated with this theory include: educators reinforce appropriate behaviour through rewards ranging from a positive statement to tangible rewards such as star charts; educators avoid reinforcing inappropriate behaviour or remove children who are behaving inappropriately; educators draw children's attention to the consequences of their behaviour. Models based on these theories are called "drill and practice" and "programmed instruction". As for example one often relevant to new teachers: when he began my first year of teaching, he was more focused on doing the job of teaching on day-to- day survival than on pausing to reflect on what he was doing. Note that in all of these examples, focusing attention on behavior instead of on "thoughts" may have been

25 NSOU ? CC-ED-06 desirable at that moment, but not necessarily desirable indefinitely or all of the time. Even as a beginner, there are times when it is more important to be able to describe how to drive or to cook than to actually do these things. And there definitely are many times when reflecting on and thinking about teaching can improve teaching itself. But neither is focusing on behavior which is not necessarily less desirable than focusing on students' "inner" changes, such as gains in their knowledge or their personal attitudes. If you are teaching, you will need to attend to all forms of learning in students, whether inner or outward. In classrooms, behaviorism is most useful for identifying relationships between specific actions by a student and the immediate precursors and consequences of the actions. It is less useful for understanding changes in students' thinking; for this purpose, we need a more cognitive(or thinking-oriented) theory, this fact is not really a criticism of behaviorism as a perspective, but just a clarification of its particular strength or source of usefulness, which is to highlight observable relationships among actions, precursors and consequences. Behaviorists use particular terms for these relationships. They also rely primarily on two basic images or models of behavioral learning, called respondent (or "classical") conditioning and operant conditioning as major learning mechanisms. Some alternative theories advocated in Europe like Gestalt psychology which can be summarized

70%

MATCHING BLOCK 2/52

W

in the quote, "The whole is greater than the sum of its parts". Accordingly, the

Gestalt approach criticized behaviourism for breaking down behaviour into its parts. In the Gestalt perspective, learning is seen as a process of understanding the structures of problems and gaining sudden insight rather than as an iterative development of stimulus-response connections. B. Constructivism : Influenced by behaviourism as well as Gestalt and other prevailing schools of thoughts in psychology, the middle of the 20th century saw the rise of cognitive psychology in both the United States and Europe and later adopted worldwide and thus a shift of focus from behaviour to information processing. Cognitive psychology examines mental processes and knowledge structures. It tries to understand how knowledge of different themes is acquired and structured, and which strategies are used for problem solving. Learning is seen as the acquisition of knowledge. But while the rise of cognitive psychology led to a deeper understanding of learning processes, it did not yield many innovative approaches for teaching. By and large, cognitive theories still encouraged lectures and the use of textbooks as the preferred instructional methods and assigned students a rather passive role in learning. During the 1970s and 1980s, yet another theory emerged to overcome the limits of cognitive

26 NSOU ? CC-ED-06 approaches. Cognitive Constructivism, also termed as biological constructivism suggested a more student-centered approach to instruction. Through interacting with the environment, students were thought to actively build up and reorganize mental structures of knowledge and skills. Numerous instructional approaches are based on constructivism. Central to these is that teachers are not thought to be direct transmitters of knowledge, but rather facilitators of an active, self-directed construction of knowledge. But this school of thoughts also failed to address the significance of the socio-cultural context of learning. Constructivism is a philosophy of learning founded on the premise that, by reflecting on our experiences, we construct our own understanding of the world we live in. Each of us generates our own "rules" and "mental models," which we use to make sense of our experiences. Learning, therefore, is simply the

100%

MATCHING BLOCK 3/52

W

process of adjusting our mental models to accommodate new experiences.

Constructivism as a paradigm or worldview posits that learning is an active, constructive process. The learner is an information constructor. People actively construct or create their own subjective representations of objective reality. New information is linked to prior knowledge, thus mental representations are subjective. So we can say that constructivism as a learning theory, simply speaking, is to make learning meaningful. The core constructivist perspectives are therefore: (a) learning is a self-directed process-knowledge is constructed rather than directly received; (b) instructor as facilitator; (c) learning as a socio-cultural process (Tobin and Tippins 1993). It has long been argued that a constructivist approach is essential for the development of skills and abilities among the learner. Originators and important contributors: Vygotsky, Piaget, Dewey, Vico, Rorty, Bruner. There are, however, two major strands of the constructivist perspective. These two strands, cognitive constructivism and social constructivism, are different in emphasis, but they also share many common perspectives about teaching and learning. Before looking at the differences between cognitive and social constructivists, it might be worthwhile to look at what they have in common. Jonassen's (1994) description of the general characteristics of constructivist learning environments is a succinct summary of the constructivist perspective. Characteristics of Constructivist learning environment : Jonassen (1994) proposed that there are eight characteristics that differentiate constructivist learning environments: 1. Provide multiple representations of reality. 2. Multiple representations avoid oversimplification and represent the complexity of the real world. 3. Emphasize knowledge construction instead of knowledge reproduction. 4. Emphasize authentic tasks in a meaningful context rather than abstract instruction out of context. 5. Constructivist learning environments provide learning environments such as real-world settings or case-based learning instead of predetermined sequences of instruction. 6. Encourage thoughtful reflection on experience. 7. Constructivist learning environments "

100%

MATCHING BLOCK 4/52

W

enable context- and content- dependent knowledge construction." 8. Support "collaborative construction of knowledge through social negotiation

C. Social constructivism : At the end of the 20th century, there was yet another turn in educational psychology. Inspired by the ideas of Vygotsky and culturally comparative research, socio-constructivist theories started examining the interaction of psychological processes within the learner with social and situational characteristics of the learning process. While constructivism described learning as a process happening within the isolated mind of an individual, the socio-constructivist view rather understands knowledge as situated and "being in part a product of the activity, context, and culture in which it is developed and used" (Brown, Collins and Duguid, 1989). Social or Vygotskian constructivism emphasizes education for social transformation and reflects individuals within a sociocultural context. Individual development derives from social interactions within which cultural meanings are shared by the group and eventually internalized by the individual (Richardson, 1997). The socio-cultural approach emphasizes the relationships and participation are central to learning; children develop and learn in multiple ways that are socially and culturally approved and constructed; children learn ways of being interdependent through their participation in everyday events and as members of different social groups; learning leads development; children are active agents and contributors in the social groups in which they participate. Pedagogical practices associated with this theory include: educators take the context of children's lives into account in their expectations, planned experiences and in routines such as meals and sleep arrangements; children's learning is scaffolded (for example, questions, demonstrations, prompts) by adults or other children; children move through learning with assistance to independent understandings; educators use responsive listening in order to understand and respect children's learning; learning experiences connect with and extend children's ways of knowing, skills and understandings that they bring from home and the community; documentation of children's learning is in multiple forms to make the learning visible to others.

Constructivism states that learning is an active, contextualized process of constructing knowledge rather than acquiring it. Knowledge is constructed based on personal experiences and hypotheses of the environment. Learners continuously test these hypotheses through social negotiation. Each person has a different interpretation and construction of

the

100%

MATCHING BLOCK 6/52

W

knowledge process. The learner is not a blank slate (tabula rasa) but brings past experiences and cultural factors to a situation.

So, context and authentic experience has been considered as major factors that are supposed to influence the learning. As biological or cognitive constructivism emphasizes the individuality of the learner it was insufficient to accommodate the experiential learning in reference to social context. Schools are the sociocultural settings where teaching and learning take place and where "cultural tools," such as reading, writing, mathematics, and certain modes of discourse are utilized (Richardson, 1997). This approach assumes that theory and practice do not develop in a vacuum; they are shaped by dominant cultural assumptions (Martin, 1994; O'Loughlin, 1995). To accomplish the goals of social transformation and reconstruction, the context of education must be deconstructed, and the cultural assumptions, power relationships, and historical influences that undergird it must be exposed, critiqued, and, when necessary, altered (Myers, 1996). Variants of social constructivism include situated constructivism, social re-constructivism, sociocultural constructivism, socio historical constructivism, and emancipatory constructivism. Several practices have evolved from this approach; for example, "self-directed learning", "cooperative learning", "self-regulated learning", "guided discovery", "scaffolding", "cognitive apprenticeship", "teacher-mediated dialogue", "independent group discussion", "problem based learning", "project-based learning", and "knowledge building". Though Europe was the hotspot of theorization, it expanded and such social constructivism was instrumental in promoting a "learner-centred approach" and an emphasis on "communicating, inquiring, conceptualizing, reasoning and problem-solving" model of learning. It also integrates ideas of adaptive or differentiated instruction, making demands to account for "individual differences and the needs of individual students" and the use of formative assessment. It is important to note here in NCF-2005, Constructivism has been singled out for learning and 5'E learning model, Interpretation Construction Model are few examples of such constructivist approach. Guiding principles of constructivism in general may include : 1. Learning is a search for meaning. Therefore, learning must start with the issues around which students are actively trying to construct meaning.

29 NSOU ? CC-ED-06 2. Meaning requires understanding wholes as well as parts. And parts must be understood in the context of wholes. Therefore, the learning process focuses on primary concepts, not isolated facts. 3. In order to teach well, we must understand the valuable way to measure learning is to make the assessment part of the learning process, ensuring it provides students with information on the quality of their learning. Constructivism as whole may impact learning in following ways : Curriculum : Constructivism calls for the elimination of a standardized curriculum. Instead, it promotes using curricula customized to the students' prior knowledge. Also, it emphasizes hands-on problem solving. Instruction : Under the theory of constructivism, educators focus on making connections between facts and fostering new understanding in students. Instructors tailor their teaching strategies to student responses and encourage students to analyze, interpret, and predict information. Teachers also rely heavily on open-ended questions and promote extensive dialogue among students. a. Involves collaboration between instructors, students and others (community members). Tailored to the needs and purposes of individual learners. Features active, challenging, authentic and multidisciplinary learning b. Constructivism can help students pursue personal interests and purposes. Use and develop his or her abilities. Build on his or her prior knowledge and experiences. Develop life? long learning c. Constructivism encourages instructors to provide for each student's preferred learning style. Rate of learning Personal interactions with other learners Assessment : Constructivism calls for the elimination of grades and standardized testing. Instead, assessment becomes part of the learning process so that students play a larger role in judging their own progress. Constructivist frameworks in teacher education : While it may inform and influence practice, constructivism is a theory of learning, not a theory of teaching, and translating theory to practice is both difficult and imprecise. However, education literature documents several large- and small-scale efforts to do so. Constructivist teacher education generally reflects two major traditions—the developmental and social reconstructionist traditions. Programs influenced by the developmental tradition attempt to teach students how to teach in a constructivist, generally Piagetian, manner. They are typically characterized by substantial direct instruction in theory and practice, often without complementary opportunities for

30 NSOU ? CC-ED-06 inquiry, discovery, or self-examination. This approach can easily become overly prescriptive. If this occurs, the teacher educator models an approach to teaching that is essentially antithetical to the approach students are intended to employ in their future classrooms. Programs influenced by social reconstructionist tradition attempt to help teacher education students deconstruct their own prior knowledge and attitudes, comprehend how these understandings evolved, explore the effects they have on actions and behavior, and consider alternate conceptions and premises that may be more serviceable in teaching. Critical analysis and structured reflection on formal course knowledge and everyday practical experience are incorporated. Richardson identifies two factors that appear to affect the approach teachers and teacher educators take in forming constructivist settings- the extent to which the social is acknowledged as a critical factor in learning and individual cognitive development and the specific content, subject matter, or discipline. Some subjects, such as mathematics, are more "bounded" than others by rules, formulae, and procedures. They are more likely to be regarded by teachers as producing problems and tasks to which there are "correct" answers. Individual interpretations and construction of ideas and concepts are less likely to be encouraged by teachers than in subjects such as literature and writing. Challenges of adapting constructivist framework : The challenge constructivism presents to teachers and teacher educators is the formidable task of translating a learning theory into a theory of teaching, which in turn raises questions about what teachers need to know and be able to do. For teacher educators, among other tasks, this involves balancing the need to acknowledge the different discipline-specific requirements of teaching with the need to model constructivist methods in teacher education courses and practicums. Researchers also note the limits of a perspective on teaching that values students' understanding at the expense of "right" answers. Student knowledge becomes idiosyncratic; 30 different students may arrive at 30 different understandings or interpretations of a concept, all of which are not equally appropriate. Inappropriately applied, constructivist approaches may lead to the "abandonment" style of teaching. Several authors cite the importance of teacher educators' modeling constructivist approaches that engage students in interdisciplinary exploration, collaborative activity, and field-based opportunities for experiential learning, reflection, and self-examination. Possible only if future teachers are to be able to employ these strategies in D. Liberationism : Methods or practices of teaching that recognize the inherently political nature of

31 NSOU ? CC-ED-06 education and aim not, as Paulo Freire puts it in his description of the banking model of education, to produce receptacles of knowledge" to be filled by the teacher, but rather to produce fully self-actualized people. In other words, while dominant education would hold that the role of education is to eradicate any idiosyncrasies an individual is born with and to conform them to an ideal of character determined by the constructs of society, liberatory pedagogy assumes that each individual is born with potentialities that have positive value for that individual and it is good for that individual to develop these potentialities. Pedagogies of liberation, then, hold at their center a celebration of diversity and the infinite variety of types that come about when difference is encouraged to develop. Then, having fostered the inner-development of the individual, liberatory pedagogy moves outward through education-based engagement with oppressions to transform the broader society. Liberatory pedagogy holds at its center a "counter-politics of knowledge" which affirms that true knowing comes from below, emerges from the context of community struggle, and enables resistance to and transgression of the dominant politics and knowledges which dehumanizes and constructs the millions of people thrown on to the margins by capitalist, colonialist logic as illiterate, unknowing objects. Where dominant pedagogies lift up the 'Europeanized,' individualized thinker as the pinnacle of knowing, pedagogies of liberation hold the experiences of the marginalized as the center of knowing. In his classic text 'Pedagogy of the Oppressed' (2007), Paulo Freire articulated his vision for an emancipatory education. Vital to this process is his emphasis on dialogue whereby the "teacher-student" facilitates a problem-solving approach to name and act on the "student-teacher's" social reality. Freire also elaborated on the conditions of oppression, although his essentialist categories of "the oppressed" and "the oppressor," and the manner in which these categories ignore the intersections of various oppressions, are problematic. In spite of certain criticism, pedagogy of the oppressed has contributed immensely to understanding oppression and to developing a philosophy and liberatory strategies for people of privilege to work with oppressed people groups. Bell Hooks in his book 'Teaching to Transgress: Education as the Practice of Freedom' raises concerns about the classroom as potentially liberative site and the academy as a hegemonic industry; she issues challenges to that academy and her fellow teachers and learners; she not only denunciantes what is wrong but also enunciated clearly and celebrates what has worked; she presents elements of her vision of what could be; and she offers particular strategies for creating and working with learning communities.

32 NSOU ? CC-ED-06 1.5 Pedagogy Vs Andragogy Pedagogy : You already have a comprehensive idea about pedagogy going through the previous subunits. Now in this subunit we would like to discuss andragogy and how it is different from Pedagogy. Andragogy : The term andragogy can be supposedly equivalent to the term pedagogy. Andragogy in Greek means the man-leading in comparison to pedagogy, which in Greek means child-leading. However, it should be noticed that the term pedagogy has been used since the Ancient Greek times while Alexander Kapp, a German educator, originally used the term andragogy in 1833. Principles of Andragogy- Let's have a look at the principles of Andragogy may be pinpointed after Mezirow (1981) 1. Progressively decrease the learner's dependency on the educator 2. Help the learner understand how to use learning resources-especially the experience of others, including the educator, and how to engage others in reciprocal learning relationship 3. Assist the learners to define his/her learning needs-both in terms of immediate awareness and understanding the cultural and psychological assumptions influencing his/her perception of needs 4. Assist the learners to assume increasing responsibility for defining their learning objectives, planning their own learning programme and evaluating their programme. 5. Organize what is to be learned in relationship to his / her current personal problems, concerns and levels of understanding. 6. Foster learner decision making-select learners relevant learning experiences which require choosing, expand the learner's range of options, facilitate taking the perspectives of others who have alternative ways of understanding. 7. Encourage the use of criteria for judging which are increasingly inclusive and differentiating in awareness, self-reflexive and integrative of experience. 8. Foster a self-corrective reflexive approach to learning-to typifying and labelling, to perspective talking and choosing and to habits of learning and learning relationships.

33 NSOU ? CC-ED-06 9. Facilitates problem posing and problem solving, including problems associated with the implementation of individual and collective action, recognition of relationship between personal problems and public issues. 10. Reinforce the self-concept of the learner as a learner and doer by providing for progressive mastery, a supportive climate with feedback to encourage promotional efforts to change and to take risk, avoidance of competitive judgment of performance, appropriate use of mutual support groups. 11. Emphasize experiential, participative and projective instructional methods, appropriate use of modeling and learning contracts. 12. Make the moral distinction between helping the learner understand his/her full range of choice and how to improve the quality of choosing vs encouraging the learner to make a specific choice. Theory of Andragogy of Malcolm Knowles Malcolm Shepherd Knowles (1913 - 1997) was an American educator well known for the use of the term Andragogy as synonymous to adult education. According to Malcolm Knowles, andragogy is the art and science of adult learning, thus andragogy refers to any form of adult learning. In 1984, Knowles suggested 4 principles that are applied to adult learning- 1. Adults need to be involved in the planning and evaluation of their instruction. 2. Experience (including mistakes) provides the basis for the learning activities. 3. Adults are most interested in learning subjects that have immediate relevance and impact to their job or personal life. 4. Adult learning is problem-centered rather than content-oriented. In 1980, Knowles made 4 assumptions about the characteristics of adult learners (andragogy) that are different from the assumptions about child learners (pedagogy). In 1984, Knowles added the 5th assumption. 1.

social roles. 4. Orientation to Learning- As a person matures his/

her

70%**MATCHING BLOCK 9/52****W**

time perspective changes from one of postponed application of knowledge to immediacy of application, and accordingly his/her orientation toward learning shifts from one of subject-centeredness to one of problem-centeredness. 34 NSOU ? CC-ED-06 5. Motivation to Learn- As a person matures the motivation to learn is internal (Knowles 1984)

Application of andragogy in personal training of adult individual – Knowles (1984) provide an example of applying andragogy principles to the design of personal training- 1. There is a need to explain the reasons specific things are being taught (e.g., certain commands, functions, operations, etc.) 2. Instruction should be task-oriented instead of memorization -- learning activities should be in the context of common tasks to be performed by the others. 3. Instruction should take into account the wide range of different backgrounds of learners; learning materials and activities should allow for different levels/types of previous experience with computers. 4. Since adults are self-directed, instruction should allow learners to discover things and knowledge for themselves without depending on people, and will be provided guidance and help when mistakes are made. Pedagogy Vs Andragogy : The principles of Andragogy further may be comprehensive from the following comparison of Pedagogical vs Andragogical Learning Assumptions, adapted from It's Called Andragogy by S. P. Forrest and T. O. Peterson, 2006 Assumption Self-Concept Learner Experience Readiness to Learn Learning Orientation Motivation to Learn Pedagogy Learners are unable to self-assess and are dependent on others to define their needs. Learners do not use minimal past experiences as a resource for learning. Willingness to learn is external and the need to know is instilled by others over time. Subject and Teacher Centered. Motivation is based on extrinsic performance awards and behavior. Pedagogy Learners know what they need to learn based on self-awareness. Learners leverage past experiences as a base for the learning process. Learning needs are internal and driven by social roles and responsibilities. Student Centered and based on tasks or problems. The more one matures, the more internalized the learning motivation.

35 NSOU ? CC-ED-06 There is no such teaching strategy where a teacher or a tutor can apply exclusively either pedagogy or andragogy but knowingly or unknowingly, we do use both in combination in most of the cases. But very commonly speaking teaching learning for school children is majorly driven by pedagogical principles while in adult learning or training the manpower for specific skills andragogy is more pertinent from application point of view. 1.6 Summary In this Unit you have learnt : • Pedagogy refers to that set of instructional techniques and strategies which enable learning to take place and provide opportunities for the acquisition of knowledge, skills, attitudes and dispositions within a particular social and material context. • Pedagogical practice, may be of three main type A Structured Approach, An Open Framework Approach, A Child-led Approach, on the other, the approach of pedagogical studies is of social pedagogy, Critical pedagogy, culturally responsive pedagogy and Socratic pedagogy. • The nature of pedagogy is critical and evolving. It may be includes-serious consideration to pupil voice, depend on behaviour (what teachers do), knowledge and understanding (what teachers know) and beliefs (why teachers act as they do), build on pupils' prior learning and experience, involve scaffolding pupil learning, focus on developing higher order thinking and metacognition, and make good use of dialogue and questioning in order to do so, embed assessment for learning, and inclusive and take the diverse needs of a range of learners, as well as matters of student equity, into account. • The scope of Pedagogy is wide and is ever-growing. Though major focus of scopes should include- Understanding Child, instructional strategy of teaching learning, Inclusive Learning and Development Services, understanding of what is informing our practice, Policy context that focuses on quality and continuous improvement of teaching-learning and Spirit of enquiry and professional dialogue for teacher. • The philosophical foundation of pedagogy helps to determine the driving purpose of education, as well as the roles of the various participants. While all foundations propose to set goals of education in general, philosophy presents the manner of thinking from which those goals are created. For developing any relevant pedagogical framework, it is needed to consider the relevant contemporary philosophical thoughts. • Sociological ideas/thoughts largely impact the kind of pedagogy we should design and practice in the school system. Social thoughts advocate majorly the use of project method, socialized techniques, Group discussion and techniques of group

36 NSOU ? CC-ED-06 dynamics. Sociological foundations also encourage cooperative learning, problem solving and democratic methods of teaching learning in practicing pedagogy. • It is the psychological foundations of approach and method of teaching-learning which hold the greatest importance because it is here that we understand how students learn; how to increase student motivation and satisfaction; how to achieve outcome-based learning. The different psychological foundations which are potentially impacting pedagogical practices could be broken down into four categories: behaviourism, constructivism, social constructivism, and liberationism. Amongst all these, two strand of constructivism namely cognitive constructivism and social constructivism are majorly appreciated in global scale. • The term andragogy can be supposedly equivalent to the term pedagogy. Andragogy in Greek means the man-leading in comparison to pedagogy, which in Greek means child-leading. The principles of Andragogy differ with pedagogy in reference to Self-Concept, Learner Experience, and Readiness to Learn, Learning Orientation and Motivation to Learn. Andragogy principles are very much instrumental to the design of personal training of adult. 1.7 Self-Assessment Questions 1. Make a critical note on different approach of Pedagogy 2. Explain the critical nature of pedagogy 3. Make a comprehensive note on the scope of study of pedagogy 4. Differentiate between Pedagogy and Andragogy in terms of principles 5. Discuss in brief the major implications of sociological thoughts on pedagogy. 6. How cognitive constructivism differs from social constructivism 7. Make a note on the limitations of behaviourism. 8. How can Andragogy be instrumental in personal training of adult individuals? 9. Make a critical note on the evolving nature of pedagogy with the ongoing research in psychology, brain research and ICT. 10. Judge the Liberationist pedagogy in the contemporary social context. 1.8 References Barber, M., & Mourshed, M. 39 Unit–2 : Pedagogy and Teaching Structure 2.1 Objectives 2.2 Introduction 2.3 Pedagogy as the Art and Science of Teaching 2.4 Pedagogy as the Art of Teaching 2.5 Pedagogy as the Science of Teaching 2.6 Summary 2.7 Self-Assessment Questionnaire 2.8 References

2.1 Objectives In this Unit, we have tried to introduce you to the basic concepts of Pedagogy as 'Art and Science of Teaching'. After familiarizing you with basic concepts we lead to the art of science of teaching with exemplifications. After the end of this unit, you should be able to : • Explain Pedagogy as Art and Science of Teaching • Comprehend Pedagogy as the Art of Teaching • Comprehend Pedagogy as the Science of Teaching • Explain when Pedagogy is arts and when Pedagogy is science • Explain how the art and science of teaching are related with each other from the perspective of application. 2.2 Introduction In this unit of course structure, the core concept of pedagogy is being discussed. Teaching is a performing art. Teaching is a creative organic evolving process where the teacher engages himself herself as a co-learner with the students. But such engagement demands a lot of science and aesthetics. We present here the ideas so that you can understand the concept of art and science of teaching. We will also expose you to the concept of andragogy and how it differs from pedagogy.

40 NSOU ? CC-ED-06 2.3 Pedagogy as the Art and Science of Teaching Pedagogical process is a deliberate process of intentional teaching and learning is a process for living (Dewey, 1963); based on specific regularities and theoretical assumptions organized process of education has to mediate the learning and developing persons with their environment. Knowledge of education and educational knowledge are complex phenomena that require integrated and updated understanding of humanities and social sciences, including large components of educational practice with the growing amount of knowledge. Therefore, pedagogy is interdisciplinary, it functions as the theory or science and teachers' professional philosophy, academic discipline and practice, meets the general requirements to achieve educational, developmental and educative goals in their integrated quality; and these are in compliance with the integrity of human's physical, mental and social nature. The 20th century theory of action in psychology (Leontyev, 1977) added to Dewey's learning by doing has become fundamental for the development of pedagogy: a) Interpreted from pedagogical perspective assumption that a human being develops all his/her faculties through different kinds of activities (Schukina, 1986); b) Implemented in didactic assumption that spirits and emotions are the center of harmonious development (Petersons, 1930). The concept of many-sided and harmonious development contributed to pedagogy, coupled by understanding that development occurs by changing-improving-empowering learner's learning as an essential activity; the latter, therefore, must be pedagogically designed, organized, and equipped so that the learner is the subject of his/her activity, development and socialization. Teacher's assistance, cooperation and communication create an appropriate supportive environment for the learner's many-sided, harmonious, autonomous learning and better achievements in his/her development with growing amounts of knowledge; pedagogic theory is especially about relationships (Petrie et al., 2006,). The nature of human development, actually, does not allow for reducing pedagogy to teaching only. Here we have come to the object of the science of pedagogy being constant links between learner, teacher, and the content of activities/learning in often specially organized environments; these links manifest themselves in relationships. Now pedagogy as science distinguishes between the object of research to be investigated for better understanding of the practical aim or overarching educative goal of pedagogy as a process of teaching-learning. The core understanding of the science of pedagogy in has developed by overcoming temporal innovations in the cultural context and by recognizing some constant values of the classical conception, mostly evolved in Europe, of pedagogy being incorporated from the following groups of sources:

41 NSOU ? CC-ED-06 oValues and pedagogical thought developed through ages being inscribed in multiple folk songs (268,815 verses, registered as The Cabinet of Dainas, the UNESCO Memory of the World) constitute a strong cultural and moral component that manifests itself in common and highly respected human attitudes. Long-lasting practices, visions and philosophical views on education demonstrate sustainability in constant innovations and are revealed in pedagogy since the first school in the Baltic countries in Riga (1211) and organized teacher education (1683). • Research related to pedagogy since the 17th century accentuated the empirical investigations (Dauge, 1929, 99); the rise of anthropology as a science with pedagogy sitting within it (Kron, 2001) has formed research at the University of Latvia in 1919 when it became focused on the holistic essence of pedagogical process by following the humanistic paradigm with the learner's mental development at the core and the empirical approach which followed the paradigm of the natural sciences; pedagogy develops scientific research and research-based studies (Hessens, 1929, 124) mainly by reflecting and investigating practices, creating a scientific method, categorization, and developing other essential features of a science. • Thanks to the long-lasting orientation of pedagogy towards philosophy and its search for fundamental background assumptions and theories, academic components developed to become part of pedagogy in the 19th century (Depaepe, 2002, 363). Philosophy and history have formed the background of many educationists (Husen, 1979); their understanding of pedagogy in its theoretical and practical capacity has developed an academic discipline (in tertiary and doctoral programmes); pedagogy has stepped beyond just teaching methods to reach the quality of science of pedagogy now being a teachers' personal philosophy that manifests itself in their professional behaviours. Pedagogy is generally regarded as the 'art and science of teaching'. Pedagogy encompasses the psychological, cultural, political and socio-emotional processes of teaching young children, and is not to be confused with curriculum (Ryan & Hornbeck, 2007). Craft (2005), defines pedagogy 'as encompassing appropriate and defensible professional judgments about how teaching is undertaken and learning nurtured', implying that pedagogy requires a sound theoretical basis. Pedagogy is influenced by classroom and school contexts; the expectations and assumptions of administrators and parents about teachers and teaching; and changing ideas about the nature of teaching. Pedagogy is considered in terms of relationships between teacher and learner. Pedagogy is seen as encompassing teaching strategies and learner responses; socio- emotional interactions between teachers and learners; the impact of teachers' educational philosophy on their teaching; and the mediating effect of the physical learning environment.

42 NSOU ? CC-ED-06 'Pedagogy' is the practice of teaching informed and framed by a shared and structured body of knowledge. This knowledge comprises experience, evidence, understanding moral purpose and shared transparent values. It is by virtue of progressively acquiring such knowledge and mastering the expertise - through initial training, continuing development, reflection and classroom inquiry and regulated practice - that teachers are entitled to be treated as professionals. Teachers should be able and willing to scrutinize and evaluate their own and others' practice in the light of relevant theories, values and evidence. They should be able to make professional judgments which go beyond pragmatic constraints and ideological concerns, and which can be explained and defended. Furthermore, pedagogy is impoverished if it is disconnected from the capacity and responsibility to engage in curriculum development and to deploy a range of appropriate assessment methodologies. Indeed, in most European countries, these elements are treated as a whole, enabling a broad conception of pedagogy, while in India we are trying to adapt this practice. Teachers should be knowledgeable about curriculum and assessment principles as a part of their pedagogical expertise. To promote the further development of professional expertise, it is needed to include these dimensions, and the interrelationships between them, in the conceptual framework of frame work for school education and for teacher education. On the basis of above mentioned understanding about pedagogy, it could be said that pedagogic expertise can be thought of as a combination of science, and art; this notion helps us to understand the complementary needs for collectively created knowledge, professional skills and personal capacities. It is also important to remember that all these are grounded in ethical principles and moral commitment - teaching is never simply an instrumental activity, a question just of technique. One of the challenges for pedagogical discourse is to distinguish between what is known in a scientific sense of being explicit, cumulative and generalizable, and what are the irreducibly intuitive and creative elements of teaching. It is generally accepted now that good teaching requires strategic decisions informed by evidence, which is the science of teaching. But it also requires a large number of implicit and often instantaneous judgments and decisions. These are responses to the dynamic situation in the classroom, often shaped by the 'community of practice' to which the teacher belongs. They are also expressions of each teacher's individual relationship with his or her pupils: how he/she generates a positive classroom climate or takes advantage of unexpected teaching and learning opportunities. This is the 'art' of teaching.

43 NSOU ? CC-ED-06 2.4 Pedagogy as the Art of Teaching We all need to acknowledge this paradox of teaching - that the more expert a teacher becomes, the more his/her expertise is manifested in sensitivity to contexts and situations, in imaginative judgments in-the-moment sourced from tacit knowledge. The importance of these forms of expertise is often underestimated. Indeed, they often become so embedded, instinctive and taken-for granted that they are barely recognized. Pedagogic expertise can be thought of as a combination of science, craft and art; this notion helps us to understand the complementary needs for collectively created knowledge, professional skills and personal capacities. It is also important to remember that all these are grounded in ethical principles and moral commitment - teaching is never simply an instrumental activity, a question just of technique. The goals of education are established in a national curriculum and in more detailed institutional curricula. In many countries, for example, in Finland, the goal of education is to support the development of the whole personality, rather than merely the cognitive domain. In this kind of holistic approach, human beings are lifelong learners who need to be educated in all educational domains to actualize their full potential. These domains include three domains in learning as identified by Benjamin Bloom: cognitive, affective and psychomotor. Many learning tasks, for example, the skills related to morality, require teaching and learning in both cognitive and affective domains. In this chapter we discuss how pedagogy, the science and art of teaching, can promote the educational goals identified in the curriculum.

44 NSOU ? CC-ED-06 We can identify two different curriculum traditions influencing national curriculums in different countries. The Bildung tradition aims at educating individuals to become competent citizens who actualize their individual talents and also benefit the society with their competences. Bildung advocates the importance of individual and society transformation through education. In Europe and Nordic countries, Didaktik is a curriculum tradition guided by the philosophy of Bildung and the idea of educating instruction, in educational institutions. In that tradition, the pedagogical relation between the teacher and students, the content relation of a teacher to the subject matter and the didactic relation of a teacher to students' learning are seen as core elements in the teaching-studying-learning process. Fig: The basic elements & relationships in Didactical Triangle (Tirri& Toom, 2019) In this Didaktik curriculum tradition both the teacher and the students have autonomy in teaching-studying-learning process that cannot be restricted by any legislation or evaluation. The teaching is guided by a "Lehrplan" that can only be implemented by a competent teacher who has total freedom to choose her teaching contents and methods. The goals of curriculum and teacher's skills to actualize those goals in her teaching are the ways to evaluate the success of a teacher. The Anglo-American curriculum tradition is based on psychological theories on learning, and the emphasis is on accountability and learning outcomes. The curriculum and the teaching plans are well-articulated and detailed with the goals to achieve the learning objectives with clearly defined contents. The teachers are trained to teach certain contents with the goal to produce good learning results that can be measured objectively with standardized tests. Teachers are certified after their training, and they are evaluated regularly on the basis of their students' learning outcomes.

Teachers' task

45 NSOU ? CC-ED-06 is to implement the given national curriculum and achieve the learning objectives listed in them. The didactic curriculum tradition in which values and morals are emphasized in guiding the teaching-studying-learning process and in educating pupils as whole. This means that pedagogy is moral in nature, and the teacher's main task is to reflect the values underlying her teaching and the purposes she wants to advance in her teaching. In addition to the values established in the national curriculum, the teacher needs to be aware of the ethical codes guiding the teaching profession. The professional status of teachers differs from country to country. In Finland, for example, teachers are considered ethical professionals who can be trusted and who share similar basic values about their work. These values are established in the ethical codes for teachers, which were first published in Finland in 1998. The values are dignity, truthfulness, fairness, responsibility and freedom. In 2017 the Teachers' Union in Finland continued to strengthen the professional status of its members and established the Comenius' Oath for teachers. The purpose of this oath was to support teachers and provide a concrete reminder of the ethical foundation of their profession. The freedom given to teacher's challenges them constantly to develop their ethical skills with regard to their students, colleagues, themselves and the networks with which they cooperate. In this pedagogical challenge, teachers need ethical sensitivity to identify and solve context- specific moral dilemmas in teaching. Shulman argues that a teacher's knowledge of ends, purposes and values of education is perhaps the most important part of teachers' professional knowledge. This kind of knowledge includes the following issues: the visions on what is possible in pedagogy, how a pedagogically well-functioning school might look like, what the students should become and how good education can be defined. In Finland, for example, the holistic growth of students is emphasized in the national curriculum with the aim to educate them to be good citizens who contribute to the society with their talents. This goal of education assumes that the teacher has internalized the values and purposes in education and can actualize them in her teaching. In addition to these general pedagogical values, the teacher needs to be aware of the subject-specific values of each subject taught. A current pedagogical challenge for Finnish teachers includes the task of curriculum integration. According to Niemelä and Tirri the need for an integrated curriculum emerges from current ethical and social issues in the world. Curriculum integration can be applied, for example, to teaching what climate change means and what can be done to stall, if not reverse it. Curriculum integration can also advance democratic education in schools with a pedagogical purpose of meeting the needs of diverse students.

46 NSOU ? CC-ED-06 To be able to act as an ethical professional with a long-term commitment, a teacher needs a personal purpose for her work. William Damon and his colleagues have defined the term "purpose" as "a stable and generalized intention to accomplish something that is both meaningful to the self and of intended consequence to the world beyond the self". Tirri argues that to meet the criteria of a purposeful teacher, three criteria need to be met. They include intention, engagement and prosocial reasoning. Purposeful teachers are those professionals who have internalized the moral core of pedagogy and the long-term goals in education. Those goals need to be both personally meaningful for a teacher and at the same time go beyond herself to serve her students holistic growth. Vygotsky (1967/2004) defines imagination as the ability of the mind to combine perceptions from reality into new forms through processes of disassociation and association, developed through the emotions. Warnock (1976, p. 10) describes imagination as 'that which creates mental images', a function that is activated in ordinary perceptions of our environment. These perceptions may be emotional as much as they are intellectual. White (Egan & Judson, 2009) characterises imagination as 'our ability to think of the possible'. Gallas (2001, p. 460) states that creativity is 'action in the mind and the world', or a further transformation of images and ideas formed by the imagination. Robinson (2006) argues that creativity is a process of having original ideas of value. According to Vygotsky (1967/2004, p. 71), play is the initial expression of imagination and 'the root of all creativity in children', followed by drawing and storytelling. In these three forms, elements of reality gained from prior experience are combined in new ways to meet children's desires and interests. Several scholars posit that imagination, thinking and learning are imbued with emotion, and it is at this intersection that creative responses emerge (Bodrova & Leong, 1996; Egan 2005; Vygotsky, 1967/2004). Research in neuroscience supports this assertion, describing the nexus between high reasoning and emotion as the basis for creativity and learning (Immordino-Yang & Damasio, 2007). Burnard et al (2006) research identified some features of 'possibility thinking' in young children in early years settings. This thinking involves posing questions, play, immersion, innovation, risk-taking, being imaginative and exercising self-determination. Artistry of Teaching Learning : Recent research about teaching for imagination and creativity in educational contexts has focused on child development, literacy learning and play in the pre-school years. Rather than relying on the long-held view that children's prior knowledge should be the basis for all new knowledge, Kieran Egan (2003) took the provocative stance of

47 NSOU ? CC-ED-06 considering what the child can imagine as the starting point for learning. Smith and Mathur (2009) recently offered a comprehensive review of research into the developmental effects of imaginative activity on children from preschool to adolescence. The authors found that children showed increased emotional regulation, empathy and cognitive ability when engaging in play, and language, literacy and drama activities designed to elicit imaginative responses. Gallas' (2001) extensive ethnographic research in school settings positioned imagination as central to literacy learning, and argued that teaching 'must become an imaginative, inside/out process that places student action and interaction at the center'. These findings challenge traditional teacher control of the classroom as children collaborate and improvise, and the teacher immerses her/himself in play with children, using a less scripted pedagogical stance (Gallas, 2001). Recent research into play pedagogies in the pre-school years, prioritized adult- child interactions and co-construction of meaning (Goouch, 2008; Lindqvist 2003). Similarly, Kudryavtsev (2011) noted the key role of teachers in engaging children creatively. Further support for this prioritizing comes from the findings of Bilton (2012) and Siraj-Blatchford (2010) who pointed to the role of teacher-child interactional quality in promoting children's thinking. The present study does not address specific curriculum areas, however, as the previously cited literature indicates, play and adult- child interactions are likely to be relevant to the study of children's imagination and creativity. Further to studies about curriculum areas and play, researchers have been interested in conceptual ideas about teaching for imagination and creativity that translate into classroom strategies. Researchers have expressed concern about the effect on children's imagination and creativity of pedagogy that separates intelligence and creativity (Robinson & Azzam, 2009). Robinson (2006) condemned schools for penalizing children's mistakes, as it is the willingness to risk being 'wrong' that gives license to creativity. Sternberg (2003) proposed that teachers and learners conceptualize the development of creativity as essentially a 'decision-making process'. He stated that strategies that enable teachers and learners to choose creativity include the tolerance of ambiguity; encouraging sensible risk taking; teachers modeling creative thinking; helping children believe in their creativity; allowing mistakes; teaching children to consider others' perspectives; and giving time for creative thinking. Research on the use of these strategies has found that their use improved school achievement (Sternberg, 2003). These studies, however, were conducted with children over eight years of age, with some participants identified as gifted. Further research on teaching is required on younger children and children in mainstream classrooms. Researchers in the United Kingdom have paid considerable attention to pedagogies that promote children's imagination and creativity. Woods' (1990) research into the

48 NSOU ? CC-ED-06 practices of creative teachers found four factors, innovation, ownership, control and relevance, to be central to their pedagogy in school settings. Research conducted in preschool and early years settings has found that teaching for creativity involves 'the passing of control to the learner and the encouraging of innovative contributions'; teachers valuing learners' 'ownership and control'; 'encouraging children to pose questions, identify problems and issues'; 'offering children the opportunity to debate and discuss their thinking'; 'encouraging children to be co-participant in learning'; and 'prioritizing learner agency' (Jeffrey & Craft, 2003, Craft, 2005). Jeffrey and Craft (2004) used Woods' (1990) framework to examine the distinction between teaching creatively and teaching for creativity, finding that this dichotomy does not reflect the reality of teaching. The authors suggested that research should focus on the experiences of the learner and the teacher (Jeffrey & Craft, 2004). Cremin, Burnard, and Craft (2006, p. 108) have described, from the perspectives of early years teachers, the pedagogy of 'possibility thinking', or that which can be imagined. The findings revealed three common strategies. 'Standing back' refers to teachers literally removing themselves from involvement in children's activities to observe emerging understandings. 'Profiling learner agency' describes teachers as resources that can advance children's thinking, by ensuring children have many opportunities to make choices about their learning. The authors also identified 'creating time and space', which is the ability of the teacher to 'stretch' time to allow deep immersion in the learning experience to ensure the physical space of the classroom affords opportunities for learning (Cremin, Burnard, & Craft, 2006, p. 115-116). The findings of these key studies contributed to the data analysis process in the present research. An effective teacher has a wide-ranging repertoire of different teaching and learning models, strategies and techniques and knows how to create the right conditions for learning. The choice is determined by the nature of the learning objective. The Key Stage 3 National Strategy booklet Key messages: Pedagogy and practice provides guidance on the relationship between pedagogic approaches (teaching models), teaching strategies, techniques and methods of creating the conditions for learning in order to inform lesson design. The units are divided into four distinct colour-coded categories: Designing lessons, teaching repertoire, creating effective learners and creating conditions for learning. The units in the Creating effective learner's category support the three Key Stage National Strategy of whole-school initiatives. The study guides do not require teachers to attend any external course, although they do complement the Key Stage three National Strategy's training. A unit requires about five hours of study and five hours of work in the classroom. Each contains :

49 NSOU ? CC-ED-06 • A clear presentation of the main ideas; • Case studies; • Tasks and classroom assignments; • Practical tips; • Opportunities for reflection; • A summary of related research; • Suggestions for further professional development and guidance; • An opportunity to set future targets, perhaps related to performance management; • Accompanying video sequences. Scope of Pedagogy as Art of Teaching : A. Designing lessons Unit : Structuring learning : This key unit provides teachers with a model for the process of designing lessons. It starts by considering factors affecting lesson design, including the influence of the type of learning objective on the choice of approach. It goes on to explore effective methods of sharing learning objectives with pupils. There is guidance on how to structure learning by splitting lessons into a series of episodes, and on choosing from a range of strategies and techniques to motivate pupils. Finally, there is an examination of three pedagogic approaches - direct interactive, inductive and exploratory - to show how they can help pupils develop tools for learning, such as inductive thinking or enquiry skills. Teaching models : This unit develops further the principles and practice of teaching reviewed in unit 1. It explores a range of teaching models and encourages teachers to review their teaching practice against the models described. For each teaching model outlined, episodes are clearly defined showing how the model might be applied in classrooms. There are also some examples to illustrate ideas, and the importance of metacognition within each is made explicit. This will enable pupils to use the technique to support their own learning. Lesson design for lower attainers : This unit explores a range of strategies and techniques that will help pupils who tend to learn more slowly. It demonstrates the importance of 'assessment for learning' - research has shown that lower-attaining pupils, in particular, make significant gains when these techniques are used. There are also guidelines on developing literacy and numeracy skills in the context of different subjects, and on strategies for aiding recall. Lesson design for inclusion : This unit considers some principles for ensuring the inclusion of all pupils in lessons, and how to hold them all into the learning process.

50 NSOU ? CC-ED-06 It provides a first insight into the needs of many groups that need to be included, such as boys, EAL, lower attainers, gifted and talented and SEN pupils. It considers various episodes in a lesson, such as starters and plenaries, and some early strategies that help to ensure all pupils are actively engaged and are able to make progress in their learning in all subjects. Starters and plenaries : The beginnings and ends of learning sequences are important. This unit describes the purpose and importance of starters and plenaries at the beginnings and ends of lessons, and also within lessons as part of teaching episodes. It provides a range of strategies and ideas as well as guidance on planning and making starters and plenaries effective. B. Teaching repertoire Modeling : Modeling is a powerful strategy that can be used across all subjects to help pupils to learn and to develop confidence in a new skill or procedure. This unit sets out the principles of this strategy and provides guidance on how to introduce modeling into lessons and make it effective. Questioning : This unit outlines the different types and purposes of questioning. It explains how to organize questioning for whole-class and group work, and offers strategies such as providing 'wait time' for making it effective. Bloom's taxonomy is used to provide a framework for planning questions that challenge and develop pupils' thinking. Alternatives to direct questioning are also explored. Explaining : This unit looks at the purpose of explanations in teaching and outlines the characteristics, features and skills of successful explanations. It explores different types of explanation, how to plan for them, which strategies are effective - particularly for those involving abstract ideas. It also provides guidance on how to support pupils in planning and articulating their own successful explanations. Guided learning : This unit explores how the principles and approaches involved in guided reading and writing can be used to support guided learning in subjects across the curriculum. It describes an instructional sequence for the teacher working with small groups, which is integrated into lessons to act as a bridge between whole-class teaching and independent work. It provides a range of examples and addresses practical questions of organization including time, classroom layout, management of behaviour and resources. Group work : This unit looks at how effective group work can help to improve pupils' speaking, listening, thinking, problem-solving and social skills. It emphasizes the need for establishing clear rules and procedures and sets out a range of techniques to ensure pupil engagement and cooperation, such as allocating roles and setting group

51 NSOU ? CC-ED-06 targets. Methods for structuring group work, such as 'snowballs', 'jigsaws', 'envoys' and 'rainbows', are suggested and the benefits and limitations of different grouping criteria explored. Active engagement techniques : This unit explores what is meant by engagement and why it is important. A range of strategies to motivate and engage pupils is examined, for example directed activities related to text (DARTs) to promote active reading, strategies to promote active listening, thinking strategies, and the use of drama across subjects. C. Creating effective learners Assessment for learning: This unit explores what is meant by assessment for learning and its importance. It explains how good assessment practice can contribute to better learning and higher achievement. This unit focuses on the key characteristics of assessment for learning and examines a range of practical strategies for incorporating these principles into classroom routines. Developing reading : This unit focuses on improving pupils' ability to understand and to respond to written texts. It considers teaching subject-specific vocabulary; how teachers can support pupils by clarifying the approach they need; how pupils need to access their prior knowledge before they read; some of the ways pupils can be encouraged to engage with text and some aspects of notetaking. It shows how the teacher can use shared and guided reading to enable pupils to develop more independence and skill as readers. Developing writing : This unit focuses on improving the quality of pupils' writing through actively teaching the techniques they will need. Pupils write best when they know what, how and why they have to write. Writing is often best taught through teacher modeling and then sharing the writing with the class. The route is from examples, modeled and shared work, through guided writing to independence. Using ICT to enhance learning : The use of ICT in classrooms enhances learning and teaching. This unit looks at the relationship between teachers' use of ICT as a medium for teaching and the development of pupil capability. There are guidelines on the use of classroom support assistants and technicians, on classroom management and on organization in the ICT-rich classroom. Leading in learning : This unit provides an introduction to thinking skills by clarifying the nature of higher-order thinking and different approaches to 'teaching' thinking. It also provides practical guidance for improving the teaching of aspects of thinking skills lessons, such as improving the teaching of the plenary, helping pupils to see the relevance of thinking in everyday contexts and developing their use of 'thinking words'.

52 NSOU ? CC-ED-06 Developing effective learners: Through the use of case studies, this unit explores what is meant by an effective learner, what learning skills might be expected of pupils at each key stage and how learning skills can be developed within subjects. D. Creating conditions for learning : Improving the climate for learning: The physical environment can make a significant difference to learning, and this unit explores how even small changes to the classroom can help. It looks at arranging furniture to suit the teaching approach and creating displays that really contribute to learning. Teacher-pupil relationships are another important factor in classroom climate, and the unit also describes how pupil expectation and motivation can be improved through the use of appropriate classroom language. Learning styles : This unit outlines some of the current thinking and research on learning styles. It provides advice on how to identify different learning styles but, more importantly, emphasizes the need to provide a variety of activities to suit different styles, over time. There is guidance on how to plan and adapt activities to accommodate visual, auditory and kinesthetic learners. Classroom management : The emphasis in this unit is on developing the concept of teaching behaviour that is conducive to learning. The fundamentals of good pedagogy and practice, which are explored in the other units, are the bedrock of successful teaching and learning. Consideration is given to the core values and beliefs which underpin the teacher's relationships with the pupils. Just as importantly, pupils' perceptions of effective teaching are examined. Pupils respond positively to clear structures and routines, and the teacher's verbal and non-verbal language is pivotal in securing and maintaining relationships for learning. 2.5 Pedagogy as the Science of Teaching : Understanding Science of Pedagogy Development of pedagogical practice follows that of the science of pedagogy in the research of scholars working on pedagogy in cooperation with experienced and reflection of practicing teachers, who have developed theory and pedagogical process with its complex character and traditional culture-oriented education focused on an individual's overall development as a person (Dauge, 1932). Learning and teaching as the central actions/activities in pedagogy foster the learner's, as well as teacher's development by using the subject matter as a pedagogical tool, while teaching and learning being implemented in cooperation and communication open new possibilities for value and attitudinal exchange as an educative goal. Teachers, or even parents, can hardly influence the learners' views, values, and ideals in a direct way; rather the

53 NSOU ? CC-ED-06 values coming from the external sphere can be facilitated and fostered through the learner's actions and communication and by targeted and meaningful development of the learners' self-conducted action. This conception underpins the learner's position as a subject of his/her activities and teacher assistant's role that manifests itself in a transition from learner-centeredness to learner's learning-centeredness. The latter emphasizes learner's action/activity/learning being an object of teachers' developmental assistance, which if coupled with respecting Learner's individual qualities enables his/ her meaningful learning-by-doing (intellectual or physical). Currently a complex understanding of pedagogy is not limited by European borders. The Gordon's Commission in the USA affirms an integrative understanding: pedagogy,- the central mechanism operative in education is interactively and trans-formatively inclusive of assessment, teaching, and learning (The Gordon Commission, 2012,). Distinguishing between the science of pedagogy and the practice of pedagogy avoids reducing pedagogy to methods of teaching, leads to integrity and educative value of deliberate education in both aspects and as a process and as learner's achievements; this also strengthens the background for pedagogy as a university discipline. Lost integrity functions as an obstacle for achieving competencies; these are complex in their nature. Competence-oriented education in organized (formal or non-formal) processes does need a clear, stable and strong theoretical background that is provided by the science of pedagogy. The latter in Latvia has developed all basic components to function in a capacity of a science and university discipline, it has attributes which need not be borrowed from other sciences (Gudjons, 1995, 33 – 35). Research is also being successfully developed for this specific area (Pipere et al., 2015). The development of the science of pedagogy as a European intellectual tradition has been long and saturated; it has been interrupted by the notion of education sciences being a tradition of the Anglophone countries; this reminds that societies live in transmission and education is in constant transformation. Political changes in the early 1990s triggered discussions over the paradigms of education, the essence of pedagogy and education sciences. It is worth reminding that discussions usually aim at more relevant definitions of the phenomena being discussed. By that time pedagogy had already been defined to a certain extent, by accentuating its practical component while education sciences are still waiting to be appropriately defined. Several research projects had been supported by the Latvian Council of Sciences and publications released, among them also in the issues by the Academy of Sciences. Here are some of these: pedagogical regularities (Žogla, 1995), considerations on the definition and object of pedagogical science; research and sub-branches of pedagogy (Kopeloviea&Zukovs, 2001, 1719); the definition and state of matters reported at the

54 NSOU ? CC-ED-06 Department of Humanities and Social Sciences of the Latvian Academy of Sciences (Žogla, 2005). A challenging participation in a project on educational studies conducted by Oxford and London Universities () raised the intellectual tradition of Latvia to a world-class discussion on the essence of pedagogy in its three capacities: science, practice and discipline. Over the past decades, attention to pedagogy has been noticeable, and this is evidence of its growing importance and a need to understand the well-structured theory operating in the discrete field of education. Different visions meet by approaching the notion of pedagogy from very different perspectives and conceptual standings (Waring & Evans, 2015): the science, craft and art (Pollard, 2010); the science of teaching (Watkins & Mortimore, 1999), dynamic process, informed by theories (Leach & Moon, 2008), multiple interactions which we call instructional dynamics and a defining feature of education. Recently a wider understanding of pedagogy appears in the Anglophone countries, and this inspires, as well as helps describe the understanding, in which neither teaching nor learning alone cover the term pedagogy, especially the science of pedagogy with its vast and complicated field of investigation. There is a promising comment that in terms of its European traditions pedagogy entails more than just teaching, it involves two aspects of learning. The first is associated with what and how students are learning; the second is about the teacher as a learner. Thinking about pedagogy in this way helps to highlight teaching as an educative process for both partners in their relationship rather than a set of technical skills (Loughran, 2010, 36 - 37). Thomas Coram Research Unit of London University investigates pedagogy and argues that children and young people are being seen as persons in their own right, rather than as problems to be managed (Petrie et al., 2009). Pedagogy as practice appears when two people with entirely different actions, those of learning and teaching are involved by the program/curriculum; pedagogy as science and its theoretical framework are needed to create a coherent process that is adjusted to the learners' needs. Teachers and learners follow different aims and motives, use different background knowledge and tools, and still their attempts have to be met. This joint venture allows for transitions from a normative to a learner learning-centered process with the learners' meaningful participation in creating, conducting and evaluating the process where the learner has to achieve; that is leading to learners' autonomy in learning and development, as well as to teachers', learners', parents and other stakeholders overcoming the growing complexity and transferring their way of thinking. Only specialists identify that real accomplishments of a pedagogical professional philosophy towards humanistic process, as well as objectives and tools chosen by teachers and adopted by learners appear when the formal inclusion of the both grows into a meaningful engagement. Learners' engagement in classroom and school, university or kindergarten settings with organized

55 NSOU ? CC-ED-06 cooperation and communication happens when teachers' assistance actualizes the learners' need for significant activities to accomplish assignments or chosen activities, when academic goals obtain meaning for learners and they achieve new or improve their personal qualities; here sits the object of the science of pedagogy to create adequate mutual relations that initiate a transition in teacher and learner understanding from rather generalized outcome-oriented process to learner achievement-oriented pedagogy. In the Latvian traditions, the practice of pedagogy creates and the science of pedagogy investigates inner dynamic links between teacher, learner and the content in social, deliberately organized integrative settings where teachers' and learners' activities and communication are mutually dependent, their orchestrated actions and communication lead to the learners' autonomy. Teachers' and learners' reflection and self-evaluation add to the achievements of the both, as well as to the educative value of the process. Research, therefore, attempts to detect pedagogical regularities in diverse settings and confront the criteria that confirm the constants, find not only a synthesis between pedagogy and the ever-changing disciplines that relate to it, but also to transform or translate the theoretical assumptions of these disciplines into pedagogical notions when two responsible people, the teacher and learner, analyses, co-construct the pedagogical process and co-operate on a basis of solidarity (Klafki, 1990, 95). Debates and disagreements over the form, content, and control of educational knowledge are central to understanding the discipline (Furlong, 2013); the new teacher education rests on a multidisciplinary theoretical framework (Cochran-Smith, 2005); it exists in transitions and therefore needs a key juncture. All this knowledge and understanding, pedagogical professional thinking and the ability to operate professionally should be learned by teacher students; the essence of a quality university discipline exists in a research-based transition from acquiring the profession to a self-directed creation of professional competencies. J. J. Paget's and L. Vygotsky's theories have been well-known since the 1930s and used to underpin the investigations towards understanding the practice and science of pedagogy. The theory of the zone of proximal development was especially productive for pedagogy as a teachers' philosophy-in-use: learning always precedes development and pulls along the learners' experience (Vygotsky, 1978). This concept highlights where the learner's autonomous learning slows down due to his/her limited possibilities and how assistance can speed it up, empowering further learning by addressing his/her experience, preserving its developmental and motivating value, and by doing so creating the dynamic links within a pedagogical process. These links are needed for personalization of the process and self-regulation that leads to a learner's holistic development.

56 NSOU ? CC-ED-06 Teachers usually in classrooms and pedagogues in other social settings provide pedagogical provision by following the same pedagogical regularities; therefore, the science of pedagogy that underpins the practices of pedagogy should be considered common for teachers, pedagogues and other professionals in the sphere of organized education. Therefore, pedagogy as a university discipline can be found in programmes, for instance, of nurses and doctors. Practice of pedagogy is sensitive towards diversity and commonalities in human development; therefore, common theoretical assumptions and practical strategies are adjusted to the current needs of the learners, peculiarities of the situation and new possibilities, like those of IT, commonalities become individually different and manifest themselves in learner's activities. Therefore, four sub-systems of digitally mediated action (Blayone, 2018) are considered relevant: a) Relating to building and maintaining human-machine pairings and meta- functional, technical and operational; b) Mediating cultural expression addresses internalization and externalization largely determined by rules and values of participating communities; c) Automatization of actions by reducing them to formal procedures (algorithms) run by a machine d) The most complex sub-system addresses digitally-mediated collaboration. This novelty needs to be pedagogically equipped in its three capacities ñ theory, practice, university discipline by undergoing further transition from individualization of organized pedagogical processes to personalized ones. Meanwhile, discrete notion of education sciences occupies a large area of human activities; and only pedagogy and educational management are developed in the capacity of science. Besides, the science of pedagogy (theory and practice of formal education) cannot be fully identified with the education sciences, since it can only be one of these; the term of education sciences is too often used in limited aspects and outside scientific contexts. For instance, the government's regulations mix up these two categories within one and the same document (Saeima, 2012). The government also points to the growing dominance of PISA as a powerful tool : a) To initiate and justify the educational developments by comparing figures related to education; b) To use its technical capacity for the national indicators for benchmarking and initiating further educational changes. Programme for International Student Assessment (PISA) and Organisation for Economic Co-operation and Development (OECD) projects are conducted in Latvia under the title of Education Sciences; these investigations are highly informative and seldom produce theories, at least by projects conducted in this country.

57 NSOU ? CC-ED-06 If compared to other fields of human activities, methods or strategies of pedagogy cannot be precisely repeated even in similar situations. This leads to the opinion that pedagogy is an art. In these cases understanding of theories and constant regularities are helpful. Multiple meanings and nuances of situation-dependent pedagogical actions, being based on complex knowledge, ceases when these no longer make sense to the learner and why interaction between learners and between learners and teachers stops. Teacher's action consists of the mediation between the proper configuration of subject content and the structured learning activities which the teacher has designed for the learners (Jank& Meyer, 1994, 81) leaving space for the learners' self-evaluation and autonomous choice. To conclude on the core features of pedagogy, D. Bellís' assumption seems to be very relevant: Typically, transformational pedagogy is seen to include the following features: action-oriented; inquiry-based and systems-based learning; integrated, holistic approaches; creative use of technology. The following definitions reflect an understanding of science and practice of pedagogy and are suggested for discussion: Pedagogy is an integrated humanistic and social science which investigates regularities of combined and unique, focused on the content of learning interactions, communication and mutual relations that occur in this process and constitute a specific research object. Pedagogical practice is mainly represented by organized pedagogical processes which are created on the background of pedagogical theories and specifically aim at achieving an educative goal. Realization of this deliberate goal occurs through internal, dynamic connections activated by targeted, organized, goal-oriented educational processes, which transform mankind's intellectual and cultural values into the meaningful educational, developmental and educative content to facilitate the acquisition of these values by participants of the process and to foster their personal development and self-actualization (Žogla, 2017). Science of pedagogy constitutes teacher's philosophy-in-use (Hessens, 1929) and manifests itself in practice of pedagogy. Teachers like any other professionals have to cover their university discipline, and that is science and practice of pedagogy ñ the theoretical background for teachers' pedagogical thinking and creating their professional competence. The core functions of the university discipline usually represented by a cluster of study subjects are as follows : a) To provide students with possibilities of creating teacher's strategic knowledge; understanding of the essence and development of humans lead to pedagogical regularities for appropriate integrating teaching, learning and the subject matter/ content and initiating a congruent pedagogical process towards the learners' engagement in the highest quality of learning together;

58 NSOU ? CC-ED-06 b) To develop students' ability of selecting appropriate pedagogical tools adopted by learners; these address and challenge the learners' diverse and developing needs in changing situations, growing amount of knowledge and possibilities provided by the digital environment; c) To facilitate teacher's professional integrity and identity that manifest themselves in building relationships on the foundation of communication and collaboration with the learners by treating them as a whole developing person. Pedagogy as a science, practice and discipline has been developed as a holistic, personalized system to assist learners or work with children, young and even elderly people (also called Andragogy) in formal and non-formal educational settings in the majority of European countries ñ Germany, Austria, Poland, Greece, Scandinavian countries etc. A pedagogue's ability of generalizing and adjusting interventions is popular also for enterprises: the science of pedagogy provides an overarching system that could bring greater coherence to educational services. It provides a framework for discussing and adopting aims, activities and evaluation of achievements for learners at any age as it deals with general constant regularities of a pedagogical process. Qualifications and degrees in pedagogy are popular due to its clear structure and system of theories being in non-stop research-based development; the graduates report their acceptance of pedagogy in European countries in different spheres where relations among people dominate as a value for their pedagogical skills that make them well equipped, flexible and stable workforce across a wide range of services, as well as governmental and non-governmental institutions (mentors for novices or refugees, nurses, trainers, coaches etc.). Pedagogy has the potential for an inclusive, integrating and engaging approach due to its core functions and clear internal system of notions, which allows for coherent mutually related actions of teaching and learning based on communication, cooperation and mutual relations. Inner constant regularities of a pedagogical process provide congruence that is among the basic criteria for research, action-based and process-oriented educational provision; the background theories of humanities allow for value exchange.

2.6 Summary In this Unit you have learnt :

- Pedagogical process is a deliberate process of intentional teaching and learning is a process for living (Dewey, 1963). Pedagogy is interdisciplinary, it functions as the theory or science and teachers' professional philosophy, academic discipline and practice, meets the general requirements to achieve educational, developmental and educative goals in their integrated quality; and these are in compliance with the integrity of human's physical, mental and social nature.

59 NSOU ? CC-ED-06 • Furthermore, pedagogy is impoverished if it is disconnected from the capacity and responsibility to engage in curriculum development and to deploy a range of appropriate assessment methodologies. Pedagogy is generally regarded as the 'art and science of teaching'. Pedagogy encompasses the psychological, cultural, political and socio-emotional processes of teaching young children, and is not to be confused with curriculum (Ryan & Hornbeck, 2007). Craft (2005), defines pedagogy 'as encompassing appropriate and defensible professional judgments about how teaching is undertaken and learning nurtured', implying that pedagogy requires a sound theoretical basis. Pedagogy is influenced by classroom and school contexts.

- Pedagogic expertise can be thought of as a combination of science, craft and art (see diagram); this notion helps us to understand the complementary needs for collectively created knowledge, professional skills and personal capacities. It is also important to remember that all these are grounded in ethical principles and moral commitment - teaching is never simply an instrumental activity, a question just of technique.
- Didaktik is a curriculum tradition guided by the philosophy of Bildung and the idea of educating instruction, *erziehende Unterricht*, in educational institutions. In that tradition, the pedagogical relation between the teacher and students, the content relation of a teacher to the subject matter and the didactic relation of a teacher to students' learning are seen as core elements in the teaching-studying-learning process. The Didaktik curriculum tradition in which values and morals are emphasized in guiding the teaching-studying-learning process and in educating pupils as whole. This means that pedagogy is moral in nature, and the teacher's main task is to reflect the values underlying his / her teaching and the purposes she wants to advance in her teaching.
- Scope of Pedagogy as Art of Teaching: A. Designing lessons unit B. Teaching repertoire C. Creating effective learners D. Creating conditions for learning
- Science of Pedagogy indicates that learning and teaching as the central actions/ activities in pedagogy foster the learner's, as well as teacher's development by using the subject matter as a pedagogical tool, while teaching and learning being implemented in cooperation and communication open new possibilities for value and attitudinal exchange as an educative goal. Teachers, or even parents, can hardly influence the learners' views, values, and ideals in a direct way; rather the values coming from the external sphere can be facilitated and fostered through the learner's actions and

60 NSOU ? CC-ED-06 communication and by targeted and meaningful development of the learners' self- conducted action.

- Vygotsky's theories have been well-known since the 1930s and used to underpin the investigations towards understanding the practice and science of pedagogy. The theory of the zone of proximal development was especially productive for pedagogy as a teachers' philosophy-in-use: learning always precedes development and pulls along the learners' experience (Vygotsky, 1978). This concept highlights where the learner's autonomous learning slows down due to his/her limited possibilities and how assistance can speed it up, empowering further learning by addressing his/her experience, preserving its developmental and motivating value, and by doing so creating the dynamic links within a pedagogical process.
- In higher education, the core pedagogical functions supposed to ensure : a) To provide students with possibilities of creating teacher's strategic knowledge; understanding of the essence and development of humans lead to pedagogical regularities for appropriate integrating teaching, learning and the subject matter/ content and initiating a congruent pedagogical process towards the learners' engagement in the highest quality of learning together; b) To develop students' ability of selecting appropriate pedagogical tools adopted by learners; these address and challenge the learners' diverse and developing needs in changing situations, growing amount of knowledge and possibilities provided by the digital environment; c) To facilitate teacher's professional integrity and identity that manifest themselves in building relationships on the foundation of communication and collaboration with the learners by treating them as a whole developing person.

2.7 Self-Assessment Questions

1. What are the theoretical assumptions of Dewey about Pedagogy as a social process?
2. Pedagogy is not mere teaching strategy it's much more than that- justify the statement.
3. Explain that Pedagogy is the artistry of teaching and learning.
4. Explain 'Didactical Triangle'.
5. Mention the steps of learning design preparation.
6. Briefly illustrate Vygotsky's idea about the art of teaching.
7. What is meant by Science of Pedagogy?

61 NSOU ? CC-ED-06 8. Briefly explain the core functions of a teacher in pedagogic practice. 9. Discuss the Scope of Pedagogy as Art of Teaching. 10. Justify that pedagogy is neither exclusively arts nor exclusively science rather it's a combination of both. 2.8

3.1 Objectives In this Unit, we have tried to introduce you to the basic concepts of Teaching. Apart from conceptual issues, the process of teaching is also being discussed with illustration with related factors and skills associated with teaching with examples. After the end of this unit you should be able to :

- Explain concepts and principles of teaching.
- Discuss teaching as a process with explanation and exemplification.
- Explain the distinct features of three different phases of Teaching.
- Justify the relevance of 3R issues in teaching.
- Explain verbal conditioning as a factor of teaching.
- Give reason how psychomotor skills can influence the process of teaching.

65 NSOU ? CC-ED-06 3.2 Introduction In this unit of course structure, the core concept of Teaching is being discussed. Teaching is a complex process, hence the need to understand it as a sequential step by step authentic series of activities designed by the teacher. As it has already been mentioned in the previous unit that teaching is a performing arts. And such performing arts follow a particular pattern of action guided by certain principles. Hence teaching is a process result of which is reflected in terms of the learning outcome of the learner. We will introduce you to the concept, principles and function of teaching as well as three different phases of teaching-respectively Pre-active, Interactive and Post-active. You will also be exposed to the concept of 3Rs and verbal conditioning and psychomotor skills as factors associated with teaching. 3.3 Teaching : Concepts, Principles and Functions 3.3.1. Concepts of Teaching Teaching as a concept is quite ambiguous and complex. There are several meanings attached to this concept traditionally. Researchers on teaching have recently advanced their own definitions of the term while philosophers of education and educational psychologists have emphasized quite different theoretical orientations from time to time. A non-professional interprets teaching to be a kind of coaching done systematically at a particular place at a particular time and through the agency of an appointed person. In much modern usage, the words 'teaching' and 'teacher' are wrapped up with schooling and schools. One way of approaching the question 'What is teaching?' is to look at what those called 'teachers' do - and then to draw out key qualities or activities that set them apart from others. The problem is that all sorts of things are bundled together in job descriptions or roles that may have little to do with what we can sensibly call teaching. Another way is to head for dictionaries and search for both the historical meanings of the term and how it is used in everyday language. This brings us to definitions like: Impart knowledge to or instruct (someone) as to how to do something; or Cause (someone) to learn or understand something by example or experience. As can be seen from these definitions we can say that we are all teachers in some way at some time. Further insight is offered by looking at the ancestries of the words. For example, the origin of the word 'teach' lies in the Old English *tæcan* meaning 'show, present, point out', which is of Germanic origin; and related to 'token', from an Indo-European root shared by Greek *deiknumi* 'show', *deigma* 'sample'.

66 NSOU ? CC-ED-06 Lexicographers define teaching as imparting knowledge or skills, giving instructions or lesson, inspiring, assisting another to learn, providing information of appropriate situations, conditions or activities designed to facilitate learning Flanders (1970) explains teaching as a transactional activity between the teacher and taught .He says that teaching behavior by its very nature exists in the context of social interaction. The act of teaching leads to reciprocal contacts between the teacher and the learners and the interchange itself is called teaching. Ronald T. Hyman observes that teaching involves a triad of elements (the teacher, the learner, the subject matter) and this triad is dynamic in quality. He rightly asserts that the nature of teaching cannot be understood properly by looking at only one or two of the elements of the teaching relationships or by thinking of teaching as dyadic. Thus, all the three elements must be considered together in order to understand the interaction recurring during teaching. In this frame of reference, a teacher needs not only to be aware of his aim of teaching but also of his relationship with his learners and the subject matter and the learner's relationship with the subject matter. Also, it prevents the teacher from trying to teach the 'syllabus' as handed out by the department as it constitutes a static and not a dynamic relationship between teacher and subject matter. B. F. Skinner (1968) defines teaching as 'the arrangement of contingencies of reinforcement'. K. Mitra in his national lecture at the Center of Advanced Study in Education, defined teaching 'as a series of acts carried out by a teacher and guided by the formulation of teaching tasks in a formalized instructional situation'. The aforementioned definitions of teaching bring out the following qualities about concept of teaching : 1. Teaching is a system of activities. In other words, it is a number of logically contrived sets of activities having a specific structure, form and orientation. 2. Teaching aims at changing others or causing learning in others. Without a suitable goal or objective, no worthwhile teaching can be arranged. 3. The core of the teaching act is increment between teacher, learners, and subject matter. Thus it is by its very nature a social enterprise involving dynamic interaction among a triad. 4. Teaching involves an influence orientation where the direction of focus of control is from the teacher to the learner. 5. Teaching does not just occur, rather it is a planned and an implemented set of activities in an interactional setting in terms of the prior thought about the learning goals, instructional strategies and the subject matter configuration.

67 NSOU ? CC-ED-06 6. As it is practiced, teaching implies an 'intentional' rather than 'success' act. In other words, when a teacher engages in the act of teaching, his intention is to cause learning but he may or may not succeed in the achievement of this goal. It is for this reason that we often debate the 'effectiveness' of teaching from one situation to the other. 7. The verbal action and use of language at various levels constitutes the predominant feature of teaching in any context. The analysis of teaching acts is therefore, quite frequently conducted with the help of data collected from the verbal behaviour of teachers. It may, however, be useful to remember that both verbal and non-verbal parts of teaching behaviour occur simultaneously and function in close juxtaposition to each other in order to accomplish the necessary effect. The critical attribute of teaching involves 'reasoning' and 'an enlightened analysis of facts'. It is not concerned with bare listing or relaying of facts in a mechanical fashion. The entire teaching act can be explained in terms of three definite phases within it - the introductory or orientation phase; the development and fixation phase; and the evaluation phase. The introductory or orientation phase involves the presentation of the new information and concept or behaviour. The development and fixation phase implies their establishment in the repertoire of the learner and the evaluation phase indicates the point where the designer of the instructional system checks the extent of learning having occurred. The teaching act by itself can also be prefixed and suffixed with two different stages. The prefix is now given a name of 'pre active' stage and the suffix is called the 'post active' stage of teaching. In the pre active stage, the goals of teaching are decided, the content of presentation is identified and the strategies and tactics for interaction setting are planned. In the post active stage of teaching, the events of the interactive stage are analyzed in retrospect and decisions for further interaction in a face to face set up are taken. The interactive stage is the actual teaching conducted by the teacher when he is before his learners. The understanding of above qualities of teaching would remain useful to understand the models of teaching, the frame of this investigation. 3.3.2. Principles of Teaching : What one person sees as good teaching can easily be seen as bad by another. Here we are going to look at what the Ofsted (2015) framework for inspection says. However, before we go there it is worth going back to what Paul Hirst argued back in 1975 and how we are defining teaching here. Our definition was: Teaching is the process of attending to people's needs, experiences and feelings, and making specific interventions to help them learn particular things.

68 NSOU ? CC-ED-06 We are looking at teaching as a specific process - part of what we do as educators, animators and pedagogues. Ofsted is looking at something rather different. They are grouping together teaching, learning and assessment - and adding in some other things around the sort of outcomes they want to see. That said, it is well worth looking at this list as the thinking behind it does impact a lot of the work we do. a judgment may be made with specific frame work of rubric on the effectiveness of teaching, learning and assessment by evaluating the extent to which: Teachers, practitioners and other staff have consistently high expectations of what each child or learner can achieve, including the most able and the most disadvantaged Teachers, practitioners and other staff have a secure understanding of the age group they are working with and have relevant subject knowledge that is detailed and communicated well to children and learners Assessment information is gathered from looking at what children and learners already know, understand and can do and is informed by their parents/previous providers as appropriate Assessment information is used to plan appropriate teaching and learning strategies, including to identify children and learners who are falling behind in their learning or who need additional support, enabling children and learners to make good progress and achieve well Except in the case of the very young, children and learners understand how to improve as a result of useful feedback from staff and, where relevant, parents, caregivers and employers understand how learners should improve and how they can contribute to this Engagement with parents, caregivers and employers helps them to understand how children and learners are doing in relation to the standards expected and what they need to do to improve. Equality of opportunity and recognition of diversity are promoted through teaching and learning. Where relevant, English, mathematics and other skills necessary to function as an economically active member of British society and globally are promoted through teaching and learning. We see some things that many will not disagree with like having high expectations of learners, knowing what the needs of the group may be, having expertise in the area being taught; recognizing diversity and having a concern for equality of opportunity; and so on. We may also see the role that assessment plays in reinforcing learning and helping to shape future learning. However, there are things we may disagree with. Perhaps more importantly there are all sorts of things missing here. For example, why is there an emphasis on economic activity as against social, religious and political participation? Another issue, for many of you reading this, is possibly the way in which little account is made of the extent to which learners take responsibility for their own learning. They are encouraged to contribute to learning but not own it.

69 NSOU ? CC-ED-06 Good teaching is rather more than technique according to Parker J. Palmer. Good teaching, he says, 'comes from the identity and integrity of the teacher' (Palmer 1998). It is the way we are experienced, our enthusiasm, our care, our knowledge, our interest in, and concern for, people that is the key to whether we are felt to be good teachers. As Beere (2012) and others have argued we need to be present as people in the classroom or learning environment. This is not to say that technique isn't important. It is. We need to be skilled at scaffolding learning; creating relationships and environments for learning; and catching teaching moments. It is just that these skills need to be employed by someone who can be respected, is experienced as real and is wise. Therefore, principles of teaching can be summarized as follows : • Principle of using previous knowledge • Principle of providing for individual difference • Principle of readiness • Principle of meaningfulness • Principle of defining specific objectives of the lesson • Principle of proceeding from simple to complex • Principle of proceeding from concrete to abstract • Principle of proceeding from general to specific • Principle of proceeding from known to unknown Guiding Principles in the Selection and Use of Teaching Strategies : The more senses that are involved in learning, the more and the better the learning. Approaching teaching as a process Some of the teaching we do can be planned in advance because the people involved know that they will be attending a session, event or lesson where learning particular skills, topics or feelings is the focus. Some teaching arises as a response to a question, issue or situation. However, both are dependent on us: • Recognizing and cultivating teachable moments. • Cultivating relationships for learning. • Scaffolding learning - providing people with temporary support so that they deepen and develop their understanding and skills and grow as independent learners. • Differentiating learning - adjusting the way we teach and approach subjects so that we can meet the needs of diverse learners.

70 NSOU ? CC-ED-06 • Accessing resources for learning. Adopting a growth mindset. • Adopting a growth mindset. 3.3.3. Functions of Teaching: The very core purpose of Teaching is Fostering learning. To make sense of this it is worth turning to what philosophers of education say. Interestingly, the question, 'What is teaching?' hasn't been a hotbed of activity in recent years in the UK and USA. This says something about the state of schooling and of university departments of education in these countries. A lot of attention has been given to what is good, great or effective 'teaching', and not much to what actually teaching is. However, as Paul Hirst (1975) concluded, 'being clear about what teaching matters vitally because how teachers understand teaching very much affects what they actually do in the classroom'. Hirst (1975) makes two very important points. For him teaching should involve: a. Setting out with the intention of someone learning something. b. Considering people's feelings, experiences and needs. Teaching is only teaching if people can take on what is taught. We can begin to weave these into a definition - and highlight some forms it takes. Teaching is the process of attending to people's needs, experiences and feelings, and making specific interventions to help them learn particular things. Interventions commonly take the form of questioning, listening, giving information, explaining some phenomenon, demonstrating a skill or process, testing understanding and capacity, and facilitating learning activities (such as note taking, discussion, assignment writing, simulations and practice). Let us look at the key elements : 1. Attending to people's feelings, experiences and needs Considering what those we are supposed to be teaching need, and what might be going on for them, is one of the main things that makes 'education' different from indoctrination. Indoctrination involves knowingly encouraging people to believe something regardless of the evidence (Snook, 1972). It also entails a lack of respect for their human rights. Education can be described as the 'wise, hopeful and respectful cultivation of learning undertaken in the belief that all should have the chance to share in life' (Smith 2015). The process of education flows from a basic orientation of respect - respect for truth, others and themselves, and the world (op. cit.). For teachers to be educators they must, therefore: Take into account people's needs and wishes now and in the future. Consider what might be good for all and the world in which we live.

71 NSOU ? CC-ED-06 2. Plan their interventions accordingly. There are a couple of issues that immediately arise from this. First, how do we balance individual needs and wishes against what might be good for others? For most of us this is probably something that we should answer on a case-by-case basis - and it is also something that is likely to be a focus for conversation and reflection in our work with people. Second, what do we do when people do not see the point of learning particular things - for example, around grammar or safety requirements? The obvious response to this question is that we have to ask and listen - they may have a point. However, we also have to weigh this against what we know about the significance of these things in life, and any curriculum or health and safety or other requirements we have a duty to meet. In this case we have a responsibility to try to introduce them to people when the time is right, to explore their relevance and to encourage participation. Failing to attend to people's feelings and experiences is problematic - and not just because it reveals a basic lack of respect for them. It is also pointless and counter-productive to try to explore things when people are not ready to look at them. We need to consider their feelings and look to their experiences - both in our classroom or teaching environment, and around the issues or areas we want to explore. Recent developments in brain science has underlined the significance of learning from experience from the time in the womb (Lieberman 2013). Bringing people's experiences around the subjects or areas we are looking to teach about into the classroom or learning situation is, thus, important to the learning process. 3. Facilitating Learning particular things Three elements are emphasized - focus, knowledge and engaging people in learning. Focus. This may be a bit obvious - but it is probably worth saying - teaching has to have a focus. We should be clear about what we are trying to do. One of the findings that shines through research on teaching is that clear learning intentions help learners to see the point of a session or intervention, keep the process on track, and, when challenging, make a difference in what people learn (Hattie 2009). As educators, pedagogues and workers there are a lot of times when we are seeking to foster learning but there may not be great clarity about the specific goals of that learning (Jeffs and Smith. 2016). We journey with people, trying to build environments for learning and change, and, from time-to-time, creating teaching moments. It is in the teaching moments that we usually need an explicit focus. Subject knowledge. Equally obvious, is that we need expertise, we need to have content. As coaches we should know about our sport; as religious educators about belief, practice and teachings; and, as pedagogues, ethics, human growth and

72 NSOU ? CC-ED-06 development and social life. It is clear that good teachers 'have deep knowledge of the subjects they teach, and when teachers' knowledge falls below a certain level it is a significant impediment to students' learning' (Coe et. al. 2014). That said, there are often times when we develop our understanding and capacities as we go. In the process of preparing for a session or lesson or group, we may read, listen to and watch YouTube items, look at other resources and learn. We build content and expertise as we teach. Luckily, we can draw on a range of things to support us in our efforts - video clips, web resources, textbooks, activities. Yes, it might be nice to be experts in all the areas we have to teach - but we can't be. It is inevitable that we will be called to teach in areas where we have limited knowledge. One of the fascinating and comforting things research shows is that what appears to count most for learning is our ability as educators and pedagogues. A good understanding of a subject area, good resources to draw upon and the capacity to engage people in learning yields good results. It is difficult to find evidence that great expertise in the subject matter makes a significant difference within a lot of schooling (Hattie 2009). Having a concern for learning - and in particular seeking to create environments where people develop as, and can be self-directed learners - is one of the key features here. Sometimes subject expertise can get in the way - it can serve to emphasize the gap between people's knowledge and capacities and that of the teacher. On the other hand, it can be used to generate enthusiasm and interest; to make links; and inform decisions about what to teach and when. Engaging people in learning. All this underlines our last key point - at the center of teaching lies enthusiasm and a commitment to, and expertise in, the process of engaging people in learning. This is how John Hattie (2009) put it: "It is teachers using particular teaching methods, teachers with high expectations for all students, and teachers who have created positive student-teacher relationships that are more likely to have the above average effects on student achievement".

4. Making specific interventions The final element - making specific interventions - concerns the process of taking defined and targeted action in a situation. In other words, as well as having a clear focus, we try to work in ways that facilitate that focus. Thinking about teaching as a process of making specific interventions is helpful, I think, because it:

- o Focuses on the different actions we take. As we saw in the definition, interventions commonly take the form of questioning, listening, giving information, explaining some phenomenon, demonstrating a skill or process, testing understanding and capacity, and facilitating learning activities (such as note taking, discussion, assignment writing, simulations and practice).

73 NSOU ? CC-ED-06

- Makes us look at how we move from one way of working or communicating to another. Interventions often involve shifting a conversation or discussion onto a different track or changing the process or activity. It may well be accompanied by a change in mood and pace (e.g. moving from something that is quite relaxed into a period of more intense activity). The process of moving from one way of working - or way of communicating - to another is far from straightforward. It calls upon us to develop and deepen our practice.
- Highlights the more formal character of teaching. Interventions are planned, focused and tied to particular objectives or intentions. Teaching also often entails using quizzes and tests to see whether planned outcomes have been met. The feel and character of teaching moments are different to many other processes that informal educators, pedagogues and specialist educators use. Those processes, like conversation, playing a game and walking with people are usually more free-flowing and unpredictable. Teaching, however, is not a simple step-by-step process e.g. of attending, getting information and intervening. We may well start with an intervention which then provides us with data. In addition, things rarely go as planned - at least not if we attend to people's feelings, experiences and needs. In addition, learners might not always get the points straightaway or see what we are trying to help them learn. They may be able to take on what is being taught - but it might take time. As a result, how well we have done is often unlikely to show up in the results of any tests or in assessments made in the session or lesson. Teachers certainly those in most formal settings like schools - have to follow a curriculum. They have to teach specified areas in a particular sequence. As a result, there are always going to be individuals who are not ready for that learning. As teachers in these situations we need to look out for moments when students may be open to learning about different things; where we can, in the language of Quakers, 'speak to their condition'. Having a sense of their needs and capacities we can respond with the right things at the right time. Informal educators, animators and pedagogues work differently for a lot of the time. The direction they take is often not set by a syllabus or curriculum. Instead, they listen for, and observe what might be going on for the people they are working with. They have an idea of what might make for well-being and development and can apply it to the experiences and situations that are being revealed. They look out for moments when they can intervene to highlight an issue, give information, and encourage reflection and learning. Considering teaching as 'process based approach', Teaching may have further following functions :

74 NSOU ? CC-ED-06 A. Recognizing and cultivating teachable moments : In other words, all teaching involves recognizing and cultivating 'learning moments' or 'teaching moments'. It was Robert J Havinghurst who coined the term 'teachable moment'. One of his interests as an educationalist was the way in which certain things have to be learned in order for people to develop. When the timing is right, the ability to learn a particular task will be possible. This is referred to as a 'teachable moment'. It is important to keep in mind that unless the time is right, learning will not occur. Hence, it is important to repeat important points whenever possible so that when a student's teachable moment occurs, s/he can benefit from the knowledge. (Havinghurst 1953) There are times of special sensitivity when learning is possible. We have to look out for them, to help create environments that can create or stimulate such moments, be ready to respond, and draw on the right resources. B. Cultivating collaborative relationships for learning : The main thing here is that teaching, like other parts of our work, is about relationships. We have to think about our relationships with those we are supposed to be teaching and about the relationships they have with each other. Creating an environment where people can work with each other, cooperate and learn is essential. One of the things that has been confirmed by recent research in neuroscience is that 'our brains are wired to connect', we are wired to be social (Lieberman 2013). It is not surprising then, that on the whole cooperative learning is more effective than either competitive learning where students compete to meet a goal or individualistic learning (Hattie 2011). As teachers, we need to be appreciated as someone who can draw out learning; cares about what people are feeling, experiencing and need; and breathes life to situations. This entails what Carl Rogers, Kirschenbaum and Henderson 1990 talked about as the core conditions or personal qualities that allow us to facilitate learning in others : ● Realness or genuineness. Rogers argued that when we are experienced as real people-entering into relationships with learners 'without presenting a front or a façade', we are more likely to be effective. ● Prizing, acceptance, trust. This involves caring for learners, but in a non- possessive way and recognizing they have worth in their own right. It entails trusting in the capacity of others to learn, make judgements and change. ● Empathic understanding. 'When the teacher has the ability to understand the student's reactions from the inside, has a sensitive awareness of the way the process

75 NSOU ? CC-ED-06 of education and learning seems to the student, then again the likelihood of significant learning is increased'. In practical terms this means we talk to people, not at them. We listen. We seek to connect and understand. We trust in their capacity to learn and change. We know that how we say things is often more important than what we say. C. Scaffolding : Scaffolding entails providing people with temporary support so that they deepen and develop their understanding and skills - and develop as independent learners. Like physical scaffolding, the supportive strategies are incrementally removed when they are no longer needed, and the teacher gradually shifts more responsibility over the learning process to the student. To do this well, educators and workers need to be doing what we have explored above - cultivating collaborative relationships for learning, and building on what people know and do and then working just beyond it. The term used for latter of these is taken from the work of Lev Vygotsky - is working in the learner's zone of proximal development. A third key aspect of scaffolding is that the support around the particular subject or skill is gradually removed as people develop their expertise and commitment to learning. Scaffolding can take different forms. It might simply involve 'showing learners what to do while talking them through the activity and linking new learning to old through questions, resources, activities and language' (Zwozdiak-Myers et al., 2013). The educational use of the term 'scaffolding' is linked to the work of Jerome Bruner -who believed that children (and adults) were active learners. They constructed their own knowledge. Scaffolding was originally used to describe how pedagogues interacted with pre-school children in a nursery (Woods et. al. 1976). Bruner defined scaffolding as 'the steps taken to reduce the degrees of freedom in carrying out some task so that the child can concentrate on the difficult skill she is in the process of acquiring' (Bruner 1978). D. Differentiation : Differentiation involves adjusting the way we teach and approach subjects so that we can meet the needs of diverse learners. It entails changing content, processes and products so that people can better understand what is being taught and develop appropriate skills and the capacity to act. The basic idea is that the primary educational objectives-making sure all students master essential knowledge, concepts, and skills-remain the same for every student,

76 NSOU ? CC-ED-06 but teachers may use different instructional methods to help students meet those expectations. It is often used when working with groups that have within them people with different needs and starting knowledge and skills. E. Accessing resources for learning One of the key elements we require is the ability to access and make available resources for learning. The two obvious and central resources we have are our own knowledge, feelings and skills; and those of the people we are working with. Harnessing the experience, knowledge and feelings of learners is usually a good starting point. It focuses attention on the issue or subject; shares material; and can encourage joint working. When it is an area that we need to respond to immediately, it can also give us a little space to gather our thoughts and access the material we need. The third key resource is the internet - which we can either make a whole group activity by using search via a whiteboard or screen, or an individual or small group activity via phones and other devices. One of the good things about this is that it also gives us an opportunity not just to reflect on the subject of the search but also on the process. We can examine, for example, the validity of the source or the terms we are using to search for something. The fourth great resource is activities. Teachers need to build up a repertoire of different activities that can be used to explore issues and areas. Last, and certainly not least, there are the standard classroom resources - textbooks, handouts and study materials. As teachers we need to have a range of resources at our fingertips. This can be as simple as carrying around a file of activities, leaflets and handouts or having materials, relevant sites and e-books on our phones and devices. F. Adopting a growth mindset Last, we need to encourage people to adopt what Carol Dweck (2012) calls a growth mindset. Through researching the characteristics of children who succeed in education (and more generally flourish in life), Dweck found that some people have a fixed mindset and some a growth mindset. Believing that your qualities are carved in stone, the fixed mindset creates an urgency to prove yourself over and over. If you have only a certain amount of intelligence, a certain personality, and a certain moral character, then you'd better prove that you have a healthy dose of them. It simply wouldn't look or feel deficient in these most basic characteristics. There's another mindset in which these traits are not simply a hand you're dealt and have to live with, always trying to convince yourself and others that you have a royal flush when you're secretly worried it's a pair of tens. In this mindset, the hand you're dealt is just the starting point for development. This growth mindset is based on the

77 NSOU ? CC-ED-06 belief that your basic qualities are things you can cultivate through your efforts. Although people may differ in every way-in their initial talents and aptitudes, interests, or temperaments-everyone can change and grow through application and experience. (Dweck 2012). The fixed mindset is concerned with outcomes and performance; the growth mindset involves getting better at the task. In her research she found, for example, that students with a fixed mindset when making the transition from elementary school to junior high in the United States, declined - their grades immediately dropped and over the next two years continued to decline. Students with a growth mindset showed an increase in their grades. The significance of this for teaching is profound. Praising and valuing achievement tends to strengthen the fixed mindset; praising and valuing effort helps to strengthen a growth mindset. While it is possible to question elements of Dweck's research and the either/or way in which prescriptions are presented, there is particular merit when teaching of adopting a growth mindset (and encouraging it in others). It looks to change and develop rather than proving ourselves. Structuring interventions and making use of different methods One of the key things that research into the processes of teaching and educating tells us is that learners tend to like structure; they want to know the shape of a session or intervention and what it is about. They also seem to like variety, and changes in the pace of the work (e.g. moving from something quite intense to something free flowing). It is also worth going back to the dictionary definitions - and the origins of the word 'teach'. What we find here are some hints of what Geoff Petty (2009) has talked about as 'teacher-centered' methods (as against active methods and student-centered methods). Teacher-centered Active methods Student-centered methods methods Talking Supervised student practice Reading for learning Explaining Discussion Private study and homework Showing Group work Assignments and essays Questioning Games Projects and reports Note-making Role play, drama and Independent learning simulations Seminars Self-directed learning

78 NSOU ? CC-ED-06 If we ask learners about their experiences and judgements, one of things that comes strongly through the research in this area is that students overwhelmingly prefer group discussion, games and simulations and activities like drama, artwork and experiments. At the bottom of this list come analysis, theories, essays and lectures. However, there is not necessarily a connection between what people enjoy doing and what produces learning. Schoolteachers may use all of these methods - but so might sports workers and instructors, youth ministers, community development workers and social pedagogues. Unlike school teachers, informal educators like these are not having to follow a curriculum for much of their time, nor teach content to pass exams. As such they are able to think more holistically and to think of themselves as facilitators of learning. This means: Focusing on the active methods in the central column; Caring about people's needs, experiences and feeling; Looking for teachable moments when then can make inputs often along the lines of the first column (teacher-centered methods); and Encouraging people to learn for themselves i.e. take on projects, to read and study, and to learn independently and be self-directed (student-centered methods). Reflection and Feedback in Teaching : A major way that teachers improve their decision making is through reflection. Reflective teachers are thoughtful, analytical, and even self-critical about their teaching. After you have taught a lesson, you will want to reconsider your planning and the decisions you have made. Reflection, whether written or mental, is an effective tool for refining professional thoughts, ideas, and beliefs. Reflection enables us to evaluate our experiences, learn from mistakes, repeat successes, and revise and plan for the future. Reflective teaching is complex and multifaceted. It is a review of one's practices in an attempt to determine whether you accomplished what you set out to do and to gain insight on more effective ways of doing what you did. A reflective teacher willingly takes responsibility for considering personal actions; is committed to thinking through difficult issues in depth, persistently seeking more knowledge and better ways to teach and to manage classrooms; maintains a healthy skepticism about educational theories and practices; and gathers as much information as possible about any given problem, weighs the value of the evidence against suitable criteria, and then draws a conclusion and makes a judgment (Ely, 1994).

79 NSOU ? CC-ED-06 TEACHING AS A PROCESS Basically, reflection asks, how effective were the decisions I made? Specifically, reflection tries to answer questions such as the following : • how appropriate were the topics-that is, should they be taught again? • was the sequence of topics appropriate? If not, how should they be re-sequenced? • was my goal(s) appropriate for my students? • was my instruction aligned? Did my lesson plans facilitate my unit plan? Were the procedures and assessments I specified consistent with my goals? • were the procedures I used as effective as they might have been? If not, what procedures might have been better? • did the materials I used adequately represent the topic? • what representations or resources would have made the topic more understandable? • is there a way I could have made the overall environment more conducive to learning? Finally, much of what has been said to this point refers to reflection as a process of questioning our practice in a variety of rational ways, but reflection can also be viewed as creative problem solving. Being creative fosters the teachers' need to know or be sure they demonstrate in their teaching sensitivity to what will be most beneficial for their students. A growing body of research shows that experienced teachers reflect on many different dimensions of their lessons and can identify erroneous assumptions and

80 NSOU ? CC-ED-06 aspects of their teaching that can be improved (Berliner, 1994). Engaging in reflective thinking about teaching promotes a more thoughtful approach to planning, implementing, and assessing and potentially furthering the achievement of their students. Here we have made a plea to explore teaching as a process rather than something that is usually approached as the thinking and activity associated with a particular role - the school teacher. As has been argued elsewhere a significant amount of what those called school teachers do is difficult to classify as education. Even the most informal of educators will find themselves teaching. They may well work hard at building and facilitating environments where people can explore, relate and learn. However, extending or deepening that exploration often leads to short or not so short bursts of teaching or instructing. For example, as sports coaches or outdoor educators we may be both trying to develop teamwork and build particular skills or capacities. As a specialist or religious educator we might be seeking to give information, or introduce ideas that need some explanation. These involve moments of teaching or instructing. Once we accept this then we can hopefully begin to recognize that school teachers have a lot to learn from other teachers - and vice versa. We also need to unhook 'pedagogy' from school teaching within English language discussions - and to connect it with the tradition of didactics. One of the problems with the false link of school teaching to pedagogy is that it is impairing a proper discussion of pedagogy. However, that may change a little in the UK at least with the development of professional standards for social pedagogy and the emergence of graduate and post-graduate study in the area.

3.4 Teaching as a Process: Pre-active, Interactive and Post-active

We already understand from the above discussion of functions of teaching that teaching is a complex task. Therefore, effective teaching is • One that is well planned & where activities are interrelated to each other • Goes beyond recall of information • One that provide learning experiences or situation that will ensure understanding, application and critical thinking • One where the learner is stimulated to think and reason and apply Hence, we need to have

77%

MATCHING BLOCK 10/52

W

systematic planning to perform this task. Teaching has to be done in steps. The different steps constituting the process are called the phases of teaching. Each phase has some operations of teaching which create the situation for learning. Teaching process can be divided into three phases/stages. 81 NSOU ? CC-ED-06 1. Pre-active phase - refers to planning 2. Interactive phase - refers to the

94%

MATCHING BLOCK 11/52

W

conduct and management 3. Post-active phase - refers to the follow-up and consolidation Fig: Different phases involve different operations of teaching. 3.4.1. The pre-active phase of teaching :

The pre-active stage begins from the point of time when the teacher decides to teach a particular item to a particular group of students and ends when the teacher is face to face with his students. Philip. W. Jackson observes that 'behaviour relevant to the teaching task in this pre active stage includes many things, such as preparing lesson plans, arranging furniture and equipment within the room, studying test reports, reading sections of a textbook, and thinking about the aberrant behaviour of a particular student. Formulating objectives, identifying the important ingredients of the contexts, specifying entry behaviour of the learners, listing the available resources for learning, developing a criterion test, and writing a teaching unit or a lesson plan are significant operations in the pre active stage of teaching. K. P. Pandey (1997) says, "there are three types of statements of objectives: general, specific and behavioural". The general objectives are quite abstract and are derived from the social philosophy of the country, the psychology of learning and the nature of the content. These statements are made specific by reference to the specific learning outcomes to be achieved after the presentation of instructional situations. Without mentioning the specific objectives, no efficiency in the system of instruction can be vouched. For writing behavioral objectives Mager (1962) and Gronlund (1971) prescribed the observance of the following three step contingency :

82 NSOU ? CC-ED-06 1. Identifying the terminal or end behaviour by name. This will require specifying the kind of behaviour that will be accepted as evidence that the learner has achieved the objective. 2. Defining the desired behaviour further by describing the important conditions under which the behaviour will be expected to occur. 3. Specifying the criteria of acceptable performance by describing how well the learner must perform to be considered acceptable. The use of taxonomic principal categories - cognitive, affective and psychomotor domains is also found useful in indicating the goals for designing effective teaching- learning programmes. The taxonomy of educational objectives (Bloom,1956) consists of a set of general and specific categories that encompass all possible learning outcomes that might be expected from instruction. The objectives are of great use for curriculum development, teaching and testing. The cognitive domain refers to those objectives that emphasize intellectual outcomes such as knowledge, understanding and thinking skills. The affective domain deals with those objectives that lay stress on feeling and emotions such as interests, attitudes, appreciation and methods of adjustment. The psychomotor domain includes those objectives that emphasize motor skills such as handwriting, typing, swimming and operating machinery. Writing a teaching unit or lesson plan is also an important activity in the pre-active stage of teaching. Therefore, a. It is the phase of planning for teaching. b. Good planning makes the task of the

94%

MATCHING BLOCK 12/52

W

teacher smooth, functional and successful. c. There one two major steps involved in this phase. • Establish some kind of goals or objectives. • Discovering ways and means to activate these objectives. Operation of teaching at pre-active phase Before classroom teaching, a teacher has to perform many tasks. This phase includes all these activities which a teacher performs before entering the classroom. This stage involves the following activities. (1) The formulation or fixing up of goal : • The teacher formulates in detail the instructional objectives in behavioral terms by using the taxonomy of educational objectives. • Objectives one determined according to

the

teacher decides about the content to be presented before learners. • For content selection following points should be kept in mind. a. The demand of syllabus/curriculum. b. The entry behavior of the accepted learners. c. Level of the motivation of learners. d. Teacher's preference for assessment related to the content. (3) The arrangement of ideas and style of teaching: After selecting the presentable content, the teacher arranges the elements of the content in a logical and psychological sequence. Sequencing should be able to assist in the transfer of learning. (4) Selecting Intuitional Methodology: The teacher has to select appropriate strategies and tactics of teaching, keeping in view the content and objectives of teaching. This operation is very important in

the

98%

teacher-education programme. (5) Development of teaching strategies: The teacher should decide beforehand about strategies and tricks, which he has to use during the course of his classroom teaching. He should decide about- • When and what device of teaching should be used. • When the teaching aids will be used. • When recapitulation or evaluation etc. will be done. (6) Deciding the duration, place, and management of classroom teaching. (7) A decision about evaluation tools and techniques. So, this stage is about working out the details of the teaching or activities a teacher wants to perform in the class. Here

the

teacher hypothesizes about the possible outcome of his action. 3.4.2. The interactive phase of teaching :

The actual implementation phase of the planned instructional system is the Interactive stage. It arises from face to face encounters in a social situation in which the teacher communicates knowledge, information or skill to the pupils with references to a subject matter. The nature of interaction between these three elements are highly dynamic in quality and this aspect of teaching is normally emphasized in empirical studies. It is so crucial that without interaction, no teaching could be said to have occurred. The verbal as well as non-verbal behaviours of teacher and pupils are involved in this process. It may be undertaken at the cognitive, social and performance

84 NSOU ? CC-ED-06 levels. For the interaction at cognitive domain, the linguistic behaviour i.e. use of language serves as a powerful vehicle. For the interaction in the social domain, the mutual relationship of acceptance, rejection and neutrality between the teacher, and pupil is important. In the performance domain, the mobility and actions of the teacher and pupils in response or reaction to directions, requests and commands assume significance. In the nonverbal behaviour, the gestures, gesticulation, and facial expressions involving the movement of eyes, lips etc. play a dominant role. Both verbal and nonverbal behaviour get expressed committedly and function in complementation to each other. During the interaction phase, presenting, asking, responding, reading, structuring, evaluating, and providing feedback are some of the specific operations.

97%

MATCHING BLOCK 18/52

W

This phase refers to the execution of the plan made during the pre-active phase. This is actual classroom teaching. In this phase, the teacher gives students the learning experiences through some suitable modes. In this phase, teachers give learners a predetermined environment. The teacher interacts with students so that desired changes can be brought in the learner. So learning is directed in predetermined directions to achieve predetermined goals. In this process, the teacher provides learners with verbal stimulation. This stimulation can be of various kinds. Few examples are:- • Asking questions • Listening to student's response • Providing guidance • Making explanations etc. Operations of teaching at interactive phase : This phase of teaching • Includes all those activities which a teacher uses after entering the classroom. • Includes actual teaching done in the classroom. In this face to face encounter with learners. Here the teacher uses some of the techniques, aids, and material planned in the first phase. This helps the teacher in achieving the relevant objectives that were already set. Here the following operations are undertaken by the teacher. (1) Setting up the class : It refers to the activity of perceiving the due size of the class, getting the feel of the mood of learners. Here teacher should be aware of • how many in the group are looking attentive 85

NSOU ? CC-ED-06 •

100%

MATCHING BLOCK 19/52

W

how many are negligent and disinterested • who are sharper ones • who are troublemakers etc. (2) Knowing the learners : Knowing the learners means to know about the previous knowledge of the new learners. It is done after preserving the class size. For this teacher can start by knowing the abilities, interests, attitudes and academic backgrounds of the new learners. (3) Starting teaching : At this stage, the teacher starts teaching. This is done after diagnosing by questioning. Here, two types of activities are involved. 1. Initiation 2. Response The initiation and response are known as 'verbal interaction'. The interactive phase of teaching is the classroom interaction between teacher and students. The interaction may be verbal or non-verbal. Interaction is the most important at this stage. This is the interchange between teacher and student by initiation or response operations. In this phase, all the activities performed by a teacher when he enters the classroom are combined together. These activities one concerned with the presentation of content in the class. 3.4.3. The post-active phase of teaching :

Post Active stage appears as a suffix to the activity of teaching. The basic point of this stage is that the teacher is so overpowered by the events of the interactive setting that he continues to think about their meaning even after they have disappeared. Hence this gives a firm basis for correcting the mistakes and reorganizing the instructional system with suitable orientations on subsequent occasions. The important operations of this stage are recollecting, listing, extrapolating, formulating a guideline and weighing the evidence. All the three stages may be viewed as an interrelated set as the impact of the decision and action in one stage may be analyzed during the subsequent stage. The researches on teaching have concentrated on the study of interactive stages even to the exclusion of pre active and post active stages which are so integrally connected. Hence, the present investigator has been urged to make efforts to set right the imbalance through her scientific probe of the model of teaching.

86 NSOU ? CC-ED-06

It is the evaluation phase of teaching. It arises when the teacher has left the class and tries to have a look back into what happened in the class. This phase is concerned with the following activities. a) Evaluation Activities : These activities are performed in various ways- • Tests or quizzes • Observing student's reactions to questions, • Instructional situations and comments etc. b) Summing up teaching tasks : To sum up, the teacher asks the questions from the learners, verbally or in written form. The behaviors of the students are also measured in order to evaluate their achievements. In absence of all these evaluative activities, the entire learning process could be incomplete. Activities/operations at the post-active phase (1) Determining the exact dimensions of behavior changes : Here the teacher compares the actual behavioral changes in students with their expected behavioral changes. If desired behavioral changes are observed in maximum students then it means that teaching strategies are very effective. (2) Selection of testing devices and techniques : For comparing desired and actual behavior changes, the teacher has to select appropriate, testing devices which are valid and reliable. For this criterion, tests are more preferred than the performance tests. (3) Changing strategies of testing : The student's testing result is also used for evaluating the effectiveness of instructions and teaching strategies. It should provide a base for improving the teaching and changing strategies of teaching. Importance of operations in different phases of teaching : 1. It focuses on bringing desired behavior changes in the students. 2. It provides the scientific basis for developing effective instructions of the teaching. 3. The classroom teaching and interaction can be made effective with this background. 4. Teaching operations ultimately create the appropriate conditions of learning for achieving the desired goals. 87 NSOU ? CC-ED-06 5. Teaching can be organized effectively at different levels by employing appropriate teaching activity. So we can say that the process of teaching starts even before the teacher enters the classroom. It continues even after class. It continues even after classroom interaction in the form of evaluation, feedback, and other activities. All three teaching phases are interrelated; each one helps to modify the other in order to make teaching more meaningful and significant. 3.5

Pedagogy of Teaching Learning: 3 R's, Verbal Conditioning and Psychomotor Skills 3.5.1 Pedagogy of Teaching Learning: 3 R's Concept : The three R's indicate the basic skills taught in the schools: Reading, Writing and Arithmetic. The phrase appeared in print as a space-filler in "The Lady's Magazine" for 1818; while it is sometimes attributed to a speech given by Sir William Curtis in 1975 about the publication of 'The Mirror of Literature, Amusement and Instruction casts doubt on this. The skills themselves allude to those first, where to read, and to write, and ciphering is being learned.' Ciphering translates differently and can be defined as transposing, arguing, reckoning, a secretive method of writing, or numerating. Since its original creation, many others have used the term to describe other triples. An extended modern version of the three R's consists of the "functional skills of literacy, numeracy and ICT. The phrase "the three R's" is used because each word in the phrase has a strong 'R phoneme' (sound) at the beginning. The term is ironic, since someone with rudimentary language education would know that two of the original words do not actually begin with the letter R. The third R was more probably Reckoning, not as is more usually stated 'Rithmetic. Reckoning was a Victorian term for mental arithmetic and had been in use as such since the 14th century. The educationalist L.P. Benezet preferred "to read", "to reason", "to recite", adding, "by reciting he did not mean giving back, verbatim, the words of the teacher or of the textbook. He meant speaking the English language." In the United States, during the 17th century, the curriculum in the common (elementary) schools of the New England colonies was summed up as the "four R's" - Reading, 'Riting, "Rithmetic", and Religion. In the early stage of institutional learning, teachers often focused on the "Three R's." These are reading, writing, and arithmetic. These three basics were the mainstay of education. However, as technology progresses, more and more schools are undermining these basic principles because students need to know more and be able

88 NSOU ? CC-ED-06 to work with computers, software, and other pieces of technology. The "three R's" can become discounted as basic and fundamental learning tools. But it is understandable that students were initially focused on reading, writing, and arithmetic while also learning science, art, and technology in the school system in the future. In fact, the school system drills down beyond these basic three tenets of learning to teach students how to both evaluate and use new information. We feel the point of education is not only to show a student how to gain more knowledge, but how to absorb and use that knowledge in a practical manner. The "Three R's" Are Relevant Today Education has always gone beyond the basics of "reading, writing, and arithmetic." However, the "Three R's" are tools with which a student can gain more knowledge in any subject. If a student can read and write, he or she can complete a research project and learn to type. If a student understands the basics of arithmetic, he or she can learn to program complex algorithms or study science. Role of Teacher : As a teacher, we can help your young learn the Three R's of education and improve his or her life. Here are a few things you can do to help your child learn these important educational basics : • Read to and/or with your child. • Write your children handwritten notes, and ask them to do so back. • Encourage your student to use a dictionary to help him or her spell words and look up the meanings of words. • Build something with your student, using a plan that defines the length and width of objects. • Encourage them to write holiday and birthday cards. • Ask your students to keep a journal of questions he or she has asked to which you do not know the answer. On the weekend, take them to the library to discover the answers. Alternatively, show them how to research the answer to such questions on the internet - while avoiding dubious websites. • Planning a trip or vacation, for children in calculating distances, mapping where you need to go, and writing the overall itinerary. All of these actions can help your youngster improve his or her skills in reading, writing, or arithmetic. Additionally, they teach your child how useful these skills are in a real-world setting.

89 NSOU ? CC-ED-06 The mission should be to give your children a strong educational foundation to reach his or her full potential. The Three R's coupled with our basic philosophy of helping students understand how to use their knowledge in a practical way keeps the young people we work with enthusiastic about growing their own education. Developing countries in the process of teaching and learning. Studies and authoritative information show different magnitudes to solve the problem by identifying factors influencing mastering of 3R's. Geske and Ozola, for instance, did research in Latvia Russia and established that there are many different and usually very complex causes for the difference in the pupils' achievement level. They also consider those factors to be beyond school influence, such as the income level and education, but there are quite many other factors that can influence students' learning achievements at school. The results of the research have also proved that there is a close coherence between the meaning of education to parents and students' learning achievements, i.e., if education is regarded as a value in the family, there is a big possibility that children will have high learning achievement. Socio-economic conditions are also significant for early achievements in reading. Morrow, Gambrell, Duke and Nero in his study advocate that during literacy teaching, teachers should break down the reading and writing into smaller parts that are easily learnable by pupils such as phonics, phonemic awareness and spelling. These could make it easy for learners to master reading and writing. Also he identified evidenced based best practices for literacy instruction such as, classrooms should reflect a culture that fosters literacy motivation as reading and writing for pleasure to be informed and performing tasks in the process of learning 3Rs. Promoting independent reading, time for self-selected reading and opportunities to use technologies accommodate the needs of individual students in mastering of 3Rs. found that different funding and grants were introduced to provide school management with resources to buy books, learning aids and school supplies, but have been marred by problems such as non-delivery and waste. The school administration must therefore make sure that resources and books provided are well kept and are used effectively to improve mastery of 3Rs. Management and funding have therefore been identified as important factors in ensuring pupils mastery of 3R. Texas Education Agency in their research found that teaching methodologies are among factors that closely influence mastering of 3Rs. They argue that pupils expand their speaking and listening skills, their background and vocabulary knowledge in formal and informal activities as they engage in story time discussions, journal keeping, wide reading, and purposeful writing. Teaching methodologies therefore, help pupils in mastering 3Rs. Such methods as the use of pictures, independent practice, numbers, figures and sound can easily help pupils in mastering 3Rs.

90 NSOU ? CC-ED-06 Mediation in the teaching and learning process is another thing of importance. To mediate is simply to "bridge". The teacher should therefore act as a bridge in the learning process by creating an environment which helps learners' interaction with both the teacher and the learners. Chuunga in his research shows that methodologies used in teaching reading and writing rely on the use of a combination of approaches such as language and phonic approaches to teaching literacy. Teachers should therefore incorporate various methodologies and strategies that facilitate interaction. Teaching methodologies are very essential in ensuring pupils' master 3Rs as they play a big role in ensuring pupils are able to read, write and to do arithmetic. Assessments used in teaching 3Rs can also influence mastering of 3Rs. Gough and Tunmer suggested that reading difficulties can be assessed cognitively and the assessment should look into the mental processes, e.g. the ability of the child to decode and recognize words and symbols. A concrete experience is to be found in Tanzania where classroom teaching is mainly through cramming, reciting singing and copying notes from chalkboards. Letters and sound naming, which are the most important skills in the development of literacy skills, are learned by memorization. Children are given charts of letters to recite and reproduce to teachers as a way to improve mastering of 3Rs. Matusevich in his research stated that the constructivism method of teaching children was most important. Children are not passive in knowledge, but active at making meaning, testing out theories, and trying to make sense out of the world and themselves. In mastering 3Rs as pupils learn through interaction with others in the groups as they construct their own understanding of the world they live in. Constructivist classrooms are diverse due to the fact that the teacher takes in the culture of the children. The teacher's role is to build an environment that allows children to make choices. The teacher is a facilitator and observer. Constructivist classrooms do more at promoting the children's social, cognitive, and moral development than teacher-centered programs and as a result, pupils' mastery of 3Rs can be realized. Teacher Related Factors Teachers should have time to work with and to consult each other, to visit each other's classrooms, and to make instructional decisions that improve coordination. A teacher is a guide in pupils' learning process of mastering 3R's. According to Tyson, teachers must take part in professional development that focuses on the implementation of 3Rs mastery. He further explains that teachers play a big role to guide pupils in mastering 3Rs. The ability, knowledge, methods of teaching and learning, assessment methods, professional development in 3Rs and instructional decisions of the teacher play a great role to ensure pupils in primary school are able to read, write and do arithmetic effectively.

91 NSOU ? CC-ED-06 Teachers must be respected and motivated by ensuring that they enjoy their work in terms of better salaries and a good working environment. In order for teachers to have morale in teaching 3Rs, their working environment must be conducive so that they can teach well. Having a very big number of pupils in a classroom makes it difficult for a teacher to assist each learner. Solving teachers' problems will therefore help pupils in primary schools in mastering 3R's as teachers will be comfortable with the working environment and as a result, they will teach well. Learner Related Factors : Individual effort made by learners can help them master 3R's in different ways including independent reading at home and at school. Many pupils in primary school try their level best to master 3R's but lack enough support from their teachers is also a fact. In Indian context some children supplement their studies by enrolling themselves in commercially-based tuition classes, but majority do not have access to these classes due to their high costs and end up dropping out of school probably due to the problems related to reading and writing. Selected learners should therefore be identified and worked upon to see to it that pupils do their part to master 3Rs. 3.5.2 Verbal Conditioning in Teaching-learning : A major concern of psychology is the control, modification, and prediction of behavior. Learning, as an area of behavior, is the focus of inquiry in both psychology and education. Today, a prime concern of educators is the study of the conditions which affect learning. Since most learning occurs in a verbal context, the relevance of verbal conditions that affect learning is self-evident. One approach to the examination of verbal conditions which affect learning is the application of operant conditioning techniques. In past years, researchers have been concerned with operant conditioning as a means of modifying verbal behavior. The technique of verbal conditioning has evolved from these concerns. Verbal conditioning may be defined as an increase in the rate of verbal response when the response is followed by a reinforcing stimulus. A common sense example of this definition might be "an experiment," the purpose of which was to condition subjects to make connections about safe driving. The response class included statements elicited from the subject such as "One should not exceed the posted speed," or "You should always slow down before approaching an intersection." Immediately after these comments were voiced, the experimenter said, "Good," or "That's a fine idea," attempting to reinforce and increase the number of statements from the subject about safe driving. Verbal conditioning as an end in itself has value in the laboratory situation. Its practical application, however, separate from or combined with other

92 NSOU ? CC-ED-06 techniques, may lie in the realm of behavior modification. It seems necessary, therefore, to explore verbal conditioning in terms of its effect on related behavior. Further, if an individual's verbal responses can be manipulated and if it can be demonstrated that the change is due to the reinforcing stimulus, still a question remains unsolved that "How reliably will this change generalize or transferable to other activities after verbal conditioning has occurred?" Mediating processes and intervening variables such as the affective loading of certain response classes and social and cultural connotations of response classes may affect overt behavioral responses. Other intervening factors have been reported by Matthews and Dixon (1968) who suggest that the subjects' reactions to the characteristics of the examiner's voice (in case of classroom learning setting learner may be subject and teacher may be examiner) may influence the reinforcing stimulus and the degree of rapport existing between the experimenter and subject has an interactive effect with reinforcement. It is also possible that the subject and experimenter may differ in their semantic interpretation (denotation and/or connotation) of the verbal response. The first factor which may contribute to this lack of conditioning is the nature of the response class, i.e., verbs depicting aggression. A larger response class, such as plural nouns, represents approximately twelve per cent of an individual's total verbal output. Plural nouns were more readily affected by reinforcement than were a smaller response class (modifiers) which represents approximately four per cent of the total verbal output. Aggressive verbs fall into the smaller response class of modifiers. Because of their lack of frequency or emission in the spoken language they may have less susceptibility to reinforcement. The operant level (natural tendency to emit without reinforcement) of malevolent words was slightly lower than benevolent or neutral words so that less of an increase was needed to show conditioning. It has found that negative cultural connotations affect conditioning. The second factor which may contribute to the lack of conditioning relates to the method of conditioning. In this study the experimenter had minimal physical contact with the subject except for the short initial greeting. To maintain even greater standardization of the procedure all directions were taped and the subject's view of the experimenter was cut off by screens during the actual experiment. Solley and Long (1958) reported that if the experimenter and subject "chit-chatted" prior to the experiment there was a higher probability that conditioning would occur than if there was no pre-experimental interaction. Systematically manipulated interactions between subject and guide might be fruitful. An initial task may be provided to the subject. He / she was then criticized, praised, or ignored. Subjects who had prior interaction with the experimenter evidenced greater

93 NSOU ? CC-ED-06 condition ability. These results suggest that pre-experimental interaction may have a facilitating effect on conditioning. The present experiment minimized pre-experimental interaction. Another factor which affects conditioning is the 'nature of the reinforcement' given the subject. Using a social approval form of reinforcement may produce better conditioning. Social reinforcement is viewed as attention to the child in the form of praise, approval, or adult verbalization of any kind. Social reinforcement is combined with the typical physical contacts with the child that are a part of the pre-school teacher's role. These include such behavior as picking the child up and brushing him off after a tumble, helping the child with clothing or giving him a friendly pat. The teacher frequently provides for the child in a direct physical sense by giving him snacks, special activities and extra materials. All, or any combination of these, are designated as adult social reinforcement. The combination of verbal and social reinforcement which accounts for conditioning and behavior change. An experimental situation in which behavior is carefully controlled and verbal reinforcement is a voice coming from behind a screen may be too impersonal or vague for the subject to associate with the desired behavior change. Implications of verbal conditioning procedures may be extended to 'influencing' processes other than psychotherapy: placebo effect, hypnosis, 'brainwashing', motor operant conditioning and soon. A theory of social motivation (more or less equivalent to physiological drive states) to account for enhancement of social influence following social deprivation. Potentially reinforcing stimuli must be studied in terms of the functional relatedness of reinforcements in the interaction between teacher or parent and child. In school children, who tend to be deprived of consistent adult contact and approval, should be more motivated to secure social reinforcement than non-institutionalized children. Generalization of a reinforced verbal response has been investigated but the results have not been conclusive. It has been found in research studies with psychiatric patients who were reinforced for emotional words in story-telling sessions prior to group therapy. The patients who received positive-personal reinforcement showed a significant increase in the adequacy of their interpersonal relationships in the group setting, thereby demonstrating a generalization effect. The manipulation of stimulus significance, by instructions from the experimenter, may be taken as an example of verbal conditioning. Consideration of such a mechanism suggested that personality effects previously found in conditioning studies should be apparent in instructional manipulations of significance in a study of the orienting response (OR) to words. Because of recent changes in dimensioning of the personality structure, some of the items originally used to define Eysenck's extraversion (E)

94 NSOU ? CC-ED-06 dimension are now used to assess the new dimension of psychoticism (P), suggesting that at least some of the established effects of E upon conditioning may be associated now with P. Majority research findings tend to support a behavioral view of verbal conditioning and are incompatible with a purely cognitive approach. It could be argued that the amount of learning which occurred was small, and that the use of cognitive processes must precede the occurrence of more complete learning. It could also be argued that regardless of what one might arrange in a particular verbal interaction, intelligent people tend to use cognitive processes in most of their learning. It is simply that learning without awareness can be made to occur, given suitable conditions. In typical classroom situations, verbal communication is a message or information expressed in words, either orally or in writing. Classrooms obviously have lots of verbal communication; it happens every time a teacher explains a bit of content, asks a question, or writes information or instructions on the chalkboard. Classrooms tend to rely heavily on explicit, verbal communication, while at the same time recognizing and allowing nonverbal communications to occur (Neill, 1991). This priority accounts for the characteristically businesslike style of teacher talk. A major reason for relying on an explicit, verbal style is that diversity among individuals increases the chances of their misinterpreting each other. Because of differences in background, the partners may differ in how they expect to structure conversation as well as other kinds of dialog. Misunderstandings may result sometimes without the partners being able to pinpoint the cause. Later in this chapter we suggest how to minimize these problems. Effective verbal communication Communicating effectively requires using all forms of classroom talk in combinations appropriate for particular utterances and interactions. In various places earlier in this book, we have suggested ways of doing so, though in those places we usually did not frame the discussion around the term communication as such. Effective content talk The ways of talking about content so that it is most likely to be understood clearly, and its need for instructional strategies. In explaining ideas, for example, whether briefly or as an extended lecture, it has been pointed out that it helps to offer, in advance, organizing ideas, to relate new content to prior knowledge, and to organize and elaborate on new information. It needs certain strategies about content talk intended for students, so that students understand their own thinking as well as possible. The following table as advocated by Kelvin Seifert (2009) summarizes instructional strategies both for students and for teachers, and indicates how they contribute to effective verbal communication about content.

95 NSOU ? CC-ED-06 Teacher Talk : Strategy Definition How it helps communication Using advance organizers Statements or ideas that Orients students' attention to give a concise overview of new ideas about to be learned; new material assists in understanding and remembering new material Relating new material to Explicit connections of Facilitates discussion of new prior knowledge new ideas to students' material by making it more existing knowledge meaningful to students Elaborating and extending Explanations of new ideas Avoids ambiguities and new information in full, complete terms misunderstandings about new ideas or concepts Organizing new information Providing and following a Assists in understanding and clear structure when remembering new material explaining new material Content talk by Student Strategy Definition How it helps communication Inquiry learning Students pursue problems To formulate and investigate a that they help to formulate problem, students need to express for themselves clearly what they wish to find out. Cooperative learning Students work in small To work together, students need to groups to solve a common explain ideas and questions to fellow problem or task students clearly. Effective procedural and control talk In addition to communicating about content, teachers need to communicate procedures and expectations about appropriate classroom behavior. Procedural talk is a method of classroom management, of creating a positive learning environment, and of resolving conflicts in the class. The following table summarizes several of the major strategies according to Kelvin Seifert (2009). By framing communication in these ways, we called attention to their importance as forms of communication. As we pointed out, procedural talk and control talk matter are used in teaching simply because clear procedures and appropriate classroom behavior are necessary for students to learn.

96 NSOU ? CC-ED-06 Procedural talk Control talk Creating and discussing procedures for Creating and discussing classroom rules of daily routines appropriate behavior Announcing transitions between activities Clarifying problem ownership Providing clear instructions and guidance Listening actively and empathetically for activities Reminding students periodically of Using I-messages procedures for completing a task It has been understood that all such verbal communications in the classroom is based on the principle of verbal conditioning which affects the learning. 3.5.3 Inculcation of Psychomotor Skills through Teaching : In general skill is defined as a stable and reliable link between perception of body and environment, and execution of goal-directed motor actions, which is both consistent across repeated performances of the action, and can be flexibly adapted to changes in task constraints. Skill in this sense is therefore considered primarily as a perceptual- motor function. Examples of perceptual-motor skills include instrumental music performance, driving a car etc. This category of skill might be contrasted with more cognitive or 'intellectual' skills, such as mathematical reasoning. It is worth noting, however, that both categories of skill (perceptual-motor and intellectual) may share processes in common, and much may be learnt by considering the acquisition of expertise across a broad range of academic achievement. In engineering and medical science along with all laboratory or field-based activities psychomotor skills are much more relevant. Hence, psychomotor skills represent those activities that are primarily movement-oriented. In teaching, emphasis is placed on this movement component, although ultimately in practice, performance requires an integration of related knowledge and values (Oermann, 1990). According to Psychomotor learning-, movement, coordination, manipulation, dexterity, grace, strength, speed; actions which demonstrate fine motor skills such as use of precision instruments or tools. Characteristics of skill acquisition : Over the previous century, many psychological theories of skill acquisition have been proposed, such as those of Fitts and Posner, Anderson and Gentile. There are differences in different psychological frameworks, the core concepts that may inform

97 NSOU ? CC-ED-06 the development of effective training structures to support skill learning may be discussed. Two common and related principles across different theories of skill acquisition are that : 1. Changes in performance due to training and practice proceed in a non-linear manner. 2. As the trainee advances in perceptual-motor learning, the way that they process the task and action will change through qualitatively different phases. The first principle is illustrated by the commonly observed learning curves, in which improvements in the performance outcomes (such as increased speed, reduced error) will be rapid during early trials, but then decelerate with increased practice. This slowing down of improvement rate as learning progresses may be due to a number of factors. The second principle - those learners come to process the task in qualitatively different ways with advanced skill acquisition - is often characterized by a stage-based account of learning. For example, learners in an early stage of skill acquisition will rely on explicit rules about the action and the information relevant to the task, whereas more advanced learners will have developed implicit associations between task-relevant information and appropriate motor responses. In perceptual - motor skill acquisition, many of the processes involved can be characterized as 'tuning' the goal directed nervous system to the constraints of the task. This tuning process applies to movement, perception and attention, each of which is discussed in turn. Movement A fundamental property of perceptual-motor learning is the improvement of precision and consistency of the spatial- temporal control of limbs. In learning to play a guitar, the practicing musician must come to get their fingers to the right place, at the right time, and to pluck the string with the correct force. These factors can become highly precise and consistently repeatable over many instances - indeed, this is the impressive aspect of skill. However, even in highly practiced movements, there is still variability in motor production. Practice might have a very crucial role, through practice, the learner's nervous system will tune into the space of outputs that maximize precision and invariance in the task-relevant dimensions. While there is much debate about exactly how the brain achieves this, one thing that seems clear is that the motor system needs to explore the space of movement possibilities in order to zone in on those that are most aligned

98 NSOU ? CC-ED-06 with task success. This may account for the finding that greater motor variability early on in skill learning is associated with accelerated learning later on. Hence, allowing the students / trainee to fully explore the possible movement space early in field or practical work may lead to improved motor control outcomes later. Perception As well as creating the correct movement output, essential to the achievement of skill is sensitivity to perceptual information about the changing position of the body in relation to the desired end point and also, task-relevant external factors. It can be seen that perception of the task is very different between novice and expert. Whereas novice chess players view the board in terms of the individual pieces and their current position, the expert player sees the board as a unified pattern, with particular opportunities for future moves. Moreover, such differences in perception are tuned into the task at hand. In football, more skilled goalkeepers visually sampled curved free kicks for longer than novices, with the result that their actions were not as susceptible to the deceptive motion in the early part of the ball trajectory. Experts are also more sensitive to the useful perceptual information available and can use this to anticipate future events. This may explain the benefits of 'implicit learning' : in the absence of explicit rules, the trainee has to abstract from the patterns in their sense the variables that directly specify the appropriate (successful) action. Attention Related to perception is the concept of attention in skill acquisition, that is, what information the learner focuses on. In sight-reading (playing music from a score that has never been seen before), more skilled piano players look further ahead, taking in a greater band width of information and attending to future events. This tuning of attention gives the skilled performer an advantage in maximizing the efficiency of cognitive resources, which is important as such resources may be reduced in stressful or unpredictable situations. It is also worth noting that expert performers generally have an external focus of attention, concentrating on the environment and the task goal. Simulation training and assessment Development of a curriculum for simulation training in applied science must consider the characteristics of the learner. The potential for learning will be strengthened if trainees are given the autonomy to decide what and when they practice. However, they should have defined goals and learning objectives relevant to their stage of training and, in parallel, a current training syllabus. Practice in the real field will improve technical skill; however, the use of virtual reality simulators reduces operation time

99 NSOU ? CC-ED-06 and improves performance when compared with no training. So online training through simulation is a growing option. Summative assessment The benefits of different forms of feedback at different stages of the learning curve need to be considered. However, in order to prove that certain proficiencies have been met, trainees will require some method of objective summative assessment of their skills. This may be deemed necessary to progress to the next stage of their curriculum or to allow operating privileges. Objective structured assessment of technical skills (OSATS) has been employed to evaluate performance in any applied course objectively for many years. However, the format is mainly considered to be valid as a measure of progress of training rather than examination or credentialing and has not been evaluated for assessment of simulation training. Taxonomy of progressive skills development (Dave, 1970) : 1. Imitation 2. Manipulation 3. Precision 4. Articulation 5. Naturalization The pedagogical framework proposed by Sawyer et. al. (2011) for psychomotor skill training is as follows : Pedagogical framework for procedural skills training 100 NSOU ? CC-ED-06 Mastery learning (Bloom, 1968) 'an instructional approach requiring learners to achieve a defined proficiency before proceeding to the next instructional objective, offers one approach to individualization.' "Basic principles of mastery learning are that educational excellence is expected and can be achieved by all learners and that little or no variation in measured outcomes will result." (McGaghie et al., 2015). The simulation-based mastery learning follow steps are important– 1. Baseline, or diagnostic testing 2. Clear learning objectives, sequenced 3. Engagement in educational activities 4. A set minimum passing standard (e.g., test score) 5. Formative testing to gauge unit completion at a preset minimum passing standard for mastery 6. Advancement to the next educational unit given measured achievement at or above the mastery standard 7. Continued practice or study on an educational unit until the mastery standard is reached. Verbal guidance also might be instrumental in instructional approach-as advocated by Sutkinet al, (2015)– 1. Didactic (descriptive about current step or anatomy) 2. Commanding (highly specific command) 3. Explanatory (offers rationale) 4. Deictic (context specific - here, there...) 5. Indirect ("I wish I could see") 6. Terse (laconic utterance) 7. Polite (prefix to a statement might imply discussion point) 8. Planning (talk about future steps) Such skill training may be designed with proper instructional steps for school level students too. But in tertiary education specially applied science learning this skill training is much more relevant.

101 NSOU ? CC-ED-06 3.6 Summary In this Unit you have learnt : • Teaching brings out the following qualities about concept of teaching : 1. Teaching is a system of activities. In other words, it is a number of logically contrived sets of activities having a specific structure, form and orientation. 2. Teaching aims at changing others or causing learning in others. Without a suitable goal or objective, no worthwhile teaching can be arranged. 3. The core of the teaching act is increment between teacher, learners, and subject matter. Thus it is by its very nature a social enterprise involving dynamic interaction among a triad. 4. Teaching involves an influence orientation where the direction of focus of control is from the teacher to the learner. 5. Teaching does not just occur, rather it is a planned and an implemented set of activities in an interactional setting in terms of the prior thought about the learning goals, instructional strategies and the subject matter configuration. • Principles of teaching can be summarized as follows : • Principle of using previous knowledge • Principle of providing for individual difference • Principle of readiness • Principle of meaningfulness • Principle of defining specific objectives of the lesson • Principle of proceeding from simple to complex • Principle of proceeding from concrete to abstract • Principle of proceeding from general to specific • Principle of proceeding from known to unknown • Functions of Teaching : 1. Attending to people's feelings, experiences and needs 2. Plan their interventions accordingly 3. Facilitating learning particular things 4. Making specific interventions : • Recognizing and cultivating teachable moments • Cultivating collaborative relationships for learning • Scaffolding • Differentiation • Accessing resources for learning • Adopting a growth mindset 102 NSOU ? Teaching has to be done in steps. The different steps constituting the process are called the phases of teaching. Each phase has some operations of teaching which create the situation for learning. Teaching process can be divided into three phases/stages. 1. Pre-active phase - refers to planning 2. Interactive phase - refers to the conduct and management 3. Post-active phase - refers to the follow-up and consolidation

Pre-active phase : Writing a teaching unit or lesson plan is also an important activity in the

59%

MATCHING BLOCK 23/52

W

pre-active stage of teaching. Therefore, a. It is the phase of planning for teaching. b. Good planning makes the task of the teacher smooth, functional and successful. c. There one two major steps involved in this phase. • Establish some kind of goals or objectives. • Discovering ways and means to activate these objectives.

Interactive phase : The actual implementation phase of the planned instructional system is the Interactive stage. It arises from face to face encounters in a social situation in which the teacher communicates knowledge, information or skill to the pupils with references to a subject matter. Operations of teaching at interactive phase are : • setting up the class • knowing the learners • starting teaching-initiation & response. Post Active Phase : It appears as a suffix to the activity of teaching. The basic point of this stage is that the teacher is so overpowered by the events of the interactive setting that he continues to think about their meaning even after they have disappeared. Hence this gives a firm basis for correcting the mistakes and reorganizing the instructional system with suitable orientations on subsequent occasions. The important operations of this stage are recollecting, listing, extrapolating, formulating a guideline and weighing the evidence. • The three Rs indicates the basic skills taught in the schools: Reading, Writing and Arithmetic. The phrase appeared in print as a space-filler in "The Lady's Magazine" for 1818. The educationalist L.P. Benezet preferred "to read", "to reason", "to recite", adding, "by reciting he did not mean giving back, verbatim, the words of the teacher or of the textbook. He meant speaking the English language." In the United States, during the 17th century, the curriculum in the common (elementary) schools of the New England colonies was summed up as the "four Rs" - Reading, 'Riting, 'Rithmetic", and Religion. Teachers should therefore incorporate various methodologies and

103 NSOU ? CC-ED-06 strategies that facilitate interaction. Teaching methodologies are very essential in ensuring pupils' master 3Rs as they play a big role in ensuring pupils are able to read, write and to do arithmetic. Assessments used in teaching 3Rs can also influence mastering of 3Rs. • Psychomotor skills represent those activities that are primarily movement-oriented. In teaching, emphasis is placed on this movement component, although ultimately in practice, performance requires an integration of related knowledge and values. According to Psychomotor learning -, movement, coordination, manipulation, dexterity, grace, strength, speed; actions which demonstrate fine motor skills such as use of precision instruments or tools. Two common and related principles across different theories of skill acquisition are that : 1. Changes in performance due to training and practice proceed in a non-linear manner. As the trainee advances in perceptual-motor learning, the way that they process the task and action will change through qualitatively different phases. Taxonomy of progressive skills development : 1. Imitation 2. Manipulation 3. Precision 4. Articulation 5. Naturalization Such skill training may be designed with proper instructional steps for school level student too. But in tertiary education specially applied science learning this skill training is much more relevant. 3.7 Self-Assessment Questions 1. What is meant by Teaching?

Elaborates the principles of Teaching. 2. What are the Functions of teaching? 3. Differentiates between the teacher centered and student-centered teaching. 4. Critically judge the pedagogical implications of the pre-active phase of teaching. 5. Explain the operations of the interactive phase 6. Mention the general significance of phases of teaching

104 NSOU ? CC-ED-06 7. Justify the role of the teacher in ensuring three R's factors of learning. Briefly explain the concept of Verbal conditioning. 8. What is meant by psychomotor skill? Mention the taxonomy of progressive skill development. 9. Explain teaching as a process with Reflection and Feedback in Teaching. 3.8 References Beere, J. (2012). The Perfect (Ofsted) Inspection. After the end of this unit you should be able to : • Explain Neural basis of Sensation • Illustrate the structure and function of neural components • Explain the structure and function of human brain • Identify and explain the factors influencing perception • Explain the relationship between cognition and teaching MODULE – 2

108 NSOU ? CC-ED-06 4.2 Introduction Learning is related to perception and cognition. Learning- teaching is an indisputably psychological phenomenon dependent on cognition. Perception and cognition are the mental processes that depend upon the central nervous system. We will try to present you here with a number of ideas to understand the Neuron-Structure, Electrical Potential, Synaptic Transmission, Structure and Function of Human Brain, Neuro-Endocrine System and apart from that we also introduce you to the concept of perception and cognition in relation to teaching. 4.3 Neural basis of Sensation: Neuron-Structure, Electrical Potential, Synaptic Transmission, Structure and Function of Human Brain, Neuro-Endocrine System 4.3.1 Neuron-Structure, Electrical Potential, Synaptic Transmission Everyday different stimuli around us will be stimulating our sense organs and are converted into sensations. Perception is the process by which an organism detects and interprets information from the external world by means of the sensory receptors. Cognition is

100%

MATCHING BLOCK 25/52

W

the act or process of knowing in the broadest sense; specifically, an intellectual process by which knowledge is gained from perception or ideas.

Perception and cognition are the mental processes that depend upon the central nervous system. Thus, the understanding of structure and function of neural components are essential to understand learning-teaching. Nerve impulse A nerve impulse is the relaying of a coded signal from a nerve cell to an effector (a muscle cell, a gland cell or another nerve cell) in response to a stimulus. It is the means by which a nerve cell communicates with another cell. This signal is relayed along the axon of the nerve cell, bringing a message that instructs an effector to act. For instance, in neuromuscular junction, the nerve impulse moves along the axon of a nerve cell to instruct a muscle cell to contract. Neuron There are unique structural features present in neurons. There are also synapses, the specialized sites where neurons send and receive information from other cells, and some of the circuits that allow groups of neurons to coordinate complex processes.

MATCHING BLOCK 26/52

W

Neurons have three basic parts: Cell body or soma : This main part has all of the necessary components of the cell, such as the nucleus (which contains DNA), endoplasmic reticulum and ribosomes 109 NSOU ? CC-ED-06 (for building proteins) and mitochondria (for making energy). If the cell body dies, the neuron dies. Axon : This long, cable-like projection of the cell carries the electrochemical message (nerve impulse or action potential) along the length of the cell. Depending upon the type of neuron, axons can be covered with a thin layer of myelin sheath, like an insulated electrical wire. Myelin is made of fat and protein, and it helps to speed transmission of a nerve impulse down a long axon. Myelinated neurons are typically found in the peripheral nerves (sensory and motor neurons), while non- myelinated neurons are found in the brain and spinal cord. Dendrites or nerve endings : These small, branchlike projections of the cell make connections to other cells and allow the neuron to talk with other cells or perceive the environment. Dendrites can be located on one or both ends of a cell.

Classification of stimulus (a) Subliminal stimulus : Subliminal stimuli (the prefix sub- literally "below, or less than"), contrary to supraliminal stimuli or "above threshold", are any sensory stimuli below an individual's threshold for conscious perception. A 2012 review of functional magnetic resonance imaging (fMRI) studies shows that subliminal stimuli activate specific regions of the brain despite participants being unaware. Visual stimuli may be quickly flashed before an individual can process them, or flashed and then masked, thereby interrupting the processing. Audio stimuli may be played below audible volumes or masked by other stimuli. (b) Supraliminal stimuli : Which can produce the LES to action potential. Origin of Nerve impulse In resting nerve cells, the surface is positively charged and the interior is negatively charged. When the surface is stimulated the stimulated point becomes negative. The fluids both inside and outside the cell are electro-lytic solutions containing 150- 160m Eq/litre. Positive ions and negative ions are accumulated along the outer and inner surface of the cell membrane, respectively. This is achieved by Na^+ outside and K^+ inside the cell membrane, and because Na^+ is placed above the K^+ in the electrochemical series. 110 NSOU ? CC-ED-06 Transmission of Nerve Impulses The transmission of a nerve impulse along a neuron from one end to the other occurs as a result of electrical changes across the membrane of the neuron. The membrane of an unstimulated neuron is polarized-that is, there is a difference in electrical charge between the outside and inside of the membrane. The inside is negative with respect to the outside. Polarization is established by maintaining an excess of sodium ions (Na^+) on the outside and an excess of potassium ions (K^+) on the inside. A certain amount of Na^+ and K^+ is always leaking across the membrane through leakage channels, but Na^+/K^+ pumps in the membrane actively restore the ions to the appropriate side. The main contribution to the resting membrane potential (a polarized nerve) is the difference in permeability of the resting membrane to potassium ions versus sodium ions. The resting membrane is much more permeable to potassium ions than to sodium ions resulting in slightly more net potassium ion diffusion (from the inside of the neuron to the outside) than sodium ion diffusion (from the outside of the neuron to the inside) causing the slight difference in polarity right along the membrane of the axon. Other ions, such as large, negatively charged proteins and nucleic acids, reside within the cell. It is these large, negatively charged ions that contribute to the overall negative charge on the inside of the cell membrane as compared to the outside. In addition to crossing the membrane through leakage channels, ions may cross through gated channels. Gated channels open in response to neurotransmitters, changes in membrane potential, or other stimuli. The following events characterize the transmission of a nerve impulse (see Figure 1) :

111 NSOU ? CC-ED-06 Resting potential : The resting potential describes the unstimulated, polarized state of a neuron (at about -70 millivolts). Graded potential : A graded potential is a change in the resting potential of the plasma membrane in the response to a stimulus. A graded potential occurs when the stimulus causes Na⁺ or K⁺ gated channels to open. If Na⁺ channels open, positive sodium ions enter, and the membrane depolarizes (becomes more positive). If the stimulus opens K⁺ channels, then positive potassium ions exit across the membrane and the membrane hyperpolarizes (becomes more negative). A graded potential is a local event that does not travel far from its origin. Graded potentials occur in cell bodies and dendrites. Light, heat, mechanical pressure, and chemicals, such as neurotransmitters, are examples of stimuli that may generate a graded potential (depending upon the neuron). The following four steps describe the initiation of an impulse to the "resetting" of a neuron to prepare for a second stimulation: Action potential : Unlike a graded potential, an action potential is capable of traveling long distances. If a depolarizing graded potential is sufficiently large, Na⁺ channels in the trigger zone open. In response, Na⁺ on the outside of the membrane becomes depolarized (as in a graded potential). If the stimulus is strong enough—that is, if it is above a certain threshold level—additional Na⁺ gates open, increasing the flow of Na⁺ even more, causing an action potential, or complete depolarization (from -70 to about +30 millivolts). This in turn stimulates neighboring Na⁺ gates, farther down the axon, to open. In this manner, the action potential travels down the length of the axon as open Na⁺ gates stimulate neighboring Na⁺ gates to open. The action potential is an all-or-nothing event: When the stimulus fails to produce depolarization that exceeds the threshold value, no action potential results, but when threshold potential is exceeded, complete depolarization occurs. Repolarization : In response to the inflow of Na⁺, K⁺ channels open, this time allowing K⁺ on the inside to rush out of the cell. The movement of K⁺ out of the cell causes repolarization by restoring the original membrane polarization. Unlike the resting potential, however, in repolarization the K⁺ are on the outside and the Na⁺ are on the inside. Soon after the K⁺ gates open, the Na⁺ gates close. Hyperpolarization : By the time the K⁺ channels close, more K⁺ have moved out of the cell than is actually necessary to establish the original polarized potential. Thus, the membrane becomes hyperpolarized (about -80 millivolts). Refractory period : With the passage of the action potential, the cell membrane is in an unusual state of affairs. The membrane is polarized, but the Na⁺ and K⁺

112 NSOU ? CC-ED-06 are on the wrong sides of the membrane. During this refractory period, the axon will not respond to a new stimulus. To reestablish the original distribution of these ions, the Na⁺ and K⁺ are returned to their resting potential location by Na⁺/K⁺ pumps in the cell membrane. Once these ions are completely returned to their resting potential location, the neuron is ready for another stimulus. Propagation in non-medullated nerve fiber : According to membrane theory, nerve impulse is a propagated wave of depolarization. When the fibre is excited at a point, the polarity is reversed. This reversed polarity is due to increased permeability of Na⁺ to the membrane which develops depolarization. A local circuit current flows between the depolarised membrane and the resting membrane areas. Positive current flows inward through the de-polarised membrane and out-ward through the resting membrane and in this way the circuit is completed. The local de-polarisation current then exits the adjacent portion of the membrane progressively more and more de-polarisation. The depolarization wave travels in all directions along the entire length of the nerve fibre. Propagation in myelinated nerve fibre : Saltatory conduction The process of excitation and conduction in vertebrate myelinated nerve fibers is characterized by its discontinuous and saltatory features. The velocity at which an action potential propagates down an axon is limited by the speed at which ion channels open and close, and therefore, is slow compared to the physical conduction of electricity in a wire. In some neurons, action potentials must travel significant distances (>1 meter) to reach the effector junction. Given that rapid, coordinated function is dependent

113 NSOU ? CC-ED-06 on signals reaching the target quickly, vertebrates accelerate action potential propagation by employing saltatory conduction. In myelinated neurons, ion channels are located at the Nodes of Ranvier, and it is only at these sites where action potentials are regenerated. The myelin sheath provides an insulation that increases membrane capacitance and, thus, significantly diminishes decremental conduction. Therefore, current propagates from node to node in a manner more closely resembling a wire. Synapse

96%

MATCHING BLOCK 27/52

W

Synapse, also called neuronal junction, is the site of transmission of electric nerve impulses between two nerve cells (neurons) or between a neuron and a gland or muscle cell (effector). A synaptic connection between a neuron and a muscle cell is called a neuromuscular junction.

It is the junctional region where one neuron ends and the other begins. Between the presynaptic and post-synaptic membranes a cleft of several nanometers is present. The transfer of information across a synaptic junction is called synaptic transmission. These transmissions are brought about either by chemical or by electrical or by both processes. Classification of Synapse : (a) According to structure : On the basis of nature of connections between neurons, synapses have been classified into three types :

114 NSOU ? CC-ED-06 • Axodendritic synapse : Pertaining to the synaptic relationship of an axon with a dendrite of another neuron. • Axosomatic synapse : The synaptic junction of an axon terminal of one nerve cell to the cell body of another nerve cell. • Axoaxonic synapse : one between the axon of one neuron and the axon of another neuron is termed as axoaxonic synapse. (c) According to function : On the basis of how one impulse transverse the synapse a) Electrical synapse : Some synapses of mammals transmit stimuli by current flow across adjacent membranes. In this case the neurons are generally in much closer proximity and even in some instances pre-synaptic and postsynaptic membranes fused together. b) Chemical synapse : A chemical synapse between a motor

neuron and a muscle cell is called a neuromuscular junction.

Chemical synapses allow the neurons of the central nervous system to form interconnected neural circuits. They are thus crucial to the biological

115 NSOU ? CC-ED-06 computations that underlie perception and thought. They also provide the means through which the nervous system connects to and controls the other systems of the body. The human brain contains a huge number of chemical synapses, with young children having about 10,000 trillion synapses. c) Electrochemical synapse : In this synapse stimulus is transmitted both with the aid of electrons and neurotransmitter. Structure of a Synapse Electron microscopic studies have revealed that the axons of the presynaptic neurons end in the expanded terminals - the synaptic or terminal knobs or buttons. The membrane of the synaptic knob is the presynaptic membrane while that of the cell body is the postsynaptic membrane. Though there is intimate contact between the two membranes, they are separated by a gap-the synaptic cleft, measuring about 10-20 nm.

116 NSOU ? CC-ED-06 Thus, there is no physical continuity in the cytoplasm of the presynaptic and postsynaptic neurons at the synapses. However, at some synapses, the two membranes show areas of closer proximity and the outer layers of the unit membranes of the pre- and postsynaptic membranes even fuse, forming gap junctions. In some synapses, the filaments form a web-like network on the postsynaptic membrane extending even into the cytoplasm of the postsynaptic neuron. This network is known as the post-synaptic web. The cytoplasm of the terminal knobs contains mitochondria and synaptic vesicles. The synaptic vesicles are spherical or ovoid shaped with diameters ranging between 20-65 nm. A 4-5 nm thick unit membrane binds the vesicles. These vesicles are more concentrated towards the synaptic cleft. Process of Transmission of Nerve Impulse through Synapse : The process can be described in two headings.

117 NSOU ? CC-ED-06 a. Releasing of chemicals from pre-synaptic knob : The transfer of nerve impulse across a synaptic junction is known as synaptic transmission. It is believed that the process is brought about by the release of chemical substances at the synapse. The neurotransmitter substances synthesized in the synaptic vesicles contain the excitatory neurotransmitter substances that mediate transmission of nerve impulses from the presynaptic to postsynaptic neurons. The vesicles may be found on both sides of the synaptic junction, and in electrically transmitting neurons also terminal processes of the axons and stored in the synaptic vesicles. On arrival of nerve action potential through the axon into the terminal knobs, the vesicles release the neurotransmitter substance. Calcium ions are required for the release, and magnesium ions inhibit the process. After the release of the transmitter the vesicular membrane moves into the cell cytoplasm and is used to package new transmitter substances synthesized. b. Transmission of neurotransmitter from presynaptic ending to a postsynaptic membrane : The neurotransmitter substances released by the presynaptic terminal diffuse across the synaptic cleft and bind to specific receptor sites on the postsynaptic membrane. In the vertebrate neuromuscular junction acetylcholine is released from 100 - 300 pre-synaptic sites and diffuses across a distance of less than 1mm.

118 NSOU ? CC-ED-06 Nature of neurotransmitter : Acetylcholine is one of the major neurotransmitter substances released at the synapse. Among other neurotransmitters, sympathin (norepinephrine) in the post-ganglionic fibres of the sympathetic nervous system is important. Dopamine, 5- hydroxytryptamine, -amino butyric acid (GABA), amino acids like alanine, glycine, aspartic acid and glutamic acid, peptides, histamine and prostaglandin are known to act as neurotransmitters. Generation of EPSP and IPSP : The binding of the neurotransmitter to the receptor molecules is accompanied by alteration of the permeability of the post-synaptic membrane. Two types of alterations in the permeability are observed. The first is a general type in which the permeability of postsynaptic membrane to all types of ions brings about a depolarization of the membrane and excitatory postsynaptic potential (EPSP) is produced. The second type increases the permeability of the membrane to K⁺ and chloride ions causing hyper-polarization of the membrane and inhibitory postsynaptic potential (IPSP) is produced. If the synaptic potentials are great enough to produce sufficiently strong local currents, a spike is generated in the appropriate region of the post-synaptic neuron. Destruction of neurotransmitter substances : The neurotransmitter substances are destroyed quickly so that normal post-synaptic resting potentials are restored and the neuron may respond again to a new stimulus. Acetylcholine is destroyed by the enzyme acetylcholinesterase at the synaptic junction and produces acetic acid and choline. 4.3.2. Structure and Function of Human Brain The brain is an amazing three-pound organ that controls all functions of the body, interprets information from the outside world, and embodies the essence of the mind and soul. Intelligence, creativity, emotion, and memory are a few of the many things governed by the brain. Protected within the skull, the brain is composed of the cerebrum, cerebellum, and brainstem. The brain receives information through our five senses: sight, smell, touch, taste, and hearing - often many at one time. It assembles the messages in a way that has meaning for us, and can store that information in our memory. The brain controls our thoughts, memory and speech, movement of the arms and legs, and the function of many organs within our body.

119 NSOU ? CC-ED-06 The central nervous system (CNS) is composed of the brain and spinal cord. The peripheral nervous system (PNS) is composed of spinal nerves that branch from the spinal cord and cranial nerves that branch from the brain. Brain The brain is composed of the cerebrum, cerebellum, and brainstem (Fig. 1). Figure: The brain has three main parts: the cerebrum, cerebellum and brainstem. Cerebrum : is the largest part of the brain and is composed of right and left hemispheres. It performs higher functions like interpreting touch, vision and hearing, as well as speech, reasoning, emotions, learning, and fine control of movement. Cerebellum : is located under the cerebrum. Its function is to coordinate muscle movements, maintain posture, and balance. Brainstem : acts as a relay center connecting the cerebrum and cerebellum to the spinal cord. It performs many automatic functions such as breathing, heart rate, body temperature, wake and sleep cycles, digestion, sneezing, coughing, vomiting, and swallowing.

120 NSOU ? CC-ED-06 Right brain – left brain The cerebrum is divided into two halves: the right and left hemispheres. They are joined by a bundle of fibers called the corpus callosum that transmits messages from one side to the other. Each hemisphere controls the opposite side of the body. If a stroke occurs on the right side of the brain, your left arm or leg may be weak or paralyzed. Not all functions of the hemispheres are shared. In general, the left hemisphere controls speech, comprehension, arithmetic, and writing. The right hemisphere controls creativity, spatial ability, artistic, and musical skills. The left hemisphere is dominant in hand use and language in about 92% of people. Figure: The cerebrum is divided into left and right hemispheres. The two sides are connected by the nerve fibers corpus callosum. Lobes of the brain The cerebral hemispheres have distinct fissures, which divide the brain into lobes. Each hemisphere has 4 lobes: frontal, temporal, parietal, and occipital. Each lobe may be divided, once again, into areas that serve very specific functions. It's important to understand that each lobe of the brain does not function alone. There are very complex relationships between the lobes of the brain and between the right and left hemispheres.

121 NSOU ? CC-ED-06 Figurure : The cerebrum is divided into four lobes: frontal, parietal, occipital and temporal. Frontal lobe • Personality, behavior, emotions • Judgment, planning, problem solving • Speech: speaking and writing (Broca's area) • Body movement (motor strip) • Intelligence, concentration, self-awareness Parietal lobe • Interprets language, words • Sense of touch, pain, temperature (sensory strip) • Interprets signals from vision, hearing, motor, sensory and memory • Spatial and visual perception 122 NSOU ? CC-ED-06 Occipital lobe • Interprets vision (color, light, movement) Temporal lobe • Understanding language (Wernicke's area) • Memory • Hearing • Sequencing and organization Language In general, the left hemisphere of the brain is responsible for language and speech and is called the "dominant" hemisphere. The right hemisphere plays a large part in interpreting visual information and spatial processing. In about one third of people who are left-handed, speech function may be located on the right side of the brain. Left-handed people may need special testing to determine if their speech center is on the left or right side prior to any surgery in that area. Aphasia is a disturbance of language affecting speech production, comprehension, reading or writing, due to brain injury - most commonly from stroke or trauma. The type of aphasia depends on the brain area damaged. Broca's area: lies in the left frontal lobe. If this area is damaged, one may have difficulty moving the tongue or facial muscles to produce the sounds of speech. The person can still read and understand spoken language but has difficulty in speaking and writing (i.e. forming letters and words, doesn't write within lines) - called Broca's aphasia. Wernicke's area: lies in the left temporal lobe. Damage to this area causes Wernicke's aphasia. The individual may speak in long sentences that have no meaning, add unnecessary words, and even create new words. They can make speech sounds, however they have difficulty understanding speech and are therefore unaware of their mistakes. Cortex The surface of the cerebrum is called the cortex. It has a folded appearance with hills and valleys. The cortex contains 16 billion neurons (the cerebellum has 70 billion = 86 billion total) that are arranged in specific layers. The nerve cell bodies color the cortex grey-brown giving it its name - gray matter (Fig. 4). Beneath the cortex are long nerve fibers (axons) that connect brain areas to each other - called white matter.

123 NSOU ? CC-ED-06 Figure: The cortex contains neurons (grey matter), which are interconnected to other brain areas by axons (white matter). The cortex has a folded appearance. A fold is called a gyrus and the valley between is a sulcus. The folding of the cortex increases the brain's surface area allowing more neurons to fit inside the skull and enabling higher functions. Each fold is called a gyrus, and each groove between folds is called a sulcus. There are names for the folds and grooves that help define specific brain regions. Deep structures Pathways called white matter tracts connect areas of the cortex to each other. Messages can travel from one gyrus to another, from one lobe to another, from one side of the brain to the other, and to structures deep in the brain. Hypothalamus : is located in the floor of the third ventricle and is the master control of the autonomic system. It plays a role in controlling behaviors such as hunger, thirst, sleep, and sexual response. It also regulates body temperature, blood pressure, emotions, and secretion of hormones. Pituitary gland : lies in a small pocket of bone at the skull base called the sella turcica. The pituitary gland is connected to the hypothalamus of the brain by the pituitary stalk. Known as the "master gland," it controls other endocrine glands in the body. It secretes hormones that control sexual development, promote bone and muscle growth, and respond to stress. Pineal gland : is located behind the third ventricle. It helps regulate the body's internal clock and circadian rhythms by secreting melatonin. It has some role in sexual development. Thalamus : serves as a relay station for almost all information that comes and goes to the cortex. It plays a role in pain sensation, attention, alertness and memory.

124 NSOU ? CC-ED-06 Basal ganglia : includes the caudate, putamen and globus pallidus. These nuclei work with the cerebellum to coordinate fine motions, such as fingertip movements. Limbic system : is the center of our emotions, learning, and memory. Included in this system are the cingulate gyri, hypothalamus, amygdala (emotional reactions) and hippocampus (memory). Memory Memory is a complex process that includes three phases: encoding (deciding what information is important), storing, and recalling. Different areas of the brain are involved in different types of memory (Fig. 6). Your brain has to pay attention and rehearse in order for an event to move from short-term to long-term memory - called encoding. Figure : Structures of the limbic system involved in memory formation. The prefrontal cortex holds recent events briefly in short-term memory. The hippocampus is responsible for encoding long-term memory. • Short-term memory, also called working memory, occurs in the prefrontal cortex. It stores information for about one minute and its capacity is limited to about 7 items. For example, it enables you to dial a phone number someone just told you. It also intervenes during reading, to memorize the sentence you have just read, so that the next one makes sense. • Long-term memory is processed in the hippocampus of the temporal lobe and

125 NSOU ? CC-ED-06 is activated when you want to memorize something for a longer time. This memory has unlimited content and duration capacity. It contains personal memories as well as facts and figures. • Skill memory is processed in the cerebellum, which relays information to the basal ganglia. It stores automatic learned memories like tying a shoe, playing an instrument, or riding a bike. Ventricles and cerebrospinal fluid The brain has hollow fluid-filled cavities called ventricles. Inside the ventricles is a ribbon-like structure called the choroid plexus that makes clear colorless cerebrospinal fluid (CSF). CSF flows within and around the brain and spinal cord to help cushion it from injury. This circulating fluid is constantly being absorbed and replenished. Figure: CSF is produced inside the ventricles deep within the brain. CSF fluid circulates inside the brain and spinal cord and then outside to the subarachnoid space. Common sites of obstruction : 1) foramen of Monro, 2) aqueduct of Sylvius, and 3) obex. There are two ventricles deep within the cerebral hemispheres called the lateral ventricles. They both connect with the third ventricle through a separate opening called the foramen of Monro. The third ventricle connects with the fourth ventricle through a long narrow tube called the aqueduct of Sylvius. From the fourth ventricle, CSF flows into the subarachnoid space where it bathes and cushions the brain. CSF is recycled (or absorbed) by special structures in the superior sagittal sinus called arachnoid villi.

126 NSOU ? CC-ED-06 A balance is maintained between the amount of CSF that is absorbed and the amount that is produced. A disruption or blockage in the system can cause a buildup of CSF, which can cause enlargement of the ventricles (hydrocephalus) or cause a collection of fluid in the spinal cord (syringomyelia). Cranial nerves The brain communicates with the body through the spinal cord and twelve pairs of cranial nerves. Ten of the twelve pairs of cranial nerves that control hearing, eye movement, facial sensations, taste, swallowing and movement of the face, neck, shoulder and tongue muscles originate in the brainstem. The cranial nerves for smell and vision originate in the cerebrum. The Roman numeral, name, and main function of the twelve cranial nerves :
 Number Name Function
 I Olfactory Smell
 II Optic Sight
 III oculomotor moves eye, pupil
 IV trochlear moves eye
 V trigeminal face sensation
 VI abducens moves eye
 VII Facial moves face, salivate
 VIII vestibulocochlear hearing, balance
 IX glossopharyngeal taste, swallow
 X Vagus heart rate, digestion
 XI accessory moves head
 XII hypoglossal moves tongue
 Meninges The brain and spinal cord are covered and protected by three layers of tissue called meninges. From the outermost layer inward they are: the dura mater, arachnoid mater, and pia mater. Dura mater : is a strong, thick membrane that closely lines the inside of the skull; its two layers, the periosteal and meningeal dura, are fused and separate only to form venous sinuses. The dura creates little folds or compartments. There are two special

127 NSOU ? CC-ED-06 dural folds, the falx and the tentorium. The falx separates the right and left hemispheres of the brain and the tentorium separates the cerebrum from the cerebellum. Arachnoid mater : is a thin, web-like membrane that covers the entire brain. The arachnoid is made of elastic tissue. The space between the dura and arachnoid membranes is called the subdural space. Pia mater : hugs the surface of the brain following its folds and grooves. The pia mater has many blood vessels that reach deep into the brain. The space between the arachnoid and pia is called the subarachnoid space. It is here where the cerebrospinal fluid bathes and cushions the brain. 4.3.3. Neuro-Endocrine System The central neuroendocrine systems serve as an interface between the brain and many of the peripheral endocrine systems. This chapter discusses the hypothalamic control of anterior pituitary systems regulating stress, basal metabolism, growth, reproduction, and lactation. Each of these systems involves one or more hypothalamic releasing or inhibiting hormones, released from hypothalamic neurons that terminate in the portal capillary vasculature that projects from the median eminence at the base of the hypothalamus to the anterior pituitary gland. There, the hypothalamic hormones act upon subsets of anterior pituitary cells to regulate pituitary hormone release and downstream physiological functions. Other hypothalamic neuroendocrine cells control water/salt balance, and lactation/parturition, through the release of vasopressin and oxytocin from nerve terminals that arise in hypothalamus and project to the posterior pituitary gland. Together, these hypothalamic neuroendocrine functions enable the central nervous system to respond rapidly to internal or external environmental change, and to maintain a response through endocrine hormonal transducers. The neuroendocrine system is composed of the hypothalamus and pituitary gland and is under the influence of neurotransmitters and neuropeptides that regulate hypothalamic releasing and hypothalamic release inhibiting hormones secreted into the blood vessels that connect the hypothalamus and pituitary gland. The release of these hypothalamic hormones influences the secretion of anterior pituitary hormones that subsequently regulate tissue function. The hypothalamus and pituitary gland have the capacity to detect humoral secretions (hormones secreted) from target tissues and adjust hormone production to maintain an optimal internal "milieu" appropriate for normal function. It is well-established that the neuroendocrine system has a critical role in integrating biological responses and influencing : (1) cellular protein synthesis and general metabolism through the release of growth hormone and thyroid-stimulating hormone (TSH), respectively, (2) reproductive function through the release of luteinizing

128 NSOU ? CC-ED-06 hormone (LH), follicle-stimulating hormone (FSH), prolactin, and oxytocin, and (3) plasma electrolytes and responses to stress through regulation of the hormones vasopressin (antidiuretic hormone, or ADH) and adrenocorticotrophic (ACTH). In addition, the hypothalamus also has an important role in the integration of parasympathetic and sympathetic nervous system activity, and can thereby influence a wide variety of functions, including heart rate, blood pressure, vascular responses, and glucose metabolism. The hypothalamus has been implicated in the regulation of biological rhythms by its interactions with hypothalamic nuclei. More recently, the regulation of fat metabolism and food intake has been shown to be regulated through the hypothalamus by its response to the protein, leptin, and its synthesis of neuropeptide Y. It should be noted that the classification of hormones and their primary function presented here is an overly simplistic view of the neuroendocrine system, since critical interactions occur among these hormones that contribute to the coordinated regulation of cellular and tissue function. Although the specific etiology of age-related changes in the neuroendocrine system is unknown, it has been proposed that cellular and molecular alterations in specific subpopulations of neurons within the hypothalamus and pituitary, and/or supporting structures within the brain, contribute to the decrease in tissue function. Some of the alterations may be related to loss of neurons or synapses, genetic errors, and/ or the production of free radicals, all of which lead to progressive aberrations in neurons and contribute to neuroendocrine aging. As a result, the neuroendocrine theory of aging is unique when compared to other theories of aging in that the neuroendocrine alterations are, in many cases, not considered the primary causative factors of biological aging, but rather are considered to be mediators of aging that are initiated by cellular changes in specific subpopulations of neurons or systems that closely interact with hypothalamic neurons. Three classic examples of age-associated changes in neuroendocrine regulation, and the resulting consequences for tissue function, help emphasize the importance of this system in the development of the aging phenotype. First, with increasing age there is a decline in growth-hormone secretion that results in a decrease in insulin-like growth factor-1 (IGF-1) production in the liver and other tissues. The loss of these anabolic hormones contributes to the general decline in cellular protein synthesis, skeletal muscle mass, immune function, and cognitive ability in rodents, nonhuman primates, and humans. The decrease in growth-hormone release from the pituitary gland results from impaired release of growth-hormone-releasing hormone and increased release of somatostatin (an inhibitor of growth hormone) from hypothalamic neurons. Second, decreased secretion of gonadotropin-releasing hormone (GnRH) from hypothalamic neurons results in a decline in luteinizing hormone. This is the primary

129 NSOU ? CC-ED-06 factor in the loss of reproductive cycles in the female rodent, and, in conjunction with the loss of ovarian follicles, contributes to the decline in estrogen levels in women. These latter changes result in atrophy of secondary reproductive tissues and have been implicated in the post-menopausal loss of bone and cognitive function. Decreased GnRH secretion in the male also contributes to a decrease in LH and androgen levels and to the corresponding loss of skeletal muscle mass and reproductive function. Finally, increased secretion of ACTH and the adrenal hormone, cortisol, in response to stress have been reported to contribute to atrophy and/or loss of neurons, as well as age-related decline in cognitive function. These latter findings have contributed to the hypothesis that increased levels of glucocorticoids contribute to brain aging. Although other mechanisms are possible, the alterations in the secretion of hypothalamic hormones with age have been traced to deficiencies in the secretion of brain neurotransmitters. For example, the activity of dopamine and norepinephrine decreases with age, and both acute and chronic procedures used to increase levels of these neurotransmitters in aged animals have been shown to restore some aspects of neuroendocrine function. Studies have shown an increase in growth hormone release and a restoration of some aspects of reproductive function in older animals in response to the L-Dopa, dopamine and norepinephrine precursor. These findings have led investigators to conclude that a decline in neurotransmitter activity is a contributing factor in the neuroendocrine decline that accompanies aging. Nevertheless, the possibility that interactions with other hypothalamic peptides, the loss of neurons, or intracellular changes within hypothalamic neurons contribute to the loss of function cannot be excluded. In fact, the inability of hypothalamic neurons to compensate for the age-related alterations in circulating levels of hormones supports the concept that the normal feedback mechanisms that occur within the hypothalamus are impaired in aged animals. Whether these altered feedback mechanisms are related to the deficiencies in neurotransmitters or result from other aberrations within the aging neuroendocrine system remain to be established. Nevertheless, deficits in the regulation of these critical hormonal systems contribute to deterioration of tissue function and undoubtedly are an important factor in age-related disease and disability.

4.4 Perception : Factors influencing Perception

4.4.1. Concept of Perception : Everyday different stimuli around us will be stimulating our sense organs. Many of these stimuli are received by our sense organs and are converted into sensations.

130 NSOU ? CC-ED-06 These sensations are transmitted to the concerned parts of the brain. In turn the brain will interpret these sensations. It is only after such interpretation we understand what the stimulus is. Hence in understanding the world around us, attention occurs first, followed by sensation and finally interpretation by the brain. In other words, Perception is the organization, identification, and interpretation of sensory information in order to represent and understand the environment. All perception involves signals in the nervous system, which in turn result from physical or chemical stimulation of the sense organs. It is not the passive receipt of these signals but is shaped by learning, memory, expectation, and attention. According to Joseph Reitz; "Perception includes all those processes by which an individual receives information about his environment-seeing, hearing, feeling, tasting and smelling." According to B. V. H. Gilmer, "Perception is the process of becoming aware of situations, of adding meaningful associations to sensations." According to S. P. Robbins, perception can be defined as "the process by which individuals organize and interpret their sensory impressions in order to give meaning to their environments." Perception includes the 5 senses; touch, sight, taste, smell and sound. It also includes what is known as perception, a set of senses involving the ability to detect changes in body positions and movements. It also involves the- cognitive processes required to process information, such as recognizing the face of a friend or detecting a familiar perfume. Principles of Perceptual Organization : William James, an American psychologist has said if we understand the world as it appears to us, it will be a big blooming- buzzing confusion. Hence, we do not see the things as they appear, but we see them as we want, i.e. more meaningfully. In the perceptual process we select a particular stimulus with our attention and interpret it. In the same way whenever it is necessary many discrete stimuli in our visual field are organized into a form and perceived more meaningfully than they appear. This phenomenon was well explained by Gestalt psychologists. They believed that the brain creates a coherent perceptual experience by perceiving a stimulus as a whole rather than perceiving discrete entities. This is more meaningfully stated in the gestalt principle as 'the whole is better than the sum total of its parts'. This is explained under many sub-principles of perception. Figure-ground Relationship : According to this principle any figure can be perceived more meaningfully in a background and that figure cannot be separated from that background. For example,

131 NSOU ? CC-ED-06 letters written with a white chalk piece are perceived clearly in the background of a blackboard. In the above figure, two faces can be seen in the background of a white colour. So also the white background can be perceived as a vessel in the background of two faces. 4.4.2. Factors Affecting Perception : There are individual differences in perceptual abilities. Two people may perceive the same stimulus differently. The factors affecting the perceptions of people are : a. Perceptual learning : Based on past experiences or any special training that we get, every one of us learns to emphasize some sensory inputs and to ignore others. For example, a person who has got training in some occupation like artistry or other skilled jobs can perform better than other untrained people. Experience is the best teacher for such perceptual skills. For example, blind people identify the people by their voice or by sounds of their footsteps. b. Mental set : Set refers to preparedness or readiness to receive some sensory input. Such expectancy keeps the individual prepared with good attention and concentration. For example, when we are expecting the arrival of a train, we listen to its horn or sound even if there is a lot of noise disturbance.

132 NSOU ? CC-ED-06 c. Motives and needs : Our motives and needs will definitely influence our perception. For example, a hungry person is motivated to recognize only the food items among other articles. His attention cannot be directed towards other things until his motive is satisfied. d. Cognitive styles : People are said to differ in the ways they characteristically process the information. Every individual will have his or her own way of understanding the situation. It is said that the people who are flexible will have good attention and they are less affected by interfering influences and to be less dominated by internal needs and motives than or people at the constricted end. Importance of Perception Learning is intrinsically related with perception. Learning- teaching is an indisputably psychological phenomenon dependent on perception. Perception is the process by which an organism detects and interprets information from the external world by means of the sensory receptors. It is our sensory experience of the world around us and involves both the recognition of environmental stimuli and actions in response to these stimuli. Through the perceptual process, we gain information about the properties and elements of the environment that are critical to our survival. The relevant importance may be list below as : 1. Perception is very important in understanding human behavior because every person perceives the world and approaches life problems differently. Whatever we see or feel is not necessarily the same as it really is. When we buy something, it is not because it is the best, but because we take it to be the best. 2. If people behave on the basis of their perception, we can predict their behavior in the changed circumstances by understanding their present perception of the environment. One person may be viewing the facts in one way which may be different from the facts as seen by another viewer. 3. With the help of perception, the needs of various people can be determined, because people's perception is influenced by their needs. 4. Perception is very important for the manager who wants to avoid making errors when dealing with people and events in the work setting. This problem is made more complicated by the fact that different people perceive the same situation differently. In order to deal with the subordinates effectively, the managers must understand their perceptions properly. 5. Perception can be important because it offers more than objective output; it ingests an observation and manufactures an altered reality enriched with previous experiences.

133 NSOU ? CC-ED-06 6. Perception builds character (not necessarily good or bad character) that defines different roles individuals fall into: the clown, the hypocrite, the self-righteous, the victim, etc. 7. It is vitally important if we want to get along with others to try to see things from their perspective or walk in their shoes for a while. If we walk in their shoes we will gain a new perspective about things and understand the other and also can love and help the other more appropriately. Thus, for understanding human behavior, it is very important to understand their perception, that is, how they perceive the different situations. People's behavior is based on their perceptions of what reality is, not on reality itself. The world as it is perceived is the world that is important for understanding human behavior. 4.5 Cognition and Fundamental of Teaching 4.5.1. Concept of Cognition :

100%**MATCHING BLOCK 29/52****W**

Cognition can be defined as "the act or process of knowing in the broadest sense; specifically, an intellectual process by which knowledge is gained from perception or ideas" (Webster's Dictionary). Cognition is central to the development of psychology as a scientific discipline. The establishment of Wilhelm Wundt's laboratory in 1879 to study human thought processes is often used as the beginning of modern psychology. Cognitive psychology is one of the major approaches within psychology and can be contrasted with the behavioral view (a focus on observable behavior), a psychoanalytic view (a focus on the unconscious), a humanistic view (a focus on personal growth and interpersonal relationships) and a social cognitive view (a focus on the social environment as it impacts personal qualities such as thinking and feeling.) An important distinction between the behavioral and cognitive or humanistic views is the importance of feedback. For behaviorists, the most important feedback comes in the form of the application of consequences from the environment. The cognitive, as well humanistic, would focus on the importance of internal feedback. The social cognitive view considers both types. Cunia (2005) provides an excellent overview of the cognitive theory applied to learning. There are a variety of perspectives and emphases within cognitive psychology (Winn & Snyder, 1996) that are currently impacting educators' thinking about how to improve the teaching-learning process. The Information Processing approach focuses on the study of the structure and function of mental processing within specific contexts, environments, or ecologies. Benjamin Bloom and his colleagues developed the Taxonomy of the Cognitive Domain as a way to classify the variety of educational 134

NSOU ? CC-ED-06

100%**MATCHING BLOCK 30/52****W**

objectives related to what and how human beings know. Researchers in the area of intelligence study how human beings learn from experience, reason well, remember important information, and adapt to the environment. Jean Piaget's theory of cognitive development describes the process and stages by which human beings develop the capacity to engage in abstract symbolic thought, one of the distinguishing features of human activity. Piaget's theory is often contrasted with the views of Jerome Bruner and Lev Vygotsky. Several different areas of inquiry provide an opportunity to test out these different theories. For example, in the area of critical thinking researchers study how human beings apply cognitive processes to evaluating arguments (propositions) and making decisions. On the other hand, in the area of creative thinking researchers study how human beings generate ideas and alternatives that do not fit the "norm." These two areas are often contrasted as the difference between convergent thinking (thinking pattern used when

the

100%**MATCHING BLOCK 32/52****W**

end result is to narrow and evaluate ideas) and divergent thinking (thinking pattern used to expand or develop new ideas). A similar comparison is between left-brain and right-brain orientations (i.e., brain lateralization dominance). Metacognition is another area in cognition that draws from a number of different perspectives and is the study of how individuals develop knowledge about one's own cognitive system. Different study methods, such as SQ4R, provide information about how individuals can be most effective and efficient during the process of learning. The materials available in this section provide a brief overview of these different approaches to the study of cognition. Joanne Ruttan provides an overview of some of the terminology used in the cognitive approach. 4.5.2.

Cognition and teaching : Cognition refers to mental activity including thinking, remembering, learning and using language. When we apply a cognitive approach to learning and teaching, we focus on the understanding of information and concepts. If we are able to understand the connections between concepts, break down information and rebuild with logical connections, then our intention of material and understanding will increase. Since one of the main aims of education concerns student learning - which is an indisputably psychological phenomenon - it is a fact that the emerging research agenda of embodied cognition has much to offer educational practitioners, researchers, and policy-makers. Most would agree that in a broad sense education involves learning, comprises learners, is associated with the intentional activity of teaching, and is closely linked with clearly demarcated spatiotemporal educational settings, such as schools and universities. Taking into consideration some psychologists' interest in

135 NSOU ? CC-ED-06 learners and learning from the early twentieth-century onward, particularly within educational contexts (Thorndike, 1910), it is not too hard to see how cognitivist or behavioral schools of thought have in turn influenced theories of learning in educational discourse and practice. In the former case, cognitivist views of learning are basically concerned with internal mental factors that influence cognition, such as how we organize and reorganize our thinking as a result of our experiences in the world (Piaget, 1960), whereas in the latter case, behavioral accounts of learning are generally concerned with external factors, such as the identification of positive and negative reinforcements for certain types of behaviors (Skinner, 1968). The strengths and limitations of both these accounts are various; however, our intention at this juncture is to elucidate how each has failed to understand the role our embodiment (mind and body) plays in cognition. Indeed, recent findings from research literature on learning and cognition from a diverse array of discipline areas, such as philosophy, psychology, linguistics, neuroscience, and computer science, have contributed to the view that traditional cognitivist accounts of the mind should be challenged because they exclude the close relationship that exists between mind and body that is more profound than initially considered (Shapiro, 2012). However, the most important point here is to highlight how concrete experience can enhance and positively influence students' learning of scientific concepts (Kontra et al., 2015). Understandably, some teachers may want to know the reason or reasons why physical experience can enhance learning through instructional manipulatives. Indeed, embodied cognition is concerned with the interaction of the mind, body, and environment in explaining how knowledge is grounded in sensorimotor routines and experiences (Barsalou, 2008; Lakoff and Johnson, 1999). It is necessary to turn our attention to the educational implications of embodied cognition through some specific examples relevant to education. An interesting starting point is a popular view of teaching and learning that argues mastery of discipline-specific knowledge should take place first, before it can be applied (Nathan, 2012). Such a view has been found to be deeply questionable because it tends to reinforce a formalisms-only mind-set toward learning and teaching that is rooted in dualistic views of knowledge that fallaciously associate intellectual work with the 'mind' and practical work with the 'body' - precisely the distinction that embodied cognition denies. When teachers are aware of gestures, they pick up information about their students' cognitive state that was not available in their speech (Novack and Goldin-Meadow, 2015). Observation of teachers revealed that they adopt different teaching strategies for students who display either discordance or concordance, relying more on mismatches of their own when explaining principles of certain phenomena to students who

136 NSOU ? CC-ED-06 mismatch. Similarly, Goldin-Meadow and Singer (2003) showed that teachers who display discordance benefit student learners because they expose them to a range of strategies in the gestural modality, thus teaching them how to 'think with gestures' about certain problems. Additional work on gesture reveals its importance in the acquisition of mathematical concepts. We can hereby further discuss with a more detailed of the implication of cognition in learning teaching : 1. Teachers could and should look for concrete cues such as gestures-speech mismatches in order to identify students who have not fully comprehended the concept being taught. In response to these mismatches, teachers could increase the proportion of gesture-speech matches they use in teacher instruction, particularly when instructing students who are in transitional knowledge states. 2. The use of gestures in teacher instruction encourages learners to produce gestures of their own, or imitate the gestures that their teachers produce, which can enhance learning. In addition, encouraging students to gesture allows knowledge to be conveyed through their bodies that cannot verbally be communicated, but most importantly it demonstrates that the student is ready to learn. 3. Gestures can be classified into different categories, with each category defined by a particular function. For instance, gesturing is known to either alter the learners' responses and thoughts or lighten the cognitive load of the teacher or learner because it shifts the cognitive load from verbal to visuospatial stores, thus permitting the individual to work harder on the task and/or change their representation of the task in a manner that facilitates learning. Teachers who acquaint themselves with the distinct purposes of different kinds of gestures will be able 'read' and communicate more effectively with their students. 4. Embodiment offers either a causal route to more effective learning or a diagnostic tool for measuring conceptual understanding, and thus, educational 'best practice or practices' require that instructors keep abreast of current research in embodied education. Education has turned to psychology to understand human learning and to guide best pedagogical practices. In this case, we argue that the emerging research agenda of embodied cognition has much to offer educational practitioners, researchers, and policymakers. Although embodied cognition is still in its infancy, the multidisciplinary and interdisciplinary nature of the literature provides some thought-provoking recommendations to enhance educational practices, which in turn can maximize the effectiveness of the teacher in bringing about student learning.

137 NSOU ? CC-ED-06 When we are aware of these mental actions, monitor the students and control our learning processes it is called metacognition, which varies from situation to situation, will greatly affect how individuals behave in a given situation. Understanding of language, or psycholinguistics. Is essential to our understanding of print and oral acquisition of knowledge. Comprehension and perception will allow individuals to interpret information. Lastly, the overall motivation. In the context of education it has been shown that there is a significant, but rather modest positive relationship between Need for Cognition and academic achievement of students, evident especially in the later grades, with a lack of such a relationship in earlier grades (Luong et al., 2017). On the other hand, Need for Cognition strongly predicts the tendency to seek optional education programs which allow for enriched, deep learning (Meier et al., 2014). The choice of such programs is predicted by NC, while controlling for intelligence, academic self-concept, mastery or performance goals. Teachers differ in the degree to which they put emphasis on content comprehension and deep learning. It has been shown that promotion of comprehension prevents intellectual helplessness of students. Promotion of comprehension is visible in requests of teachers for students to justify their answers, but in such a way that those requests allow for students' individual interpretations. Therefore these justifications are not just elaborate memorizations, but actually reflect student comprehension and mistakes inherent in early phases of learning. Promotion of comprehension is therefore similar to mastery-approach learning, oriented toward developing new skills and understanding. Positive correlation between mastery goals and Need for Cognition is very likely as well as a positive relationship between NC and deep learning (Cazan and Indreica, 2014). Therefore we can expect that teachers who place emphasis on deep learning, will also be likely to exert more effort in information search, as well as engage in mastery of new technological tools. 4.6 Summary Learning is related to perception and cognition. Learning- teaching is an indisputably psychological phenomenon dependent on cognition. Perception and cognition are the mental processes that depend upon the central nervous system. A nerve impulse is the relaying of a coded signal from a nerve cell to an effector (a muscle cell, a gland cell or another nerve cell) in response to a stimulus. Neurons are the structural and functional units of the nervous system which carry impulse. It majorly consists of cell body axons and dendrites. Propagation of nerve impulse slightly differs through myelinated and non-medullated nerves, though it follows a

138 NSOU ? CC-ED-06 typical neuro-chemical process while passing through the synapse by specific neurotransmitter. The brain is an amazing three-pound organ that controls all functions of the body, interprets information from the outside world, and embodies the essence of the mind and soul. Intelligence, creativity, emotion, and memory are a few of the many things governed by the brain. Protected within the skull, the brain is composed of the cerebrum, cerebellum, and brainstem. The brain receives information through our five senses: sight, smell, touch, taste, and hearing - often many at one time. The central nervous system (CNS) is composed of the brain and spinal cord. The peripheral nervous system (PNS) is composed of spinal nerves that branch from the spinal cord and cranial nerves that branch from the brain. There are twelve cranial nerves that work in coordination with the brain. The central neuroendocrine systems serve as an interface between the brain and many of the peripheral endocrine systems. The neuroendocrine system is composed of the hypothalamus and pituitary gland and is under the influence of neurotransmitters and neuropeptides that regulate hypothalamic releasing and hypothalamic release inhibiting hormones secreted into the blood vessels that connect the hypothalamus and pituitary gland. Perception is the organization, identification, and interpretation of sensory information in order to represent and understand the environment. All perception involves signals in the nervous system, which in turn result from physical or chemical stimulation of the sense organs. It is not the passive receipt of these signals but is shaped by learning, memory, expectation, and attention. Perceptual learning, mental set, Motives and needs and Cognitive styles influence perception. Learning- teaching is an indisputably psychological phenomenon dependent on perception.

142 NSOU ? CC-ED-06 142 Unit-5 : Pedagogy in Practice Structure 5.1 Objectives: 5.2 Introduction 5.3 Pedagogy and its application: Developing Concepts and Principles, Problem solving ability and Knowledge Construction ability 5.3.1 Pedagogy : Developing Concepts and Principles 5.3.2 Pedagogy : Inculcation of Problem-solving ability 5.3.3 Pedagogy : Inculcation of knowledge construction solving ability 5.4 Observation of Classroom Behaviour: Flanders' Interaction Analysis System 5.5 Teaching and Instruction, Instructional Design 5.5.1 Teaching & Instruction 5.5.2 Teaching Strategy: Direct instruction 5.5.3 Teaching Strategies: Indirect Instruction 5.5.4 Effective Instructional Strategies 5.6 Summary 5.7 Self-Assessment Questions 5.8 References 5.1 Objectives In this Unit, we have tried to introduce you to the concepts and principles of Pedagogy from the perspective of problem-solving skill and knowledge construction. Flanders' Interaction Analysis System one of the major approaches of observing classroom behavior of learners addressed in this unit. Apart from behavioral issues in classroom situations the concept of teaching-instruction and their relationship is dealt with in this unit. After the end of this unit, you should be able to ● Comprehend the perspective of application of Pedagogy in learning teaching ● Explain how to inculcate the concept and principles about natural phenomena ● Innovate and justify the pedagogical model and strategy to develop problem solving ability ● Evolve pedagogical strategy to ensure knowledge construction ● Explain Flanders' Interaction Analysis System

143 NSOU ? CC-ED-06 ● Differentiate Teaching and Instruction ● Differentiate direct and indirect instruction 5.2 Introduction Pedagogy encompasses how teachers think and how teachers act, that is teacher thinking and teacher doing, the one impacting on the other, and with the third dimension of the visible, observable and measurable impact of the teachers' pedagogy on the learners. Therefore, these three aspects of teacher thinking, doing and their impact on student learning outcomes make up 'effective pedagogy'. The pedagogy impacted learning that is being reflected in terms of learner's behavior, hence analysis of learners' behavior is crucial in taking academic decisions. Furthermore, the instructional design is being governed by pedagogical principles. So in this unit we will introduce you with the concepts and principles of application of pedagogy, methodical approach of classroom observation and the different approach of instructional design. 5.3 Pedagogy and its application : Developing Concepts and Principles, Problem solving ability and Knowledge Construction ability. 5.3.1 Pedagogy : Developing Concepts and Principles Quality teaching is defined as pedagogical practices that facilitate for diverse children their access to knowledge, activities and opportunities to advance their skills in ways that build on previous learning, assist in learning how to learn and provide a strong foundation for further learning in relation to the goals of the early childhood curriculum. Developmental Pedagogical Continuum Pedagogy naturally embeds all of the key values and philosophy in a developmentally and culturally appropriate way. The following figure illustrates the Developmental Pedagogical Continuum (Walker and Bass 2012) that demonstrates the changes in pedagogy to suit the developing child while maintaining the inclusion of all key values and practices consistent with the educational philosophy from child development perspectives(This is also influenced by children's contexts, environments and communities). In the early childhood years children are engaged in exploratory play with no formal teaching, in the Prep-Year 2 children are engaged in investigative concrete hands-on experiences that are balanced and integrated with formal teaching. In the

144 NSOU ? CC-ED-06 Years 3 to 8 children are engaged in project-based learning that is child-centered and integrated with formal teaching. Pedagogy is the act of teaching together with its attendant discourse. It is what one needs to know, and the skills one needs to command in order to make and justify the many different kinds of decisions of which teaching is constituted. For their pedagogy to fully reflect the research findings it is important for educators to: Understand that intentional teaching/intentionality can occur in child initiated and educator directed learning experiences and intentional teaching can be planned or spontaneous (Mangione et al., 2011); Understand that intentional teaching/intentionality is based in knowledge of children's cultural contexts gained through interactions with children and their families and children's skills, knowledge and understandings gained through interactions and assessment of children's learning and development (OECD, 2006); Develop a range of teaching techniques including modelling, facilitating, questioning, telling and instruction, scaffolding and co-construction as described in McNaughton and Williams (2004). The skill of the educator lies in using these strategies, ensuring a balance of child and adult initiated experiences and in using assessment of children's learning in all types of experiences to plan for children's future learning; Draw on their content knowledge to extend children's thinking and inquiry and to

145 NSOU ? CC-ED-06 support children's cultural identity and sense of contribution and belonging. When they do not have the necessary content knowledge to support children's learning educators need to access information with children, for example, through books, the internet and by asking community and family specialists (Farquhar, 2003); How to ensure learning of Principles and Concepts : A concept is the sum total of what we know about the object. It refers to a generalized idea about the objects, persons, events. It stands for a general class and not for a particular object, person, and event. It is a common name given on the basis of similarities or commonness found in different objects, persons, events. There are concepts of objects such as cat, tree, chair etc., and concepts of persons such as mother, Indian, Negro etc., and concepts of qualities such as honesty, goodness, and obedience. It is a mental disposition that helps in understanding the meaning of the objects or perceived earlier. In one sense, it is a general mental image of the objects / persons / events experienced or perceived earlier. Concepts are very useful in recognizing, naming and identifying the objects / persons / events. Concept is the process of discrimination of the common features. Concept formation is the association of certain stimuli and responses. Concepts can be formed without the use of language. Concept is a part of the thought process. The concept is not common for all, different persons may have different concepts about the same object / events. A concept is not static, it is always changing. For example, first a child considers even the walls and doors to be living things. Then it understands they are nonliving, considers cars, buses and running objects to be alive. Later, it learns that only animals and plants are living. Types of Concept Formation : Direct Experience : It is the first type of concept formation, in which the learner develops concepts through direct experience with the particular objects / persons / events. It is developed from early childhood onwards. For example, the concept about cows. Indirect Experience : Here the learner develops concepts through pictures, photos and reading descriptions, hearing from others. For example, the concept about Kangaroo. Faulty Concepts: The concepts or the general ideas we have about the objects, persons or events, are not always adequate and accurate. Small children have so many concepts that are quite erroneous and inadequate. For example, one's anxiety over the crossing of his way by a cat or one's feeling of hatred towards the person belonging to other caste or religion is the result of faulty concepts.

146 NSOU ? CC-ED-06 Process of Concept Formation: The process of concept formation has three important phases : 1. Perception : Experiences or learning in any form is the starting point of the process of concept formation. Our perceptions or imaginary experiences, formal or informal learning, provide opportunities for getting mental images of the objects, persons or events. 2. Abstraction : The mind analyses the perceived images and synthesizes what is common to all, neglecting what is particular. This process of observing similarities and commonness is named as abstraction. 3. Generalization : After making such observation in the form of abstraction for a number of times the child is able to generalize or form a general idea about the common properties of some objects or events. On account of this generalization, he will develop a concept about these things or events. Later on, when he perceives a white or red cow he does not immediately call it a cow. He again makes an enquiry and comes to that these are cow For example, the child perceives a black cow at the first time and is told that it is a cow, he tries to form an idea about it. In the beginning the idea is very particular in nature. Concept Formation: In this way he compares and contrasts the similarities or dissimilarities of his mental images related to all perceived cows. In spite of the differences in colour, appearance etc., they are found to possess so many common properties or characteristics. He tries to compare the particular mental image of the previously perceived cow with the images he is having, at present, by perceiving white and red cows. Students are challenged and supported to develop deep levels of thinking and application. Students are challenged to explore, question and engage with significant ideas and practices, so that they move beyond superficial understandings to develop higher order, flexible thinking. To support this, teaching sequences should be sustained and responsive, and explore ideas and practices. The following pedagogically appropriate sequence may be adopted with localization and improvisation. A. Teaching sequences promote sustained learning that builds over time and emphasizes connections between ideas : This component involves running with ideas for sufficient time to examine and use them in depth. This applies to the way key ideas are built across a learning sequence, but might also mean having sufficient time in teaching sessions to properly examine ideas. Links are made across learning. Link areas to demonstrate relevance and connectedness with what is being taught and how key ideas can apply to a range of situations.

147 NSOU ? CC-ED-06 B. Examples to illustrate the component A teaching session on the conditions on the Western Front during World War I is followed by students reading extracts from soldiers' diary entries and letters and matching the 'first-hand' information found there with the main ideas from the previous teaching session. Students then record the main ideas from these two teaching sessions on an ongoing 'mind map' on World War I and make any links with previous subtopics. C. The teacher promotes substantive discussion of ideas : This component involves the teacher providing opportunities for students to talk together, discuss, argue and express opinions and alternative points of view. 'Substantive' refers to a focus on significant ideas, practices or issues that are meaningful to students, and that occur over a sufficient period of time to be effectively explored. D. The teacher emphasizes the quality of learning with high expectations of achievement. Teachers need to clearly signal an expectation that students will achieve at a high level and put in effort to produce quality work. This also involves teachers expressing and demonstrating confidence that students are capable of significant achievement. There is structured support to help students learn effectively so that this expectation does not occur in a vacuum. E. The teacher uses strategies that challenge and support students to question and reflect : This component involves the development of learning tasks designed to encourage and support students to move beyond their current understanding and think more deeply about ideas and practice. to promote depth and breadth of knowledge and understanding. Teachers emphasize engagement with ideas and practice through exploration. F. The teacher uses strategies to develop investigating and problem solving skills This component refers to higher order thinking skills that may be described in various ways, but encompass such things as interpretation, analysis, and application. It refers to the development of knowledge of ways of reasoning with evidence, particular to the learning area. These skills and knowledge are needed to successfully solve problems. G. The teacher uses strategies to foster imagination and creativity There has been considerable recent attention paid to lateral and creative thinking, as part of 'higher order' thinking and a 'thinking oriented curriculum'. Many schools have made this a major focus of learning and teaching policy. There are a number of

148 NSOU ? CC-ED-06 elements of 'creativity', including flexible and unusual thinking, and facility with generating ideas. Developmentally appropriate pedagogy and instruction Based on Vygotsky's zone of proximal development (ZPD) framework, the level of scaffolding from the teacher needs to accommodate the constraints set by a certain developmental stage. Guided participation in culturally valued activities can be applied effectively at lower grade levels (Rogoff et al 1995). Two major concepts are incorporated in guided participation: children's behaviour is guided by skilled members, and the children participate in activities that are culturally valued. Continuous informal assessment and diagnosis of individuals' ZPD are needed to provide adaptive instruction. An illustration about adaptive instruction to improve self-regulated skills is given below. Self-regulation skills development is one of the essential expected learning outcomes. Following the ZPD notion, a metaphor of self-regulation skills acquisition is "transition of other-regulation voices to self-regulation voices" in the reciprocal social interaction (Karasavvidis, Pieters and Plomp 2000). For example, at the beginning, the teacher may help students set goals for a task, provide strategies for the students to use, and prompt questions at every step triggering reflection. Gradually, the teacher leaves more space for the students to practice setting goals by asking questions like "How would you approach this problem?" which are also an informal assessment of students' self-regulated behavior. Instead of directly giving students the options of strategies, the teachers may ask the students to discuss and figure out strategies to use. The scaffolding from the teacher is gradually phased out as the students become more familiar with the task format. The teacher needs to have some standards in mind, and continuously measure students' ability in self-regulation skills, for example, with checklists. This helps the teacher measure the ZPD for providing adaptive instruction. This also provides implications for the alignment of pedagogy across grade levels. The interaction among different grade-level teachers may involve discussion about their experiences in providing scaffolding, students' ability in certain types of tasks, and so on. In this way, teachers may have a better idea of how these self-regulated skills develop and how to provide the appropriate amount of scaffolding. For example, the teacher may stop more often to ask the students to think reflectively and set goals for younger students. Due to the different level of development on cognitive, social-cognitive and affective aspects, different age groups may differ in their self-regulation skills (Zimmerman 2002), which may be manifested in various contexts. In pre-school, children are able

149 NSOU ? CC-ED-06 to learn to control their actions and pay attention; at elementary school level, they may be required to control behaviours in various environments, learn to achieve goals, seek help, keep track of their work, and so on. After they get to the secondary level, more self-initiation and goal-oriented planning and monitoring are expected. A smooth transition across levels requires the teachers to have a clear idea of the ZPD at each level. Some questions the teachers can ask include: "what is the level of the Approaches to learning : Literature review 5.3.2. Pedagogy: Incultation of Problem solving ability : Problem-based learning Problem-based learning (PBL) takes a student-centered approach, usually conducted within small groups. The teacher acts as a facilitator in problem-based learning. The required knowledge and skills are achieved in the process of solving authentic problems (Barrows 1996). Problem-based learning and inquiry-based learning are not mutually exclusive; rather, problem-based learning involves inquiry strategies. Some objectives of PBL are: (1) helping students develop cognitive flexibility; (2) practicing problem-solving skills as generic skills; (3) self-directed learning which requires high metacognitive ability; (4) practicing collaborative skills and communication skills; (5) increasing intrinsic motivation (Hmelo-Silver 2004). Kolodner et al (2003) list a sequence of PBL classroom practices: (1) analyzing a problem scenario and facts in groups; (2) hypothesizing and explaining how to solve the problem; (3) dividing up the learning issues within the group, learning new knowledge which is needed to solve the problem; (4) returning to the problem; evaluating the hypotheses and learning issues; (5) repeating the learning cycle until the problem is successfully solved; (6) reflection and abstraction. A meta-analysis study done by Dochy et al (2003) generates some interesting results showing the general effects of PBL on knowledge and skills, and factors moderating the effect of PBL. 1. The effect of PBL on skills could be positive across students' expertise levels; however, the effects of PBL on content knowledge might differ significantly based on students' expertise levels and knowledge base. Age-related characteristics such as students' metacognitive skills, social-cognitive and affective ability need to be addressed. For example, students with a low level of prior knowledge may be overwhelmed when asked to apply the newly encountered knowledge. 2. Although students might learn slightly fewer facts and less content knowledge in a PBL environment, the knowledge they acquire is much more elaborate; thus, students in PBL might perform better in retention and transfer of the knowledge in larger contexts.

150 NSOU ? CC-ED-06 3. Different forms of assessment might yield different results due to the complex structure of achievement; thus, a range of diversified assessment strategies are needed to gain a clear picture of students' knowledge and skills achievement in PBL. The implementation of PBL is difficult especially in educational systems where transmissive instructional models are pervasive. For example, the teacher's role change, training model transitions, the constriction set by the classroom resources (for example, technology, students' experience in using technology) are major challenges in applying the PBL learning model in China (Tang and Shen 2005). Some practical examples of implementation for two different age groups are given here. 1st and 2nd graders : Mathematics and language arts materials are embedded in a virtual environment with animated characters and interesting stories. Students are assigned roles in playing the game in which the mathematics and language questions are embedded. The scenario can be a practical problem which is age-appropriate. For example, a problem scenario could be: the password to a door is the total number of apples on two trees; a piggy needs to open the door in order to save his friend. To help them analyze the problem, the teacher can ask questions such as "If you want to get the password, what should you do?" Teacher-student reciprocal interaction with hints and support can help students reflect on their own learning state, set further goals and think reflectively after solving the problem. The progression of problems can gradually get more difficult. In a curriculum teaching the respiratory system to middle school students, problem scenarios could be "diagnose various respiratory diseases" or "design an artificial respiratory system". Students can be divided into groups and each group assigned a problem such as "how is asthma caused?", "what happens to the respiration if the chest muscles are injured?" Each group is assigned a worksheet, which provides basic problem-solving sequences and guidelines. The students will be learning the mechanism of the respiratory system from the textbook, online resources, computer simulations, and will discuss how the knowledge can be used to solve the problems. The groups then present their work to the whole class. The whole class can work together to design an artificial respiratory system.

5.3.3. Pedagogy: Inculcation of knowledge construction solving ability : Critical Thinking and Knowledge construction : Critical thinking is a complex mental process involving paying attention to details, selecting relevant information, analyzing carefully and skeptically, making judgments, and metacognitive thinking such as reflection and higher-order planning (Cottrell 151 NSOU ? CC-ED-06 2005). It is an essential skill for both academic achievement and for dealing with various real-life problems. Critical thinking, as a generic thinking skill, is emphasized in a variety of content areas of curriculum planning documents across cultures, for example, the US (National Commission of Excellence in Education 1983), Hong Kong , Singapore (Sale, Leong and Lim 2001), Taiwan and Japan (Li 2010). Critical- thinking curriculums are relatively more difficult to implement in Asian classrooms because the teachers and students are more accustomed to the passive, trans missive, and knowledge-based model of learning; thus, more clear practice guidelines and more transitional time are needed for Asian learners to practice and acquire this essential skill (Van Der Mensbrughe 2004). Creative-thinking skills Creative thinking refers to the ability to look at problems and situations in new ways, be able to generate new ideas and provide original, elaborative, and appropriate solutions (Sternberg 1999). Creative-thinking skills, as an essential ability for success, have been emphasized in the curriculum across cultures likewise, it is more difficult to implement in examination-driven and teacher-centred educational cultures. Instructional and learning models following the constructivist and student-centred approaches are more likely to help learners acquire and practice creative thinking. For example, in an e-learning setting in Malaysian schools (Sultan, Woods and Koo 2011), constructivist environments were found to reinforce creative thinking in addition to knowledge acquisition. Cognitive apprenticeship model A traditional definition of "apprenticeship" is that an expert transmits knowledge or skills to the learner by showing the process of the work. The expert shows a learner how to perform a task, and the learner may take a small portion of the work and gradually practice to take over all the steps. In a cognitive apprenticeship model, the cognitive and learning processes are explicitly demonstrated by the teacher for the students to practice various cognitive, metacognitive and socio-cultural skills (Collins 2006). In a cognitive apprenticeship model, students can be well scaffolded to tackle complex problems. Collins, Brown and Holum (1991) list some general guidelines for applying the cognitive apprenticeship model in the classroom: (1) identify the processes of a task and explicitly demonstrate how the task can be accomplished; (2) ensure the abstract tasks are situated in authentic contexts; (3) diversify the contexts and articulate common underlying concepts to scaffold transfer. Some practical methods for applying the cognitive apprenticeship model (Collins

152 NSOU ? CC-ED-06 2006) are: (1) the modelling method means the teacher explicitly showing how a task can be performed, for example, a science teacher can demonstrate and explain the steps for constructing an electric circuit in a science lab; (2) coaching refers to the teacher observing students perform a task and facilitating by providing hints, challenges and feedback, for example, the teacher can observe how the students edit a video and provide feedback and hints at key points; (3) articulation refers to the teacher encouraging students to verbalize their thinking process, which facilitates students' reflective thinking; (4) scaffolding refers to the teacher providing specific support for students' task accomplishment; (5) reflection refers to the teacher guiding students to compare their problem-solving steps to that of an expert's or their peers' to foster reflective thinking; (6) exploration refers to the teacher encouraging students to ask questions and solve their own problems. For example, the teacher can set general goals for a task and invite students to come up with sub-goals and questions regarding particular issues in the task. Based on the specific requirements of a discipline and students' age-related characteristics such as prior knowledge, metacognitive ability and communicating skills, the teacher may choose different methods. The development of social cognitive skills and affective skills. Social cognition development refers to the developing conceptions of the self, social reality, and relationships between people such as friendship, love, power, influence, and other related phenomena. Selman's five stages of perspective taking⁶ can demonstrate some age-related constraints of social cognitive skills. Knowledge about feelings and emotions, and the ability to make inferences about another person's emotional state develops with age. Age-related identity development may influence the effectiveness of certain instructional methods (Renninger 2009). The development of social cognitive skills and affective skills needs to be emphasized in all levels of education. Brain research evidence suggests that during childhood, children gradually become more self-conscious, attend to other people's thoughts and perspectives, and the adolescent years (middle school and high school years) are an especially sensitive and critical period of social cognitive and affective development (for example, Steinberg 2005; Choudhury, Blakemore and Charman 2006). For example, compared to adults, adolescents are more susceptible to peer influence, and compared to younger kids, adolescents are more likely to compare their own skills and competencies with their peers to form their identity. Competition and feedback from peers may affect their self-efficacy for the ones who haven't developed an individual interest in the learning content (Renninger 2009). To provide adaptive intervention, it is critical for middle school and high school teachers to understand how social relations direct students' motivation and academic goals, and affect academic outcomes. Increased self-awareness

153 NSOU ? CC-ED-06 and schools' emphasis on competition and social comparison is one of the major difficulties young adolescents face in the PYP-MYP transition. Interventions such as academic tracking to adapt to individual needs, and educational support initiatives to ensure the social emotional well-being of students may facilitate programme transition (Cowie de Arroyo 2011). Group work for middle school students and elementary school students may need to be organized differently. At the lower elementary level, without sufficient guidance from the teachers it is difficult for children to conduct effective collaborative discussion since they may fail to consider others' perspectives. Middle school students are more likely to compare their own skills and competencies with their peers to form a self-representation; thus, group work that singles anyone out for peer assessment may have negative consequences, as students may be too engaged in comparing themselves to others (Renninger et al 2007). The interaction between students' perceived identities and the sociocultural environment contributes to students' motivation and affects school performance (also see section 2.2). At different developmental stages, individuals may have different social identities, which are defined as one's knowledge of how he or she belongs to the social group. The process of social identity construction takes place by interacting with the members in that social group (Duveen 2007). According to Winther-Lindqvist (2012), the objectives, central activities and leading motives of a social environment establish students' perception of their membership in that group. School transition and a change of sociocultural environment usually involve major changes of objectives, cultures and values, and may involve the construction of new social identities. For example, when pre-school children transition to the elementary school, a sudden change of leading school activities and objectives (learning becomes the major objective) may cause a social identity crisis. Elementary students may form social identities in play-based participatory environments, and internalize the values and motives; in transition to middle school, they may face many changes and may need to form new social identities (for example, additional school responsibilities, and more self-regulated activities). The sudden change of learning cultures when students enter high school may also cause negative emotional consequences. This social identity concept can also help us understand why students might have identity crises when coming to a new culture. For example, for Asian students, solitary work and effort, good self-control and good academic performance are believed to be appreciated by the teacher and peers. When they are in a culture where collaborative interaction and inquiry are the central activities, they may not be accepted by their peers and they may then have a negative social identity (Chen, French and Schneider 2006), which could negatively affect their learning performance.

154 NSOU ? CC-ED-06 Adult guidance and negotiation on the central motives and activities are very important to help students construct new social identities (Winther-Lindqvist 2012). To create a sense of belonging requires the teacher to understand students' perception of self and social values through teacher-student conversation. The teacher needs to explicitly clarify the expectations and negotiate with the students about the desirable behaviours and actions to help them form positive social identities (Osterman 2000). Teachers need to understand students' social identities and corresponding learning behaviours. During staff meetings, teachers can share their experience to get a better image of students' potential identity crises in the context, especially when they newly transition to a higher grade level. Transitional support to clarify the expectations, objectives and central learning activities of a new programme may help the students form new identities much faster. Learning how to learn Self-regulated learning (SRL) is emphasized in all three IB programmes. SRL is a relatively domain-general skill. Key components of SRL include the ability to : A. effectively choose and coordinate various cognitive strategies B. set learning goals and direct one's own learning C. commit to and engage in reaching the self-set goals (Boekaerts 1999). At different developmental stages, students have different self-regulated learning skills. Teachers need to measure students' self-regulation abilities effectively in various contexts and provide adaptive intervention. Criterion-referenced informal assessment is very important to measure SRL skills since it is a complex construct with many dimensions and manifestations. The learning objectives, contextualized outcomes (SRL behaviours in specific contexts) and teachers' experience in providing intervention in the ZDP in each programme can be written in the articulation documents and shared with other programmes. Although the exhibition project in PYP, personal project in the MYP and extended essay and reflective theory of knowledge course in the DP are argued to practice students' research skills, metacognitive ability and learning skills, self-regulated learning needs to be emphasized beyond the small project level and needs to be developed consistently and continuously at the classroom and school levels. This could be an important issue for the IB worth further exploration.

5.4 Observation of Classroom Behaviour: Flanders' Interaction Analysis System

Classroom communication is a vital ingredient in the instructional and learning process in the school environment. It is as necessary as food is a prerequisite for

155 NSOU ? CC-ED-06 healthy growth. The quality and quantity of teacher-student interaction is a critical dimension of effective classroom teaching. The term 'interaction' implies an action - reaction or a mutual or reciprocal influence which may be between individuals, e.g. pupil - pupil; teacher-pupil in classroom setting or between materials and individuals or groups. An interaction is usually inferred from the behaviour of persons in the environment being studied. This behaviour may be verbal or non-verbal and can be classified as being predominantly cognitive, affective or controlling in nature. Interaction Analysis (IA) is an analytical observation scheme that gives an insight into what a teacher does while teaching. It is a systematic observation that represents a useful means of identifying, studying, classifying and measuring specific variables as the teacher and his/her students interact within instructional learning situations. It uses a system of categories to encode and quantify classroom behaviour of teachers and students.. The purpose of developing the observational system is that a teacher can be trained to use it for analyzing classroom behaviour; for planning, and studying his/her teaching activities in order to create more effective classroom learning. Interaction Analysis as an observational system captures the verbal behaviour of teachers and pupils that is directly related to the social-emotional climate of the classroom. Interaction Analysis is a process of encoding and decoding the study pattern of teaching and learning. In the coding process, categories of classifying statements are established, a code symbol is assigned to each category and a trained analyst interprets the display of coded data and reconstructs the original events on the basis of the encoded data even though he may not have been present when data were collected. Interaction Analysis is used as a technique capturing qualitative and quantitative dimensions of teacher's verbal behaviour in the classroom. The Basic Theoretical Assumptions of Interaction Analysis The various theoretical assumptions, which are basic to every idea of interaction analysis, are as follows :

- In a normal classroom situation, it is verbal communication, which is predominant.
- Even though the use of spoken language might resort to non-verbal gestures in the classroom, verbal behaviour can be observed with higher reliability than most non- verbal behaviour and also it can reasonably serve as an adequate sample of the total behaviour in the classroom.
- We can normally assume that verbal statements of a teacher are consistent with his non-verbal gestures and, in fact, his total behaviour.
- The teacher exerts a great deal of influence on the pupils. Pupil's behaviour is affected to great extent by this type of teacher behaviour exhibited.

156 NSOU ? CC-ED-06 • The relation between students and teacher is a crucial factor in the teaching process and must be considered an important aspect of methodology. • It has been established that social climate is related to productivity and to the quality of interpersonal relations. It has been proven that democratic atmosphere tends to keep work at a relatively high level even in the absence of the teacher. • Children tend to be conscious of a warm acceptance of the teacher and to express greatest fondness for the democratic teacher. • The role of classroom climate is crucial for the learning process. • The teacher-classroom verbal behavior can be observed objectively by the use of observational technique designed to 'catch' the natural modes of behaviour, which will also permit the process of measurement with a minimum disturbance of normal activities of the group of individuals. • Modification of teacher classroom behaviour through feedback is possible, though how much change can occur and more knowledge relating to the permanence of these changes will require further research. • Teacher influence is expressed primarily through verbal statements. Non-verbal acts of influence do occur, but are not recorded through interaction analysis. The reasonableness of this assumption rests upon the assertion that the quality of the non-verbal acts is similar to the verbal acts; to assess verbal influence, therefore it is adequately a sample of all influences. (Niki, 2011) Flanders Interaction Analysis Categories (FIAC) The development of the original system of interaction analysis was primarily the work of Ned Flanders. Indeed, the system is often referred to as the Flanders System of Interaction Analysis (FIA) - an innovation which made possible significant insights into the analysis and improvement of instruction. Flanders' interaction analysis system is an observational tool used to classify the verbal behaviour of teachers and pupils as they interact in the classroom. Flanders' instrument was designed for observing only the verbal communication in the classroom and non-verbal gestures are not taken into account. Flanders Interaction Analysis is a system of classroom interaction analysis which is concerned with verbal behaviour only, primarily because it can be observed with higher reliability than can non-verbal behaviour and more also, the assumption made that the verbal behaviour of an individual is an adequate sample of his total behaviour. Flanders Interaction Analysis Categories (FIAC) is a Ten Category System of communication which is said to be inclusive of all communication possibilities. There are seven categories used when the teacher is talking (Teacher talk) and two when the pupil is talking (Pupil talk) and tenth category is that of silence or confusion.

157 NSOU ? CC-ED-06 Accepts feelings : Accepts or clarifies an attitude of feeling tone of a pupil in a nonthreatening manner. Feeling may be positive or negative. Predicting and recalling feelings are included. Praise or Encourage : Praise or Encourage action or behavior. Jokes that release tension, but not at the expense of other individuals; nodding head saying or Umm...Hmm are included. Accepts or uses ideas of pupils. Clarifying building or developing ideas suggested by pupils. Teacher's extension of ideas of pupils are included, but the teacher can integrate more of his/ her own ideas into it. Ask question : Asking a question about content or procedure; based on the teacher idea with the intent that the pupil will answer. Lecturing : giving facts about opinion of content or procedures; expressing his / her own ideas' giving his / her own explanations or citing an authority other than the pupil. TEACHER Indirect Influence TALK (response) Giving direction : Direction order or commands to which pupils are expected to comply. Criticizing or Justifying authority : Statement intended to change pupil behavior from unacceptable to acceptable pattern. Bawling someone out; stating why the teacher is doing what he is doing; extreme self-reference. Direct Influence (initiation) Pupil-talk-response : Talk by pupil in response to teacher. Teacher initiates the contact or solicits the pupil's response or structures the situation. Freedom to express one's own ideas is limited. PUPIL Response TALK Pupil-talk-initiation : Talk by pupil that they initiate. Expressing own ideas; initiating a new topic; freedom to develop opinion and a line of thought, like asking thoughts, like asking thoughtful questions; going beyond the existing structure. Initiation Silence or Confusions : Pause; short periods of silence or confusion in which communication cannot be understood. SILENCE

158 NSOU ? CC-ED-06 In this system, all teachers' statements are either indirect or direct. This classification gives central attention to the amount of freedom the teacher grants to the student. In a given situation therefore, a teacher has a choice. He can be direct, that is minimizing the freedom of the student to respond. His choice, consciously or unconsciously depends upon many factors among which are his perceptions of the situations and the goals of the particular learning situation. In order to make the total behaviour or total interaction in the classroom meaningful, the Flanders system also provides for the categorizing of students' talk. A third major section, that of silence or confusion is included in order to account for the time spent in behaviour other than that which can be classified as neither teacher nor student talk. The Coding System Flanders Interaction Analysis is a system for coding spontaneous verbal communication. Interaction could either be observed in a live classroom or in a tape recording. Whichever, the coding system is applied to analyze and improve the teacher - student interaction pattern. For every 3 seconds, the observer writes down the category number of the interaction he has observed. He records these numbers in sequence in a column. He will write approximately 20 numbers per minute and at the end of a period of time, he will have several long columns of numbers. It is best for the observer to spend five to ten minutes getting oriented to the situation before he/she actually begins to categorize. This enables him to have a feeling for the total atmosphere in which the teacher and pupils are working. The observer stops classifying whenever the classroom activity is changed to avoid inappropriate coding. For example, when children are working on workbooks or doing silent reading. He will usually draw a line under the recorded numbers, make a note of the new activity and resume categorizing when the total class discussion continues. At all times, the observer notes the kind of class activity he is observing. Information is plotted on a matrix for easy analysis and interpretation. The method of recording the sequences of events consists of entering the sequences of numbers into a 10-row by 10-column table. The generalized sequence of the teacher-pupil interaction can be examined readily in this matrix. Adopting the guidelines for coding the verbal interactions of FIAC as expatiate in the preceding paragraph, the following observations are recorded and coded in 2.1; decoded in sequence of numbers in figure 1; the sequence of numbers entered into a 10-row by 10-column matrix in table 2; and patterns of interaction analyzed in table 3.

159 NSOU ? CC-ED-06 Precautions in the Use of Flanders Interaction Analysis • The classroom encoding work should be done by an observer, who is familiar with the entire process and knows its limitations. • It is an exploratory device therefore value judgments about good and bad teaching behaviors are to be avoided. This technique is not an evaluator device of classroom teaching. • The questions regarding classroom teaching can only be answered by inspecting the matrix table. The observer cannot answer the question relating to teacher behaviour. • A comparison between the two matrices can be reliable in terms of behaviour ratios, interaction variables and percentage of frequencies in each category and calls for frequency but value judgment is not possible. • The accuracy of the observation depends upon the reliability of the observer. The classroom recording should be done after estimating the reliability of observers. • At least two observers should code the classroom interaction for analyzing teaching and teacher behaviour

Limitations of Flanders Interaction Analysis The system does not describe the totality of the classroom activity. Some behaviour is always overlooked and who is to say that the unrecorded aspects of the teaching act are more important than those recorded. • Efforts to describe teaching are often interpreted as evaluation of the teaching act and of the teacher. While descriptions may be used as a basis of evaluation, judgment can be made only after additional value assumptions are identified and applied to data • The system of interaction analysis is content-free. It is concerned primarily, with social skills of classroom management as expressed through verbal communication. • It is costly and cumbersome and requires some form of automation in collecting and analyzing the raw data. It is not a finished research tool. • Much of the inferential power of this system of interaction analysis comes from tabulating the data as a sequence of pairs in a 10 x 10 matrix. This is a time- consuming process. • Once the high cost of tedious tabulation (electric computers) is under control

160 NSOU ? CC-ED-06 but the problem of training reliable observers and maintaining their reliability will still remain. • Its potential as a research tool for a wide application to problems is to be explored. Flanders Interaction Analysis as a technique for capturing the qualitative and quantitative dimensions of a teacher's verbal behavior. This technique can be adopted in the teaching learning process in our primary and secondary schools. Its adoption will impact positively on the social climate of learning that is actually lacking in most of the public primary and secondary schools. It has been established that social climate is related to productivity and to the quality of interpersonal relations. The improvement of pupils' interaction and social skills is an important aim of education and this juxtaposes Flanders' technique of Interaction Analysis as

100%

MATCHING BLOCK 38/52

W

a bold step in the right direction to improve the quality of education.

Research using FIAC has suggested that the proportion of teacher statements that make use of ideas and opinions expressed by the pupils (sometimes called 'indirectness') is directly related to average class scores on constructive attitudes towards the teacher and the class work; and also, scores higher on achievement tests (Newman, 2001). Therefore, the appropriateness to train and retrain our teachers in Interaction Analysis (IA), a technique that gives insight into student-teacher exchanges, putting teachers in a better position to analyze and improve their teaching and enhance the social abilities of the students cannot be overemphasized. Interaction Analysis as a technique should be applied to teacher education in a fashion that is consistent with a philosophy of personal inquiry. Inquiry in teacher education means translating understanding into action as part of the teaching process. It means experimenting with one's own behaviour, obtaining objective information about one's own behaviour, evaluating this information in terms of the teacher's role; in other words, attaining self-insight while acting like a teacher. Flanders argued that established norms in schools are 80% teacher talk, 20% pupil talk and 11 - 12% silence. This is indeed, the prevalent scenario in our present educational system across the three levels of the primary, secondary and tertiary. There is an earnest need to reverse this scenario. In the traditional teaching situation, it is expected that the teacher shows more initiating behaviour than the pupils. The Pupil Initiation Ratio (PIR) measures the proportion of pupil talk that is an act of initiation. A high PIR indicates that students show a lot of initiative introducing their own ideas into the classroom discourse. Interaction Analysis is linked to the personal relationship between teachers and pupils. There is an obvious interplay between the pedagogical authority of the teacher and his way to manage classroom interaction. The quality of

161 NSOU ? CC-ED-06 verbal interaction is establishing a rapport between the teacher and pupils wherein, the students could easily confide in the teacher their emotions, secrets, ideas and teething problems concerning learning. When a 'free talk' atmosphere is established within the school system, negative influences are the bane in our present educational system. 5.5 Teaching and Instruction, Instructional Design 5.5.1. Teaching and Instruction : Since the inception of formal, classroom-based instruction, a fundamental aspect of teaching has been the way teachers arrange the classroom environment so students can interact and learn. The instructional strategies teachers use help shape learning environments and represent professional conceptions of learning and of the learner. Some strategies consider students empty vessels to be filled under the firm direction of the teacher; other strategies regard them as active participants learning through inquiry and problem solving-still others tell children they are social organisms learning through dialogue and interaction with others. In the early twenty-first century there were many instructional strategies. Similarly, there are tactics used by teachers to support particular strategies. The following provides a framework for thinking about instructional strategies, and then provides descriptions of seven strategies used frequently by teachers. A number of educators over the years, such as Barrie Bennett and Carol Rolheiser, have developed conceptual frameworks for thinking about instructional strategies. The frameworks most often include instructional organizers, instructional strategies, and tactics. Instructional organizers are at one end of a complexity continuum, and provide the "big ideas" that allow us to think about instructional practices. Examples of instructional organizers would be Howard Gardner's multiple intelligences or Benjamin Bloom's taxonomy for organizing instructional objectives. On the other end of the continuum are what are often labeled instructional tactics. These are specific, and for the most part, simple actions taken by teachers within the confines of particular teaching strategies. Asking questions, checking for student understanding, providing examples or visual representations, or examining both sides of an argument are examples of instructional tactics. Many tactics have grown out of the practices of experienced teachers. In the middle of the continuum are instructional strategies that involve a series of steps, are supported by theory and research, and have been designed to produce certain types of student learning. Examples of instructional strategies would include direct instruction, cooperative learning, and the others described later in this article.

162 NSOU ? CC-ED-06 Finally, some teaching strategies are tightly tied to the content of particular lessons. Pedagogical content knowledge is a term coined by Lee Shulman in 1987 to describe the relationship between content and strategy and to illustrate how what is being taught influences the way it is taught. For example, an English teacher teaching a Shakespearian tragedy would use different strategies than the biology teacher who is trying to help students understand photosynthesis. Similarly, a fourth-grade teacher would use different methods to teach reading, fractions, or the concept of scarcity. An instructional strategy is intricately related to the learning environment. Classrooms are places where teachers and students interact within a highly interdependent environment. At particular times, some types of learning environments have been deemed more appropriate than others. Both formal and informal learning emanates from the particular environments that teachers create, and these are highly influenced by the strategies being used. For instance, lecturing creates a tightly structured learning environment where students are expected to listen, observe, and take notes. On the other hand, if the teacher divides students into cooperative learning groups, an environment is created where students are actively engaged and in charge of their own interactions. Instruction was defined previously as "the purposeful direction of the learning process" and is one of the major teacher class activities (along with planning and management). Professional educators have developed a variety of models of instruction, each designed to produce classroom learning. Joyce, Weil, and Calhoun (2003) describe four categories of models of teaching/instruction (behavioral systems, information processing, personal development, and social interaction) that summarize the vast majority of instructional methods. Each model differs in the specific type or measure of learning that is targeted. Therefore, as we make decisions about "best educational practices" we must be certain that we connect recommended practices with specific desired outcomes. This point is often omitted; discussion of best practices then becomes a debate about desired outcomes rather than a discussion of how to achieve them. Evolution of Concept of Instruction : The instructional strategies used in the early twenty-first century began in antiquity. In ancient Greece, Socrates illustrated a questioning strategy intended to facilitate the learner's independent discovery of important truths. An instructional strategy similar to direct instruction was reported by Samuel Griswold Goodrich's account of teaching in a rural Connecticut school during the early eighteenth century. As education extended beyond society's elite, educators became interested in instructional strategies that would accommodate large numbers of students in efficient

163 NSOU ? CC-ED-06 ways. One example, the Lancaster Method, popular in the early nineteenth century, consisted of gathering as many as a hundred students in one large room, sorting them into groups of similar abilities, and having monitors (teacher aides) guide pupil recitations from scripted lesson plans. Nineteenth-century instructional strategies were teacher centered, intended mainly to transmit basic information clearly. In the early part of the twentieth century, however, this emphasis started to shift. John Dewey and his disciples of Progressive education left a legacy of student-centered instructional methods aimed at helping students acquire higher-level thinking and problem-solving skills. Of particular importance was the project method that provided the intellectual heritage for such contemporary methods as cooperative learning, problem-based instruction and other approaches emphasizing active student learning and group interaction. The early work of the Progressives, fueled later by new theories and research about learning by such eminent theorists as European psychologists Lev Vygotsky and Jean Piaget and Americans Jerome Bruner and Albert Bandura extended thinking in the profession about instructional strategies in the post-Sputnik reforms of the 1950s and 1960s. Cognitive psychology and constructivist perspectives produced instructional strategies such as discovery learning and inquiry teaching that were at the center of the curriculum reforms of that era, and the cooperative learning and problem-based strategies popular today became more widely known and used. In the late 1960s Bruce Joyce began describing the various approaches to teaching that had been developed over the years. He developed a classification system to analyze each approach according to its theoretical basis, the learner outcomes it was designed to accomplish, and the teacher and student behaviors required to make the approach work. Joyce used the term model rather than teaching strategy to refer to a particular approach to instruction. In his initial work (Joyce and Weil, 1972) more than twenty models were identified. Joyce's conceptualization of the field was a significant contribution and has influenced greatly how educators have thought about instructional strategies worldwide. Theoretical Paradigm : Contemporary conceptions of instructional strategies acknowledge that the goals of schooling are complex and multifaceted, and that teachers need many approaches to meet varied learner outcomes for diverse populations of students. A single method is no longer adequate. Effective teachers select varied instructional strategies that accomplish varied learner outcomes that are both behavioral and cognitive.

164 NSOU ? CC-ED-06 Taxonomies for Categorizing Instructional Methods Several taxonomies have been developed that categorize instructional strategies based on the strategy's theoretical underpinnings and on the type of learner outcomes that result from using the strategy. Joyce's taxonomy divided instructional models into four major families: information processing, behavioral, personal, and social. Behavioral strategies are designed to help students acquire basic information and skills. Information processing strategies help the learner process and use information and data. Social strategies help develop a sense of community and facilitate the learning of social skills. Personal methods emphasize the development of personal growth and awareness. Others have made distinctions among strategies based on achieving learning outcomes most closely associated with behavioral theory as compared to those outcomes that stem from information processing, cognitive, and constructivist theories of learning. Still others have found the student-centered and teacher-centered categorization scheme useful for thinking about the relationship between student learning and instructional strategies. The seven strategies are categorized according to the degree of student versus teacher centeredness and the theoretical basis for the strategy. Frequently Used Instructional Strategies The rationale and theoretical background for each strategy is described in the table, along with the learner outcomes the strategy is intended to produce and the syntax and learning environment required to make the strategy effective. Syntax refers to the steps or phases through which a lesson progresses. Learning environment refers to the classroom context and required teacher and student behaviors. Each strategy described has been subjected to substantial research and evaluation and has been deemed highly effective. Positive effects, however, are sizable only if the strategy is implemented faithfully. 5.5.2. Teaching Strategy: Direct instruction Direct instruction is a method for imparting basic knowledge or developing skills in a goal-directed, teacher-controlled environment. The teacher identifies clearly defined learning outcomes, transmits new information or demonstrates a skill, and provides guided practice. Direct instruction is designed to maximize academic learning time through a highly structured environment in which students are "on task" and experience high degrees of success. Direct instruction has its roots in behaviorism. Behavioral theorists emphasize breaking behaviors and skills into component tasks and mastering each subcomponent. They emphasize the importance of modeling desired behavior and using feedback and reinforcement to guide students toward desired goals. The clearest empirical support

165 NSOU ? CC-ED-06 for direct instruction came from the teacher effectiveness research of the 1970s and 1980s. By studying the relationship between teaching behaviors and student achievement in classrooms, researchers concluded that direct instruction produced greater time-on-task and higher student achievement, particularly for the acquisition of basic information and skills. Direct instruction can be used effectively to promote acquisition of knowledge that is well structured and that can be taught in a step-by-step fashion, such as parts of speech, the multiplication tables, or the capitals of the fifty states. It is also effective in teaching how to perform simple and complex skills such as how to subtract, read a map, or swing a golf club. Although direct instruction is widely used, it is not appropriate for teaching concepts and generalizations, higher-level thinking, inquiry, problem solving, group processes, or independent learning. In general, a direct instruction lesson proceeds through five phases. Teachers begin the lesson with an orientation phase. The teacher clarifies the goals of the lesson, explains why the lesson is important, ties the lesson to previous lessons and students' prior knowledge, and motivates students. This establishes the students' mental set and prepares them for the lesson. This initial phase is followed by phase 2, presentation or demonstration. The teacher demonstrates the skill or presents new information. If a skill is being taught, each step must be identified and demonstrated accurately. If new information is being taught, the information must be well organized and logically presented. Effective teachers give multiple examples, provide accurate demonstrations, restate the information often, and use visual models or illustrations. The third phase is guided practice. The teacher structures the initial practice by walking the students through, step-by-step, and giving feedback on correct and incorrect responses. When students understand, the teacher moves to guided practice in which students work independently while the teacher monitors student work and gives individual feedback. Guided practice is most effective in short increments repeated over time. At the end of guided practice, phase 4 checks for understanding and provides feedback, informally or formally, verbally or in writing. The most common tactic in this phase of the lesson is teacher questioning, but assessing independent work, giving a quiz, or observing a live or taped performance may also be appropriate. Feedback must be given as soon as possible after practice and be specific and focused on behavior. The final phase of a direct instruction lesson is extended practice. Extended practice reinforces the knowledge or skill. It can be accomplished through seatwork or homework, but should only be given when students are at or near mastery and timely feedback can be given. Extended practice over time increases retention, transfer, and

166 NSOU ? CC-ED-06 automaticity. The learning environment in a direct instruction lesson is highly structured by the teacher. Students are expected to be careful listeners and keen observers. Teaching strategies unit objective is to : 1. Create or select teaching methods, learning activities, and instructional materials or other resources that are appropriate for the students and that are aligned with the goals for the lesson. Direct Instruction lesson objectives are to : 1. Describe and explain the features and purposes of direct instruction. 2. Describe and be able to follow guidelines for the effective use of different methods of direct instruction (such as presentations, questions, practice, drills, reviews, guided practice, and homework) Direct Instruction Have students explain the difference between direct and indirect teaching strategies Teaching strategy continuum 1. Use continuum, with direct on one end, indirect on other. Have students draw 3 continuums: (1) enjoy most as a learner (2) learn best (3) might prefer teaching using. Have them put "x" on each continuum, committing to which category of strategy they enjoy most as a student; then repeat, but ask them from which category of strategies that think they learn best. Now, have them stand on a continuum in the room, and see what the spread is. 2. Discussion: of where they place themselves on each continuum, why, and if there were differences, why. Specific questions: 3. For those of you who enjoy learning most from direct instruction, why? From indirect? Why? 4. How many had differences between the category they enjoy most and the category from which they learn best? Why these differences? For others, why not different? 5. How many had differences between the category they enjoy most and the category from which they might prefer teaching most? Why? 6. What are the implications of this discussion for you as a teacher? (discuss in small groups) Key steps in teacher directed lesson : Barak Rosenshine's Explicit Teaching model : 1. daily review

167 NSOU ? CC-ED-06 2. present new material 3. conduct guided practice 4. provide feedback and correctives 5. conduct independent practice 6. weekly and monthly review Madeline Hunter's Instructional Theory into Practice (ITIP) or Elements of Lesson Design : 1. anticipatory set 2. objective and purpose 3. instructional input 4. modeling 5. monitoring to check for student understanding 6. guided practice 7. independent practice Homework : For Monday : Review the different direct teaching strategies described in Chapter 7 and consider ways in which you might use each to teach your subject. Read chapter 8, Indirect Instructional Strategies, and also consider ways to use it in your area. Begin developing a matrix of teaching strategies, with the first section being on Direct Strategies and the second on Indirect. Under each section, list as many strategies that you can find, and for each give examples of when and how you might use these for teaching middle and secondary students. Peer teaching strategies : Lecture/presentation, Demonstration using deductive strategies and questioning, Recitation, Concept attainment; Inquiry problem solving, whole class discussion. 5.5.3. Teaching Strategies: Indirect Instruction Consider indirect instruction for teaching concepts, inquiry, and problem solving. An old adage says: "Tell me and I forget, show me and I remember, involve me and I understand." The teaching of concepts, inquiry, and problem solving are different forms of indirect instruction that actively involve your learners in seeking resolutions to questions and issues while they construct new knowledge. Indirect instruction is an approach to teaching and learning in which (1) the process is inquiry, (2) the content involves concepts, and (3) the context is a problem. These three ideas are brought together in special ways in the indirect instruction

168 NSOU ? CC-ED-06 model. This chapter presents teaching strategies you can use to compose your own indirect teaching approach that asks your learners to share the excitement of becoming actively involved in their own learning and contributing new knowledge to solve real- world problems. We begin by looking into two classrooms, one in which Tim Robbins is teaching a lesson with the direct instruction model and the other in which Kay Greer is teaching the same lesson with the indirect instruction model. Examples of Problem Solving, Inquiry, and Concept Attainment Strategies Generalization is a process by which the learner responds in a similar manner to different stimuli, thereby increasing the range of instances to which particular facts, rules, and sequences apply. Discrimination is a process by which the learner selectively restricts the acceptable range of instances by eliminating things that may look like the concept but differ from it on critical dimensions. The processes of generalization and discrimination together help students classify different-appearing stimuli into the same categories on the basis of essential attributes. Essential attributes act as magnets, drawing together all instances of a concept without the learner having to see or memorize all instances of it. The following are instructional strategies of the indirect model: • Use of advance organizers • Conceptual movement-inductive and deductive • Use of examples and non-examples • Use of questions to guide search and discovery • Use of student ideas • Student self-evaluation • Use of group discussion Content Organization An advanced organizer gives learners a conceptual preview of what is to come and helps them store, label, and package content for retention and later use. Three approaches to organizing content and composing advanced organizers are the concept learning, inquiry, and problem-solving approaches. Conceptual Movement : Induction and Deduction Induction starts with a specific observation of a limited set of data and ends with a generalization about a much broader context.

169 NSOU ? CC-ED-06 Deduction proceeds from principles or generalizations to their application in specific contexts. Using Examples and Non-examples Providing examples and non-examples helps define the essential and nonessential attributes needed for making accurate generalizations. Using examples and non-examples includes the following steps : • Providing more than a single example • Using examples that vary in ways that are irrelevant to the concept being defined • Using non-examples that also include relevant dimensions of the concept • Explaining why non-examples have some of the same characteristics as examples The Use of Questions to Guide Search and Discovery In indirect instruction, the role of questions is to guide students into discovering new dimensions of a problem or new ways of resolving a dilemma. Some uses of questions during indirect instruction include the following: • Refocusing • Presenting contradictions to be resolved • Probing for deeper, more thorough responses • Extending the discussion to new areas • Passing responsibility to the class Learner Experience and Use of Student Ideas Student ideas can be used to heighten student interest, to organize subject content around student problems, to tailor feedback to fit individual students, and to encourage positive attitudes toward the subject. Because these goals should not become ends unto themselves, there should be a plan and structure for using student ideas in the context of strategies to promote problem solving, inquiry, and concept learning. Student-centered learning, sometimes called unguided discovery learning, allows the student to select both the form and substance of the learning experience. This is appropriate in the context of independently conducted experiments, research projects, science fair projects, and demonstrations. However, the preorganization of content is always necessary to ensure that the use of student ideas promotes the goals of the curriculum.

170 NSOU ? CC-ED-06 Student Self-Evaluation Self-evaluation of student responses occurs during indirect instruction when you give students the opportunity to reason out their answers so you and other students can suggest needed changes. Students can most easily conduct self-evaluation in the context of student-to-student-to-teacher exchanges, wherein you encourage students to comment on and consider the accuracy of their own and each other's responses. Use of Group Discussion A group discussion involves student exchanges with successive interactions among large numbers of students. During these exchanges, you may intervene only occasionally to review and summarize, or you may schedule periodic interaction to evaluate each group's progress and to redirect the discussion when necessary. The best topics for discussion include those that are not formally structured by texts and workbooks and for which a high degree of consensus among your students does not yet exist. Moderating functions during discussion include the following : • Orient students to the objective of the discussion. • Provide new or more accurate information that may be needed. • Review, summarize, and relate opinions and facts. • Redirect the flow of information and ideas back to the objective of the discussion. Comment : Direct and indirect instruction is often used together, even within the same lesson, and you should not adopt one model to the exclusion of the other. Each contains a set of strategies that can compose an efficient and effective method for the teaching of facts, rules, and sequences and to solve problems, inquire, and learn concepts. Comparing Direct and Indirect Instruction Indirect instruction is an approach to teaching and learning in which concepts, patterns, and abstractions are taught in the context of strategies that emphasize concept learning, inquiry, and problem solving. In indirect instruction, the learner acquires information by transforming stimulus material into a response that requires the learner to rearrange and elaborate on the stimulus material.

171 NSOU ? CC-ED-06 Direct Instruction • Teachers tell the students the concept or skill to be learned and then lead them through instructional activities designed to result in student learning. • Based on behavioristic learning principles (e.g. getting students' attention, reinforcing correct responses, providing corrective feedback, practicing correct responses) • Higher use of academic learning time (time on task) • Teacher structured lessons, following a clear, sequential approach, with the teacher in control of the content, activities, and lesson pacing. • Usually used to teach new skills or concepts (often use deductive methods). • Academically focused, with the teacher stating the goals for the lesson. • Teacher monitors student understanding and provides feedback. • 4 components : • clearly articulated goals • teacher-directed instruction • careful monitoring of student outcomes • use of clear classroom organization and management strategies • Key models : Rosenshine's Explicit Teaching & Hunter's Instructional Theory Into Practice (ITIP) or Elements of Lesson Design Indirect Instruction • Limited teacher direction, with emphasis on students co-creating their learning with the teacher as a facilitator of their learning. • May use social instructional approaches (learning with other students) or students working independently. • Often based on constructivist principles where students create meaning through active engagement and investigation. Constructivism promotes (a) the student point-of-view (b) teacher-student or student-student interaction (c) questioning to promote student thought (d) nurturing of student reflection rather than emphasis on a single correct answer. • Tends to use more inductive methods (leading students to discover concepts). 5.5.4. Effective Instructional Strategies : Simulation : Simulation involves students playing roles in simulated situations in order to learn skills and concepts transferable to "real life." Students make decisions and learn from successes and failures. Simulations enable the learning of complex concepts or mastery of dangerous tasks in more simple and safe environments.

172 NSOU ? CC-ED-06 Simulations include hands-on games such as Monopoly (real estate), social-political- economic role-playing or problem solving, software games and experiments (chemical changes), and simulators (driving a car or landing a plane). Although some simulations are done individually (such as driving), others occur in groups. Simulation is grounded in a branch of behavioral psychology called cybernetics, which holds the perspective that learning occurs in an environment in which the learner receives immediate feedback, experiences the consequences of behavior, and continually self-corrects until mastery occurs. When learning to land a plane in a flight simulator, for example, the "pilot" receives feedback on the speed, height, and angle of descent, and corrects (or under-or over-corrects) until the plane "lands" or "crashes." With continued practice, corrective behaviors become automatic until the "pilot" lands the plane safely each time. Simulations are effective for teaching complex skills or concepts. Simulations can be used to practice skills such as driving, to teach concepts such as how political, social, and economic systems work, or to discern scientific principles through simulated experiments. Additional outcomes include problem solving, decision making, cause- effect relationships, cooperation or competition, and independent learning. Simulations are not effective for teaching large amounts of fact-based information. Presentation using advance organizers : Presentation (or lecture) is among the most commonly used strategies for knowledge acquisition and retention. But presentation is more than teachers talking. An effective presentation requires a highly structured environment in which the teacher is an active presenter and students are active listeners and thinkers. Teachers use advanced organizers-powerful concepts to which subordinate ideas and facts can be linked-to provide structure and then involve students in processing the new information. The presentation strategy is grounded in information processing theory, which describes how learning occurs and how the mind organizes knowledge. The brain utilizes short-term memory for complex thought processes and long-term memory for information storage. Stored information is organized according to hierarchically ordered concepts and categories called cognitive structures. New information must be processed actively in short-term memory and tied to students' existing cognitive structures in long-term memory. Just as the mind has cognitive structures, every discipline has an organizational structure. Presentations should be organized around key ideas and structures and these structures should be made explicit to students. Presentation enables teachers to organize and convey large amounts of information efficiently. It is an appropriate strategy for instructing students about the key ideas in a subject, for acquisition and retention of factual information linked to these ideas,

173 NSOU ? CC-ED-06 and for comparing similarities and differences among ideas. Presentation is less appropriate for higher-level thinking, problem solving, and inquiry, although it may be used prior to such activities to ensure that students have the necessary foundational information. Concept teaching : Concept teaching helps students learn concepts and develop higher level thinking skills. Concepts (such as round and integer in mathematics, scarcity and freedom in social studies, energy and motion in science, and comedy and tragedy in literature) serve as the foundation for knowledge, increase complex conceptual understanding, and facilitate social communication. There are several different approaches to concept teaching. The approach described here is called concept attainment and is an inductive process in which students construct, refine, and apply concepts through teacher-directed activities using examples and non-examples and in which students learn to classify, recognize members of a class, identify critical and noncritical attributes, and define and label particular concepts. Cognitive theorists such as Jean Piaget and Jerome Bruner and information processing psychologists such as Robert Gagne emphasized that thinking is organized around conceptual structures. Children begin learning concepts very early through interaction with concrete objects. Conceptual structures continue to develop with increasing complexity and abstraction throughout life. Concept formation requires students to build categories (an island is land surrounded by water; a noun is a name for a person, place or thing). Concept attainment requires students to figure out the attributes of a category (e.g., a triangle has three sides and three angles; an adjective describes a noun). Young children can categorize using one rule or attribute (a bird has feathers), but students gradually develop the ability to use multiple rules or attributes (birds have feathers, lay eggs, have feet, and are warm-blooded) and to distinguish noncritical attributes (some birds fly, but not all birds). Examples and non- examples are used to help students construct new concepts (a diary is a primary source, but a novel is not). The primary purpose of concept teaching is to learn new concepts. It is also effective for teaching higher-level thinking, including inductive reasoning, hypothesis formation, logical reasoning, concept building strategies, and taking multiple perspectives (Is a slave's concept of slavery different from a master's concept?). Although not designed to convey large amounts of information, students must process information as they formulate new concepts. Concept teaching has four phases. In phase 1 the teacher explains the purposes of the lesson, describes why concepts are important, and gets students ready to learn. The second phase consists of presentation of examples and non-examples of the concept.

174 NSOU ? CC-ED-06 The teacher gives examples and non-examples, and the students strive to discover the concept and its attributes through inductive reasoning. After the concept has been discovered, the teacher gives more examples and non- examples, then asks students to provide examples and non-examples. The purpose of this tactic is to test student understanding of the concept and its attributes. A concept lesson concludes with the teacher asking students to analyze their thinking patterns, strategies, and decisions in order to develop more effective thinking skills and to help students integrate the new concepts into existing knowledge. The learning environment for concept teaching has a moderate degree of structure in that the teacher controls the first three phases of the lesson rather tightly. The fourth phase is more open and student interaction is encouraged. As students gain more experience with concept learning, they can assume increasing responsibility for how the lesson proceeds. Discussion is central to all aspects of teaching. Classroom discussion may serve as a strategy in itself or as part of another strategy. Teachers and students talking about academic content and students displaying their ideas and thinking processes to the teacher and to each other characterize discussions. Effective discussions go beyond question-and-answer recitations. The more involved students are in the discussion, the more effective the learning. Discussion is an appropriate strategy for improving student thinking; promoting engagement in academic content; and learning communication and thinking skills in a social environment. Discussion is particularly appropriate for topics that are subjective or controversial and that involve several points of view, such as the causes of World War I or funding of stem-cell research. Classroom discussion proceeds through five phases. The teacher introduces the discussion by providing a clear purpose for the discussion and engaging students so they will become involved. This is followed by phase 2 where the teacher sets the ground rules, then poses a question, raises an issue, or presents a puzzling situation. Cooperative learning : In cooperative learning students work together in small groups on a common learning task, coordinate their efforts to complete the task, and depend on each other for the outcome. Cooperative learning groups are characterized by student teams (of 2-6) working to master academic goals. Teams are normally composed of learners of mixed ability, ethnicity, and gender. Rewards systems (grades) are designed for the group as well as individuals. Cooperative learning is rooted in two theoretical traditions. First, it is based on the progressivism of John Dewey, particularly his idea that the school should mirror the values of the society and that classrooms should be laboratories for learning democratic values and behaviors. Students are prepared for civic and social responsibilities by

175 NSOU ? CC-ED-06 participating in democratic classrooms and small problem-solving groups. Cooperative learning also has roots in constructivist theory and the perspective that cognitive change takes place as students actively work on problems and discover their own solutions. Particularly important is Lev Vygotsky's theories that students learn through language-based interactions with more capable peers and adults. Cooperative learning has three distinct goals: academic achievement, acceptance of diversity through interdependent work, and development of cooperative social skills. There are numerous approaches to cooperative learning and each proceeds in slightly different ways. However, in general, a cooperative learning lesson has six phases. The teacher begins the lesson by presenting the goals of the lesson, motivating students, and connecting the forthcoming lesson to previous learning. Procedures, timelines, roles and rewards are described. Required group processes or social skills may also be taught at the beginning of a cooperative learning lesson. In phase 2 the teacher facilitates the acquisition of the academic content that is the focus of the lesson. This may be done verbally, graphically, or with text. The teacher during phase 3 explains how the teams are formed and helps students make transitions into their groups. Phase 4 is teamwork. Students work together on cooperative tasks and the teacher assists students and groups, while reminding them of their interdependence. The final phases of a cooperative learning lesson consist of phase 5 (assessment) and phase 6 (recognition). The teacher tests student knowledge or groups present their work. Individual students and groups are assessed on cooperation as well as academic achievement. The effort of individuals and groups are recognized through displays, newsletters, presentations, or other public forums. The learning environment for cooperative learning differs markedly from the traditional individualistic classroom environment. Students assume active roles and take responsibility for their own learning. The social atmosphere is collaborative and respectful of differences. Students learn group processes and problem-solving skills and become increasingly independent in using them. Students construct their own learning through active engagement with materials, problems, and other students. The teacher forms the teams, structures the group work, provides materials, and determines the reward structure, but the students direct their own work and learning.

Instructional Materials : They allow teachers to make the learning experience more fun and practical and can also encourage students to take more of an active role in their education. The

176 NSOU ? CC-ED-06 objective of using instructional strategies beyond subject comprehension is to create students who are independent strategic learners. Instructional material takes the pupil to formulate or generate ideas in order that learning would be faster and easier. These certain characteristics; first on the online, it should be on the level of the learner. Second, it should be related and relevant to the subject matter. It should be clearly understood. Some characteristics of a good IM's that will help you in your teaching process; The size, it is the must that the material is big enough to be seen by the farthest students in the classroom.; The color, the students are more interested to those materials w/c are colorful and beautiful.; The durability, Instructional materials are not made for one session only they must last if possible until lifetime so that it can be reuse; The economy, consider also the salary of the teacher his expenses in making that instructional material. Its portability, your material must be easy to handle and carry so that it is more convenient for your part wherever you will teach. The instructional material should arouse the interest of the pupil. The materials used give opportunities for enrichment and remediation to ensure effectiveness in the creation of IM's, a teacher must be resourceful and creative. The importance of characteristics of IM's it helps the teacher to facilitate the teaching-learning process. These visual aids are important in motivating and arousing your student's interest. More important instructional software, if used effectively, instructional software is beneficial to students because it cultivates engagement, motivation, interest in learning and personalized learning.

Characteristics of Good Teaching Learning Resources / TLM / Teaching Aids A few characteristics of good teaching aids are as follows :

- 1) Teaching aids are large enough to be seen by the students for whom they are used.
- 2) Teaching aids are meaningful and they always stand to serve a useful purpose.
- 3) Teaching aids are up to the mark and up to date in every respect.
- 4) Teaching aids are simple, cheap and may be improvised.
- 5) Teaching aids are accurate and realistic.
- 6) Teaching aids are according to the mental level of the learners.
- 7) Their purpose may be informative but it is not just entertainment.
- 8) Teaching aids help in realization of stipulated learning objects.
- 9) Teaching aids are really very useful and can be used in many lessons and at different class levels.

177 NSOU ? CC-ED-06 10) Teaching aids are useful for supplementing the teaching process but they cannot replace the teacher.

Advantages of Instructional Resources / Teaching Aids

- 1) Supplement in verbal instructions.
- 2) Teaching aids makes learning permanent.
- 3) Teaching aids provide variety.
- 4) Teaching aids are helpful in attracting attention of the students.
- 5) Teaching aids saves time and energy.
- 6) Teaching aids encourages the healthy classroom interaction.
- 7) Teaching aids helps the teacher to create situations for teaching the beginners.
- 8) Teaching aids are helpful in creating positive environment for discipline.
- 9) Teaching aids are helpful in meeting individual differences.
- 10) Teaching aids helps in providing speech training to the pupils.
- 11) Teaching aids enable the children to retain language items for a longer time.
- 12) Teaching aids gives vividness to the learning situation.
- 13) Teaching aids makes the abstract ideas concrete and thus help in making learning more effective.
- 14) Teaching aids provide good substitutes for the real objects as they make learning equally meaningful.
- 15) Teaching aids help in the development of various skills such as, how to draw a diagram of the topic among the students.

How to Use Instructional Resources / Teaching Learning Materials / Teaching Aids

- 1) Teaching aids should be simple and brief.
- 2) Teaching aids should be related to the objectives of teaching.
- 3) Teaching aids should be big door to be seen by all the students.
- 4) Teacher must use proper teaching aids according to the interest of the student.
- 5) Teaching aids should be prepared and planned in advance.
- 6) Teaching aids should be properly selected according to the physical and mental level of the student.
- 7) Teaching aids should be colorful and should have direct impact on the lesson.

178 NSOU ? CC-ED-06 8) Teaching aids should be meaningful and interesting. Where to Use Instructional Resources / Teaching Learning Materials/ Teaching Aids ? 1) When the subject is far away in time. 2) Where the subject is too far, distance to be actually seen. 3) Where the subject is too small to be seen by the whole class. 4) Where the subject is too big to be brought in the class. 5) Where the growth of the process is slow. Criteria for evaluating instructional materials : Criteria for evaluating instructional materials is very important to make teaching effective and meaningful, here are some criteria: Content Aligns with curriculum and standards, and is current, valid and reliable, with real world examples. Design to meet the interest of the individual learners from various skills levels. Enhances conceptual understanding and engages higher order thinking skills. Free from bias. Equity and Accessibility Materials are durable, easily stored, transported and are universally accessible. Materials are easily updated and are adaptable and customizable to match the resources of the school. Appropriateness : Materials are appropriate for the subject matter, and also appropriate for the learner's capacity or levels of learning. Presentation : Comprehensiveness of student and teacher resources; alignment of instructional components; organization of instructional materials; readability of instructional materials; pacing of content; ease of use and durability of materials. Learning : Motivational strategies; teaching a few "Big Ideas;" explicit instruction; guidance and support; active participation of students; targeted instructional strategies; targeted assessment strategies. Cost : The materials used for teaching should not be expensive, as long as it is eye captivating and catches the attention of the students then it is an effective instructional materials. 5.6 Summary Pedagogy encompasses how teachers think and how teachers act, that is teacher thinking and teacher doing, the one impacting on the other, and with the third dimension of the visible, observable and measurable impact of the teachers' pedagogy on the learners. Pedagogy naturally embeds all of the key values and philosophy in a

179 NSOU ? CC-ED-06 developmentally and culturally appropriate way. The following figure illustrates the Developmental Pedagogical Continuum. A concept is the sum total of what we know about the object. It refers to a generalized idea about the objects, persons, events. Concept can be formed by direct experience or by indirect experience. Concept formation involves perception and abstraction. Students are challenged and supported to develop deep levels of thinking and application. Students are challenged to explore, question and engage with significant ideas and practices, so that they move beyond superficial understandings to develop higher order, flexible thinking that is conceptual learning. Teaching sequences promote sustained learning that builds over time and emphasizes connections between ideas. Teachers have a very crucial role in promoting engagement that leads to concept formation. In concept learning, Problem-based learning (PBL) is a very useful method that takes a student-centered approach, usually conducted within small groups. The teacher acts as a facilitator in problem-based learning. Problem-based learning and inquiry-based learning are not mutually exclusive; rather, problem-based learning involves inquiry strategies. Some objectives of PBL are: (1) helping students develop cognitive flexibility; (2) practicing problem-solving skills as generic skills; (3) self-directed learning which requires high metacognitive ability; (4) practicing collaborative skills and communication skills; (5) increasing intrinsic motivation. Critical thinking is a complex mental process involving paying attention to details, selecting relevant information, analyzing carefully and skeptically, making judgments, and metacognitive thinking such as reflection and higher-order planning. Critical thinking and creative thinking both as a generic thinking skill, is emphasized in a variety of content areas of curriculum planning documents across cultures. There are different pedagogical models in use for inculcation of such skills. Classroom communication is a vital ingredient in the instructional and learning process in the school environment. The quality and quantity of teacher-student interaction is a critical dimension of effective classroom teaching. The term 'interaction' implies an action - reaction or a mutual or reciprocal influence which may be between individuals. Interaction Analysis (IA) is an analytical observation scheme that gives an insight into what a teacher does while teaching. It is a systematic observation that represents a useful means of identifying, studying, classifying and measuring specific variables as the teacher and his/her students interact within instructional learning situations. Flanders' interaction analysis system is an observational tool used to classify the verbal behaviour of teachers and pupils as they interact in the classroom. Flanders' instrument was designed for observing only the verbal communication in the classroom and non-verbal gestures are not taken into account.

180 NSOU ? CC-ED-06 Since the inception of formal, classroom-based instruction, a fundamental aspect of teaching has been the way teachers arrange the classroom environment so students can interact and learn. The instructional strategies teachers use help shape learning environments and represent professional conceptions of learning and of the learner. "The purposeful direction of the learning process" and is one of the major teacher class activities is instruction. Instructions may be of different kinds. Direct instruction is a method for imparting basic knowledge or developing skills in a goal-directed, teacher-controlled environment while indirect instruction for teaching concepts is based on inquiry, and problem solving that is learner-centered in nature. Teachers need to develop mastery of using instruments on the basis of the nature of learners and subject. Preparing best instructional materials and their purposive use is also the responsibility of the teachers. 5.7 Self-Assessment Questions 1. What is meant by the Developmental Pedagogical Continuum? Illustrate through a model 2. What is problem-based learning? Explain the principles of problem-based learning. 3. Developmentally appropriate pedagogy and instruction after Vygotsky. 4. Explain how Critical Thinking and Knowledge construction are related. 5. Explain how to develop the development of social cognitive skills and affective skills. 6. Mention the basic theoretical assumptions of Flanders Interaction Analysis 7. What are the advisable Precautions in the Use of Flanders Interaction Analysis? What is the limitation of such a classroom observation method? 8. Explain the relation of teaching and Instruction 9. What is meant by instruction? Differentiate between direct and indirect instruction with exemplification. 10. What is meant by Instructional Materials? Mention the characteristics of good instructional materials and explain how to use instructional material. 5.8 References Amatori, V. O. (2015). 183 Unit-6 : Teacher and Teaching Structure 6.1 Objectives 6.2 Introduction 6.3 Levels of Teaching : Memory Understanding and Reflective 6.3.1 Memory Level of Teaching 6.3.2 Understanding Level of Teaching 6.3.3 Reflective Level of Teaching 6.4 Teaching Methods : Lecture, Demonstration, Problem Solving and Programme Instruction 6.4.1 Lecture Method of Teaching 6.4.2 Demonstration Method of Teaching 6.4.3 Problem Solving Method of Teaching 6.4.4 Teaching Method : Programme Instruction 6.5 Function of a Teacher as Planner, Facilitator, Counselor and Action Researcher 6.5.1 Function of Teacher as Planner 6.5.2 Role of teacher as Facilitator 6.5.3 Function of Teacher as Counselor 6.5.4 Function of Teacher as Researcher 6.6 Summary 6.7 Self-Assessment Questions 6.8 References 6.1 Objectives In this Unit, we have tried to introduce you to the more fundamental issues relating to the process of teaching. More clearly speaking the memory, understanding and reflective levels of teaching. Apart from such dimensions of teaching, the basic methods of teaching learning transactions like Lecture, Demonstration, Problem Solving and Programme Instruction are also explained with examples. And finally, the more broader role of teacher as facilitator, counselor and researcher are also discussed. After the end of this unit, you should be able to : • Understand and apply Memory Understanding and Reflective phase of Teaching

184 NSOU ? CC-ED-06 • Explain and demonstrate different teaching methods with example • Differentiate between the different methods of teaching • Explain why reflective Phase is crucial in quality development of teaching • Explain Function of a Teacher as Planner, Facilitator, Counselor • Explain how Teacher Research matters in innovation and problem-solving in teaching learning challenges. 6.2 Introduction Pedagogy, curriculum and culture provides an overview of the key issues and dominant theories of teaching and learning as they impact upon the practice of classroom teachers; punctuated by questions, points for consideration and ideas for further reading and research. Every teacher operates according to a theory or theories of learning and within the context of a philosophy of what education should be fundamentally about. The only difference is that sometimes these theories are very consciously held and operated upon by the teacher, perhaps carefully referenced to published theory in the field, while others are held and operated upon rather less consciously, with perhaps little or no reference to published theory. Despite content process debate or behaviorist or cognitivist or constructivist, as teaching is performing hence it has specific sequence which essentially follow memory level, understanding level and finally reflective level. It is really not possible to single out any pedagogical approach but teaching is a combination of lecture demonstration, authentic engagement for problem solving and the learner may be exposed to programme instruction based on certain pedagogical principles. Role of teacher cannot be confined only with the formal task of learning teaching. Rather, teachers need to play the role of planner, facilitator, counselor and action researcher that could contribute in qualitative upscaling of teaching and all- around development of learners. This unit has dealt with these issues. 6.3 Levels of Teaching: Memory, Understanding and Reflective Levels of Teaching We all know that teaching is a purposeful activity. Through teaching the teacher brings a desirable change in the learner. Both

the concepts teaching and learning are interrelated to each other. Development of the all-round personality of the learner is the final goal of teaching and learning. During teaching an interaction takes place between an experienced person (

teacher) and an inexperienced person (student). Here the main aim is to bring change in the behavior of the student. 185 NSOU ? CC-ED-06 Teachers teach students at three levels. They have to keep

78%

MATCHING BLOCK 41/52

W

in mind the developmental stage of the learners so that desired educational objectives can be achieved. These three levels are 1. Memory level : Thoughtless teaching 2. Understanding level : Thoughtful teaching 3. Reflective level : Upper thoughtful

level Here you will get the idea of all these three levels of teachings along with their advantages and disadvantages. 6.3.1. Memory Level of Teaching It is the first and thoughtless level of teaching. It is concerned with memory or mental ability that exists

51%

SA

Sambalpur-MA-Education-SEM-II-Pedagogical Tren ... (D156211178)

in all living beings. Teaching at memory level is considered to be the lowest level of teaching. At this level, • The thinking ability does not play any role. • Students only cram the facts, information, formulas and laws that are taught to them. •

The teaching is nothing but learning the subject matter by rote.(Bigge, Morris L(1967) • The role of the teacher is prominent and that of the student is secondary. • The study material is organized and pre-planned.

The teacher presents the study material in a sequential order. Memory level teaching lacks insight. Psychologically, it is cognitive level

teaching Herbart's Model of Memory Level Teaching Herbart was the exponent of memory - level teaching. Herbart described the following steps for presenting the model of memory level of teaching. 1. Focus 2. Syntax 3. Social System. 4. Support System. Focus– Emphasis on cramming of facts & development of the following capacities. 1. Training of mental aspects. 2. Providing knowledge of facts. 3. Retaining the learnt facts. 4. Recalling & Re-presenting the learnt facts.

186 NSOU ? CC-ED-06 Syntax Herbert's five steps- 1. A) Preparation– The pupils are prepared to acquire new knowledge by testing their previous knowledge B) Statement of aim– Topic clear to the pupils & teacher writes the topic on the black - board. 2. Presentation– Stimulating the students' mental activity, the pupils are provided with opportunities for self - learning. 3. Comparison of association– Herbert named this step as association. Teacher establish a relationship between two subjects, facts & events of the same subject. By comparison, the new knowledge may be clarified & made permanents in the minds of the pupil. 4. Generalization– Herbert named this step as a system. After explaining the basic lesson, the pupils are given the opportunities to think in this lesson. Pupils formulate some principles & laws which can be used in the future life situations 5. Application– Last steps of teaching. Observed, whether there new learnt knowledge can be used in new situations or not. Verified through questioning or new opportunities to make use of learnt knowledge. Makes the knowledge permanent & laws can be verified. Social system– The process of teaching is social & professional. Pupils & teachers are members of this social system. Teacher occupies the primary place & pupils have a secondary place. Function of the Teacher– 1. Presenting the contents. 2. Controlling the pupils' activities. 3. Providing motivation. Support System– • Cramming is stressful. • Both oral & written examinations are used. • Essay type examinations are more useful. • Recall & recognition are used successfully. • Through the objective type examination. 6.3.2. Understanding Level of Teaching

76%

(D156211178)

Understanding something is to perceive the meaning, grasp the idea and comprehend the meaning. In the field of Education and Psychology, the meaning of 'understanding' can be classified as • seeing the total use of facts • seeing relationship • a generalized insight 187 NSOU ? CC-ED-06 The teaching at the understanding level is of a higher quality than the one at the memory level. It is more useful and thoughtful

from the point of view of mental capabilities. At

(D156211178)

this level of teaching, the teacher explains the student about the relationship between principles and facts and teaches them how these principles can be

applied. Memory level teaching barrier is essential to be crossed for this level of teaching. As compared to memory level teaching, the understanding level teaching has greater merit. This enables students to have complete command over subject material. In the understanding level, the role of the teacher is more active.

55%

(D156211178)

The students at this level are secondary. At this level, no cramming is encouraged. The new knowledge acquired at this level is related to the earlier knowledge gained.

A generalization is made on the basis of facts and the facts are used in the new situations. Morrison's model of Understanding Level of Teaching The model of understanding - level teaching was indoctrinated by Morrison, it is named as "Morrison's teaching Model" Focus– The pupil should achieve the mastery of the concept. Teacher stresses upon the mastery of the content so that a desirable change may occur in the personality of the pupils. Syntax– Syntax divided into five steps. 1. Exploration– • Previous knowledge testing by questioning. • Analyzing the contents, the elements are arranged in a logical sequence from a psychological point of view. • Determining how the units of contents or new. • Knowledge should be presented. 2. Presentation-Teacher remains more active. He forms the following activities for the presentation of the contents. • Presents the content in small units to maintain the sequence of these units & a relationship with the pupils' establishments. • Teacher diagnoses whether the contents have been understood by the pupils or not. • Teacher recapitulates the contents till most of the pupils acquire the understanding. 3. Assimilation– Teacher provides pupils opportunities for assimilation. Assimilation has the following characteristics. a) Pupils are provided with occasions for generation through assimilation. b) Assimilation - opportunities are provided in order to stress upon the depth of the content.

188 NSOU ? CC-ED-06 c) At the time of assimilation, every pupil studies in accordance with his requirement. d) In assimilation, the pupils work themselves in laboratories & libraries. e) Supervised study occurs. f) Both pupils & teachers remain active. g) The pupils perform individual activities & teachers guide them according to the need during supervision. h) During the assimilation period, the teacher tests whether the pupils have achieved mastery over the content or not. 4. Organization– Pupils are provided with the occasions for representation, all the pupils write contents in their own language. The teacher comes to the conclusion whether the pupils can write the contents without anybody's help or not. The representation in subjects like mathematics, grammar & arithmetic etc., has no importance. 5. Recitation– Last step of understanding level teaching. The pupils present the contents orally before the teacher & his mates. Social system– • Teacher controls the behavior of the pupils by providing motivation. • Teacher imparts instruction to the pupils and they work themselves with full involvement. • Both extensive & intrinsic motivation is used. Support System– Support system does not remain static, but it goes on changing. In assimilation, the pupils have to pass the examination. Assimilation test pass - essentially for their entry into organization & recitation. End of the organization period, a written test takes place. Recitation is followed by an oral test. Both oral & written tests (Essay type & objective type) occur during the various steps of understanding level of teaching. 6.3.3. Reflective Level of Teaching This level is also known as introspective level. Reflecting on something means giving careful thought to something over a period of time. It also means thinking deeply about something. Reflective level of teaching is considered to be the highest level at which teaching is carried out. •

100%

Teaching at the reflective level enables the students to solve the real problems of life. • At this level, the student is made to face a real problematic situation. The student by understanding the situation and using his critical abilities succeeds in solving the problem. • At this level emphasis is laid on identifying the problem, defining it and finding a solution to it. The student's original thinking and creative-abilities develop at this level. • The role of the teacher in this level of teaching is democratic. He does not force knowledge on the students but develops in their talents and capabilities. • The role of the students is quite active. • Reflective level of teaching is that which is problem-centered and the student is busy in original imagination.

Hunt's Model of reflective Teaching– For developing a reflective level of teaching the credit goes to hunt. This teaching model is named as Hunt's model of teaching. Focus– 1. To develop problems - solving competency among the pupils. 2. To develop critical & constructive thinking among pupils. 3. To develop independent & original thinking power among the pupils. Syntax– The individual & social nature, syntax of reflective level teaching is designed in the following four steps. i) The teacher creates a problematic situation before the pupils. ii) Pupils formulate hypotheses for testing. iii) Pupils collect data to verify the hypothesis. iv) Hypotheses are tested. Results are derived on the basis of these tests which are original ideas of the pupils. Social System– The class - room environment is open & independent. Pupil occupies primary & the teacher secondary place. Objectives are as- a. To present some problem before the pupils. b. To use discussion & seminar during teaching.

190 NSOU ? CC-ED-06 c. To raise the level of aspiration of the pupils. – • All pupils become active & sensitive for solving the problem. • Both self - motivation & social motivation have importance. Support System– Objective type tests are not used, essay type tests used for evaluation. Things are evaluated– i) The attitudes & beliefs of the pupils should be evaluated. ii) Involvement in the learning activities should be evaluated. iii) Evaluated the development of the critical & creative competencies of the pupils. 6.4 Teaching Methods: Lecture, Demonstration, Problem Solving and Programme Instruction 6.4.1. Lecture Method of Teaching One of the most common alternatives used by those at the college level is communicating directly to the students where the talking by the teacher is the most predominant activity, and it is called 'lecture'. 'Lecture' can be talking to the students or talking with the students. When it is talking to the students, it takes the form of one-way communication in which the teacher plays an active role and remains the main focus. It may take the form of two-way communication when the teacher talks with the students. In this way, the lecture becomes a question-answer or discussion activity instead of merely giving information. Lecture, as a method of instruction, can be traced back to the time of the Vedas and the Upanishads in our country, or to the Socratic dialogue in the Greek context. In Vedic period, a lecture was given through a question-answer method [with the Shishya (student) sitting by the side of the Guru (teacher)]. In the medieval period, however, the preacher (as in a church or a temple) used lecture as a one-way communication, since, in most of these situations, the group of listeners was large. But with the advent of the printing technology, and of late, of the information and communication technology, the role played by a lecture is being redefined. Unlike the past, when it was equated with mere oratory, it is now seen in a different context. Lecture, once considered to be the sole source of information, is now being treated as only one of the different sources of information available to the learners. Apart from its major function of information-giving, it plays certain unique roles which cannot be performed by other inanimate sources. Firstly, the teacher may use it to motivate the students. It is through listening to lectures, that students are attracted to different areas of study. Secondly, the teacher may use it to integrate various sources of

191 NSOU ? CC-ED-06 information, and use it as a thread which brings different sources of information into one garland. Unlike the common belief, the lecture, as a method of instruction, can be used in a structured way. Thus, the lecture follows some specific steps through which it is carried out. Let us discuss these in the following sub-section : Steps in a lecture

Lecture, as a method of instruction, mainly follows two steps, i.e., Planning and Delivery. The delivery of a lecture is again divided into three phases. These are the introduction, the development and the consolidation phases.

Planning of a lecture We should dispense with the idea that a lecture does not require planning. An unplanned lecture hardly achieves the objectives of classroom instruction. When we talk of the planning of a lecture, it entails a number of things. The teacher must prepare a lesson plan for the lecture to be delivered. This contains the instructional objectives to be achieved, the amount and nature of content to be covered, the kinds of audio-visual aids that are to be used, class size and nature of students for whom lecture is to be prepared, kinds of questions to be asked, the kinds of other interactional modes to be used, the feedback mechanism to be used, etc. In disciplines which require laboratory work, the teacher must ensure the required logistics inside the classroom such as blackboard, charts, OHP, laboratory equipment to be used, and the seat arrangement of the class. Thus, planning a lecture boosts the confidence of the teacher in handling the class. He/she knows in advance, what to do, when and what not to do. Sometimes, the teacher can plan for humorous interludes, jokes, etc. to make the lecture more interesting. You will know more about this in Block 2, Unit 7.

Delivery of a lecture As it has already been mentioned, delivery of a lecture is done generally in three phases. Let us now discuss these.

Introduction of a lecture Sometimes, the introductory phase is also called the warm-up phase. The main task of the teacher here is to establish rapport with the students, create interest and motivation amongst them and gradually lead the learners to the next phase. At this stage the teacher relates the new topic to the one already taught and to the previous experiences. The main function here is to arouse interest and motivate the students. The teacher 192 NSOU ? CC-ED-06 also uses the blackboard or any other visual medium to highlight the theme. Some of the examples of planning an introduction of a lecture are given hereunder.

A. Plan an introduction to catch the listener's interest Suggestion: Raise a question to be answered by the end of the lecture. Example: "By the end of the lecture, you should be able to answer the question." Are essay test questions better than objective test questions?" Suggestion: Explain the relationship of lecture content to laboratory exercises, homework problems, professional career interests, etc. Example: "Today, I'll lecture on cost-of-living indices, a topic in macroeconomics which will help you understand the recent discussions related to inflation." Suggestion: Relate lecture content to previous class material. Example: "For the past few weeks, Skinner, Osgood, and others who take a behavioristic view of language acquisition have occupied our attention. Today, I'll introduce another different perspective on language acquisition and learning. We'll spend the rest of this week and the next on understanding this view and comparing it with the behavioristic position." Alternative; Ask a student to summarize previous course content.

B. Provide a brief general overview of the lecture's content. Example: "In Victorian England the conflict between religion and science was well reflected in the literature of the time. Today, we'll look at two poems. 'In Memoriam' and 'Dover Beach', which illustrate this conflict." C. Tell students how you expect them to use the lecture material. Example: "Today I'll offer a specific model of evaluation and illustrate its applicability in several kinds of settings. When you meet in your discussion groupS this week, you'll be asked to apply the model." D. Define or explain unfamiliar terminology. Example: "In Physics, the term 'work' has a precise technical meaning. The work done by a force, F when the object on which it acts moves a distance q (drawing on the board) is defined by $\text{Work} = \text{Force} \times \text{Displacement}$ or $W = F \cdot q$. It is assumed that F does not change much during the motion through the distance q .

Development phase This is the most important phase of a lecture, because the transaction of ideas and information between the teacher and the learner takes place here. The teacher explains the concepts and principles, provides facts, data, figures, etc., to the learners. In order to explain the content matter, the teacher cites various examples, uses various communication aids, uses analogies and illustrations, etc. The teacher, when-required, adopts different non-verbal communication techniques such as gestures, postures, etc.,

193 NSOU ? CC-ED-06 to facilitate the teaching activity. During this phase, the teacher should be cautious of his lecture otherwise it becomes ineffective. The following questions relating to Lecture-Delivery should be considered throughout the Development phase.

Vocal delivery, do you :

1. Cue important ideas by varying speech rate, volume and pitch?
2. Speak to students and not to the blackboard, walls, notes or floor?
3. Enunciate clearly?
4. Let your sense of humor show?
5. Avoid repetition of pet words or phrases (e.g., okay, you know, uh)?

Physical delivery :

1. Establish and maintain eye contact with your students.
2. Use gestures and physical movements which complement your verbal statements (e.g., looking at students while asking for student questions)?
3. Practice in advance with audio-visuals?
4. Avoid using distracting gestures or. Physical movements (e.g., grooming, pacing)?

Consolidation phase This is the concluding phase of a lecture. Here the teacher recollects whatever he has covered during the course of lecture. He then summarizes the main teaching points of the lecture either verbally, or by writing- them on the blackboard or by using PPT: The teacher also asks a few questions on the content matter covered, in order to evaluate the students' understanding of the lecture. Through these questions, the teacher gets to know the learning difficulties of students and accordingly modifies his teaching. The teacher also gives some take-home assignments to the students which they are expected to complete and bring back for the teacher's remarks. The teacher also informs the students as to what the next lecture will deal with.

Lecture in combination with other methods and media In the examples given in the previous section, you might have noticed that during the presentation, different methods and media hardware are used. For example, the English teacher uses group tasks as a method. He also uses individual tasks as a method. The Chemistry lecturer uses an overhead projector to present the graphs prepared by the students. This is an example of the use of hardware. Similarly, a variety of methods and media can be used in combination with the lecture method. To understand this better, you might consider your position as systemic from a wider angle, that is to say, the viewpoint merely from a session or period is-insufficient to

194 NSOU ? CC-ED-06 appreciate this fully. Let us look at content treatment from a larger angle, i.e., the treatment on one unit from the prescribed syllabus for which the time allotted is about ten sessions. During the first session you introduce the topic to the students through a lecture, at the end of which, a home assignment is given for the students to collect information regarding the topic from identified sources. In the next session, a group task is given to the students to process the information collected, which is followed by a discussion. During the third session, along with one of your colleagues, you teach the students through 'Team Teaching'. Here, you present two distinct viewpoints on the topic under study. During the course of the fourth and the fifth sessions, you engage them in the laboratory/field work, verifying the alternative viewpoints put forward. In the sixth session, you divide the students into small groups and ask them to discuss their points of view based on their recent experiences and arrive at their conclusions. The teacher acts here as a moderator. During the seventh session, you present a problem for the students to solve, based on their experiences. A sample of solutions are analyzed to 'Study the merits and demerits of the suggested solutions. The eighth session is used for independent study in the library and the ninth to give a test on the unit. This is immediately followed by a discussion on the expected responses of the test (the feedback). Disadvantages However, the lecture also~ ● places students in a passive rather than an active role. Passivity can hinder learning and students' attention may be lost. ● encourages one-way communication; therefore, the lecturer must make a conscious effort to become aware of student problems and student understanding of content. ● requires a considerable amount of unguided student time outside the classroom to achieve understanding and long-term retention of content. In contrast, interactive methods (discussion, problem-solving sessions) allow the instructor to influence students when they are actively working with the material. ● requires the instructor to have or to learn effective writing, speaking and modelling skills. ● places the responsibility of organizing and synthesizing content upon the lecturer.

195 NSOU ? CC-ED-06 6.4.2. Demonstration Method of Teaching : Another teacher-controlled instructional technique widely used in higher education institutions is Demonstration. As college teachers, you may well be acquainted with the word 'Demonstration'. In colleges, especially, Science teachers use demonstration very often, though teachers of other disciplines take recourse to demonstration when something related to teaching of skills comes. A Science teacher demonstrates Newtonian laws, a Music teacher demonstrates a. classical Hindustani music, an Art teacher demonstrates how to sketch and so on. What then is the demonstration? Webster Dictionary defines it as "a public showing emphasizing the salient merits, utility, efficiency, etc., of an article or product". While used in teaching, demonstration means showing how something is to be done or not to be done. It involves the art of depicting the skills associated with an action. Sometimes, ideas, attitudes, processes and other intangibles. are also demonstrated consciously. Let us now discuss in detail the various aspects of demonstration. Major characteristics of demonstration i) Both concrete and abstract matter can be effectively demonstrated. Generally, we demonstrate concrete matter or processes connected with them. But abstract matters like discussing the theme of a play or novel, the organization of state or federal governments, can also be demonstrated. ii) Demonstration is-though to be the best method for displaying skills in operation. Driving an automobile, playing the sitar/guitar, dissection of a frog, etc., can easily be demonstrated. iii) Apart from the demonstrator and the audience, demonstration is facilitated by audio-visual materials like the chalkboard, a filmstrip, a film, a recording, a diagram, a chart, etc. Now-a-days, even critical surgery like heart surgery is demonstrated on television. Principles of demonstration in teaching The principles of demonstration are the following : i) Establishing rapport : The demonstrator should always maintain a friendly relationship with students. He should be simple and a warm human being as far as possible. He should stimulate interest and arouse curiosity amongst the students. ii) Avoiding the 'COIK Fallacy : The demonstrator must be able to put himself in the role of the observer. Hence, he requires thoughtfulness and. vigilant effort. If he does not make this effort, the demonstrator is likely to commit the CalK Fallacy which stands for "Clear Only If Known'. In this case, the demonstrator knows his subject well whereas the students who are observers may be ignorant of that.

196 NSOU ? CC-ED-06 iii) Watching for key points : The demonstrator must ensure that the key points in the demonstration are being communicated to the students. Hence, he should lay special emphasis on them, repeat them and highlight them. Ina demonstration, there are mainly three important steps/considerations. These are preparation, performance and evaluation. Let us discuss these steps. Preparing a classroom demonstration. While making preparation for a classroom demonstration, the demonstrator has to take note of the following points: , i) To plan a demonstration that will create interest among the students: The demonstrator should prepare himself in such a way that his performance will create interest among the students as well as make them active and responsive. ii) 'Plan every step (including materials) carefully: The demonstrator should ensure that the requirements of every step in the task of demonstration are ready and kept in order. He has to make every piece of equipment ready beforehand. It is undesirable to interrupt and go for some equipment once the demonstration is already on. iii) Rehearse your demonstration: After the procedure has been organised, the demonstrator should rehearse the demonstration in order to test it for clarity, interest, duration and other elements, with a good critic. iv) Outline the steps-on the chalkboard: In order to make the demonstration understandable, the demonstrator should outline the steps on the chalkboard before the class begins. The teacher may remove the steps one by one when a particular step is completed. v) Make sure that everyone can see and hear: The teacher should take note of the fact that everyone present during the demonstration can see and hear the teacher. Hence, he should ensure that proper light and seat arrangement exist in the classroom. He must be audible to all the students present. vi) Prepare written materials: It is known that learning through hearing and seeing is reinforced by written materials. The demonstrator, therefore, should prepare hand- outs which may be provided to the students at the end of the demonstration. He has to keep in mind that written materials should not be handed out at the beginning or in the middle of the demonstration because these may disturb the students. Performing the classroom demonstration When the preparation for the demonstration is over, the demonstrator starts the demonstration. The key points here are: i) Setting the tone for good communication : The demonstrator should arouse curiosity, and generate interest among the students and hold their attention as he goes through the stages of demonstration. He/ She should not show his wit or profundity

197 NSOU ? CC-ED-06 because these may confuse the students. He/ She may allow the students to ask questions at this stage, about the purpose of the demonstration. ii) Keeping the demonstration simple : The demonstrator should try to keep the demonstration simple. He should take care of the less capable students and stress much on the main points of the demonstration. He should not try to overload the students with many ideas which he knows. iii) Not digressing from the main idea sometimes it may so happen that the teacher may digress from the main point and launch into a detailed discussion on something else, which is not the main focus of the demonstration and which can hence be postponed till a later stage. If you do not follow this principle, you will probably frustrate many of your students and in the process, waste a lot of time. Hence the demonstrator should not go out of track during the demonstration. iv) Checking continually that your demonstration is being understood : The demonstrator should always watch his audience and detect signs of bewilderment, boredom or disagreement. He should not have the impression that everything is clear just because no student looks puzzled or asks a question. Hence, he should put questions to the students in order to make sure that his ideas are getting across the students. v) Not hurrying your demonstration : Sometimes, the demonstrator proceeds somewhat fast while demonstrating. He should keep in mind that his students are seeing the demonstration for the first time. He may stop the demonstration for a while and ask questions to the students. vi) Not dragging out the demonstration : Everything in demonstration class should be kept in its proper place. Sometimes, the demonstrator forgets this and walks around the table to grasp something that should have been placed within his reach. This shows his unskillful presentation which mars the students' interest. Facilitating observation by students It may be remembered that the demonstration is for the students to observe keenly. Hence, the object or process being demonstrated should be clearly visible to the students. And, the significant parts/aspects in the demonstration should be observed and described by the students, rather than merely the teacher should encourage the students to pay more attention to the demonstration and observe things on their own. vii) Summarizing as the demonstration goes on : A good demonstrator keeps on summarizing as the demonstration progresses. He uses chalkboard, charts, diagrams or some other devices for the summarizing purpose in a lengthy demonstration. viii) Distributing handouts in the end: At the end of the demonstration, the demonstrator distributes handouts, which serve as the summary of the demonstration.

198 NSOU ? CC-ED-06 These materials must include a step-by- step outline of what the students have just witnessed, followed by the general conclusions and the key points. It may include questions for immediate discussion or for use at the next class meeting. Input Alternatives-Teacher Controlled Advantages of demonstration 1. Difficult concepts become clear to most of the students. 2. It provides an interesting forum for the teacher and students to interact. 3. Students can see as to how things happen, they manipulate objects, record their observations, cross-check with each other and evaluate themselves. 4. Students can develop the skills required to perform the given task. 5. Social development, sympathy and empathy can be developed among the students. Disadvantages of demonstration : 1. It is not effective in a big size class. 2. It takes a lot of time for the teacher to plan for it. 3. It requires teachers' competency and skills to handle the equipment and do it step by step. 4. Some of the demonstrations require a proper natural environment etc. that it is impossible for the teachers to have the demonstration. 5. Same thing does not happen twice. Teaching Method: Problem Solving 6.4.3. Problem Solving Method of Teaching : In problem-based teaching methods students are presented with authentic, meaningful problems as a basis for inquiry and investigation. Sometimes called project-based instruction, inquiry learning, or authentic investigation, this strategy is designed to promote problem solving and higher-level thinking skills. All problem-based instruction strategies include more or less the following features: a driving question or problem, interdisciplinary focus, authentic investigation, production of artifacts or exhibits, and collaboration. This strategy is designed to involve students in the kinds of real-world thinking activities they will encounter outside of school from childhood through adulthood. Sample problems include the following : • Why did the settlers at Jamestown die? • How can we recycle in the school cafeteria? • What causes clouds to form different shapes?

199 NSOU ? CC-ED-06 • How much peanut butter does our school need for a year and how much would it cost? • Why did some civilizations thrive while others died out? • What will happen if the world population doubles in five years? Like cooperative learning, problem-based instruction has its roots in the progressivism of John Dewey and the constructivism of Jean Piaget, Lev Vygotsky, and Jerome Bruner. Dewey argued that learning should be relevant and engaging through the involvement of students in group projects of their own interest. Piaget theorized that learning occurs through active investigations of the environment in which students construct personally meaningful knowledge. Vygotsky stressed the importance of social, language-based learning. Bruner emphasized the importance of learners working with their own ideas and finding meaning through active involvement and personal discovery. The primary goal of problem-based instruction is learning content through inquiry that can be applied in authentic situations. Students learn to think and behave like adult workers, scholars, and problem solvers and to regulate their own learning. They learn collaboration skills and research and inquiry strategies, and gain an understanding of knowledge as complex, multifaceted, and uncertain. Problem-based instruction involves five phases similar to those in cooperative learning. A lesson may extend over several days or even weeks. Phase 1 is orientation to the problem. The teacher presents the problem or driving question, provides the parameters for student inquiry, and motivates students to engage in problem-solving activities. In phase 2 the teacher assists students in forming study groups and assists the groups in defining, planning, and organizing tasks and timelines, and by clarifying roles and responsibilities. During the students' investigation, phase 3, the teacher encourages, questions, and assists students in data/information gathering, hypothesis formulation and testing, and the generation of explanations and solutions. Guiding and coaching is emphasized, not directing and telling. Problem-based lessons are brought to conclusion through student presentation of products and exhibits, phase 4, and through reflection, phase 5. The teacher assists students in planning, preparing, and presenting products that share their work with others. These might include reports, videos, multimedia presentations, murals, plays, reenactments, models, diaries, or computer programs. After presentations, the teacher helps students reconstruct and analyze their thinking processes and integrate their learning. Problem-based instruction is the most student centered of the strategies presented. Students work actively and independently on problems that interest them. This requires an environment that is open and safe for asking questions, forming hypotheses, and

200 NSOU ? CC-ED-06 sharing ideas. The teacher's role is to pose problems, ask questions, facilitate investigation and dialogue, and provide support for learning. 6.4.4. Teaching Method: Programme Instruction In 1954 James Howard and B F Skinner developed the Auto instruction Method which fashioned the base for Programmed Learning. For the first time in 1963 NCERT started the preparation of Material for programmed Instruction / Learning and sincere attempts were made for the use of programmed instructions in the class room and in providing programmed study material to the students of distance education. He stated that "education is perhaps the most important branch of scientific technology" and "in the present state of our knowledge of educational practices, scheduling [of behaviors and consequences] appears to be most effectively arranged through the design of the material to be learned". Skinner was at the forefront in articulating the need to accomplish this scheduling of behaviors and consequences and a program for effective and efficient learning through operant conditioning. Operant conditioning is a form of conditioning that reinforces desired behavior and it is this behaviorist theory that forms the basis for programmed instruction. "important features of personal instruction" (Skinner, 1986) Leith (1966) : Programmed is a sequence of small steps of instructional material (called frames), most of which require a response to be made by completing a blank space in a sentence. To ensure that expected responses are given, a system of queuing is applied and each response is verified by the provision of immediate knowledge of the result. Such a sequence is intended to be worked at the learners own pace as individualized self-instruction. Jacobs, et al (1974) : Self-instructional programmes are educational materials from which the students learn. These programmes can be used with many types of students and subject matter, either by themselves, hence the name "self-instruction" or in combination with other instructional techniques. Principles of Programmed Instruction 1. Principle of Small Steps : It is a well-known fact that a learner learns better if the content matter is presented to him in suitable small steps. Therefore, in programmed instruction the subject matter is divided into sequenced and meaningful very small steps called frames, which are presented to the learner one at a time for responding. 2. Principle of Active Responding : In Programmed Instruction a learner is provided information in frames and he is supposed to be very active in responding to the 201 NSOU ? CC-ED-06 individual frames as the learner is provided only one frame at a time and is allowed to proceed further only on completing the previous frame, thereby keeping him active and meaningfully busy throughout the programme. 3. Principal of Immediate Reinforcement : The learner understands better when he is motivated to learn by receiving the information of the result just immediately after responding, which is also in accordance with the psychological phenomenon of reinforcement in learning. In programmed instruction it is important to provide immediate results of individual frames so that the learner will get appropriate reinforcement in time. 4. Principle of Self-pacing : The concept of programmed Instruction has actually emerged on the concept of providing learners an opportunity to learn at their own pace. The programme should be prepared keeping in view the principle of self-pacing, so that the learner can respond and move from one frame to another according to his own speed of learning. 5. Principal of Student-testing : In programmed learning as the learner gets the results of his learning while the process of learning provides him continuous evaluation of his own learning. In this process the learner has to leave the record of his own response because he is required to write a response for each frame on a response sheet. This detailed record helps in revising the programme and acts as a source for studying and improving the complex phenomenon of human learning. Types of Programmed Instruction 1. Linear or Extrinsic Programming 2. Branching or intrinsic Programming 3. Mathematics programming 4. Ruling System of programming This type of programming is referred to as 'linear' as the sequence of frames and path of learning in this programmed learning is systematic and linear. Here all the learners have to proceed through the same frames and in the same order. The whole instructional procedure is well controlled. However, this control is quite extrinsic exercised by the programmer and so, linear programming is also referred to as extrinsic programming.

202 NSOU ? CC-ED-06 Example : Our Digestive System Frame 1 The Mouth is an important organ of our Digestive system. The other parts of the system are esophagus, stomach, small intestines, large intestines, rectum and anus. The mouth, and stomach are responsible for digestion of the food, the small intestines help in digestion and absorption of the food and.....are responsible for absorption of water. The rectum helps in temporary storage of Response : Large Intestines; Wastes. Frame 2 In addition to the organs of the digestive system there are a large number of enzymes that help in the process of digestion, some of them are secreted by mouth, some by and some others by the intestines. Besides there are some hormones which also aid in the process of..... Responses : Stomach; Digestion In this manner, the students may proceed on their self-learning path by going from one frame to another arranged in a sequential and systematic way. Branching or Intrinsic Programming : Norman A. Crowder (1957), an American psychologist is credited for developing the branching programme of programmed instruction. In his own words, branching or intrinsic programming is one which adapts to the need of the students without a medium of an extrinsic device such as a computer, In contrast to linear programming; this style provides an intrinsic arrangement in the sense that it is not controlled extrinsically by the programmer. Here, a learner is free to make decisions and is able Figure : Arrangement of frames in lines programming

203 NSOU ? CC-ED-06 to adapt the instruction to his needs. The basic assumptions underlying this style are as below : 1. When the learning material is presented in its totality or in the form of meaningful components or units, the learning gets better. 2. Learning takes place better if the students are made to learn on the pattern of traditional tutorial methods. 3. Due to the Student's exposure to the new material, basic learning takes place. 4. In a learning process, errors may occur. If an error occurs, it may be detected and corrected before proceeding further on the learning path. The biggest advantage of branching programming is that the wrong responses do not necessarily hinder the learning of a correct response. 5. Learning takes place better if a learner is allowed sufficient freedom to make decisions for adapting the instruction to his needs. 6. Learning will be better if each response is used to test the success of the latest communication to the student and the testing is followed by remedial instruction. 7. Multiple-choice items help more in the learning process than the force choice single response items. Based on the above assumptions, the procedure for branching programme may be outlined in the following way : 1. The size of the frames is quite larger in branching programming than that employed in linear programming and instructional material is divided into 'units' of material called 'frames'. Much information, one or two paragraphs or even a page, is provided in a frame. 2. The learner is provided more than one choice while responding to the frames as he is required to respond to multiple choice questions associated with the learning material of the frame. He has to discriminate and choose one right answer. 3. The learner moves forward if he answers correctly, but is diverted (branched) to one or more remedial frames if he does not. These frames explain the matter afresh, ask him questions to elicit the right answer and reveal his previous mistakes, and then return him to the original frame. 4. This cycle goes on till the learner passes through the whole instructional material at his own pace.

204 NSOU ? CC-ED-06 6.5 Functions of a Teacher as Planner, Facilitator, Counselor and Action Researcher 6.5.1. Function of Teacher as Planner Teachers are planners. This is the essential role of successful teaching. Before all else, the teacher must develop a good 'flight plan', it must lay out a destination and the path to that destination. A well-conceived plan is fundamental to a successful learning experience. Without a good plan, the inexperienced teacher may fail to reach the goal. Then they must pick themselves up and go on to the next flight. The beginning teacher first becomes a manager and then a planner. As any senior teacher will admit, crashes lead to successes; successes, to experience; and experience lead to the happy veteran teacher. Planning is preparing a course of action to achieve specific objectives. There are three levels of planning. Planning covers following areas: :

205 NSOU ? CC-ED-06 The Curriculum Planning : Teacher must be a curriculum planner. The school curriculum is a long-term plan of action. It is the combined total of what a student should learn and when he should learn it. Well-developed curriculum has two dimensions, each composed of two elements. Curricula are horizontal, referring to what aspects need to be addressed within a level (2nd grade), and vertical, meaning what students should be learning from one grade level to the next (reading, science, etc). Both of these dimensions involve scope, what is to be taught, and sequence, the order it is to be taught in. It is important to note here that effective curricula are "living" instruments, that is, they are in a constant state of flux. Teachers and specialists work together to respond to changes in student learning styles, creative approaches and new materials. These working curricula are functional. Teachers are able to use the curriculum to aid in their planning and use their planning to improve the curriculum. It is a vital tool that is in a state of constant revision. Far too many schools have showcase curricula. The Unit Planning : Teachers' involvement most often begins at the unit phase of planning. Units are just that, they are units of the curriculum that teachers can work with. These manageable blocks of a curriculum can be adapted for lessons taught over a segment of time, weeks or months. A unit might be 'Cell Division'. Teachers often assign catchy names to their units: The Magic of Cell division(study of mechanism with stages of cell division). Experienced teachers often use two types of units: the resource unit and the working unit. Resource units are storage folders or boxes or cabinets that contain resource materials for units. For example, a third grade class might have four science units- plants, animals, sounds, and colors. The teacher would then have four resource units set up to store materials, ideas, pictures, worksheets, etc. The working unit is vital to the success of a teacher. Updating the elements of a unit are needed to maintain the unit as an effective teaching instrument. The three basic parts of a good teaching unit are the objectives, the methods (activities) and the assessments. Other things can be included, such as, a list of needed materials, technology needs (web sites and videos), worksheets to be used, tests or rubrics, bulletin board ideas, etc. The "other things" are organizational aspects of a unit that help to save the teacher time by all the needs of the unit in one place. The Lesson Plan The lesson plan is a plan for the day. It is specific and time sensitive. Listed in the lesson plan is the objective, the activities and the assessment. The activities are

206 NSOU ? CC-ED-06 the prime part of the plan. The activities should be laid out in sequence of their occurrence and the approximate time to complete the activity. Timing is a key to success. Inexperienced teachers point to this as a major problem. Lesson plans are too short or too long. It takes a few months for the new teacher to hone their skills at timing. Daily lesson plans are the "bread and butter" of the teacher. A clearly stated objective will clarify the assessment. Well thought-out activities that develop the objective will lead to the assessment. The well-planned lesson reduces classroom management difficulties. The greatest difficulties arise in classrooms of the teacher who has not planned well. Students need direction. Students who are left to design their own plan will probably do just that. Teachers do not have to be talking all the time or directing every activity. Students do need to be actively engaged in an activity designed by the teacher. Teachers need to be aware of what is happening in the classroom and why it is happening. This is referred to as control. Teachers who control their class are directing activities and children are not creating their own adventures unless this is the teachers' activity. Loss of control (a classroom management issue) is often the result of poor planning and is probably the single most frustrating aspect of the teacher's job. In conclusion, a teacher who plans well will succeed. Preparation and planning are a critical component of effective teaching. Lack thereof will lead to failure. If anything, every teacher should be over prepared. Good teachers are almost in a continuous state of preparation and planning. They are always thinking about the next lesson. Make the Time to Plan Teachers get a planning period at school, but that time is rarely used for "planning". Instead, it is often utilized to contact parents, conduct a conference, catch up on emails, or grade papers. True planning and preparation occur outside of school hours. Many teachers arrive early, stay late, and spend part of their weekends working to ensure that they are adequately prepared. They explore options, tinker with changes, and research fresh ideas in hopes that they can create the optimal learning environment. Benefits of a Good Planner : An effective teacher is a good planner Make you a better teacher : A significant part of planning and preparation is conducting research. Studying educational theory and examining best practices helps define and shape your own teaching philosophy. Studying the content that you teach in depth will also help you grow and improve.

207 NSOU ? CC-ED-06 Boost student performance and achievement : As a teacher, you should have the content that you teach mastered. You should understand what you are teaching, why you are teaching it, and you should create a plan for how to present it to your students every single day. This ultimately benefits your students. Make the day go by faster : Downtime is a teacher's worst enemy. Many teachers use the term "free time". This is simple code for I did not take the time to plan enough. Teachers should prepare and plan enough material to last the entire class period or school day. Minimize classroom discipline issues : Boredom is the number one cause of acting out. Teachers who develop and present engaging lessons on a daily basis rarely have classroom discipline issues. Students enjoy going to these classes because learning is fun. Make you confident in what you do : Confidence is an important characteristic for a teacher to possess. If for nothing else, portraying confidence will help your students buy what you are selling. As a teacher, you never want to ask yourself if you could have done more to reach a student or group of students. Help earn the respect of your peers and administrators : Teachers know which teachers are putting in the necessary time to be an effective teacher and which teachers are not. Investing extra time in your classroom will not go unnoticed by those around you. They may not always agree with how you run your classroom, but they will have a natural respect for you when they see how hard you work at your craft. 6.5.2. Functions of Teacher as Facilitator You cannot teach a man anything; you can only help him discover it within himself– Galileo The teacher occupies a central role in the whole teaching-learning process. In spite of the development of new types of mechanical and electronic teaching aids and an increased emphasis on pupil centered education, it is still the fact that it is the teacher who, after all has been said and done, can make education the most worthwhile human enterprise. The role of teachers is socially significant as it affects the knowledge, skills and attitude of future adults. Teacher expected to play many roles which may most important is teacher's role as a learning facilitator This is a composite role that calls upon many facets of a teacher's abilities and common sense. It is difficult to quantify or define precisely, yet it is not difficult to recognize when it is occurring and to know when it is missing. It is one of the most crucial advances in developing a more complex visualization of teachers.

208 NSOU ? CC-ED-06 As a facilitator of learning : An effective teacher is an organizer of the group and facilitator of learning. A teacher can play the following roles to facilitate learning. 1) As facilitator of learning the teacher must be warm, understanding, and self- controlling 2) He must listen and accept students' feelings. 3) He must observe students' reactions closely. 4) He must listen attentively and accept the student's feelings and ideas. 5) He must ask questions to the students and praise and encourage them when necessary. 6) In his planning and execution of work, he must be responsible, business-like, systematic, flexible and work oriented. 7) Whenever he criticizes a student he must explain the reason for criticism. 8) He must be stimulating and imaginative in his approach to classroom behavior and subject. 9) To facilitate learning the teacher must encourage classroom discussion, panel discussion, and question and answer session. 10) Whenever necessary he must lecture, demonstrate, and explain things with examples. He must encourage independent study habits. Six characteristics which identify teachers who are high facilitators of personal growth : 1. effective listening 2. genuineness 3. understanding 4. respect 5. intelligence 6. skill in interpersonal communication (Wittmer & Myrick, p. 40) Effective Listener & Communicator 1. Good eye contact 2. Gives attention to what is being said - particular words, body language and non-verbal expressions, vocal tones, process and timing 3. Try to feel how the person is feeling and thinking 4. Attempt to become involved in how the speaker is perceiving the world 5. Express that you are listening, are following the ideas, are hearing what is being said

209 NSOU ? CC-ED-06 6. Send awareness of the person as a being with no judgmental overtones 7. Validate recognition by checking with the person or reflecting what was said 8. Listen to disclosures without rushing the person 9. Work to rescue true meanings and real needs as a part of listening Genuineness 1. Direct personal encounter, person to person 2. Defensiveness or retreating are minimal and real sharing is maximized 3. Roles are recognized as roles and not used to distance one another 4. Feelings are admitted and recognized, those which are positive and those which are less comfortable but just as real - anger, sadness, weariness, joy, ennui, frustration, peace, need for solitude 5. Because human growth is developmental, there is a peace in letting be, in giving time to children to see things in different ways from our own 6. The right to disagree is valued, honored, and offered in peace. When two men inform one another of their basically different views about an object, each aiming to convince the other of the rightness of his own way of looking at the matter, everything depends, so far as human life is concerned, on whether each thinks of the other as the one he is, whether each, that is, with all his desire to influence the other, nevertheless unreservedly accepts and confirms him in his being this man and in his being made in this particular way. The strictness and depth of the human individuation, the elemental otherness of the other, is then not merely noted as the necessary starting point, but is affirmed from the one being to the other. The desire to influence the other then does not mean the effort to change the other, to inject one's own "rightness" into him; but it means the effort to let that which is recognized as right, as just, as true (and for that very reason must also be established there, in the substance of the other), through one's influence, take seed and grow in the form suited in individuation (Buber, 1967). Understanding 1. Empathy describes true understanding - becoming immersed in how a student feels rather than how we feel they may feel or should feel 2. Reading the clues and cues another sends and validating them 3. Perceive what is being expressed to eliminate defensive stances or withdrawal 4. Involve the student in learning to understand self, and move toward understanding others. — (this works better after a child is at least 7 and can become involved in second person perspective more readily)

210 NSOU ? CC-ED-06 Respectful 1. Accept a student's experiences as important to him/her 2. Practice respect of others as a part of the classroom system and process 3. Task analyze the times when students do not show respect to each other or the teachers to better set up the procedures, drills and skills which will enhance the use of respect with one another 4. This is often shown through optimism, deep interest and concern 5. Positive regard, warmth and respect will earn the respect of students, while demanding or punishing for respect will lead to anger and misbehavior There is nothing produced by man more powerful than an idea, yet there is nothing at birth so delicate. An earthshaking idea could be murdered at birth by a smirk. It has been said that nothing can stop an idea whose time has come. The problem seems to be in its surviving until its time can come! - Theodore A. Cheney Knowledgeable 1. Extensive knowledge of subjects taught 2. Love of knowledge and learning - with a desire to share the love and the skills 3. Knows when to expedite learning by sharing personal insights and when to allow student exploration and personal discovery 4. Becomes involved in learning about the cultural background of students Mastery of the fundamental ideas of a field involves not only the grasping of general principles, but also the development of an attitude toward learning and inquiry, toward guessing and hunches, toward the possibility of solving problems on one's own. Just as a physicist has certain attitudes about the ultimate orderliness of nature and a conviction that order can be discovered, so a young physics student needs some working version of these attitudes if he is to organize his learning in such a way as to make what he learns usable and meaningful in his thinking. To instill such attitudes by teaching requires something more than the mere presentation of fundamental ideas. -Jerome Bruner Communication for students : Communication skills are very simple and straightforward sets of behaviors. Young people can be taught to communicate using these behaviors, and are quite good at doing so. Because of the pace of development of empathy and the ability to know and care how others feel, it does take a while for empathy and understanding to become an equal part of the communicating process. This does not suggest that teaching

211 NSOU ? CC-ED-06 children a set of skills will teach them to communicate, but it does suggest that the skills can be put in place and the other facets will come together over time and as a result of social and emotional development. Teacher Power : Coercive Power Rewarding Power 1. Punitive acts 1. Responsibility for self 2. Negative acts 2. Privilege & choice 3. Scolding 3. Verbal praising the student as a person. 4. Belittling 4. Verbal praising of work 5. Inflicting pain-physical & emotional 5. Love warmth & respect. 6. Deprivation 6. Expression of belief on student's dignity. 7. No attention 7. Attention to students; need. 6.5.3. Functions of Teacher as Counselor "The paradox of learning a really new competence is this: that a student cannot at first understand what he needs to learn, can learn it only by educating himself, and can educate himself only by beginning to do what he does not yet understand." - Schön (1990). Taking the responsibility for a relationship role in teaching, gives teacher as counselor a new importance. The historic nature of this role can be traced at least as far back as Socrates. Repeatedly in the writings of Plato we see Socrates involved in assisting his students and followers in a counseling posture. General Guidelines: From the perspective as discussed in Northern Arizona University we could place these guidelines— • Effective helpers hold positive beliefs about people and recognize and establish a philosophy of human nature and the purpose of helping. • We need to have healthy self-concepts and possess traits such as empathy, congruence, warmth, compassion, genuineness, unconditional positive regard for self / others. • Helpers clarify who is responsible for change and how to facilitate change. • We should be always interested in finding out about the way people behave. • We should recognize that many child behaviors are developmental and meet a need, therefore we may change self or environment to meet the individual need rather than changing the child.

212 NSOU ? CC-ED-06 • Helpers recognize human nature and the need and right to positive and negative emotions. • Since we need to recognize limitations of time and role, we frequently help with an immediate crisis or problem and then get appropriate assistance for long term, chronic or deeply involved issues. • We should keep in mind that we do not counsel the family, but we do share information about good referrals. • We grow in ability to counsel others through workshops and training, as available. General Steps in Helping a Student The focus is to provide a safe, secure and nurturing climate in which the child can grow as a healthy, whole individual. 1. Recognize the student's need for intervention and build rapport 2. Provide an appropriate time to truly listen to the child 3. Help the person identify and clarify the problem 4. Illuminate options and alternatives for problem solving 5. Help create goals to facilitate improvement or change 6. Encourage the student to succeed 7. Enhance child's perspectives, wellbeing through educating about the problem 8. Refer to others if in depth skills are needed 9. Keep the student's confidence sacrosanct unless abuse is involved or it is believed that the student might hurt self or others 10. Listen to the inner messages that come through interaction with the child Conduct a life space interview assisting students to express themselves and see others' views. Accept the child's feelings without agreeing to inappropriate behaviors. Analyze problems for solutions using the following steps : 1. Help students see and accept reality, abandoning defensive positions 2. Assist student to see why the behaviors are self-defeating 3. Clarify values 4. Suggest behaviors to child for change if student does not supply them 5. Support students in self exploration to avoid problems with others 6. Assist the child to release anger through sympathy and understanding 7. Help students find alternative positive ways to express emotions like panic, rage, guilt rather than venting in destructive ways

213 NSOU ? CC-ED-06 8. Maintain open communications with friendly gestures and reminders 9. Clarify student thinking and decision making at crisis points. Teacher power : The power base for the counseling role comes primarily from Personal Power and involves two types of empowerment, referent power and information power. Referent power is the attractiveness which the teacher possesses in the eyes of students and others. The relationship between the teacher and the student has a major influence on the students' behaviors. Information power assists the teacher in influencing behavior. It is part of the confidence which students and parents gain as they perceive the teachers' ability to act as a center of information. Parents and students alike will be amenable to the teachers' programs if they believe the instructor possesses and disseminates unbiased information as well as being a valuable resource when called upon to assist with individual problems and concerns. Teachers build these powers by : Referent Power Information Power 8. Build rapport with students 8. Draw parents into school involvement 9. Increase sense of charisma 9. Send positive messages about students to parents 10. Show students you are consistent 10. Be an active, responsive listener 11. Establish and maintain sense of trust 11. Show respect for self and students 12. Share sense of security by showing 12. Cultivate "second person" perspectives care for them and their problems 13. Maintain maturity rather than peership 13. Familiarize self with community referrals and resources and help parents with access The frequency and gravity of problems met in counseling activity According to notes, the most frequent problems met in school environment are from family, school, affective/sentimental, disciplinary and self-knowledge areas : • School problems : school inadaptability, absenteeism, low school promotion and school abandon, difficulty of understanding children with learning difficulties who came from disadvantaged families or from Children Placement Centers, behavioral deficiencies as ADHD. • Familial problems : students who came from familial backgrounds with very low socio-economic situations, students from single parent families, divorced parents, students who pass through difficult situations due to a parent's death,

214 NSOU ? CC-ED-06 students with emotional problems and its cause being family abandonment of one or both parents who left abroad to work, etc. • Problems of sentimental nature : lack of affective response from those sentimentally invested by teenagers, disappointments, sentimental frustrations, different emotional expectations, physical and emotional abuses from partners. • Identity and self-knowledge problems : self-searching, self-analysis, the need to understand his own identity, behaviors and personal expectations from others and themselves, analysis on personality development during teenage years, etc. • Disciplinary problems : deriving from rules and regulations, bully acts, aggression towards opposite, self-aggression (suicide attempts), juvenile delinquency, and violence. • Misjudged ideas, preconceptions : Even though this is not a problem in itself, this type of thinking is met at some parents, as well as some teachers, these considering that only those children who have "real" problems end up at a psychologist, followed by the fact that every child who needs the counselor's intervention to receive a negative label just because he goes to the counseling private practice. The implications of these prejudices represent one of the reasons why the quality of the teacher-student relation is demanding. The cases we dealt with include situations of certain gravity, most of these referring to abuses and violence, in school environments as well as at home. These manifestations are to be seen mostly at preadolescence and teenage 6.5.4. Functions of Teacher as Researcher 'Quality teaching' is undoubtedly acknowledged to be the most important school- level input having an impact on students' academic achievement. Such reality indicates the importance of teacher education, from initial training and induction for beginning teachers, to on-going professional development to help update teachers' knowledge, deepen their understanding and advance their skills as expert practitioners. Policy- makers in different countries have approached and adapted the task of teacher preparation and professional development in different ways, reflecting their distinctive values, beliefs and assumptions about the nature of professional knowledge. According to the simple concept of 'research', research is about answering questions with data and it is 'organized'. Reflective practice may not involve gathering data. How organized it is depends on the teacher, and it isn't usually focused on a particular issue. Thus the role of teacher as researcher is gaining importance. The concept of teacher-as-researcher is included in recent literature on educational reform, which encourages teachers to be collaborators in revising curriculum, improving

215 NSOU ? CC-ED-06 their work environment, professionalizing teaching, and developing policy. Teacher research has its roots in action research. The National Policy on Education (NPE) 1986/92 recognized that "...teachers should have the freedom to innovate, to devise appropriate methods of communication and activities relevant to the needs of and capabilities of and the concerns of the community." (NPE-1986 / 1992) Hence, the ability to conduct research to reflect practice is an essential component in professional development of teachers and teacher educators. Research-based teacher education has lately received increasing interest both among researchers of teacher education (Kansanen et al., 2000; Jakku-Sihvonen & Niemi, 2006, 2007) and in public discussion. Research-based approach of teaching covers the activities of practicing inquiry and research which reflected from the following table as advocated by Toom et al., 2010 (Center for Research on Teaching, University of Helsinki):

LEVEL TEACHING RESEARCHING

GENERAL • Metacognition • Reflection • Producing Pedagogical thinking • Expertise BASIC • Every day thinking • Adaption • Skill based teaching • Consuming • Teaching recipes, routines, tips • Knowledge based Making pedagogical decisions Inquiring one's own work When practice concerns teaching it is a question of making pedagogical decisions. Practice in research, in turn, implies inquiry into one's own work as a teacher. These both are the dimensions of research-based teacher education which aims at producing inquiry-oriented future teachers. Importance of teacher-research : The benefits of teacher-research can include: a. For teachers : • Becoming better able to understand and address teaching challenges • Feeling more empowered and more motivated in their work b. For learners : • Enhanced engagement in learning • Feeling more trusted, as partners in research

216 NSOU ? CC-ED-06 c. For the school or institution : • Continuing professional development which meets teachers' specific needs • Increased commitment from teachers d. For a mentor : • Supporting a process with clear value for participants • Learning new skills, and gaining new knowledge e. For the wider profession : • Contributing to a new approach to knowledge generation • Sharing of ideas for effectively addressing real teaching issues. Action research is deliberate, solution-oriented investigation that is group or personally owned and conducted. It is characterized by spiraling cycles of problem identification, systematic data collection, reflection, analysis, data-driven action taken, and, finally, problem redefinition. The linking of the terms "action" and "research" highlights the essential features of this method: trying out ideas in practice as a means of increasing knowledge about and/or improving curriculum, teaching, and learning (Kemmis & McTaggart, 1982). Very often action research is a collaborative activity where practitioners work together to help one another design and carry out investigations in their classrooms. Teacher action research is, according to John Elliott, "concerned with the everyday practical problems experienced by teachers, rather than the 'theoretical problems' defined by pure researchers within a discipline of knowledge" (Elliott, cited in Nixon, 1987). Research is designed, conducted, and implemented by the teachers themselves to improve teaching in their own classrooms, sometimes becoming a staff development project in which teachers establish expertise in curriculum development and reflective teaching. The defining feature of teacher-research is that it is research carried out - and usually initiated voluntarily by teachers themselves into an issue that concerns them, for their own benefit and that of their students. It is therefore a form of practitioner research - research done by practitioners (who might include, for example, nurses, social workers, etc.) with the intention of understanding and perhaps improving their practice. Action research is practitioner research which seeks to effect change and evaluate the consequences. Most teacher-research is centered on what happens in the teacher's own classroom, in other words it is a kind of classroom research or classroom-based research. But if the project belongs to and is mainly carried out by an outside researcher, this isn't classroom-based teacher-research. Teacher-research, then, is practitioner research - usually, classroom-based research - which is initiated and carried out by and for teachers, for their own benefit and that of their students!

217 NSOU ? CC-ED-06 Stringer (1999) suggested the action research process works through three basic phases : Look – Building a picture and gathering information. When evaluating the teacher (researcher) has to define and describe the problem to be investigated and the context in which it is set. He also has to describe what all the participants (educators, group members, educational administrators etc.) have been doing. Think – Interpreting and explaining. When evaluating He/she has to analyze and interpret the situation. He/ she has to reflect on what participants have been doing. He/she must look at areas of success and any deficiencies, issues or problems. Act – Resolving issues and problems. In evaluation the teacher (researcher) has to judge the worth, effectiveness, appropriateness, and outcomes of those activities. Teacher (researcher) acts to formulate solutions to any problems. As discussed above, action research involves attempting to improve a situation via some kind of new action, and evaluating what does or does not change. This can then lead into a further cycle of attempted change and evaluation, and so on Source: Smith, R. (2020). Mentoring teachers to research their classrooms: a practical handbook British Council, New Delhi, India

218 NSOU ? CC-ED-06 Therefore, a teacher has to follow a specific method for doing action research for his or her professional development. The concept of professional development of framework for teachers based on action research can be elaborate by following 'PEPP & ER' model as advocated by Peggy Leong (2004) where- P stands for PLAN to improve the quality of teaching and learning E stand for EXPLORE new and innovative strategies P stand for PRACTICE - carry out the plan agreed upon and P is stands for PERFORM - reflect on learning experience and share findings This can be done by Enquiry and Reflection. Source : Peggy Leong (2004), Embarking on a Learning Journey: Developing the PEPP & ER Framework for Action Research Nature of Educational Action Research : 1. It is conducted by the practitioners who are involved in the object of research (like teachers or teacher educators who are engaged in the act of teaching some of the aspects of which are being researched) 2. It may be either individual and/or collaborative effort. 3. It is carried out within the confines of the social situation in which the participants are functioning, i.e. in an educational scenario such type of research is conducted by the teachers within the school in which they are employed.

219 NSOU ? CC-ED-06 4. The method in such a type of research predominantly relies on self-reflection of the participant (researcher) rather than on rigorous statistical analysis. 5. It is practical and directly relevant to an actual situation in the working world of teachers. The subjects are the students in the classroom, the staff, or others who are primarily involved in the school. 6. It is flexible and adaptive, allowing changes during the trial period and sacrificing control in favour of responsiveness and on the spot experimentation and innovation. 7. As the situation is unique and the problem is unique so action research is situation based and context specific. Therefore, action research produces results which are not always generalizable. Scope and purpose of Action Research in Education : While teaching, the teacher is encountered with several problems for which he/she doesn't have any ready-made solutions. In the particular situation a befitting solution needs to be discovered by the teacher and hence he/she is led to conduct action research thereon. Therefore, action research has a wider scope in education. Considering the view of Carr and Kemmis (1986), we can say there is lot of scope in following areas- • the improvement of practice; • the improvement of the understanding of practice; • the improvement of the situation in which the practice takes place. More analytically speaking, action research can serve the following purpose- • Facilitates change in classrooms and schools • Fosters disciplined and systematic inquiry • Empowers individuals via collaborative teams • Encourages reflection on practice • Enhanced capacity of teacher to influence change • Vehicle for creating professional learning communities • Seeks to narrow gap between vision & practice 6.6 Summary Every teacher operates according to a theory or theories of learning and within the context of a philosophy of what education should be fundamentally about. The only difference is that sometimes these theories are very consciously held and operated 220 NSOU ? CC-ED-06 upon by the teacher, perhaps carefully referenced to published theory in the field, while others are held and operated upon rather less consciously. We all know that teaching is a purposeful activity. Through teaching the teacher brings a desirable change in the learner. Both the concepts teaching and learning are interrelated to each other. Teachers teach students at three levels. They have to keep

this level of teaching, the teacher explains to the student about the relationship between principles. 6.

Reflective level : Upper thoughtful level: This level is also known as introspective level. Reflecting on something means giving careful thought to something over a period of time. It also means thinking deeply about something. Reflective level of teaching is considered to be the highest level at which teaching is carried out. There are different types of Teaching Methods : Lecture, Demonstration, Problem Solving and Programme Instruction. One of the most common alternatives used by those at the college level is communicating directly to the students where the talking by the teacher is the most predominant activity, and it is called 'lecture'. This teacher centered approach may take the form of two-way communication when the teacher talks with the students. In this way, the lecture becomes a question-answer or discussion activity instead of merely giving information. Another teacher-controlled instructional technique widely used in higher education institutions is Demonstration. As college teachers, you may well be acquainted with the word 'Demonstration '. In colleges, teachers use demonstration very often, though teachers of other disciplines take recourse to demonstration when something related to teaching of skills comes. Problem-based teaching method students are presented with authentic, meaningful problems as a basis for inquiry and investigation. Sometimes called project-based instruction, inquiry learning, or authentic investigation, this strategy is designed to promote problem solving and higher-level thinking skills. All problem-based instruction

221 NSOU ? CC-ED-06 strategies include more or less the following features: a driving question or problem, interdisciplinary focus, authentic investigation, production of artifacts or exhibits, and collaboration. B F Skinner developed the Auto instruction Method which fashioned the base for Programmed Learning. Programmed is a sequence of small steps of instructional material (called frames), most of which require a response to be made by completing a blank space in a sentence. To ensure that expected responses are given, a system of queuing is applied and each response is verified by the provision of immediate knowledge of the result. Such a sequence is intended to be worked at the learners own pace as individualized self-instruction. There are usually four Types of Programmed Instruction. 1. Linear or Extrinsic Programming 2. Branching or intrinsic Programming 3. Mathematics programming 4. Ruling System of programming Teachers are planners. This is the essential role of successful teaching. Before all else, the teacher must develop a good 'flight plan', it must lay out a destination and the path to that destination. Planning is preparing a course of action to achieve specific objectives. There are three levels of planning. It covers curriculum planning, unit planning, lesson planning and time budget planning. The teacher occupies a central role in the whole teaching-learning process. In spite of the development of new types of mechanical and electronic teaching aids and an increased emphasis on pupil centered education, it is still the fact that it is the teacher who, after all has been said and done, can make education the most worthwhile human enterprise. The role of teachers is socially significant as it affects the knowledge, skills and attitude of future adults. Teacher expected to play many roles which may be broadly categorized into two : 1. Role as a learning facilitator : An effective teacher is an organizer of the group and facilitator of learning. 2. Role as a learning organizer : Teachers need to play the role of organizer by adopting instruction, as an ideal model of social behavior and also as an artist in human. Taking the responsibility for a relationship role in teaching, gives teacher as counselor a new importance. The teacher as counselor is a powerful role. The focus is to provide a safe, secure and nurturing climate in which the child can grow as a healthy, whole individual.

222 NSOU ? CC-ED-06 'Quality teaching' is undoubtedly acknowledged to be the most important school- level input having an impact on students' academic achievement. Such reality indicates the importance of teacher education, from initial training and induction for beginning teachers, to on-going professional development to help update teachers' knowledge, deepen their understanding and advance their skills as expert practitioners. Action research is deliberate, solution-oriented investigation that is group or personally owned and conducted. When practice concerns teaching it is a question of making pedagogical decisions. Practice in research, in turn, implies inquiry into one's own work as a teacher. These both are the dimensions of research-based teacher education which aims at producing inquiry-oriented future teachers. 6.7 Self-Assessment Questions 1. What is meant by level of teaching? Briefly explain the understanding level of teaching. 2. Explain reflective levels of teaching with any suitable model. 3. Briefly discuss the steps involved in effective lecture methods. Mention How lecture methods can be improvised. 4. Describe Major Characteristics and principles of Demonstration method. 5. What is Programmed Instruction? Explain Principles of Programmed Instruction. 6. Explain branching model of programme learning with a model. 6. An effective teacher must be a good planner-justify the statement with reason. 8. Role of a teacher as a counselor is gradually evolving -explaining the responsibilities of the teacher as counselor. 9. Now, teaching is facilitating—explain the challenges a teacher faces as facilitator. 10. Mention the nature of action research. What is the importance of teacher research in education? 6.8 References American Psychological Association (APA). (2001). It is the evaluation phase of teaching. It arises when the teacher has left the class and tries to have a look back into what happened in the class. This phase is concerned with the following activities. a) Evaluation Activities : These activities are performed in various ways- • Tests or quizzes • Observing student's reactions to questions, • Instructional situations and comments etc. b) Summing up teaching tasks : To sum up, the teacher asks the questions from the learners, verbally or in written form. The behaviors of the students are also measured in order to evaluate their achievements. In absence of all these evaluative activities, the entire learning process could be incomplete. Activities/operations at the post-active phase (1) Determining the exact dimensions of behavior changes : Here the teacher compares the actual behavioral changes in students with their expected behavioral changes. If desired behavioral changes are observed in maximum students then it means that teaching strategies are very effective. (2) Selection of testing devices and techniques : For comparing desired and actual behavior changes, the teacher has to select appropriate, testing devices which are valid and reliable. For this criterion, tests are more preferred than the performance tests. (3) Changing strategies of testing : The student's testing result is also used for evaluating the effectiveness of instructions and teaching strategies. It should provide a base for improving the teaching and changing strategies of teaching. Importance of operations in different phases of teaching : 1. It focuses on bringing desired behavior changes in the students. 2. It provides the scientific basis for developing effective instructions of the teaching. 3. The classroom teaching and interaction can be made effective with this background. 4. Teaching operations ultimately create the appropriate conditions of learning for achieving the desired goals. 87 NSOU ? CC-ED-06 5. Teaching can be organized effectively at different levels by employing appropriate teaching activity. So we can say that the process of teaching starts even before the teacher enters the classroom. It continues even after class. It continues even after classroom interaction in the form of evaluation, feedback, and other activities. All three teaching phases are interrelated; each one helps to modify the other in order to make teaching more meaningful and significant. 3.5

	<p>Cognition can be defined as "the act or process of knowing in the broadest sense; specifically, an intellectual process by which knowledge is gained from perception or ideas" (Webster's Dictionary). Cognition is central to the development of psychology as a scientific discipline. The establishment of Wilhelm Wundt's laboratory in 1879 to study human thought processes is often used as the beginning of modern psychology. Cognitive psychology is one of the major approaches within psychology and can be contrasted with the behavioral view (a focus on observable behavior), a psychoanalytic view (a focus on the unconscious), a humanistic view (a focus on personal growth and interpersonal relationships) and a social cognitive view (a focus on the social environment as it impacts personal qualities such as thinking and feeling.) An important distinction between the behavioral and cognitive or humanistic views is the importance of feedback. For behaviorists, the most important feedback comes in the form of the application of consequences from the environment. The cognitive, as well humanistic, would focus on the importance of internal feedback. The social cognitive view considers both types. Cunia (2005) provides an excellent overview of the cognitive theory applied to learning. There are a variety of perspectives and emphases within cognitive psychology (Winn & Snyder, 1996) that are currently impacting educators' thinking about how to improve the teaching-learning process. The Information Processing approach focuses on the study of the structure and function of mental processing within specific contexts, environments, or ecologies. Benjamin Bloom and his colleagues developed the Taxonomy of the Cognitive Domain as a way to classify the variety of educational 134</p> <p>W http://www.edpsycinteractive.org/topics/cognition/cogsys.html</p>		<p>Cognition can be defined as "the act or process of knowing in the broadest sense; specifically, an intellectual process by which knowledge is gained from perception or ideas" (Webster's Dictionary). PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific / generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes of all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this, we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

Prof. (Dr.) Subha Sankar Sarkar Vice-Chancellor

the educational institution both serve as two of the principles on which a curriculum is formulated. Curriculum is a selection of

information, segregated into disciplines and courses, typically designed to achieve a specific educational objective. It encompasses a variety of technical and non-technical courses that are required to complete a specific degree.

100%

MATCHING BLOCK 7/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ... (D154644155)

Curriculum refers to an interactive system of instruction and learning with specific goals, contents, strategies, measurement, and resources.

The desired outcome of curriculum is successful transfer and/or development of knowledge, skills, and attitudes. Everything that is written or unwritten taught and tested in an educational programme of study. Therefore, Curriculum includes everything that takes place, and everything that does not take place, within the purview of the school and other educational institutions. 1.3 Curriculum : Meaning, Nature, Scope of Curriculum 1.3.1 Meaning of Curriculum There are four components of education – student or the learner, teacher, school or educational institution and curriculum. These components are the four pillars of education process and the effectiveness of any educational programme depends on the working of all components in proportionate ratios. Thus curriculum is an important element of education as the aims of education are reflected through the curriculum. In other words, the curriculum is determined by the aims of life and society. Aims of life and society are subject to constant change. Some popular concepts in Education are - Education for development, Education for work and Education for lifelong learning; hence, the aims of education are dynamic and subject to change. The aims of education are attained by the school programmes, concerning knowledge, experiences, activities, skills and values. The different school programmes are jointly known as curriculum and one static factor that characterises curriculum is 'change' since it is ever-changing.

NSOU ? CC-ED-07 ? 9 The origin of

83%

MATCHING BLOCK 5/392

W

the word curriculum was derived from the Latin word 'currere', which means

to run a race or a runway on which one runs to reach a goal or a

100%

MATCHING BLOCK 6/392

W

race course referring to the course of deeds and experiences through which children grow

and mature to live successfully in adult society. This means that once a child starts to learn, he/she begins to run the race. This race is comprehensive in nature because, in the course of the race, the child or the learner encounters a lot of experiences, which may be intellectual, social, moral, spiritual or physical. These experiences are necessary to produce the complete man. The experiences may be formal and planned or informal and accidental or unplanned. In the course of the race, the child may also encounter some obstacles which he/she must overcome either through his/her own efforts or by the assistance of someone else to enable him/her to attain the expectations of the society. The child is the main focus of the

81%

MATCHING BLOCK 8/392

W

curriculum. It is the instructional and the educative programme which helps the pupils achieve their goals, ideals and aspirations of life.

It is curriculum through which the general aims of a school education receive concrete expression. One of the most popularly used definitions of a curriculum is that curriculum is the total learning experience. This description implies that the crux of a curriculum is the different planned and unplanned activities which have been lived, acted upon or done by the learners under the guidance of the teacher. So, curriculum is nothing but content, programme of planned activities, intended learning outcomes, cultural preservation, experience and agenda for social reconstruction. Towards a definition of the term curriculum—

as the massive, ongoing process, the author also mentions about family, peer groups, neighbourhoods, churches, organizations, occupations, mass media, and other socializing forces that "educate" all of us throughout our lives

in the form of informal curriculum. Curriculum may be viewed - as a course of studies offered in the school for the education of the learners, and which students pursue in order to get a degree, a certificate, a diploma or any other forms of academic awards. Learning experiences are embedded in courses taught to the learners in schools. The learning experiences are learner oriented, goal oriented; and they can be physical or mental activities, observable or unobservable (Offorma, 2002) i.e. having unlimited scope. On the other hand it can be viewed differently as Curriculum covers all learning inside and outside school, it is something more than teaching and learning. It is a tool in hands of a teacher. Curriculum is a blueprint and pre-planned but can be revised and changed accordingly. It also caters to the needs of individually different learners. Hence, curriculum is formulated for fulfilment of the following objectives - complete development of an individual, which includes preparation for complete living i.e. self preservation, self protection, social & political protection, proper utilization of leisure time; and also the social aspects like - Modernizing the society, National integration, Raising standard of living, Developing democratic life and National development. In a nutshell, curriculum can be defined as the total and complete experience. From this view point, curriculum is not only the content selected and delivered, but also the planned and unplanned activities in which individuals' participate as students. Traditional concept versus Modern Concept in curriculum Traditionally, curriculum was a body of preserved factual knowledge to be transmitted from the teacher to the pupils and mastered by them through memorization, recitation and NSOU ? CC-ED-07 ? 12 drill; and to be reproduced on the demand of the teacher. The traditional curriculum was subject- centred while the modern curriculum is child and life-centred. Modern education is the combination of these two dynamic processes. The

93%

MATCHING BLOCK 24/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

one is the process of individual development and the other is the process of socialization, which is commonly known as adjustment with

the social environment. Modern curriculum prepares the child to fulfil both the objectives. 1.3.2 Nature of Curriculum From the various definitions and concepts presented, it is clear that curriculum is a dynamic process. Development connotes changes and for curriculum which are systematic. A change for the better means, it is any modification or improvement in the existing condition. To produce positive changes in curriculum, development should be purposeful, planned and progressive. The nature of curriculum can be described by these brief descriptions derived from the definitions given above – 1. A document which describes a structured series of learning objectives and outcomes for a given subject matter area. 2.

100%**MATCHING BLOCK 25/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

Curriculum is the entire range of experiences, both directed and undirected, concerned in unfolding the abilities of the individual

in school under the guidance of the teacher. School takes responsibility for all the experiences of the child and

90%**MATCHING BLOCK 31/392****SA**

the learning experiences are planned and directed by the school to attain its educational goals. 3.

It is the written plan outlining all the courses offered in a school to its students and what a school actually teaches under a particular area of study. Some authors mention

curriculum as the total effort of the school to bring about desired outcomes in school and out-of-

85%**MATCHING BLOCK 26/392****W**

school situations. 4. Curriculum includes the planned interaction of pupils with instructional content, materials, resources and processes for evaluating the attainment of educational objectives. Curriculum

may also be described

100%**MATCHING BLOCK 27/392****W**

as a sequence of potential experiences set up in school for the purpose of disciplining children and youth in group ways of thinking and acting. 5.

This document is a specification of what should be learned, how it should be taught, and the plan for implementing/assessing the learning.

NSOU ? CC-ED-07 ? 13 Hence, curriculum includes

80%**MATCHING BLOCK 28/392****W**

the process of selecting, organizing, executing, and evaluating learning experiences on the basis of the needs, abilities and interests of the learners and the nature of the society or community. It is a

dynamic concept as changes made in content may necessitate changes in experiences, which may again bring about changes in evaluation etc. Experts believe that curriculum process is a very complex set of activities and decisions. 1.3.3 Scope of Curriculum Scope means the extent of the area or subject matter that something deals with or to which it is relevant. It determines the opportunity or possibility to do or deal with something. Scope is applicable to an area of activity, predetermined and limited, but somewhat flexible. The areas that are covered in curriculum determine its scope, so in other words it is subject matter of curriculum. The key component of any curriculum is its instructional objectives or learning outcomes. On the basis of the objectives, content is included in the curriculum. Therefore, it can be said that the scope or subject matter or areas covered in any subject or discipline depends on the objectives of that subject. Now scope directly relates to what should be taught or learned. Scope determines the length and

91%**MATCHING BLOCK 29/392****W**

breadth of the curriculum i.e. the content, learning experiences and activities to be included in the curriculum.

There should be balance or integration among the three domains of objectives namely - Cognitive, Affective and Psychomotor, to cover all the abilities of students. Balance between

95%**MATCHING BLOCK 30/392****W**

Knowledge and experience, Objectives and content, Child's activity and needs

of the societal activities and needs to be established. Lastly, there should be integration between

100%**MATCHING BLOCK 32/392****W**

the content, learning experiences and activities to be included in the curriculum

and every attempt should be related to the social environment, where the students are actually placed. The scope of curriculum is broad and wide. It ranges from the individual needs to the global needs. It includes all those activities which help in obtaining the comprehensive objectives of education.

100%**MATCHING BLOCK 33/392****SA**

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

It is not only about the school, the learners and the teachers. It is also about the development of a society in general.

The scope of curriculum is discussed under the following heads. Aims, goals and Objectives of Curriculum Goals and objectives are important because they help to

78%**MATCHING BLOCK 35/392****SA**

ASSIGNMENT 1 curriculum.pdf (D55197896)

direct the choice of curricular content; suggest what learning methods will be most effective;

enable evaluation of learners and the curriculum; suggest what evaluation methods are appropriate; clearly NSOU ? CC-ED-07 ? 14 communicate to others what the curriculum addresses and hopes to achieve. Objectives of curriculum are determined by the objectives of education. There is a close relationship between curriculum and education. Curriculum does not decide its objectives independently rather it seeks guidance from the objectives of education. Curriculum content is selected according to the objectives of education. If it is not done, it would fail in securing the objectives. To summarize, curriculum, without the consideration of objectives of education, is a mere combination of information and skills which lead to the production of socially unproductive individuals. Selection of Content Selection of content is a very sensitive activity as the content gives a material form to the concept of curriculum. A curriculum expert should take into account all aspects of individual and social life; the mental, physical, social, economic and psychological needs of the students should also be taken into consideration during the selection of content for a particular level of education. If the content of curriculum is compatible with the needs of the individuals and the society, it would succeed in securing all of its pre-specified objectives. Curricular Activities The curricular activities include human learning experiences, observations, skills and other academic excellences. These activities help in developing the personality of the students in a comprehensive way. These curricular activities belong to all aspects of human life. They range from earth to heaven and from an individual to the far end of the society. These activities are developed in line with the objectives of curriculum so co-ordination and integration among these activities are necessary. The social, cognitive, moral, and psychological needs of the students are fulfilled through these activities. Thus they are considered as the soul of the whole process of education. Co-curricular Activities The aim of education is all-round development of personality of the individuals. Only the textbooks are not capable of developing the individuals' personality in a comprehensive way. For the balanced development of the personality of the students, the school should arrange the co-curricular activities along with the curricular activities. The, co-curricular activities include games, sports, athletics, student union, tutorial groups, literary society, subject society, scouting, Girls' Guide and welfare organizations etc. These activities leave positive impression of personality of the students and deepen their life experiences. These activities play a significant role in the development of moral and leadership abilities as well as social qualities like cooperation, sharing, sympathy, fellow-feeling etc.

NSOU ? CC-ED-07 ? 15 Methodology for Transaction Along with the content, a method of instruction is also required to transmit the content to the learner by the teacher. This method is selected keeping in view the nature of the content. A teacher should use the technique of teaching which corresponds to the psychological needs of the students and requirements of the content. If the element of methodology is eliminated from the process of curriculum, the transmission of the academic excellences to the students would have become impossible. Methodology is the science of teaching or the medium that includes all strategies through which the content is passed on from the teacher to the student. Transmission of Curriculum It is the essence of the process of curriculum. It is the process of transmission of information, skills and other academic excellences from one place to another and from one mind to another. For the successful transmission of curriculum to the students, a teacher must have the ability of explicit communication. If the teacher has mastery in the skill of communication, he/she might have expressed him/herself in an effective way helping the curriculum fulfil the objective. Through appropriate transmission of curriculum, teachers develop the ability of effective communication in the students. Teaching- learning Materials or TLMs TLMs play a significant role in the transmission of content to the students effectively and successfully. Appropriate use of TLM is an important element of the process of curriculum transaction. These are also known as instructional aids and effective teaching depends on each other. These aids make the lesson attractive, absorbing, interesting, result-oriented, and effective. Hence a skilled teacher can effectively transmit the selected content to the students with the help of proper TLMs. Therefore, it plays a very significant role in the instructional process and well as in the scope of curriculum. All-round development The contents of curriculum should target towards achieving the comprehensive and all-round development of the individual's personality. This is the primary responsibility of curriculum and the foremost aim of education. There must be comprehensiveness, broadness and versatility in the contents of curriculum so that the objectives of curriculum and education may be realized. Personality development of the individual is the core criterion of curriculum, so the curricular and co-curricular activities should be properly amalgamated to keep all aspects of human personality and social stability in consideration.

NSOU ? CC-ED-07 ? 16 Guidance Curriculum attempts to guide the students through all the unknown and unseen ways of life ranging from very simple to very complicated situations. This guidance may involve cognitive, physical, emotional, moral or spiritual aspect of human personality. People are confronted with various problems in everyday life. Curriculum suggests solutions to these problems in a formal way by training the individuals for leading a successful life. Hence, the transmission of curriculum requires the transmission of guidance too. Again guidance is a significant function of education, so a process of guidance is rightly included in the scope of curriculum. National ideology Education is directly concerned with the ideology of a nation. Naturally, all the aspects of curriculum are developed on the basis of philosophy of a nation. The contents of curriculum cannot maintain its existence without the guidance of national ideology. All the components of content should correspond to the basic principles of the national ideology. This is the only natural means of promoting the national ideology in the youths of a nation through education. From the above discussion it is clear that scope directly relates to what should be taught or learned. There should be proper sequencing between the different parts of the curriculum and each part should be learned with respect to the other parts of the curriculum. Integration and not mere collection between the parts of curriculum is desired. The teacher should plan transaction carefully so that previous learning and future learning relate in terms of cumulative effects of learning and the child learns successfully how different strings of a piece of curriculum relate to other things in life. 1.3.4 Functions of Curriculum Education is an orderly, society oriented and intentional process. So, some plan is needed to guide this effort before actual execution. This plan refers to the curriculum and it is indispensable for the acquisition of the objectives associated with curriculum. Curriculum is the instrument by means of which schools seek to translate the hopes of the society into concrete realities. It is planned and sequenced activity through which education is attained. The real essence of education is the ability to transfer the knowledge, facts, skills, values and attitudes learnt from one situation to solving problems in another situation, and this is done through curriculum. Functions of curriculum in the process of education is not simple and static or fixed rather it is completely a dynamic concept altogether. Role of curriculum is different for different levels of education. The purpose of curriculum changes with demographic location, society, economy, polity etc.

NSOU ? CC-ED-07 ? 17 Every curriculum aims at developing certain competencies or abilities in the learners, the aims may range from the very broad to the more specific. The curriculum process must therefore clearly identify the aims that the curriculum is intended to achieve.

In fact, that is why we use the terms aims, goals and objectives to refer to them. Aims are broad statements which cover all of the experiences provided in the curriculum; goals are tied to specific subjects or group of contents within the curriculum; while objectives describe the more specific outcomes that can be attained as a result of lessons or instruction delivered at the classroom

by the teacher. Now, the function of curriculum depends on the pre-specified aims and objectives of education. Aims and objectives of education cannot be discussed without mentioning Bloom's Taxonomy of Educational Objectives, which attempted to classify the goals of education. Bloom's taxonomy is a set of three hierarchical models used to classify educational learning objectives into levels of complexity and specificity. The three behaviours: cognitive, affective and psychomotor are borne in mind, while selecting objectives. This is to ensure that the curriculum is comprehensive and will produce the total man. The cognitive domain list has been the primary focus on education and is frequently used to structure curriculum, learning objectives, assessments and activities as it involves knowledge and the development of intellectual skills (Bloom, 1956). Curriculum is a criterion to provide experiences to the learners toward the maximum growth of their personalities. Same is the objective of education itself. To achieve this objective curriculum has an enormous role to play. In the following section various functions of curriculum are listed and described.

1. Development of Individuals All learners do not learn equally or in the same manner, as each individual has got his own unique abilities, talents, interests, knowledge, attitudes, ideals, appreciations, skills and understanding. Therefore, the type of curriculum, the design of curriculum, methods applied and techniques followed can offer opportunities to the learners to benefit according to their own abilities. Here lies the function of the curriculum to provide the students those experiences which may meet the need of all the students.
2. Organisation of curricular and co-curricular activities Curriculum consists of curricular and co-curricular activities. These activities are organised effectively to play an important role in mental, moral, social, emotional and physical development of the learner. The curricular activities help in the intellectual growth while co-curricular activities help in around development of the learners in order to produce balanced personalities. Function of curriculum is to balance and integrate these activities to maximise comprehensive development of the individual.
3. Producing Responsible Citizens A well-organized educational programme can only produce responsible and useful citizens. Curriculum plays a central role in providing knowledge about rights and responsibilities of the citizens and helping them in the development of desirable and useful skills to be applied in daily life. Ideal curriculum works for development of rights as well as sense of duties in the students.
4. To Develop Basic Skills This is the major function of written curriculum. Age appropriate application of suitable curriculum may help in acquisition of basic skills like, reading, writing, speaking in the learners and also teach the students to act according to situational demand.
5. Preservation and Transmission of Cultural Heritage These two functions always come together. This is a vital function of education in any country irrespective of sex, religion, caste, creed and ethnicity. The function of each society is to preserve its culture and to transmit it to its next generation. The curriculum preserves the culture in books, literature and journal; and with the help of suitable teaching- learning situation it is transmitted to the next generation. Only curriculum can perform this function in a suitable way. Beside the above mentioned functions, curriculum has some other functions too.

1. Providing knowledge about the world.
2. Inculcating values.
3. Developing and building up some attitudes towards life.
4. Making the people broad minded.
5. Engaging the people in some useful tasks.
6. Producing scientists, educationists or specialized people for various field improving social, cultural and economic conditions.
7. Improving physical and mental health of the people.

Curriculum is considered the "heart" of any teaching-learning institution, which means that schools, colleges, universities or any other educational institution cannot exist without a curriculum. It is very important in formal education but it no less important in informal status too. Curriculum and society is related in such a way that

curriculum has become a dynamic process due to the changes that occur in society. Therefore, in its broadest sense, curriculum refers to the "total learning experiences of individuals not only in school, but in society as well" (

Bilbao et al., 2008).

NSOU ? CC-ED-07 ? 19 1.3.5 Different Types of Curriculum The term 'curriculum' has different meanings to different people. For Educational administrators, including head teachers, it often refers to the organisation of school subjects and the allocation of time when each subject is taught, as depicted upon the school timetable. For teachers, the term embraces the content of what should be taught during each of the allotted time tabled periods in classroom. For the students curriculum in the true sense of the term is not very clear, rather they are familiar with the term syllabus or the course content. Again the concept of curriculum has changed with time. According to the traditional point of view,

80%

MATCHING BLOCK 36/392

W

curriculum in Indian educational system is divided into chunks of knowledge, which we call subject areas in basic education such as English, Mathematics, Science, Social Studies and others.

While Progressive view point of curriculum is somewhat broader in scope and view curriculum

84%

MATCHING BLOCK 37/392

W

as the total learning experience of the student. This concept is anchored on John Dewey's definition of experience and education. He believed that reflective thinking is a means

to unify all curricular actions, to him thought is not derived from action but it is tested by application. Few other progressive thinkers like

78%

MATCHING BLOCK 38/392

W

Caswell and Campwell view curriculum as – 'All experiences children have under the guidance of teachers'

while

76%

MATCHING BLOCK 39/392

W

Marsh and Willis describes curriculum as – 'Experiences in the classroom which are planned and imparted by the teacher and learned by the students'.

Taking into consideration different concepts of curriculum the following types of curriculum are listed here. 1. Written Curriculum It is also known as overt or

90%

MATCHING BLOCK 46/392

includes documents, course of study or syllabi for implementation. Most written curricula are made by curriculum experts with participation of teachers.

It consists of

100%

MATCHING BLOCK 42/392

W

varied activities that are implemented in order to arrive at the objectives or purposes of the written curriculum.

It varies according to the learning styles of the students and the teaching styles of the teacher. Written curriculum is usually limited to those written understandings and directions, formally designated and reviewed by administrators, curriculum directors and teachers, often collectively. This is actually

91%

MATCHING BLOCK 43/392

W

the curriculum-in-use, it is the actual curriculum that is delivered and presented by each teacher. 2.

Recommended Curriculum Most of the curricula are

61%

MATCHING BLOCK 44/392

W

recommended and proposed by experts, scholars and professional organizations. The curriculum may come from a national agency

or any professional organization or any other stakeholder in education.

NSOU ? CC-ED-07 ? 20 3. Social curriculum This type of curricula can now be expanded to include the powerful effects of social media (Facebook; Watsapp; Twitter etc). It actively helps create new perspectives, and help to shape both individual and public opinion. 4. The internal curriculum New knowledge is created in the learner when content knowledge and processes are combined with the experiences and realities. Educators should be aware of this curriculum as they have little control over the internal curriculum. Moreover it is unique to each student. It is often very enlightening and surprising to find out what is meaningful for learners and what is not at all meaningful. 5. Taught Curriculum or received curriculum Received curriculum refers to the students' experiences in real situation.

100%

MATCHING BLOCK 45/392

W

The different planned activities which are put into action in the classroom compose the taught curriculum. These are

the

91%

MATCHING BLOCK 47/392

W

things that students actually take out of classrooms; those concepts and content that are truly learned and remembered. 6.

Learned Curriculum It includes what the student understands, learns, and retains from both the intentional curriculum and the hidden curriculum. The discussion here focuses on what is learned from the intentional curriculum. This type of curriculum indicates all the changes in values, perceptions, and behaviour of the learner that occur as a result of school experiences. 7. Supported Curriculum This curriculum facilitates each

62%

MATCHING BLOCK 48/392

W

learner to achieve real and lifelong learning. This refers to a tested or evaluated curriculum. Series of evaluations are being done by the teachers

59%

MATCHING BLOCK 49/392

W

at the end of the teaching episodes to determine the extent of teaching-learning or to tell if the students are progressing. Assessment tools like pencil-and-paper tests, authentic instruments like portfolio

and projects are being utilized. Support curriculum includes

material resources such as textbooks, computers, audio-visual materials, laboratory equipment, playgrounds and other facilities. 8.

Rhetorical curriculum Curriculum elements are comprised of ideas offered by policymakers, school officials, administrators and

90%**MATCHING BLOCK 51/392****W**

politicians. This curriculum may also come from those professionals involved in concept formation and content revision or from those educational programmes resulting from decisions based on national and state reports.

NSOU ? CC-ED-07 ? 21 9. Assessed

92%**MATCHING BLOCK 52/392****W**

Curriculum This refers to the learning outcomes achieved by the students. Learning outcomes are indicated by the results of the tests and changes in behaviour which can be

under the cognitive, affective or psychomotor domains. 10. Hidden Curriculum Hidden curriculum is that implicit knowledge students learn in school inside or outside the classroom.

79%**MATCHING BLOCK 53/392****W**

This is the unintended curriculum, hence not deliberately planned but may modify behaviour or influence learning outcomes.

School environment,

68%**MATCHING BLOCK 54/392****W**

peer influence, physical condition, teacher-learner interaction, teacher's temperament and many other factors make up the hidden curriculum.

Things that are taught at home, experiences that are a

100%**MATCHING BLOCK 55/392****W**

part of a family's experiences, or related experiences sanctioned by the family

influence students' behaviour in school. Curriculum can't be always limited to 'intended learning outcome' as criticised by Lawrence Stenhouse. It is simply problematic because much of what occurred and was learned within schools was unintended, as a result the term 'hidden curriculum' was coined. The hidden curriculum has very strong impact on student learning, Glatthorn and Jailall (2009). They identified the key factors that seem to constitute the hidden curriculum. Time allocation: For example, are health and physical education allocated sufficient time to change the behaviour of children and youth? Space allocation: How much space is allocated for teacher conferring and planning? Use of discretionary funds: How are such funds expended, and who decides this? Student discipline: Do suspensions seem to reflect an ethnic bias? Physical appearance: Does the appearance of facilities suggest that those in the building care for the school? Are walls decorated with student artwork? Student activities program: Does this programme reflect and respond to student talent diversity? Communication: Are most of the messages over the public address system of a positive nature? How often are student voices heard? Power: Do teachers have power in the decision-making process? Do students have any real power over the factors that matter?

NSOU ? CC-ED-07 ? 22 11. Concomitant Curriculum Concomitant implies existing or occurring with something else, often in a lesser way.

82%

MATCHING BLOCK 56/392

W

What is taught, or emphasized at home, or those experiences that are part of a family's experiences, or related experiences sanctioned by the family. This type of curriculum may be received at temples, in the context of religious expression, lessons on values, ethics or morals, or social, cultural as well as religious experiences based on

the preference of the family. 12. Phantom Curriculum The messages prevalent in and through exposure to any type of media may lead to enculturation of students into the predominant meta-culture. These components and messages play a major part in the gradual acquisition of the characteristics and norms of a culture or group by students of another culture. This may also result in acculturating students into narrower subcultures. 13. Null curriculum Null is what is not taught. Not teaching some particular idea or set of ideas may be due to mandates from higher authorities, to a teacher's lack of knowledge, or to deeply ingrained assumptions and biases. Null curriculum means those topics that are not included in the curriculum. So, teachers

93%

MATCHING BLOCK 57/392

W

do not teach, thus conveying students the message that these elements are not important in their educational experiences or in our society.

But what schools do not teach may be as important as what they do teach (Eisner, 1994). These are important to consider when making choices within content. In history detailed description and consequences of wars are taught but not peace, selected cultures and their histories are taught in geography but not about others. The curriculum framers should be careful that their choices and omissions should not send and wrong messages to students. 14. The electronic curriculum This includes lessons learned through searching the Internet for information, or through using e-forms of communication. This type of curriculum may be either formal or informal, and intrinsic lessons may be overt or covert, good or bad, correct or incorrect depending on the person who is using this. Students use the internet on a regular basis, both for educational and recreational purposes. Much of this information may be factually correct, informative, or even entertaining or inspirational. But there is also a great deal of other e- information that may be very incorrect, back-dated, biased, vicious, or even manipulative uploaded for some vested interest.

NSOU ? CC-ED-07 ? 23 15. Outside curriculum It implies information gathered and knowledge gained by students outside classroom and school. The source may be home, peer group, social media, neighbourhood etc. The development of an effective curriculum guide is a multi-step, on-going and cyclical process. There are many approaches to curriculum development as presented in this section. There is no perfect type, form or approach. Different approaches and types of curriculum are amalgamated in required proportions to get a desirable blend that intends to fulfil the pre-specified objectives to the utmost. However, to be effective, an approach must attract acceptance of the teachers and other stakeholders in the education of the learners. This acceptance will be far easier to attain when the curriculum approach reflects child growth and development, the philosophy of the society, principles of teaching and learning, needs and varying abilities of the learners, ease of implementation; and cooperatively developed by a broad-based committee of teachers and relevant experts. 1.3.6 Difference and Relation between Curriculum and Syllabus In education, curriculum and syllabus are the two terms which are commonly misconstrued due to the converging boundaries and over-lapping nature of these two topics. Syllabus connotes the subjects as well as the topics covered in the course of study. On the other hand, Curriculum implies the chapters and academic content taught in school or college along with knowledge, skills and competencies that students learn during their course of study. While studying Curriculum Studies it is necessary to understand these two concepts distinctively as they are two equally important words in the field of Education and are often confused in their meaning and scope. Strictly speaking these are two different concepts that give different meanings. What is meant by Syllabus? The word syllabus is derived from modern Latin meaning - "list"; "table of contents of a series of lectures", etc. Plural form of Syllabus is syllabi (Oxford English Dictionary).

83%

MATCHING BLOCK 58/392

W

The syllabus is defined as the document that consists of topics or portions covered in a particular subject

or discipline. The topics to be included are decided and determined by the experts and professors of that particular discipline, who are responsible for the quality of the course. Essentially it is a descriptive outline and summary of topics that are to be covered in an education or training course and ideally it should be drafted by the subject experts along with the instructor of the course.

NSOU ? CC-ED-07 ? 24 It is available to the students by the teachers either in the printed form or in the electronic form directly available in the respective university's website. Syllabus helps the students to know about the subject in detail. It also includes objectives of the selected content i.e. what is expected of the students at the end of the course. General rules, instructions, assignments, projects, dates for assessment and evaluation etc. are mentioned in the syllabus. A syllabus will often contain a reading list of relevant books and articles that are compulsory or optional for students and teachers for reading and reference. Generally, a syllabus is prescribed for one year as in conventional annual educational programmes or six months as in semester system. In both the cases the teacher or the course instructor is supposed to complete the specific portions within the stipulated time. Examinations are conducted at the end of the course duration. What is meant by Curriculum? Curriculum is defined as the guideline of the chapters and academic content covered by an educational system while undergoing a particular course or programme. It includes the

75%

MATCHING BLOCK 59/392

W

teaching methods, lessons, assignments, physical and mental exercises, other activities, projects, study materials, tutorials, presentations, assessment, test series,

learning objectives and so on. A general curriculum, in its broadest sense, lists all courses offered at a specific school. A curriculum is prescriptive in nature, which indicates that it is issued by the concerned authority or governing body, and the listed content or topics must be understood by the student at the end of the course so that they are able to achieve a particular grade to get qualified for the next course. Theoretically, curriculum refers to what is offered by the schools and colleges. But practically it has a wider scope which covers the knowledge, attitude, behaviour, performance and skills that are imparted or inculcated in a student. It is well planned, guided and designed by the Government or the Education Board. It aims both physical and mental development of students. This is the overall learning experience that a student goes through during the particular course of study. According to Kelly (1999), purpose of an effective curriculum is not as simple as conveying only the subject knowledge. It should offer much more than a statement about the knowledge-content in order to be a productive curriculum. Learning experiences are equated to curriculum content by authors like - Tyler (1971) and Ivowi (2009). But Wheeler (1978) distinguishes learning experiences from the content. He viewed the former

NSOU ? CC-ED-07 ? 25 as the activities engaged by the learners and the latter as the knowledge they are exposed to. The learning experiences are the means while the content is the end. Offorma (2002) offered a comprehensive explanation of the concept, mentioning that curriculum content is made up of the subject matter to be taught, body of knowledge, topics, ideas, concepts, symbols, facts and cognitions, presented to the learners. Comparison between Curriculum and Syllabus Syllabus is the portion of study that should be covered in a subject for example – English, Bengali, Mathematics, History etc. each of these subjects are a part of the course. Now what the whole course should cover, including different subjects and their relevant study areas are all included in the curriculum for example – Madhyamik course or Higher Secondary course. Thus syllabus is nothing but a part of curriculum. Similarities Both the terms have some features in common. First, contents and topics are included in syllabus as well as in curriculum in accordance with the aims and objectives of education. Second, the content of syllabus is also a portion of the curriculum. Third, both Curriculum and Syllabus are essentially related with the targets and goals of teachers and students. Fourth, Curriculum is superset of syllabus and syllabus is a sub-set of curriculum so both complement each other. Fifth, in education curriculum and syllabus are concerned about what/how to teach and what/how to test.

NSOU ? CC-ED-07 ? 26 Dissimilarities CURRICULUM Curriculum refers to all the educational activities of the schools or any other educational institution in the widest possible sense. It refers to the whole course – including different subject areas and experiences.

100%

MATCHING BLOCK 60/392

Curriculum is based on the philosophy, goals and values of education.

87%**MATCHING BLOCK 61/392****W**

Curriculum is the sum total of all subjects, learning experiences and activities

required for a particular course of study or a programme. Curriculum has a wider scope. Learning experiences and content altogether makes the curriculum. A curriculum is prescriptive or specific. It is a guide the institution follows for the course as long as the course lasts. There is

89%**MATCHING BLOCK 62/392****W**

prescribed co-curricular and extra – curricular activities in the curriculum. Curriculum includes not only indoor activities but also out-door activities of the school

100%**MATCHING BLOCK 63/392****W**

The curriculum has a countless role to play and it is considered as a plan, an experience, a subject matter or content and as a field map.

It is an inclusive concept. The plural of curriculum is curricula A curriculum can be as long as the course lasts. Curriculum is decided by the government or similar bodies. SYLLABUS

100%**MATCHING BLOCK 64/392****W**

Syllabus refers to a list of unelaborated headings or book-let.

It covers the portions of study to be covered by the subject; so it is a sub-set of curriculum. Syllabus does not take into account these factors directly. It is basically concerned with subjects, more specifically a set for a particular subject. Syllabus has a comparatively narrow scope. The content only is termed as syllabus. It is descriptive and it explicitly describes the areas to be covered in a subject.

100%**MATCHING BLOCK 65/392****W**

No prescribed co-curricular and extra- curricular activities in the form of syllabus.

Syllabus
is concerned with activities mostly undertaken in the class room (in-door activities)

93%**MATCHING BLOCK 66/392****W**

The syllabus has a limited role to play and has less significance in the educational world. It is not an inclusive concept

as it is only a part of a curriculum. The plural of syllabus is syllabi or syllabuses Syllabus generally covers a specific duration – may be one year or six months. Conversely, syllabus is decided by teachers, members of Board of Studies etc. NSOU ? CC-ED-07 ? 27 Curriculum and syllabus are two significant terms used in the field of education. The teachers impart knowledge and skill to their students, thus transferring the fund of knowledge from one generation to the other. In this process of transmission, curriculum and syllabus act as the role of vehicle.

100%**MATCHING BLOCK 67/392****W**

Many people still equate a curriculum with a syllabus. An UNESCO publication entitled "Preparing Text Book Manuscripts" (1970) has differentiated between the curriculum and syllabus.

It mentions – ‘

99%**MATCHING BLOCK 68/392****W**

The curriculum sets out the subjects to be studied, their order and sequence and so ensures some balance between humanities and science and consistency in the study of subjects, thus facilitating inter subject links. It follows that the curriculum determines the amount of school time allotted to each subject, the aim of teaching each subject, the place of the motor skills which take time to acquire; and possibly the variations between rural and urban school teaching. The curriculum in the schools of developing countries is often directly related to the requirements for developments. The syllabus determines the basic content of instructions in a given subject and the range of knowledge and skills which the pupils must acquire and establish in detail, the themes and individual points to be studied in each school year. The syllabus is a refined detail of the curriculum at a particular stage of learning for a particular subject'. 1.4

Determinants of Curriculum Traditionally the idea of curriculum was limited to mastery of specific knowledge and skill but at present the scope has extended to help pupil to live in present world and also to equip them to live in future world. Curriculum refers to a course of study that will enable the learner to acquire specific knowledge and skills. Determiners are factors which decisively affect the nature or outcome of something. In curriculum development process there are many factors that influence the process of curriculum development from the planning phase to the implementation phase. Mudaliar commission rightly observed that curriculum includes all the learner's experiences to help him/her develop physically, emotionally, socially, spiritually and morally. The concept of Curriculum is not new in the sphere of education. But the meaning and scope of this term has changed and expanded respectively over the years. There are various dimensions of viewing and understanding this concept. Literally it means 'a course' but deeper delve into the term reveals it is not so simple. As modern education is a combination of two processes – individual development and social development. It aims to achieve individual development, by drawing out the inherent qualities and shaping them; together with preparing those individuals to adjust with the social environment. Education attempts to reach its goals through the 'tool' – curriculum. Hence modern curriculum is bound to be a very comprehensive concept. As Monroe has rightly observed – '

91%**MATCHING BLOCK 69/392****W**

Curriculum includes all those activities which are utilised by the school to attain the aims of education.'

NSOU ? CC-ED-07 ? 28 The development of curriculum is a dynamic process and revision of curriculum continues as the goals and objectives of education keeps on changing.

100%**MATCHING BLOCK 73/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

In developing a curriculum a number of factors are considered,

and these factors are the elements that can promote or ruin curriculum implementation if not taken care of in the beginning. The elements include the learners, who are the curriculum recipients; the teachers who are the curriculum implementers; the society and culture from where the learners come and where they will function after schooling; the philosophy of education, on which the goals of education hinge; psychology of learning, which is the embodiment of the principles for effective teaching and learning; the economy of the society, which determines how robust the curriculum is and its effective implementation; resources, which are important for effective curriculum implementation and without which curriculum development becomes worthless; and values of the society, which is the essence of education. Content is what teachers teach; learning experience is an activity which the learner engages in and which results in changes in his behaviour; hence those contents and learning experiences that will help in attaining the goals of the curriculum should be selected judiciously.

1.4.1 Factors influencing curriculum: The factors that help to determine both learning experiences and content are discussed in the following sections.

Need of the child The child is considered as the centre of the education process so child is the most important determinant of curriculum. Learners' age, characteristics, abilities, aptitudes, intelligence, interest areas etc. should be taken into consideration. Curriculum should be child centred and pay attention to the previous knowledge of the learner, nature of the learner and process of learning for individual learners and the conditions facilitating optimum learning. To develop a true child-centric curriculum – needs, pattern of growth and development and interest areas should be taken into consideration by the curriculum planners.

Needs – The core pattern of curriculum should be flexible to cater the individual needs of the learners. The process of learning in the curriculum should be so planned that the learner gets ample opportunity to learn through first hand experiences. Curriculum should focus at all round development of learner i.e. physical, mental, social, emotional, spiritual, moral etc.

NSOU ? CC-ED-07 ? 29 Growth – The curriculum framers should have knowledge of growth and development of learners. Contents and experience that are included in the curriculum should be sequenced according to the chronological age and mental age of learners to facilitate learning as well as development.

Interests – One condition of optimum learning is including those learning experiences and contents which are interesting to the learners. Children spontaneously attend to things which seems interesting to them.

Need of society and culture Social and Cultural aspects include - Visible Rules, Means of Livelihood, Food, Dress, Language, Music, Dance, Political Behaviour Family etc. These visible means are not directly taken care of in the formal educational institutions. Curriculum includes academic and non academic aspects. The non-academic aspects are addressed more by the hidden curriculum or the intended curriculum. The concept of curriculum is

88%

MATCHING BLOCK 70/392

W

influenced by modes of thoughts, pedagogies, political, social as well as cultural experiences.

In school settings students of different cultures gather together. Successful teaching indicates teaching students from culturally and linguistically diverse backgrounds. Experience acquired from Social environment is very important for harmonious development of the child. Culture is an important source for determining the content of the curriculum.

Need of discipline Every subject has got its criterion and accordingly the need for the discipline is decided. Subjects like - Literature, science, mathematics, social sciences etc. has got their own exclusive requirements. Contents in curriculum are included not only for the sake of adding theoretical portions, but the branch to which the subject belongs is also considered, for example pure science (physical science, life science, mathematics) subjects have got a different status in curriculum than a social science (history, geography) subject. Whether the content is meaningful, relevant, practicable, acceptable to students, rational and clear; all these questions should have positive answers before the content is included in the curriculum.

Need of values Values are socially approved desires and goals that are internalised through the process of conditioning, learning or socialisation and that become subjective preferences, standards and aspirations - R. K. Mukherjee. Values play a crucial part in the formulation and implementation of educational ideologies. Generally, two kinds of values are considered during curriculum making - Ultimate values and Instrumental values.

NSOU ? CC-ED-07 ? 30 Ultimate values determine the aims and purposes of education and Instrumental values are related to the means of education. The ultimate values and instrumental values of a society decide the type of curriculum appropriate for it. Values, attitudes, and behaviours are closely linked. Attitudes refer to the willingness to act in any given moment and behaviour implies the actual action. Values and attitudes are significant as these decide the willingness of learners towards learning the content and influence actual learning. A value is a shared idea about how contents and learning experiences are ranked in terms of desirability, worth or goodness. Thus value system is considered as a very important determinant of curriculum. 1.4.2 Few other determinants Computer technology of the 21st century influences curriculum development at every level of learning. Computers are provided in large numbers in classrooms as requisite for studies and interaction among students. Technological multimedia use influences educational goals and learning experiences among students. Therefore, technological need is also taken care of in curriculum planning. National and international needs should also be considered as presently earth is considered as a global village so what is going on in and around the country and abroad should be placed suitably in the curriculum to prepare the child as a global citizen. Apart from the above determinants of curriculum, some other factors also need to be considered to make effective use of the determiners in terms of content and learning experiences. The curriculum developer should concentrate on useful organization of all these determinants. In India most of the curriculum is subject based. There should be Content-balance between various subdivisions of the content. The learning experiences should be relevant to the child's experience, environment and stage of mental development. Another important area of relevance is the balance required between Instructional objectives and Evaluation strategies. A sense of equilibrium is definitely important among the determinants of curriculum to achieve the best in education. 1.5 Co-curricular Activities Curriculum is a framework that sets expectations for student learning. It serves as a guide for teachers that establishes standards for student performance and teacher accountability. Curriculum is a group or a set of courses offered by an educational institution that are required to complete an area of specialization. Curriculum is a set of courses that comprise a given area of study. The scope of curriculum is difficult to define

NSOU ? CC-ED-07 ? 31 as curriculum can be both written and unwritten. Essentially, curriculum is what the school is attempting to teach, it also includes social behaviours as well as content and thinking skills. Curriculum is the

80%

MATCHING BLOCK 71/392

W

series of things that students must do and experience by way of developing abilities to do the things well that

adults do in life. Thus co-curricular activities comprise an important part of the curriculum and these activities contribute immensely in all round development of the child. 1.5.1 Meaning, Concept, Objectives and types of Co-curricular Activities (CCA) "By education I mean an all-round drawing out of the best in child and man" Mahatma Gandhi. Modern education needs to address physical, mental, social, spiritual, cultural, aesthetic and vocational development of the learner. Modern curriculum aims at all round and harmonious development of the individual. All round development includes both academic and non-academic activities. Curricular activities and programmes take care of the academic aspects and the non-academic aspects are left to co-curricular activities to be taken care off. So, any discussion on curriculum is incomplete if the area of co-curricular activities is not taken into consideration. If used judiciously, co-curricular activities may take care of the students' different developmental needs such as their sense of moral values and attitudes, skills and creativity. Through these activities students explore their abilities, develop the strengths and eradicate the shortcomings both inside and outside the classroom to develop their personality. Students can learn to communicate, to co-operate with other people and enrich their life experiences through continuous participation in co-curricular activities. Evolution of Terminology from Extra-curricular Activities to Co-curricular activities Co-curricular activities have great 'educational potential' as most classroom experiences are theoretical, and practical knowledge can be imparted through co-curricular activities only. These activities facilitate the development of various domains of mind and personality such as intellectual development, emotional development, social development, moral development and aesthetic development. Creativity, Enthusiasm, Energetic and

68%

MATCHING BLOCK 72/392

W

Positive thinking are some of the facets of personality development and the outcomes of co-curricular

activities. Earlier Co-curricular activities (CCAs) were known as Extracurricular Activities (ECA), as these activities include the components of non-academic domain. But later the

NSOU ? CC-ED-07 ? 32 significance of co-curricular activities in child's development was well understood and henceforth, these activities are no more considered as 'extra' and are included as a significant part of the curriculum in the process of education. Curriculum helps to develop various facets of the personality of the child or the student but mostly it takes care of the cognitive or academic aspects. For all-round development of the child, there is a need of emotional, physical, spiritual and moral development that is complemented and supplemented by Co-curricular activities. Definition of Co-curricular activities Co-curricular activities are defined as the activities that enable to supplement and complement the curricular or main syllabi activities. These activities are undertaken side by side with curricular activities as these are the very important part and parcel of educational institutions to develop the students' personality as well as to strengthen the classroom learning. They have wide horizon to cater to the cultural, social, aesthetic development of the child and supplement the curricular activities and prepare the students for life. "Activities sponsored or recognized by a school or college which are not part of the academic curriculum but are acknowledged to be an essential part of the life of an educational institution. Co curricular activities include sports, school bands, student newspaper etc. They may also be classed as 'Extracurricular' i.e. activities carried on outside the regular course of study; activities outside the usual duties of a job, as extra class activities" - according to The International Dictionary of Education (1977). "Co-curricular activities were mainly organized after school hours and so were the extra curricular but they are not an integral part of the activities of the school as its curricular work" - according to Aggarwal (2000). In general we can say - The activities which try to develop the student's physical, moral, mental, social, and emotional development i.e. all-round development are called Co-curricular activities. Such activities complement but are not part of the traditional academic curriculum. These activities are those activities which are beyond the curriculum though they are the part of schools and College. OBJECTIVES OF CO-CURRICULAR ACTIVITIES Most of the educational institutions provide many co-curricular activities to the students; the main aim of these activities is to develop all-round development of students. Let us see the objectives of the co-curricular activities in detail.

NSOU ? CC-ED-07 ? 33 Physical Development Outdoor games and sports such as, cricket, volley ball, kabaddi, etc. provide physical exercise to the students; with the help of these exercises physical development of a child is possible. Mental development To make education effective the students should be mentally active and energetic. Co-curricular activities aim to develop a child mentally healthy. Moral Development Schools and colleges arrange for different events, such as story telling competition, poetry reading, etc. These activities help moral development of students. Social Development Man is a social being, born in society and grows in society. Education has an important role to play in social development of children. Co-curricular activities through its different programmes equip the students for leading a suitable social life making them responsible and accountable. Emotional development Co-curricular activities attempts to achieve emotional development in students. Through different activities the participants develop feelings for their peers, teachers, their school etc. Cultural Development Traditions, heritage, rites and rituals are understood by learners through co- curricular activities. Cultural development may be possible through the use of Drama, Plays, Folk, Folk-Dance, Poetry reading, Religious and Social Ceremonies etc. TYPES OF CO-CURRICULAR ACTIVITIES Co-curricular activities may be classified under the following broad heads. These activities are planned for all round development of learners. Types of co-curricular activities are as follows - 1. Activities for Physical development – A common proverb is 'healthy mind stays in a healthy body. So one condition for academic development of students is healthy physical development. Sports, games and outdoor activities are examples of physical activities.

NSOU ? CC-ED-07 ? 34 2. Activities for Literary orientation or academic development – This includes writing in school magazines, essay writing, story writing, recitation, debates, preparation of charts and models etc. 3. Activities for Social development personal and social skills - This type of activities inculcate respect, responsibility and resilience and expand community-based participation of students. This also includes youth parliament, student's council, visit to parliament and assembly. 4. Activities for Cultural development – The students should be made aware of culture and heritage of their own country. Performing art activities and visual art activities are few examples which may help in this type of development. 5. Activities for Aesthetic development – Participation in any school programme that need decoration of school or classroom or any area of the campus helps develop the aesthetic sense in students. 6. Activities for productive Leisure – Excursion encourage pursuit of meaningful leisure activities. Photography, coin collection, stamp collection are some examples of this type of activities. 7. Activities for Emotional development – This includes Celebration of National and International days and other similar activities. 8. Activities for Moral development – Celebration of birthdays of great men and participation in community service are planned to develop the students morally. 9. Activities for development of scientific temperament – Science exhibitions, projects etc. are the examples of activities under this type of co-curricular activities. 10. Activities regarding Spiritual development – Participation in religious festival like Saraswati puja and celebrating birthdays of great men like Swamiji, Rabindranath Tagore, Netaji etc. 11. Activities for Vocational development – These activities include album making, book binding, photography, toy making, soap making, kitchen gardening, manufacturing teaching aids etc. which may help selecting vocation in future. 12. Multipurpose activities – Apart from the above mentioned types there are many other activities which are clubbed together under this. First aid, field trips, science and social science clubs, geography clubs, hobby clubs etc. Another category of co-curricular activities on the basis of venue or place of conducting the activities may be discussed here, these are Indoor and Outdoor activities. The nature of activities conducted as indoor and outdoor activities are well understood from the names itself.

NSOU ? CC-ED-07 ? 35 1. Indoor – These activities are conducted inside the classroom or school auditorium. Example – debate, extempore, exhibitions, drawing/ essay writing competition etc. 2. Outdoor – Activities which are planned and performed on the play grounds or outside the school comes under this type of co-curricular activities. Example – foot ball, cricket, badminton etc.

1.5.2 Organisation of Co-curricular Activities The process of curriculum development begins with the selection of the content followed by selection of the learning experiences. In order to produce a collective effect, content and learning experiences should be so organised and scheduled in such a way, so that each of the factors may strengthen the other in a cumulative way. Hence organisation of co-curricular activities is also very important.

Organisation is similar to cooking, inspite of putting the best ingredients one may not get the best dish if it is not known how much of what to be used, when to use etc. So best school, best curriculum, best teacher may yield best output if organisation is done carefully between the ingredients of education. 1. Time Frame – The activities should be selected in such a way so that it can be completed within school time. 2. Equal participation – Every student should be given equal opportunity of selecting and participating in co-curricular activities. 3. Individual difference – Similar activities should not be assigned for all the students as each student is different from the other. Adequate types and numbers of activities should be offered so that students get activities of their choice and interests. 4. Maximum utilisation of resources - The co-ordinator of co-curricular activities should give suggestions to the school principal regarding the utilisation of finances, the allocation of resources and the equipment needed for the running of CCA. Administratively, the school principal may authorise the teacher-coordinator to plan the financial budget, to control the expenses of various activities or to assist in administering the fund. 5. Training and support – The teacher concerned may need training and orientation to support the co-curricular activities programme effectively. Leadership training courses should be organised to prepare students to guide activities with effective assistance of teachers. 6. Adopt safety measures- School should ensure that all activities should be conducted safely. Particular attention should be paid to safety measures while

NSOU ? CC-ED-07 ? 36 conducting co-curricular activities in school. It is also necessary to remind all teachers and staff, involved with co-curricular activities, to abide by the safety guidelines. 7. Notifying Parents – Special attention should be paid when outdoor activities are organised by the school, for which parental consent of the participants should be asked for in writing. Letters to parents should be sent stating the date of the activity, time, venue and teachers-in-charge, etc. School should inform parents mentioning the details of co-curricular activities organised and students' participation for all other indoor activities. 8. Evaluation and appraisal – A suitable assessment and appraisal system for the various activities, school clubs, staff and student performance is very important. This will help improve the planning of future activities. 9. Reporting and record keeping – At the end of every school year a report should be submitted to the principal, mentioning all the activities undertaken, assessment of the performance of teachers and staff who helped in the activities, evaluation results of students, special area of success etc. These Annual reports should be preserved for later reference. 10. Teacher's role - For all activities the role of the teacher should be of a facilitator. 11. Cost effective – Less expensive and feasible activities as far as possible should be selected for students. Organisation is thus seen as an important problem in curriculum development because it greatly influences the efficiency of instruction

100%**MATCHING BLOCK 78/392****SA** Assignment+1.curriculum.docx (D55005071)

and the degree to which major educational changes are brought about in the learners (Tyler, 1969).

If students are given the opportunities to organise co-curricular activities, they will gain first-hand experience of programme planning and leadership, thus enabling them to discover and develop their potential. 1.5.3 Significance of Co-curricular Activities Views of Mudaliar Commission (1952-53), is of much relevance in this context, which mentions that – “Co-curricular activities are as integral part of curricular activities of a school and their proper organisation needs just as much care and forethought as the organisation of the curricular activities”. A curriculum is considered successful if it is capable of building links between the school and the broader community. Let us now discuss the how activities help in total development of the child -

1. Teaching-learning - Classroom learning is reinforced as it allows students to put NSOU ? CC-ED-07 ? 37 their knowledge and skills into practice. It facilitates the teaching of certain skills and the inculcation of certain values that may be difficult to present in a formal classroom setting.
2. Promoting students' personal development by broadening their interests, developing their potential and providing opportunities for character formation and leadership training.
3. Making school life more challenging and interesting by promoting students' social development by offering opportunities for the broadening of their social experiences. It is useful for socialisation of students as it offers the chance to practice social skills that helps in the internalisation of moral and social values.
4. Physical activities like running, football, volley ball etc. help not only in the physical fitness they also refresh the burdened mind. Games and Sports help the child to be fit and energetic.
- 5.

98%**MATCHING BLOCK 74/392****W**

Co-curricular activities guide students to organize and present an activity; how to develop skills, how to co-operate and co-ordinate in different situations;

thus improve the sense of leadership in students and make them aware about their responsibilities. It also prepares one for perfect decision making. 6.

100%**MATCHING BLOCK 75/392****W**

Co-curricular activities stimulate playing, acting, singing, recitation, speaking and narrating,

hence facilitating cultural development in students. 7. Activities like participation in debates, extempore, narration enable the students to express themselves freely. This is a valuable quality for future life. 8. Sports and games develop a positive sense in students and a sense of healthy competition is also developed for future life. 9. A deep sense of belongingness is developed in students through close interaction with the peers and teachers too. 10. Teaching-learning process in our country does not provide ample opportunity for practical exposure. Co-curricular activities bring a balance between theoretical and practical experiences thus help to provide motivation for learning. 11. The students go through various experiences while participating in the different activities under the school. If all the activities are planned and executed then the students invariably develops the habit of disciplinary life. 12. Almost all the activities are performed in group. The learners interact, share and collaborate to complete the course of action. This lead to inculcation of values to respects other's views and feelings.

NSOU ? CC-ED-07 ? 38 Hence, all-round development of students may be achieved through effective introduction of Co-curricular activities. These activities act as

77%**MATCHING BLOCK 76/392****W**

avenues of socialization, self-identification and self-assessment, when the child comes in contact with organizers, fellow participants, teachers, and people outside the school during different activities. Co- curricular activities develop the values

88%**MATCHING BLOCK 77/392****W**

like physical, psychological, Ethical, academic, civic, social, aesthetic, cultural recreational and disciplinary values.

100%

MATCHING BLOCK 79/392

W

curricular activities 1. The teacher must be a good planner so that

the

92%

MATCHING BLOCK 80/392

W

different activities could be carried out systematically throughout the year. 2. It should be the duty of the teacher to give more and more opportunity to the child while performing co-curricular activities. 3. The Teacher should act as innovator by introducing some innovative programmes. 4. The teacher must be a good organiser so that the students experience maximum of it. 5.

The concerned teacher should act like as director, recorder, evaluator, manager, decision maker, advisor, motivator, communicator, coordinator, so that the student and child could gain the utmost of the finer aspects of Co- curricular activities. Some Examples of Co-Curricular Activities in Indian Schools and Colleges Sports, Yoga, Athletics, NCC, NSS Musical activities – singing and dance School cleaning and decoration Annual Gathering in schools and colleges Morning Assembly Programmes Spot drawing and painting competition Quiz Competition, Debate, Recitation, elocution competitions, Story writing competition and Essay writing competition Exhibitions, Poster competition, Display of material on Bulletin Board Fancy dress competition Film and slide shows, Photography

NSOU ? CC-ED-07 ? 39 Bicycling, Gardening, Cricket, Football, Basketball, Volleyball, Kabaddi, Kho kho, Hand ball Preparation of chart & models, Album making, Clay modelling and Toy making Survey and social service in neighbourhood Organizing school Panchayat and Student self-government Excursions, Trips to place of geographical, historical, economic or cultural interest

SOME LIMITATIONS Co-curricular activities are not evaluated systematically, so some students and parents too think that participation in these activities is mere wastage of time and these activities interfere with studies too. Teachers are often over-burdened with the academic responsibilities and cannot arrange the Co-curricular activities due to inadequate time. In overcrowded class of Indian classrooms, teachers find difficult to organise sufficient number of activities involving each student. These activities are not given any place in the school timetable. One practical problem is that different activities need different time-frame, this flexibility is not permissible in Indian education system. Sometimes to participate in Co-curricular activities the student requires bearing some extra expenses. Students may not be economically well off to bear this additional expense. Thus keeping in view the significance and relevance of co-curricular activities in education, it may be concluded that planning and execution of co-curricular activities require lot of time, innovative strategies, genuine involvement and interest of teachers. The teacher-coordinator should also have knowledge of Psychology. Co-curricular activities are practical experiences received by students. Theoretical knowledge, to great extent gets strengthened when a relevant co-curricular activity is organized related to the content taught in the classroom. Intellectual aspects of personality are attempted to be accomplished in classroom, while aesthetic development, character building, spiritual growth, physical growth, moral values, creativity, etc. are supported by co-curricular activities. Co-curricular activities help to develop co-ordination, adjustment, speech fluency, extempore expressions, frankness and clarity in language and personality development among students both at the school as well as college levels.

NSOU ? CC-ED-07 ? 40 Sometimes this seems to be a pressure for the subject teachers, there should be co-curricular activities coordinators in schools, serving exclusively for conduction co- curricular activities. He/she is responsible for organising the co-curricular activities of the school, helping to arrange and to coordinate inter-school activities and major school functions. The coordinator is held responsible for setting up of goals following directions and policies for the implementation of co-curricular activities. The co-ordinator also guides students towards development of proper concepts of co-curricular activities and encourages all the students to participate in the activities. The coordinator may need help of other subject teachers for successful implementation of co-curricular activities. The co-ordinator and the head of the institution should understand the strengths, interests and abilities of his/her fellow colleagues, as both of them are responsible for recruiting the necessary personnel for effective running of co-curricular activities.

1.6 Summary We all know that curriculum is a very important factor of education. It is the basis of any educational system and is the road map to reach the goal of education. In this unit we have discussed various definitions of curriculum given by eminent educationists and curriculum developers. On the basis of various definitions an attempt is made to understand the nature of curriculum. When one wants to gain knowledge and understanding of any concept it becomes necessary to know the length and breadth of the concept. The scope of curriculum gives an idea about the various areas covered by curriculum. In the second sub unit we have discussed the determinants of curriculum. As we have already said curriculum is a very important aspect of education and education is highly influenced by a country's philosophy, society, economy, trade and commerce etc. In this part we tried to know the different factors which influence the development of the curriculum. The last sub unit of this introductory unit discusses the co-curricular activities, which happens to be very important in present educational perspective. In this subunit meaning of co-curricular activities, different types of CCA, the reason behind organising these activities and significance of co-curricular activities for students are discussed. Role of the teacher in organising and implementing co-curricular activities is also described in this subunit.

1.7 Self-Assessment Questions 1. What are the main components of education? 2. What is the etymological meaning of the term curriculum? 3. Define curriculum.

NSOU ? CC-ED-07 ? 41 4. Give reasons for considering the need of the child as an important determiner of curriculum. 5. 'Curriculum is a dynamic process' – do you agree with the statement? Give reasons supporting your answer. 6. Mention the similarities between curriculum and syllabus. 7. Justify the concept of hidden curriculum in Indian Scenario. 8. Write a short note on written curriculum. 9. Define co-curricular activities. 10. Briefly mention the objectives of co-curricular activities for students. 11. Write the role of teacher for conducting co-curricular activities. 1. Explain the nature of curriculum. 2. Write a short essay on determinants of curriculum. 3. Compare and contrast between curriculum and syllabus. 4. Discuss different approaches of curriculum. 5. Describe different types of curriculum. Which one do you think is most appropriate for learners? 6. Mention the principles of organising co-curricular activities. 7. Elaborate the relevance of co-curricular activities in education. 1.8 References

Introduction In unit 1 of this block you have studied the meaning nature and scope of curriculum. You have also studied the factors and determinants of curriculum.

Curricular and co-curricular activities also form an important section of unit 1 of this block. In this second unit off the block we shall discuss the three different bases of curriculum development in detail, namely philosophical sociological and the psychological base of curriculum development. in this section the major approaches to curriculum development that is Subject centred Approach, Broad Fields Approach and Humanistic Approach will also be discussed. This unit also contains important discussion on the process of curriculum development which includes the

100%

MATCHING BLOCK 87/392

assessment of educational needs, formulation of objectives, selection and organisation of content

as well as learning experiences and evaluation. All the subunits are very important and interesting too. This will help the students to understand the base of foundation of curriculum development. 2.3 Bases of Curriculum - Philosophical, Sociolo- gical, Psychological Bases are the forces that influence the minds of curriculum developers. These are

78%

MATCHING BLOCK 88/392

W

the foundations of curriculum which set the external boundaries of knowledge of curriculum. These bases will determine - what constitutes valid source of information from which come accepted theories, principles and ideas relevant to the field of curriculum.

In this way, the bases influence the content and structure of the curriculum which reflects the society and culture of a country and this is the desire of any

NSOU ? CC-ED-07 ? 46 society including us, that children should learn the habits, ideas, attitudes and skills of their society and culture. Educational institutions are the perfect mediums to impart these skills in a proper way. The duty of the teacher and the school is to provide them the set of experiences in the form of curriculum. The needs, knowledge and information of the society provide foundation or basis in the formation of curriculum, thus forming the bases of curriculum. The purpose of curriculum planner and developers are to translate traditional norms, philosophies, ethics, knowledge and attitudes in the objectives of education and curriculum, the content, learning processes and the evaluation of elements

46%

MATCHING BLOCK 89/392

W

of the curriculum. Here comes the significance of the bases or foundations of curriculum. The bases of curriculum are considered usually from philosophical, sociological and psychological points of view. 2.3.1

Philosophical Base Philosophy means the love of wisdom; it also means the search for truth. This search is for the eternal truth that reveals the reality and general principles of life. Philosophy helps in understanding the realities and ideas of life and this world; and curriculum is called the dynamic side of philosophy. Philosophy is the foundation of knowledge and it provides the theoretical basis for education. Philosophy is the search for wisdom and it is the mother of all disciplines. Education is the practical component of philosophy and curriculum is the component which helps to achieve the aim of education. Philosophy is a systematic, vigorous, critical and objective study of the reality. Education borrows its theories from philosophy and uses curriculum to put this knowledge into practice. The term curriculum implies the course of deeds, actions and experiences through which a child grows to maturity. It is the sum total of the selected activities needed for living successfully in the society; and all these activities comprise the curriculum. Curriculum includes all the activities required to develop an individual into social and responsible adult. The curriculum framers should have Knowledge of the desirable qualities for adults in a society. This knowledge of the desirable qualities in the society can be rightly estimated by philosophy. Here lies the basis of relationship between philosophy and curriculum. Philosophy discovers and determines what is good for mankind, which is projected in all goals of education. The ultimate aim of Curriculum is to set the required principles, standards, knowledge, skills, and values to be attained in a particular course of study. Therefore like philosophy curriculum is also an ideal and not a concrete reality.

NSOU ? CC-ED-07 ? 47 Curriculum itself is a complex concept having its own set of principles and theories. Curriculum comprises of a body of knowledge and skills which depends on different principles derived from philosophy, psychology and sociology. But philosophy probably has greater influence on curriculum development as it provides curriculum planners, educationists and teachers with the framework for planning, implementation and evaluation

86%**MATCHING BLOCK 90/392****W**

of Curriculum. In decision making, philosophy provides the starting point. The philosophy of a curriculum planner, implementer or evaluator reflects his or her life experiences, common beliefs, social and economic background and education.

Philosophical base as a foundation of curriculum aims at the all-round development of the individual. It is based on the philosophy of the nation. It reflects the ideals and aspirations of the people. It inculcates the desired ideals of life in the younger generation. It helps in the development of proper philosophy of life. It is in accordance with the aspiration level of the individual. Thus, it enables the learners to learn the desirable cultural values, intellectual virtues, societal norms and moral doctrine. It helps in the development of the personal and national character. Various philosophical foundations of curriculum emphasises different aspects of curriculum.

90%**MATCHING BLOCK 91/392****W**

The selection of learning experiences according to the present needs, interests and activities of the child

is emphasised under Naturalistic philosophy. Need centeredness or utilitarianism is the pivotal point in Pragmatic philosophy. Activity is the focus of project and basic curriculum.

100%**MATCHING BLOCK 102/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

Idealistic curriculum reflects the cultural heritage and civilization of the whole human race.

Major philosophies and curriculum There are different philosophies determine that influence curriculum in several ways. Idealism, Realism, Naturalism, Existentialism, Pragmatism etc. are the different philosophies that determine the goals of education. Idealism and curriculum It is one of the oldest school of thoughts which has its origin in Plato's ideas. It stresses the mental moral and spiritual nature of an individual and his universe. Idealism emphasizes on the spiritual, mental and moral development of the individual and the self is the ultimate reality of individual experiences. It also emphasizes that social values are realised only when the individual recognises self as a part of the society. Disciplines like literature history, philosophy, religion, mathematics and arts are emphasized in idealist curriculum.

NSOU ? CC-ED-07 ? 48 Realism and curriculum Realists like John Locke and John Amos Comenius believe that education is the process of developing rational powers to their fullest so that the good life can be achieved and education should focus on essential and practical knowledge. Thus in realism great emphasis is put on understanding facts and ways of classifying knowledge. And curriculum should be able to train the individuals senses to develop ones natural powers. Idealist Curriculum consists of reading, writing, drawing, geography, astronomy, arithmetic, history ethics and law. Naturalism and curriculum Naturalists believe that truth can be discovered only through nature. Some proponents of naturalism Democritus, Epicurus, Hobbes, Spencer, Rousseau etc. who believed that human development should take place in accordance with the laws of nature. Education for the child should be practical preparation for life and should never be planned for mere development of concepts. Naturalist Curriculum should be planned in such a way so that the child may have first hand contact with the physical environment as knowledge acquired through experience is always superior to the knowledge supplied by traditional sources. Existentialism and curriculum This philosophy emphasizes on individual existence freedom of choice and personal responsibility. Concept of goodness truth and reality are individually defined as personal subjectivity prevails also the world. Soren Kierkegaard is known as the Father of existentialism. Aim of education according to Existentialism is to train the individual for significant and meaningful existence. As there are no universal guidelines for decision making, the student is encouraged to make independent decisions to make his existence authentic. The school of philosophy emphasizes subject centred curriculum along with literature, history, ethical values and arts for aesthetic expression. Curriculum should be transacted through experimentation, question answer method and self expressive activities. Different schools of philosophy have always guided the expansion, growth, organization and management of education. Naturalism serves as the basis of the curriculum, idealism focuses on the nature of the learner and recommends the learning activity of the learner and the positive influence of the teacher, pragmatism suggests the change of knowledge because it is not permanent and realism recommends the acquisition of information about culture. These different schools of thought emphasizes on continuous construction and reconstruction of the curriculum.

NSOU ? CC-ED-07 ? 49 Significance of the philosophical base Aims of education are determined by philosophy of life or aim of life. Philosophy formulates the goals of life, and education offers suggestions how these goals are to be achieved. Aims of education change with the changing philosophy of life. The aim of Spartan system of education was to prepare patriotic citizens and soldiers. The Athenian system of education aimed at the cultural development of each individual. Curriculum is a major tool of education, used for the modification of the students' behaviour and philosophy help in the process of finding new ways and basis for teachers and curriculum planner to modify their behaviour. Today the world emphasise on finding new ways through which man develops new concepts of reality and knowledge and form a new structure of knowledge. In this dynamic and changing time, a high value is given to discovery, invention and restructuring of knowledge and curriculum in new patterns. It guides the curriculum planner on the basis of the philosophical and ideological belief of the society in the selection and construction of subject matter keeping in view the future demands and needs of the schools and help in the promoting of human life through social change in the behaviour of the students.

89%

MATCHING BLOCK 93/392

W

Philosophy provides educators, teachers and curriculum makers with framework for planning, implementing and evaluating curriculum in schools. Philosophy helps in answering what school are for, which subjects are important, how students should learn and what materials and methods should be used.

It also helps in exploring new methods of teaching and devise ways to apply them in the classroom situation for better functioning of the teaching learning process. It also provides new ways and methods for the evaluation of student's achievement and evaluation of curriculum. Philosophy determines the aims of education and curriculum determines how these aims can be attained, therefore, the curriculum is the means to accomplish the aims of education. Curriculum is to be determined by the educational objectives which are again determined by philosophy. Hence, the curriculum to be followed in schools has to conform to the prevailing philosophy of the nation and life. Thus, the issue of curriculum construction is successfully handled and solved by philosophical beliefs. 2.3.2 Sociological Base "The school

on education. Education has to adjust itself to the changing situations

prevailing in society or else it will be a closed system

100%

MATCHING BLOCK 97/392

W

isolated from life. In short, it will remain unrealistic, useless and

without much meaning. The individual depends upon the society for his existence and self-development. Sociology aims at explaining the inter-personal and group relationships. It explains the nature of occupational, religious and social groups of the nation or the state. It studies various social changes that are taking place within group life and analyses such processes of interaction as competition, Conflict, co-operation, accommodation and assimilation. Society is an ever dynamic entity and sometimes changes take place very fast making difficult to cope with or to adjust. Schools are expected to understand these changes and reflect the same in its curriculum. In order to make school education more relevant, school curricula should address diversity, explosion of knowledge, social and educational reforms and education for all. Core values and needs of the Indian society are one important Sociological determinant of curriculum. Changing values of the people, Demands of the modern society, Good family, Ways of life, Democratic temper of the society, Faiths, Beliefs and the attitudes of the people are the parameters of social consideration in the curricula. Society

86%

MATCHING BLOCK 98/392

W

grows and changes and as such these social changes must not only be reflected in education but also be influenced by it. Changes occur in the cultural sphere and every sector of natural life. Curriculum should reflect these relevant factors and promote desirable changes in the learners.

The social aim of education makes education an effective media of social control. Human society is dynamic, flexible and progressive. Keeping in mind the social changes the curriculum should reflect the social needs of the community; transmit the values and ideals that the society upholds and consider significant to be inherited by new generation. Sociologists are of opinion that perhaps this is the most important foundation or base of curriculum as it helps the youngsters to participate efficiently in social life this view emphasise on inculcating in students the respect for different vocations and professions and creates the dignity of labour. It also helps develop the desirable social attitudes and aids them in promoting the social progress. It is socially utilitarian as each individual is assisted to achieve the optimum possible progress.

NSOU ? CC-ED-07 ? 51 Social change and curriculum Learners construct their knowledge through play, experiences and enquiry. The purpose of education is to create a safe environment through meaningful relationships among the child, parents and teacher. Every human being constructs their knowledge immersed in a social context. Teachers, peers, neighbours, parents and other adults forms an important part of this social setting. Children learn through social processes of constructing relationships between objects, events and people through interaction with others in such a way that these interactions help modify their perspectives. Factors like growth of technology structure of family and cultural diversity are important factors of social change that influence the process of curriculum development. Growth of technology Technology is the use of scientific knowledge to make tools and techniques that solve specific problems of mankind. Technological advancements have resulted in significant changes around the world. Technology has helped to open access to the sources of information resulting to self-education, environmental awareness, Change is the law of nature, and it is a universal phenomenon that every society experiences regularly even if any society strive for stability. Social change is likely to be influenced by many factors, including the introduction of technology. Technological Shift in the Worldwide Map also indicates the same. Structure of family Various factors, like urbanisation, industrialisation and modernisation influence family structure in India. Traditional joint family system, families of the urban and rural India are significantly influenced by the forces of development and change, though the pattern of change may be different. With the penetration of the different forms of media like, the Newspapers, the Television, the Radio, Internet, social media etc.; consumerism culture and market forces have helped individualism grow at a faster rate than ever. A high sense of individualism is also growing among section of the villagers and city dwellers and the members of family have started believing more in their individuality. Cultural diversity Cultural diversity helps us build bridges of trust, respect, and understanding across cultures. This indicates various "ways of being" that are not necessarily our own. This diversity makes our country a more interesting place to live in as people from diverse cultures interact with others and contribute language skills, new ways of thinking, new knowledge, and different experiences. Knowledge of Cultural diversity

NSOU ? CC-ED-07 ? 52 is important in our country as workplaces, and schools consist of various cultural, racial, and ethnic groups. We can learn about different cultures from one another, but first, we must have a level of understanding about each other. Learning about other cultures helps us understand different perspectives within the world in which we live, more we understand acculturation takes place ultimately leading to change in our society. Significance of the Sociological Base of curriculum For any country, the curriculum should be reflective of the society and curriculum design in a way leads to social change. The society manifest through the curriculum and education, and the outcomes of the curriculum developers display the role of both of the above in curriculum development. Curriculum experts and developers are the part of the society therefore they are indirectly influenced by the society and culture. Their cultural standards, attitudes and beliefs leave deep impact on the curriculum and thereafter on individuals because the curriculum designers' personal viewpoints also influence various aspects of curriculum, namely - the selection of objectives, subject matter, teachers' role, teaching learning methods and the process of evaluation. Sociological factors have highest impact on the content of curriculum and that is the reason that curriculum developers and planner both reflect and transfer their own culture in curriculum. Therefore a curriculum without the reflection of culture is not possible for that reason one should consider what characteristic of the culture should be the part of curriculum and what not. The social and cultural inspirations that affect curriculum designers consciously and unconsciously are apparent from the curriculum and their influence is profound. Some vital problems and social issues, such as rapid growth of population, democratic values, urbanization, and management problems are considered as a source of content and information for

77%

MATCHING BLOCK 99/392

W

the curriculum formulation. The present and future trends, issues of national and international interests, Curriculum trends, Equality of educational opportunities in education

and access to global education etc. are very important issues in curriculum and education that are taken into consideration in the Sociological basis of curriculum. The relationship of curriculum and society is mutual and encompassing. Hence, to be relevant, the curricula should reflect and preserve the culture of society and its aspirations. At the same time, society should also imbibe the changes brought about by the formal institutions called schools.

100%

MATCHING BLOCK 100/392

But schools are formal institutions that address more complex and interrelated societies.

Therefore it can be concluded, that social and cultural forces have deep effect upon the curriculum as well as education. To find how much and to what degree the society and culture affect the education system of that society is a controversial issue. Curriculum developers are part of the society and culture, therefore they should keep in mind that their decision regarding curriculum should be related to the individual needs and societal values. 2.3.3 Psychological Base

69%

MATCHING BLOCK 103/392

W

William Kilpatrick (1871-1965) – viewed curriculum as purposeful activities which are child-centred so the purpose of curriculum is child development and growth.

95%

MATCHING BLOCK 104/392

W

Franklin Bobbit (1876-1956) - presented curriculum as a science that emphasizes on students' need

and it should aim to develop the whole child. Thus curriculum is a tool which prepares children for adult life. A child centred curriculum needs education to become child-centred. Child-centred education as well as curriculum, to be ideally child-centred should have a strong psychological foundation in other words, it has to be

100%

MATCHING BLOCK 105/392

W

psychologised. Psychological foundation consists of the accumulated knowledge which guides the learning process and allows the teacher who is executing the curriculum to make intelligent decisions regarding the behaviour of the learner.

Hence, psychological determinants of curriculum include -

84%

MATCHING BLOCK 108/392

SA

in terms of the learner's behavioural changes. This is just an indication of how psychology is influencing educational thought and practice.

Learning Theories and Curriculum Psychology has provided various avenues for better understanding of the teaching-learning process. Psychology as a discipline will be important for curriculum specialists as long as teaching and learning are important considerations in the process of

NSOU ? CC-ED-07 ? 54 curriculum development. Psychology provides the theories and principles that influence students and teacher behaviour within the context of curriculum. Psychology forms the basis and background for understanding how an individual child interacts with persons and objects in the environment and the quality of interaction determines the amount and type of learning. The psychological foundation of curriculum unities all the elements of teaching-learning process and clarify some serious issues that crop up in the process of curriculum development. Regarding curricular decisions psychology forms the basis for teaching methods, teaching- learning materials and activities of learning. Major learning theories and their contribution to curriculum development is discussed in the following section. i) Behaviorist theories Behaviourist psychology considers that learning should be organized in a specific order for the students to experience success. The subject matter should be presented step by step with proper sequencing of task. Behaviourist theories deal with various aspect of stimulus - response and reinforcement scheme. Behaviourism is the first school of psychology, which studied the nature of learning. Behaviourists emphasized on conditioning behaviour of the learner by changing the environment to elicit selected responses. These theories were predominant in the first half of the twentieth century and have gained popularity with the advent of individualized education. Behaviour is likely to be influenced by the conditions under which learning takes place. With Selective reinforcement learning experiences can be controlled to create desired behavioural outcome. Hence we see that behaviourism has a major impact on education. Curriculum framers who believe in this school of thought use principles of behaviourism to create new educational programme. As a result we find successful implementation of these principles in teacher training programmes, educational technology courses, computer assisted instruction etc. ii) Cognitivist theories Theories in Cognitive psychology focus their attention on how individuals process information and manage thinking as learning constitutes of logical method for organizing and interpreting learning. According to this school of psychology teachers use a lot of thinking and problem solving skills in teaching and learning which are represented in practices like reflective thinking, creative thinking, intuitive thinking, discovery learning etc. Cognitive school of thought firmly believes that learning is cognitive in nature. It elucidates the process of human growth and development as cognitive, social, and psychological.

87%

MATCHING BLOCK 115/392

SA

Curriculum Document Critique.pdf (D139248702)

The cognitive approach constitutes a logical method for organizing and interpreting learning.

Piaget in 1950 described learning and development as a process of maturation, which continues and is based on previous growth. The NSOU ? CC-ED-07 ? 55 stages follow a hierarchical order and the attainment in each stage varies depending on the hereditary and environmental factors. He described the four cognitive stages of development from birth to maturity. First, Sensori-motor stage (birth to age 2) - The child begins to establish simple relations between objects and progresses from reflex operations and undifferentiated surroundings to complex sensori-motor action in relation to environmental patterns. Second, Pre-operational Stage (age 2 to 7) - The child begins to take on a symbolic meaning. Third, Concrete operational stage (ages 7 to 11) - The child learns to organize data into logical relationships and can learn concrete concepts in problem solving situations. Fourth, Formal operational stage (age 11 to onwards) - Child is able to perform formal and abstract operations. The adolescent can think logically about abstract ideas, formulate hypotheses and deduce possible consequences from them. Learning at this stage has no limitations and the individual can learn according to intellectual potential and environmental experiences. iii) Humanist psychology This school of psychology emphasizes on human attitudes and feelings, which comes under the affective domain of learning. Humanistic psychology concentrates on how learners can develop their human potential based on Gestalt psychology; where learning can be explained in term of the wholeness of the problem and where the environment is changing making the learner continuously recognize his/her perceptions. Schools are considered as miniature societies that exist within the social context therefore schools and their curricula are significantly influenced by societal culture. The curriculum and society shares a mutual and encompassing relationship hence a relevant curriculum should reflect and preserve the culture of the society and its aspirations. These theories view the total organism in relationship to the environment, and the personal meaning constructed in a given situation. Learning is explained in term of the "

100%

MATCHING BLOCK 109/392

W

wholeness" of the problem. Human beings do not respond to isolated stimuli but to an organization or pattern of stimuli.

However, in the actual teaching-learning situation, this learning model seems to be incomplete as something is lost when implemented in the classroom situation. It is a known fact that many schools are not pleasant places for learners and that quality of student life in the classrooms can be improved. Curriculum specialists must understand that school should be a place where one is free to ask questions, not afraid of being wrong, and not-afraid of taking cognitive risks and playing with ideas. To be sure, schools should be more humane places where students can fulfil their human potentials. Selection of curriculum content materials or subject matter

100%

theories of interest and attention, transfer of learning, growth and development of physical and mental capacities, intelligence, creativity and personality development

are equally important to guide learning of the student. All educators, curriculum planners, psychologists share similar views

100%

MATCHING BLOCK 113/392

W

that curriculum should be organised on the theories of learning and motivation and on the aptitudes and abilities of the learners. Curriculum

constructors suggested that if curriculum is planned based on the above mentioned theories and laws of psychology then the curriculum they plan is a psychologically approved one. Earlier curriculum for child development and learning was developed in traditional ways without keeping in view the psychological implication in the development of curriculum. But with the introduction of child-centric education, the purpose of psychology has broadened and role of psychologist has expanded in the field of studying human behaviour. It Investigates and explains the behaviour of animate creatures. Hence, curriculum needs educational psychology to provide information particularly in formulating the objectives of education, understanding characteristics of the students, planning the methods of teaching according to the learning processes of children. While formulating the curriculum some questions generally crop up. These are – Does the curriculum meet the objectives of all round development of learners?

87%

MATCHING BLOCK 114/392

W

Is the curriculum planned keeping in view the needs and interest of the learners? Is it sequenced according to the age and particular stage of the development of the learners? Is it flexible enough to make allowances for the individual differences among learners? Does it cultivate a sense of innovation, independent and divergent thinking in individuals?

Does it take into consideration the background and input behaviour of the learners? To give a strong psychological base the curriculum should fulfil all the above mentioned conditions.

NSOU ? CC-ED-07 ? 57 Significance of the Psychological Base of curriculum At present psychology is the core element of all the learning processes; curriculum development, child's mental development, teaching methods, learning theories, administration of education system and planning, character building of the students and attitude of students and teachers. Even the use of different technologies in teaching- learning process is controlled by principles of psychology. Every student is different in nature, so they can't be treated alike in teaching learning process, some may be fast learner while others may be slow. Psychological foundation is based on the individual differences. It is very true that every student has own unique personality and is different in their learning and acquisition of skills. Therefore the curriculum should be based on the above facts, and it should be designed to support the capacity and potentialities of all the students, which is impossible without a psychological base in curriculum. Psychology play a vital role in the teaching learning process it is the foundation for all type of education related programme. Psychology helps to determine the methods of teaching, the selection of content and methods, the theories of learning and the overall development of the students according to the norms of the society. Today, the researchers and Scholars are using experimental approach to find new ways of teaching learning process, how students learn under different conditions. Finding new ways and materials from the analysis of teaching learning problem and formulating new approaches for teaching and learning process is not feasible without psychological foundation and experimental psychology, a very popular branch of psychology helps in this regard. Thus in a nutshell, it can be said that the impact of psychological sources on the foundations of curriculum is more than significant and still on the rise. The principles, concepts, processes of psychology have immense influence in curriculum construction and with each day it is becoming increasingly more relevant, meaningful and unavoidable. Psychology helps in all fields of education and it is also applied in practical classroom situation as well as in the curriculum development process by defining teaching materials and methods. After an elaborate discussion on all the three foundations or bases of curriculum, it may be summed up by one single statement that each of the three bases has got their significance both individually and collectively. The concept of curriculum development is equally influenced by these three bases. Philosophical base takes care of the aims and goals of curriculum. The child is the primary and sole concern of the psychological base. The sociological base takes care of the place where a child is

NSOU ? CC-ED-07 ? 58 born and attains maturity. So it can be said the three bases are continuously influencing the curriculum development process. 2.4 Major approaches to curriculum: Subject centred, Broad fields approach, Humanistic approach Approach means the way of dealing with something and it is the way of doing or thinking as per Webster dictionary. When we are referring curriculum development then approach is the way dealing with the curriculum and it includes thinking, creating and designing a curriculum. Curriculum planners and developers main use one or more approaches in planning implementing and evaluating the curriculum. Teachers and curriculum practitioner's have accepted the major curriculum design models which are implemented through different approaches of curriculum. The approach to the curriculum determines how the design should be utilised and implemented. Curriculum developers and implementers use one or more approaches in planning, designing, implementing and evaluating the curriculum. Different curriculum approaches lays emphasis on the importance of planning in curriculum design. The components of curriculum can be organised in various ways. Different modes of organisation have generated different approaches to curriculum. Three major approaches in curriculum design are discussed here. Before discussing the major approaches of curriculum design we should understand the basic steps to be followed in designing a curriculum. A committee for designing the Curriculum should be appointed to monitor the developmental process of curriculum design. This committee should include teachers, parents and administrators and if necessary some students too. Some important guidelines to be followed for developing any curriculum design are mentioned here. 1. The curriculum design committee should conduct meetings in the early stages and establish a sense of vision and mission or purpose. 2. While designing curriculum, the committee should address the needs and pri- orities in relation to the students and society. 3. Goals and objectives of the school should serve as the guiding criteria for curriculum design. The curriculum should be at par to the broad educational philosophy. 4. The design should reveal expected cognitive, affective and psychomotor skills so that the teachers may gain insight into the new and modified design.

NSOU ? CC-ED-07 ? 59 6. The curriculum design process should also be supported by the principal. 7. Administrators from district and state should have peripheral impact on the curriculum design, as established policies, rules and regulations have impor- tant impact on curriculum and instruction. 8. Comparison with alternative curriculum design should be done to find out cost, class size, facilities, personnel required etc. Three basic curriculum designs: 2.4.1 Subject centred designs

100%

MATCHING BLOCK 116/392

W

Knowledge and content are well accepted as integral parts of the curriculum

hence this group of design is most popular and are

83%

MATCHING BLOCK 117/392

W

widely used for organising educational experiences. In this design the subject matter

is considered as the basis around which learning experiences are organised. There is a very strong tradition of knowledge or content in our culture and content or subject matter is considered as central to schooling. Let us discuss briefly the sub-categories of designs under subject centred design. 1. Subject designs Subject designs are oldest and best known. This design is well known to teachers as well as persons responsible for text book treatment or preparation of study materials. It is believed that human being is unique and distinctive due to his intellect and fulfilment of that intellect takes place through searching and attainment of knowledge. In mid 1930s Robert Hutchins prescribed language, mathematics, sciences, history and foreign languages would comprise a curriculum design. Since 1980s to till date, due to knowledge explosion subject divisions have increased in number. The teacher usually assumes a very active role, using lecture, recitation, group discussions etc. as major instructional techniques. This category of curriculum design is criticized as it prevents individualisation of the programme and the learner too is not centrally placed in the programme. Strengths 1.

62%

MATCHING BLOCK 118/392

W

Introduces students to essential knowledge of society. 2. Easy to deliver 3. Textbook and materials are commercially available.

Weaknesses 1. Do not allow students to choose the content which is most meaningful to them. NSOU ? CC-ED-07 ? 60 2. Presented without consideration of context. 3. Fails to foster social, psychological and physical development. 4. Neglects students' needs, interest and experiences. 2. Discipline designs In this design only academic disciplines were emphasised. This new design grew rapidly during 1950s and became very popular during mid 1960s. But its popularity was tarnished during student protests of 1970. One important reason for this downfall may be over stress on disciplined knowledge that seems like a command to teach only the disciplines of Science, Mathematics, English, History and so on. For example Students would approach History as a historian and investigate biological topics by following procedures used by biologists. This design lays stress on understanding the conceptual structures and processes of the disciplines. This category of design encourages students

100%

MATCHING BLOCK 119/392

W

to see the basic logic or structure of each discipline

i.e. the key relationships, concepts and principles and thus develops a deep understanding of the content. Strength : Students master the content areas and are able to continue their learning independently. Weaknesses : A lot of knowledge cannot be classified as 'disciplined'; example aesthetics, humanism, personal- social living etc. 3. Broad-field design This subcategory of curriculum design is another variation of subject-centred design. This approach developed as an effort to rectify the fragmentation caused by subject design. In this design an attempt was made to integrate content logically. Broad-field approach evolved as an attempt to bring together the subject matter, knowledge and understandings into a broad organization. Thus, subjects like geography, history, political science, economics, sociology, anthropology etc. were considered under a single umbrella term social studies. The main focus of this design was to give students a sweeping understanding of all content areas and try to integrate contents that fit together logically. Strength : This design is simple and students can learn wide area of knowledge. Knowledge will no longer be fragmented or linear even if multi-disciplinary and multidimensional. Weaknesses : The depth of knowledge is insufficient because if a student study

NSOU ? CC-ED-07 ? 61 economics for one year will surely acquire more knowledge of economics in comparison to one year spent on learning social studies. 4. Correlation design This particular design lies somewhere in the middle of 'separate subjects' and 'total content integration'. It attempts to identify ways to relate subjects but maintain their separate identities. For example students in a physics course may have a unit in mathematics that deals with those concepts of mathematics required to conduct an experiment in chemistry. Subjects that can be studied in correlation are Science and mathematics; literature and history etc. In this group of design the core or content of the subject is retained but the content is selected on the basis of broad and general themes. For successful implementation of this design, teachers of various content areas work together and have students working on assignments of different but related content areas. Strengths 1. This category of Curriculum design is innovative and attractive. 2. Collaborative effort and interaction between teachers help to develop good relationship. Weaknesses 1. It is time consuming and teachers often are from separate disciplines and departments, scheduling difficulties are common. 2. Correlating different subjects and working together in one class requires a lot of planning. 3. Most class schedules do not allow sufficient time for students to study mean- ingfully correlated subjects. 5. Process designs In this category of design the procedures and the processes by which students gain knowledge are considered to be important. Thinking process has always been considered important in education and students are taught to think in schools. Students learning process is equally important to what should be learnt and this process of learning is the core of this design. For example - biological procedures to learn biology, ethnographic procedures to study culture and society are employed. Strengths 1. This design enables teachers to analyse reality, create frameworks to derive knowledge.

NSOU ? CC-ED-07 ? 62 2. The students can be made aware of the different learning processes so that they may take decision about their own process of learning. 3. Thinking qualities like fostering critical thinking, rational thinking and prob- lem solving capacities develop through this design. Weaknesses : Difficult to analyse validity of students' conclusion individually. 2.4.2 Learner centred designs In early 19th century educator asserted that students are the centre or focus of all educational programmes. These designs can better be followed in the primary level of education, where student is considered as the centre of the process, but it becomes difficult to follow in the secondary level of education where the content or subjects are more emphasised. a) Child centred design : This design advocates that the students must be active in their learning environments. Learning should be closely linked with students' life. This can be done successfully if is based on students needs and interests. Many proponents of this design laid emphasis on learning by doing for self-realization and social participation. The curriculum based on this design is child centred and experience centred. It is believed that effective learning did not require strict discipline as child's innate tendency is to become engaged with interesting knowledge. This design is organised around human impulses like to socialize, to construct, to inquire, to experiment, to express and to create. Strengths: The process of education centres round the child; here lies the strength of the design. Weaknesses: Social demands and requirements are also considered in this design. b) Experience centre design : This design is similar to child centred design to a certain extent but the major difference is that experiences based on needs

63%

MATCHING BLOCK 120/392

W

and interests of children cannot be anticipated, therefore no fixed curriculum framework can be planned for all children.

Thus in this design curriculum is not pre-planned rather it is 'on the spot' decision. Teachers have faith in each student's uniqueness. Teachers design potential experiences for students to consider. Strength: Students design their own learning, construct and revise their knowledge through direct participation and active observation.

NSOU ? CC-ED-07 ? 63 Weakness: Every time the teacher has to search for starting points. It is very important as the teacher has to understand the previous knowledge of the learner, interest of students should be linked to formalized knowledge. c) Romantic or radical design : Radical curricularists believe that learning is a reflective process and which cannot be externally imposed by a person or institution in power. Ideally education should lead to freedom and emancipation. In this particular curriculum design knowledge is not considered to be a finished product in a course of study or syllabus. Learning results from interaction between people. Radicals view the general society as corrupt and repressive. Hence this category of curriculum design advocates students' active involvement with the content, engaging into a dialogue with teachers and fellow students. Teachers ask relevant questions to evaluate knowledge and students should accept responsibility for educating themselves and demand freedom. Strengths i. Students learn ways of engaging in a critique of knowledge. ii. Learning is reflective hence no longer the students have to follow the social conventions without thought for reflections. d) Humanistic design : Most of the humanistic designs are associated with humanistic psychology that developed in 1950 against behavioural psychology. According to this category of Curriculum design human action was considered to be much more than simply a response to a stimulus so the focus of attention should be subjective nature of human existence. In this design the main emphasis is on the disciplines and individuals are allowed to become full functioning persons. The emphasis is on human potential hence students are empowered by actively involving them in their own growth process. Teachers provide environment that encourages genuineness, empathy and respect. Students approach problems with flexibility and intelligence, work cooperatively but do not need others approval and mistakes are accepted as part of the learning process. Education in this design should address pleasure and desire and curriculum should elicit emotion. Humanistic designs also mentions that cognitive, affective and psychomotor domains are interconnected and follows a specific hierarchy while attainment. Strengths i. Education is a successful combination of affective and cognitive domains so, teachers must permit students to feel, value and grow while learning. ii. This approach adds affective components like feelings, attitudes and values making education and learning more humane.

NSOU ? CC-ED-07 ? 64 Weaknesses i. Overemphasis on the individual ignoring societies needs. ii. Require

100%

MATCHING BLOCK 121/392

W

teachers with great skills and competence in dealing with individuals. 2.4.3

Problem centred designs This category of design focuses on the problems of institutional and group life. These

77%

MATCHING BLOCK 122/392

W

designs are organised to reinforce cultural traditions and also address those needs that are currently unmet. These designs

often cut across subject boundaries as content is selected and planned even before the arrival of the students. Needs, concerns and abilities of students are considered to be important areas in this design, thus emphasis is both on content and development of the learner. There may be different forms of problem centred designs emphasizing persistent life situations, contemporary social problems, areas of living, reconstruction of society etc. a) Life situation designs : This design originated in 19th century in Herbert Spencer's writings on education for complete living. Three fundamental assumptions are found in this design; firstly, persistent life situations important for a society to function successfully, secondly, the students will be able to see direct relevance between content of study and aspects of community life; thirdly, the students will be directly involved in improvement of the society. The content is organised

100%

MATCHING BLOCK 123/392

W

in ways that allow students to clearly view problem areas.

This design uses learner's past and present experiences to help them analyse the basic aspects of living. Strengths 1. It focuses on problem solving procedures of learning. 2. The process and content are effectively organised and integrated to help students view problem areas clearly. 3. Subject matter is closely related to real situations to increase relevance of the curriculum. Weaknesses 1. Tends to indoctrinate youth to accept existing conditions, thus perpetuates the social status quo. 2. Another important problem is to determine the scope and sequence of the essential areas of life. 3. Teachers need to be adequately trained to implement is design at the same time textbooks and other teaching-learning materials cannot help in imple- mentation of this design.

NSOU ? CC-ED-07 ? 65 2. Core design This design centres on general education and basic problems arising out of human activities. Content is an important

100%

MATCHING BLOCK 124/392

W

part of this design, the common needs problems and concerns of

the learners are of central concern. Strengths 1. These designs unify content and present relevant subject matter to learners. 2. It fosters intrinsic motivation as it presents subject matter in a relevant form. 3. Students learn democratic practices as they can view community as a laboratory for learning. Weaknesses 1. Requires materials that are difficult to find in conventional textbooks. 2. It requires exceptional teacher having wide knowledge of subject matter, skills of problem solving and general knowledge. 3. Reconstructionist design Curriculum workers in this design

87%

MATCHING BLOCK 125/392

W

believe that through the curriculum educators will affect social change and ultimately a more just society

will be created. It was

82%

MATCHING BLOCK 126/392

W

believed that the school should help the individual to be a social being and a skilled planner of social reality.

This design advocates that curriculum should foster social action, aimed at reconstructing society. It encourages industrial and political changes and also suggested that students should be involved in creating a more equitable society. In a nutshell, it can be stated that, curriculum design is a complex process and request careful attention on the part of the educators. Any curriculum design can be successful if it can identify those worthwhile and essential, concepts, attitudes and skills; which help the students in their growth and development. Every curriculum design has some history and philosophy is there background. There are different sub-categories under each of the three subject centred, learner centred and problem centred designs. Each group of design has got their own pros and cons. But it is difficult to follow a single design in practical life situation, therefore some schools mould these designs to construct a unique curriculum process that will suit the specific requirement of the school and its students.

NSOU ? CC-ED-07 ? 67 2.5 Process of Curriculum development 2.5.1 Assessment of educational needs

75%

MATCHING BLOCK 127/392

W

Need assessment is an important task in determining what the curriculum should prescribe for a given population for a period of time.

Every education system is based on some philosophy which helps in the formulation of goals and objectives, which is once again very important to give a definite direction to the curriculum. Before determining the goal of Curriculum, a basic process of need assessment is very important for curriculum development. The degree to which the stated philosophy of education can be followed and implemented and the degree to which the goals can be achieved depend on need assessment. For assessing need, authentic data should be collected by using objective methods and techniques. Perception of students, parents and educators should be included in the need assessment process. Opinion of students, parents and educators may be subjective so the process of need assessment should be analysed scientifically. Need indicates any necessity of an organism to lead a healthy life. For example air, water, food, clothing, shelter etc. are considered as needs as these are required for a safe, secured and healthy life. As need implies necessity any deficiency may cause a clear adverse outcome that may lead to dysfunction or even death. Needs are frequently viewed in different categories. These are felt needs, real needs and observed needs. Felt needs can be simply described as wishes and hopes of human beings which a person thinks to be necessary for his life. These needs are self defined by each person as being important to them. An individual often describes a felt need to be 'want' for him. Drinking water, schooling, higher education, road and communication, employment etc. are included under the category of felt needs. Real needs are real qualities a person needs to develop to fulfil the wishes he desires. Examination of purity of water and the knowledge to treat water, personal cleanliness, maternal and child health education etc. are the real names of individuals. Observed needs are also termed as normative need and this need is often perceived by others. Persons who are considered as authorities, experts or significant others define something to be important and then it is considered as observed need. For example model fashion. Approach means the way of dealing with something and it is the way of doing or thinking as per Webster dictionary. When we are referring curriculum development then approach is the way dealing with the curriculum and it

NSOU ? CC-ED-07 ? 68 includes thinking, creating and designing a curriculum. Curriculum planners and developers main use one or more approaches in planning implementing and evaluating the curriculum. Teachers and curriculum practitioner's have accepted the major curriculum design models which are implemented through different approaches of curriculum. The approach to the curriculum determines how the design should be utilised and implemented. Curriculum developers and implementers use one or more approaches in planning, designing, implementing and evaluating the curriculum. Different curriculum approaches lays emphasis on the importance of planning in curriculum design. For example modern fashion, Health education on environmental sanitation, health services, safe drinking water, knowledge on various diseases, desirable body weight and attractiveness comes under observed needs. 2.5.2

Formulation of Educational objectives Formulation of objectives is based on the philosophy and need assessment. After this, the identified needs are then transformed into goals and objectives. Goals are the general statements of the results of educational endeavours and these form the basis for educational planning. When goal statements are made more specific then only we get educational objectives and objectives are made even more specific in behavioural terms to make them attainable. Goals and objectives can be distinguished very easily as goals are general and objectives are specific. Goals are determined philosophically and are related to all aspects of the learning situation beginning from the development of an overall curriculum plan to lesson plans used in the classroom. Hence, we can say goals are generated on the basis of philosophy and specific objectives are formulated on the basis of goals. The three major sources of objective formulation namely Society, individual and knowledge are discussed here. Society The objectives of education are determined broadly by society at the local and the national level. Such needs are preservation and transmission of cultural heritage, implant the democratic values of life and augment the impact of science and technology and other innovations. Social needs are essentially taken into consideration while planning and developing curriculum to develop the competences and qualities in learners.

NSOU ? CC-ED-07 ? 69 Individual Society determines the basic requirements of education following that it is the individual whose needs are reflected through the society. There are certain other needs of the individuals like physical and psychological growth of the students which may be grouped as self-development or self-fulfilment. Psychological growth consists of cognitive, affective and psychomotor aspects which need to be considered while determining educational objectives. Some thinkers believe that an individual has some spiritual needs too. Therefore it is desirable to provide him some opportunity to fulfil these spiritual needs too. Knowledge In the absence of knowledge, there cannot be any growth of civilization hence knowledge is the most important condition to growth of civilization. Knowledge has its own categories such as facts, processes, basic ideas, concepts, thought systems, etc. The nature of knowledge i.e. subject matter is one of the most important considerations in formulating educational objectives. Therefore it may be safely stated that there is a close relationship between society, knowledge and individual influencing each other. Society Individual Knowledge Society is a dynamic concept and keeps on changing and the individual has to cope to exist in society. Knowledge helps the individual to adjust in society without sacrificing his individuality. The character of knowledge is related to and is determined by individual and social welfare.

NSOU ? CC-ED-07 ? 70 2.5.2 Formulation of Educational Objectives A learning objective should describe what students should know or able to understand and should take into consideration factors like – Matching, Worth, Wording, Appropriateness, Logical Grouping and Revision while formulating educational objectives Formulating Educational Objectives Matching Worth Wording Appropriateness Logical Grouping Periodical Revision These factors are briefly discussed here— Matching: Specific objectives identified to any specific content

52%

MATCHING BLOCK 128/392

W

should be related to the broader or ultimate goals of education from which they had been originally derived. Worth:

Worth or value relates to whether attaining the pre-specified objectives have significant value in the life of the learner at present or in future. The quality of life is gradually improving with time as a result our knowledge base is continually changing, the objectives need to be re-evaluated and modified. The objectives should be meaningful, beneficial, constructive and relevant to the demand and requirement of the learners. Wording: Pre-specified objectives are expressed in statements of specific pattern. The objectives should be formulated and phrased properly, so that young learners can easily understand the expected outcomes already planned. Appropriateness: The needs and interests of the learners should be the source of the pre-specified objectives. The objectives should be appropriately chosen. Lack of clarity in

42%

MATCHING BLOCK 129/392

W

an objective may create confusion in the minds of the teachers, the students and other stakeholders. This may adversely affect the process of Curriculum Development.

Logical grouping: Proper organisation and coherence is required in formulation of objectives. Each content area caters to the development of different knowledge,

NSOU ? CC-ED-07 ? 71 understanding and application areas. Therefore, objectives need to

76%

MATCHING BLOCK 130/392

W

be grouped according to some common idea or in terms of domains - cognitive, affective and psychomotor. Consistent and sensible grouping of the objectives will help develop a more effective curriculum.

Revision: At present every society and economy is changing very fast causing changes in students' needs, sphere of knowledge, instructional techniques and strategies; thus making revision in objectives to be obvious. Curriculum development is an ongoing process and to keep this process dynamic revision of objectives is mandatory. This will have a recurrent impact on the curriculum keeping it flexible and updated to handle the latest demands in the society successfully. When objectives reflect specific behaviour in the form of a statement then it is known as behavioural objective. A Behavioural objective helps the learner to know and understand what is expected of him and it also describes what the learner has to do at the time of learning. Any discussion on formulation of educational or behavioural objectives can not be considered as complete without considering Bloom's Taxonomy In 1956 under the competent leadership of educational psychologist, Dr Benjamin Bloom, Bloom's Taxonomy was formulated in order to promote higher forms of thinking in education. This system of classification helped in analyzing and evaluating concepts, processes, procedures, and principles, apart from just remembering facts or rote learning. This taxonomy is often used when designing educational, training, and learning processes. Three domains of educational activities or learning (Bloom, et al. 1956) are Cognitive Domain- considering Mental skills (knowledge), Affective Domain Growth in feelings or emotional areas (attitude or self) and Psychomotor Domain Manual or physical skills (skills). 2.5.3 Selection and organisation of content Content should be selected on the basis of students day to day life experiences so that students can apply the acquired knowledge in their day to day life. Content selection should be based on aims, goals and objectives. Content selection is based on various sources. Some of these sources are briefly discussed here – Knowledge as a source : The domain of knowledge itself is considered as an important source of Curriculum content as no particular content should be left out. Knowledge can be disciplinary and interdisciplinary. Disciplined knowledge has content organised in a particular structure, unique to that discipline. For example the methods of inquiry of a discipline like physics or literature is specific to that discipline only,

NSOU ? CC-ED-07 ? 72 whereas interdisciplinary knowledge does not have a unique content or method of inquiry. These disciplines are somehow overlapping where content is taken from different disciplines and clustered around a focus of investigation for example sociology and education, bioinformatics and biotechnology etc. Learner as a source of content : The child or the individual is of primary importance in content selection process. The individual is the centre of education, who should be motivated to create his or her own ideas. Education can only become learner centred if the curriculum focuses on how the learner learns, form attitudes, values, develop interests, create novel ideas etc. Although students' interests are transitory teachers should identify search interests which shall help the students to develop as socially useful citizens. Society as a source of content : Analysis of the social situation and selecting content on the basis of social analysis gives curriculum a strong basis. Curriculum designers consider School as a miniature society and believe that curriculum content should be based on an understanding of the society. Children are born and grow up in society so curriculum should enable individuals to make a place for themselves in society at the same time curriculum should facilitate change or improvement of the social order. The role of teacher is very important as they act as agents for social change through the contents of curriculum. After brief discussion of the sources some important criteria of content selection should also be mentioned here, which are as follows — ? Content selection should analyse the utility criterion which means the usefulness of the content. Usefulness is determined by a person's philosophical orientation. ? Learning ability is another very important criterion which is related to the appropriateness of the selected

47%

MATCHING BLOCK 131/392

W

content. The content should be within the range of students' experiences so that the content can be easily grasped and assimilated by the students for whom it is intended. ? Feasibility is another important criterion of content selection.

Whether the content is appropriate with reference to time allowed, whether adequate re- sources are available, availability of academic expertise, financial resources etc. are some of the components considered under this criterion. The curriculum framers may find a vast body of content important to be included in curriculum but factors like working days in academic calendar, size of class- room, number of teaching personnel etc are the limiting factors that need to be considered.

NSOU ? CC-ED-07 ? 73 After selection of the content the next important task is to put the identified content in a particular sequence so that the pre-specified objectives can be realised. The desired objectives cannot be attained if a curriculum lacks systematic organisation. Logical sequencing and organisation of the curriculum is not an easy task as it requires an in-depth understanding of the teaching learning process. The curriculum framers often face problem in ideal organisation of the content as certain concepts are central to the content while some are prerequisites to other concepts, thus proper sequencing becomes a difficult and complex task. Again to some curriculum planners' content should be organised on the basis of psychological principle, hence

80%

MATCHING BLOCK 132/392

W

content should be organised such that the concrete is experienced before the abstract

or simple concepts should come before complex ones and so on. For proper sequencing of concepts different ideas should be related together in a logical manner. Again the events should be presented in chronological order so as to maintain a basis of sequencing the content and experiences. Definite sequence, continuity and integration of various components should be effectively done to prepare a well organised curriculum. Continuity is the second aspect of curriculum that needs to be maintained by vertical repetition and recurring appearances of the content. This process helps to strengthen the permanency of learning in the learner. Jerome Bruner named this concept of continuity as the spiral curriculum. He stated ideas

96%

MATCHING BLOCK 135/392

SA

Curriculum Planning and Development CFP3010 - ...
(D13185640)

should be developed and redeveloped in a spiral fashion increasing depth and breadth

of knowledge and skill in the learner; each time the learner go to the concepts off the content. Next important aspect is the principle of integration. Human life is a series of emerging themes and every theme is integrated and interconnected. This sense of integration is also important in curriculum design. The boundaries or gaps between different disciplines of subject matter should be erased and isolation should be eliminated to give education an integrated nature. Another thing that needs to be mentioned here is that too much or too little of these elements may be catastrophic to the curriculum therefore keeping a balance between content, time, experiences and all other elements is always desirable. This requires continuous review regarding the effectiveness and relevance of the curriculum.

2.5.4 Selection and organisation of learning experiences After selection and organisation of content the next step in curriculum development is selection of appropriate learning experiences. To carry out the instructional programme successfully wide range of experiences should be offered so that that teacher can exercise flexibility in selecting curriculum experiences. At present NSOU ? CC-ED-07 ? 74 the border line between curricular and extracurricular activities has been removed and importance of both academic and non-academic activities is genuinely felt. The task of Curriculum framers has become more difficult as they have to plan for balanced and comprehensive instructional programme providing varied learning experiences. Following this it can be stated that curriculum should help in individual and personal development of the learner, inculcate social competence and should also develop skills for continued learning. For personal development different kinds of activities should be included in the curriculum, for example physical activities according to age and maturity. The curriculum framers should also include activities leading to better self -understanding. For developing social competence different subject areas like Science, Mathematics and Humanities should be effectively used. For developing the skills for continued learning, successful relationship should be developed between learning needs; and instructional programme should be structured on the basis of the nature or characteristics of the individual. One important factor for selection of suitable experiences in the process of curriculum development is relevance. The experiences are considered to be useful if they reflect recent knowledge, social and cultural trends etc. The process of Curriculum development should be tuned to help students equip to face the future. In view of the goals and objectives of the programme some useful criteria for selection of curriculum experiences can be stated: 1. The knowledge and skills should be valid so that the learners can apply them in and out school situations. 2. Selected experiences should be feasible in terms of time, infrastructure, staff and other facilities in the school. 3. The learner should get optimal chance to learn the content. In other words, the students should be allowed to develop their power of thinking and ratio- nality. 4. The learners' experiences should be organised in such a way so that they achieve

70%

MATCHING BLOCK 133/392

W

a greater understanding of their own existence as individuals as well as responsible members of

groups. 5.

Experiences in the field of education should allow the students to broaden their interests and satisfy their needs. This will foster a sense of openness to new experiences and tolerance for diversity in learners. 6. Complete development in students can be achieved by including experiences leading to cognitive, affective, psychomotor, social and spiritual domains. If this phase of Curriculum development is done as mentioned above then this will address social and security needs of the learners in a desired pattern, which

NSOU ? CC-ED-07 ? 75 ultimately will instil in them a sense of appreciation and empathy for others. If learning experiences are organised scientifically then the activities selected for students will be meaningful and interesting. In order to translate the selected curricular experiences into reality a wide range of activities should be offered to facilitate learning. Among this wide range of activities the teacher will decide which instructional strategy to be adopted for a particular child. There should be more than one option both in method and teaching-learning appliances to be used. For example lecture, discussion, questioning, collaborative method, group work, library reading, field trips etc. are some of the instructional methods and chalkboard, maps, models, audio-visual aids, movie clips etc. are some of the teaching-learning appliances. The teacher and the students mutually decide which method and teaching learning material to be used to make the students experiences interesting and successful. While organising learning experiences another important criterion should be kept in mind. The teacher should ensure that the need of the student population is met and the nature of the programme matches the pre-set goals and objectives.

2.5.5 Evaluation of the curriculum In curriculum development programme evaluation aims

76%

MATCHING BLOCK 134/392

W

to determine the extent to which the objectives are achieved through implementation of

the curriculum. Evaluation of the curriculum can be ascertained by expressing the relationship between three major curricular components namely Objectives, Learning experiences (content and method) and outcome. Three major curricular components of Evaluation. Learning Objectives Evaluation Strategies Teaching and Learning Experiences NSOU ? CC-ED-07 ? 76 All these three components are interdependent and cannot be studied in isolation. One important outcome of this phase of Curriculum development is to provide useful feedback for improving the curriculum. Evaluation of Curriculum when conducted during the process of development is called formative evaluation. The feedback derived from formative evaluation can be used to accept, modify or reject different aspects of the curricular components. Evaluation of learning and evaluation of instruction both are two important phases of Curriculum development. Evaluation of learning implies the techniques by which student learning is evaluated. Tests, projects, multiple choice questions or MCQ etc. are some of the techniques popularly used. Which technique should be suitably used is determined by the degree to which they meet the needs of the specific student population. The extent to which instructional methods and materials used are matched is also analysed. Lastly, whether goals and objectives of the programme match the goals of the institution is also verified. The nature and type of expected learning should also be reflected through the curriculum evaluation programme along with the content of the course or programme. The term evaluation is generally applied to the process of making a value judgment. Both curriculum evaluation and student evaluation are significant parts of evaluation. Curriculum evaluation is the process of evaluating the curriculum and it

Assessment of student learning could be formative or summative or both. There are various types of tests such as standardized tests, teacher- made tests, performance-based tests, ability tests

etc. Methods of administration may be - oral, written, practical, discussions or any other form as required. Curriculum Evaluation Model CURRICULUM EVALUATION Evaluation Methods Objectives Content NSOU ? CC-ED-07 ? 77 Evaluation of instruction is equally effective and important as evaluation of learning. Evaluation of instruction can be done by review of students' work, student ratings of instruction, anecdotal comments and other records. For making effective changes and improvements in the instructional programme every aspect of the programme should be reviewed regularly and systematically. 2.6 Summary The above section consists of three sub-sections. In the first sub-section the bases or foundation of curriculum is discussed. Meaning and significance of philosophical, psychological and sociological bases are described here. A student of education should have a clear idea about all these sections to understand the idea of curriculum and education separately as well as mutually. The second sub-section considers the major approaches to curriculum namely - subject centred, broad fields approach, humanistic approach. Curriculum approach is a way of dealing with a curriculum. It is a way of thinking, designing and creating a curriculum. Curriculum practitioners and implementers may use one or more approaches in planning, implementing, and evaluating the curriculum. Broadfields approach implies combining two or more subject areas into a single broad field. Subjects which are closely related are integrated to form a broad field. Subject-centered approach focus primarily on the subject matter and emphasises on bits and pieces of information which are may not be attached from life. The continuous quest of learning outside the formal system is not emphasized. Humanistic Approach Rooted in the

progressive philosophy and child-centered movement

curriculum is the instructional and the educative programme by following which the pupils achieve their goals, ideals and aspirations of life.

It is curriculum through which the general aims of a school education receive concrete expression. Traditional concept- The traditional curriculum was subject- centered while the modern curriculum is child and life-centered. Curriculum is the instructional programme designed to meet the various requirements of a vast heterogeneous population. It is the courses of study that embodies the outlines of knowledge to be taught. Therefore, it is the sum total of experiences provided under the guidance of the school. The second unit deals with the bases of curriculum. Curriculum development is the most important component of educational programme. Bases of Curriculum development are the pillars upon which the foundation of curriculum is constructed. On the bases of Curriculum development, the content and methodology of education is decided. The root of planning any curriculum depends upon the fundamental ideas of Philosophy, Sociology and Psychology. Curriculum evaluation is the next step in the process of curriculum development. This unit will focus on curriculum transaction and curriculum evaluation, basic considerations in curriculum planning and stages for planning of curriculum development with special emphasis on system approach.

3.3 Curriculum Transaction and Curriculum Evaluation: A Continuum

People get educated both through formal and informal ways. In a formal NSOU ? CC-ED-07 ? 82 environment all sources of information keep influencing our mind so the more we focus on something the greater is our perception about it. While learning through informal ways is always a slow process. The learners have got their own specific needs and aspirations, to cater their needs within a specified span of time, organisations like schools and colleges have been set up. Selected chunks of knowledge and series of learning experiences carried out for educating the learners is known as curriculum. Curriculum transaction is the process of instructional planning and implementation. Curriculum transaction is the process of putting into practice the set of activities listed or topics covered in the curriculum. This transaction of curriculum is a complicated task and all stakeholders specially the teachers need to reflect, visualise and plan. In order to make this process effective maximum utilisation of all physical, material, financial and human resources is required. Curriculum cannot be developed in isolation. Issues related to socio-economic factors, environmental conditions help develop meaningful curriculum. The main purpose of the school system is to preserve and transmit the culture of the society; the curriculum helps to achieve this goal. The curriculum has two important aspects to consider; firstly, what knowledge is most worth is to be preserved and transmitted and secondly how this worthy knowledge can be acquired or transmitted. Now this is the task of the curriculum planner to develop the curriculum according to the two considerations mentioned above. The process of Curriculum transaction is based on national needs, nature of course of study and the social philosophy. The form of government, recommendation of national commissions and committees, along with the theory of human organisation also determines the process of Curriculum transaction. Another important element to be considered in curriculum transaction is the growth and development of students and type of examination suitable for them. The process of curricular transaction requires a series of micro-operations performed by students, teachers, parents, School administrators, textbook writers etc. In this process the official curriculum gets transacted in various ways to the target group. Curriculum according to different perspectives In objective perspective curriculum is generally built around a set of assumptions about the knowledge, understanding and skill to be acquired and also the way it is acquired. This perspective knowledge is considered to be relatively known, fixed NSOU ? CC-ED-07 ? 83 2nd Proof • Classic Print & Procces (09-02-2022) and transmittable. Students generally demonstrate their mastery of knowledge through performance on tests. In the constructive perspective knowledge is constructed by the learners through their experience. Learning is considered to be a social process where students construct meaningful concepts through interaction of prior knowledge and new information. Curriculum can be based on any perspective mentioned above but Curriculum transaction or implementation is an indispensable tool for learning to take place. Curriculum transaction is a tough and complicated job.

90%

MATCHING BLOCK 150/392

W

Curriculum transaction is the effective and desired implementation of the curriculum contents on the basis of aims and objectives listed in the curriculum. It incorporates effective planning for providing suitable learning experiences for its learners.

This process also includes organisation or planning, administration or implementation and evaluation of the implementation procedures conducted by teachers or experts in the relevant field.

3.3.1 Important features of Curriculum

transaction: 1. Curriculum transaction is the process of planning and organising the curriculum in a particular subject area for different levels of education. 2. Curriculum transaction requires continuous monitoring while being implemented.

It requires direct involvement of teaching staff and a considerable amount of reflection visualisation and planning during the transaction process. 3. Curriculum implementation process should also reflect the changing needs and aspirations of the people. A uniform curriculum for all countries and for all time is difficult to frame. 4. An efficient and effective curriculum transaction calls for maximum utilisation of all available resources – physical, natural, financial and human. 5. The process of Curriculum transaction needs to be based upon current social, economic, and political changes in a country. From these features of Curriculum transaction it is clear that this process involves rigorous planning. The planning and development process takes into account a step by step procedure for teaching, the selection of learners, resources and facilities that lead to attainment of Pre-specified objectives. This planning phase also involves additions, deletions and interpretations about place, sequence and importance of the curriculum.

NSOU ? CC-ED-07 ? 84 Effective curriculum transaction requires adequate planning along with clarity of thought and organisation. Those who are responsible for transaction should know the appropriate method of transaction. Curriculum transaction cannot be done single-handedly therefore each team member should be aware of his or her responsibility. Different levels of children need to be addressed in curriculum transaction which requires clarity in communication. The target group that is the group of children should be observed and understood so that every child can be accessed. Material organisation and appropriate room setup both are important for effective curriculum transaction. Time management again is another important aspect to be kept in mind in all the stages of Curriculum transaction. Persons responsible for transaction should be alert always. Review of the work and keeping alternatives ready are also important criteria in ideal curriculum transaction. 3.3.2 The process of curriculum transaction: Curriculum is divided into a definite number of subjects for convenience of transaction. The topics and activities that fall under one subject altogether are known as syllabus. Text books are prepared based on this syllabus. Teacher teaches the portion of the syllabus allotted to him or her. By appropriate techniques and methods teachers transact the content of the textbook to the students thereby helping children to acquire appropriate knowledge, develop necessary skills and attitudes. This is actually the process of curriculum transaction. For effective transaction of curriculum, teacher should be competent enough in organising the activities and experiences of the learners. Planning is an important part of curriculum transaction. While planning and developing of the curriculum the different variables, namely - learners, resources and facilities are taken into account so that students may be helped to attain the pre-specified objectives. For clear understanding the process of curriculum transaction different aspects of planning need to be discussed. 1. Planning for instruction In curriculum transaction planning is a process that gives both teachers and students a sense of direction. While planning both students and teachers become aware of the goals or specifically the learning objectives and this also helps in uninterrupted teaching-learning activities. Most of classroom management problems can be handled by consistent planning. In an ideal educational setup the specified objectives are stated in behavioural terms and teaching actions and strategies are

NSOU ? CC-ED-07 ? 85 2nd Proof • Classic Print & Procces (09-02-2022) designed to achieve these pre-set objectives; which is ultimately measured in terms of student achievement. Planning results in comprehensive, integrated and meaningful content development at an appropriate level. Effective planning provides for a variety of instructional objectives, economizes cost, time and energy and also provides for logical sequencing and pacing lessons. A sequence of well-organized learning experiences can be the outcome of good planning. Planning for Purposeful Instructional Planning for teaching involves sequences of steps. It calls for decisions with respect to each of the tasks involved. If all these tasks are accomplished successfully, the prospects that students will master what has been taught are excellent. The interrelationships among these tasks are presented as a cycle. There are several issues related to planning of instruction. Most important issues in this context are Subject matter for teaching, methods to be used, levels of instruction, organising learning etc. Subject matter or content for teaching The subject matter for teaching is selected by curriculum planners at different levels. Agencies like Boards of School Education, Board of studies and various bodies associated with the education system determine the broad outlines of the curriculum. Finally, during the course of teaching the teacher decides which parts of curriculum are to be more emphasised and which ones are less emphasised. Time allotment, use of teaching learning materials, use of technology, methodology used in teaching-learning are decided by the teacher. There may be some contents which do not require much explanation while some topics may be difficult to grasp. Even experienced teachers need to plan instruction carefully for this purpose. Methods to be used The aim of classroom instruction is to bring about desired changes in students' behaviour and this cannot be accomplished by random trying out of all methods of teaching for all types of contents. The most appropriate method for teaching a particular subject matter should be selected by the teacher. Information can be catered in different ways so teachers should use different teaching techniques and devices for teaching facts, concepts, principles and generalizations. Presentation of content requires adequate planning. Students of different ages, form concepts in different ways. So a teacher should use an instructional procedure that allows learners to make direct observations. While planning for instruction the teacher should employ such methods, rules and generalizations, which will enable the students to know and understand the subject matter well. Whether the content is age appropriate, whether relevant teaching-learning tools are used, whether the presentation is

NSOU ? CC-ED-07 ? 86 enjoyable to the students are some of the concerns that a teacher should consider while selecting a suitable method. Levels of instruction Teachers can plan instruction in different ways to teach the same subject matter in different learning conditions and at different levels by various customisations. There are three levels of instruction; namely - memory level, understanding level and reflection level. In the first level students are expected to remember and produce the learnt materials as taught, so students memorise and retain the content. Generally nominal concepts, mathematical tables, spellings, symbols, etc., are taught by arranging instruction at memory level. Comprehending is the second level where the teacher presents the content meaningfully to the students. If the teachers want that the learners should be able to apply the learnt content later in different situations, then content should be explained with examples and linked with earlier experiences or previous knowledge of the learners. Instruction should be planned in such a way that students can understand and incorporate the content at mastery level and apply the knowledge in different situations. This level of instruction is called the understanding level. Reflective level is the highest stage of Instruction. The aim of reflective level instructions is to develop problem solving ability among learners. Students learn to analyse facts, categorise facts and formulate appropriate generalizations through deep thinking and is engaged in innovative and creative activities. Organising of learning experiences Teachers have to identify which facts are more accurate and relevant, which concepts are familiar to the students' previous knowledge and which new ones need to be explained. Teachers also have to find out which methodology will enable the students understand the content better, this requires planning as well as organisation of learning experiences. The scientific process of sequencing and presenting content is rooted in the principles of psychology. Learning can be organised on the basis of some considerations; the most important one is previous knowledge of the learner as on the basis of prior learning depends the ease of understanding of the present and future concepts. So all teaching-learning should precede from simple to complex concepts. The link between the concept and sub concepts should be properly explored to make the learner understand the structure underlying the concepts. For example flower is a broader concept and the calyx, corolla, androecium, and gynoecium etc. are the sub-concepts. If a student clearly understands the fundamental structure any one of these concepts, he can potentially understand other related concepts.

NSOU ? CC-ED-07 ? 87 2nd Proof • Classic Print & Procces (09-02-2022) Student's needs and interests – In planning instruction one important task is diagnosing the student's needs and abilities. Systematic techniques should be employed to gather information about the student's interest and capabilities. Students are the most important factor in the instructional process and without understanding of the students' needs and interests the teacher cannot develop instructional and behavioural objectives and formulate desirable outcomes. The teacher should try to balance the students' needs and interests with objectives of curriculum. A good balance between students' needs, interests, abilities in one hand and meaningful learning experiences provided for students in the classroom on the other helps in achieving the pre-specified objectives.

2. Different levels of planning Even before the commencement of the academic year the teachers are supposed to carry out pre-instructional planning at three stages. Course planning, unit planning and lesson planning are the three important levels of planning required for effective curriculum transaction. The number of units in a particular course is determined in a course plan. Planning of instruction helps the teacher achieve the desired objectives. A scientific and systematic planning of instruction enables the teacher to be fully in command of the system. The teacher needs to utilise imagination, creativity and insight while following the different levels of planning instruction. It is a known fact that there are no boundaries to knowledge and any topic can be extended beyond its limits. Content is divided into several units and each unit is divided in different subunits in unit plan. One unit is essentially a chunk of content and associated experiences that are perceived to fit together in a logical way. Again each subunit is divided into a number of lesson plans based on the content covered under each sub unit. Depending on the needs of learner a teacher has to delimit the contents to be taught. This requires proper analyses of the content. Analysis means detailed examination of the elements or structure of something. Content analysis means dividing the content into its constituent parts. The teacher in this process selects topics given in the curriculum, splits these into their constituent parts, arranges all these in a hierarchical sequence and limits the length and breadth of the sub-topics. The syllabus being part of the curriculum, only mentions the topics to be covered and does not prescribe the sequence. The teacher therefore, has to take up the pre-specified objectives one by one, analyse the related content and accordingly find the sequence and arrange accordingly. Throughout the process the teacher follows the needs interests and abilities of the students. Some of the sub-topics may be less emphasised because they are part of their everyday knowledge. A teacher may take

NSOU ? CC-ED-07 ? 88 up certain elements or sub-topics because these match well with the mental age of the students. The limits of the topics are decided once the subject matter has been identified. After deciding the limits and the scope of the topics the teacher has to arrange these topics in some specific order. Sequencing of topics should be based on the psychological maxims of learning like 'known to unknown' and 'simple to complex'. At this stage it has to be ensured that the sequence is absolutely rational from the point of view of the subject matter. Each element should be linked with the other elements vertically and horizontally; altogether forming a part of the main topic. Teachers' own learning experience, hunch, perception and feeling plays a very important role here. At this stage, the teacher develops a flow chart of the content. Flowchart helps to present important aspects of the content clearly and effectively and may also help reduce the burden of large amounts of unstructured content. It provides a diagrammatic view of the inter-relationships among various sub-topics and elements of the content. A comprehensive picture of the whole content is framed in the mind of the teacher as well as students. Flow charting the content: PLANT- Selected Unit or Content or Topic ? Subunit 1 Subunit 2 Subunit 3 Subunit 4 Subunit 5 Stem Root Flower Fruit Leaf ? ? ? ? ? NSOU ? CC-ED-07 ? 89 2nd Proof • Classic Print & Procces (09-02-2022) Selecting Suitable Presentation Mode After content analysis the teacher has to decide upon suitable presentation mode of the content. Numerous questions may crop up at this stage regarding – the teaching methods to be used, more suitable teaching strategies, effective teaching-learning materials and so on. There may be many answers to each of such questions and the answers primarily and depend upon a large number of criteria including the nature of pre-specified instructional objectives, subject matter, diverse background of students, learning styles of the students and strategies of teaching. Teachers should recognise the students' ability to learn and should ensure that the presentation mode selected by him should enable the students to process the presented information meaningfully and satisfactorily. Moreover teacher's own experiences and his/her personal style of teaching plays an important role in a particular mode of presentation. A brief discussion on lesson plan is given here. Different types of activities and experiences are organised in lesson plans to fulfil the objectives of that specific part of the subunit. There should be daily lesson plans to be used in the span of a period of 40 to 45 minutes. Generally there are four sections in a lesson plan. Information regarding subject, class, topic, previous knowledge and general objectives of the lesson are mentioned in the first section. Secondly comes the introduction section which establishes a link between the lessons done on the previous day and to be done on that day. Some provisions for the previous day's lesson are also included in this section. Next comes the presentation section, it involves presentation of learning experiences by using different methods and teaching learning materials. The students are motivated to take active part in the presentation phase. The concluding section comprises of summarisation, revision and evaluation. Home assignment is given in this closing phase. Generally these four phases are followed but depending on circumstances customisation is also permitted.

3.3.3 Use of media in curriculum transaction

The selected content has to be transacted by the use of appropriate media. Selecting media to be used in the classroom is a difficult task. At the very beginning teachers should have clear idea of what is to be taught, how it is to be taught, how effectiveness of teaching-learning can be tested, the nature of learners, teachers knowledge and skill to handle technology required to present the selected content. The process of selection and handling media becomes easier if one has appropriate and affirmative answers to most of these questions. The teachers can use both conventional and electronic media, but appropriate selection of media depends on several factors.

NSOU ? CC-ED-07 ? 90 Firstly, the instructional objectives to be achieved and the content or subject matter to be taught determine the mode of presentation and media to be used. Secondly, the use of media is dependent on characteristics of the learners for whom the lesson plan is prepared. Thirdly, use of media depends on the availability and accessibility of the media in school, college or university level. The cost of the media is also important here. School or college should have the required infrastructural facilities for application of the media. For example, there should be projectors for Power Point presentations and computer lab for computers. Fourthly, the user friendly and interactivity of the media implies that the learners can interact easily by using this media. This is an important factor that decides the type of media to be used. The media should be able to communicate to the learners effectively. Fifthly, the selection and use of media is also determined by the ability of the teacher to handle the media. Teachers should be adequately trained to manage the required media in the classroom. Sixthly, the media should be able to satisfy the pedagogic aspects to cater achievement of learners in cognitive, affective and psychomotor domains. Using media during instruction is an integral part of the instructional system. To avoid any confusion among students the selected content to be taught through media should be correlated with the content taught through other modes of presentation. The instruction given by the teacher through the selected media has to be integrated with the teaching methods in such a way so that teaching-learning process seems like natural flow and nothing appears artificial in the class. For example, the teacher may use discussion method in the class to teach some parts of a unit and may like to supplement the teaching by showing some video clippings to teach another part of the same unit. In other words media should not be used for the sake of using media rather it should be judiciously used to complement the major instructional method used by the teacher.

3.3.4 Different modes of curriculum transaction in classroom situation

Teachers in classrooms use different modes for transacting the curriculum content. Selection of a particular mode depends on the target group or the students, the content or the subject matter, infrastructural facilities of the institution etc. On the basis of the learning environment being provided, the curriculum transaction can be classified as structured, interactive, self- directed and computer assisted.

NSOU ? CC-ED-07 ? 91 2nd Proof • Classic Print & Procces (09-02-2022) Structured - When each and every component of the curriculum is planned and curriculum development takes place as per predetermined planning then it is called a structured process. In structured curriculum transaction and implementation in classroom also follows a specific structure and pattern. Interactive – This mode of curriculum transaction is followed mostly in group discussion as a major technique of group learning. Group discussion allows frequent and multiple ways of communication among the students in the group. Learning is more influenced by the group rather than the teacher. These interactive techniques used in the classroom may differ from subject to subject and from one level of education to another. Self- directed - In this mode of curriculum transaction, the course materials consist of a number of small chunks of information called units, each unit having its own learning objectives and the learner is given a study guide that suggests a number of ways and means to achieve the pre-stated objectives of the unit. These units are necessarily self-instructional in nature and the learner uses the suggested text books and supplementary notes as per the study guide. A course unit may contain preset assignments; work on exercises, slides and models that help the learner to proceed smoothly through the course. Course tutors are consulted to discuss any problem encountered in the units. Generally in self-directed methods variations are allowed for different types of learners with a varied pace of learning. Computer assisted – Computer Assisted Learning (CAL) offers two-way communication instead of one-way communication as in teacher-centred techniques, and in the absence of a teacher it simulates dynamic interaction between the learner and the learning programme. The computer, as an important information device, has not only extended the role of the teacher but has also individualized learning and increased learner freedom. In the process of learning, a computer performs different functions like storing, processing and retrieving information, and thereby helps an individual to be an independent learner. In CAL, the computer helps a learner to find out whether a response, given by him/her is correct or not. If the answer is correct, the learner proceeds to the next step; if not he/she is advised to redo the exercise. Besides this, it can make learning more individualized by taking into account the needs, characteristics, skills, aptitudes, and pace of an individual student. Different means of curriculum transaction used by teachers in classroom situation are discussed below - 1. Lecture method or verbal exposition This is a popular and age old practice which is used even today for transacting the

NSOU ? CC-ED-07 ? 92 curriculum. In lecture method the teacher introduces the content or topic, explains the subject matter, interact with students, conduct formative evaluation and collect feedback from students. Lectures or talk by teachers is considered to be a very important aspect of curriculum transaction; it is used for giving directions, eliciting information, inviting students' participation etc. In classroom communication teachers play a dominant role through verbal exposition and these remain to be a very important factor even if the teachers use the latest audio-visual equipment to assist them in their instruction. Teacher's lecture is not one way communication but it is also used in classroom discussion, questioning and answering and even in a cooperative learning session, when the teacher is engaged in constant dialogue with the learners to extend their thinking about particular concepts or checking their understanding of the subject matter. 2. Classroom discussions Another popular mode of transaction of the curriculum is discussion conducted in classroom. At present most of the teachers try to create interactive classroom for active involvement of their students. Discussion is an important strategy that has been employed in various situations across all models of teaching. There is no hard and fast rule to use discussion and teachers initiate discussion among students to help them achieve the behavioural objectives. The instructional objectives of the teacher are also accomplished to a great extent through discussion. A great deal of conversation, sharing of experiences and argument is required to develop complex ideas among students. Discussion can help to refine concepts and produce new explanations. In this method the students gets a chance to express their thoughts, which may be incomplete or faulty. The teachers also get scope to understand the thinking process of their students and may provide correction and feedback if necessary. Through discussion the students can improve their thinking and construct their own meaning of academic contents. This process allows students to loud thinking and enables them to strengthen their cognitive structure. This helps the student to increase their ability to thinking and reasoning. 3. Question-answer mode This method can be used as an important tool for classroom communication as well as curriculum transaction. Questioning and answering is primarily used for evaluating the substantive knowledge and skill of learners. The learners can attain higher levels of cognition i.e. application, analysis, synthesis, evaluation and creation through questioning. The teacher can use probing to understand the deeper levels of understanding, insight and discovery of the learner.

NSOU ? CC-ED-07 ? 93 2nd Proof • Classic Print & Procces (09-02-2022) In a classroom questioning can be used to understand the previous knowledge of the learner, to develop the content, to evaluate students understanding etc. Therefore the role of questioning in curriculum transaction is unquestionable and Socrates rightly accepted questioning as the main tool for education. Different questions can also be used to solve different purpose. Factual questions can be asked to assess the level of knowledge acquisition of learners and understanding. Best questions can be asked to assess the level of comprehension of content and higher order questions can be asked to assess the higher order skills of learners. While questioning the teacher should remember that there is individual difference among learners therefore, he/she should wait for the learner to respond. This reaction time or waiting time may be different for different learners. A disadvantaged child in a classroom may require more time than the average child. 4. Participation of the learners In most of the classroom situations the teachers play a dominant role and the students play the role of passive listeners. For effective curriculum transaction learners should be taken to higher levels of cognition. This can be done by increasing learners' participation so that teaching learning process can proceed in a collaborative way. Different Participation structures can be adequately employed for effective curriculum transaction - Learners' participation can be enhanced through maximum utilisation of classroom participation structures. These structures refer to typical arrangement of speakers and listeners into communication networks. The structures include specific ways of turn taking by students during group lessons regarding asking questions and also responding to the teachers' questions. In traditional classrooms teachers used to talk to the silent students and whenever the teacher use to talk with one student, the rest of the class is expected to notice silently. In order to increase participation and involvement of the learners the teacher has to shift to those participants structures where learners' participation is more emphasised. 1. Use of active learning methods: The teachers should make more use of active methods like discussion, role play, brainstorming, seminar, debate, projects, practical work, demonstration, survey, excursion etc. These methods ensure a lot of involvement and participation on the part of the learners. For more interaction and participation of the learners the teachers may divide the students into small groups and involve them collaborative learning.

NSOU ? CC-ED-07 ? 94 2. Creating greater scope for learners' involvement: Recent researches reveal that when learners are actively involved in any classroom activity then their commitment increases. With increased scope for autonomy and involvement the students identify themselves with the goals to be achieved. Therefore students should be involved in activities like distribution and collection of copies, worksheets and books; taking care of the bulletin board, acting as monitors in the classroom and prefect in the school, peer teaching, collaborative teaching etc. Here we have discussed different modes of curriculum transaction in a classroom. For successful transaction of the curriculum that teachers should have a clear idea of the overall as well as the specific objectives of teaching learning. Teachers must set realistic and achievable goals and the learners should also be provided a clear understanding of the goals and objectives to be achieved. If there is any ambiguity or lack of clarity regarding the intentions of instruction then successful transaction of the curriculum cannot be attained. 3.3.5 Curriculum

100%

MATCHING BLOCK 153/392

W

Evaluation Evaluation is the process of collecting data on a programme to determine its value or worth with the aim of deciding whether to adopt, reject or revise the programme.

Evaluation of curriculum

is a part of the curriculum development programme and is conducted when the developer or the planner and teachers want to know the effectiveness of the programme in achieving the aims and objectives; and they are also interested in improving the curriculum product. The value of a programme or course of study is assessed by curriculum evaluation. Few definitions of curriculum evaluation are given here. More definitions are stated in the fifth chapter -

92%

MATCHING BLOCK 154/392

W

Curriculum evaluation is the formal determination of the quality, effectiveness or value of a programme, product, project, process, objective or curriculum. (

Worthen and Sanders, 1987).
Curriculum

100%**MATCHING BLOCK 158/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

evaluation is a process or cluster of processes that people perform in order to gather data that will enable them to decide whether to accept change or eliminate something - the curriculum in general or an educational textbook in particular (

Ornstein and Hunkins, 1998). The process of Curriculum evaluation determines the merit or worth of Curriculum. This process determines whether the planned courses, programmes, activities and learning opportunities are developed and organised to produce desired results. This evaluation process also tries to find out how this can be improved.

NSOU ? CC-ED-07 ? 95 2nd Proof • Classic Print & Procces (09-02-2022) The total process of curriculum development depends on interaction between curriculum planning and curriculum evaluation. Changes can be legitimately made when careful evaluation demonstrates best strengths and weaknesses of a program. It can be said that no particular curricular proposal can claim widespread support unless it is justified by carefully collected data. Therefore curriculum planning and curriculum evaluation are very important stages of curriculum development. In fact the process of curriculum development starts with curriculum planning and ends with curriculum evaluation. These two processes establish link between the total process of curriculum development.

92%**MATCHING BLOCK 155/392****W**

Curriculum evaluation refers to the evaluation of different components of curriculum; namely objectives, content, methods and evaluation procedures for student assessment.

All these components are mutually dependent each has to be evaluated in combination with the others.

100%**MATCHING BLOCK 156/392****W**

To determine whether the curriculum caters to the needs and the educational purposes of the target group

the mode of elution should be chosen judiciously. Each component affects and influences the rest of the Curriculum components so these cannot be scrutinized in isolation. Some major considerations in curriculum evaluation are Pre-testing and post testing; Non reference testing and Criterion referenced testing; Formative evaluation etc. Learner scores on pre-test reveal the status of the student again the set criteria or the expected terminal behaviour. Curriculum evaluation is to be done with reference to a set of criteria called criterion-referenced testing or in relation to a norm like a normal distribution called norm-referenced testing. Comparing with a norm or standard, one can evaluate a curriculum for its attainment of objectives. Evaluation may be conducted at the Formative and Summative stages. Formative evaluation is carried out at two levels at the developmental level called process evaluation and at the implementation level or product evaluation. There are several aspects of Curriculum evaluation which makes the evaluation process a comprehensive activity and on these depend the choice of evaluation mode. Problems in curriculum evaluation The curriculum development process suffers from numerous challenges at every stage of development and implementation. Here some obstacles regarding curriculum or programme evaluation are discussed. Firstly, a common trend of putting greater emphasis on evaluation of those aspects which are easy to measure than those aspects which are important to measure is observed. In an educational setting traditionally emphasis was put on measuring acquisition of factual knowledge and basic subject matter. Presently huge efforts are utilised and most of the tests have been reviewed to assess higher order skills beyond basic subject matter. But still important aspects like critical thinking, problem solving, creative expressions, cultural appreciations etc. are neglected till date. One simple reason behind this is, it is easy to

NSOU ? CC-ED-07 ? 96 develop and use measuring devices that are associated with simpler learning. On the contrary it can also be said that people are not encouraged explore to controversial and difficult areas. As a result more emphasis is laid on contents covering all important educational outcomes, which can be easily measured, leaving important concepts unassessed. Secondly, an unauthentic sense of certainty has come into widespread existence because of uncritical use of standardized instruments. The test makers put honest efforts to create and standardise evaluation instruments. These instruments also mention different cautions and precautions to be maintained during the process of testing and evaluation. Most of the time there is a gap between the test makers and test users regarding their line of thought. Thirdly, the locally constructed measures are not emphasized. The evaluation tools and techniques can be developed on global and local basis. Many a time global instruments need to be customised to suit the local needs. A programme when constructed on the basis of the needs of local boys and girls; the creative endeavours are encouraged and students learning can be objectively assessed. Fourthly, lack of communication between teachers and test technicians: Too often teachers are unduly resistant to the complexities of standardized testing inspite of its possible benefits. Tests are mostly selected and administered with little regard to the reality of the classroom. Thus teachers' experimentation and creativity is discouraged. The measurement skill of teachers and educational test contractors has to be improved. Evaluation is a system of feedback, providing information to planners, developers, teachers, students, parents, policy framers and decision-makers. Curriculum evaluation may be formative as well as summative. Formative evaluation is a process of involving ongoing activities aimed at gathering timely information about the quality of a programme. Summative evaluation is conducted to assess the overall effectiveness of a curriculum so that decisions about dissemination, institutionalization and desired revisions can be made. Any curricular proposal cannot be widely accepted unless it is supported and justified by proving its own worth. Curriculum transaction and curriculum evaluation are two vital stages of curriculum development.

NSOU ? CC-ED-07 ? 97 2nd Proof • Classic Print & Procces (09-02-2022) 3.4 Basic considerations in curriculum planning Identification and analysis of the existing situation has to be done in the process of curriculum planning to determine needs and purposes of the programme. The programme should be formulated as per the aspiration of the nation. There should be a committee consisting of educators, policymakers, economics, philosophers, psychologists, curriculum experts etc. for developing are suitable curriculum. The process of curriculum planning is based on four important criteria. Firstly, the programme should be prepared jointly by a group of persons able to make significant contribution in the process. The role of cooperation between different subject experts is highly desirable for curriculum planning. Secondly, general and abstract considerations are important and will give a strong basis for drawing up the essential structure of a relevant programme. Thirdly curriculum planning is a continuous process and hence the preparation of a programme is not a one shot operation. Every stage of curriculum development requires continuous planning and revision. Fourthly, curriculum planning has to be comprehensive i.e. all the components of the programme must be defined with requisite precision, so that the programme mainly covers all the areas required to fulfil the objectives of curriculum. Major Areas of consideration in curriculum planning

100%

MATCHING BLOCK 157/392

W

A curriculum is more than putting together a set of academically required subjects.

In curriculum planning several things need to be considered, such as the learning needs of students; the mutual consent of teachers and administrators; the expectations of the community; and current breakthroughs in academic fields. The developmental, social, economic, environmental and institutional considerations are some of the very important considerations in curriculum planning. Nature of the discipline is yet another factor of consideration and due emphasis on role and function of the teacher is yet another point of concern for curriculum planners. And it goes without saying that no factor can operate in isolation; formulation of an effective curriculum is only possible if all the factors re considered in relation to each other.

NSOU ? CC-ED-07 ? 98 Major Areas of consideration in curriculum planning Developmental considerations Nature of discipline Teacher related factors Social considerations Environmental considerations Economic considerations Institutional considerations Diagram showing Major Areas of consideration in curriculum planning 1. Developmental considerations Ideally speaking in any educational process all the developmental considerations of learners are covered in curriculum. Curriculum planning should consider knowledge, experience and skills for Physical development, Emotional development, Social development and Intellectual or cognitive development of the learners. The activities suggested should nurture the development of ideas, skills and ways of thinking having educational values. Textbooks should not be considered as the only source of knowledge and experiences learnt by the individual. They should be able to connect the content and other aspects of the curriculum to their community at large. Moreover curriculum planning should be done in such a way so that the experiences lead the students to various avenues of enquiry that may ultimately help in achieving the objectives under affective domain. Knowledge of the nature of the learner in terms of developmental level, learning style, normative needs and other philosophical and psychological concerns are also important factors to be covered in curriculum planning. The learners are the beneficiaries of Curriculum revision efforts. It is necessary to know their needs and interests so that the curriculum design can respond to their developmental needs that impact on the growth of knowledge, skills, values,

NSOU ? CC-ED-07 ? 99 2nd Proof • Classic Print & Procces (09-02-2022) attitudes and habits as well as their expectations in relation to the socio-economic realities in their own environment. 2. Nature of Discipline The nature of discipline should be considered as an important criterion to determine what knowledge is most worthwhile, which skills must be mastered and which values are relevant. The most important outcome of education is individual development. Some progressive educators emphasize the creative role of education in society by accentuating the development of a creative learner. The objectives and demands of this changing society should be continuously examined and the forces in action should be well understood in order to keep the curriculum reality-oriented and dynamic. The background in which education functions should be continuously studied and a constant effort is required to mobilize the resources of different sciences and social sciences such as psychology, biology, anthropology, sociology and social psychology. The accumulated knowledge about society or culture should be utilized when framing educational policies and formulating the curriculum. 3. Social and cultural considerations Different social forces influence curriculum development therefore with emphasis on liberal education the curriculum contents should be revisited. To achieve the goal of productive manpower, curriculum must be made relevant to the timely demands of society so that education must enrich society, improve the living conditions of its people and help in its optimum development. A group of people in any given society may be defined by its culture which is manifested by both visible and non visible dimensions. Visible dimensions include food dress, rules and regulations, language, music, dance, means of livelihood, political behaviour as well as family community and institutional norms and practices. While the non visible dimensions of culture and society include philosophy, beliefs, value system, which have far greater influence and impact on the way of life of the people. Shared philosophy, beliefs, behaviour, norms and rules of the society are important considerations under this category. Culture is an important factor in curriculum planning as the essence of education is to preserve and transmit the cultural heritage of a society to the younger generation of the society. Curriculum is an effective tool for attaining the educational goals of a nation. Education is the hub of all forms of development in any country and no country can develop if her educational system is not strong. Curriculum planning should therefore endeavour to integrate the significant components of society and culture, which is the essence of education in curriculum development. Curriculum planners should ensure that the products of the educational system would be functional members of their society.

NSOU ? CC-ED-07 ? 100 Each social institution, including educational system, influences and get influenced by other components of society. Social customs and aims in cultural, political, and economic matters also shape school curriculum. Every institution performs in relation to the system as a whole and to its various parts. Decisions of government agencies, quasi-legal and professional organisations affect the structure, function and goals of formal agencies, informal agencies and non-formal agencies too. And operations of these institutions in turn affect governmental practice. The government implements policies on education and its curriculum for example the new educational policy of 2020, government controls are based on constitutional and statute laws; Quasi-legal agencies include universities and colleges, parent-teacher associations (PTAs), textbook writers, publishers, philanthropic organisations, mass media, etc. and professional organisation include National Council of Teacher Education (NCTE). Curriculum should aim at

80%

MATCHING BLOCK 159/392

SA

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

establishment of intercultural communication among the diverse cultures as a basis for building a world

and national community. 4. Economic considerations Probably the most powerful consideration in curriculum planning is the national economy, because educational institutions are continuously challenged to meet the workforce demands of a changing world. The process of curriculum development comes under sphere of education. Now whether financial responsibilities of education will be borne by the state or centre or both is determined by the existing policy of the country. The economic considerations are basically related to the practicality of a curriculum and this also includes the factors influencing economic condition of learners. It goes without saying that if the basic needs for food health and housing of majority of the people are not met then many children of school age are malnourished and they will remain out of school. The process of a curriculum implementation involves several actions including provision of physical facilities, development of learning materials and recruitment of untrained teachers. These recurring expenses are borne by the government, and also by the community and other institutions. Some expenses may be of non-recurring nature too. The cost of providing certain learning opportunities are weighed and compared with alternative modes of providing educational opportunities have varying cost are done by the planners. The curriculum planner has to keep in his mind four types of cost – namely, initial cost, maintenance cost, supplementary cost and personal cost. For example, if a course on inclusive education is being proposed, it will involve the initial cost of infrastructural facilities like ramps, lifts etc. the cost of maintaining the lift to keep it in working order, the cost of teaching-learning materials like books on Braille, audiometer etc., and the cost of appointing a suitable teacher having aptitude, knowledge and skill in inclusive education.

NSOU ? CC-ED-07 ? 101 2nd Proof • Classic Print & Procces (09-02-2022) 5. Environmental considerations The environment in which the educational institution is located and the culture shared by people of that locality are two very important considerations for the curriculum planners. Recently the educated society has given much attention to the environmental condition of the educational institution. The environment should facilitate students to attend to experiences that have been selected and organised for them. The supporters of learner centred designs suggest in favour of making the environment meaningful for students. Adequacy of space is very important to allow other individuals to grow or in other words if more space is provided then worthy things can be expected to happen. The environment for educational institutions should address social needs, security needs, need for belongingness, along with development of inner awareness, appreciation and empathy for others. The curriculum planners should plan for such an environment that will facilitate students learning and stimulate them for a wide range of activities. Gaining social perspective in curriculum development is by analyzing the impact of technology and the changes it has produced or is producing in society. Expansion of technology has brought vast changes in what modern man is required to do. • There are new conditions which set new tasks for curriculum developers

MEDHC 2.1 Curriculum- Principles and Planning ...
(D154644155)

An ever increasing demand for increasingly skilled and literate workers.

As new occupations have sprung up, demands have been made on the educational institutions to prepare the nation's workers 6. Institutional considerations Under this aspect the curriculum planners have to consider the relationship between the school and community. Objectives and goal of education including physical education is another important aspect to be considered by the planners. Under institutional considerations an important aspect is dealing with the physical issues of the environment. Physical arrangement for layout of the institution including floors, doors and windows should be considered in terms of cost, durability and aesthetics. Secured electrical wiring, adequate lighting, comfortable temperature appropriate for educational institutions should also be considered while planning the curriculum. Size of class should be proportionate to the number of students. Utilisation of space should be done appropriately but at the same time overcrowded classes should be avoided.

NSOU ? CC-ED-07 ? 102 7. Teacher related considerations This is an important issue for curriculum planners as curriculum implementation is mostly done by the teachers. The teachers should be aware of the education philosophy and goals of the programme. Every curriculum will require a certain group of teachers equipped with appropriate knowledge, education and training to transact the curriculum successfully. Competent teachers are an integral part of the teaching-learning system. Teachers' functions include interpretation, explanation, demonstration and guidance in various activities and experiences incorporated in the curriculum. Therefore, a curriculum planner should consider the teacher-related factors as well during curriculum planning. A certain group of teachers equipped with appropriate education, training and experience are required to successfully transact the curriculum. They are the artists who will choose the activities for their students and to help the students in achieving the pre specified objectives. Teachers decide which teaching methods to be utilised, teaching learning materials or equipments to be used etc. So the curriculum planners should decide the parameters or qualities required to serve as teachers. 8. Recognizing future needs of the students It is necessary that the curriculum planning process may anticipate future needs and expectations of the learner. In order to educate the learners to live in and cope with the demands of a world that will certainly be unlike the present in many significant ways. The modern Curriculum should be able to outline visions about the future. 3.5 Stages for planning of Curriculum development (System approach in curriculum development) Curriculum development should be done systematically and not in any haphazard manner. Many a time curriculum development process has some hidden agenda like fulfilling some specific social or political objectives or fit a particular instructors' preference. These aren't desirable problems can be avoided by following system approach in curriculum development. Let us list the definitions of a system A system is a collection of elements interacting with each other to achieve a common goal. Crunkilton and Finch, 1999.

NSOU ? CC-ED-07 ? 103 2nd Proof • Classic Print & Process (09-02-2022) Systems Model with emphasis on curriculum content. Source : Adapted from Finch & Crunkilton (1999) Webster's dictionary defines a system as "a regularly interacting or independent group of items forming a unified whole." System approach is a systematic process to coordinate all elements of a problem towards specific objectives. The characteristics of a system of may be explained with the help of a simple example –

66%

MATCHING BLOCK 166/392

SA

Sambalpur-MA-Education-SEM-II-Curriculum Devel ...
(D156211172)

Every component of the digestive system contributes to and supports in functioning of the digestive system as a

whole therefore, various components of the digestive system altogether may be called a system. A thematic curriculum framework is - A set of organised experiences such as programmes courses and other school sponsored activities that provide the students with the exposure to abroad predominant theme. Thus system approach plays a significant role in curriculum development. In the sphere of education, system is a unit as a whole incorporating all its aspects and parts, namely, pupils, teachers, curriculum, content and evaluation of instructional objectives. The teaching-learning process is viewed as communication that takes place between the components of a system. Therefore, in education, the system is composed of a teacher, a student and a programme of instruction, all in a particular pattern of interaction.

NSOU ? CC-ED-07 ? 104 There are different models which describe how curriculum can be developed in specific and systematic steps. For example in the model developed by Ralph Tyler curriculum development is conducted in 4 simple steps - development of objectives, development of activities and experiences, development of organisation and finally evaluation. Tyler's model of curriculum development was expanded by Doll. In this model the stages followed are - statement of need based on assessment, statement of objective, content list and organisational plan, description of learning experiences, evaluation plan, and lastly plan to solicit support for the curriculum. A system comprises of different components which if work in union will increase the efficiency of the system. All the components of a system are interrelated and change in one component affects the functioning of all other components of the system directly or indirectly. All the components together contribute to the wholeness of the system. An ideal system consists of five elements. Which are as follows: 1. Input 2. Process 3. Output 4. Feedback 5. Environment Inputs - The inputs are said to be feed to the system in order to get the output. For example: Input of a computer system that includes-keyboard, mouse, joystick and sun, rain, etc. Process(s) - The process is the element of a system that involves the actual transformation of input into output. It is the operational component of a system. For example: CPU, Machineries, engines, fields, ecosystem etc. Output - Those elements that exist in the system due to the processing of the inputs is known as output. The output of a system may be in the form of cash, information, knowledge, reports, documents etc. For example - Output devices of a computer which includes printers and screens, monitor etc. Environment – It implies the Boundary and interface. More explicitly environment is the space where the total process is going on. Feedback – Simply speaking feedback means collecting information regarding the quantity and quality of output.

NSOU ? CC-ED-07 ? 105 2nd Proof • Classic Print & Procces (09-02-2022) Katz and Kahn Open System Model showing the Elements of System approach Source: Katz and Kahn (1978). System approach implies a simplified but communicable representation of a real world setting or situation. This is an organised and systematic way of accomplishing a goal or task. Furthermore this approach should be practical, realistic, efficient and inclusive. Education planners define the system approach as a tool which aims at finding the most efficient and economically cost effective methods for addressing educational problems significantly. A system has three Major characteristics 1. A system is developed to perform certain function. 2. Different components of a system have got different functions to perform. A system can run only if all components contribute to the function of the system. 3. All the components of a system are interrelated hence they are interdependent too. System approach is designed in several stages 1. Planning phase : This is the period for need assessment and task analysis. Formulating of specific instructional objectives to be achieved and defining instructional goals is done in this initial stage. 2. Designing phase : In this phase programmes and lessons are designed based on the results of need analysis. During this phase attempt is made to match the needs with identified constraints. Appropriate media to achieve these goals is also selected at this stage.

NSOU ? CC-ED-07 ? 106 3. Developing phase : This stage is meant for developing new materials and revision of the existing materials. Defining learner characteristics and requirements, selecting appropriate methods suitable for effective learning to take place etc. are conducted at this stage. 4. Role assignment : Assigning appropriate personal roles for teachers, students and supporting staff, selecting appropriate learning experiences from available alternatives and selecting appropriate materials and tools required are the prescribed tasks at this stage. 5. Implementing phase : In this phase the materials which are developed are implemented in real situation. 6. Evaluating the outcome in terms of original objectives measured in student performance 7. Revising to improve efficiency of the system to improve students' learning. The word system is used by sociologists, politicians, economists, leaders and managers. This term is also used by layman and all of them refer to the wholeness component of something. In the sphere of education there are different systems that encircle the teaching learning process. The education system lies in the outer periphery, then comes the school system; the teaching learning process is placed at the centre of core. System approach is the process of thinking that implies problem identification and problem resolution. In system approach a problem can be defined precisely considering the alternatives available and thereby selecting the most efficient alternative to solve the identified problem and achieve the goal. There are various stages that are usually followed in system approach of instruction. The stages are briefly described in the following section: 1. Formulation of objectives in terms of terminal behaviour At this initial stage the specific instruction all objectives are stated in terms of observable and measurable terminal behaviours. Terminal behaviours expected from students after going through the instructional system. 2. Developing an evaluation process At the end of the evaluation process the performance of the students is tested for which the system designer has to prepare various questions or items representing the expected terminal behaviour for understanding whether all expected terminal

NSOU ? CC-ED-07 ? 107 2nd Proof • Classic Print & Procces (09-02-2022) behaviours have been achieved or not. The achievement of performance of students can be tested at the development stage as well as at the end of the process. Formative and summative tools maybe used for this purpose. Outcomes of Formative tests provide feedback during the process and the summative tools at provide feedback at the end of the process. 3. Identifying input specifications Students' entry behaviour that is their previous knowledge or prerequisite knowledge and skills is specified. Some form of test may be used for this purpose. 4. Specifying the alternatives This stage a variety of teaching learning methods may be identified that can be used effectively to achieve the desired objectives for terminal behaviours. Selection of alternatives depends on type of objectives, nature of target group etc. 5. Selecting the best alternative After identification of all possible alternatives naturally the task of selecting the best one comes up. This depends upon nature of the subject, availability of human resources, availability of material resources, size of the class etc. 6. Planning for learning experiences This is a very important step when the materials needed for providing appropriate learning experiences are prepared. The activities required for imparting the learning experiences should be arranged in order to facilitate effective teaching learning. 7. Pilot testing or try out At this stage one has to find out whether the system is functional in terms of attainment of the pre-specified objectives. The system should be tested on a small group of students in a control situation. The weakness of a system is identified by this which require improvement through rectification. 8. Revision and implementation: This is the last and final stage of the system, but one thing should be kept in mind that this is not the end of the system. Modification and revision can be done after every implementation of the system as it is an ongoing process.

NSOU ? CC-ED-07 ? 108 Various stages of System approach Identify the task or the problem Analyse the situation Identify the objectives Specify the materials to be used Try out Analyse the results Implementation Recycle Fig: Stages of system approach Advantages of systems approach ? Systems approach helps to identify the suitability of the resource material to achieve the specific goal. ? It analyses the resource needs, their sources and facilities in relation to quantities, time and other factors effectively. ? This approach allows an orderly presentation of components demonstrated to be required for systems success in terms of student learning. ? Rigidity in plan of action can easily be avoided as continuous evaluation affords desired and beneficial changes to be made. Limitations of systems approach ? Systems approach requires hard and continuous work on the part of school personnel. Some are not prepared for the extra load.

NSOU ? CC-ED-07 ? 109 2nd Proof • Classic Print & Procces (09-02-2022) ? There may be lack of understanding. Teachers and administrators are still not familiar with systems approach. Though it has been successfully implemented in industries, it has still to make headway in education. ? There is always resistance to any new method or approach, as old ways are difficult to erase. 3.6 Summary In this unit we studied the basic consideration in curriculum planning. Planning

92%

MATCHING BLOCK 162/392

W

a curriculum involves the interaction of several components, reaching beyond the academic wall to impact the entire community. Without an effective curriculum, students would not be able to understand or meet the challenges of society. A curriculum has an

objective to prepare

an individual with the knowledge to be successful, confident and responsible

citizen. To start with development of a new programme need-analysis is important, Re-evaluating the precision accuracy of the original needs analysis is important because the feedback helps to improve existing practice in developing curriculum. Hence intensive planning of curriculum is considered to be an important part of curriculum development process. Towards the end of the sub-unit, we described the process of

82%

MATCHING BLOCK 164/392

W

curriculum transaction and evaluation. Curriculum transaction is the effective and desired implementation of the curriculum contents on the basis of the aims and objectives listed in the curriculum. It incorporates effective planning for providing learning experiences for its learners, organisation of planning, administration

and implementation of the organised and planned components, and lastly evaluation of the implementations by the teacher or implementer and the experts in the relevant field. Therefore, it can be stated that

85%

MATCHING BLOCK 165/392

W

curriculum transaction is the effective and desired implementation of the contents on the basis of listed objectives in the curriculum

and curriculum evaluation is the implementation by experts. In system approach the role of a teacher can be visualised as a system designer as the teacher decide which method is to be used, which materials are to be imported and the extent of media used. Any instructional system the teacher is not merely a participant of the subsystem but he or she can create and improve the system on regular basis after each session of implementation. It is well understood that system approach is a systematic attempt to coordinate all aspects of a problem towards specific objectives. In education and curriculum development, this means planned and organised use of all available learning resources, including audio-visual media, to achieve the desirable learning objectives by the most efficient means possible.

The factors that influence the process of curriculum development are also discussed. The meaning, concept, objectives and types of co-curricular activities are also described in the first unit. In the second unit the three bases of curriculum namely – philosophical, sociological and psychological are discussed. The three major approaches to curriculum i.e. subject centred, broad fields approaches, humanistic approach along with the processes of curriculum development are also discussed in the second unit. The third unit deals with the basic considerations in curriculum planning. Stages for planning of curriculum development, curriculum transaction and curriculum evaluation are explored in this unit. This fourth unit provides opportunities to explore current developments in curriculum design and dimensions of curriculum also help to understand the central concepts the process of designing a curriculum. The theories of Curriculum Development are also discussed and this unit throws light on models of curriculum development. Ideally the principle and practice of curriculum design for Education for Sustainable Development curriculum design will consider some important areas – curriculum must take into consideration the National curriculum standards. Curriculum development requires diversification and differentiation with reference to Citizenship, value education and social transformation. Current approaches to curriculum development should be pointed towards integration of objectives, content competencies and common student learning outcomes. Curriculum should also provide opportunities to explore current trends of science, technology, health education and development of coping skills in emergency situations. 4.3 Dimensions of Curriculum development 4.3.1 Components of Curriculum Design The blue print of all teaching-learning activities are planned by the teacher on the basis of

level of students, need of the society and the nation. Nature of content

is very essential for identifying the objectives of teaching – learning. The same content can develop several types of teaching objectives. A specific range of

95%

MATCHING BLOCK 174/392

SA

Book Final modification 10.12.2018.docx (D45523568)

objectives are realized by organizing specific teaching tasks and activities. The

four elements of curriculum mentioned above, are essentially interrelated to each other. Brief description of the components is given below a) Design of goals and objectives On the basis of philosophical, sociological and psychological bases aims and objectives are decided at central, state, and local levels. Aims and objectives determine “what is to be done”. The objectives

52%

MATCHING BLOCK 173/392

W

of teaching and learning are determined by the subject’s content structure, levels of students, and type of examination

etc. These objectives are specific and written in behavioural terms so that these may be successfully developed among the students in a congenial learning environment. The statements of objectives are supposed to reflect the vision, the mission and the philosophy. b) Subject matter or content Curriculum Content or Subject Matter is the channel or the medium through which the objectives are accomplished. An elementary concern of formal education is primarily to transmit the organized knowledge to the new generation of young learners. A sound content requires proper organization of the learning contents. There should be balance, articulation, sequence, integration and continuity among different parts of the content. The content of any subject usually covers a broad area. It is divided into sub-contents or sub-units and those can further be divided into simpler elements. These elements are arranged in a logical sequence in the curriculum. The behavioural objectives are framed on the basis of each of these smallest elements of the content. c) Design of the methods and organisation Method means the Instructional strategies; resources and activities are to be used in

The level of students' attainment is evaluated by employing criterion referenced test.

Norm referenced test is used when students' attainment is evaluated in respect of the group to which he/ she belongs. Formative and summative evaluation measures the process and product of the curriculum respectively. All elements of a curriculum are distinct but interrelated to each other. These four components are essential ingredients and should be present in a curriculum mandatorily. The aims and goals serve as the anchor of the learning journey, the content or subject matter serve as the core or substance of the educational journey, method or experience serves as experience to the real spectrum of learning and finally the curriculum evaluation serves as the tool to measure how far the learners had reached on their educational journey. Relationship between the 4 elements of curriculum 1. Objectives 2. Content 3. Experience 4. Evaluation Source : Giles, et. al (1942) 4.3.2 Sources for Curriculum Design For designing a curriculum, the curriculum framers require a vision of education's meaning and goal. The designers must view common curriculum's sources from philosophical, social, and political views of society. One's beliefs and values NSOU ? CC-ED-07 ? 116 influence what one considers worth knowing and teaching. The main sources of curriculum design are: society as a source, science as a source, moral doctrine or External and Divine Sources as a source, knowledge as a source, and the learner as a source. In present context the most important source is the learner. The curriculum should be derived from various information regarding the students i.e. how they learn, form attitude, develop interest and inculcate values. The student is the genuine source where the curriculum comes from. This source influences curriculum designers by stressing student-centered learning and activities. Students are active individuals who participate in their learning. Science as a Source Science is a significant source as it provides meaning for the curriculum design. The scientific method is necessary to observe and measure all the elements and variables engaged in the process of curriculum development. Procedural knowledge or knowledge of process can be understood if only the method of scientific inquiry is adopted to deal with reality and arrive at truths Society as a Source Curriculum can be

100%**MATCHING BLOCK 178/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

designed to serve the broad social interests of society, as well as the local community.

School is a miniature of society and most curriculum framers strongly believe that curriculum should be based on an understanding of society. Curriculum developers also believe that a curriculum should enable individuals to make a place for themselves in society. So we can say, the learners are coming from the society in order to prepare themselves for the society and schools could change society if they had the will to do so. Society directs when and where to modify the curriculum and curriculum is a significant agent for that change of society. Society shows where to modify the

94%**MATCHING BLOCK 179/392****SA**

Sambalpur-MA-Education-SEM-II-Curriculum Devel ... (D156211172)

curriculum. Hence, "Whenever we have in mind the discussion of a new movement in education, it is especially necessary to take the broader or social view" (

Dewey, 1900). Knowledge as a Source The domain of knowledge itself is considered as one of the prime sources of curriculum.

83%**MATCHING BLOCK 181/392****SA**

Sambalpur-MA-Education-SEM-II-Curriculum Devel ... (D156211172)

Knowledge is perhaps the only source of curriculum, and that society and what we know about learners really serve as filters in the selection

of content (Hunkins, 1980). Knowledge can be both Disciplined and Undisciplined. Disciplined knowledge is unique as content is organised into a particular structure for example geography and physics. Whereas undisciplined knowledge content is taken from different disciplines and clustered around a focus of investigation for example Bio- science and Bio-technology.

NSOU ? CC-ED-07 ? 117 The Learner as a Source Curriculum is derived from what we know about the learner so the individual is of primary importance. Education should motivate the individual to create his or her own ideas. Based on cognitive researches the curriculum planners draw much from the psychological foundations. Therefore, curriculum should be learner centred and experience centred; and the nature of education as is well as method of teaching – learning is determined by how the learner learns, forms attitudes, values, develops and interests. The teacher serves only as a facilitator in the learning process of the individual child. External and Divine Sources There may be some external and divine Sources that influence the Curriculum design. Religion may be an important source long with curriculum designer's values and personal morality. Curriculum design Curriculum design is a record of organisation of the elements of a curriculum. It states the inter-relationship of the elements, and this also indicates the principles of organisation for effective operation. This also mentions the pre-requisites of the administrative conditions under which it is to operate (Hilda Taba, 1962). In curriculum design

66%**MATCHING BLOCK 180/392****W**

the components or elements of curriculum are organised along two vital dimensions horizontal and vertical.

In horizontal organisation the fundamental components of curriculum are arranged side by side. For example, selected contents of separate subjects like geography, history, sociology, political science etc. can be arranged into a course dealing with contemporary studies. While in vertical organisation a specific sequence, order and continuity is maintained in arrangement of content. For example, computation of simple interest in mathematics starts in class 6 then it is continued to higher classes with a higher difficulty level. This concept is similar to Bruner's idea of spiral curriculum. Johnson identified three notions of Curriculum design as - - An arrangement of selected and ordered learning outcomes intended to be achieved through instruction. - An arrangement of selected and ordered learning experiences to provide in an instructional situation. - A scheme for planning and providing learning experiences.

NSOU ? CC-ED-07 ? 118 Curriculum Tips - Establishing a Broad

75%

MATCHING BLOCK 183/392

SA

Book Final modification 10.12.2018.docx (D45523568)

Curriculum Design Curriculum design refers to the placement of the key elements of curriculum

and the relationships of these elements in one or another, a type of mapping of the curriculum course of study. Here are a few helpful recommendations for developing a broad curriculum view to be followed by curriculum planners. These recommendations can be effectively used to "Map" or design the curriculum. 1. Be sure you comprehend the rationale for the course in context with the goals of the school. 2. Be sure you understand objectives of the course according to state or school district guidelines. 3. The focus of the course should be clarified; it should be set whether the designs should stress subject matter, learner needs, societal needs, or all three in some particular balance or weightage. 4. Determine if there is a special need audience or programme for the course. 5. Identify the important components content skills, attitudes and values. 6. Examine the components of the curriculum map to see if they - a. Meet the objectives of the course, b. Address all the key thinking processes, c. Match students abilities according to the data obtained from needs assessment, d. Stimulate the student interest, e. Feasible in terms of school time allotted and school resources, and f. Balanced in terms of content, skills and attitudes. 7. Decide on the components so that they can be used as a framework for your unit planning. 8. Show the map to an experienced colleague or supervisor and revise as necessary. Source : Allen C. Ornstein, Institutionalized learning in America (New Brunswick, NJ: Transaction, 1990) 4.3.3 Dimensions of Curriculum Curriculum designs provide clear relationships between and among the different elements of the curriculum: objectives, contents, activities and evaluation. These NSOU ? CC-ED-07 ? 119 elements will determine the shape of the curriculum and also determine the kind of learning experiences it will provide. The six dimensions of Curriculum design are discussed hereunder: 1. Scope : It means the length and breadth of contents. All types of educational experiences to engage students in learning- cognitive, affective and psychomotor learning (some might add the moral or spiritual domain).

88%

MATCHING BLOCK 182/392

W

All the content, topics, learning experiences and organising threads comprising the educational plan

come under this dimension. The terms broad, limited, simple and general are few of the words that can describe the scope. It refers to the coverage of the curriculum. The scope of the curriculum can be divided into chunks called units, subunits, chapters or sub chapters as the case may be. Every chunk is guided by the general curriculum objectives or goals. Teachers and other educators should consider the scope of the curriculum to decide which content to include and the amount of detail of the content to be included in the curriculum. It is desirable

58%

MATCHING BLOCK 184/392

SA

Curriculum Planning and Development CFP3010 - ... (D13185640)

that the scope of the curriculum should be kept manageable and should address a limited number of objectives.

Now here arises a very important question raised by Herbert Spencer, who asked "What knowledge is of most worth?" This question poses many problems to the curriculum planners as it is really difficult to identify most worthy contents. One last thing should be mentioned here that is the sole objective is to educate the learner as a whole so that contents selected should reflect the same. 2. Sequence : Sequence implies the order or arrangement in which the content should be taught for the best learning (building on past knowledge) throughout the course. Educators must decide the sequence before a course begins to be effective. Vertical relationship among the elements to provides continuous and cumulative learning.

100%

MATCHING BLOCK 189/392

SA

Curriculum Planning and Development CFP3010 - ... (D13185640)

When considering sequence curriculum planners are challenged to deal effectively with the

curriculum elements so that it fosters cumulative, comprehensive and continuous learning, this is possible by establishing vertical relationship among the content areas.

60%**MATCHING BLOCK 185/392****W**

Contents and experiences arranged in hierarchical manner where the bases can either be the logic of the subject matter or the developmental patterns of growth of the cognitive, affective and psychomotor domains.

In organising content into an effective sequence the curriculum planners should take into consideration how the individuals develop and learn. At the same time they should also consider the substantive structure of the content. Hence we can say that sequencing is a very important step in curriculum design and it should take care of individual need and group interests.

NSOU ? CC-ED-07 ? 120 Principles of sequence : Four principles for sequence as introduced by Smith, Stanley and Shore are mentioned here - i.

78%**MATCHING BLOCK 186/392****W**

Simple to complex learning - Contents and experiences are organised from simple to complex, concrete to abstract, easy to difficult.

Researches reveal that students learn most when started with easy and concrete concepts rather than difficult and abstract concepts. ii. Prerequisite learning - There are fundamental things to be learned ahead. Students can learn better any content if they do have the prerequisite for learning that content. iii. Whole to part learning- This implies overview before the specific content or topics are delivered and it is related Gestalt principle. Whole versus part learning receives support by the cognitive psychologists. iv. Learning chronologically -

96%**MATCHING BLOCK 187/392****W**

The order of events is made as a basis of sequencing the content and experiences.

For subjects like history, political science; world events should be organised chronologically for better comprehension. Few other principles for organising content or sequencing in units are - - World related sequence (space, time, physical attributes) - Concept related sequence (class relations, prepositional relations) - Inquiry related sequence - Learning related sequence (empirical prerequisites, familiarity) Again, sequencing of contents or units may be done in different ways- Concept related sequence indicates how ideas are related together in logical manner. Inquiry related sequence is

91%**MATCHING BLOCK 188/392****W**

based on the process of generating, discovering and verifying knowledge, content and experiences are sequenced logically and methodically.

Learning related sequence implies people learn through experiencing contents and activities. Utilisation related sequence indicates how people use their knowledge through an activity.

NSOU ? CC-ED-07 ? 121 Continuity : This component deals with vertical repetition and recurring appearances of the content and thus provides continuity in the curriculum. For example if developing writing skill is an important objective then it becomes necessary to see that it is occurring repeatedly so that the child gets enough opportunity to practice and develop the specific skill of writing. At this point mention should be made of Bruner's " spiral curriculum" where the content is organised

90%**MATCHING BLOCK 190/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

according to the interrelationship between the structures of the basic ideas of a major discipline. The concept of spiral curriculum

emphasizes on vertical and horizontal integration of knowledge. Therefore the curriculum planners will try to establish link between topics within a discipline or field of study.

100%**MATCHING BLOCK 193/392****SA**Curriculum Planning and Development CFP3010 - ...
(D13185640)

Integration refers to linking all types of knowledge and experiences contained within the curriculum plan. "

100%**MATCHING BLOCK 191/392****W**

Everything is integrated and interconnected. Life is a series of emerging themes" (

Ornstein and Hunkins, 2014), therefore organisation is drawn from the world themes and from real life concerns. Subject matter content or disciplined content lines are erased and isolation is eliminated. It emphasizes on horizontal relationships.

89%**MATCHING BLOCK 192/392****W**

Everything is integrated and interconnected. Life is a series of emerging themes. This is

the essence of integration in the curriculum design.

90%**MATCHING BLOCK 194/392****SA**Curriculum Planning and Development CFP3010 - ...
(D13185640)

People cannot disconnect themselves from their inquiries and the curriculum cannot exist as a separate

bit. Therefore the curriculum planners should emphasize on integration between

48%**MATCHING BLOCK 195/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

various content, topics and themes involving all domains of knowledge and skills. By integration the students develop unified view of knowledge and deeper meaning of the subject matter. The opportunities of

learning should be arranged and sequenced in such a way that integration occurs within the learner. Lack of integration of knowledge in education is increasing due to knowledge explosion. At present integrated curriculum has become an urgent need as students goes on adding information to their existing knowledge without actual integration. Articulation : It refers to the vertical and horizontal interrelatedness. For example, Teacher

90%**MATCHING BLOCK 199/392****SA**Curriculum Planning and Development CFP3010 - ...
(D13185640)

design algebra course so that it relates algebra concepts to key concepts presented in geometry course.

This can be done either vertically or horizontally resulting in vertical articulation or horizontal articulation. Vertical articulation implies

55%**MATCHING BLOCK 197/392****SA**Curriculum Planning and Development CFP3010 - ...
(D13185640)

sequencing content from one level to another. It also ensures students receive necessary preparation for coursework. Horizontal articulation

is also known as correlation. It blends contents in one part of the educational programme with contents similar in logic or subject matter. At

NSOU ? CC-ED-07 ? 122 present horizontal articulation is more emphasized. Articulation is difficult to achieve as to develop interrelationships between 6th grade English and 6th grade social studies are practically difficult. Many a times it happens that contents in the curriculum are added without paying any attention to connect the subject areas. Balance : In curriculum designing when educators strive to give appropriate weight to each aspect of design.

100%**MATCHING BLOCK 196/392****W**

Equitable assignment of content, time, experiences and other elements to establish balance is needed in curriculum design.

Curriculum design committee should be present to involve teachers, parents, administrators and even students. Students' vision, mission, goals and objectives should be reviewed and used as bases for curriculum design. The needs and interests of the learners in particular and the society in general should be considered. The curriculum design should take into account cognitive, affective, psychomotor skills, concepts and outcomes. Perhaps it is very difficult to bring total balance in the curriculum. It is quite common that curriculum planners and educators tend to put too much emphasis on a single subject or group of subjects at the expense of others. Olivia (1997) has listed a set of points to consider, that can provide a base for attaining balance in the curriculum. According to her balance has to be sought between 1.

84%**MATCHING BLOCK 200/392****SA**

Book Final modification 10.12.2018.docx (D45523568)

The child centred and subject centred curriculum. 2. The need of the individual and of society 3. The needs of common education and specialised education. 4. Breadth and depth of Curriculum content. 5. Traditional content and innovative content. 6. The needs of the unique range of pupils regarding their learning styles. 7. Different teaching methods and educational experiences. 8. Work and play 9. The community and school as educational forces.

The probability of attaining balance within the various components of the curriculum may increase if the above mentioned suggestions are followed.

NSOU ? CC-ED-07 ? 123 4.4 Theories / Models of Curriculum Development / Designing The process of Curriculum development is an ongoing dynamic and interactive phenomenon and can begin with any curriculum element. Curriculum approaches or models are central to the curriculum process. These approaches are essential in determining the content and implementation of the curriculum programmes. Curriculum model refers to an educational system that combines theory with practice. A curriculum model has a theory and knowledge base that reflects a philosophical orientation and is supported, in varying degrees, by child development research and educational evaluation. Prescriptive, Descriptive and Critical Theories/Models The descriptive and prescriptive models are alternative ways of explaining the two broad and widely accepted models of curriculum development, namely, the Product and Process models. Prescriptive model stands for product model and process model almost similar to descriptive model. Types of Curriculum Models Curriculum models fall into two types, models for the curriculum which prescribe what teachers should do (prescriptive) and models of the curriculum which describe what teachers actually do (descriptive). 4.4.1 Prescriptive Theory / Models of Curriculum Development Prescriptive curriculum models are models which prescribe what teachers should do. Over the years two forms of prescriptive models have emerged - the traditional prescriptive and the contemporary prescriptive models. The most well-known example of Traditional Prescriptive Models is Ralph Tyler's Objectives or Rational Planning Model. A prescriptive theory is one that says how people or things should function, as opposed to how they actually do. Prescriptive Theory of Curriculum Development prescribes how things ought to be. The purpose of prescriptive theory is to establish norms for action which was coined by Hirst (in Tibble, 1966). In Prescriptive Theory of curriculum planning process should be defined by first thinking about the outcomes that are to be obtained by students. Having identified the outcomes, the curriculum planners, work "backwards" to, determine content, teaching and learning activities, assessment and evaluation. The terms prescriptive and descriptive are derived from the models of language teaching, especially teaching of grammar. In curriculum designing, prescriptive curriculum means to prescribe what curriculum designers should do, how to create a curriculum. This model is more concerned with ends rather than means to developing a curriculum. One of the classical examples of NSOU ? CC-ED-07 ? 124 prescriptive curriculum is Ralph Tyler's Objective based model. It asks four basic questions: 1. What educational purpose (objectives) the curriculum should

57%**MATCHING BLOCK 198/392****W**

seek to attain? 2. What educational experiences are likely to ensure attaining the purposes? 3. How experiences can be organised effectively? 4. How can we determine whether purposes

have been attained? In order to set objectives, it is essential to write them in observable behavioural terms. As for example – Acceptable objective Unacceptable objective To describe, to define To know To explain, to elaborate To understand* (*These are just examples, all objectives can be stated similarly). Recently, the classical objective based model has been modified more meaningfully on the basis of 'Broad outcomes and specific Curriculum objectives' Advantages of Prescriptive approach are ? Prescriptive models for the curriculum prescribe what teachers should do therefore this group of models provide a set of advice for the teachers and curriculum implementers beforehand. ? The advocates of this approach start with a simple message, they prescribe curriculum planning process should start with defining the students outcomes that are to be obtained by students then the curriculum planners work backwards to achieve those outcomes.

4.4.2 Descriptive Theories / Model of Curriculum Development

The authors of Descriptive Models also criticised the prescriptive curriculum models for being simply objective or out-come based model. The reason behind disagreement is that curriculum planning process is a complex human activity and so it should not be considered as a matter of following some fixed and pre-specified steps. Stenhouse, was one of the critics of the objective or prescriptive model. He put forward a 'research- based' model plan for curriculum development. For him, the curriculum process represented an agenda for classroom-based research by teachers. Models grounded in the complexity of practice were then proposed. This category of models is known as 'Descriptive' curriculum models. They represent what is genuinely happening actual setting. An example of the descriptive model is the NSOU ? CC-ED-07 ? 125 'Situational' Model developed by an Australian, Malcolm Skilbeck. This model considers the complete 'situation' or context in which the curriculum is located. The significant external and internal issues that may impinge on the curriculum developmental process are also under the purview of curriculum developers. Malcolm Skilbeck, as a champion of descriptive model of curriculum designing thinks that the situation or context in which the curriculum is developed and will work should be thoroughly and systematically analysed to find out the function and effect of every unit on the curriculum. Descriptive models are more concerned with what curriculum designers do, what the curriculum covers. The outcomes and curricular objectives are determined by what is known as Situational Analysis. This is a pragmatic approach which caters more to the societal needs rather than academic needs. Situational analysis is done both on peripheral or external and core or internal factors. As for example, some external factors are goals of the nation, societal expectation and change, Employers' and community values, nature of the discipline, support system, flow of resources etc. On the other hand, typical internal factors are, Students', Teachers' and institutional culture, existing resources, problems and shortcomings etc. Curriculum Maps Curriculum mapping is the process of indexing or diagramming a curriculum to identify and address academic gaps, redundancies, and misalignments for purposes of improving the overall coherence of a course of study and, by extension, its effectiveness (a curriculum includes everything that teachers teach to students, instructional materials and techniques they use). Before the advent of computers, curriculum designers used to do paper work for curriculum mapping. At present, spreadsheets, software programmes, online services are used to understand the extent to which the teachers are able to fulfil students' expectations and how the expectations change with time. This is also a descriptive approach to curriculum change as to curriculum development. Advantages of Descriptive approach are ? Descriptive approach to curriculum is a pragmatic approach which caters more to the societal needs rather than academic needs and societal needs cannot be adequately fulfilled without satisfying academic needs. ? These curriculum models basically represent what is genuinely happening actual setting.

NSOU ? CC-ED-07 ? 126 4.4.3 Critical Theory / Model of Curriculum Development

Paulo Freire (1985), a Brazilian educator and philosopher, wrote in his book 'Pedagogy of the Oppressed' about what he called Critical Pedagogy. This theory is basically derived from post-Marxian theorists and the theory deals with careful reflection of the suppressed socio economically backward people and how curriculum can be framed to bring them out. Critical approach to curriculum assumes that ? Education is value laden process; ? Learners actively create knowledge, participate in learning by taking a critical look at what power and impact on those who are without it; ? This way the learners recognize causal and circumstantial relationship that causes social injustice; ? Gaining power with words transfer into personal power making a social change; ? Promote critical thinking, dialogue and discussion making activities that support democratic ideals and move towards socially critical consciousness. Paulo Freire believes that, ? Teachers lead the class while following leads from the students. ? Form of knowledge gained is fixed and depends on interaction among students, text and teachers. Knowledge is treated rather than taken in. ? Education is political. Both language and power are connected. ? Curriculum is not set in advance. It emerges from action an interaction of the participants. It addresses social and community issues of importance. ? Learning is assessed through portfolio, self assessment, and by means of social and political changes and levels of consciousness reached. External performance levels do not apply. Advantages of critical approach are, ? It does not ignore the difficulties learners face in learning head on, ? It is motivating, does not separate learners' life and learning. ? Bridges class room and real world. ? Helps in social justice and empowerment.

NSOU ? CC-ED-07 ? 127 There are some disadvantages too, ? It is time consuming. ? Teachers need special facilitative skills in teaching reading and writing. ? The whole idea and practice are unfamiliar and difficult. ? Learners' potential has been ignored. ? It is formulated keeping in mind the primary or elementary education and may be unsuitable for academic higher studies. 4.4.4 Personal Curriculum Theory This theory is derived from the work of Pinar and Grumet (1976), it is based on reconceptualists and also a critique on traditionalist. Personal Curriculum, as it appears in the Michigan State notification to a number of schools intending to implement Michigan Merit Curriculum, is defined as "the intent of Personal curriculum is to individualize the rigor and relevance of the educational experience and provide a tool to help all students succeed.." Its prime features are, · Seat time waiver – A student is allowed to be in the class room as long as she wishes. Fixed sitting time is waived. ? On line learning – Facilities for on line learning are provided and allowed. ? Dual Enrolment – Flexible enrolment policy is adopted and students can enrol simultaneously in two courses of her choice. ? Testing out – Testing time is flexible. A student can opt to be tested at a suitable stage of the course and quit. ? Career and Technical Education – What is commonly known as vocational education, is provided if the learner so desires. ? Personal Curriculum – The learner is free to choose the educational and non-academic experiences to be included in her course of study. Students are encouraged to – ? Undertake competency based learning: ? Follow integration principle in content and approach in studies: ? Be awarded due credits for out of school learning by the teachers: and ? Get adapted to the school curriculum flexibility. The other features of Personal Curriculum include variation in its application like, ? To go beyond academic credit requirements focusing on enrichment of learning. NSOU ? CC-ED-07 ? 128 ? To modify Mathematics learning requirements so that learners are allowed to learn Mathematics at various levels. ? To provide Individualized Education Programme (IEP) to modify individual requirements for students with special needs. ? To modify credit requirements for transfer students. Michigan State has experimentally implemented Personal Curriculum to a number of selected schools willing to accept the plan. Obviously, the whole project is complex and needs careful planning. 4.5 Models of curriculum development: Tyler, Taba, Kilpatrick Introduction In curriculum development model serve as a guideline to action. Almost in every educational area models are used to represent different concepts. The educational field has models on instruction, administration, evaluation, supervision etc. In curriculum studies models are found in curriculum development as well as curriculum evaluation. Print (1987) explains a model as a simplified representation of reality which is often depicted in diagrammatic form. In the process of curriculum development models are designed to provide a basis for decisions regarding selection, structuring and sequencing of the learning experiences. Several models can be developed based on various approaches of

58%

MATCHING BLOCK 201/392

SA

modells.docx (D54508427)

curriculum development. Most models can be classified as either technical / scientific models or non-technical / non-scientific models.

Those educators who emphasize on subject matter approaches adopt the scientific or technical approach to curriculum development. Advocates of learner-centered and problem centered designs have formulated non-technical or non-scientific curriculum designs. Technical-Scientific Models Curriculum developers designed this approach by using the scientific model which requires observing and monitoring of components subject matters, objectives, learning experiences and evaluation. In this approach curriculum development is a useful blueprint for structuring the learning environment.

73%

MATCHING BLOCK 202/392

SA

Sambalpur-MA-Education-SEM-II-Curriculum Devel ... (D156211172)

According to this point of view, "Curriculum development is basically a plan for nurturing the environment to

NSOU ? CC-ED-07 ? 129

coordinate in an orderly manner the elements of time, space, materials, equipment and personnel." (Feyereisn, et. al. 1970.) The curriculum can be understood

78%

MATCHING BLOCK 203/392

SA

modells.docx (D54508427)

from a macro or broad point of view with its prime objective of educating the individual. It enables the educationists to work with a specific plan in mind,

which may help

91%**MATCHING BLOCK 205/392****SA** modells.docx (D54508427)

to achieve optimal student learning, through a scientific organization of its components into a complex unit. These

are the three models under the Technical-Scientific Approach. ? Hilda Taba Model ? Goodlad Model ? Hunkins's Developmental Model Hilda Taba Model is discussed in detail in the later part of this unit; a brief outline of the other two models is given here -

54%**MATCHING BLOCK 204/392****W**

Goodlad Model In this model educational aims are formulated by analysing the values of the existing culture. Then accordingly the educational

objectives and learning objectives are stated. Based on these the behavioural objectives are determined following which the learning experiences and opportunities are provided. Goodlad's model is considered as technical- scientific as the various components of this model are inter-connected. Feedback is generated after analyzing the student's performances and relating them to the values and culture of the society, and accordingly the entire model may be revised if necessary (John L. Goodlad and Maurice N. Richter, 1966; in Ornstein and Hunkins, 1988).

54%**MATCHING BLOCK 206/392****SA** SCE 611 Mankutu.docx (D50988352)

Hunkin's Developmental Model This model helps the curriculum planners to reconsider their decision making about curricular actions. If the curriculum planner finds that no content exists for a particular student

at the stage of content selection, they can revisit the curriculum development process from the very

63%**MATCHING BLOCK 207/392****SA** SCE 611 Mankutu.docx (D50988352)

beginning and rethink the curriculum to recreate and state the learning objectives. Hunkin's Developmental Model has seven major stages; namely - curriculum conceptualization and legitimization, diagnosis, content selection, experience selection, implementation, evaluation and maintenance.

There are several other technical or scientific models each having the essential aspects for curriculum development though each is not all-embracing and complete.

NSOU ? CC-ED-07 ? 130 Non-technical /Non-scientific Models Non-technical or Non-scientific Models do not mean they are non-systematic or non-rational, but this approach focuses on the perception of needs and preferences of the learners. In this approach learners are also involved in the curriculum planning process. Since this model focuses on the individual need of the learner, subject matter and society, it is considered as subjective and particularly individualistic. There are three models under non-scientific curriculum designs ? Open Classroom Model ? Wienstien and Fantini Model ? Roger's Model of Interpersonal Relations Open Classroom Model / Kilpatrick model William Kilpatrick is one of the proponents of the Open Classroom model, it is based on the Activity Curriculum. Though the believers of this model do not believe in planning any activity for the children in advance; as this may suppress and hold back the child's developmental trajectory. This movement was initiated at the time when learning was teacher dominated the whole educational scenario and learners were mere passive recipients of knowledge. The activity model allows children to move around freely in the classroom and learn by doing. In Open Classroom model learners can make choices according to their own needs, interests and aptitudes. In Open classroom model, teachers' control and rigid curriculum is replaced by child's capability and sovereignty. Weinstein and Fantini Model This model is called non-scientific or non-technical as this model is based on concern of the students. In this model the process of curriculum development is initiated with identification of the learner group. Teaching-learning process is based on the interests and characteristics of the group. The proponents of this model believe that teachers generate new content and techniques by keeping the learner at the centre to the whole process. The existing curriculum and instructional methods are assessed to modify the curriculum to meet the learner needs.

Learners' feelings, students' identity, experiences of a growing person, and students' knowledge of the social content

play an important role in determining the sources of content. This model emphasizes enhancement of self-image of the learner and instills in them a confidence and belief in themselves (Orstein and Hunkins, 1988). This model attempts to develop a feeling

100%**MATCHING BLOCK 210/392****SA**

SCE 611 TERM PAPER.docx (D54365610)

of self-worth in the learners after interaction with content and teachers.

NSOU ? CC-ED-07 ? 131 Roger's Model of Interpersonal Relations Carl Rogers (1979) is one of the proponents of this model.

90%**MATCHING BLOCK 208/392****W**

Rogers has developed a model for changing human behaviour which can be used for curriculum development.

In this model human experiences are considered more important than content or learning activities. He believes that by expressing themselves honestly and exploring each other's feelings in a group, learners can solve their problems. Rogers claims that the climate of openness in a group generates trust and permits individuals to know themselves and each other comprehensively. The main points of concern of these two approaches are outlines here - Therefore it can be stated that

59%**MATCHING BLOCK 209/392****W**

the technical-scientific models rely more heavily on the view of experts and demands of subject matter, while considering learner's needs.

75%**MATCHING BLOCK 217/392****SA**

modells.docx (D54508427)

Hence we can say that technical-scientific models primarily focus on subject matter whereas non-technical non-scientific models, which focus on learner needs

and subject matter and society. Both the groups are looking at the curriculum from different frameworks. Educators who emphasize learners and problems formulate non-technical or non-scientific curriculum designs. Technical Approach 1. This approach is considered to be logical efficient and effective in delivering education. 2. Curriculum is viewed as a plan or blueprint. 3. Curriculum development is a definable process and helps in analysis of means and ends. 4. The objectives of these curriculum approaches are usually preordained. 5. The models under these approaches are criticized as too linear. Non technical approach 1. Non technical approach is subjective, personal, aesthetic and it focuses on the learner. 2. The main focus of these approaches is the students. 3. Non technical approaches consider the learners as the participants and view learning as a holistic process. 4. These approaches question the universality and objectivity; as well as the assumptions of the technical approach. 5. These approaches put more emphasis on the personal, subjective and aesthetic nature of the curriculum.

NSOU ? CC-ED-07 ? 132 Curriculum Designs or models may again be classified under four broad categories 1. Traditional curriculum model 2. The Student-Centered model 3. The Critical model 4. The Structural model 1. Traditional curriculum model or

92%**MATCHING BLOCK 211/392****W**

Subject-Centered Curriculum This traditional model focuses on the content of the curriculum. The subject centered design corresponds mostly

to the textbook written or study materials prepared for the specific subject. Some common examples of this model are Subject Design, Discipline Design, Correlation Design, Broad field design/interdisciplinary etc. 2. The Student-Centered or child-centred model Rousseau, Pestalozzi, John Dewey and Froebel are the proponents of Child-centered design/model. It

81%

MATCHING BLOCK 212/392

W

is based on the needs and interests of the child. The learner is considered as an active individual but as one who engages with his/her environment.

Experience- centered design, Humanistic design are some of the models or designs under child-centred model. The integration of thinking, feeling and doing of the whole person is emphasised for developing the positive self-concept and interpersonal skills. This model states that

91%

MATCHING BLOCK 214/392

W

the cognitive, affective and psychomotor domains need to be interconnected and must be addressed in the curriculum. 3.

The Critical model or approach to curriculum Paolo Freire (1985) was a pioneer of critical approach to curriculum. This approach assumes that education is a value-laden process. Freire's theories and curricula promote critical thinking, dialogue, and discussion making activities that support democratic ideals and move towards socially critical consciousness. In developing critical curriculum, teachers must first learn about important issues in their student's lives through conversation, and lots of listening. Learners actively create their own knowledge as they participate in learning by taking a critical look at who has power and what impact the powerful person has on the lives of others. The form of knowledge gained is fixed and depends on interaction among students, texts and teachers. Knowledge is created rather than taken in as readily available. 4. The Structural model This approach assumes that every discipline has a fundamental structure, which is reflected by the organisation of its content and the interrelationships among its various NSOU ? CC-ED-07 ? 133 components. The curriculum should reflect the structure of the specific discipline. Understanding of the structure will enable the students to develop new ideas, thoughts and insights; then they can express these in their own language. In this approach the structure is most important hence the curriculum in a particular subject can be formulated in advance for various grades. Gaining mastery on subject matter is most important. Knowledge about learners need, interest and attitude is of little importance. After giving an outline of the four broad categories of Curriculum Designs or models, in the following section three very significant models of curriculum development is discussed - 4.5.1 Tyler's model of curriculum development Ralph Tyler (1902-1994) published more than 700 articles and 16 books. Tyler stated that the curriculum should be dynamic and it is such a programme which is constantly evaluated and revised. Before Tyler, curriculum was thought to be a static set programme and preoccupied with student testing. For the first time he offered the innovative idea that teachers and administrators should spend as much time evaluating their plans as they do while accessing their students. Ralph Tyler's Objectives or Rational Planning Model is called the Objective Model because it starts with the objectives. This model sets out what curriculum workers should do.

Tyler proposed

100%

MATCHING BLOCK 215/392

W

that curriculum planners should identify general objectives by gathering data from three

main sources, which are the learners, subject matter and the contemporary life outside the school. After identification of the objectives the planners need to refine them by filtering through two screens that is the philosophical screen and the psychological screen. In

59%

MATCHING BLOCK 216/392

W

Tyler's model of curriculum development four basic questions are raised. 1. What is the purpose of education? In other words, what educational

purposes should the school seek to attain? This question indicates determination of objectives. The learners should be studied and observed important source of educational objectives. The philosophy and contemporary life outside the school can be used in selecting objectives. The psychology of learning and learning experiences of children are considered as important sources for selection of objectives. In determining objectives the progressives emphasize the importance of studying and understanding the child to find out his own objectives and interests. If the child encounters any problem, that should also be known to the curriculum planners while selecting the objectives. Subject specialist and teachers especially chapters may also be considered as important sources for selecting objectives.
