Entire Document

PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific / generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes of all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this, we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

Prof. (Dr.) Subha Sankar Sarkar Vice-Chancellor

Summary 1.7 Self-Assessment Questions 1.8 Reference 1.1

Objectives After going through this unit, you will be able to – ?

understand concept, nature and scope of

Educational Studies; ? elucidate the aspects of Educational Studies; ? analyze how Education and Society are inter-

related. 1.2 Introduction “Education” is a very common term. But if I ask you, what do you mean by EDUCATION; in all probability you will find that this question will have multiple answers. Some will say it is learning, some may say it is acquisition of knowledge, some may say it is getting some degree after completing a course; some may say it is the all-round process of development of a person etc. However, the English term EDUCATION is derived from Latin Words: ? “Educere”, which means to draw out, ? “Educare” meaning to nourish, and ? “Educatum”, which means to instruct.

NSOU ? CC-ED-01 ? 8 On combining the three, we can see that “education means drawing out of the inner qualities of individuals and nourishing them through instruction[”. This may lead to a change in behavior. Thus, education helps in modification of one’s behavior.

75%

MATCHING BLOCK 1/143

SA QUADRANT-I.docx (D46082731)

Education is also the process of acquisition of knowledge, skills, values, beliefs, and habits.

Thus, it means facilitating learning or modification of covert and overt behavior. This takes place right from the time of birth till the end of one’s life. It is not limited to the arena of schools and formal educational institutions only, it includes people in general and at work too. In short, it is a life-long process. So, we can see that it is a complex process. Does it take place only at an educational institution? No, we get education also from our family members, from friends, mass-media like newspaper, Television etc. 1.3 Educational Studies 1.3.1 Concept To understand an abstract concept like education or educational studies, one is required to explicate its meaning or nature from the point of view of the functions such concepts perform or the contexts in which such concepts are appropriately used. But there is another sense also in which people (probably wrongly) see education as an instrument by application of which certain individual or social changes are brought about. Interpreted in the latter sense, the economists would see education as a commodity in which it is profitable for the community to invest. Sociologists would tell people that education is a socializing force and teachers are the socializing agency in the community. Similarly, a psychiatrist would say that the role of education, and hence of teachers, would maintain the mental health of children. But you will agree that education is different from being a commodity, real estate, type of social work or psychiatry. Education is what it is and not the way it is differently interpreted. Education is there in all of the above and each one is linked to the process of education, yet it lays above all these. We talk of educating children, teaching or instructing them; socializing or developing or converting them into good citizens or good human beings. In all these expressions definitely something that we call education is involved. But what exactly is that, a process or a product is not very clear. If it is a process, how does it occur or what are its conditions? And if it is a product, what does it look like? How can one define that product? There are such and many more questions, which occur to us when we talk of understanding education. In this unit, an attempt has been made to seek answers to such questions in order to arrive at a deeper understanding of education.

NSOU ? CC-ED-01 ? 9 Etymologically, the word “Education” is derived from the Latin words “educare” and “educere”. Educare refers to “to bring up’ or “to

76%

MATCHING BLOCK 2/143

SA CHAPTER.docxfff.docx (D38939747)

nourish”, whereas the word ‘educere” means “to bring forth” or “to drag out”.

Some

60%

MATCHING BLOCK 3/143

SA CHAPTER.docxfff.docx (D38939747)

others believe that the word has been derived from another Latin word “educantum” which has two components. Implies a movement from inward to outward and “

duco” refers to developing or progressing. An analysis of these words reveals that education aims at providing a learner or a child a nourishing environment to bring out and develop the latent potentiality hidden inside him. In India, the concept of education is traced back to the “Gurukula Parampara” which was developed in ancient times. Basically, a Guru-Shishya or Teacher-Pupil tradition emphasized the education of the latter in ancient times. Two prominent words in Sanskrit namely, “Shiksha” and “Vidya” also stand out equivalents of the term “Education”. The former has been

40%

MATCHING BLOCK 4/143

W

derived from the root word “Shas” meaning “to discipline” or “to control”. The latter word is derived from the root word “Vid” which means “to know”.

Therefore, ancient Indian education stressed emphasis on two of major aspects in the education of an individual. These are 'discipline' and 'knowledge'. A learner must be disciplined and develop a curiosity to acquire new knowledge to lead a fruitful life. Therefore, Educational studies are a field of study that tries to see how education takes place. It intends to foster within students a deep understanding of the complexity of education and schooling. It also tries to develop the ability to think critically about the ways in which education interacts with a broad range of social, cultural, political and economic forces. It provides students with the opportunity to study the discipline of education as it relates to other liberal arts or social science disciplines. Looking back at the history, we find that Education was studied as a part of the teacher training course. As the demand for trained teachers increased, especially in schools, the B.Ed degree was considered to be degree in Education. Then Education was studied as a combination of philosophy, psychology, history and sociology. It dealt mainly with the environment of the classroom and school education. The different subjects of philosophy, psychology, history and sociology were taught as different entities were mainly theoretical in nature. The prime focus was on the subjects they were going only to teach in the classrooms and classroom management. Gradually, with changes taking place in the socio-political and educational fields, teaching was no longer restricted to classroom only. The role of teacher and the educational institutions started changing. With distance education, open learning, internet etc. coming in, the need for changing the outlook towards teaching and learning was felt. Along with school teaching, need to look at teaching in higher education, adult learning, distance and open learning were NSOU ? CC-ED-01 ? 10 felt. The different contributions of the different subjects like history, philosophy, psychology and sociology were needed to be combined along with management and technology to form a new discipline for academic pursuits called EDUCATION or EDUCATIONAL STUDIES. Definition: Education of a human being is, perhaps, the most cherished goal of any human civilization that ever existed or is yet to come in this world. Therefore, philosophers, educationists and great thinkers have tried their best to define education. But in most of these definitions, one would find the mark of their conceptions of the reality, values and belief systems. Although such definitions might reflect the contemporary societal systems.

85%

MATCHING BLOCK 5/143

SA

CHAPTER.docxfff.docx (D38939747)

No single definition has been found so far that satisfies everyone. The search for a universal definition of education still

continues. However, the definitions of education given by the great philosophers and educationists can broadly be categorized into three major trends. They are discussed in the following paragraphs: Education as a Spiritual Pursuit: The stress on education as a spiritual pursuit is basically an Indian concept. Right from the Vedic period, Indian spiritual thinkers have been propagating education as the means of achieving spiritual goals. According to the Upanishada as, "Education is that whose end product is salvation" and Adi Shankaracharya said, "Education is the realization of the self". The Rigveda says, "

78%

MATCHING BLOCK 6/143

W

Education is something which makes a man self-reliant and selfless". Viveknand says, "Education is

the manifestation of divine perfection already existing in man". All these definitions underline the pre-supposition that human beings are the creation of God. It is education whose role is to bring out the divinity already existing in man and help him to realize himself as well as lead him to achieve salvation. Development of Innate Human Potentialities: According to some educators, the human being is the embodiment of rich inherent potentialities and it is the task of education to help him to develop, enhance and realize these potentialities. These innate potentialities are to be tapped right from the birth of a child and nurtured through his growth and development of adulthood. Rousseau said, "Education is the child's development from within".

93%

MATCHING BLOCK 7/143

SA

MS original.pdf (D142208068)

Plato propagated that, "Education develops in the body and soul of the pupil all the beauty and all the perfection he is capable of",

whereas
Froebel said, "

91%

MATCHING BLOCK 9/143

W

Education is unfoldment of what is already enfolded in the gene. It is the process through which the child makes the internal external".

According to
Mahatma

80%

MATCHING BLOCK 12/143

SA

CHAPTER.docx (D38939747)

Gandhi, "By education, I mean an all- NSOU ? CC-ED-01 ? 11 round drawing out of the best in the child and man - body, mind and spirit".

86%

MATCHING BLOCK 8/143

W

T.P. Nunn says, "Education is the complete development of the individuality of the child so that he can make an original contribution to human life according to the best of his capacity".

A close analysis of these definitions reveals the following: ? Human personality has different facets - physical, mental, social and spiritual; ? It is the task of education to ensure harmonious and balanced development of these innate powers of an individual by providing a nurturant and conducive environment for their growth and development. Social Orientation: According to some thinkers, education is a means to achieve larger societal goals as it is a sub-system of the macro-societal system. Hence, education of an individual should emphasize his orientation to achieve the social goals. In this context, social dimension of education takes priority place in comparison to individual dimension of education. For example, Kautilya says, "

100%

MATCHING BLOCK 10/143

W

Education means training for the country and love for the nation".

Similarly John Dewey has said that "

91%

MATCHING BLOCK 11/143

W

All education proceeds by participation of the individual in the social consciousness of the race". 1.3.2 Nature Education

is a Tri-polar process: Fig - 1: The learner, teacher and environment form the three poles Interactions of the three lead to education and change in behavior. The bigger environment or society determines the aim, contents and methods of knowledge dissemination by framing the curriculum, through textbooks etc. Educational Studies tries to probe into the

91%

MATCHING BLOCK 14/143

W

systematic process through which a child or an adult acquires knowledge, experience, skill and positive attitude. It

also tries ENVIRONMENT EDUCATION TEACHER LEARNER

NSOU ? CC-ED-01 ? 12 to look into the various methods of learning and teaching, stages of growth and development. It tries to look into the policies, socio-political conditions, means and methods of implementation of that etc. Thus, the Nature of Educational Studies is very complex, as education itself is a complex process. 1.3.3 Scope The scope of any subject or area of study

89%

MATCHING BLOCK 13/143

W

means its range of view, outlook, field or opportunity of activity, operation and application.

In the broadest sense, education begins in the womb and ends in the tomb. It is concerned with the whole being of an individual and encompasses the entire life experiences of a person in relation to his environment. The scope of educational studies lies in the range of educational operation in terms of various social spaces or environments, the major focus of the study of knowledge or the mode of imparting education. On this basis the scope of educational studies can be stated as: Educational Philosophy Philosophy of education emerged as one of the separate and newest disciplines in the twentieth century. Educational philosophy is the combination of philosophy and education. Educational philosophy is the philosophy applied in the field of education for solving various issues related to it. It forms the basis for determining the aims of education. Educational Sociology

96%

MATCHING BLOCK 15/143

SA

CHAPTER.docx (D38939747)

Educational sociology may be defined briefly as a 'study of relations between education and society'.

This branch of society deals with the aim of education, method of teaching, administration and supervision, curriculum and school of environment. Educational Psychology Psychology has been regarded as one of the most influencing factors which affect the process of education in different ways. Educational psychology studies various stages of physical, social, mental and emotional development of a child. It deals with the problems related to personality, intelligence, adjustment and understanding of a child. Educational Technology This branch of study helps the teacher and students to achieve the most effective learning with the least possible time, energy and resources by applying various teaching techniques. Special Education Special Education refers to the methods of imparting education to deviant groups of the society – differently abled, backward or marginalized.

NSOU ? CC-ED-01 ? 13 Other Fields of Study Since education plays a dynamic role in the dynamic society, many new subjects of studies are coming under the jurisdiction of education such as Inclusive education, Library education, Audio-visual education, Population education, Environmental education, Adult education, Women's education Health and Physical education, Globalization and education etc. 1.4 Aspects of Educational Studies In the last sub-unit, we have discussed about the meaning of the term education, its concept, nature and scope of educational studies. Now we will look into the aspects that are dealt with in Educational Studies. In the formal sphere, we find that educational studies cover the various aspects of education including student learning, teaching methods, teacher training, and classroom dynamics. Following are the important points related with the aspects of educational studies: ? For this it takes into consideration about the educational philosophy so as to decide on the

60%

MATCHING BLOCK 16/143

W

aims of education, nature of education, importance of education and functions of formal education. ? Main aim of education is the development of child. Psychology helps to understand the child better and also the development of child with respect to physical, mental, emotional, social adjustment, individual difference, personality, thinking, reasoning,

and problem solving. Psychology also helps in understanding the appropriate teaching methods, means of drawing attention and increasing attention of the learners, dealing with teacher stress and teacher personality. These aspects are looked into with the help of Educational Psychology. ? The child as well as the teacher, lives in the bigger society, while the classroom is a miniature society. Educational Study looks into the, need and type of society, culture, interrelation and interdependence of culture and society. ? The present always stands on our past. Educational studies tries to look into the aspects of nature the historical development of the present system of education, its aims, policies, methodology of teaching, study materials used etc. History of Education is an important aspect considered by Educational studies. ? Education leads to the development of human resources which again can help in the economic development of the country. It is important to look into the

NSOU ? CC-ED-01 ? 14 cost or investment and the return. Educational Studies tries to look into the demand of knowledge, the scope in the national and global sphere. Economics of Education is also an aspect that has to be looked into. ? With changes in the socio-economic-political and cultural spheres the roles of teachers have changed too. Teaching methods are also changing at a drastic speed. Teaching skills and proficiency need to be refreshed, technology has to be applied as per the needs and demands of the learners. This aspect forms an important part of Educational Studies. ? In the fields of Non-formal and Informal Education the aspects that are very often looked into are the role of social institutions, mass media, distance learning methods etc. ? In fact, educational studies have a whole lot of areas to constantly revisit and research for the progress of the society, nation as well as whole mankind.

1.5 Education and Society

Right from the pre-historical age we find that man has tried to adjust himself or change the environment to suit his needs. He used stones to kill animals to feed himself. Then he learned to sharpen the stones and make weapons, which made his hunting of animals easier. He learnt to use the skin of hunted animals to cover himself and protect himself from the fury of the weather. Once he discovered how to light fire by rubbing two stones against each other, he learnt to keep himself warm, cook or rather roast the raw flesh of animals and have a tastier meal. His learning to change has been taken place from the environment. His environmental needs and experiences have been his motivating teacher. We all know that education helps us to adjust with the environment. And this adjustment carries on throughout life. For example, we learn the language from our family members who form our first environment. We use gestures and then learn to speak to express our needs and communicate with others in the environment. Family is our first place of socialization. Our family members are a part of the larger society. The family members educate us with the norms, culture and social customs. We learn and gradually modify our behavior to be a part of that society. School or Educational institutions are in fact miniature society. The aim and values are reflected in the aims of education. Those are transmitted through the curriculum. We can also see how the values upheld by the society are reflected in the curriculum overtly as well as covertly. For example, dress code, the celebration of important days

NSOU ? CC-ED-01 ? 15 etc. In fact, teachers and students come to the institution from different culture, follow different customs and language. At the institution, there are interactions amongst the members leading to assimilation and adaptation. The rules of the institution develop in us the value that we may have freedom and differences as individuals yet we need to follow certain rules, which are common, for the benefit of the institution and society at large. Education and society are intimately related. Education is a social process which can help in bringing about social change. At the same time, we find that the aims of education are decided by the need and values of the society. Through the educational institutions like schools and colleges we develop the following social processes which are required by the society for the future citizens. ? Interaction - Interaction helps in the development of communication and relationship. For a society to exist interaction amongst its members is of vital importance. Interaction is a system of response which brings about changes in the social attitude and behaviours of the individual. Interaction helps in changing both the individual and society. ? Socialization - It is the act of adapting behaviour to the norms of a culture or society. For example, learning of language, developing certain habits, ways of taking food etc. Through socialization social rites, rituals, traditions are transferred to the next generation leading to the preservation of social heritage, ? Opposition and co-operation - Changes in society can take place through opposition. Opposition may be expressed through competition and conflict. Competition is constructive and controlled by social laws whereas conflict is narrower and destructive in nature. Individuals working together to reach a particular goal is co-operation. Co- operation is vital for the members of the society in order to bring about any progress. ? Assimilation - When a culture or group accepts certain social ideals from another culture or group and makes it a part of their own it is assimilation. ? Acculturation - It is a type of cultural modification process. Two social groups through constant contact influence each other leading to the emergence of a new cultural unit. ? Accommodation - When two groups of equal ability tend to live together without dominating on each other, accepting each other by adjustment and tolerance of the differences, it is accommodation.

NSOU ? CC-ED-01 ? 16 From the above social processes, we can see that educational process is very similar with the nature. There are mutual interactions between pupil and teacher, pupil and pupil, teacher and teacher as well as the other individuals of the educational institution. Socialization also takes place in the educational institution through purposive and balanced interactions. Competition and co-operation are encouraged. Through assimilation, acculturation and accommodation new ideas develop leading to the development and progress of society. Again, society decides on the aim of education and provides it to its citizens for the future. Let us look at an example. Think of India 100-150 years back. Initially most girls were not given the opportunity for education. Only few girls belonging to affluent class were trained in the basic skills of reading and writing by tutors who would go to their respective homes. Then most of the schools catered only to boys. There were very few Indian girls of the middle-class families who went to school later on. The need for the education of girls was being emphasised by Vidyasagar, Raja Rammohon Roy and also the other social reformers. Slowly girls were given more opportunity to pursue formal education So there were few girls' schools, and no co-educational schools. Gradually, as girls started getting school education, they started realizing the importance of pursuing education further. They also felt the importance and need of equality and economic independence. Hence, families started becoming less rigid and became more permissive for female education. Slowly with a change coming in due to education and outlook as well as value for education, society realized the need and importance of allowing girls to pursue higher education. It was realized that women would add to the human resource of the nation. So, girls were allowed by society to take admission into technical and vocational courses too. Slowly society created opportunities for girls to avail the technical and vocational education by either establishing institutions for girls or allowing boys institutions to be converted to co- educational institutions. Girls too by bringing in success in the different areas of work had started bringing about a change in the approach and outlook of society. Thus, we may conclude that education arises from the need of the society and helps in the development and progress of the society. The two are intimately related to each other and one leads to other. Society

96%

MATCHING BLOCK 17/143

W

Society is a group of people living together. According to Ottaway (1953), "People living together are said to live in a society or community". R.G Collingwood, cited by Ottaway describes a society as "a kind of community (or a part of a community), whose members have become socially conscious of their mode of life and are united NSOU ? CC-ED-01 ? 17 by a common set of aims and values. It is a collection of people who look to the future." From a sociological perspective, human society owes its culture, certain norms and systems from existing society. All these systems are made by society itself but once these systems are made, they control the functioning and activities of the society. The systems (economy, education policy) which control the functioning of the society are the sub-systems of that society. These sub-systems are interdependent because they transfer ideas or principles which are interrelated to each other. As a sub-system, nature of education is dynamic, not static as it goes through various changes according to the needs of society. You can read many books, theories etc. which might have given you conceptual knowledge and practical aspect of education as a sub-system. Education is also related with different sub-systems like economy, polity etc. You will read interrelationship of all these

sub-systems

further with education in this Unit. Characteristics and Functions of Education as a Social Sub-system As a sub-system, education has the following characteristics: ? Education is a part of larger system called society. ? Education as a sub-system has its own rules, regulations, norms and more importantly,

its

98%

MATCHING BLOCK 18/143

W

parts like school which includes primary-elementary secondary and senior secondary levels. ? Education, as a sub-system, has specific aims and objectives. Education has the objective of overall development of the human being. ? Education as a sub-system receives input from the society and changes occur in the system of education according to the needs and requirements of the society. ? As a sub-system, education arranges its resources in the form of teachers, infrastructure, etc. from external environment, and from other systems of the society. ? As a sub-system, education enhances the functioning of other systems of society and acts like a changing factor and transmitter of changes. ? As a sub-system, education is also affected by other sub-systems like culture, religion, economy etc. Education, as a sub-system, helps to build a qualified and creative workforce which can use technologies to develop the economy of the country. This way, capacity and ability of working of people living in any society is increased which enhances the sense of respect among each other and creates cooperation and respect for inter- cultures and inter-traditions. Education brings in a sense of rights and responsibilities NSOU ? CC-ED-01 ? 18 among individuals. People come to know about different values and life skills, learning to be, learning to do, learning to know, learning to live together etc. by education. This inculcation of social attitude leads to the development of a healthy society having people of peaceful mind and responsible attitude towards society. People learn how to preserve their culture, perform duties and avail their rights etc. with the help of education. Thus, education is an important medium of transmitting values, preserving cultural heritage, inculcating multiple values and life-skills, and helps in the holistic development (social, economical, political, and cultural) of the society.

Structure and Nature of Indian Society Social structure is a social organization which is based on the pre-established patterns of social interaction between different relationships like parents and children, teachers and students, employees and employers etc. These relationships regulate through accepted norms, concepts, beliefs, principles, behaviors between the relationships. Anthropologically, social structure is an enduring pattern or interrelationship of social elements/entities. In other words, it is more or less enduring pattern of social arrangements within a particular society, groups or social organizations. In general, social structure is an arrangement of persons in institutionally controlled or defined relationships (Brown, 1952). Indian society is a versatile society. Many castes, creeds, religions categories have formed Indian society and live together peacefully. In India, there exist many religions, customs, and beliefs. Social structure of Indian society is an amalgamation of various castes, religions, language, ethnicity, social classes etc. Caste System As we all know, Indian society was divided into four major castes: Brahmin, Kshatriya, Vaisya, and Sudra. Being a conservative social caste systems practice in India, still in the present time it has experienced to live with cooperation and cordially with each other. Indian society is the biggest example of 'unity in diversity'. There are equal rights for all. This describes the diversified structure and nature of Indian society which is based on unity in India. Social Structure The beauty of Indian society is its joint family lifestyle which still exists all over the country but due to the effect of modernization on the Indian family system nuclear families have come into existence. It shows that social structure of India is a mixture of multiple cultures, castes, and creeds and follows hereditary principles. Social structure

People generally follow the customs, religion, culture and even occupation prevalent in the families to which they belong. Indian social structure is Multi-religions, Multicultural, Multilingual. But at the present scenario a lot of changes in the system have been observed specially in the occupations. Democratic Structure Structure of Indian society is democratic. Everyone has the freedom and equal right to live. Indian political system follows democracy in which all the people have the right to vote and select the government. It follows the democratic principles of "of the people, by the people, and for the people". In Indian democracy justice, equality, brotherhood and liberty are the four pillars. In Indian

society every religion has its norms and principles. Indian society is coloured with multi-religious groups like Hindu, Sikh, Muslim, Christians etc. These religions make Indian society a very rich and vast one. Each culture respects the existence of the other and people carry respect in their hearts for each other. Because Indian society is multi-religious and multi-cultural, there are many languages used in Indian society like Marathi, Bengali, and Gujarati etc. This is also a

sub-system of Indian society.

Education in Indian social structure Indian education system has moved from the Gurukul system to 21st Century modern education system. There was a time when Gurukul system, Madrasa etc. were followed to educate children. Students used to study in Ashramas or Madrasas, but since British education systems to till date, India has developed a lot in its present education system. Now, education is given in the formal schools. As we can also see in our modern Indian society, inclusive education system has prevailed in Indian schooling. Education provisions are made for all children and special provisions are for children belonging to disadvantaged section of society. Gender and Indian Society In ancient Indian social structure, women were not treated equal to men but in the present structure women have equal rights to education and occupation. Indian social structure gives special place to women, as women are the bearers of family culture and duties. Women in the modern Indian social structure also are the important workforce of Indian economy. For protecting the rights of females, special laws and provisions have also been made in Indian Constitution. Economy and Indian Social Structure: The economy of India is a developing one. There are many professions followed in India, from a small trade to big industries, from agriculture, handicrafts to manufacturing

Education and its Relationship with Indian Social Structure There are various forces in a society which act like social sub-system. These

sub-systems are

related with education, for example, education helps to provide the right direction and solution for cultural conflicts. Through education, culture is transmitted from one generation to another. Education provides strength to the economy of a country. It helps to make policies and provides directions to implement various policies. Inter-relationship between Education

98%**MATCHING BLOCK 28/143****W**

and Economy Education is a key factor which influences the abilities and skills of working people. These increased abilities lead the economy towards better productivity. It also enhances technological skills, like using computer and ICT along with the workforce and ultimately these increased and polished skills results in good economic growth. Innovations in education improve the capacity of the economy by promoting more insights, ideas, economic, social and industry trends, technology etc. Education is

the

100%**MATCHING BLOCK 29/143****W**

medium to increase the capacity of the economy. According to Organization for Economic Co-operation and Development (OECD 2010), education functions like a means of applying and framing new ideas for the growth of national economy and it also includes knowledge of using new technologies for broader private and social returns. Education

as a social phenomenon is concerned with the preparation of the children for their future occupations in life. This is one of the main economic functions of education and it is in the interest of both the nation and the individual. Education and Policy

100%**MATCHING BLOCK 30/143****W**

Education is treated like a strategic agent for the transformation of mindsets and for the creation of a well-educated nation. A nation where all citizens are well equipped with knowledge which is required to competently and competitively solve the challenges comes

for

93%**MATCHING BLOCK 31/143****W**

the development of a nation. In this light, the education system NSOU ? CC-ED-01 ? 21 is restructured and transformed qualitatively time to time. With a focus on promoting free and compulsory education to all the children from 6 to 14 yrs of age group; the vision emphasized the need to ensure that all children of India should get basic education so that they can be future productive citizens of a country. Poor communities and

socio-economically

MATCHING BLOCK 32/143

W

backward sections of the society have been targeted to ensure their access to basic education. As more equalisation facilities have been provided to the backward classes more workforce has come into existence. More skillful persons have become the part of the social system and policies are framed and reframed from time to time to develop the nation. Education and Caste System India is a country of very strong social institutions. Caste system is one of the main reasons of this strong social institution. Children who belong to lower class and caste face various challenges like economic backwardness, lack of education, lack of resources. After independence, to upgrade the lives of backward class, various policies have been framed. Modern liberal education system which is based on democratic values like equity and equality, liberty and fraternity has changed the thinking process of the people. Various scientific values that have also

been

97%

MATCHING BLOCK 33/143

W

included in the present education system that have increased the thought process of the people with the spread of education. Education guides the nation to live peacefully without any difference. Education and Amelioration of Social Backwardness Amelioration means "to make or become better". In any society when traditions become a burden on the members of the society or if any social change does not act in favor of the members of the society than education acts like an agent or a sub- system to ameliorate or improve the situations for betterment. Education improves the level of awareness by making people ready for learning. There are certain members of a country who used to suffer from gross economic deprivations and social humiliations. The major segment identified among the backwards has been the scheduled castes and scheduled tribes, and the backward classes. Another category of the backward group included women in Indian society. One major single cause of their social backwardness has been identified as lack of education. It has been the feeling that education could erase the stigma of backwardness. Education brings in a sense of consciousness to a backward section of the society about their rights and privileges. Education, works as a vital aspect of all developmental schemes for the advancement of backward classes. Special education policies, reservation schemes and social provisions have been framed for social and economic upliftment or amelioration of social backwardness.

Education and Language Language is a means of communication, expressing the feelings and emotions. It is used to convey messages verbally as well as non-verbally. Language can be defined as generic, communicative phenomena especially in teaching learning process, language is used to communicate the content, ideas and to give instructions. Teachers use spoken or written language to transact the content, to interact with students, to assess and facilitate their learning. Students use language for learning process, to ask or present their questions, assignments, their academic content etc. Therefore, in a teaching learning process language is a means of displaying knowledge and skill and it maintains and also forms the teaching learning environment in the classroom. As the economy is globalizing and modern societies are developing, need of learning international languages have emerged and education plays as a medium to learn languages. Language forms from the very beginning in the families and the society. The students use vocabularies (phrases) while narrating and they listen and speak in the environment in which they live. While teaching language in classrooms, teachers need to be sensitive to cultural variations in narrative performance and in assessment of children's language abilities because learning and teaching language constitutes the children's language abilities, cultural variations and the type of education system of a society. Learning about a language enhances the knowledge of a person and it brings the children close to the social structure. This is because language is a medium of joining people with each other and building harmonious relationships from sociological point of view. Education and Culture You have already studies about the regional and cultural diversities in India. The term culture has been derived from the verb 'cultivate' and the noun 'cultivation'. In this way, it is

the

90%**MATCHING BLOCK 35/143****W**

refinement of individuals as a result of cultivation. Culture is an integrated group of people who follow same ideas, beliefs, norms, customs, behavior, attitudes and the values. Culture can be defined as that complex whole

which

100%**MATCHING BLOCK 36/143****W**

consists of everything we think, do and have as members of the society. It is transmitted from one person to the other. This interaction forms an integrative culture. Culture is progressive and aims at enhancing the capacity of individuals. Education plays its role as a medium to teach about the culture to the individuals. Education system not only helps to understand the culture but it also helps to promote and transmit the cultural heritage from generation to generation.

NSOU ? CC-ED-01 ? 23 1.6 Summary In this unit you have introduced to the discipline of Educational Studies as the concept, nature and scope of the discipline are discussed in detail. Various aspects of Educational Studies are also looked into covering the formal, non-formal and informal parameters of education. Finally, the inter relationship between education and society has been explored under the sub-unit titled; Education and Society. 1.7 Self-Assessment Questions 1. Discuss on the nature and scope of Educational studies. 2. How is Education and Society related? 3. Mention the terms from which the word education has been derived. 4. What is Educational Studies? 5. Mention a few aspects of Educational studies. 6. What is socialization? 7. What is interaction? 8. Give an example of accommodation in educational institution. 1.8 References Durkheim, E. (1956), Education and Sociology, Chicago: Free

Unit 2 ? Education and Human Resource Development Structure 2.1 Objectives 2.2 Introduction 2.3 Education as Human Rights 2.4 Education for Human Resource Development 2.5 Education for Sustainable Development 2.6 Summary 2.7 Self-Assessment Questions 2.8 Reference 2.1

Objectives After going through this unit, you will be able to – ?
understand concept
of

human rights; ? analyze how education can help in developing human resources; ? elucidate the role of education in bringing about sustainable development. 2.2 Introduction Human rights are the basic rights and freedoms that belong to every person in the world, from birth until death. They apply regardless of where you are from, what you believe or how you choose to live your life. Human rights are rights inherent to all human beings, regardless of race, sex, nationality, ethnicity, language, religion, or any other status. The entire related issues related to human rights and education will be discussed in this unit. 2.3 Education as Human Rights Human rights include— ? the right to life and liberty, ? freedom from slavery and torture,

NSOU ? CC-ED-01 ? 26 ? freedom of opinion and expression, and ? the right to work and education, and many more. These basic rights are based on shared values like dignity, fairness, equality, respect and independence. These values are defined and protected by law. The concept of human rights emerged from the need to ensure social, political and economic justice and providing equal growth opportunities to all individuals. Education can serve as a means to move towards this goal. Achieving it in totality may be a herculean task due to ignorance, poverty and illiteracy widespread in our country. This requires not only the awareness about these but also respect for other rights and capacity to protect our own rights. Education can and does influence the attitudes of individuals by creating awareness through disseminating knowledge. It can be used effectively in evolving a culture sensitive to the needs and rights of individuals. That Education as a human right has been thought of right from the framing of our Constitution. However, to legalize it in India the (Eighty-sixth Constitution Amendment) Act, 2002 has inserted Article 21-A to provide free and compulsory education of all children in the age group of six to fourteen years as a Fundamental Right.

100%

MATCHING BLOCK 38/143

W

The Right of Children to Free and Compulsory Education (RTE) Act, 2009,

represents the consequential legislation envisaged under Article 21-A, means that every child has a right to full-time elementary education of satisfactory and equitable quality in a formal school which satisfies certain essential norms and standards. Article 21-A and the RTE Act came into effect on and from 1 April 2010. The title of the RTE Act incorporates the words 'free and compulsory'. 'Free education' means that no child, other than a child who has been admitted by his or her parents to a school which is not supported by the appropriate Government,

94%

MATCHING BLOCK 39/143

W

shall be liable to pay any kind of fees or charges or expenses which may prevent him or her from pursuing and completing elementary education. '

Compulsory education' casts an obligation on the appropriate Government and local authorities to provide and ensure admission, attendance and completion of elementary education by all children in the 6-14 age groups. The RTE Act 2009 provides for the- ? Right of children to free and compulsory education till completion of elementary education in a neighborhood school. ? It clarifies that 'compulsory education' means obligation of the appropriate NSOU ? CC-ED-01 ? 27 government to provide free elementary education and ensure compulsory admission, attendance and completion of elementary education to every child in the six to fourteen age group. 'Free' means that

94%

MATCHING BLOCK 40/143

W

no child shall be liable to pay any kind of fees or charges or expenses which may prevent him or her from pursuing and completing elementary education. ?

It makes provisions for a non-admitted child to be admitted to an age appropriate class level. ? It specifies the duties and responsibilities of appropriate governments, local authorities and parents in providing free and compulsory education, and sharing of financial and other responsibilities between the Central and State Governments. ? It lays down the norms and standards relating inter alia to Pupil-Teacher Ratios (PTRs), buildings and infrastructure, school-working days, teacher-working hours etc. ? It provides rational deployment of teachers by ensuring that the specified pupil teacher ratio is maintained for each school, rather than just as an average for the State or District or Block, ensuring that there is no urban-rural imbalance in teacher postings. It also provides for prohibition of deployment of teachers for non-educational work, other than decennial census, elections to local authority, state legislatures and parliament, and disaster relief. ? It provides for appointment of appropriately trained teachers, i.e., teachers with the requisite professional entry and academic qualifications. ? It prohibits (a) physical punishment and mental harassment; (b) screening procedures for admission of children; (c) capitation fees; (d) private tuition by teachers and (e) running of schools without recognition. ? It provides for development of curriculum in consonance with the values enshrined in the Constitution, and which would ensure the all-round development of the child, building on the child's knowledge, potentiality and talent and making the child free of fear, trauma and anxiety through a system of child friendly and child centered learning. There is a field of study which deals with Human Rights. Human Rights education is directed towards

strengthening respect for human rights and fundamental freedom; full development of human personality and sense of dignity; promotion of gender equality, understanding, and

tolerance and enabling everyone to participate effectively in a free society. On 10 th December 1948, the international statement of these rights was adapted by the General Assembly of UNO. Since then, this day has been celebrated as 'The Human

NSOU ? CC-ED-01 ? 28 Rights Day' every year. The declaration proclaims economic, social, political, civil and cultural rights. Through its Universal Declaration of Human Rights (UDHR), United Nations is endeavoring to teach the people the "Common language of Humanity". In December, 1994. UN General Assembly proclaimed 1995-2004 as United Nations decade of Human Rights Education. They appealed to all governments to contribute to the implementation of a global plan of action for assessing needs and formulating strategies for promotion of Human Rights Education, building capacities for Human Rights Education at various levels, co-coordinating the development of Human Rights Education material; strengthening the role and capacity of mass media for propagating Human Rights Education and global dissemination of Universal declaration of Human Rights. The preamble to the Indian Constitution reflects the basic principle of Universal Declaration of Human Rights. Justice, liberty, equality and fraternity are the four basic ideals mentioned in it and this forms the core of our Indian Constitution. In the year 1993, Protection of Human Rights Act was adopted and soon after National Human Rights Commission was constituted with a former Chief Justice of India as its chairman. Constitution of India and Act by Parliament for Education Constitution of India nothing tells about human rights directly but it deals with these rights through Fundamental Rights and Directive Principle of state policy (DPSP) described respectively in part III and part IV. Acc. to UDHR, every person of the world has the right to education which means the basic education should be given to every person. The Preamble of Indian Constitution talks about equality, liberty, and dignity of an individual, which means Indian Constitution's basic objective is to secure the rights of its citizen. [In Minerva Mills vs Union of India Judgement, Supreme Court of India clearly said that Preamble describes the soul motto of the Constitution and legislature has no power to amend its basic structure.] So, the education is the only key by which we can make aware the people about their basic and fundamental rights which came into existence with their birth. Indian Education Commissions have recommended policies for human rights education in India, which are: University Education Commission: In 1948, Indian Government appointed a Commission under the chairmanship of Dr. Radhakrishnan. The commission submitted its report in August 1949 and recommended various steps for higher education. It described duties and responsibilities of the Universities for developing 'the skilled minds for the nation'. Secondary Education Commission: The Government of India in September 1952

NSOU ? CC-ED-01 ? 29 appointed a Commission under the chairmanship of Dr. A. Lakshmanswami Mudaliar. Commission's main objectives were the development of democratic citizenship, development of personalities, education for leadership, the concept of world citizenship, the introduction of basic knowledge related to societies and human being surrounding. Kothari Commission: Indian Education Commission which was popularly known as Kothari commission was appointed under the chairmanship of Daulat Singh Kothari in July 1964. The Commission submitted its report on 29 June 1966. The Kothari commission recommended 22 major recommendations in the education system like that equalization of educational opportunity, educational structure, improvement in methods of teaching, quality of text books, teachers' education etc. Indian government introduced the National Policies for Education in 1968; which was on the basis of recommendations given by education commission (1964- 1966). These policies were called for compulsory education for all children up to the age of 14 years and talked about better training for teachers and quality education. These policies focused on 'three language formula'. Then govt. further introduced other national policies for education in 1986 which was focused on girl child transformation, up gradation of backwards classes, the special school for mentally and physically challenged students, education for tribal people, admission on merit list in higher education, etc. After that Indian Parliament established new Commissions; one in 1992 under the chairmanship of Acharya Ramamurti for evaluating the progress of National Education Policies and further, under the headship of S.B. Chavan, Chavan Committee, has recommended value based education which includes truth, righteous conduct, peace, love, and non-violence, as these five are the universal values. On the recommendations of the law commission of India, The Indian parliament passed an amendment bill in 2002 which provides Free and Compulsory Education for the children age of 6 to 14 years as a Fundamental Right and such right is inserted in Part III of the Constitution of India by adding additional Article 21A. The Indian Parliament also inserted an additional duty for the parents under Article 51A; which creates an obligation on the parents to provide education to their children age of 6 to 14 years but such duty is not under legal obligation. National Education Policy Indian Parliament introduced the national policies for secondary education and higher education in 1969 and 1986 respectively, which was the result of the various education

NSOU ? CC-ED-01 ? 30 Commissions like University Education Commission in 1949, Secondary Education Commission in 1952, Kothari commission in 1964, and so many, as these policies were on the principle of equalization of educational opportunity. The recommendations are given by National Education Policy (NEP), 1986: ? To provide good educational facilities for the rural areas and other backward classes; ? Schools are suggested that admission should be on merit list; ? To educate the girl child for accelerating the social transformation; ? Provide the basic education in the tribal areas; ? Special school for the mentally challenged students. Model of Human Rights Education There are three models of Human Rights Education which are generally used in the world including India. 1. Awareness and Value Model 2. Accountability Model 3. Transformation Model These three have different approaches; the awareness model highlights basic knowledge of human rights issues and to promote the growth of human rights integration into public values. The value and awareness model includes health and hygiene issues, environmental issues and consumer rights matter. The accountability model is related with political approach as well as legal approach, in which it covers the area of the case study, code of ethics, media dealing, transparency in the system, the right to information, training and networking, etc. The transformation model is more effective than the other two. This model has psychological and sociological approaches and its main objective is to empower the individual. It also talks about stop abuse. Need of Human Rights Education in India Now-a-days, moral and ethical values in education system of India are sometimes loosing the norms. It is very harmful to the democracy and dignity of individuals; which are covered by human rights as well as Constitutional rights; so, that In India, it is strongly recommended to establish human rights education as a subject at primary level as well as in higher education. Knowledge is the best defense for human beings to protect their rights against violation; education is the basic source which will provide the information about the human rights. Learning about the ones rights which build about others' rights and which

NSOU ? CC-ED-01 ? 31 helps to establish a peaceful and tolerant society. The promotion of human rights can be fulfilled with the mass awareness program about human rights issues. Through these programs, we will get help to reduce the violence of Human rights. The National Human Rights Commission of India; the Indian Institute for Peace, Disarmament and Environmental Protection (IIPDEP); and many NGOs have launched a public information campaign for human rights countrywide. Its main objectives are to make everyone more conscious of human rights and fundamental freedom and better equip and to stand up for them. At the same time, the campaign spreads knowledge of the means which exist at the international and national levels to promote and protect human rights and fundamental freedoms. IIPDEP and many NGOs work to make school authorities and the general public aware of civic education and to know about their birth rights. They focus on developing knowledge, skills, and attitudes needed to apply fundamental human rights and freedom. and consequently, the non-violent resolution of conflict. 2.4 Education for Human Resource Development The development of any country depends on its resources and their proper utilization. One such important resource is human resource. For any nation, development of skilled and productive labor forces is required. The skilled and productive labor forces of a country are considered as human resources. Human resource can also be considered as human capital, educated, trained and technologically developed people from the human resources. Without human resource, other factors of development become ineffective. Human resources are not fully in born and natural. It means that man does not turn into resources just after his birth. As we have seen in Unit1 the work of education is to draw out and refine the inner qualities of the individual. So, the process of formal and informal education enables him to be turned into human resource. According to Verna and George (2000) "Human resource development has been defined as the process of increasing the knowledge, skills and the capacities of the people in a society". The concept of development is qualitative as well as quantitative. According to Prof. Sethi (2000), "Human resource development, if taken as total development means optimum utilization of existing human capacities - intellectual, technological, entrepreneurial and even moral and creation of new ones."

NSOU ? CC-ED-01 ? 32 There is a difference between a man and human resource. A man is considered human resource when he actively involves himself in any socially productive process. As for example: i) A person is considered a resource, only when he or she can participate in any production process in the society. ii) Only a healthy man is considered as a resource. Health or physical capacity is an essential component of human resource. iii) There is some individual and special mental capability in a man beside his common mental capability. This individual mental capability helps him in drawing a special activity or work efficiency. A man with this individual and special capability is called a human resource. iv) Education is the most important element of human resource and the literacy must be up to the specified social standard. v) Human resource development is a long and continuing process. There is no blue print of HRD. The power in manpower comes from education. Education is an effective means for the transformation of the society through the development of human resources. It itself is a fundamental need because it increases an individual understanding of himself, his society and his natural environment and gives him access to his cultural heritage. It improves living standards, enhances productivity by improving work skills and decreasing birth rate by raising women status. Education, an important indicator of the strategy of human development, is the key to open the door to modernization. To build the skill and knowledge for the development of resources for economic, social, cultural and political growth and to provide avenues of participation, to create a better society for all are the aims of the strategy of Human resource development. The accumulation of human capital might begin with moral education and could eradicate illiteracy to make people realize their responsibility. "Education is the most useful instrument in human capital formation efforts or a vehicle of social transformation. Education, more than any other single initiatives, has the capacity to foster developments, awaken talents, empower people, and protect their rights." (UNICEF, 2000 Impact of Education on Human Resource Development) There is no alternative of education and training to convert people into human resource. The influence of education on human resource development is extensive.

NSOU ? CC-ED-01 ? 33 The impact of education on human resource development is given below: i) Awareness development: Education increases self-awareness. It can help to know their habit, culture, social status and management. ii) Learning: By acquiring knowledge one can develop one self, his family and also can participate in country's development. iii) Thinking and judgment: Education can help to think transparently free from emotion and prejudice. As a result, they can invent exact work process on the basis of analyzing individual and socio-economic conditions. iv) Generous outlook: Education can help man's outlook to be generous and democratic. It teaches to be united. So, they can be able to build up society, Social welfare organizations and other co-operative organizations. v) Duties and responsibilities: Education can build up consciousness about their Duties and responsibilities. So, they can implement and establish their rights in their social and political life. vi) Modern science and technology-based education: Modern science and technology can enhance the ability to do heavy work within a short time and it can also increase the quality of work. vii) Medical science and economic effect: The application of higher education in medical science can develop the health services of a country. As a result, the life expectancy will increase and that would be helpful to play a role in economic development for longer time. Thus, we find that development of human resource is impossible without education, be it formal, informal or non-formal. 2.5 Education for Sustainable Development (ESD) Before we start our discussion, we need to know what sustainable development is? It has been defined in many ways, but the most frequently quoted definition is from our common future, also known as the Brundtland Report (1992). "Sustainable development is the

92%

MATCHING BLOCK 42/143

W

development that meets the needs of the present without compromising the stability of future generations to meet their own needs."

Education is an instrument to support the sustainable development process. It can generally be stated that - Education for Sustainable Development covers all kinds of educational concepts, steps and processes, which are suitable to foster in the individual and/or collective contribution towards sustainable development.

NSOU ? CC-ED-01 ? 34

100%

MATCHING BLOCK 44/143

W

UNESCO aims to improve access to quality education on sustainable development at all levels and in all social contexts, to transform society by reorienting education and help people

to

develop knowledge, skills, values and behaviours needed for sustainable development.

It is about including sustainable development issues, such as climate change and biodiversity into teaching and learning. Individuals are encouraged to be responsible actors who resolve challenges, respect cultural diversity and contribute to creating a more sustainable world. Education for Sustainable Development generally focuses on the development and strengthening of individual competencies, enabling the individual to contribute to and participate in sustainable development processes of various kinds and dimensions. From that definition it is obvious that all types of competencies and skills including basic competencies such as reading, writing, numeracy are included. Higher level competencies such as creativity, solution-oriented thinking and action ability are fundamental for Education for Sustainable Development, since without them it would not be possible to find ways, concepts techniques, which make us succeed to reach the space of sustainability. ESD empowers learners to take informed decisions and responsible actions for environmental integrity, economic viability and a just society, for present and future generations, while respecting cultural diversity. It is about life-long learning, and is an integral part of quality education. ESD is holistic and transformational education which addresses learning content and outcomes, pedagogy and the learning environment. It achieves its purpose by transforming society. Learning content: Integrating critical issues, such as climate change, biodiversity, disaster risk reduction (DRR), and sustainable consumption and production (SCP), into the curriculum. Pedagogy and learning environments: There is no 'correct' pedagogy for sustainability education, but there is a broad consensus that it requires a shift towards active, participative, and experiential learning methods that engage the learner and make a real difference to their understanding, thinking and ability to act. Five pedagogic elements that cover a host of pedagogical approaches or methods that may be used to bring these elements into the learning environment. 1. Critical reflection: Including the more traditional lecture, but also newer approaches such as reflexive accounts, learning journals, and discussion groups. 2. Systemic thinking and analysis: The use of real-world case studies and critical incidents, project-based learning, stimulus activities, and the use of the campus as a learning resource. NSOU ? CC-ED-01 ? 35 3. Participatory learning: With emphasis on group or peer learning, developing dialogue, experiential learning, action research/learning to act, and developing case studies with local community groups and business 4. Thinking creatively for future scenarios: By using role play, real-world inquiry, futures visioning, problem-based learning, and providing space for emergence. 5. Collaborative learning: Including contributions from guest speakers, work-based learning, interdisciplinary/ multidisciplinary working, and collaborative learning and co-inquiry. Thus, designing teaching and learning in an interactive, learner-centred way that enables exploratory, action oriented and transformative learning and also by rethinking about learning environments, physical as well as virtual and online may inspire learners to act for sustainability. Societal transformation: Empowering learners of any age, in any education setting, to transform themselves and the society they live in. ? Enabling a transition to greener economies and societies; ? Equipping learners with skills for 'green jobs'; ? Motivating people to adopt sustainable lifestyles; Empowering people to be 'global citizens' who engage and assume active roles, both locally and globally, to face and to resolve global challenges and ultimately to become proactive contributors to creating a more just, peaceful, tolerant, inclusive, secured and sustainable world. Learning outcomes: Stimulating learning and promoting core competencies, such as critical and systemic thinking, collaborative decision-making, and taking responsibility for present and future generations. After more than two decades of intense discussions an international consensus was reached with the following set of eight competencies published by UNESCO in 2017: Systems thinking competency: The abilities to recognize and understand relationships; to analyze complex systems; to think of how systems are embedded within different domains and different scales; and to deal with uncertainty. Anticipatory competency: The abilities to understand and evaluate multiple futures – possible, probable and desirable to create one's own visions for the future; to apply the precautionary principle; to assess the consequences of actions; and to deal with risks and changes.

NSOU ? CC-ED-01 ? 36 Normative competency: The abilities to understand and reflect on the norms and values that underlie one's actions and to negotiate sustainability values, principles, goals, and targets, in a context of conflicts of interests and trade-offs, uncertain knowledge and contradictions. Strategic competency: the abilities to collectively develop and implement innovative actions that further sustainability at the local level and further a field. Collaboration competency: the abilities to learn from others; to understand and respect the needs, perspectives and actions of others (empathy); to understand, relate to and be sensitive to others (empathic leadership); to deal with conflicts in a group; and to facilitate collaborative and participatory problem-solving. Critical thinking competency: the ability to question norms, practices and opinions; to reflect on one's own values, perceptions and actions; and to take a position in the sustainability discourse. Self-awareness competency: the ability to reflect on one's own role in the local community and (global) society, to continually evaluate and further motivate one's actions, and to deal with one's feelings and desires. Integrated problem-solving competency: the overarching ability to apply different problem-solving frameworks to complex sustainability problems and develop viable, inclusive and equitable solution options that promote sustainable development, integrating the above mentioned competences. Importance of Education for Sustainable Development ? Converse to the traditional way of teaching, ESD means adopting a more holistic approach to education with the aim of 'creating a better world for this generation and future generations of all living things on planet Earth'. This allows every child

100%

MATCHING BLOCK 46/143

W

to acquire the knowledge, skills, attitudes and values necessary to shape a sustainable future. ?

Humans tend to look at development as a needed and normal process, but when this process becomes increasingly dependent on over-exploitation of our natural resources, the replenishment of these reserves and supplies is affected; and managing this imbalance demands assuming a slightly different school of thought. ? One way to cultivate this mindset in our youngsters is by encouraging sustainable lifestyles through Education for Sustainable Development. Living sustainably is about changing our attitudes in a way that helps to transform our lives into something that doesn't impact too heavily on our current routines, while using the planet's resources in moderation.

NSOU ? CC-ED-01 ? 37 ? Education for Sustainable Development incorporates key-environmental challenges like climate change into core subjects like mathematics science and art, and involves modifying the teaching-learning process to a more all- encompassing approach. Students are thus able to relate what they learn in the classroom to their real life actions, and will increasingly be in a better position to take the lead in changing behaviours and adopting sustainable lifestyles, more of this type of education is to be adopted. ? As schools no longer function in isolation, their integration with the world outside has exposed students to different people and cultures', giving them the opportunity to appreciate what the planet offers, while respecting the need to use resources efficiently and responsibly. ? The decade of ESD is already proving popular with thousands of students across the world taking part in environmental education programmes; among them, Be'ati Watani and Eco-Schools UAE, both implemented by EWS-WWF. These two programmes are serving as vital tools for schools to produce environmentally-responsible citizens. ? One evident example of how environmental education is helping to shape a sustainable future is from an Eco-School in the UAE recently awarded the Green Flag, a symbol of excellence in environmental performance. These students identified the need for more wall space to spread environmental awareness messages in their schools, so they create a huge mobile wall of used cartons piled one above the other. Besides reducing the amount of waste produced in their school and saving school funds, these students put forward the important message within their school community and beyond, of thinking innovatively to make maximum use of available and reusable resources. ? ESD is not only about being environment-friendly; it also involves developing life-skills including leadership, communication and management; all of which are extremely important for personal development. By equipping young people with these relevant capabilities in addition to their environmental knowledge, they can excel at living lives which not only further humanity, but that care for and respect our planet's resources too. ? There are numerous examples that only serve to reiterate the benefits of implementing Education for Sustainable Development in schools in the UAE. Students from an Eco-School in Ras Al Khaimah encouraged their head teacher to install water dispensers in the corridors and fellow students to bring a reusable bottle to school; saving both money and plastic. The reason of these

NSOU ? CC-ED-01 ? 38 youngsters did this was simple, because of their belief in the need to lower water usage and waste in their school. ? ESD can help change our future. Continued support from authorities, appropriate policies and laws, responsible action by individuals and communities, and above all a deep compassion for our planet will together serve to alleviate the global environmental crises we face today. ? This type of learning goes beyond the school. What a child learns during this process shouldn't stop there, it must be practiced by the family too. Wise use of water and energy both at home and in the work place must be the part of our natural behaviour as parents and care-givers. ? Greater efforts must be put in by families and communities to reduce waste, recycle regularly and opt for public transport to demonstrate the importance to our children of living more sustainably. Our homes and communities can be the ideal platform for children to exercise and experience what they learn in the classroom.

2.6 Summary In this unit we looked into some important areas concerned with education and their impact as well as relevance in our contemporary world scenario. The thrust of the topic 'Human Rights Education' was on discussing the importance of education as a right and how it has been provisioned in our country through the RTE Act, 2009. While the topic 'Education for Human Resource Development' sought to bring out the relevance of education in developing the human resources of a nation, the topic 'Education for Sustainable Development' brought to highlight the role of education in enabling mankind to progress and advance without jeopardising the lives of the future generations.

2.7 Self-Assessment questions

1. What is Human Rights?
2. What is the full form of RTE Act?
3. When was RTE Act implemented?
4. What does RTE Act provide for?
5. What is human resource?
6. When does a man become a human resource?
7. What is the impact of Education on human Resource Development?
8. What is meant by Sustainable Development?
9. Define Education for Sustainable Development,
10. How can Education help in bringing about sustainable development?
11. Discuss the role of Education in developing Human Resource Development.
12. What is the role that Education can play in bringing about Sustainable development?

Unit 3 ? Education as Academic Discipline Structure 3.1 Objectives 3.2 Introduction 3.3 Educational Studies in the Domain of Social Sciences 3.4 Education as the Discipline of Study: Liberal Vs. Applied 3.4.1 Education as the Discipline of Study: Liberal 3.4.2 Education as the Discipline of Study: Applied 3.5 Foundations of Education 3.6 Summary 3.7 Self-Assessment Questions 3.8 Reference 3.1 Objectives After going through this unit, you will be able to – ?

understand concept

of Educational Studies in the Domain of Social Sciences; ? analyze Education as the Discipline of Study Liberal Vs. Applied; ? state the Foundations of Education; 3.2 Introduction Sciences as the field of study may broadly be classified as natural sciences and social sciences. The natural sciences cover topics such as physics, biology and chemistry. Social sciences, on the other hand, examine the development and operation of societies and the relationships between individuals and societies, rather than studying the physical world. In this unit, educational studies will be discussed in the domain of social sciences. 3.3 Educational Studies in the Domain of Social Sciences Social sciences help to explain how society works. It tries to explore how economic growth takes place, what are the causes of various societal problems like unemployment

NSOU ? CC-ED-01 ? 41 and what makes people in the society happy? This branch of science studies how people interact with each other, behave, develop a culture, and influence the world. Social Sciences also help to shape government policies. We have seen Educational study deals with the miniature form of society, the learners and the educators in the educational institutions. It tries to frame and rethink about the curriculum or the knowledge to be given to the future citizens of the society. It also tries to develop the ability to think critically about the ways in which education interacts with a broad range of social, cultural, political and economic forces. It looks into the kind of education that will help in the development of the country and society and thus reframe the curriculum and suggest ways of developing the future citizens of the country. We can see that Educational studies describe education as an input-output-outcome system which a good policy can make more efficient (Windham, 1990). Investment in education gives people much more opportunities by developing their latent abilities. Society gains much more from its educated members. Economic development depends upon positive utilization of advancement in technology and science and educated members are better equipped to do so. Education also leads to better health care, population control increased community awareness and participation. Education plays a critical role in demographic transition and female education in particular is responsible for lowering mortality and fertility. So, we find that educational studies are intimately related to society and thus have made its place in the field of social sciences.

3.4 Education as Discipline of Study: Liberal Vs. Applied

What is a discipline of study? Discipline is defined by the Oxford English Dictionary as "a branch of learning or scholarly instruction." A field of study or academic discipline that is taught at college or University level and also researched at the higher education or University level may be considered as a discipline. Disciplines are recognized by learned society and academic journals by publishing research in those areas. In other words, an academic discipline or field of study is a branch of knowledge, taught and researched as a part of higher education. It is commonly defined by the university faculties and learned societies to which they belong and the academic journals in which they publish research papers. A new academic discipline should address issues of ongoing concern that are not NSOU ? CC-ED-01 ? 42 adequately addressed by existing disciplines. In spite of sharing content and methods with other disciplines, it should have its own well-defined aims objectives, content and methods.

Education

100%

MATCHING BLOCK 52/143

SA

QUADRANT-I.docx (D46082731)

is relatively a new discipline that combines aspects of Psychology, History, Philosophy, Sociology and some practical studies. The discipline of Education is nowadays a compulsory subject used for educating teacher educators.

Education is, of course, also a field of research that aims to understand the process of education.

98%

MATCHING BLOCK 50/143

W

The main problems and questions in education deals with - What content should be taught to pupil and students (the question of curriculum)? How should the content be taught (the question of teaching method)? What other educational goals shall be pursued in addition to teaching knowledge and skills (the question of values)? In other words, education has to answer the questions of truth, learning and morals. It has to reflect on the higher goals of education beyond passing on random knowledge and skills. The study of education would be the reflexive effort of looking at the reality of education and trying to understand how it is practiced. This is a serious question that whether education can be called a discipline, and there are three schools of thought on the subject. The first suggests that since education borrows from and combines with other, more traditional disciplines and often focuses on practice, it should not be called a discipline but a field of study or a second level discipline. Using the same rationale that many areas within education bring together a traditional discipline within an educational frame, the second school of thought calls education

as

90%

MATCHING BLOCK 51/143

W

an inter-discipline. In addition, education has its own set of problems, questions, knowledge bases and approaches to inquiry and a third school of thought pushes for accepting education as a discipline.

One reason for the lack of consensus around the use of 'discipline' for education is that as a field of study, education may be seen as one of a set of academic program anomalies in which the enterprise itself is primarily an activity. Looking specifically at areas in education that bring together a traditional discipline and education, we could use the term inter - discipline to describe education. Considering education as an inter-disciplinary study suggests that the work of scholarship in education should focus on bringing together the disciplines as a means of solving problems and answering questions that cannot be satisfactorily addressed using single method or approach.

100%

MATCHING BLOCK 53/143

SA

QUADRANT-I.docx (D46082731)

At this point, it would be well worth examining education as a discipline. Not only does education have its own set of problems, questions and knowledge bases, and

NSOU ? CC-ED-01 ? 43

77%

MATCHING BLOCK 55/143

SA

QUADRANT-I.docx (D46082731)

approaches to enquiry but also that which is borrowed from other disciplines often becomes transformed within the study of education. Can we consider Education as a Discipline

of Study? To Answer this we can look into the following reasons: ? It has its own theory and practice. ? It has a well-defined function. ? As a discipline its objectives and purposes are clearly defined. ? The function of Education is the development of individual and growth of society. ? Education has well defined scope and subject matter. ? Education is purposive. ? Practitioners of Education require specific skills, aptitude and knowledge in the discipline. The discipline of study or approach to learning that empowers individuals and prepares them to deal with complexity, diversity and change is considered to be liberal. 3.4.1 Education as the Discipline of Study: Liberal Liberal Education is a term used for its multi-disciplinary approach to education. Liberal Education emphasizes a learning system of education which provides students the choices to take courses which are varied and responds to the discovery and explorations of the student needs to make. Students can experience a broad spectrum of courses and they have the possibility of meandering into many streams of knowledge to discover. Their curriculum is not close ended. There is a structure and the student experiences some courses across the streams of existing knowledge to be able to make very well informed choices in their specializations. It is an interdisciplinary platform of education that propagates different models and paradigms from various learning disciplines. This platform develops students with abilities to connect and integrate knowledge helping them to apply it in current and future real world scenarios. Liberal Education strives to deliver an academic experience that fosters intellectual curiosity, a critical thought process, self-reflection, leadership and teamwork skills, a sense of commitment and professionalism and a heightened sensitivity to one's socio-cultural environment. It lays emphasis on the creation of a learning environment where the student takes the responsibility of learning and the role of the teacher is to facilitate the learning process. It provides students with broad knowledge of the wider world as well as in-depth study in a specific area of interest. It helps in the development of a sense of social

NSOU ? CC-ED-01 ? 44 responsibility as well as strong and transferable intellectual and practical skills like communication and the ability to apply knowledge and skill in real-world settings. In essence, Liberal Education inculcates the following: ? Broad knowledge of multiple disciplines; ? In-depth study of a chosen discipline; ? Inter-disciplinary learning; ? Differential approach to learning; ? Transferable skill set; ? Ability to apply knowledge to practical real world situations; ? Connecting through various mental models; ? Habits of self-reflection; ? Contextual learning; ? Freedom of the mind; ? Life-long learning. 3.4.2 Education as the Discipline of Study: Applied or Professional The applied areas are those wherein the knowledge of basic disciplines are used. For example, scientific and industrial knowledge is used in technological applications. The areas of bio-engineering, bio-technology, applied physics, environmental biology, medical sciences are some of the examples of applied areas. Meteorology, oceanography and space science may be grouped with the earth sciences, like geology, ecology, mineralogy and environmental science which by the application of methods and principles used in mathematics, physics, chemistry and biology describe the earth and its environment. Although the domain of a human knowledge can be regarded as composed of a number of logically distinct forms of knowledge, we do, in fact, for many purposes, deliberately and self-consciously organize knowledge into a large variety of fields which often form the units employed in teaching science. Apart from this, as knowledge advances, new specializations be developed from the roots of basic disciplines and merged with other relevant areas. When the knowledge gained through research and experiences are put to practical use or when that knowledge can be put to use in real life situations it is the applied study. Academic discipline is formulated for the professional training of researchers, academics and specialists. It is a branch of knowledge that is taught and researched as part of higher education. Examples for Academic Disciplines are Anthropology, Space Science, Education is an art of appreciating life. Its purpose

NSOU ? CC-ED-01 ? 45 is to teach values, develop stimulated intellect, understand tolerance for disagreeable belief systems, dig out opportunities to question what exists, and contribute to the growth of the human society. The knowledge of Education can be applied in the areas of Primary Education, Secondary Education, Higher Education, Teacher Education, Special Education as well as Distance Education and many more. The analysis of policies and their impact on society as well as the suggestion for formulation of future policies etc. require the knowledge of Education. Thus, it is both a liberal as well as an applied discipline. 3.5 Foundations of Education In the previous units we have seen that Education is a very complex process. As a subject of study, it is based on four basic foundations. ? Philosophical Foundation ? Psychological Foundation ? Sociological Foundation and ? Historical Foundation Philosophical Foundation Etymologically philosophy is derived from Greek words 'Philo' meaning 'love' and 'Sophia' meaning 'wisdom'. Wisdom is something more than knowledge. It goes beyond knowledge to find relationship and its impact. Education on the other hand means to draw out the innate abilities, to nourish them. Human life cannot properly be understood without philosophy.

100%

MATCHING BLOCK 54/143

W

Life and education are inseparably connected. One cannot be separated from the other. Hence, life has a philosophical base and so education also has a philosophical base.

100%

MATCHING BLOCK 64/143

W

Philosophy furnishes the goals of life and education gives the means to achieve those goals. Man is the common subject of both philosophy and education. Philosophy and education are interrelated, interdependent, identical and inseparable from each other. Every philosopher has an educational outlook and every educator has a philosophy of life.

100%

MATCHING BLOCK 56/143

W

The truths and principle established by philosophy are applied in the conduct of education process.

100%

MATCHING BLOCK 57/143

W

Philosophy exercises tremendous influence on education in all its aspects—aims, curriculum, methods, teachers, textbooks, administration, discipline, evaluation etc. There is no aspect of education, which is not influenced and determined by philosophy.

92%**MATCHING BLOCK 58/143****W**

Thus, we find that philosophy effects both the theoretical and practical aspects of education. One cannot be separated from the other.

Right from the beginning of

NSOU ? CC-ED-01 ? 46 civilization, man has been trying to find the meaning and aim of life. For reaching the answer to this, one needed the help of education. In fact, philosophy determines the aim of education. Sir John Adams describes 'education as the dynamic aspect of philosophy'. That is the theory of what to teach or what one is going to learn is determined by the philosophical foundation of Education. Again, based on the philosophy, one decides the curriculum or what to learn. Based on this depends the study materials and the way of teaching and learning. Study materials are the text books or activities that are to be selected for learning and teaching. In other words, it is the methodology of teaching. Whether the aim of education has been attained or not is verified through evaluation. For example, if the philosophy is to train the future citizens as productive members of society, then the aim of education will be to develop more of vocational skills. So, its curriculum will include more of subjects which will help in specific skill development. Its methodology will be more practical oriented. Thus, we find that the foundation of philosophy is essential for any sort of education to take place. Psychological Foundation Psychology is the science of behaviour. We know that Education is that which leads to a modification of behaviour. Until and unless we understand behaviour we will not be able to modify it.

95%**MATCHING BLOCK 59/143****W**

Psychology has greatly influenced the development of modern education. Basic connections and relationships between psychology and education are manifold. Educational theory and practice are conditioned by the nature of human behaviour.

92%**MATCHING BLOCK 60/143****W**

Educational Psychology has been developed to study scientifically the behaviour of the students and to help the process of education.

93%**MATCHING BLOCK 61/143****W**

Educational psychology discusses process of development of the students, process of learning, social adjustment of the students, individual differences in physical abilities and mental traits and powers, interest and motivation of child and various problems associated with the mental health of the students. The function of educational psychology is to know the child and his educational process completely. It tries to determine the means of attaining the educational goals and objectives outlined by educational philosophy. It helps the teacher, the students as well as the parents. The primary aim of education

is the total development of the child. Modern education is child-centric, that is why psychology studies the nature and behaviour of the child in different developmental stages. Child centered education has the direct effect of psychology on education. All the principles of modern school organization and administration have directly been influenced by psychology. For example, timetable in a class is framed on the basis of fatigue index
NSOU ? CC-ED-01 ? 47 of the students. The modern concept of school discipline is also a psychological product. Psychology emphasizes the importance of freedom of the child in the maintenance of discipline in the school. Thus, we find that philosophy determines the aim of education, while psychology tells us the way to reach that aim in the most effective way. Sociological Foundation Sociology is the science of society, social institutions, and social relationship specifically the systematic study of the development, structure, interaction, and collective behavior of organized groups of human beings. Education takes place in the society which is

95%**MATCHING BLOCK 62/143****W**

constituted of individuals. It is a social process. It has a social function as well as social relevance. A school is created by the society and the society is shaped and molded by the school. Thus, education is both a cause and product of society. It originates in the society and it must fulfill the needs and aspirations of the society. There is thus, an intimate relationship between education and society.

Modern education has two-fold functions. It must help in individual development as well as social progress. Education helps to solve the multifarious social problems. Education is not a static phenomenon but a dynamic and ever-changing process. Every society with its own changing socio-cultural needs require education to meet those needs. Since needs change continuously therefore education must also change. As the needs of different societies differ, education too should be dynamic. Educational sociology analyses and evaluates the groups and institutions in which learning takes place and the social process involved in learning and teaching. It analyses and evaluates the social trends and ideologies, which affect education. It helps us to understand that education is a means of social change. It throws light on human interaction and relationships within the school and the community. It emphasizes that learning is a social process. It is the total cultural milieu in which and through which the learning experience is acquired and organized. Educational sociology plays a vital role on the modern educational theories and practices. It influences

100%**MATCHING BLOCK 63/143****W**

the aims of education, the principles of curriculum construction, the methods of teaching, the school organization and administration.

Historical Foundation Our present is formed by our past. The history of education helps in knowing the early educational thoughts and its evolution to the present state. The main task of history of education is to trace the development of education to try to evaluate the functions it has fulfilled at different stages of social development and so to reach a deeper understanding of the function it fulfills today and also in solving different educational problems.

NSOU ? CC-ED-01 ? 48 The study of educational organizations

78%**MATCHING BLOCK 67/143****SA**

EDU_UG_Unit-1_Nabanita Sarmah.pdf (D54349017)

of pre-historic, ancient and modern periods, relation of culture and education, pioneers of education and educational thoughts of various educationists

are studied. The history of education may suggest causal explanations for changes that punctuate the political and social timelines of educational development. It helps us to understand the evolution of the educational system and structures to date. There are key-dates and events within the development of the education system that reflect the significant political and social issues of the time. While the scope of education has changed radically since the late nineteenth century, the disciplinary knowledge distribution, functions of schools, and other education establishments are found significant in modern societies. If we try to trace the historical pattern of education in India, we will see that it has gone through various phases. Education during the Vedic period to the change in the Medieval period and again changes in the modern age with the influence of Western education. It has had an effect on the present system of education in India as well. With globalization taking place at the socio-political and economic levels, education is bound to get influenced. Technology crept into education. Along with it came the ideas of distance and open learning. 3.6 Summary This unit may have helped you to conceptualize and comprehend the role of Educational Studies in the domain of Social Sciences. With its foundations on such varied and rich disciplines like Philosophy, Psychology, Sociology and History, the discipline of Educational Studies, finds a remarkable position in the field of Social Sciences. Education being a integral part of the social system, its bearing in the society is crucial and indispensable and hence we find the discipline of Education as the discipline of both liberal and applied studies. 3.7 Self-Assessment Questions 1. What are the characteristics of an academic discipline? 2. What is liberal discipline? 3. What is an applied discipline? 4. Is Education liberal or applied discipline? Justify. 5. What is Social Sciences?

NSOU ? CC-ED-01 ? 49 6. Why is Educational Studies included in the domain of Social Science? How does History form the foundation of Education? 7. Justify why Education Studies should be considered as Social Science. 8. Discuss on the Foundations of Education. 3.7 References Brubacher, John S., Modern Philosophies of Education, McGraw Hill Book Company. Inc, New York. Kneller, George F. aims of education, ? know factors of education, ? state types of Education. NSOU ? CC-ED-01 ? 51 4.2 Introduction Education is a social necessity. It takes care of the changing social needs and aspirations. It is an activity which is directed to some goals. It always acts with an aim. This aim makes it a purposeful activity. The basic aim of education is to help each individual to progress towards the attainment of his or her full potential, both as a person and as a member of society. Any other human activities like education should have its own aims and objectives.

Different aims of education

will be discussed in this unit. 4.3 Aims of Education

95%

MATCHING BLOCK 69/143

W

Knowledge Aim of Education Knowledge has widely been accepted as one of the most important aims of education. It is essential for adjustment to and mastery of one's environment. Human progress through ages has been made possible through the increase and diffusion of knowledge. It is indispensable for the continuity and growth of society. It is a powerful agent for intellectual satisfaction and innate curiosity of man. Vocational Aim of Education It says that education is meaningful only when it aims at some employment. It is the direct outcome of industrial and scientific advancement. The modern democratic education has placed the vocational aim in its fore front. It makes the student self-sufficient in life. It makes education a purposeful activity. The vocational aim, however is narrow and one-sided because it does not consider higher values of human existence. It neglects the intellectual, aesthetic, cultural, moral and spiritual aspects of human life. Cultural Aim of Education Preservation, transmission and enrichment of culture is regarded as the ultimate aim of education. Education for culture attempts to develop man's aesthetic sensibilities to appreciate fine arts and cultivate human powers and virtues. It helps in inculcation of noble ideas, attitudes and patterns of behavior. Over emphasis on cultural aim, however, may lead to neglect of other aspects of learner's personality. Education with cultural aim alone may be misused by the privileged group in such a manner that many of the social evils may reappear. Character Building Aim of Education Development of moral character is the supreme aim of education. It consists in the NSOU ? CC-ED-01 ? 52 cultivation of values, social attitudes, ethical conduct and habits of a person. The moral aim of education serves as the basis of discipline and order in the school system. Over emphasis on the character-building aim of education will, however, de-accelerate free thinking, material prosperity, scientific development and the economic growth of the society. Citizenship Aim of Education Education for citizenship is the outcome of the sociological approach to education. It involves teaching and inculcating democratic values in the children. Education for citizenship should train the individuals to discharge his duties and make him conscious of his rights. This aim will help the learner to acquire democratic values such as liberty, fraternity, equality, fellow-feeling, tolerance; cooperative living etc. It prepares the students to uphold the dignity of the individual. Harmonious Development as Aim of Education Man is born with many innate powers and capacities. A progressive education should aim to develop all these powers and capacities in a harmonious manner to produce a well-balanced personality. It aims to produce individuals who are personally and socially well-adjusted and productive.

Its major drawback is

97%

MATCHING BLOCK 70/143

W

that, there is no agreement among educationists regarding the standard of development of various capacities to consider it as ideally harmonious. Moreover, complete and harmonious cultivation of all powers cannot be achieved within the limited formative years of an individual. Spiritual Aim of Education Spiritual aim in education seeks to make man morally sound by developing the spiritual potentialities. It is only through education that spiritual virtues like generosity, sacrifice, good intention, sympathy, compassion etc. can be awakened. Spiritual aim of education makes a person gentle and pious. It reduces the problems of indiscipline, conflicts, quarrels, corruption, hatred etc. in the society. Leisure Hours Aim of Education Leisure means free and unoccupied time. The advancements in science, technology and means of transport and communication has reduced time and space resulting in the increase of leisure hours. Hence, education should aim at the wise and the proper use of leisure hours. Proper use of leisure will increase the efficiency of the students besides providing pleasure to them. Leisure is essential and helpful in making our life dynamic and rich. One great cause of strikes and indiscipline among the students is that they are not taught how to utilize their leisure hours.

NSOU ? CC-ED-01 ? 53 Nature of the Aims of Education: In order to know the aims of education, we must know the nature of aims. Aims of education are not fixed and universal. These are changeable and relative in nature. We can point out some specific nature of educational aims as follows: ? As education is not a single aimed activity, plurality is an important feature of educational aims. Different aims represent different ways of looking into the same thing. ? Educational aims differ in nature and orientation. Some are permanent, definite and unchangeable, whereas others are flexible, adjustable and changeable. ? Educational aims are related to the multiple needs of the individual, as well as, of the society. ? Educational aims are correlated with the ideals of life. Thus, educational aims change in keeping with the different schools of philosophy, religious, political and economic ideals held by an individual or by a country. Therefore, the formulation of aims of education is formulation of aims of 'life', itself. ? In reality, education is a reflection of the society and a process of social control. So educational aims are the means to shape and form a society. ? Educational aims change from age to age and place to place. Thus, these aims are not fixed. ? Lastly, different types of education have separate aims of education. Thus, educational aims are changing according to the specific needs and ideals of the individual as well as the society. Quest of educational aims has been made since time immemorial. This quest gains momentum with the appearance of great thinkers and philosophers and with their educational experiments. Social and economic issues also serve as determinants of educational aims and objectives. Education must prepare the future generation for the economic and social system of the country. In determining its educational objectives, every country has to take into consideration its economic conditions. Thus we find variability is the nature of educational aims. The Secondary Education Commission (1952) puts it: "As the political, social and economic conditions change and new problems arise, it becomes necessary to re-examine carefully and re- state clearly the objectives which education at definite stage should keep in view."

aim. For achieving success in activity of life, clear and well defined NSOU ? CC-ED-01 ? 54 aim is essential. An educator without the knowledge of aims can be compared to a sailor who does not know his destination. This means that a system of education which is not clear about its aims or which has undesirable ends is bound to fail. Aims give foresight to the educational planner. All our methods of teaching, our curriculum and our system of evaluation are shaped and molded according to our aim of education. It is the ignorance of right aims that has vitiated our educational system, its methods and its products, and has successfully resulted in the physical, intellectual and moral weaknesses of the race. There is a great necessity of aims in education because of the following reasons: To direct efforts: If aim is known we can make efforts to that end. Educational aims keep the teacher and the taught on the right track. They provide a line of action and guidance to the teachers. They give direction and zest to the work of the pupils. Educational aims help us to avoid wastage in time and energy. In the words of John Dewey, "To have an aim is to act with meaning." Aims help us to act intelligently and to act with a meaning. We know what is to be done and we straight away start doing that. To evaluate ourselves: Educational aims help us to evaluate ourselves. They use to take stock of the results of our effort. The aim is a yard-stick with which we can measure our success and failure. They are necessary to assess the outcome of the educational process. To evaluate the existing conditions: We as educators carefully evaluate the existing conditions, i.e., contents of education, methods of teaching, efficiency of teaching, library equipment, planning of curricular and co-curricular activities in the light of our objective and plan for the future. To provide efficient school administration: Aims are necessary for efficient school administration and organization. They help the school authorities in organizing, equipping, and administering the school. Various aspects of school administration and organization such as proper selection of teachers, proper curricular and co-curricular activities are guided by educational aims. It is rightly said that good schools evolve out of enlightened aims. Aims are guide-lines in the educational process. Like the sun, aims illumine our life. The ignorance of right aims will spoil the whole educational system. Factors Determining Educational Aims: Many factors have been contributing and do contribute to determining of educational aims. These factors touch every phase of human life that was, that is or what will be.

Factors associated with Philosophy of life Aims of education are always influenced by the philosophy of life of the people of that country. Idealistic philosophy lays down different aims like education for self- realization. Pragmatists have not faith in any fixed aim of education. The philosophy prevailing in the life of the people is reflected in the aims of education of that country. Factors associated with Psychology The aims of education should be according to the nature, needs, requirements, inspiration and interest of learners. If the aims of education are not in tune with the music of life, they will prove futile, useless, fruitless and ineffective. The aims of education should relate knowledge with the activities of life. Factors associated with Socio-economic problem Besides, political ideologies, the

socio-

96%

MATCHING BLOCK 73/143

W

economic problems of a country determine the aims of education. Education is a vital force, which can silently bury the socio-economic problems. It can thus evolve a society based on equality, co-operation and socialistic ideals. Factors associated with Political ideology Political ideologies also help in determining the aims of education. Different political ideologies like democracy, totalitarian, fascist or communist etc. will fix different aims for education in the state. The aims of education under democratic state are flexible and changeable according to changing needs and conditions of many on the contrary in a totalitarian state. The aims of education are fixed in accordance with the ideology of the state to uphold the rights of state. Factors associated with exploration of knowledge Education has also to give due consideration to the advancements in knowledge as far as the question of educational aims are concerned. Education today has become science oriented all over the world. Like other countries, in India also more and more stress is being laid on the study of modern sciences. This clearly shows that the spreading of new knowledge is an important factor in determining aims of education. Factors associated with Culture Cultural heritage of a country also determine the aims of education. It is the most important function of education to develop and preserve the cultural heritage. The changing and developing pattern of cultural factors directly influence the aims of education.

NSOU ? CC-ED-01 ? 56

Factors associated with Religion Religious factor also influence the aims of education. Education and religion have close relationship. They affect society in different ways. In India although there is no state religion, yet different religious viewpoints influence the aims of education. There are many large number of institutions run by different religious organization. They have to work to realize the aims accordingly. 4.3.1

93%

MATCHING BLOCK 74/143

Individual Aim of Education Individual aim emphasizes the development of the individuality of the learner according to his or her natural tendencies to hold the central notion that individual should be in the forefront of the educational process. It wants to foster the free growth of the individuality of the learner, helping him to achieve the highest degree of individual development in social context. Individual aim of education means that education should develop individuals according to their interest capacities and specialties. It should be noted that individual aim of education is not a new aim. In ancient India, Greece and some other countries also this aim was given due importance and prime position. In the present time also, since the entry of psychology in the field of education, Rousseau, Pestalozzi, Frobel, Nunn and other eminent educationists have again started giving greater emphasis on the individual aim of education. In the following lines we are throwing light on the narrower and wider meanings of this aim.

Sir Percy Nunn, a British educationist, is the chief proponent of the

85%

MATCHING BLOCK 75/143

W

individual aim of education. According to him, "Nothing good enters just the human world except in and through the free activities of individual men and women and that educational practice must be shaped to accord with that truth."

The success of education lies upon the complete development of the highest potentialities of an individual. Individual development implies self-realization of his/her native potentialities, which then flourishes the national growth. Narrower

74%

MATCHING BLOCK 76/143

W

of Individual Aim In its narrow sense, individual aim is known as self-expressing, all-round development of the child is natural development. In its narrower sense, individual aim

of education

92%

MATCHING BLOCK 77/143

W

is based on the philosophy of naturalization according to which education should develop the unique individuality of a child in accordance with self instincts. History reveals the fact that it was Rousseau who first of all advocated this aim though his insistence on education in the lapse of nature according to the nature of the child, but after him some other educationists also emphasized the importance of this aim. NSOU ? CC-ED-01 ? 57 Amongst such an educationist sir Percy Nunn of England is the chief-supporter and hence, ranks at the top of the list. He holds that the central aim of education is 'the autonomous development of the individual.' In his famous book 'Education, Its Data and the first principles' he says, "Nothing good enters into the human world except in and through the free activities of individual men and women, and that the educational practice must be shaped to accord with its truth." In the second chapter of his book Nunn further remarks that each species is moving towards perfection. Hence, individual aim is according to nature. Thus, in its narrow sense, individual aim of education emphasizes self-expression or natural development of the child so that after receiving education according to his interests, inclinations, capacities and needs, the child is able to choose a vocation according to his nature. Wider Meaning of individual Aim In its wider sense, individual aim is known as self-realization. Psychology also corroborates the development of individuality. This is because psychological researches have clearly established the fact that each individual is born with his own peculiar and distinct innate tendencies and capacities. Hence, it is the prime function of education to develop each individual fully and completely according to his or her interests, inclinations, aptitudes and capacities in such a way that he or she becomes an able and capable person.

In
other

MATCHING BLOCK 78/143

W

words, education of the individual should be planned with a view to individual good as well as the good of the society of which he is an integral part. Sir Percy Nunn reveals himself as a naturalist when he argues in favour of individual aim on the basis of biological phenomena in the second chapter of his book. But this is not the reality. Actually, Nunn believes that if an individual is cut away from society, he cannot develop himself in any way.

Merits of Individual Aim ? Allows self-actualization of the individual beings. ? Develops individuality and unique expression of character. ? Individual development brings social development. ? Improves economic effectiveness. ? Drives motivation and satisfaction for personal growth. Demerits of Individual Aim ? Makes individuals selfish and self-centered. ? Discourages the development of man's uniqueness. ? Ignores the socio-cultural heritage derived from society. NSOU ? CC-ED-01 ? 58 ? Impractical idea as individuals can't live without a society. ? Too much emphasis on personal development may lead to immoral behavior and sense of superiority. 4.3.2 Social Aim

97%

MATCHING BLOCK 79/143

W

of Education The social aim of education is based on the assumption that the society is superior to the individual. Thus, the aim of education should be the good of the society. It should aim to meet the needs of the society and ensure the welfare of the state. The social aim of education will help to strengthen social qualities like loyalty, co-operation, sacrifice equity etc. it will make man civilized and bring security, peace and justice in society. Some educationists have laid greater emphasis upon the social aim of education so that education develops in the children social feeling which will make them contribute their utmost to meet the demands of society after meeting their own needs. These educations evaluate the society higher than the individual. They believe that man is

a social being. He cannot live without the

100%

MATCHING BLOCK 80/143

W

society. In case he is cut off from the society, it will be very difficult for him to remain alive.

John Dewey, an American philosopher and educational reformer, was the chief exponent of the social aim of education. According to him, "

90%

MATCHING BLOCK 81/143

W

All education proceeds from the participation of the individual in the social consciousness of the race."

According to J. Ross, another great thinker, "

93%

MATCHING BLOCK 82/143

W

Individuality is of no value and personality a meaningless term, apart from the social environment in

which they are developed and made manifest." The social aim of education expounds that the development of society is of per importance of individual development as man cannot live in vacuum. Every moment of his life is influenced by the social environment. Education must train the child to live as an effective member of the society and provide constructive contributions to social development. In other words, Social aim means 'Cooperative efforts, shared interest.'

90%

MATCHING BLOCK 83/143

W

Narrow meaning of Social Aim In its narrow meaning, social aim of education is equated with the state socialism. In this sense, liberty of the individual is totally curtailed and all aspects of individual cannot even dream of his individual life are socialized. Any individual cannot even dream of his individual identity. He is expected to scarifice his everything, even his life for the welfare to the state. As such the state frames such a scheme of education thought by which it will be able to control the aim, curriculum and the methods of NSOU ? CC-ED-01 ? 59 teaching. Individuals are subjected to rigid discipline to cube their sense of identity and individualism. Wider Meaning of Social Aim In its wider sense the social aim is equated with democratic socialism. In this sense, it does not accept the importance of state, but at the sametime does not agree with the insignificance of the individual before the state. Thus, in its wider meaning, the social aim grants liberty to the individual to enjoy certain rights to develop his personality but at the same time expects from the individual to serve the state to best of his ability and capacity. India and other democratic countries where democracy has been combined with socialism. It may be noted that true citizens are greatly essential for the progress and prosperity of the state. Therefore, all the democratic states having accepted the individual aim of education in its wider meaning, indifferent forms. The American educationists John Dewey and Bagley have also accepted the wider meaning of social aim. Prof. Bagley in his book 'Education values' has mentioned three chief characteristics of a socially efficient individual. They are: (1) Economic efficiency, (2) Negative morality and (3) Positive morality. By economic efficiency, he means ability to pull one's own weight in the economic life. By negative morality, he means willingness to sacrifice one's desire when their gratification would interfere with the economic efficiency of others. By positive morality he means willingness to sacrifice one's own desires when their gratification would not contribute, directly or indirectly to social progress. In this way socially efficient individual is not a parasite on any member of society. He is a good citizen to understand and appreciate the world and is ready to sacrifice his own desires if they are harmful for others.

Supporters of the social aim of education ? According to Prof. Dewey - a socially efficient individual is an asset to himself as well as to society. He is able to earn his Livelihood. He conforms to moral and social standards of conduct. ? Reymont says that an individual is a social being. An isolated individual is figment of imagination an individual lives in the society. So, he or she should be trained through social contacts. ? The education commission 1964-66 emphasized that education cannot be considered in isolation. It is to be planned in social settings. It must contribute to national development. Merits of Social Aim ? Social Aim enables proper socialization and makes man a 'human being.' ? Social Aim brings the development of social living.

NSOU ? CC-ED-01 ? 60 ? Social Aim of education inculcates the 'we-feeling' among the members of society. ? Social harmony and cohesion is greatly caused by the social aim. ? Culture becomes more enriched and flourishes with the help of social aims of education. Demerits of Social Aim ? Makes the individual a 'non-entity'. ? Promotes narrow nationalism, i.e. implies the superiority of state over individuals. ? Ignores the psychological aspect of individual differences. ? Zero-importance of self-realization of the individuals. ? Discourages individual freedom. 4.4 Factors of Education In order to bring about a change in the individual and the society, education is organized through institutions like schools and colleges. For this process to take place certain indispensable elements are required. These elements are the factors of education. There are FOUR main or basic factors of education. ? Whom to teach? - the child or learner ? Who will teach? - the teacher ? What to teach? – the curriculum ? Where to teach? – the educational environment or the institution like school Now let us see why and how these factors are important in institutionalized education. 4.4.1 Child / Learner As we have seen previously that

75%

MATCHING BLOCK 84/143

W

the term 'Education' has been derived from Latin words "educere", "educare" and "educatum" which means to

draw out or bring out, to nourish and to instruct. So, we can see that the learner is the first and most important factor of education. Education needs to draw out or bring out the innate abilities of the learner and nourish them in and through the socio-cultural environment. The old concept of education was stuffing the brain of the child with information from outside. This information is to be provided by the teacher. Then the child did not have any place in the educational endeavour. But now education is centred round

NSOU ? CC-ED-01 ? 61 the child. It is the child whose innate powers are to be drawn out through education. The innate powers of the child are to be modified by selecting, coordinating, organizing in and through proper socio-cultural environment, so as to form an integrated personality. One has to learn to adjust successfully with the ever-varying socio-cultural environment. The innate powers of the child are immature and flexible. Through education they get modified and prepare themselves for adjustment with the present as well as with the future. This learning and modification takes place throughout life, through various phases of maturation and development. In the sphere of formal or institutionalized education this guidance for the modification comes from the teacher, through the curriculum, in the institution or school. Thus, the main factor is the child or learner, based on who are the other factors. 4.4.2 Teacher: In order to bring out or nourish the innate good qualities and eradicate or subdue the bad ones through instruction and guidance someone is required. This role is played by the teacher. At a point of time education was thought to be a bipolar process, with the learner or educand at one end and teacher or educator at the other. It was thought that the matured personality of the teacher will act on the tender immature child and make the child a better individual and a productive citizen. Initially when there were no formal schools, the parents and elder members of the family and community acted as teachers. As life started getting more complex a separate group of efficient individuals were assigned with the special task of training and assisting children to learn the important lessons of life, over a stipulated time span. The personality of the teacher is very important. The immature child looks up at the teacher as a role model. The role of the teacher is not limited within the classroom or just in the transfer of information. It is something more than that. The teacher is the 'friend, philosopher and guide'. In the modern era where there is information explosion taking place due to internet and social media the role of the teacher is more challenging. The teacher is the facilitator. The teacher is a trained person who can use technology, create interest and motivate the child to learn, to do and to be a productive member of the future society. 4.4.3 Curriculum The modification of the individual's behaviour that is done by the teacher is done through the curriculum. Curriculum is derived from the Latin word "Currere" which means the race course, or the run-way to be covered by an individual to reach a certain destination. Curriculum, infact, is the sum total of all the experiences and activities provided to the learner in order to bring about desirable

NSOU ? CC-ED-01 ? 62 changes in the individual and also the society. It is the resultant of the two forces - need of the child and aspirations of the society. It is the tool through which the aims and goals of education are to be achieved. It is not just the syllabus or subject of study. It includes interactions during school hours, library activities, co-curricular activities, morning assembly, concerts, social welfare works organized by the school or institution along with the students and others too. It is the vehicle through which the treasures of culture and social norms can be preserved and transferred to the next generations.

4.4.4 Educational Environment Environmental education is a process that allows individuals to explore environmental issues, engage in problem solving, and take action to improve the environment. As a result, individuals develop a deeper understanding of environmental issues and have the skills to make informed and responsible decisions. Now education is considered as a tri-polar process. The three poles are formed by the child or educand, teacher or educator and the third pole is the environment. The environment is made up of the agencies, both formal and informal. School is one of the most important formal agency or formal institution. It is the first stage of formal education which is assigned with the purpose of educating young people. The family, religious institutions, internet, mass-media etc. are not directly responsible for imparting education. So, they are the informal agencies and have a great influence on the growing minds. Though the four factors have been dealt with separately, yet they are not completely separate entities. They are interrelated as well as correlated with each other. The components of environmental education are: ? Awareness and sensitivity to the environment and environmental challenges; ? Knowledge and understanding of the environment and environmental challenges; ? Attitudes of concern for the environment and motivation to improve or maintain environmental quality; ? Skills to identify and help resolve environmental challenges; ? Participation in activities that lead to the resolution of environmental challenges. Environmental education does not advocate a particular viewpoint or course of action. Rather, environmental education teaches individuals how to weigh various sides of an issue through critical thinking and it enhances their own problem-solving and decision-making skills.

NSOU ? CC-ED-01 ? 63 4.4.1 Child Centric Education: The term Child-centered learning refers to a wide variety of educational programmes, learning and experiences, instructional approaches and academic support strategies that are intended to address the distinct learning needs, interests, aspirations or cultural background of individual students and group of students. The concept of child-centered education implies that the child occupies the central place in the educational process. On the contrary, the old concept of education emphasized the importance of the teacher who always remained at the giving end. The modern concept of education gives more importance to the child and places him/ her at the centre-stage. In child-centred education, the child is the centre of activity which means all programmes are organized and extended to his requirements., Prof. P.M. Lohithakshan elaborates the concept of child-centred education, in the Dictionary of Education, by saying that in this type of education "educational activities are designed and implemented on the basis of the capacities, needs and interests of children. Curricula, teaching methods, evaluation, co-curricular activities, etc. are all planned accordingly." The primary objective of child-centred education become important, responsible and confident. This approach wants to cover all areas of growth and development including social, emotional and physical. The important features in child-centred education in the present education system children become active participants in the teaching-learning process. They are enjoying enough opportunities for active learning, classroom interaction, social involvement and scope of problem solving and creative work in the classroom. Child-centred education accommodates individual differences. It involves an understanding of the cause-and-effect relationship, questioning one points of view and that of others, clarifying one's beliefs and values and formulating a framework for taking decisions and acting on these decisions. After studying the basics in child-centred education, we shall now conclude that the concept of child-centred education is based on the premises that individual's life is self-contained and self-sufficient, and the individual is the end, not the means. It emphasizes that education must center on the perception and feeling of the individual in order to facilitate understanding of personal reaction or responses to life situations and since life is based upon personal meanings, the nature of education should be largely determined by the learners. Individual learners should not be forced into predetermined programmes of study rather learning provision must be made by the teacher according to the choice of the learners.

4.4.2 Role of a Teacher: In the 21st century classrooms, teachers are facilitators, mentors, manager and a motivator of student learning and creators of productive classroom environments, in

NSOU ? CC-ED-01 ? 64 which students can develop the skills they might need at present or in future. The role and presence of teacher in whole teaching-learning process was very important in earlier time. In modern education system, teaching is viewed in broader perspective and teaching is observed as a comprehensive process. There has been a tremendous change in the role of the way of understanding teaching. Now, teaching includes all the activities organized by a teacher to bring about learning, be it inside or outside a classroom with or without the presence of the teacher. Teacher assumes a wide range of roles to support school and student's performance. Teacher exhibits leadership role in multiple, sometimes overlapping ways. Among these some roles are formal with designated responsibilities. Whereas, others are informal roles emerge as teacher interact with peers and students. The variety of roles provided the teachers to find out different ways to lead the students and tackle the challenges. Regardless of the roles they assume teachers shape the culture of their schools, improve instructional practices and students learning. Teachers become resource provider not only to students but also to their own colleagues by sharing instructional resources, planning lessons and exploring appropriate instructional methodologies. Facilitating learning opportunities to students is another important role teacher plays, as well as serving as a mentor for students is a common role for teacher.

4.4.3 Curriculum

Curriculum may be defined as the "educational and social environment in motion". It is the sum total of all the activities and experiences provided by the schools to the learners for achieving the desired objectives. The courses of studies are merely a suggestion for curricular and activities and procedures, a guide for teaching to follow. Curriculum is one of the most important items in the educative process. The curriculum, in fact, is the fundamental problem which determines the 'warp' and 'woof' of the process of education. What to do and how to do is the very essence of curriculum. There are three important aspects of a curriculum that we should bear in mind and these are as follows:

1. A curriculum is always pre-planned; it is not a set of activities developed on the spot or spontaneously.
2. Any curriculum has five bases i.e. philosophical basis, social forces, knowledge of human development as provided by the accepted theories, the nature of learning and the nature of knowledge and cognition. Hence, a curriculum is meant for education in a particular society and for learner and particular age group.
3. The purposes of a curriculum are reflected in the set of educational objectives

NSOU ? CC-ED-01 ? 65 that accompany it. These objectives are the end and the given curriculum is meant to achieve them. Definition: Let us examine some of the definitions of curriculum as given by experts: ? A curriculum is the formulation and implementation of an educational proposal, to be taught and learnt within schools or other institutions and for which that institution accepts responsibilities at three levels: its rationale, its actual implementation and its effects (Jenkin & Shipman, 1975). ? According to Wiles & Bondi (1988), "A curriculum can be called a plan for learning, which contains assumptions about the purpose of education in our society. It also has a definite structure through which the vision of the planners can be translated into learning experiences for the learner. Hence, any curriculum comprises two major dimensions: a vision and a structure". ? According to Hilda & Taba, "Curriculum usually consists of statement of aims and objectives indicating selection and organization of content: it implies or manifests certain pattern of learning and teaching. Because the objective demands or because the content organization requires, it includes a programme of evaluation of the outcomes."

4.4.4 Educational Environment

The educational environment discussed here is in the context of a school. School is a formal set up of education, wherein teachers and students interact with each other for achieving pre-determined objectives. It is through this interaction that students learn. The quality of interaction enhances the quality of learning outcomes. Classroom processes and interaction depends upon many factors in a classroom, like regularity in classroom activities, discipline, motivation of students, resources availability and so on. Classroom interaction also gets influenced by the school environment outside the classroom like cleanliness, state of infrastructure, conduct of co-curricular and extra-curricular activities. Today the school has been assigned the function of imparting information regarding the various discipline related to cognitive and non-cognitive domains of learning. These domains incorporate the areas related to the learning of certain subjects for the attainment of knowledge and understanding. They also focus on the application of the acquired knowledge in real life situation. The non-cognitive areas of learning sensitize the child to various other aspects such as appreciation of art, creative aspects of one's personality. The school has been marked as a temple of learning or a centre to seek knowledge and information. So, the vision of school is getting changed and with this the prime function of the school is also to preserve,

NSOU ? CC-ED-01 ? 66 disseminate and transmit the values, culture and principles of that society in the children. According to the educationist's view the school is an essential part of the society which does not and should not have a separate existence, distinct from society, because it is an important institution meant solely for the development of society. The present day school envisages certain functions to perform such as: ? To discharge its responsibility towards the education of a child; ? To be sensitive to know the local needs of the community and their fulfillment; ? To educate children according to the needs and aspiration of the society; ? To prepare the future citizen by providing awareness about their rights and duties; ? To assume leadership to develop self-confidence and self-reliance.

4.5 Types of Education

FORMAL NON -FORMAL TYPES OF EDUCATION INFORMAL VIRTUAL Education may be broadly classified as Informal, Formal, Non-formal and Virtual.

4.5.1 Informal

100%**MATCHING BLOCK 86/143****W**

Informal education is quite diverse from formal education and, particularly, from non-formal education, although in certain cases it is capable of maintaining a close relationship with both. It does not correspond to an organized and systematic view of education; informal education does not necessarily include the objectives and subjects usually encompassed by the traditional curricula.

It is aimed at students as much as at the public at large and imposes no obligations whatever their nature are. There being no control over the performed activities, informal education does not

NSOU ? CC-ED-01 ? 67 have necessity of providing degrees or diplomas; it merely supplements both the formal and non-formal education.

96%**MATCHING BLOCK 87/143****W**

Informal education for instance comprises the following activities: (a) Visiting to museums or to scientific and other fairs and exhibits, etc.; (b) Listening to radio broadcasting or watching TV programmes on educational or scientific themes; (c) Reading texts on sciences, education, technology etc. in journals and magazines; (d) Participating in scientific contests, (e) Attending lectures and conferences.

There are many instances of situations/activities encompassed by informal education, from those that may take place in the students' homes - such as scientific or didactic games, manipulation of kits, experiments, reading sessions (biographies, scientific news etc.) - to institutional activities - lectures in institutions, visiting museums, etc. It is easy to see

100%**MATCHING BLOCK 88/143****SA**

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

that the higher the degree of systematization and organization involved in informal education activities, the nearer

to it will be to non-formal education. This is a relevant fact in as much as it suggests the possibility of transition from informal to non-formal. We must ponder that, considered by itself, we cannot generally assert whether an educative action belongs to the formal, to the non-formal or to the informal universe. For instance, a visit to a Science Museum may be an informal education instance if arising from a personal and spontaneous decision by a student,

90%**MATCHING BLOCK 89/143****SA**

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

as it is not directly related to his scholastic activities. However, if such a visit is

part of an established

89%**MATCHING BLOCK 90/143****SA**

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

curriculum, requiring from students a written report and including assessments by the teacher, or tutor, then it will probably be an activity associated to either the formal or to the non-formal education. Importance of informal Education 1.

Gathering and collecting the desired knowledge is easier today owing to the exhaustive media and devices we have. Informal Education does not require any prior learning experiences or prerequisites. All you need is the willingness to complete your learning. 2. Learning informally is more relaxing and less threatening for most people. With no exams or projects to complete within limited schedules, many learners commit to learning a new skill or a concept readily. 3. In an informal setting, you will find SMEs willing to share more knowledge than ever. So if you have a group of experts in your organization simply arrange an informal meeting and have them share their expertise. Better yet, make them

NSOU ? CC-ED-01 ? 68 leaders in the online community where employees post questions and they can answer them. A low-stake, no-hot-spot setting is the ideal for this kind of knowledge sharing and knowledge management. 4. Informal learning is close to natural learning. People tend to follow the pathway that best suits their individual needs. Lifelong learning is a great example of informal learning. We acquire more knowledge informally than formally. 5. Resistance to learn new concepts and ideas is also lower when learning is presented informally. Adult learners strive on autonomy and self-direction. They readily complete self-generated tasks. 6. Boredom and procrastination are replaced by excitement and curiosity. Time and cost barriers are almost non-existent in informal learning environments. 4.5.2 Formal

100%

MATCHING BLOCK 91/143

W

Formal education corresponds to a systematic, organized education model, structured and administered according to a given set of laws and norms, presenting a rather rigid curriculum as regards objectives, content and methodology.

It is characterized by a contiguous education process named, as Sarramona¹ remarks, "prudential education", which necessarily involves the teacher,

82%

MATCHING BLOCK 92/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

the students and the institution. It corresponds to the education process normally adopted by our schools and universities. Formal education institutions are administratively,

physically and curricular based organization and require from

67%

MATCHING BLOCK 93/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

students a minimum classroom attendance. There is a program that teachers and students alike must observe, involving intermediate and final assessments in order to advance students to the next learning stage.

It confers degrees and diplomas pursuant to a quite strict set of regulations. The methodology is basically expositive, scarcely relating to the desired behavioral objectives - as a matter of fact, it is but seldom that such targets are operationally established.

92%

MATCHING BLOCK 94/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

Assessments are made on a general basis, for administrative purposes and are infrequently used to improve the education process.

Their character is, for the most part, punitive, obeying

86%

MATCHING BLOCK 95/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

a mono- directional methodology that fails to stimulate students and to provide for their active participation in the process,

though in most cases, failures are ascribed to them.

98%

MATCHING BLOCK 96/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

The setting-up of a formal education system does not consider the students' standards, values and attitudes that are relevant to the education system which, generally, is not tested or assessed at the level of student

acceptance, as well as for efficacy and efficiency. The same methodology - poor, ineffective, scarcely creative - is adopted, whether the universe contains 10, 50 or 200 students. Other institutional resources other than the expositive method are seldom employed, and when they are employed, the basic learning principles are disregarded. The subjects are presented in isolated blocks, whether as to content or methodology. Thus, for instance, in the case of

NSOU ? CC-ED-01 ? 69 Physics, for techno-administrative reasons the subject is divided into theory, laboratory and exercises and, their adequate order and correlation are disregarded. In general, the objectives aimed at the personal growth of students are negligenced and, the basic principles of learning fail to be considered in the planning and the performance of education systems. It is not excessive to say that in the case of formal education, for the most part teachers pretend to teach; students pretend to learn; and, institutions pretend to be really catering to the interests of students and of the society. Thus, generally, formal education cannot disguise its aloofness from the real needs of the students and of the community. IMPORTANCE OF FORMAL EDUCATION: Knowledge and Learning Traditionally, the schools and colleges are responsible for the formal education of a child. They affect the way a child thinks and gives direction to life. The ultimate purpose of formal education is to impart knowledge. It is through the formal education that the child learns the basic art and sciences. It teaches us the usage of this art and science in everyday life, and that is how a child becomes a learned person. It helps a person develop views and insights about various things. Degrees and Certificates Formal education provides you with degrees and certificates of merit that informal education does not. Informal education is also important, and that should go on throughout your life, but if being formally educated it is mandatory to survive in the competitive society today. Students need their degrees from educational institutions to practice law, accounting, etc. Share Knowledge Knowledge is power. So, to be powerful, you must be knowledgeable. The way to understand the importance of knowledge and use of it in practical life is by being formally educated. Having gained experience, you must share it with other people. This helps you gain their respect too. Discipline Formal education instills a sense of discipline in you. When we go to schools and colleges, we are bound to follow a set of rules and regulations. Gradually, we start following these rules in everyday life. This is good because it helps in keeping yourself and your activities organized. Specialization The world today consists of people who have developed the understanding of the deep and complex aspects of various things. Only through formal education can one NSOU ? CC-ED-01 ? 70 fit in the specialized world. The people driving the world today are those who have understood the complex nature of various subjects. This kind of understanding takes time and a gradual system of learning. Schools and colleges help us to develop a sense of competition and motivate us to contribute to the development of the nation. Organized Formal education is an organized way of education. In the absence of a systematic system of education, the learning process remains patchy. Economy of the Country By being formally educated, one can hope to improve the economy of a country. This is because the employers would be impressed by an educated work force and chooses countries which have a higher population of an educated work force. 4.5.3

66%

MATCHING BLOCK 98/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

Non-formal As seen, formal education has a well-defined set of features. Whenever one or more of these is absent, we may safely state that the educational process has acquired non- formal features.

Therefore, if a given education system is not prudential most of the time - non-contiguous communication - we may say that it has non-formal education features. Likewise,

100%

MATCHING BLOCK 97/143

W

non-formal education characteristics are found when the adopted strategy does not require student attendance, decreasing the contacts between teacher and student and most activities take place outside the institution - as for instance, home reading and paperwork. Educative processes endowed with flexible curricula and methodology, capable of adapting to the needs and interests of students, for which time is not a pre-established factor but is contingent upon the student's work pace, certainly do not correspond to those comprised by formal education,

but fit into

the so-called non-formal education. Proportionally to the number of formal education factors that are absent from a process, we find several grades of non-formal systems. These preliminary considerations emphasize the need clearly and objectively to establish the possible basic features of non-formal education. This, however, is not an easy task. As remarked by Ward and collaborators, "A comprehensive and standard definition of non-formal education is not yet available in common usage. Perhaps such a definition will not emerge until after much more study of the educational issues and potentialities inherent in the variety of experiences now called non-formal education has been done." As regards the distinction between both educational models, the same authors point out that "the implied and real distinctions between formal and non-formal education should be seen within a systematic and holistic view of education." In the same paper, they remark that education remains relatively undefined because the non-school view of education has merited little interest and responsibility

NSOU ? CC-ED-01 ? 71 from educational planners. Notwithstanding the above, even a preliminary analysis of the existing non-formal systems reveals the constant presence of two features: (a) centralization of the process on the student, as to his previously identified needs and possibilities; and, (b) the immediate usefulness of the education for the student's personal and professional growth. Non-formal education seems better to meet the individual needs of students. According to Ward, et al., 'a systematic analysis of the main features of non-formal education, diversely from formal schooling, shows

91%

MATCHING BLOCK 99/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

that participants are led to non-formal programmes because these offer the expertise that they hope to

acquire and the necessary assistance

94%

MATCHING BLOCK 100/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

for a better understanding of their own selves and of their world'. It is natural that if

the

96%

MATCHING BLOCK 101/143

SA

Unit 9 Dr. Gaurav Rao 1.docx (D19538677)

education offered by schools is without value for a student's life and fails to prepare him to deal with daily problems, he will simply refuse to participate in

programmes that may finally disappear or, at best, have to be reformulated to gain it significance for students. As non-formal education is focused on the student, it presents flexible features as regards the initially established and adopted procedures, objectives and contents. It is therefore, quicker to react in face of the changes that may affect the needs of students and of the community. With the basis on these preliminary considerations we may easily conclude that the non-formal label encompasses a wide variety of educational systems endowed with features that either lead them towards or away from the established formal systems. Thus, we might infer the existence of a certain degree of continuity linking the formal and the non-formal education. This view is not limited to a merely academic interest because, as will be seen below: It is an extremely objective and practical one in search for alternative solutions to educational problems. Given its scope, non-formal education is comprised of an ample diversity of educational situations, many of which have played a significant role in the renewal of educational systems. We shall now analyze three educative processes, namely: "correspondence learning", "distance learning" and "open education systems", which, because of their features fall within the scope of non-formal education. Correspondence Learning: It has been continuing as organized, structured correspondence schools from more than one century. Several works and authors mention that in 1856, at Berlin, Toussaint and Langenscheidt founded a correspondence languages course. In 1886, a graduate studies correspondence course was introduced in England. A "Society to encourage Study at Home" was organized in 1873, in Boston, and the first formal experience took place in 1883, at New York, the "Correspondence University".

NSOU ? CC-ED-01 ? 72 Correspondence course participants are found in all ages in brackets and economic- social classes. It is a planned and systematized activity, based on the preparation of printed educational materials which are forwarded to students who are physically separated from the teachers and who can give but a limited assistance to them. Correspondence learning is an individualized learning system that allows students to proceed at their own pace, according to their interests. The institutional materials are for the most part printed and are generally prepared by a teacher who has not enough didactic and technical knowledge to prepare top quality educational material. Although a number of correspondence courses currently offer other types of instructional material - audio-tapes and videotapes, kits, etc. We shall for classification purposes solely consider the printed materials offered by correspondence courses. We shall reserve the name "distance learning" to the courses prepared on a high technical level, by a multi-disciplinary team, administered by a relatively large institution, comprising a wide variety of educational materials. Correspondence courses generally establish a bi-directional communication by mail, supported by the teacher who corrects the paperworks, offers guidance and the requested explanations. A degree may or may not be obtained and there is no pressure - the student's motivation is the basic factor for the program's success. It is not difficult to see that correspondence courses do not incorporate several features of the formal education and are thus classified in the field of non-formal education.

Distance Learning: According to Holmberg, "Distance study is learning supported by those teaching methods in which, because of the physical separateness of learners and teachers, the interactive, as well as the preactive phase of teaching is conducted through print, mechanical or electronic devices." Distance learning is based on non- contiguous communication , that is, "the learner is at a distance from the teacher for much, most or even all the time during the teaching-learning process". Based on this definition, we may infer that the concept of distance learning is wider than that of correspondence learning, with which it is sometimes confused. Thus, Butts remarks that "the rapid adoption, over the past 10 years, of the phrase 'distance learning' to replace 'correspondence courses' would seem to reflect the incorporation of media other than print (and particularly the medium of broadcasting); the fresh impetus coming from research into individualized learning and self- instructional methods; the broadening of the social base for open learning systems; and the development of courses and qualifications designed specifically to meet the needs of distance learning students." The concept of open learning systems used by Butts is wider than that of distance learning, as analyzed below:

NSOU ? CC-ED-01 ? 73 In sum, according to Holmberg , the three universally accepted features of distance learning are as follows: 1. Typical of the whole distance study is that it is based on non-contiguous communication, i.e., the learner is at a distance from the teacher for much, most or even all of the time during the teaching-learning process. 2. A pre-produced course, as self-instructional as possible, printed and/or consisting of presentation brought about by other means than print (audio or video-tapes, radio or TV programmes, etc.) guides the study. 3. Organized non-contiguous two-way communication is a constitutive element of distance study. It is in most cases principally brought about by assignments for submission for the students to solve and answer and for the tutors to comment on (in writing or on audio-tape), but freer forms of communication also occur." The organization and administration of distance learning significantly differs from those of formal education. Thus, for instance, no student attends classes at the institution, except for occasional visitors. There are no classrooms; instead there are places where multidisciplinary teams comprised of tutors, authors, audio-visual experts, and so on, plan and compose the materials that will be used. In distance learning we find no "academic semesters". The students may at will discontinue studies whenever he needs or wants to do so. As per Holmberg, distance learning is comprised, of the following basic activities: ? the development and technical production of distance study courses; ? the distribution of course materials; ? the non-contiguous two-way communication between students and tutors/ counselors, and record-keeping. Holmberg also reminds us that, in some cases, other activities may be required, as for instance: "course certificate - examination and degrees - supplementary face-to-face contacts between students and tutors/counselors." A large experience has been obtained over these years through application of distance study at various levels, for different target populations. Our main concern in this Chapter relates to the use of distance study for higher level education. A well-succeeded example of such use is the Open University. As pointed out by Oliveira, Open Universities are generally based on distance study through one or more communication media, such as radio, TV and the printed press. They mostly formulate the instructional materials used in their courses, for the most part employing a distance tutoring system that contracts teachers to provide the required support to the performance

NSOU ? CC-ED-01 ? 74 of supplementary activities. The assessment and graduation requirements are not uniform and in some cases, the diplomas are on par with those issued by regular universities, whereas in others we find that certain restrictions are made with regard to given courses. There are also open universities which are in no way concerned with the validation or equivalence of the offered courses and of their diplomas to those given in the existing formal universities. Open universities need their own organizational structure that differs widely from that of traditional universities. According to Oliveira, "The nature of their tasks and the *modus operandi* of open universities provide a mixture of academic culture and industrial activity", requiring the cooperation of professionals from varied backgrounds to act as redactors, educational planners, professors specializing in the different fields, audio-visual experts, and so on, thus displaying a multi-disciplinary character. The materials forwarded to the students, comprising printed texts, audio or videotapes, kits, etc., is usually validated prior to their utilization, so as to ensure a high degree of efficacy and efficiency. Oliveira also notes that "in countries with a shallower academic sedimentation, open universities seldom have their start on an academic basis and this results in their remaining for the most part on the fringes of the educational process" - an extremely significant aspect which will be relevant to the proposal that will be submitted below. The British Open University may be mentioned as being the most successful among all open universities. As described by Grayson, the British Open University founded on 1969 was created in order to remain open to new people, methods and ideas. The traditional matriculation requirements were abolished and efforts were made to attract working students. Approximately, 63.000 students enrolled in 1980, and its syllabus included printed materials, audiotapes, reading, study guides, self-assessments and radio and TV programmes. Tutorial assistance and counseling are available in about 280 study centers throughout Great Britain. We must include here about the high quality of the produced instructional resources, as well as to the disposition shown by the planners of the British Open University always to remain receptive to non-conventional programmes. The courses encompass six areas, namely: education, mathematics, sciences, social sciences, and technology. Their duration is approximately one year. The success of the British Open University led to the creation of several open universities in France, in Germany and in the United States as from 1971, without even mentioning the several Latin-American efforts in this field. Oliveira mentions the pilot-experiment of the China Open University which is planning to enroll approximately two and a half million students. According to that author, "despite NSOU ? CC-ED-01 ? 75 a variety of forms and contexts, Open Universities illustrate the many possibilities for widening the scope of higher level education." As to the expression "Open" he remarks that it may relate to - (a) The moment in which the student enrolls on a course for which the required credits system has been extremely simplified; (b) The educational process itself, as well as the range of options offered to the students as regards programmes and courses; (c) The fact that the course is taught at a distance; and (d) The fact that although not generally providing final degrees, they offer to students the possibility and the required flexibility to stay on or to leave the courses. Open Systems: The third instance of non-formal education corresponds to open systems or open learning, which have drifted much farther apart from the features of formal education, creating a wide, deep rift. As remarked by Butts, "open learning systems are defined as those which offer students a measure of flexibility and autonomy, to study the programmes of their choice when and where they wish, and at a pace to suit their circumstances. "The features ascribed to open systems, by the author, necessarily sets them as non-formal education instances, jointly with correspondence learning and distance study. As Butts points out, "...distance learning is seen ... as one type of open learning." As mentioned before, correspondence learning can be deemed a type of distance learning and, as distance learning can be said to be an instance of open systems, we may conclude that this concept is the most widely encompassing class among non-formal education examples. Some authors also consider rather freely the concept of open education - as synonymous with open systems. As Yalli says, "the idea of openness may be two-fold: open as to structures, that is, a rupture of the physical barriers of educative institutions, so as to provide free access to schools; or open as to methodology and learning resources." And, he concludes: "The essential fact about open education is that it does not matter how knowledge is acquired, all means are valid. The open learning system aims at the formation of independent students who have the capacity for self-discipline and a high capacity for synthesis and for analysis." Thus, in an open system, learning is the function of an interaction between the student and the actual world. 4.5.4 Virtual Education Virtual education is delivered, usually via information technology networks, without restricting the learner in space and time. There may or may not be the existence of an institution physically or in reality. For example some Universities have a provision for on-line or digitalized library which the students can access even if they are not present

NSOU ? CC-ED-01 ? 76 in the campus. Again there are certain on-line sites which have no institution in the physical sense. Virtual education is often seen as synonymous with on-line learning. Virtual education, in the past would have included distance education but in the second decade of the twenty-first century it usually implies learning via the Internet without any formal requirement to attend a physical campus. In some cases virtual education compliments on-campus learning. Now in the Covid pandemic situation, as new crises in the field of education has been emerged, the virtual education is found most relevant. Importance of Virtual Education: ? Virtual education for student gives interactive access to the digital libraries provides with powerful search engines, can study at home or where there is an Internet access. ? Virtual educational space modelling for higher education based on competence- based approach for students professional development is actual than ever. One way or virtual education realization is virtual reality technology application where highly-realistic professional activity multi-component space modelling supports dynamic interaction with students. In this process, the complex psychology-pedagogical conditions, where the virtual education opportunities realization are possible to be implemented. ? Virtual educational space creation for higher education is innovative for future students' professional development, and directs on professional education quality improvement. ? Virtual educational space creation for university education has to take into account properties of virtual reality, and based on virtual outlook phenomenon. The virtual educational environment is realized in the conditions of pedagogical interaction in space and time, online. These signs provide various models creation optimum conditions. ? Virtual reality forms new forms of mentality and consciousness activity manifestation, and the return impact on factors which have generated them, and human life. ? The virtual educational environment influences to human knowledge and reality transformation; on human activity, worthiness, self-determination, and self-realization. Therefore, the virtual educational environment has to be based on recognition of humanistic essence and focused on professional education. ? The virtual educational environment of university education consists of six main components - informative, integrative, communicative, co-ordinating,

NSOU ? CC-ED-01 ? 77 developing and professional focusing. These cognitive and logic-subject components provide professional knowledge individual conceptual system formation. ? The virtual educational environment organization for university education the educational models, methods and receptions for future student's professional development have to be focused on virtual education opportunities realization and provide training process of reflexive management. ? The virtual educational environment as part of system of a common information space allows increasing the students' professionalism. 4.6 Summary In this unit we have covered some essential dimensions related to the process of education. Education is a purposive activity and therefore is driven towards a goal or aim. The aims of education give direction to all that is to be done and achieved in and through education. The Individualistic as well as Social Aims of education, among many other consequential aims, strive towards achieving a twofold purpose of individual growth and development as well as social progress and advancement. The aims give direction to the educational process which encompasses the various components or factors of education comprising of the learner, the teacher, the curriculum and the environment. The educational process remains incomplete in the absence of any of these factors of education. As discussed in the preceding units, education is a life-long process and does not end with the attainment of a degree. Hence, it can be categorized into different types like Informal, Formal, Non-formal and Virtual Education. These avenues open up multiple prospects for providing and receiving education. 4.7 Self-Assessment Questions 1. What is individual aim of education? 2. What is social aim of education? 3. Justify which aim of education is more relevant individual or social. 4. What are the factors of education? 5. Why is child considered as a factor of Education? 6. What are the types of education?

NSOU ? CC-ED-01 ? 78 7. State differences among the types of education. 8. Give an example each of formal, non-formal and informal education. 9. Justify which aim of education is more significant-Individualistic or socialistic. 10. Discuss on the types of Education. 4.8 References Ananda, C.L.et.el.(1983). Objectives After going through this unit, you will be able to – ?

understand education as the process and product; ? know about the agencies of Education; ? understand the characteristics and significance of Child-centric education. 5.2 Introduction We have seen in the previous units that Education is modification of behaviour. Now this modification takes place through a process. So when education is acquisition of knowledge and skill, leading to wisdom and bringing about changes in our thought process and helping in bringing about a modification in our behaviour, it is a process. In this unit, education is considered as process and product will be discussed.

NSOU ? CC-ED-01 ? 80 5.3 Education as the Process and Product Education can also be called a process when education is helping in the act of developing the intellect, critical thinking abilities, social and cultural understanding, and understanding of one's own self. Education is considered as an active and a dynamic process which takes place continuously during one's life by way of various experiences acquired through either a formal type or an informal type of agency. The individual continuously learns for successful adjustment with the environment. In this process, he or she learns to utilise the experiences in learning and reconstructing new things in the place of old ones. Thus, the learning takes place throughout life which is an active and a dynamic process. When education leads to a quantitative increase in knowledge or recollecting and retrieving the stored or memorized information for later use it acts as a product. Again, when the knowledge, skill and wisdom acquired through the process of education is assimilated in the culture and society and is transmitted from one generation to another, education becomes a product. Education fosters values in people,

87%**MATCHING BLOCK 104/143****W**

which are universally accepted as valuable at a given point of time.

Transmission of knowledge or skills which takes place as a purposeful activity in a variety of ways could be termed as the product of education. Let us look at some real life learning experiences. For example, when a child is learning to do addition. Say, $5+3=8$. A child will learn that when there is + sign between two numbers it implies addition, that is putting together the value of the two numbers and the resultant value will have to be written after the = sign. So, here a child is learning the process of addition. Similarly, the child learns the process of subtraction where the symbol or sign – (minus) implies taking away the number after this sign from that before the sign. This will lead to a lesser value than the first one. e.g. $5-3=2$. So this is the process. When the child can solve problems like $6+2=?$, education becomes the product. That is the knowledge of addition and subtraction now becomes the product. This product knowledge can help in the process of acquiring further knowledge, for example applying it in the BODMAS (coding) sums. Similarly, when one is initially learning to read, one learns to combine alphabets leading to a certain word. One learns the process of formation of words and how the combination of alphabets can lead to different sounds or pronunciation. This becomes a product when one can read words by looking at the words instead of spelling each letter of the word. So, it can be said that education is a process as well as a product.

NSOU ? CC-ED-01 ? 81 5.4 Agencies of Education We have seen that education leads to modification of behavior. This modification takes place throughout life. So, we

100%**MATCHING BLOCK 105/143****W**

understand that education is a life-long process. It starts

right from the time of

95%

MATCHING BLOCK 106/143

W

birth of the child and continues till the death. During the entire period of one's living, the human being comes in contact with various situations, institutions, and organizations and get themselves educated through different agencies of education.

One of the functions of education is socialization. We have seen in the previous units that the aims of education can broadly be divided into individualistic and socialistic. We have also discussed how these two aims are interrelated and interdependent. Our interactions with the environment or society can help us to have an impact in the modification of behavior as they form the sources for getting information and knowledge. The social agencies of education like the Family, School, Community, Media etc. contribute in our learning.

94%

MATCHING BLOCK 107/143

W

According to Bhatia (1994), 'Society has developed a number of specialized institutions to carry out the functions of education. These institutions are known as 'Agencies of Education'. Agencies may be

classified in various ways as prescribed by Brown (1947) and stated by Saxena (2009). Among the classifications, one may be based on being a formal agencies of education like schools, libraries, educational programmes etc. or informal agencies like family, market place, fairs etc. Another is based as active agencies, like school, family, community, religion, social clubs etc or passive agencies like Cinema, TV, radio etc. The third classification of agencies is based on four categories - formal agencies of education like schools, libraries, etc.; informal agencies like family, society; commercial agencies like radio, T.V., club, theatres, movies etc.; and non- commercial agencies like sports clubs, social welfare centres, scouts and guides etc. The

96%

MATCHING BLOCK 108/143

W

various agencies of education can be clubbed in each sub-category of the agencies, keeping in view their scope and the functions of getting education. It is therefore said that only one agency of education is not enough for the child to get education and for their growth and development. There is the scope to get education from the formal as well as the informal systems, active and passive systems, commercial as well as non-commercial

systems.

NSOU ? CC-ED-01 ? 82 5.4.1 Family Family is an active informal agency of education. It is the first social habitat of human being and the most influential agency of education. Brown has defined family as the "we group having an affectionate tie amongst members and sharing of common interests. It is a place of security and safety for the healthy growth of a child".

100%

MATCHING BLOCK 109/143

W

Psychologically and physically the first contact and interaction the child makes with the outer world is with his/her mother. Learning process of the child begins the moment s/he is born. His/her brain takes shape in accordance

with

97%**MATCHING BLOCK 110/143****W**

the responses made to the stimulus. The child's brain is nascent, eager to record the first reaction of the person who comes in contact with him/her. The home environment gives shape to his/her psychological and sociological growth. Mother becomes the first teacher. Undoubtedly, that is the reason that the first language a child learns is called "mother tongue". When we use the term "Home", it signifies the place where there are parents and other family members who the child comes in contact with, where the child is loved, cared for, disciplined, reared, taught and brought up, where a responsibility is felt by the family to modulate the child and attend his/her needs. Home, therefore, plays a very important role in laying the foundation of the child's personality in terms of physical, emotional, social, moral and cognitive aspects. As change is a continuous process,

socially, the changes in family system have taken place. Joint families have given way to unitary families. Now the size of the family is smaller with only the parents and one or two children.

97%**MATCHING BLOCK 111/143****W**

In joint families, there are other family members who are emotionally attached with each other and play an active role in the upbringing of the development of the child. The following are the major educational functions of the family which works for developing the all-round personality of the child: ?

It helps in physical, mental, and emotional developments

91%**MATCHING BLOCK 112/143****W**

of the child. From the very beginning of infancy, child learns to understand others, recognize signs and symbols, speech and imitate others. This is the family that educates the child, not through formal process but informally by action, play, and stories.

100%**MATCHING BLOCK 113/143****W**

The behavior of the parents defines the emotional development of the child. Needless to say, the child first develops emotional bonding with the parents. The feeling of 'acceptance', 'love and belongingness' and 'togetherness' comes from the family only, which provides emotional maturity to the child.

98%**MATCHING BLOCK 114/143****W**

It educates the child about the attitude, moral values, ethics, skills, behavior pattern at the family as well as the society. ? It teaches the child about the culture, tradition, and customs of the society and also, teaches fellow - feeling, love and belongingness in living together.

NSOU ? CC-ED-01 ? 83 ? It influences the socialization and actualization of the child.

96%**MATCHING BLOCK 115/143****W**

The first step towards socialization is learnt by the child is the love and affection receives from his/her family. Home is the first social institution that attempts to socialize the child. The social development of the child depends upon the love, affection, recognition, security, approval, freedom etc. the child receives from the family. The child receives approval for righteous conduct from parents. The child also observes parents' day to day activities and it impinges upon behavior of the child. The manner in which the family conducts itself channelizes future role and performance of the child. ?

100%**MATCHING BLOCK 116/143****W**

Home not only provides basic necessities of the child, it also equally provides many opportunities to the child for future living. ?

Moral and religious education starts from the family.

100%**MATCHING BLOCK 117/143****W**

The parents become the first role model for the child. It is widely seen that a girl child copies her mother and so does the boy of his father. The reinforcement that comes as a response to the child's behavior creates the value system. The reinforcement that a child receives from his/her parents towards a particular act makes the child differentiate between the right and the wrong. The immoral acts of the child should be checked by the parents at the very initial stage. The value system of the child depends on the morals and religious activities practiced within the family. Apart from these, the family has further responsibility to make the child develop a sense of nationalism towards

the

100%**MATCHING BLOCK 118/143****W**

country, to understand their duties and responsibilities to the society, to respect human life and dignity, and to preserve family values and culture. ?

100%**MATCHING BLOCK 119/143****W**

It helps the child for developing a balanced personality in all aspects of human living.

Thus we see that the family through its various stages and interactions with the child acts in an informal way to educate the child.

95%**MATCHING BLOCK 120/143****W**

Family as an Agency for the Development of the Child Family brings the following developments among the child –
Physical Development The child spends his/her infancy within the family. The priority, initially, should be on the physical growth of the child. The family should take care of the diet of the child and ensure that the child is nourished.
Social Development The first step towards socializing is learnt by the child is the love and affection receives from his/her family. Home family is the first social institution that attempts NSOU ? CC-ED-01 ? 84 to socialize the child. The social development of the child depends upon love, affection, recognition, security, approval, freedom etc. the child receives from the family. The child also receives approval for righteous conduct from parents. The child also observes parents' day-to-day activities and it impinges upon behaviour of the child. The manner in which the family conducts itself channelizes future role and performance of the child.
Emotional Development The behavior of the parents defines the emotional development of the child. Needless to say, the child first develops emotional bonding with the parents. The feelings of 'acceptance', 'love and belongingness' and 'togetherness' come from the family only, which provides emotional maturity to the child.
Mental Development Like the physical growth, mental development of the child also goes on simultaneously. From the very beginning of infancy, child learns to understand others, recognise signs and symbols, speech and imitate others. This is the family that educates the child, not through formal process but informally by action, play, and stories. Moral

and

100%**MATCHING BLOCK 121/143****W**

religious Development The parents become the first role model for the child. It is widely seen that a girl child copies her mother and so does the boy of his father. The reinforcement that comes as a response to the child's behavior creates the value system. The reinforcement that a child receives from his/her parents towards a particular act makes the child differentiate between the right and the wrong. The immoral acts of the child should be checked by the parents at the very initial stage. The value system of the child depends on the morals and religious activities practiced within the family. Apart from these, the family has further responsibility to make the child develop a sense of nationalism towards

the

country, to understand their duties and responsibilities to the society, to respect human life and dignity, and to preserve family values and culture. 5.4.2

Society The two terms 'society' and 'community' are often confusing. However, there is a difference in the two. A society is a group of individuals involved in persistent with social interactions, or a large social group sharing the same spatial or social territory, typically subject to the same political authority and dominant cultural expectations. Community refers to a group of people who live in a definite locality but society refers

NSOU ? CC-ED-01 ? 85 to a system of social relationships. There exists more than one community within a society. Hence community is smaller unit than society. The society, thus has different types of social relations under it which affect the education of individuals. As agencies under the macro-system of society comes the Government or state, the religious institutions, the socio-cultural organizations, etc. Neighborhood can be said to be a local social unit where there is constant interactions among people living near one another or people of the same locality. In such spatial units, face-to-face interactions frequently take place. In this sense they are local social units where children grow up. Children through interactions learn the language and social norms. Interaction with different age groups of the society helps an individual to socialize. Besides one may observe diverse set of people in the neighborhood who differ in caste, class or religion or occupation. By interacting with such diverse set of people, one is exposed to various customs and practices; various occupations that people pursue; the skills required for such occupations and also the qualities possessed by those members. The growing child may also imbibe values of discipline and orderly behavior. The concept of inclusiveness also develops through the social interactions at the society. One learns to accept diversity. Interactions are both physical and social environments wherein children get easily affected. If the child is surrounded by people who are warm and cooperative, it will get definitely transmitted to the child. On the other hand, if the locality is peopled by aggressive and violent group, it is possible that such children may learn unsocial or anti-social behaviors. Social values, thus develop through the social interactions which help in the development of personality and character. It is easy to observe interdependence among people of the same locality. There may be individual differences. At the same time these residents of the same locality seek to realize common values share common traditions, folk-ways and customs, socialize youth, and maintain effective social control. So, we can see how society has a tremendous effect in educating us directly and indirectly leading to a modification of behaviour throughout our life. 5.4.3 Organization When a group of people work together with a particular purpose they form an organization. There are various organizations in the society which act as formal and informal agencies of education. The School and educational institutions, library are formal organizations. Whereas, religious institutions, state or Government, Clubs, socio-cultural organizations act as informal agencies of education.

NSOU ? CC-ED-01 ? 86 As it is not possible to discuss on all sorts of organizations, we will see a few and how they act as agencies of education. School For an individual, the school is usually the first direct, active and formal organization. It is one of the most important agencies of education. The child spends a great part of his days in this organization. The school being a direct and formal agency of education has specific aims and method of modifying the behaviour of the child or imparting education. The teachers are the parent substitutes, who are like role models to the children. The matured personality of the teacher through various interactions acts on the child and brings about modification of behaviour. As an agency of education the school performs various functions – ? Custodian function – The children stay in school for a greater part of the day, under the care and responsibility of the institutional authority. The school acts as a custodian of the developing children. ? Supplemental function – For the few years before coming to school children grow and develop in and through their respective home environment which may be influenced by other non-school agencies. The influence of the family creates unique behaviour patterns, mental structure etc. All the influences the child may not have the be useful experiences. The school tries to supplement those with useful learning which the child may not have got from the home. ? Corrective function – It is a fact that all homes are not good homes. Different types of behaviour problems of children are found to originate from home or other non-school agencies. Specially in the modern era the mass-media and social media are creating a great impact on a child's behaviour, all of which may not be beneficial for the child. In these cases, the school performs the corrective function by modifying these unwanted physical and mental problems. ? Preventive function – The school makes an attempt by manipulating the environment and framing the curriculum in such a manner that children are dissuaded or prevented from developing undesirable habits or traits. The maxim of "prevention is better than cure" is better to follow as undesirable behaviour patterns once formed cause difficulty in its eradication. ? Conservation and transmission function – The cultural heritage is preserved and transmitted to the future citizens by the school through its various curricular and co-curricular activities. ? Stimulative and Creative function – The school through its activities of the curriculum manipulates the academic and psycho-social environment in such

NSOU ? CC-ED-01 ? 87 a way so that it acts as a stimulant to nurture the creative abilities of the child. Flexibility of the thought is developed through discussions, debates etc. ? Socialization function – The school is a miniature society. It deals with children during the most crucial stages of its development – programmes and activities can help in the socialization of the child. The value of punctuality, discipline, hard work is infused by the school. Mutual respect amongst individuals is childhood and adolescence. Interaction amongst peer group and adults through various situations. ? Evaluative function – The school not only teaches, but also evaluates the learnings in the different dimensions be it physical, academic, cultural, aesthetic or social and determines the learner's future as a member of the society. ? Man-power training – The school takes the responsibility of creating the future citizens of a country. It tries to bring out the latent quality of its students and develop the leadership qualities. ? Educational and vocational guidance – With diversification of subjects and specialization in various fields, the school has an important role to play in providing guidance as per the aptitude and interest of the students. Pre- Vocational skills are to be developed by the school so that in future the children can be on their own feet economically and act as a human resource to the country. Thus, from the above discussions we can see that the school as an agency of education has a very crucial role to play. The State or the Government Initially education was a personal or private affair. The family took the responsibility of teaching its younger members the knowledge required to live. Gradually when men started living in groups or tribes, the elder members of the group decide on the type of education and who will impart the education to the younger members. Gradually, as kings came in, some benevolent rulers started patronizing the educational institutions by providing lands, or financial assistances. However, most of the time personal grants by the rich or voluntary services by the members of the society were taken to run the educational institutions. At present the Government directly and indirectly control the education of the country. Education Acts as the means through which the thought of the ruling political party is disseminated. This is done by determining the aim of education, framing the curriculum and syllabus, revising the textbooks etc. Direct control is practiced through the policies, rules and regulations, financial assistance, affiliating agencies by way of

NSOU ? CC-ED-01 ? 88 supervision and inspection. The Government also collects, compiles and publishes information. The Government also makes provision for teacher training and research on teacher education. Education being in the concurrent list of the Constitution of India both State Government and Central Government has a responsibility in the expansion and implementation of it. Socio-Cultural Organization The socio-cultural organizations spring up out of the needs and interests of the people. These are specified, at the same time spontaneous agencies of education. These may have some forms depending on their demands like clubs, sports organizations, Scouts and Guides etc. These organizations cater to innumerable needs of the people. They help in social interactions, group work and have an everlasting influence upon the development of one's personality. Education is a life-long process of learning and an unending process of development of powers in response to the socio-cultural aspirations. An individual develops his/ her body and mind, expands the horizon of knowledge, creates new values, acquires skills and unfolds the latent powers to the full. These organizations benefit both the individual and society. The individual is benefitted through the development of his/ her powers, learning of skills, social interaction, sublimation and fulfillment of creative urges. The society on the other hand benefits as it gets better citizens. Awareness programmes, relief work during natural calamities, blood donation camps, inter club sports programmes etc. help in the development of cohesion and feeling of unity among the citizens.

5.4.4 Mass-Media Mass media refers to a diverse array of media technologies that reach a large audience via mass communication. It may be print media like newspaper, magazines or non- print media like drama, Jatra, puppet show or electronic media like TV, radio, movies, internet etc. The goal is to reach out to the mass or large number of people without establishing any personal contact between senders and receivers. It permeates into all aspects of society, be it political, linguistic, cultural or spiritual. Media is all pervasive; its functioning is very subtle and has both positive and negative influences. Mass media can perform the functions of providing information. Through this information education can be transmitted, mass-media can act as an entertainment media too. It has broad appeal. It can reach out to majority or mass at great speed. Compared to formal schools and institutions the cost of reaching the mass is lower. Long before the birth of formal schools, education of the mass took place informally through various forms. Philosophy, values, religious preachings and culture were

NSOU ? CC-ED-01 ? 89 preserved and disseminated through indigenous ways, like Kirtan, Jatra, Kavigaan, Kathakata, Puppetry, folk-songs and dances like Chau of Purulia. These were the mass media that were less expensive, a part of the peoples' lifestyle and entertaining. These forms of mass-media were attractive to the common man and helped them to know about various things, imbibe our cultural norms and modifying the thought process. With an increase the literacy and advent of press, newspapers became popular. They are less expensive and readily available. They help in the development of public opinion and awareness of the surroundings. The press, specially the newspaper tries to fight against ignorance, social evils and keep the people updated with the day to day affairs of the administrative machinery of the state as well and thus try to build the democratic spirit. The Radio, Television and Cinema are not only means of entertainment but are providers of education too. The radio or transistor being handy to carry and battery run can be carried to different places as per conveniences. It can be heard from a certain distance too. It is a powerful mass-medium for disseminating information. Unlike the newspaper which can reach the literate people only, the radio can be effective on those who are illiterate. The television and cinema has a greater impact on the mass than the radio. Both of them use the auditory as well as the visual sense organs. So not only the people with vision and hearing can gain benefit from it, even those deprived of these sense organs can use the other and be a part of the receiver. The television with its discussions, debates, news and programmes can help in the dissemination of knowledge, awareness and formation of opinion. Through its various programmes vocational classes and educational programmes can also be reached to the mass. In the present era, the internet and the social media like twitter, you tube, face book, whatsapp are helping to act as a two-way or interactive mass-media. It is not only helping in the circulation of knowledge very fast to the mass, it is also effective in collecting information from the mass. There is no barrier of geographical distance or of countries for this type of mass media. It is a good mode of adult education too. There is a huge explosion of knowledge and this media opens the casket of knowledge for anyone who is eager to know. Media is being used both as formal and non-formal system

of education. Information Communication Technology is especially used for non-formal education like in ODL system. In India, IGNOU and NIOS like institutions are providing educational programmes throughout the country through Radio, Television, and online programmes. The Central Institute of Educational Technology under the NCERT is mainly concerned with the development of innovations and with using various media in School education. It is engaged in the development of an attractive system of education using television NSOU ? CC-ED-01 ? 90 through INSAT to reach in and out of school children and teachers in rural areas. It produces E.T.V. programmes and these programmes are being telecast via INSAT. The Electronic Media Production Center in IGNOU is also contributing in developing audio-video materials, direct telecast through Teleconferencing and Interactive Radio Counselling for the learners.

Tools of Media The various tools of media have been stated as follows (Nasir, 2013). Newspaper and Magazine Newspapers and magazines are regarded to be the major sources that make provision of all kinds of information and knowledge to the individuals on various issues and concerns. They include information about education, employment opportunities, current affairs, notices, advertisements about products and services, fashion, health, diet and nutrition, medical and health care services, technology, business, management, administration and so forth. There are numerous kinds of newspapers and magazines, which provide abundant information on various issues and problems. Individuals who are not able to access the internet are able to obtain information through newspapers and magazines. Television – Television is considered to be the major source of entertainment. Individuals watch news movies, serials and other programs on television and acquire information. There are numerous kinds of programs on television, that contribute in making provision of knowledge on various areas such as education, relationships, how to communicate, respect for the elderly individuals, promote proper growth and development of the children, form appropriate terms and conditions at the workplace and within the community, and through television programs and cinemas, individuals acquire knowledge about how to present themselves in an adequate manner. Radio – The radio is a source of media, which normally people listen to, in most cases, it is the electronic media of communication, it is also the first with the news like newspaper and has several news bulletins within 24 hours. Internet – Internet has influenced the lives of the individuals not only in India but in all the countries of the world on the wide range. Individuals are able to access information on each and every issue and concern on the internet at any time. The internet facilities largely contribute in making provision of information to the individuals even in buying and selling of products and services. Individuals are largely depending upon the internet to carry out all kinds of day to day activities and functions. Advertisements – It is considered to be the part of mass media. The main purpose of the advertisements is to generate awareness amongst the individuals about various products and services. Market of the advertisements has been developing to such an NSOU ? CC-ED-01 ? 91 extent as one is able to observe an advertisement within the time of one minute. In the present world, there has been creation of advertisements on television, radio, magazines, newspapers and even books about various products and services. **Importance of Mass Media:** 1. Mass Media provide information to the mass within a less time. 2. It takes a wide coverage of information regarding anything that is happening in any corner of the world. 3. It brings the entire world to the individual or to the classroom. Children spend hours sitting together in front of the television and can visualize, hear and acquire knowledge about the world. 4. These media easily reach groups, allow repeated use, give more reality, influence attitudes, show cause and effect relationships and ultimately motivate the audience. 5. It sends information to remote places and helps in distant learning. 6. It helps in modification of attitudes, inculcation of desirable values and acquaintance with cultural heritage. 7. Mass media acts as an agency of social change. 8. These are useful for reinforcing group dynamics and interpersonal communication. 9. Mass-media as means of communication make ideas clear to children and help them to acquire correct knowledge. They help in simplifying and in giving vividness to explanation. 10. These make the instruction concrete and stimulate interest and excite curiosity in things. Education today, therefore, has a far greater responsibility than it had ever before. It has to meet the demands of a dynamic world which change its character every day. Contemporary education has to be more comprehensive and complete than it was ever before. The role of the various agencies of education like home, society, community etc. has consequently increased, so has the role of the mass media like television, radio, cinema, newspaper increased.” So now-a-days, press, radio, cinema, television, etc. are becoming more and more important in an individual’s life. Mass media in education are press, radio, motion-picture, television, etc. So mass media are many and these are technically called ‘passive agencies of education’. They influence the attitude and behaviour of the people indirectly. These agencies cover entertainment, informatory propaganda, historical record, education and improvement of moral judgement and moral tone of the people.

NSOU ? CC-ED-01 ? 92 5.5 Characteristics and Significance of Child-Centric Education Looking back at history, we find that education meant transference of knowledge, which was found to be important for the adult members of society to the child. The child's needs, interest, abilities were not taken into consideration. After numberless efforts made by educators through decades child is now considered to be the centre of education. Child-centricism signifies that educational endeavour with its objective, curricular organization, methodology and technique of teaching, disciplinary measures should rotate round an individual child's physical ability, intellectual ability, emotional state, socio-cultural background, interest and aptitude in order to bring about an integrated development in the child. The Naturalistic Movement brought about by J.J. Rousseau, the architect of French Revolution, questioned and shattered the conventional and traditional ideas. He felt education can act as a weapon to fight against all sort of evils. Through his naturalistic philosophy he brought about naturalism in education. He vehemently opposed the traditional educational ideas and stressed on natural education. His natural education was based on the original nature of the child. That is, his education laid stress on the child, the natural interest, capacities and psycho-physical demands of the individual. Pestalozzi was inspired by Rousseau and tried to bring in Psychological approach to the method of education by catering to the varied interests, aptitudes and inclination of students. Thus, he too tried to place the child as the central point in the educational process and like Rousseau had immense faith in the innate goodness of the child. Froebel's Kindergarten (in German language means Childs' garden) system implies through its nomenclature the importance of the child. According to Froebel, education of an individual is nothing but the self-developmental process. Education is unfoldment of the natural powers of an individual. Madam Montessori introduced individualization of instruction. She stated that a child has a delicate body and a delicate mind and so requires delicate handling. So, she never allowed any individual child to be lost in a group. Her scheme of education provided the child with the environment full of joy, freedom and scope for fullest expression of individual powers. Similarly, John Dewey, the American pragmatist was eclectic in his approach and placed the learner in a very important place. He stated that education is a process of growth through reconstruction of experiences. It must cater to the social needs and NSOU ? CC-ED-01 ? 93 demands. So education should see that it leads to the harmonious development of the individual and also lead to well-being of society. Our Indian educators too laid great emphasis on reformation of the traditional system of education. Rabindranath Tagore, Swami Vivekananda, Sri Aurobindo, Mahatma Gandhi and all modern educationists have laid on child-centricism in their own ways. The slogan for today is "Education is meant for the child and not child for the education". 5.5.1 Characteristics of Child-Centric Education As the name states, child is to be considered as

87%

MATCHING BLOCK 124/143

W

the Centre of Education. So development of mind, body and spirit of the child should be reflected in the programme and planning of education.

So the characteristics of child-centred education are as follows: a. Dignity of the child: Every child is to be accepted with his or her individual difference. No child is similar. So the individuality of the child is to be respected. The spirit of child-centric education is to uphold the dignity and individuality of the child in the academic fabric. b. Inclusiveness or No discrimination: With the idea of upholding the dignity and individuality of the child is the idea of no discrimination or inclusion. No discrimination on the grounds of caste, creed, sex, economic background or social background of the child. c. Freedom: Freedom based discipline has been emphasized. Freedom to learn through discovery and creation of own experiences instead of getting second hand information through books are emphasized. d. All round development and Self-activities: The aim of education according to child-centricism is the all round development of the child. That can best be achieved when a child is allowed to learn through experiences and activities. Such learning

100%

MATCHING BLOCK 125/143

W

is permanent. The course and subjects should be experience-oriented to meet the need of the child.

The teaching styles and techniques should be such that it leads to the development of physical, cognitive and affective areas of a child. e.

100%**MATCHING BLOCK 126/143****W**

Development of interest and needs: The education of child depends on his interest and needs. The physical, social, moral and spiritual development of the child is "the main objective of the child-centered Education.

f. Dignity of the Child: The spirit of child-centred education upholds the dignity of the child in the academic and social fabric. Such a system of education gives due respect to the individuality of the child.

NSOU ? CC-ED-01 ? 94 g.

100%**MATCHING BLOCK 127/143****W**

Self-activities: Froebel developed plays, games and songs and occupations, designed especially to stimulate the child's self-activity. He laid great stress on self-development of the child and child's activity should stem from his own interests.

h.

95%**MATCHING BLOCK 128/143****W**

Development of interest and needs: The education of child depends on his/her interest and needs. The physical, social, moral and spiritual development of the child is "the main objective of the child-centered Education.

Principles of Child-Centered Education Child centric education today exists in various forms in schools all over the world. The principles of child-centred education are – i) The child is the most sacred organism in education: The basic principle of child-centered education is to enable the optimal development of a child's personality and competencies in line with his or her individual requirements. ii) Orientation on the needs of the children: The teacher should understand child psychology and guide the child according to his/her needs and attitudes. Children should be treated as children and not as miniature adults. iii) Active self-regulated learning: A child must learn through self-activity. Therefore, children are instructed and encouraged to actively search for knowledge by carrying out learning activities. iv) Well designed learning environment: Learning environment should be such that children can work towards developing their competencies in an autonomous and self-directed manner and in accordance with their own needs. Therefore, importance should be given in didactically designed learning material, such as, learning tasks, games, materials to stimulate development, learning platforms, user friendly libraries, learning rooms etc. v) Social learning as a method and goal: Learning is designed as a shared social process. Cooperative planning, working in teams and groups, such as, discussion groups, student council, etc. are encouraged. vi) Importance on Psychological findings: Child-centric education is based on psychological findings which are applied at all levels of learning, viz., motivation by creating interest in the child, interest, positive reinforcement of good learning habits through rewards etc. vii) Conducive school community: School administrators, teachers, students and parents, all work together in a respectful, professional and committed way and form a conducive school community where teachers cooperate with and include parents in school activities.

NSOU ? CC-ED-01 ? 95 5.5.2 Significance of Child-Centric Education Child-centric education has been supported from various angles, viz., Philosophy, Psychology and Sociology. All supports of child-centrism are from their own perspectives. Philosophy in its various forms justifies child-centrism. Idealists believe that a child has innate goodness which is unfolded in the natural process of expression. Child centric education doesnot allow any interference from outside and so allows in the enfoldment of the innate goodness naturally. Naturalism believes that child has got natural endowments which seek natural development and expression. That is possible only in child-centric education. Pragmatism believes that nothing is constant and eternal. So readymade information prepared by adult members may not be of any use for the child in future. Life experience gathered by an individual teaches many lessons. Child-centricism advocates experiential learning. This learning helps the child to reconstruct experiences in accordance with the basic capacity, aptitude, need and interest of the learner. Psychology believes in individual difference. That is each child has difference in instinct, emotion, urges, aptitude, capacity, interest and inclination. So a uniform educational system cannot cater to all children because each child is unique. Child- centrcism advocates the individual needs of the child and freedom for self-development and all round development of the child. Thus Child-centric education is advocated strongly by Psychology. Sociology, the study of society, justifies child-centrism in education as a social process. This process aims at ensuring one's successful adjustment with society. This adaptation to socio-cultural environment comes as a process of self-learning and self- adjustment through purely subjective reconstruction of experiences. Thus, we find that child-centrism is significant from various standpoints. 5.6 Summary Education with its manifold applications and implications can rightly be understood both as a process and a product. It is concerned with both; the ongoing learning experiences that an individual goes through in an educative programme as well as what the individual has become or achieved after going through the learning experiences. The learning experiences that an individual goes through in one's life span are numerous and multifarious in nature. They cannot be restricted to only one source and so, there are various agencies of education through one learns, grows and educates oneself. In this unit you are familiarised with some of the important agencies of

NSOU ? CC-ED-01 ? 96 education like family, society, organisations, mass media etc. The role of these agencies in the education of an individual is immense as they go on to influence the individual at every stage of her/his life. Another important topic that has been dealt with in this unit is child-centric education, its characteristics and significance. Educational Studies in the present times would remain insufficient without the discussion of child centric education. It has a significant historical past to the manner in which educational studies as a discipline has been impacted and has evolved over the years. The unit covers the trajectory of child centric education and its relevance in the present times. 5.7 Self-Assessment Questions 1. How does family act as an agency of Education? 2. State the role of mass media in education? 3. State the characteristic of Child-centric education. 4. Justify education as a process and product? 5. Discuss the importance agencies of Education. 6. State the characteristic and significance of child-centric Education 5.8 Reference

Objectives After going through this unit, you will be able to – ?

understand education and knowledge development; ? know about the interrelation between education and culture; ?

know about the Report of the International Education Commission for 21st Century: Major Suggestions regarding Four Pillars of Education 6.2 Introduction Before discussing on the function and role of Education for knowledge development we need to know what "knowledge" is. Knowledge is the facts, information and skills acquired by a person through experience or education. It also means the theoretical or practical understanding of a subject. In fact, it

96%**MATCHING BLOCK 130/143****SA**

Unit I.docx (D21052702)

is a familiarity, awareness, or understanding of someone or something, such as facts, information, descriptions,

or

96%**MATCHING BLOCK 131/143****SA**

Unit I.docx (D21052702)

skills, which is acquired through experience or education by perceiving, discovering or learning.

It is a meaningful structure of facts into some relationships. Education for knowledge development, culture and education along with the Report of the International Education Commission for 21 st Century: Major Suggestions regarding Four Pillars of Education will be discussed in this unit.

NSOU ? CC-ED-01 ? 98 6.3 Education for Knowledge Development

Philosopher Plato defined knowledge as "justified true belief". Thus, the information that we gain from the curriculum, the justified skills that we develop from the curricular and co-curricular activities are all leading to knowledge. There are four standard basic sources of knowledge - perception, memory, consciousness and reason. Memory as a basic source plays the preservative role more than a generative role. It helps as a source for justification. Perception is giving a meaning to the sensation. This meaning is given based on previous experience stored in memory. Education is modification of behaviour. This modification occurs due to knowledge. Education also leads to the acquisition or formation of new knowledge. One of the main functions of education, whether formal or informal or non-formal, is concerned with the acquisition, generation and transmission of knowledge. One of the main functions and aim of formal education is preservation and transmission of knowledge. Taken in this sense, it encompasses three particular actions: (i) it selects, from the infinite body of knowledge, packages that are thought to be particularly worth knowing, (ii) it provides the means and resources, whereby those things can be approached and known, and (iii) it applies pedagogical expertise in an attempt to ensure that these things are learnt. In transmitting knowledge and methodology for gaining knowledge, education should, however, introduce us to establish truths and facts about the world in a neutral and objective way. The fact remains that we rather perceive it in particular ways, from particular perspectives and from particular viewpoints, which are largely determined by our interactions with the world in a particular spatio-temporal and social context. Since the ancient age educators of the East and West have emphasized knowledge as the supreme aim of education. Socrates stated that 'Knowledge is Power'. According to the ancient Indian educators or Rishis, knowledge is the third eye of man. Knowledge helps one to progress materially and mentally. Formal education through its curricular and co-curricular activities tries to preserve, transmit and enhance knowledge. Though the transaction of the curriculum, deeper understanding of the subject is enhanced, thus leading to the accumulation of knowledge. Knowledge also helps in the development of skill. An individual becomes resourceful through knowledge. Again we find

82%**MATCHING BLOCK 133/143****W**

that knowledge is indispensable for all right actions and is the source of power

and happiness. Now how can education help in the development of new knowledge? By gathering of facts and then drawing out generalizations, one learns to infer from the information

NSOU ? CC-ED-01 ? 99 so collected. Through perception and reasoning one can draw up certain general principles or relationship about the occurrence of the phenomena. Education develops in man the skill to think with reasons. It also teaches one through various experiences to think deductively and inductively. Every individual is unique genetically and environmentally. So one constructs or learns from the experiences in one's own unique way leading to the formation of new knowledge.

6.4 Education and Culture 'Culture' is one of the most important concepts used in education, psychology, sociology, political science and economics. The study of human society immediately and necessarily leads us to the study of its culture. The study of society becomes incomplete in absence of an understanding of the culture of that society. It is because both culture and society go together. Hence, they are inseparable in any circumstance.

Meaning of Culture The origin of the Latin word 'culture' is clear. It is a derivative of the verb 'colo' (infinitive colere), meaning "to tend," "to cultivate," and "to till," among other things (Tucker, 1931). It can take objects such as ager, hence agriculture, whose literal meaning is "field tilling." Another possible object of the verb 'colo' is animus ("character"). In that case, the expression would refer to the cultivation of the human character. Consequently, the Latin noun culture can be associated with education and refinement. The etymological analysis of "culture" is quite uncontroversial. But in the field of anthropology, the situation is much more complex. Definitions of culture abound and range from very complex to very simple. For example, a complex definition was proposed by Kroeber and Parsons (1958): "transmitted and created content and patterns of values, ideas, and other symbolic-meaningful systems as factors in the shaping of human behavior" (p. 583). An even less easily comprehensible definition was provided by White (1959/ 2007): "By culture we mean an extra somatic, temporal continuum of things and events dependent upon symbols" (p. 3). "Culture is ordinary: that is the first fact. Every human society has its own shape, its own purposes, its own meanings. Every human society expresses these, in institutions, and in arts and learning. The making of a society is the finding of common meanings and directions, and its growth is an active debate and amendment under the pressures of experience, contact, and discovery, writing themselves into the land. The growing society is there, yet it is also made and remade in every individual mind. The making

NSOU ? CC-ED-01 ? 100 of a mind is, first, the slow learning of shapes, purposes, and meanings, so that work, observation and communication are possible. Then, second, but equal in importance, is the testing of these in experience, the making of new observations, comparisons, and meanings. A culture has two aspects — the known meanings and directions, by which its members are trained to; the new observations and meanings, which are offered and tested. These are the ordinary processes of human societies and human minds, and we see through them the nature of a culture: that it is always both traditional and creative; that it is both the most ordinary common meanings and the finest individual meanings. We use the word culture in these two senses: to mean a whole way of life—the common meanings; to mean the arts and learning—the special processes of discovery and creative effort. Some writers reserve the word for one or other of these senses; we may insist on both, and on the significance of their conjunction. The questions I ask about our culture are questions about deep personal meanings. Culture is ordinary, in every society and in every mind." Definitions of Culture Edward Burnett Tylor says of his 'Primitive Culture' (1871): "

Culture is

100%

MATCHING BLOCK 132/143

W

that complex whole which includes knowledge, belief, art, morals, law, custom, and any other capabilities and habits acquired by man as a member of society." "

Culture is the collective programming of the human mind that distinguishes the members of one human group from those of another. Culture in this sense is a system of collectively held values." — Geert Hofstede "Culture is the deeper level of basic assumptions and beliefs that are shared by members of an organization, that operate unconsciously and define in a basic 'taken for granted' fashion an organization's view of its self and its environment." — Edgar Schein *Damen, L. (1987). Culture Learning: The Fifth Dimension on the Language Classroom. Reading, MA: Addison-Wesley; "Culture: learned and shared human patterns or models for living; day- to-day living patterns. these patterns and models pervade all aspects of human social interaction. Culture is mankind's primary adaptive mechanism" (p. 367). Hofstede, G. (1984) "Culture is the collective programming of the mind which distinguishes the members of one category of people from another." (p. 51). Lederach, J.P. (1995). "Culture is the shared knowledge and schemes created by a set of people for perceiving, interpreting, expressing, and responding to the social realities around them" (p. 9). Linton, R. (1945). "A culture is a configuration of learned behaviors and results of*

NSOU ? CC-ED-01 ? 101 behavior whose elements are shared and transmitted by the members of a particular society" (p. 32). Parson, T. (1949). "Culture...consists in those patterns relative to behavior and the products of human action which may be inherited, that is, passed on from generation to generation independently of the biological genes" (p. 8). Useem, J., & Useem, R. (1963). "Culture has been defined in a number of ways, but most simply, as the learned and shared behavior of a community of interacting human beings" (p. 169). Characteristics of Culture: 1. Learned Behaviour: Not all behaviour is learned, but most of it is learned; combing one's hair, standing in line, telling jokes, criticising the president and going to the movie, all constitute behaviours which had to be learned. Sometimes the terms conscious learning and unconscious learning are used to distinguish the learning. For example, the ways in which a small child learns to handle a tyrannical father or a rejecting mother often affect the ways in which that child, ten or fifteen years later, handles his relationships with other people. 2. Culture is Abstract: Culture exists in the minds or habits of the members of society. Culture is the shared ways of doing and thinking. There are degrees of visibility of cultural behaviour, ranging from the regularised activities of persons to their internal reasons for so doing. In other words, we cannot see culture as such we can only see human behaviour. This behaviour occurs in regular, patterned fashion and it is called culture. 3. Culture is a Pattern of Learned Behaviour: The definition of culture indicated that the learned behaviour of people is patterned. Each person's behaviour often depends upon some particular behaviour of someone else. The point is that, as a general rule, behaviours are somewhat integrated or organized with related behaviours of other persons. 4. Culture is the Products of Behaviour: Cultural learnings are the products of behaviour. As the person behaves, there occur changes in him. He acquires the ability to swim, to feel hatred toward someone, or to sympathize with someone. They have grown out of his previous behaviours. In both ways, then, human behaviour is the result of behaviours. The experience of other people are impressed on one as he grows up, and also many of his traits and abilities have grown out of his own past behaviours. NSOU ? CC-ED-01 ? 102 5. Culture includes Attitudes, Values and Knowledge: There is widespread error in the thinking of many people who tend to regard the ideas, attitudes, and notions which they have as "their own". It is easy to over estimate the uniqueness of one's own attitudes and ideas. When there is agreement with other people it is largely unnoticed, but when there is a disagreement or difference one is usually conscious of it. Your differences however, may also be cultural. For example, suppose you are a Catholic and the other person a Protestant. 6. Culture includes Material Objects: Man's behaviour results in creating objects. Men were behaving when they made these things. To make these objects required numerous and various skills which human beings gradually built up through the ages. Man has invented something else and so on. Occasionally one encounters the view that man does not really "make" steel or a battleship. All these things first existed in a "state nature". Men merely modified their form, changed them from a state in which they were to the state in which he now uses them. The chair was first a tree which man surely did not make. But the chair is more than trees and the jet airplane is more than iron ore and so forth. 7. Culture is shared by the Members of Society: The patterns of learned behaviour and the results of behaviour are possessed not by one or a few person, but usually by a large proportion. Thus, many millions of persons share such behaviour patterns as religion, the use of automobiles, or the Bengali language. Persons may share some part of a culture unequally. For example, as Americans do the Christian religion. To some persons Christianity is the all important, predominating idea in life. To others it is less preoccupying/important, and to still others it is of marginal significance only. 8. Culture is Super-organic: Culture is sometimes called super organic. It implies that "culture" is somehow superior to "nature". The word super-organic is useful when it implies that what may be quite a different phenomenon from a cultural point of view. For example, a tree means different things to the botanist who studies it, the old woman who uses it for shade in the late summer afternoon, the farmer who picks its fruit, the motorist who collides with it and the young lovers who carve their initials in its trunk. The same physical objects and physical characteristics, in other words, may constitute a variety of quite different cultural objects and cultural characteristics.

NSOU ? CC-ED-01 ? 103 9. Culture is Pervasive: Culture is pervasive it touches every aspect of life. The pervasiveness of culture is manifested in two ways. First, culture provides an unquestioned context within which individual action and response take place. Not only emotional action but relational actions are governed by cultural norms. Second, culture pervades social activities and institutions. 10. Culture is a way of Life: Culture means simply the "way of life" of a people or their "design for living." Kelly defines it in his sense, " A culture is a historically derived system of explicit and implicit designs for living, which tends to be shared by all or specially designed members of a group." Explicit culture refers to similarities in word and action which can be directly observed. For example, the adolescent cultural behaviour can be generalized from regularities in dress, mannerism and conversation. Implicit culture exists in abstract forms which are not quite obvious. 11. Culture is a human Product: Culture is not a force, operating by itself and independent of the human actors. There is an unconscious tendency to defy culture, to endow it with life and treat it as a thing. Culture is a creation of society in interaction and depends for its existence upon the continuance of society. In a strict sense, therefore, culture does not 'do' anything on its own. It does not cause the individual to act in a particular way, nor does it 'make' the normal individual into a maladjusted one. Culture, in short, is a human product; it is not independently endowed with life. 12. Culture is Idealistic: Culture embodies the ideas and norms of a group. It is sum-total of the ideal patterns and norms of behaviour of a group. Culture consists of the intellectual, artistic and social ideals and institutions which the members of the society profess and to which they strive to confirm. 13. Culture is transmitted among members of Society: The cultural ways are learned by persons from persons. Many of them are "handed down" by one's elders, by parents, teachers, and others of older generation. Other cultural behaviours are "handed up" to elders. Some of the transmission of culture is among contemporaries. For example, the styles of dress, political views, and the use of recent labour saving NSOU ? CC-ED-01 ? 104 devices. One does not acquire a behaviour pattern spontaneously. He learns it. That means someone teaches him and he learns. Much of the learning process both for the teacher and the learner is quite unconscious, unintentional, or accidental. 14. Culture is continually changing: There is one fundamental and inescapable attribute (special quality) of culture, the fact of unending change. Some societies at sometimes change slowly, and hence in comparison to other societies seem not to be changing at all. But they are changing, even though not obviously so. 15. Culture is Variable: Culture varies from society to society, group to group. Hence, we say culture of India or England. Further culture varies from group to group within the same society. There are sub-cultures within a culture. Cluster of patterns which are both related to general culture of the society and yet distinguishable from it are called subcultures. 16. Culture is an integrated system: Culture possesses an order or system. Its

86%

MATCHING BLOCK 134/143

W

various parts are integrated with each other and any new element introduced is also integrated. 17.

Language is the Chief Vehicle of Culture: Man lives not only in the present but also in the past and future. He is able to do this because he possesses language which transmits to him what was learned in the past and enables him to transmit the accumulated wisdom to the next generation. A specialised language pattern serves as a common bond to the members of a particular group or sub-culture. Although culture is transmitted in a variety of ways, language is one of the most important vehicles for perpetuating cultural patterns. To conclude culture is everything which is socially learned and shared by the members of a society. It is culture that, in the wide focus of the world, distinguishes individual from individual, group from group and society. Types of Culture Sociologists describe two interrelated aspects of human culture: the (i) Natural Culture and the (ii) Non-Natural Culture. Material Culture Material culture refers to the physical objects, resources, and spaces that people use to define their culture. These include homes, neighborhoods, cities, schools, churches, synagogues, temples, mosques, offices, factories and plants, tools, means of production, goods and products, stores, and so forth. All of these physical aspects of a culture

NSOU ? CC-ED-01 ? 105 help to define its members' behaviors and perceptions. For example, technology is a vital aspect of material culture in today's India. Indian students must learn to use computers to survive in colleges and businesses.

Non-material Culture Non-material culture refers to the non-physical ideas that people have about their culture, including beliefs, values, rules, norms, morals, language, organizations, and institutions. For instance, the non-material cultural concept of religion consists of a set of ideas and beliefs about God, worship, morals, and ethics. These beliefs, then, determine how the culture responds to its religious topics, issues, and events. When considering non-material culture, sociologists refer to several processes that a culture uses to shape its members' thoughts, feelings, and behaviors. Four of the most important of these are symbols, language, values, and norms.

Functions of Culture Among all groups of people we find widely shared beliefs, norms, values and preferences. Since culture seems to be universal human phenomenon, it occurs naturally to wonder whether culture corresponds to any universal human needs. This curiosity raises the question of functions of culture. Social scientists have discussed various functions of culture. Culture has certain functions for both individual and society.

1. **Culture Defines Situations:** Each culture has many subtle cues which define each situation. It reveals whether one should prepare to fight, run, laugh or make love. For example, suppose someone approaches you with right hand outstretched at waist level. What does this mean? That he wishes to say Namaskar with folded hands in greeting is perfectly obvious, that is to anyone familiar with our culture. But in another place or time the outstretched hand might mean hostility or warning. One does not know what to do in a situation until he has defined the situation. Each society has its insulting and fighting words. The cues (hints) which define situations appear in infinite variety. A person who moves from one society into another will spend many years misreading the cues. For example, laughing at the wrong places.
2. **Culture defines Attitudes, Values and Goals:** Each person learns in his culture what is good, true, and beautiful. Attitudes, values and goals are defined by the culture. While the individual normally learns them as unconsciously as he learns the language. Attitudes are tendencies to feel and act in certain ways. Values are measures of goodness or desirability, for example, we value private property, (representative) Government and many other things and experience.

NSOU ? CC-ED-01 ? 106 Goals are those attainments which our values define as worthy, (e.g.) winning the race, or becoming a dedicated member. By approving certain goals and ridiculing others, the culture channels individual ambitions. In these ways culture determines the goals of life.

3. **Culture defines Myths, Legends, and the Supernatural:** Myths and legends are important part of every culture. They may inspire, reinforce effort and sacrifice and bring comfort in bereavement. Whether they are true is sociologically unimportant. Ghosts are real to people who believe in them and who act upon this belief. We cannot understand the behaviour of any group without knowing something of the myths, legends, and supernatural beliefs they hold. Myths and legends are powerful forces in a group's behaviour. Culture also provides the individual with a ready-made view of the universe. The nature of divine power and the important moral issues are defined by the culture. The individual does not have to select, but is trained in a Christian, Buddhist, Hindu, Muslim or some other religious tradition. This tradition gives answers for the major (things imponderable) of life, and fortifies the individual to meet life's crises.
4. **Culture provides Behaviour Patterns:** The individual need not go through painful trial and error learning to know what foods can be eaten (without poisoning himself), or how to live among people without fear. He finds a ready-made set of patterns awaiting him which he needs only to learn and follow. The culture maps out the path to matrimony. The individual does not have to wonder how one secures a mate; he knows the procedure defined by his culture. If men use culture to advance their purposes, it seems clear also that a culture imposes limits on human activities. The need for order calls forth another function of culture that of so directing behaviour that disorderly behaviour is restricted and orderly behaviour is promoted. A society without rules or norms to define right and wrong behaviour would be very much like a heavily travelled street without traffic signs or any understood rules for meeting and passing vehicles. Chaos would be the result in either case. Social order cannot rest on the assumption that men will spontaneously behave in ways conducive to social harmony.

Culture and Society The relationship between society, culture and personality is stressed by Ralph Linton: "A society is organised group of individuals. A culture is an organised group of

NSOU ? CC-ED-01 ? 107 learned responses. The individual as living organism capable of independent thought, feeling and action, but with his independence limited and all his resources profoundly modified by contact with the society and culture in which he develops. A society cannot exist apart from culture. A Society is always made of persons and their groupings. People carry and transmit culture, but they are not culture. No culture can exist except as it is embodied in a society no society can operate without, cultural directives. Like matter and energy, like mind and body, they are interdependent and interacting yet express different aspects of the human situation. One must always keep in mind the interdependence and the reciprocal relationship between culture and society. Each is distinguishable concept in which the patterning and organization of the whole is more important than any of the component parts.

DIMENSIONS OF CULTURE: Like education

100%**MATCHING BLOCK 140/143****W**

there are three major dimensions of culture. They are described below: 1. The cognitive dimension: The cognitive dimension of culture includes thinking, imagining, remembering and recognition. The most important aspect of the cognitive dimension is beliefs or ideas about what is thought to be true. Beliefs are the convictions. They are important because people account them as being true. Beliefs guide their activities

though

98%**MATCHING BLOCK 135/143****W**

beliefs may or may not be true. There are number of beliefs which do not stand to reason. For instance, some people think that if a dog barks near the house, the dewelers may face some kind of trouble. But there are some beliefs for which there is factual evidence. 2. The material dimension The material dimension of culture consists of concrete and tangible objects within a culture. The examples of material dimension are automobiles, airplanes, buildings, chairs, highways etc. There is no common measuring rod by which we can assess the material dimension. Different ages and different groups have their own standards of judgement. Thus, the paintings of Picasso may appear to some as abomination, while to others they are invaluable modes of art. Objects of material dimension have no meaning apart from the meaning given to them by a group. They have not the same meaning and uses in all the societies. 3.

97%**MATCHING BLOCK 136/143****W**

The normative dimension The normative dimension of culture consists of ideas about what is normal behavior. It tells us what is expected of us as members of a group. The most important aspects of the normative dimension are norms, sanctions and values. NSOU ? CC-ED-01 ? 108 a. Norms: Norms are standards of group behavior. Norms are so ingrained that they guide the daily activities without our awareness. For example, brothers and sisters should not have sexual relations; a child should respect his parents etc. There are three basic types of norms: folkways, mores and laws these three types of norms vary in their importance within a society. i. Folkways: Folkways literally mean the ways of the folk. Rules that cover customary ways of thinking, feeling and behaving are called folkways. They have not much moral significance. So violation of folkways is not considered bad from moral point of view. For example, saying 'hello' when encountering an acquaintance. A man may eat 6 meals a day. It is a violation of folkways but it is not a moral issue. Such an act is considered odd but not immoral. ii. Mores: Mores are norms of great moral significance. The violation of mores evokes strong social disapproval and their fulfillment brings significant social approval. Prohibiting illegitimate children is mores. Some mores are more vital to society than others.

iii. Laws: Laws are the third types of norms. Laws are norms that are formally defined and enforced consciously. b. Sanctions: Sanctions are rewards and punishments used to encourage socially acceptable behavior. Formal sanctions may be given only by officially designated persons such as judges. For example, awarding death penalty by a judge is formal sanction. Informal sanctions can be applied by most members of a group. For example, looking harshly at someone who is cheating on a test. Sanctions may be positive or negative. The severity of the sanction varies from one society to another. For instance, a person convicted of theft may be sentenced only to a few months jail, but a person convicted of theft in Saudi Arabia is to tolerate the amputation of hands. The severity of sanction may vary from time to time. For instance, in USA possession of an ounce of marijuana could result in several years in prison during 1960's, but today it is considered equivalent to a minor traffic violation. NSOU ? CC-ED-01 ? 109 c. Values: Values are assumptions of what is right and important for the society. Values have a tremendous influence on our daily life, because norms are based on them. For instance, a society that values democracy will have norms ensuring personal freedom; a society that values hard work will have norms against laziness. Values are also important because they are so general that they tend to permeate most aspects of daily life. In America, for example, the influence of the value of freedom goes beyond political life. It affects such diverse areas as relationship in the family, functioning of organization, religious affiliation etc. Culture and Education There is intimate relationship between culture and education. Every person is born into a particular culture which produces him with definite patterns of behavior and values which guide his conduct in different walks of life. Thus culture plays an important part in man's life. As Theodore Brameld remarked, "It is from the stuff of culture that education is directly created and that gives to education not only its own tools and materials but its reason for existing at all." Culture has profound implications for education. The social living is influenced by education and education itself is governed by social life. The total pattern of a society's life determines education and education molds the total pattern of society's life. Education produces a cultured man and is also nourished and nurtured by the cultured man. Functions of education towards culture 1. Conservation of culture: One of the important functions of education is the preservation of cultural heritage. If education is not agency of social conservation there would not have been any cultural heritage at all. The school must inculcate in pupils the traditional standards and values, which account for cultural evolution. The conservative function of education has been emphasized by Percy Nunn. The special function of a nation's school, according to him, is to consolidate its spiritual strength, to maintain its historic continuity, to secure its past achievements and to guarantee its future. In Radhakrishnan's Report also the conservation function of education is emphasized. Pandit Nehru held, "Education must help in preserving the vital elements of our heritage." The core of Indian cultural heritage, according to him, is "love of beauty

and

95%**MATCHING BLOCK 138/143****W**

truth, spirit and tolerance, capacity to absorb other cultures and work one new synthesis." NSOU ? CC-ED-01 ? 110 2.

Continuity of culture: Another function of education is to maintain the continuity of culture by handing down customs, traditions, experiences and values of the society from one generation to another. This continuity is essential condition for survival of the nation. 3. Transmission of culture: Education is the savior of cultural traditions, experiences, values and norms. It helps in transmission of cultural patterns. In the words of Ottaway, "One of the tasks of education is to hand over the cultural values and behavior patterns of the society to her young and potential members." Without transmission of culture, there can be no growth and progress of man. 4. New cultural patterns: Education is not only concerned with the transmission of culture but it also builds new cultural patterns. It brings changes in the existing culture. These changes are necessitated due to cross-cultural constructs or the building of new knowledge which makes the old cultural patterns redundant. 5. Promotion of culture: Education helps in the modification and promotion of culture. It helps in the establishment of a better and happier society. As D. J. O Cannon remarked, "If each generation had to learn for itself what has been learned by its predecessors, no sort of intellectual or social development would be possible and the present state of society would be little different from the society of the old stone age." Thus, education reorganizes and reconstructs human experiences for the promotion of culture and civilization. 6. Adjustment to cultural patterns: Education equips the individual to adjust himself in the changing cultural patterns. Thus education is required to perform the functions of transmission and enrichment, acceptance and reformation, change and reconstruction of culture. Function of culture towards human's education 1. Helpful in refining personality Culture helps the individual in refining physical, intellectual, aesthetic and moral aspects of personality by drinking deep into the accumulated best experiences of the race. Thus culture beautifies human personality and adds grace to human life.

NSOU ? CC-ED-01 ? 111 2.

100%**MATCHING BLOCK 139/143****W**

Helpful in socializing the individual: Culture helps in socializing the person. It is due to this reason that the quality and direction of socialization differs from one society to another. 3. Helpful in making social adjustments: Knowledge of culture helps the individual in making social adjustments and solving various problems. 4. Helpful in understanding and improving society: Culture helps the person to understand human society as a whole, to estimate wisely the ends that communities should pursue, and to see the present in its relation to the past and future. 6.5

Report of the International Education Commission for 21st Century Introduction In the Introduction of the "International Commission on Education for the Twenty- first Century Report" (UNESCO, 1996), it has been stated that in confronting the many challenges that future holds in store, humankind sees in education an indispensable asset in its attempt to attain the ideals peace, freedom and social justice. The Commission affirms its belief that education has a fundamental role to play in personal and social development. Looking Ahead Some remarkable scientific discoveries and breakthroughs have been made during the last twenty-five years. The truth is that all-out economic growth can no longer be viewed as the ideal way of reconciling material progress with equity, respect for the human condition and respect for the natural assets that we have a duty to hand on good conditions to future generations. We have already seen how education and society are interrelated. There were huge changes internationally since the beginning of the 1980s. With globalization setting in, nearly all countries were affected directly or indirectly. There are six basic tensions which have been prevailing worldwide during the end of last century like. Tensions to Overcome To this end, we have to confront seven basic tensions of the twenty-first century to overcome for developing a better world. These are:

NSOU ? CC-ED-01 ? 112 1. The tension between Global vs. Local: People need gradually to become world citizens without losing their roots to play an active part in the life of their nation and their local community. 2. The tension between Universal vs. Individual: Culture is steadily being globalised, but as yet only partially. We cannot ignore the promises of globalization nor its risks, not the least of which is the risk of forgetting the unique character of individual human beings. Unless we are careful, we can be endangered by contemporary developments. 3. The tension between Traditions vs. Modernity: How is it possible to adapt to change without turning one's back on the past, how can autonomy be acquired in complementary with the free development of others and how can specific progress be assimilated? 4. The tension between Long-term vs. Short-term considerations: this is always existed, but now very precisely, educational policies are concerned. 5. The tension between Competitions vs. Equality of Opportunities: it is a classic issue, which has been facing both economic and social policy-makers and educational policy-makers since the beginning of the century to rethink and update the concept of life-long learning. 6. The tension between unlimited knowledge vs. Limited Capacity of human being to assimilate: The Commission has suggested some new subjects of study, such as, self-knowledge, Physical and Psychological well-being, Preservation of natural environment etc. 7. The tension between the Spiritual vs. material: Educator's noble task is to encourage each and every one to act in accordance with their traditions and convictions and paying full respect to pluralism to lift their minds and spirits to the plane of the universal end. The international community tried to search for an education system that would help to meet these challenges through an educational philosophy for better international understanding. The United Nations Educational, Scientific and Cultural Organization (UNESCO) appointed the International Commission on Education for the 21st Century (1993-1996). The members of this commission comprised of 14 members from different countries like China, France, Japan, Poland etc including India. The report of this commission was published in 1996 by the name of 'Learning: The Treasure Within' and submitted to UNESCO, Paris by an International Commission on Education for the twenty-first century under the chairmanship of Jacques Delors of France. So this report is also referred to as the Delor's Report 1996.

NSOU ? CC-ED-01 ? 113 Four Pillars of Education: In the opening chapter the Commission declared that education is the principal means available to foster a deeper and more harmonious form of human development and thereby to reduce poverty, exclusion, ignorance, oppression and war. According to the commission education is based on the

97%

MATCHING BLOCK 141/143

SA Unit I.docx (D21052702)

four pillars – 1. Learning to know 2. Learning to do 3. Learning to live together 4. Learning to be 1. Learning to know:

This type of learning is concerned less with the acquisition of structured knowledge than the mastery of learning tools. It may be regarded as both a means and an end of human existence. Looking at it as means, people have to learn to understand the world around them, at least as much as is necessary for them to lead their lives with some dignity, develop their occupational skills and communicate with other people. Regarded as an end, it is underpinned by the pleasure that can be derived from understanding, knowledge and discovery. That aspect of learning is typically enjoyed by researchers, but good teaching can help everyone to enjoy it. Even if study for its own sake is a dying pursuit with so much emphasis now being put on the acquisition of marketable skills, the raising of the school leaving age and an increase in leisure time should provide more and more adults with opportunities for private study. The broader our knowledge, the better we can understand many different aspects of our environment. Such study encourages greater intellectual curiosity, sharpens the critical faculties and enables people to develop their own independent judgments on the world around them. From that point of view, all children – no matter where they live – must have a chance to receive an appropriate education and become a good learner throughout their lives. It implies learning how to learn by developing one's concentration, memory skills and ability to think. One has to learn how to concentrate on objects and on other people. This process of improving concentration skills can take different forms and can be aided by the many different learning opportunities that arise in the course of people's lives like games, work experience programmes, travel, practical science activities, etc. Thinking is learnt first from their parents and then teachers. The process should encompass both practical problem-solving and abstract thought. Both education and research need to combine deductive and inductive reasoning, which are often claimed to be opposing processes. While

NSOU ? CC-ED-01 ? 114 one form of reasoning may be more appropriate than the other, depending on the subjects being taught, it is generally impossible to pursue a logical thought without combining the two. The process of learning to think is a lifelong one and can be enhanced by every kind of human experience. In this respect, as people's work becomes less routine or stereotyped, they will find that their thinking skills are increasingly being challenged at their place of work. Education is also essentially an attempt to find out that information which is needed and useful for life.

The role of the teacher is that of a facilitator

where the child is taught learning how to master deeply and extensively certain fields of study. Skills under this learning include literacy, numeracy and critical thinking. 2. Learning to do: This is closely associated with the issue of occupational training: how do we adapt education so that it can equip people to do the types of work needed in the future? Here we should draw a distinction between industrial economics, where most people are wage-earners, and other economics where self-employment or casual works are still the norm. The future of these economic hinges on their ability to turn advances in knowledge into innovations that will generate new business and new jobs. 'Learning to do' can no longer mean what it did when people were trained to perform a very specific physical task in a manufacturing process, skill training, therefore, has to evolve and become more than just a means of imparting the knowledge needed to do a more or less routine job. The trends of the new century have been identified as given below: a. From Certified Skills to Personal Competence; b. Shift away from Physical Work – the Service Industries; c. Works in the Informal Economy; and d. People to be prepared to Innovate. It further implies that the learning process produces changes in the cognitive domain, increased competence, and conscious selection and acceptance of values, attitudes, rewards, feelings, and willingness to act or respond to a stimulus. Education equips people not only to know but also to be skilled at doing or doing something so that it produces something meaningful for life. Education should be such that it helps in learning to apply knowledge and to solve the problems in various situations. Schools as a learning community should facilitate students to actualize their skills, and their talents and interests so that "Learning to do" can be realized. Although in fact the talents and interests of children are influenced by heredity to a great extent, the

NSOU ? CC-ED-01 ? 115 growth and development of talents and interests also depend on the environment. We all know that skills are a means to sustain one's life and are more dominant than mastering knowledge alone. So 'learning to do' is closely associated with the issue of occupational training. The key-concept now is one of "personal competence", involving social skills as much as occupational skills and learning to act appropriately in an uncertain situation. 3. Learning to live together: It states that education should adopt two complementary approaches. In the first stage, focus should be on human diversity, an awareness of the similarities and interdependence of all people. It is learning to understand and respect others, their history, and religious values. The habits of living together, mutual respect, being open, giving and receiving need to be developed in school. This condition allows the growth of mutual understanding between race, ethnicity, and religion. With the ability that is owned, as a result of the education process, it can be used as a provision to be able to play a role in the environment in which individuals are, and at the same time be able to place themselves according to their needed role. An understanding of the role of self and other people in learning groups is a provision in socializing in the community. The second stage of education and in life-long education, involvement in common projects needs to be encouraged. One is to be taught about human diversity, instillation of an awareness of the similarities and interdependence of all people. Empathy has to be taught for a positive effect on young persons; Teaching one to recognize the rights of other people too is a part of this pillar. One of the essential tools for education in the twenty-first century should be a suitable forum for dialogue and discussion. Violence too often dominates life in the contemporary world, forming a depressing contrast with the hope which some people have been able to place in human progress. Human history has constantly been scarred by conflicts, but the risk is heightened by two new elements. Firstly, there is a extraordinary potential for self-destruction created by humans in the twentieth century. Then we have the ability of the new media to provide the entire world with information and unverifiable reports on ongoing conflicts. Public opinion becomes a helpless observer or even a hostage of those who initiate or keep up the conflicts until now education has been unable to do much to mitigate this situation. Can we do better? Can we educate ourselves to avoid conflict or peacefully resolve it? Education should adopt two complementary approaches in this regard. From early childhood, education should focus on (i) 'discovering other people', in the first stage of education, and in the second stage, through lifelong education, it

NSOU ? CC-ED-01 ? 116 should encourage involvement in projects (ii) 'towards common goals'. These seem to be effective measures of avoiding conflict or resolving latent conflicts. 4. Learning to be: The Commission powerfully re-asserted a fundamental principle that "mind, body, intelligence, sensitivity aesthetic appreciation and spirituality" should receive the children and youths which equip them to develop their own independent, critical way of thinking and judgement so that they can make up their own minds on the best courses of action in different circumstances in their lives. It is mastery of knowledge and skills as part of the process of being oneself. This is closely related to talent, interests, physical development, psychology, personal typology of children and their environmental conditions. It is being a complete human being in mind and body, intelligence, sensitivity, aesthetic appreciation and spirituality. Education that equips one to develop own independent, critical way of thinking and judgement for the best courses of action in the different circumstances of ones lives - as individual, as member of a family and community, as a creative citizen, producer and inventor of techniques. Being neself is interpreted as a process of understanding needs and identity. Learning to behave in accordance with the norms and rules that apply in society, learning to be a successful person, is actually a process of achieving self-actualization. It is learning to be independent, to be the person responsible for realizing shared goals. So, we can see how the commission has tried to look at the function of education as vehicle for individual as well as social development. Education has not only economic benefits but also non-economic benefits. The four pillars emphasize on both the individual development for non-economic development and social for economic development. Learning to know, develops individual knowledge about self as well as learning to relearn from life experiences. It emphasizes on life-long learning. This can help in bringing about changes in the individual as well as changes in the society. Similarly learning to do, stresses on development of skill and human resource. This in turn can help in bringing about economic development. In the present era of globalization, the conflict of global versus local can be resolved by inculcating mutual respect, understanding and accepting the differences, by finding the commonness and interrelatedness amongst the apparently different cultures, ethnic groups and religions. Only then can we learn to live together in an inclusive society. The mastery of knowledge and skills can build in an individual the confidence to be an individual who is a productive member of the society.

NSOU ? CC-ED-01 ? 117 6.6 Summary In this unit we dealt with some key-concepts related to knowledge development, interrelation between education and culture and the Report of the International Education Commission for 21 st Century: Major Suggestions regarding Four Pillars of Education. Knowledge development and education are closely associated with one another. They are in fact, two sides of the same coin. The unit has helped you understand how the two concepts to complement are each other. The other topic focuses on education and culture. You have seen the concept of culture and its role in the society. The topic also throws light on the impact of education on culture and vice-versa. Finally, the unit covers the Report of the International Education Commission for 21 st Century: Major Suggestions regarding Four Pillars of Education. It states Delor's Report, 1996 and lays down at length, the four pillars of education as suggested in the report by UNESCO. 6.7 Self-Assessment Questions 1. What is Knowledge? 2. How does education help in knowledge development? 3. What is Culture? 4. How does culture influence education? 5. How are culture and education related? 6. Discuss the role of education in knowledge development. 7. State the interrelationship of Culture and Education? 8. Discuss the significance of Dolor's Commission Report. 9. What is the name of the report published by International Commission on Education for the 21st Century? 10. What are the four pillars of education?

Society is a group of people living together. According to Ottaway (1953), "People living together are said to live in a society or community". R.G Collingwood, cited by Ottaway describes a society as "a kind of community (or a part of a community), whose members have become socially conscious of their mode of life and are united NSOU ? CC-ED-01 ? 17 by a common set of aims and values. It is a collection of people who look to the future." From a sociological perspective, human society owes its culture, certain norms and systems from existing society. All these systems are made by society itself but once these systems are made, they control the functioning and activities of the society. The systems (economy, education policy) which control the functioning of the society are the sub-systems of that society. These sub-systems are interdependent because they transfer ideas or principles which are interrelated to each other. As a sub-system, nature of education is dynamic, not static as it goes through various changes according to the needs of society. You can read many books, theories etc. which might have given you conceptual knowledge and practical aspect of education as a sub-system. Education is also related with different sub-systems like economy, polity etc. You will read interrelationship of all these

Structure and Nature of Indian Society Social structure is a social organization which is based on the pre-established patterns of social interaction between different relationships like parents and children, teachers and students, employees and employers etc. These relationships regulate through accepted norms, concepts, beliefs, principles, behaviors between the relationships. Anthropologically, social structure is an enduring pattern or interrelationship of social elements/entities. In other words, it is more or less enduring pattern of social arrangements within a particular society, groups or social organizations. In general, social structure is an arrangement of persons in institutionally controlled or defined relationships (Brown, 1952). Indian society is a versatile society. Many castes, creeds, religions categories have formed Indian society and live together peacefully. In India, there exist many religions, customs, and beliefs. Social structure of Indian society is an amalgamation of various castes, religions, language, ethnicity, social classes etc. Caste System As we all know, Indian society was divided into four major castes: Brahmin, Kshatriya, Vaisya, and Sudra. Being a conservative social caste systems practice in India, still in the present time it has experienced to live with cooperation and cordially with each other. Indian society is the biggest example of 'unity in diversity'. There are equal rights for all. This describes the diversified structure and nature of Indian society which is based on unity in India. Social Structure The beauty of Indian society is its joint family lifestyle which still exists all over the country but due to the effect of modernization on the Indian family system nuclear families have come into existence. It shows that social structure of India is a mixture of multiple cultures, castes, and creeds and follows hereditary principles. Social structure

	<p>Education in Indian social structure Indian education system has moved from the Gurukul system to 21st Century modern education system. There was a time when Gurukul system, Madrasa etc. were followed to educate children. Students used to study in Ashramas or Madrashes, but since British education systems to till date, India has developed a lot in its present education system. Now, education is given in the formal schools. As we can also see in our modern Indian society, inclusive education system has prevailed in Indian schooling. Education provisions are made for all children and special provisions are for children belonging to disadvantaged section of society. Gender and Indian Society In ancient Indian social structure, women were not treated equal to men but in the present structure women have equal rights to education and occupation. Indian social structure gives special place to women, as women are the bearers of family culture and duties. Women in the modern Indian social structure also are the important workforce of Indian economy. For protecting the rights of females, special laws and provisions have also been made in Indian Constitution. Economy and Indian Social Structure: The economy of India is a developing one. Education and Language Language is a means of communication, expressing the feelings and emotions. It is used to convey messages verbally as well as non-verbally. Language can be defined as generic, communicative phenomena especially in teaching learning process, language is used to communicate the content, ideas and to give instructions. Teachers use spoken or written language to transact the content, to interact with students, to assess and facilitate their learning. Students use language for learning process, to ask or present their questions, assignments, their academic content etc. Therefore, in a teaching learning process language is a means of displaying knowledge and skill and it maintains and also forms the teaching learning environment in the classroom. As the economy is globalizing and modern societies are developing, need of learning international languages have emerged and education plays as a medium to learn languages. Language forms from the very beginning in the families and the society. The students use vocabularies (phrases) while narrating and they listen and speak in the environment in which they live. While teaching language in classrooms, teachers need to be sensitive to cultural variations in narrative performance and in assessment of children's language abilities because learning and teaching language constitutes the children's language abilities, cultural variations and the type of education system of a society. Learning about a language enhances the knowledge of a person and it brings the children close to the social structure. This is because language is a medium of joining people with each other and building harmonious relationships from sociological point of view. Education and Culture You have already studied about the regional and cultural diversities in India. The term culture has been derived from the verb 'cultivate' and the noun 'cultivation'. In this way, it is

aims of education, ? know factors of education, ? state types of Education. NSOU ? CC-ED-01 ? 51 4.2
Introduction Education is a social necessity. It takes care of the changing social needs and aspirations. It is an activity which is directed to some goals. It always acts with an aim. This aim makes it a purposeful activity. The basic aim of education is to help each individual to progress towards the attainment of his or her full potential, both as a person and as a member of society. Any other human activities like education should have its own aims and objectives.

AIMS OF EDUCATION- INDIVIDUAL AND SOCIAL. OF EDUCATION-AND SOCIAL. Aims of Education Education is a social necessity.It take care of the changing social needs and aspirations. It is an activity which is directed to some goals. It always acts with an aim.This aim makes it a purposeful activity.The basic aim of education is to help each individual to progress towards the attainment of his full potential, both as a person and as a member of society. Any other human activities like education should have its own aims and objectives.

W <http://eduphilogarden.blogspot.com/2015/08/aims-of-education-individual-and-social.html>

Knowledge Aim of Education Knowledge has widely been accepted as one of the most important aims of education. It is essential for adjustment to and mastery of one's environment. Human progress through ages has been made possible through the increase and diffusion of knowledge. It is indispensable for the continuity and growth of society. It is a powerful agent for intellectual satisfaction and innate curiosity of man. Vocational Aim of Education It says that education is meaningful only when it aims at some employment. It is the direct outcome of industrial and scientific advancement. The modern democratic education has placed the vocational aim in its fore front. It makes the student self-sufficient in life. It makes education a purposeful activity. The vocational aim, however is narrow and one sided because it does not consider higher values of human existence. It neglects the intellectual, aesthetic, cultural, moral and spiritual aspects of human life. Cultural Aim of Education Preservation, transmission and enrichment of culture is regarded as the ultimate aim of education. Education for culture attempts to develop man's aesthetic sensibilities to appreciate fine arts and cultivate human powers and virtues. It helps in inculcation of noble ideas, attitudes and patterns of behavior. Over emphasis on cultural aim, however, may lead to neglect of other aspects of learner's personality. Education with cultural aim alone may be misused by the privileged group in such a manner that many of the social evils may reappear. Character Building Aim of Education Development of moral character is the supreme aim of education. It consists in the NSOU ? CC-ED-01 ? 52 cultivation of values, social attitudes, ethical conduct and habits of a person. The moral aim of education serves as the basis of discipline and order in the school system. Over emphasis on the character-building aim of education will, however, de-accelerate free thinking, material prosperity, scientific development and the economic growth of the society. Citizenship Aim of Education Education for citizenship is the outcome of the sociological approach to education. It involves teaching and inculcating democratic values in the children. Education for citizenship should train the individuals to discharge his duties and make him conscious of his rights. This aim will help the learner to acquire democratic values such as liberty, fraternity, equality, fellow-feeling, tolerance; cooperative living etc. It prepares the students to uphold the dignity of the individual. Harmonious Development as Aim of Education Man is born with many innate powers and capacities. A progressive education should aim to develop all these powers and capacities in a harmonious manner to produce a well-balanced personality. It aims to produce

that, there is no agreement among educationists regarding the standard of development of various capacities to consider it as ideally harmonious. Moreover, complete and harmonious cultivation of all powers cannot be achieved within the limited formative years of an individual. Spiritual Aim of Education Spiritual aim in education seeks to make man morally sound by developing the spiritual potentialities. It is only through education that spiritual virtues like generosity, sacrifice, good intention, sympathy, compassion etc. can be awakened. Spiritual aim of education makes a person gentle and pious. It reduces the problems of indiscipline, conflicts, quarrels, corruption, hatred etc. in the society. Leisure Hours Aim of Education Leisure means free and unoccupied time. The advancements in science, technology and means of transport and communication has reduced time and space resulting in the increase of leisure hours. Hence, education should aim at the wise and the proper use of leisure hours. Proper use of leisure will increase the efficiency of the students besides providing pleasure to them. Leisure is essential and helpful in making our life dynamic and rich. One great cause of strikes and indiscipline among the students is that they are not taught how to utilize their leisure hours.

economic problems of a country determine the aims of education. Education is a vital force, which can silently bury the socio-economic problems. It can thus evolve a society based on equality, co-operation and socialistic ideals. Factors associated with Political ideology Political ideologies also help in determining the aims of education. Different political ideologies like democracy, totalitarian, fascist or communist etc. will fix different aims for education in the state. The aims of education under democratic state are flexible and changeable according to changing needs and conditions of many on the contrary in a totalitarian state. The aims of education are fixed in accordance with the ideology of the state to uphold the rights of state. Factors associated with exploration of knowledge Education has also to give due consideration to the advancements in knowledge as far as the question of educational aims are concerned. Education today has become science oriented all over the world. Like other countries, in India also more and more stress is being laid on the study of modern sciences. This clearly shows that the spreading of new knowledge is an important factor in determining aims of education. Factors associated with Culture Cultural heritage of a country also determine the aims of education. It is the most important function of education to develop and preserve the cultural heritage. The changing and developing pattern of cultural factors directly influence the aims of education.

is based on the philosophy of naturalization according to which education should develop the unique individuality of a child in accordance with self instincts. History reveals the fact that it was Rousseau who first of all advocated this aim though his insistence on education in the lapse of nature according to the nature of the child, but after him some other educationists also emphasized the importance of this aim. NSOU ? CC-ED-01 ? 57 Amongst such an educationist sir Percy Nunn of England is the chief-supporter and hence, ranks at the top of the list. He holds that the central aim of education is 'the autonomous development of the individual.' In his famous book 'Education, Its Data and the first principles' he says, "Nothing good enters into the human world except in and through the free activities of individual men and women, and that the educational practice must be shaped to accord with its truth." In the second chapter of his book Nunn further remarks that each species is moving towards perfection. Hence, individual aim is according to nature. Thus, in its narrow sense, individual aim of education emphasizes self-expression or natural development of the child so that after receiving education according to his interests, inclinations, capacities and needs, the child is able to choose a vocation according to his nature. Wider Meaning of individual Aim In its wider sense, individual aim is known as self-realization. Psychology also corroborates the development of individuality. This is because psychological researches have clearly established the fact that each individual is born with his own peculiar and distinct innate tendencies and capacities. Hence, it is the prime function of education to develop each individual fully and completely according to his or her interests, inclinations, aptitudes and capacities in such a way that he or she becomes an able and capable person.

Narrow meaning of Social Aim In its narrow meaning, social aim of education is equated with the state socialism. In this sense, liberty of the individual is totally curtailed and all aspects of individual cannot even dream of his individual life are socialized. Any individual cannot even dream of his individual identity. He is expected to scarifice his everything, even his life for the welfare to the state. As such the state frames such a scheme of education thought by which it will be able to control the aim, curriculum and the methods of NSOU ? CC-ED-01 ? 59 teaching. Individuals are subjected to rigid discipline to cube their sense of identity and individualism. Wider Meaning of Social Aim In its wider sense the social aim is equated with democratic socialism. In this sense, it does not accept the importance of state, but at the sametime does not agree with the insignificance of the individual before the state. Thus, in its wider meaning, the social aim grants liberty to the individual to enjoy certain rights to develop his personality but at the same time expects from the individual to serve the state to best of his ability and capacity. India and other democratic countries where democracy has been combined with socialism. It may be noted that true citizens are greatly essential for the progress and prosperity of the state. Therefore, all the democratic states having accepted the individual aim of education in its wider meaning, indifferent forms. The American educationists John Dewey and Bagley have also accepted the wider meaning of social aim. Prof. Bagley in his book 'Education values' has mentioned three chief characteristics of a socially efficient individual. They are: (1) Economic efficiency, (2) Negative morality and (3) Positive morality. By economic efficiency, he means ability to pull one's own weight in the economic life. By negative morality, he means willingness to sacrifice one's desire when their gratification would interfere with the economic efficiency of others. By positive morality he means willingness to sacrifice one's own desires when their gratification would not contribute, directly or indirectly to social progress. In this way socially efficient individual is not a parasite on any member of society. He is a good citizen to understand and appreciate the world and is ready to sacrifice his own desires if they are harmful for others.

Wider meaning desire one of social aim In its wider sense the social aim is equated with democratic socialism.In this sense it does not accept the importance of state, but at the some does not agree with the insignificance of the individual before the state. Thus in its wide meaning, the social aim grants liberty to the individual to enjoy certain rights to develop his personality but at the same time expects from the individual to serve the state to best of his ability and capacity. India and other democratic countries where democracy has been combined with socialism. It may be noted that true citizens are greatly essential for the progress and prosperity of the state.Therefore all the democratic states having accepted the individual aim of education in its wider meaning, indifferent forms.The American educationist John Dewey and Bagley have also accepted the wider meaning of social aim. Prof.Bagley in his book 'Education values' have mentioned three chief characteristics of a socially efficient individual.They are 1)Ecoomic efficiency,2)Negative morality and3)positive morality.By economic efficiency he means ability to pull one's onen weight in the economic life.By negative morality he means willingness to sacrifies one's desire when their gratification would interfeace with the economic efficiency of others.By positive morality he means willingness to one's quen desires when their gratification would not contribute, directly or indirectly to social progress.In this way socially efficient individual is not a parasite on any member of society.He is a good citizen to understand and appreciate the world and is ready to sacrifies his own desires if they are harmful for others.

aim. For achieving success in activity of life, clear and well defined NSOU ? CC-ED-01 ? 54 aim is essential. An educator without the knowledge of aims can be compared to a sailor who does not know his destination. This means that a system of education which is not clear about its aims or which has undesirable ends is bound to fail. Aims give foresight to the educational planner. All our methods of teaching, our curriculum and our system of evaluation are shaped and molded according to our aim of education. It is the ignorance of right aims that has vitiated our educational system, its methods and its products, and has successfully resulted in the physical, intellectual and moral weaknesses of the race. There is a great necessity of aims in education because of the following reasons: To direct efforts: If aim is known we can make efforts to that end. Educational aims keep the teacher and the taught on the right track. They provide a line of action and guidance to the teachers. They give direction and zest to the work of the pupils. Educational aims help us to avoid wastage in time and energy. In the words of John Dewey, "To have an aim is to act with meaning." Aims help us to act intelligently and to act with a meaning. We know what is to be done and we straight away start doing that. To evaluate ourselves: Educational aims help us to evaluate ourselves. They use to take stock of the results of our effort. The aim is a yard-stick with which we can measure our success and failure. They are necessary to assess the outcome of the educational process. To evaluate the existing conditions: We as educators carefully evaluate the existing conditions, i.e., contents of education, methods of teaching, efficiency of teaching, library equipment, planning of curricular and co-curricular activities in the light of our objective and plan for the future. To provide efficient school administration: Aims are necessary for efficient school administration and organization. They help the school authorities in organizing, equipping, and administering the school. Various aspects of school administration and organization such as proper selection of teachers, proper curricular and co-curricular activities are guided by educational aims. It is rightly said that good schools evolve out of enlightened aims. Aims are guide-lines in the educational process. Like the sun, aims illumine our life. The ignorance of right aims will spoil the whole educational system. Factors Determining Educational Aims: Many factors have been contributing and do contribute to determining of educational aims. These factors touch every phase of human life that was, that is or what will be.

	<p>the responses made to the stimulus. The child's brain is nascent, eager to record the first reaction of the person who comes in contact with him/her. The home environment gives shape to his/her psychological and sociological growth. Mother becomes the first teacher. Undoubtedly, that is the reason that the first language a child learns is called "mother tongue". When we use the term "Home", it signifies the place where there are parents and other family members who the child comes in contact with, where the child is loved, cared for, disciplined, reared, taught and brought up, where a responsibility is felt by the family to modulate the child and attend his/her needs. Home, therefore, plays a very important role in laying the foundation of the child's personality in terms of physical, emotional, social, moral and cognitive aspects. As change is a continuous process,</p>

Family as an Agency for the Development of the Child
 Family brings the following developments among the child – Physical Development The child spends his/her infancy within the family. The priority, initially, should be on the physical growth of the child. The family should take care of the diet of the child and ensure that the child is nourished. Social Development The first step towards socializing is learnt by the child is the love and affection receives from his/her family. Home family is the first social institution that attempts NSOU ? CC-ED-01 ? 84 to socialize the child. The social development of the child depends upon love, affection, recognition, security, approval, freedom etc. the child receives from the family. The child also receives approval for righteous conduct from parents. The child also observes parents' day-to-day activities and it impinges upon behaviour of the child. The manner in which the family conducts itself channelizes future role and performance of the child. Emotional Development The behavior of the parents defines the emotional development of the child. Needless to say, the child first develops emotional bonding with the parents. The feelings of 'acceptance', 'love and belongingness' and 'togetherness' come from the family only, which provides emotional maturity to the child. Mental Development Like the physical growth, mental developmentl of the child also goes on simultaneously. From the very beginning of infancy, child learns to understand others, recognise signs and symbols, speech and imitate others. This is the family that educates the child, not through formal process but informally by action, play, and stories. Moral

Family as an Agency for the Development of the Child
 Family brings the following developments among the child: ? Physical Development: The child spends his/her infancy within the family. The priority, initially, should be on the physical growth of the child. The family should take care of the diet of the child and ensure that the child is nourished. ? Social Development: The first step towards socializing is learnt by the child is the love and affection receives from his/her family. Home is the first social institution that attempts to socialize the child. The social development of the child depends upon the love, affection, recognition, security, approval, freedom etc. the child receives from the family. The child receives approval for righteous conduct from parents. The child also observes parents' day to day activities and it impinges upon behaviour of the child. The manner in which the family conducts itself channelizes future role and performance of the child. ? Emotional Development: The behavior of the parents defines the emotional development of the child. Needless to say, the child first develops emotional bonding with the parents. The feeling of 'acceptance', 'love and belongingness' and 'togetherness' comes from the family only, which provides emotional maturity to the child. ? Mental Development: Like the physical growth, mental development of the child also goes on simultaneously. From the very beginning of infancy, child learns to understand others, recognise signs and symbols, speech and imitate others. This is the family that educates the child, not through formal process but informally by action, play, and stories. 69 ? Moral &

The normative dimension The normative dimension of culture consists of ideas about what is normal behavior. It tells us what is expected of us as members of a group. The most important aspects of the normative dimension are norms, sanctions and values. NSOU ? CC-ED-01 ? 108 a. Norms: Norms are standards of group behavior. Norms are so ingrained that they guide the daily activities without our awareness. For example, brothers and sisters should not have sexual relations; a child should respect his parents etc. There are three basic types of norms: folkways, mores and laws these three types of norms vary in their importance within a society. i. Folkways: Folkways literally mean the ways of the folk. Rules that cover customary ways of thinking, feeling and behaving are called folkways. They have not much moral significance. So violation of folkways is not considered bad from moral point of view. For example, saying 'hello' when encountering an acquaintance. A man may eat 6 meals a day. It is a violation of folkways but it is not a moral issue. Such an act is considered odd but not immoral. ii. Mores: Mores are norms of great moral significance. The violation of mores evokes strong social disapproval and their fulfillment brings significant social approval. Prohibiting illegitimate children is mores. Some mores are more vital to society than others.

iii. Laws: Laws are the third types of norms. Laws are norms that are formally defined and enforced consciously. b. Sanctions: Sanctions are rewards and punishments used to encourage socially acceptable behavior. Formal sanctions may be given only by officially designated persons such as judges. For example, awarding death penalty by a judge is formal sanction. Informal sanctions can be applied by most members of a group. For example, looking harshly at someone who is cheating on a test. Sanctions may be positive or negative. The severity of the sanction varies from one society to another. For instance, a person convicted of theft may be sentenced only to a few months jail, but a person convicted of theft in Saudi Arabia is to tolerate the amputation of hands. The severity of sanction may vary from time to time. For instance, in USA possession of an ounce of marijuana could result in several years in prison during 1960's, but today it is considered equivalent to a minor traffic violation. NSOU ? CC-ED-01 ? 109 c. Values: Values are assumptions of what is right and important for the society. Values have a tremendous influence on our daily life, because norms are based on them. For instance, a society that values democracy will have norms ensuring personal freedom; a society that values hard work will have norms against laziness. Values are also important because they are so general that they tend to permeate most aspects of daily life. In America, for example, the influence of the value of freedom goes beyond political life. It affects such diverse areas as relationship in the family, functioning of organization, religious affiliation etc. Culture and Education There is intimate relationship between culture and education. Every person is born into a particular culture which produces him with definite patterns of behavior and values which guide his conduct in different walks of life. Thus culture plays an important part in man's life. As Theodore Brameld remarked, "It is from the stuff of culture that education is directly created and that gives to education not only its own tools and materials but its reason for existing at all." Culture has profound implications for education. The social living is influenced by education and education itself is governed by social life. The total pattern of a society's life determines education and education molds the total pattern of society's life. Education produces a cultured man and is also nourished and nurtured by the cultured man. Functions of education towards culture 1. Conservation of culture: One of the important functions of education is the preservation of cultural heritage. If education is not agency of social conservation there would not have been any cultural heritage at all. The school must inculcate in pupils the traditional standards and values, which account for cultural evolution. The conservative function of education has been emphasized by Percy Nunn. The special function of a nation's school,

iii. Laws. Laws are the third types of norms. Laws are norms that are formally defined and enforced consciously. b. Sanctions. Sanctions are rewards and punishments used to encourage socially acceptable behavior. Formal sanctions may be given only by officially designated persons such as judges, college professors etc. For example, awarding death penalty by a judge is formal sanction. Informal sanctions can be applied by most members of a group. For example, looking harshly at someone who is cheating on a test. Sanctions may be positive or negative. The severity of the sanction varies from one society to another. For instance, a person convicted of theft may be sentenced only to a few months jail, but a person convicted of theft in Saudi Arabia is to tolerate the amputation of hands. The severity of sanction may vary from time to time. For instance, in USA possession of an ounce of marijuana could result in several years in prison during 1960's, but today it is considered equivalent to a minor traffic violation. truth, spirit and tolerance, capacity to absorb other cultures and work one new synthesis." NSOU ? CC-ED-01 ? 110

2. Continuity of culture: Another function of education is to maintain the continuity of culture by handling down customs, traditions, experiences and values of the society from one generation to another. This continuity is essential condition for survival of the nation.

3. Transmission of culture: Education is the savior of cultural traditions, experiences, values and norms. It helps in transmission of cultural patterns. In the words of Ottaway, "One of the tasks of education is to hand over the cultural values and behavior patterns of the society to her young and potential members." Without transmission of culture, there can be no growth and progress of man.

4. New cultural patterns: Education is not only concerned with the transmission of culture but it also builds new cultural patterns. It brings changes in the existing culture. These changes are necessitated due to cross-cultural constructs or the building of new knowledge which makes the old cultural patterns redundant.

5. Promotion of culture: Education helps in the modification and promotion of culture. It helps in the establishment of a better and happier society. As D. J. O Cannon remarked, "If each generation had to learn for itself what has been learned by its predecessors, no sort of intellectual or social development would be possible and the present state of society would be little different from the society of the old stone age." Thus, education reorganizes and reconstructs human experiences for the promotion of culture and civilization.

6. Adjustment to cultural patterns: Education equips the individual to adjust himself in the changing cultural patterns. Thus education is required to perform the functions of transmission and enrichment, acceptance and reformation, change and reconstruction of culture.

Function of culture towards human's education

1. Helpful in refining personality Culture helps the individual in refining physical, intellectual, aesthetic and moral aspects of personality by drinking deep into the accumulated best experiences of the race. Thus culture beautifies human personality and adds grace to human life.

truth, spirit and tolerance, capacity to absorb other cultures and work one new synthesis." 2. Continuity of culture. PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific / generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes of all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this, we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

W

Philosophy The word philosophy is derived from Greek word "Philosophia" which is a combination of two Greek words 'Philo' and 'Sophia'. Here 'Philo' means 'love' and 'Sophia' means 'knowledge'. Hence, the etimological meaning of the word

Philosophia or Philosophy is love of wisdom or knowledge. Therefore, study of philosophy deals with the fundamental nature of study of knowledge, reality and values. According to Collins English Dictionary (2006) the term philosophy is defined as: • Philosophy is the study of making theories about basic things such as the nature of reality, knowledge, thought or about how people should live. • Philosophy is a particular theory about how to exist or how to deal with a particular situation. Babylon English Dictionary: Study the principle of existence, behavior and knowledge; study the nature of human thought and of the world. NSOU ? CC-ED-02 ? 9 Specific Meaning of Philosophy: Philosophy may be defined as intensive thinking and contemplation which concerns with reality, knowledge and values. Definition of Philosophy: To make the meaning of Philosophy clearer, the following definitions are given: "

80%

MATCHING BLOCK 3/127

W

Philosophy is a persistent attempt to give insight into the nature of the world and

of Ourselves by means of systematic reflection". R W Sellars "Philosophy like other studies, aims primarily at knowledge". Bertrand Russell "Philosophy is the science of knowledge" Fichte "Philosophy is unceasing effort to discern the general truth that lies behind the particular facts, to discern also the reality that lies behind appearance". Raymont "Philosophy is a logical enquiry into the nature of reality". S. Radhakrishnan In the light of above definitions, we can say that philosophy explores man in relation to the universe. It stands for an inquiry after truth and search for knowledge. It is a method of critical and reflective thinking leading to human values. Philosophy is concerned with the three important aspects of human life and development. These are as follows: • Metaphysics—Theory of reality • Epistemology—Theory of knowledge; • Axiology—Theory of value. • Metaphysics or problems of reality is the study of existence, and deals with the questions of reality. The usual questions are: What is the nature of the universe? How the world has been created? What is God? • Epistemology or problems of knowledge is the most fundamental branch of philosophy. It deals with the problems of knowledge. It discusses the following

NSOU ? CC-ED-02 ? 10 types of questions? What are the sources of knowledge? What are the instruments of Knowledge? What are the possibilities and impossibilities of Knowledge? • Axiology or problems of value is that branch of philosophy which deals with the problems of values. 1.3.2 Nature of Philosophy It is not very easy to interpret the nature of philosophy in a very particular way. But it can be assumed that philosophy explores the universe in its own way. Shortly nature of philosophy describes its general attributes as perceived by the universe. ? Philosophy is a method of experiencing reality: By nature, Philosophy is an analytical method explaining reality and the place of human being occupies in it. The study of philosophy offers one of the best opportunities to enhance one's analytical, critical, expressive and interpretive abilities. It is, undoubtedly, the beginning of a process that can enrich one's life immensely. ? Philosophy explores comprehensive pattern of life: Philosophy is an activity of thought, a type of thinking. It is critical and comprehensive, in fact, the most critical and comprehensive manner of thinking which the human species has yet devised. Philosophy as a critical and comprehensive process of thought involves resolving confusion unmasking assumptions, revealing pre-supposition, testing positions, looking for reasons, examining world –views and questioning conceptual frameworks. ? Philosophy is associated with Knowledge base of all discipline: Philosophy is the interpretation of life, its nature and meaning. It is an enquiry into its source and destiny. It enquires into nature, meaning, purpose, origin and destiny of human life. It tries to understand the universe in relation to man. It investigates the nature of the supreme norms, ideals or values of life. Now, philosophy is regarded more as an interpretation of human life, its sources, value, meaning, and destiny than as an enquiry into the nature of the world, soul and God. ? Philosophy is a search for truth and reality: Truth is the central subject in philosophy. Philosophy is a search for truth and reality. Philosophy helps us understand what is meant by truth, whether truth can be known, and the means by which something can be said to be true. It helps us become more rational, ethical, appropriately open-minded and appropriately sceptical and it helps us attain justified

NSOU ? CC-ED-02 ? 11 beliefs that are more likely to be accurate than unjustified ones. Therefore, philosophy may be interpreted as an inquiry into the foundations of our beliefs, an attempt to clarify and justify them with reason. ? Philosophy is an attempt to answer the value of life: Philosophy relates to the study of, and attempts to understand the root nature of reality, existence, and knowledge. It is an attempt to answer all the ultimate questions of life. What is self? What is mind? What is ethics? What is the true nature of the universe? What are the qualities of truth, goodness and beauty? All these questions are interpreted by philosophy. Philosophy is deeper and more comprehensive. It tries to answer the ultimate questions of life. Thus philosophy is an attempt to think in most general and systematic way about everything in the universe, about reality as a whole. ? Philosophy is speculative: Philosophy is speculative in pursuing questions that do not bear directly on practical matters. It is speculative in considering problems which only highly abstract thoughts present. It is speculative in developing effective philosophical perspectives and concerns. It is speculative in considering ultimate metaphysical issues, pursuing the most critical formulation of principles held to govern thought and action. This nature of philosophy tries to seek to establish meaning by resolving controversies. It also seeks to identify and to clarify the fundamental assumptions of conflicting points of view. ? Philosophy is analytical: Philosophy is concerned only with the problem and methods of knowledge. Philosophy is not the study of ultimate reality as a whole. Philosophy aims to consider the deeper questions about life and the world that we live in by thinking through the possibilities, the repercussions, the facts, and the experiences that people have in order to define knowledge. Philosophy as analysis focuses on logic and an evaluation of language to attempt to define questions, analyze definitions and determine what is true about the world. ? Philosophy is synthetic: The nature of philosophy is to synthesize man's total experience in the form of knowledge. Philosophy is an effort to combine all knowledge and all experiences, both individual and social. Kant puts forth that synthesis describes the central and foundational function of cognitive activity, namely the rule-bound combination of data received by the senses and

NSOU ? CC-ED-02 ? 12 considered by means of this process under a specific general aspect i.e a concept of the understanding. From the above discussion, it is apparent that philosophy is the conscious reflection upon the world as a whole. Philosophy investigates the ultimate nature of the supreme ends or values, like –Truth, Good, Beauty and the God, and their relation to Reality. 1.3.3 Scope of Philosophy The scope of philosophy does mean the type of works that philosophy exhibits. Scope of philosophy refers to its range of application to various fields of study. There are certain core areas in which philosophical investigation is active. We shall have found the scope of philosophy by expanding of its own field and similarly by correlation with the other areas too. Ultimately it can be concluded that universe may be interpreted in terms of philosophical scope by means of reality, knowledge and values. These scopes are: (a) Epistemology (b) Metaphysics (c) Axiology Epistemology: Epistemology is the philosophy of exploring knowledge. It is often called theory of knowledge also. Within the scope of the epistemological philosophy it creates the possibilities and impossibilities of acquiring knowledge and the scope and validity of knowledge. The scope of epistemology includes

78%

MATCHING BLOCK 4/127

W

nature of knowledge, sources of knowledge, authenticity of knowledge, instrument of knowledge, methods of attaining knowledge,

relational aspect of knowledge and possibility and impossibility of knowledge. Metaphysics: Metaphysics deals with the nature of reality, existence of god and the nature of the universe which also includes its sub-classes on ontology. Speculation concerning the nature of Being or Existence is called ontology. There are three essential parts of metaphysics viz., ontology of nature, ontology of the soul or mind and ontology of the Absolute. It discusses the theories of monism, dualism and about pluralism. Ontology includes in its fold cosmology and cosmogony. The speculation which deals with the constitution of universe, space, time, the origin and nature of life, the philosophy of evolution, the purpose or design in nature is called cosmology. Cosmogony deals with the origin or creation of the world. So, metaphysics discusses the most basic categories of thing, such as existence, objects, properties, causation and so forth.

NSOU ? CC-ED-02 ? 13 Axiology: Axiology is the philosophical study of value and "value" originally meant the worth of something. Axiology asks the questions: What is a value? Where do values come from? How do we justify our values? How do we know what is valuable? What is the relationship between values and knowledge? What kinds of values exist? Can it be demonstrated that one value is better than another? Who benefits from values? etc. Other scope of Philosophy besides the major scopes are discussed below: Logic: Logic is a distinct aspect of philosophy having scope of explanations, arguments and critical evaluation. It is the logic that gives a scientific understanding of enquiry through its inductive and deductive methods. Ethics: It stands for moral concepts and reasoning – such as right action, obligation and justice. It is also called moral philosophy. Philosophy of Mind: The philosophy of mind describes different mental state and modes, having essential mental components: belief, desire, emotion, feeling, sensation, passion, will etc. Philosophy of Religion: It is concerned with the relation between faith and reason, the nature of religious language, the relation of religion and morality and the question of how a God who is wholly good could allow the existence of evil. Philosophy of Science: It clarifies both the quest for scientific knowledge and the results yielded by that quest. Political Philosophy: It concerns the justification and limits of governmental control of individuals, the meaning of equality before the law, the basis of economic freedom and many other problems concerning government. Philosophy of Law: It explores such topics as what law is, what kinds of laws there are, how law is or should be related to morality and what sorts of principles should govern punishment and criminal justice in general. Philosophy of Art: It concerns the nature of art, including both performing as well as painting, sculpture and literature. Philosophy of Language: This field has close ties to both epistemology and metaphysics. It deals with the nature of meaning, the relations between words and things, the various theories of language learning etc. From the above discussion, it is clear that philosophy is the creator of all subjects. All

NSOU ? CC-ED-02 ? 14 branches of science and knowledge emerged from philosophy. Philosophy is that type of knowledge which has a close relation with almost all of the prevailing branches of knowledge. Philosophy is a vast field where all branches of knowledge are to be discussed. Philosophy harmonizes the highest conclusions of the different sciences, gives a rational conception of the whole world. To sum up, we can say that- • Philosophy refers to knowledge concerned with discovery of truth. • Philosophy refers to the acquisition of wisdom which influences the role of life. • Philosophy is the study of the most general and abstract features of the world and categories with which we think. • Philosophy is the general study of values, ethics, logical thinking and theoretical speculation about the nature of reality and reason. 1.4 Philosophy as the foundation of educational Studies: Concept, Nature and Scope: 1.4.1 Concept ? Equips individuals with the skills and substantive knowledge that allows them to define and to pursue their own goals, and also allows them to participate in the life of their community as full-fledged, autonomous citizens.

As a social process education upgrading social enhancement and focusing individual achievement.

NSOU ? CC-ED-02 ? 15 ? Education is a process of Democratizing Education System: But this is to cast matters in very individualistic terms, and it is fruitful also to take a societal perspective, where the picture changes somewhat. It emerges that in a multicultural society democratic pattern of philosophy can bring change. Dewey in his classic work Democracy and Education (1916), opined that in its broadest sense education is the means of the social avenue of life.

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Philosophy of education is essentially a method of approaching educational experience rather than a body of conclusions. It is the specific method which makes it philosophical. Philosophical method is critical, comprehensive and synthetic. Therefore, • Philosophy of education is the criticism of the general theory of education. • It consists of critical evaluation and systematic reflection upon general theories. • It is a synthesis of educational facts with educational values. In brief, it is a philosophical process of solving educational problems through philosophical method, from a philosophical attitude to arrive at philosophical conclusions and results. Thus, it aims at achieving general as well as comprehensive results. 1.4.2 Nature of

Philosophy of Education

72%**MATCHING BLOCK 12/127****SA**

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Philosophy of education is one of the areas of applied philosophy. There are three branches of philosophy namely metaphysics, epistemology and axiology

and try to communicate education in terms of realistic approach, development of knowledge and creating values among learners and broadly speaking nature of Philosophy of Education can be termed as Interdisciplinary. 1) Interdisciplinary Nature: applying Reality in Education:Metaphysical Nature

100%**MATCHING BLOCK 13/127****SA**

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Metaphysics is a branch of philosophy that investigates principles of reality transcending those of any particular science. It is concerned with explaining the fundamental nature of being and the world. Metaphysics is the study of the nature of things. Metaphysicians ask what kinds of things exist, and what they are like. They reason about such things as whether or not people have free will, in what sense abstract objects can be said to exist, and how it is that brains

are able to generate minds.

NSOU ? CC-ED-02 ? 16 2) Epistemological Nature: Philosophy of Education by nature seeks to explore Knowledge:

100%**MATCHING BLOCK 14/127****SA**

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Epistemology is the branch of philosophy that studies knowledge. It attempts to answer the basic question: what distinguishes true (adequate) knowledge from false (inadequate) knowledge?

Practically, this question translates into issues of scientific methodology: how can one develop theories or models that are better than competing theories? It also forms one of the pillars of the new sciences of cognition, which developed from the information processing approach to psychology, and from artificial intelligence, as an attempt to develop computer programs that mimic a human's capacity to use knowledge in an intelligent way. When we look at the history of epistemology, we can discern a clear trend, in spite of the confusion of many seemingly contradictory positions. The first theories of knowledge stressed its absolute, permanent character, whereas the later theories put the emphasis on its relativity or situation-dependence, its continuous development or evolution, and its active interference with the world and its subjects and objects. The whole trend moves from a static, passive view of knowledge towards a more and more adaptive and active one. As you can tell,

100%**MATCHING BLOCK 15/127****SA**

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

the different branches of philosophy overlap one another. A philosopher considering whether people ought to give excess wealth to the poor is asking an ethical question. However, his investigations might lead him to wonder whether or not standards of right and wrong are built into the fabric of the universe, which is a metaphysical question. If he claims that people are justified in taking a particular stance on that question, he is making at least

a tacit

98%

MATCHING BLOCK 17/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

epistemological claim. At every step in his reasoning, he will want to employ logic to minimize the chance of being led into error by the great complexity and obscurity of the questions. He may very well look to some of the ethical, metaphysical, and epistemological writings of past philosophers to see how his brightest predecessors reasoned about the matter. Aspects of each branch of philosophy can be studied in isolation, but philosophical questions have a way of leading to other philosophical questions, to the point that a full investigation of any particular problem is likely eventually to involve almost the whole of the philosophical enterprise. One view on education believes or subscribes to the view that philosophy of education comes under the umbrella of axiology. As a branch of philosophy, it utilizes philosophical methods for the solution of philosophical problems with a philosophical attitude to arrive at philosophical conclusion. In this comprehensive process

it

90%

MATCHING BLOCK 16/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

includes facts concerning education and synthesizes them NSOU ? CC-ED-02 ? 17 with values. The other school of thought believes that education as a discipline utilizes or needs to incorporate all modes of philosophical inquiry; metaphysical, axiological and epistemological. As individuals involved in the process of education right from the aims, purpose, functions and building theory we need to look at any body of knowledge or generate new knowledge based on the three modes of philosophical inquiry. 3)

Axiological Nature: Educational Philosophy deals with Ethics and Aesthetics for enreaching philosophical components in Educational systems: •

100%

MATCHING BLOCK 18/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Aesthetics: The study of basic philosophical questions about art and beauty. Sometimes philosophy of art is used to describe only questions about art, with "aesthetics" the more general term. Likewise "aesthetics" sometimes applied even more broadly than to "philosophy of beauty: to the "sublime," to humour,

to the frightening--to any of the responses we might expect works of art or entertainment to elicit. •

97%

MATCHING BLOCK 19/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Ethics: The study of what makes actions right or wrong, and of how theories of right action can be applied to special moral problems.

Sub disciplines include meta-ethics, value theory, theory of conduct, and applied ethics. 1.4.3 Scope of Philosophy of Education The scope of philosophy of education is confined to the field of education. Thus, it is philosophy in

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Education critically evaluates the different aims and ideals of education. These aims and ideals have been prorogated by various philosophers in different times.

They are

99%

MATCHING BLOCK 22/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

character building, man making, harmonious human development, preparation for adult life, - development of citizenship, utilization of leisure, training for civic life, training for international living, achieving social and national integration, -scientific and technological development, education for all, equalizing educational opportunities, strengthening democratic political order and human source development. These and other aims of education presented by educational thinkers in different times and climes are scrutinized and evaluated. Thus, philosophy of education critically evaluates different aims and ideals of education

to arrive at.

NSOU ? CC-ED-02 ? 18 Value is typically a philosophical subject since it is more abstract, integral and universal. Philosophy-of education not only critically evaluates the values but also systematizes them in a hierarchy. Educational values are determined by philosophical values. Educational values propagated by different philosophers have been derived from their own world, view and their outlook on the purpose of human life. Therefore,

100%

MATCHING BLOCK 23/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

a scrutiny of the world views, outlook, and beliefs is the specific function of philosophy and it is necessary for the philosophical treatment of the values. 2.

Analytical Scope: Critical analysis of any educational concept and other educational components:

99%

MATCHING BLOCK 24/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

One of the most important contributions of the philosophy of education to the cause of education is the provision of criteria for deciding the relationship of state and education, economic system and education, curriculum, school organization and management, discipline etc. These problems have led to the evaluation of different philosophies of education. The criteria of judgment everywhere are determined by philosophy; therefore, philosophy of education provides the criteria for critical evaluation and judgment in these fields.

Interpretation of Human Nature: A philosophical picture of human nature is a result of the synthesis of the facts borrowed from all the human science with the values discussed in different normative, sciences. The philosophical picture, therefore, is broader as compared to the picture of man drawn by biology, sociology, psychology, economics and anthropology and other human science.

3.Eclectic Scope: Pursuing inquiry, interpreting reality, exploring epistemology Education is related to knowledge. It is determined by the source, limits, criteria and means of knowledge. The discussion of all these falls within the jurisdiction of epistemology, one of the branches of philosophy, therefore, an important area of the functioning of philosophy of education is related to theory of knowledge.

Relationship between Philosophy and Education: Much has been said on education, its meaning and function in a preceding chapter. Etymological definitions will not serve our purpose. Education can be defined as the strongest instrument for the achievement of the ideals of life and civilised attempt to bring out about the balanced and proper development of human personality. The definition indicates that the plant of education draws its nourishment from the soil of Philosophy. In the words of Adams, "Education is the dynamic side of Philosophy. It

73%

MATCHING BLOCK 25/127

SA

03 Analysis and result - BASKARAN.C.pdf (D61753646)

is the active aspect of Philosophical belief; the practical means of realizing the ideals of life."

NSOU ? CC-ED-02 ? 19 There is wide and close relation between education and Philosophy. The following are a few Quotations that establish the relationship between education and Philosophy:

View

82%

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

of Ross: "Philosophy and education are two sides of the same coin; the former is Contemplative while the latter is the active side."

View of John Dewey: "

78%

MATCHING BLOCK 28/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

John Dewey endorses the view point of Ross when he says; "Philosophy is the theory of education in its most general phase."
Gentile's view: "

Education without Philosophy would mean a failure to understand precise nature of education” After considering these views we can describe the relationship between Philosophy and education as under: 1. Philosophy determines the real destination, towards which education is to go: Philosophy has always inspired educational theory as well as practice. It determines the realdestination, towards which education has to go. In the words of Dewey, “Education is alaboratory in which philosophic distinctions becomes concrete as are tested.” Philosophy is wisdom; education transmits that wisdom from one generation to the other. Philosophy represents a system of thought; education embraces that thought in the content ofinstruction. Philosophy embodies a way of life; education is a preparation for life. Philosophy isa knowledge obtained by natural reasons; education is the development of that reason and otherpowers of mind. 2. Education is the means to achieve goal: Philosophy deals with the ends and education isthe means to achieve those ends. Philosophy gives ideals, values and principles; education workout those ideals, values or principles, in the words of Herbart, “

87%

MATCHING BLOCK 26/127

W

education has no time to makeholiday till all the Philosophical questions are once for all cleared up.”

It can, therefore, be said that philosophy

25%

MATCHING BLOCK 29/127

SA

Philosophical Book.docx (D143579534)

is the contemplative side while education is its activeside. Philosophy is the theory of education while education is the practical thereof. Education isthe best means for the propagation of philosophy. It is the dynamic of philosophy. 3. Great Philosophers have been great

educators also: Great philosophers have been greateducationists in the East as well as in the West. We can find the clearest examples of thedependence of education on philosophy in the lives and teachings of all the great philosophersfrom Yajnavalka down to Gandhi in the East and from Socrates down to the John Dewey in the West. Philosophers like Gandhi, Tagore, Radhakrishnan, Aurbindo Ghosh, Plato, Socrates, Locke, Comenius, Rousseau, Froebel and Dewey have been great NSOU ? CC-ED-02 ? 20 educators. They reflected theirphilosophical views in their educational schemes. Socrates has given the world his “Socraticmethod” (Method of questioning and cross-questioning of teaching; Plato, the Republic the firsteducational class. Rousseau, the great French philosopher, held that education should “follownature”. John Dewey of America took keen interest in solving the educational problems of hiscountry. Gandhi is the father of basic education. In the words of Ross, “if further agreement isneeded to establish the fundamental dependence of education on philosophy, it may be found inthe fact that on the whole great philosophers have been great educationists”. 4. Philosophy determines the various aspects of education: Every aspect of education has aphilosophical base. There is no aspect of education-aims, curriculum, methods, text books, discipline, teacher etc. Which is not influenced and determined by philosophy? Height andbreadth of education is probed in by philosophy. It is philosophy which provides aims educationand these aims determine the curriculum, the methods of teaching, the text books, the role ofteacher and the school discipline. Thus education is the dynamic, active and practical side ofphilosophy. Significance of Educational Philosophy: The need and importance of educational philosophy can be explained as in the follows: 1. Philosophy and Aims of Education: Every system of education must have an aim. Without aim education is meaningless. The aim of education is directly related with the aim of life, andthe aim of life is always dependent on the philosophy that prevails. It is philosophy whichdetermines whether the aim of education should be moral perfection or intellectualdevelopment, whether education should be vocational or liberal should it be for the developmentand happiness of the individual or for the good the society? Such conflicting views regarding theaim of education are reconciled in the light of philosophy. 2. Philosophy and Curriculum: In no other sphere is this dependence of education on philosophy more marked than in that of the curriculum. Determination of curriculum needs the services of philosophy in its entirety. Specific curriculum problems demand a philosophy for this satisfactory solution. While discussing curriculum problems Briggs remarks, “It is just here (in curriculum) that education seriously needs leaders. Leaders who hold a sound comprehensivephilosophy of which they can convince others, who can direct its consistent application to theformulation of appropriate curricula.” It is philosophy which will decide a particular subjectshould be included in the curriculum and what particular discipline that subject will promote. Curriculum is the contents of education. It is just like a gun

NSOU ? CC-ED-02 ? 21 powder for the soldier. Through curriculum education becomes effective or ineffective. Curriculum is not fixed for all the times. It changes in accordance with the aims of education, which are determined by philosophy. So curriculum differs with different schools of philosophy. 3. Philosophy and Text-books: Even in choice of text-books we are guided by philosophical Considerations. Curriculum can be enforced only through proper selection of text-books. Textbooks markedly affect methods of raising standards of scholarship. A philosophy is needed to determine the quality and contents of textbooks. A good text-book must reflect the prevailing values of life fixed by philosophy. If the text books reflect the life values of the prevailing philosophy, they are considered to be appropriate text-books. On the contrary, if they oppose the prevailing philosophy of life, they are considered inappropriate. In one of the modern trends in education a text-books regarded as it must be remembered that a text-book is an institution which cannot be demolished. In order to keep this institution healthy and serviceable there must be a philosophy in order to determine its nature and contents. 4. Philosophy and Methods of Teaching: Kilpatrick's use of the term philosophy of method shows that there is a close relation between educational method and philosophy. Philosophy influences and determines the methods of teaching as well. Method as an important place in education. It is through method that the teacher establishes and maintains the contact between the children and the subject-matter. 5. Philosophy and Discipline: Like curriculum text-books and methods, Discipline too, is determined by the philosophy of life accepted as a particular time. In other words, the philosophy of an age is reflected in the discipline of its educational institution. Discipline reflects political philosophy prevalent in the country. In a despotic system of government, repression in common and blows is given for every branch of order. The methods of repressionists are the police methods of control. In a democracy, the doctrine of emancipation is advocated. Emancipationist beliefs in giving complete freedom to the child. They wish no interference on the part of the teacher. Let the child do what this nature prompts him to do, say the protagonists of the school. So the emancipationists believe in giving opportunity to the educands to have self-control. In the impressionistic system, it is the personal influence of the teacher which is effective in ensuring discipline. Repressionists believe in the method of physical force, emancipationists advocate the method of love and understanding, and impressionists favour the method of persuasion. 6. Philosophy and teacher: Teacher has very important role to play in education. A

NSOU ? CC-ED-02 ? 22 teacher who is well-aware of the philosophy of life and education is very successful in his job. Gentile has rightly remarked, "The belief that men may continue to educate without concerning themselves with philosophy means a failure to understand the precise nature of education. The process of education cannot go on right lines without the help of philosophy. According to naturalist, the teacher should not interfere with the education of the child. He throws the teacher to the back-ground. The idealist holds that the teacher is indispensable for the education of the child. Unless there is teacher, there can be no education. He gives highest place to the teacher. The pragmatist adopts via media so far as the place of teacher is concerned. He is simply to guide the teacher in various learning activities. 7. Philosophy and Educational Administration: The knowledge of what kind of school administration we should adopt is determined by Educational philosophy. Educational philosophy helps to establish a school in democratic or Totalitarian system. Now a days we are following democratic principle for administering the Educational institutions. This is based on educational philosophy. 1.5 Basic Propositions of Philosophy: Epistemology, Metaphysics, Axiology

EDN-101-Philosophical Foundations of Education.pdf
(D141385432)

Philosophy deals with the most basic issues faced by human beings. The content of philosophy

is better seen as asking questions rather than providing answers. Philosophical content has been organized around three fundamental categories: Branches of Philosophy Metaphysics (Theory reality) 1. What is the nature universe ? 2. Is there any intelligent purpose behind this world? Epistemology (Theory of knowledge) 1. How does the man get the knowledge that he has? 2. What are the sources of knowledge? Axiology (Theory of values) 1) What are the principles of life? 2) What is good? What is bad? Ethics Aesthetics Logic (What is good ?) (What is beautiful?) (It resolves doubt)

NSOU ? CC-ED-02 ? 23 1.5.1 Metaphysics A. Metaphysics deals with reality Metaphysics is the branch of philosophy that studies the ultimate nature of reality or existence. It asks questions such as 'What exists?' or 'What is real?' Metaphysicians seek an irreducible foundation of reality or 'first principles' from which absolute knowledge or truth can be induced and deduced. The term metaphysics is derived from the Greek words "meta" means 'beyond' or 'upon' or 'after' and "physical" means 'physics'. Literally it refers 'those things after the physics.' Metaphysical questions are the most basic to ask because they provide the foundation upon which all subsequent inquiry is based. Metaphysical questions may be divided into four subsets. First, the cosmological aspect. Cosmology consists in the study of theories about the origin, nature, and development of the universe as an orderly system. Questions such as these populate the realm of cosmology: "How did the universe originate and develop? Did it come about by accident or design? Does its existence have any purpose?" A second metaphysical aspect is theological. Theology is that part of religious theory that deals with conceptions of and about God. "Is there a God? If so, is there one or more than one? What are the attributes of God? If God is both all good and all powerful, why does evil exist? If God exists, what is His relationship to human beings and the 'real' world of everyday life?" A third subset of metaphysics is the anthropological. Anthropology deals with the study of human beings and asks questions like the following: What is the relation between mind and body? Is mind more fundamental than body, with body depending on mind, or vice versa? What is humanity's moral status? Are people born good, evil, or morally neutral? To what extent are individuals free? Do they have free will, or are their thoughts and actions determined by their environment, inheritance, or a divine being? Does each person have a soul? If so, what is it? People have obviously adopted different positions on these questions, Ethics Aesthetics Logic (What is good ?) (What is beautiful?) (It resolves doubt) and those positions influence their political, social, religious, and educational ideals and practices. Metaphysics & Education: It reveals the impact of the cosmological, theological, anthropological, and ontological aspects of metaphysics upon their social, political, economic, and scientific beliefs and

NSOU ? CC-ED-02 ? 24 practices. People everywhere embrace answers to these questions and then live their daily lives in keeping with those assumptions. There is no escape from metaphysical decisions; unless one chooses to vegetate and even that choice would be a metaphysical decision about the nature and function of humanity. Education, like other human activities, cannot operate outside the realm of metaphysics. Metaphysical issues of ultimate reality, is central to any concept of education, because it is important for the educational program of the school to be based upon fact and reality rather than fancy, illusion, error, or imagination. Varying metaphysical beliefs lead to differing educational approaches and even separate systems of education. Metaphysical beliefs regarding the nature of ultimate reality is to follow the existence of God, the role of God in human affairs. At their deepest levels, men and women are motivated by metaphysical beliefs. History demonstrates that people are willing to die for those convictions, and that they desire to create educational environments in which their most basic beliefs will be taught to their children. The anthropological aspect of metaphysics is especially important for educators of all persuasions. After all, they are dealing with malleable human beings at one of the most impressionable stages of their lives. Views about the nature and potential of students form the foundation of every educational process. The very purpose of education in all philosophies is closely tied to these views. Thus, anthropological considerations lie extremely close to the aims of education. Variations in anthropological positions will produce significantly different approaches to the educational process. Metaphysics is speculative and focus on issues as the nature of cause-effect relationships. It relates to teaching in terms of thoughts about educational goals, the selection of appropriate content and educational goals, and attitudes towards the general nature of learners. 1.5.2 Epistemology Epistemology is the branch of philosophy concerned with the nature and scope of knowledge and is also referred to as "theory of knowledge". Etymologically the word epistemology has been derived from the Greek word episteme, meaning "knowledge, understanding", and logos, meaning "study of". In other word we can say that Epistemology is the study of the nature, source, and validity of knowledge. It seeks to answer of the basic questions as "What is true?" and "How do we know?"

NSOU ? CC-ED-02 ? 25 Thus, epistemology covers two areas: the

79%

MATCHING BLOCK 32/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

content of thought and thought itself. Or in educational terms: curriculum and instruction or content and method.

The study of epistemology deals with issues related to the dependability of knowledge and the validity of the sources through which we gain information. Epistemology seeks answers to a number of fundamental issues. One is whether reality can even be known. Most people claim that reality can be known. However, once they have taken that position, they must decide through what sources reality may be known, and must have some concept of how to judge the validity of their knowledge. A second issue foundational to epistemology is whether all truth is relative, or whether some truths are absolute. A major aspect of epistemology relates to the sources of human knowledge. If one accepts the fact that there is truth and even Truth in the universe, how can human beings comprehend such truths? How do they become human knowledge? Empiricism: Knowledge obtained through the senses. Empirical knowledge appears to be built into the very nature of human experience. Sensory knowing for humans is immediate and universal, and in many ways forms the basis of much of human knowledge. Sensory knowledge is built upon assumptions that must be accepted by faith in the dependability of human sensory mechanisms. The advantage of empirical knowledge is that many sensory experiences and experiments are open to both replication and public systems. A second influential source of knowledge throughout the span of human history has been revelation. Revealed knowledge has been of prime importance in the field of religion. It differs from all other sources of knowledge because it presupposes a transcendent supernatural reality that breaks into the natural order. On the other hand, it is generally realized that distortion of revealed truth can occur in the process of human interpretation. Some people assert that a major disadvantage of revealed knowledge is that it must be accepted by faith and cannot be proved or disproved empirically. A third source of human knowledge is authority. Authoritative knowledge is accepted as true because it comes from experts or has been sanctified over time as tradition. In the classroom the most common source of information is some authority, such as a textbook, teacher, or reference work. Accepting authority as a source of knowledge has its advantages as well as its dangers. Civilization would certainly stagnate if people refused to accept any

NSOU ? CC-ED-02 ? 26 statement unless they personally verified it through direct, firsthand experience. On the other hand, if authoritative knowledge is built upon a foundation of incorrect assumptions, then such knowledge will surely be distorted. A fourth source of human knowledge is reason. The view that reasoning, thought, or logic is the central factor in knowledge is known as rationalism. The rationalist, in emphasizing humanity's power of thought and the mind's contributions to knowledge, is likely to claim that the senses alone cannot provide universal, valid judgments that are consistent with one another. From this perspective, the sensations and experiences humans obtain through their senses are the raw material of knowledge. These sensations must be organized by the mind into a meaningful system before they become knowledge. Rationalism in a less extreme form claims that people have the power to know with certainty various truths about the universe that the senses alone cannot give. A fifth source of knowledge is intuition- the direct apprehension of knowledge that is not derived from conscious reasoning or immediate sense perception. Intuition occurs beneath the threshold of consciousness and is often experienced as a sudden flash of insight. Intuition has been claimed under varying circumstances as a source of both religious and secular knowledge. Epistemology and Education: Epistemology and education are tacit companions since both are primarily the act of knowing. Epistemology is the motor of education in a sense because it drives the educational process. Whatever educational theories and practices one employs will be consistent with his or her theories and practices of epistemology. Epistemology has a

direct impact upon education on a moment-by-moment basis. For example, assumptions about the importance of various sources of knowledge will certainly be reflected in

curricular emphases and teaching methodologies. 1.5.3 Axiology Axiology, which stems from two Greek words- "Axios means value, worth" and "logos", means "reason/ theory/ symbol / science/study of". Hence, Axiology is the philosophical study of value and "value" originally meant the worth of something. Axiology, like metaphysics and epistemology, stands at the very foundation of the educational process. A major aspect of education is the development of values and in that context; the classroom is an axiological entity in which teachers explore their moral selves.

NSOU ? CC-ED-02 ? 27 By their actions, teachers constantly instruct groups of highly impressionable young people who assimilate and imitate their teachers' value structures to a significant extent. Axiology has two main branches- ethics and aesthetics. Ethics is the study of moral values and conduct. Ethical theory seeks to provide right values as the foundation for right actions. In many ways, ethics is the crucial issue of our times. World societies have made unprecedented technological advances, but have not advanced significantly, in their ethical and moral conceptions. Both as individuals and within societies, human beings exist in a world in which they cannot avoid meaningful ethical decisions. Thus, schools must teach ethical concepts to their students. Axiology and Education: Our contemporary age is an age of great confusion and turmoil. Wars and conflicts continue unabatedly and innumerable alarming and tragic phenomena, including terrorism, destruction, arson, kidnapping, murder, drug abuse, alcoholism, sexual immorality, family breakdown, injustice, corruption, oppression, conspiracy, and slander, are occurring worldwide. At the vortex of this turmoil, humankind's most valuable assets are now almost obliterated. It is referring to the loss of personal human dignity, the loss of time-honored traditions, the loss of the dignity of life, the loss of mutual trust among people, the loss of the authority of parents and teachers, and the list goes on. In this context education plays an important role for inculcating the value (such as- truth, beauty and goodness etc.) and transmitting from one generation to another through its curriculum. It has been rightly stated that culture is a totality of values created throughout history and that education is the means of performing culture. This is why axiology requires an important educational dimension. Which are the components of this dimension? First, axiology, by projecting a system of values, proposes educational aims under the form of axiological objectives and ideals. Second, axiology comprises both general human or universal and specific values for a determined community, thereby giving it its personality. Education preserves and transmits values that guarantee the cultural identity of the human community. Third, the performance of values requires knowledge and experience, which means the involvement in this process of education on its two interrelated planes: cognitive and emotional. Finally, as axiology is the horizon of the manifestation of human creativity, education has among its fundamental functions that of cultivating the creative power of the individual and the human community. Otherwise expressed, though personality is the source of all values, it is not born, but is developed by education. That is why we estimate nowadays that education is one of the fundamental resources for future social development. From this concise presentation of the elements making up the content of the educational

NSOU ? CC-ED-02 ? 28 dimension of axiology, there results a very important conclusion: without education, axiology would be deprived of living power, and, without the light of axiology, education would grope about in the dark. 1.6 Summary • We discussed the concept, nature and scope of philosophy, and concept ,nature , scope of philosophical foundation of education. Also discuss the basic proportions of philosophy: Metaphysics, Epistemology & Axiology and their Applications in education. Philosophy, it may be concluded, indispensable for every aspect of life and much for education which prepares the man for complete living. •

The word "philosophy" comes from the Greek word "philosophia", which

combines the words "philo" meaning "love of" and "Sophia" meaning "wisdom". Philosophy is a form of inquiry – a process of analysis, criticism, interpretation and speculation. Philosophy is an attempt to answer all the ultimate questions of life. What is self? What is mind? What is ethics? What is the true nature of the universe? What are the qualities of truth, goodness and beauty? • From different angles of the educational problem there is a demand for a philosophical foundation of education. All educational questions are ultimately questions of philosophy. It is the basis of education, All educational efforts and achievements become purposeful by philosophy. It is essential if we want to evolve a required type of personality of the child after education. Real educational progress is the product of philosophy. Great educational advances have always been brought forth by intuitive insights of great philosophers. • Philosophical content has been organized around three fundamental categories: Metaphysics, Epistemology and Axiology. Metaphysics is the branch of philosophy concerned with the nature of existence, being and the world. Epistemology is the most fundamental of philosophy. It is the study of knowledge. Epistemology is the explanation of how we think. It is that branches of philosophy which studies the origin or sources, types, structure, methods and validity of knowledge. It is needed in order to use and obtain knowledge of the world around us. Axiology is the philosophical study of value and "value" originally meant the worth of something. Axiology asks the questions: What is a value? Where do values come from? How do we justify our values?

NSOU ? CC-ED-02 ? 29 1.7 Self-Assessment Questions 1. What do you mean by the term Philosophy? 2. Point out the main aspects of a Philosophy 3. What is Axiology? 4. What are the main problems of epistemology? 5. Discuss the Nature of Philosophy? 6. Point out the Scope of Philosophy 7. How to define Philosophy as the foundation of educational Studies? 8. Write the concept of Philosophical foundation of Education. 9. Write the Nature of Philosophical foundation of Education 10. What is meant by Epistemology? 11. What is the relationship between Education and Epistemology? 12. What is meant by Metaphysics? 13. What is the relationship between Education and Metaphysics? 14. What is meant by Axiology? 15. Objectives After going through this unit, you will be able to – • Describe

the concept and basic characteristics of Indian Philosophy: • Theism • Atheism • To know the Epistemological Characteristics of Samkhya Philosophy • To know the Epistemological Characteristics of Yoga Philosophy • To know the Epistemological Characteristics of Naya Philosophy • To know the Epistemological Characteristics of Buddhism Philosophy • To know the Epistemological Characteristics of Jainism Philosophy • To know the Epistemological Characteristics of Islamic Philosophy 2.2 Introduction Now we are going to discuss different schools of philosophy and its educational implications. We know, philosophy and education are interrelated and interdependent. Education is sourced from philosophical truths. The people used to take education from different subject like Kavya (literature), Nataka (drama), Tarka (logic), Vyakarana (grammar) etc. The basic objectives of this education system are to develop quality of life. Here the education system is life centric. Life has been exposed through philosophical principles for the attainment of highest truth where philosophy and education superimpose to each other. Indian schools of philosophy contribute to humanize their education system by their lifelong education process, where philosophy and education go hand in hand. Indian schools of philosophy are divided broadly in two categories, namely orthodox (astika) and heterodox (nastika). The astika believes in the authority of Vedas. The nastika does not consider the Vedas as infallible. Before going to discuss schools of philosophy let us consider the classification of knowledge according to Indian Philosophy—

NSOU ? CC-ED-02 ? 33 From Naya Philosophy it will be clear that how presentative cognition is possible through different sources of knowledge. Here knowledge is possible through the interaction of objects with sense organ. Philosophy is a system. The systematic structure of philosophical thought is unfolded into three sub-systems such as- 1. Epistemology- theory of knowledge, 2. Metaphysics- deals with reality of the world, and 3. Axiology- related to the values of different philosophical schools. Education as a discipline we try to elaborate our ideas regarding the epistemological dimension of schools of philosophy as because it will help to extract educational objectives and other necessary principles. 2.3 Basic Characteristics of Indian Philosophy: Theism and Atheism In Indian context, philosophy is taken to mean darshana or tattva. We shall consider how the etymological meaning of "philosophy" correlates itself with darshana or tattva.

NSOU ? CC-ED-02 ? 34 "Drisyate anenaitidarshanam. - the one through which it is seen. The word seen can be understood either literally or philosophically. Though the difference is irrelevant, let us consider only the latter. To see in philosophic sense means to "realize". Darshana, therefore, means to realise. Again, the verb realise is a transitive verb. We always realise "something" whenever we realise. Indian thought is essentially pluralistic as regards arguments which give an exposition of reality. First, we can begin with types of reality and this can be done from two different angles. Indian Philosophy Theism Atheism 2.3.1 Theism Theism means belief in one or more Gods. It covers a huge range of religious beliefs, notably the Abrahamic monotheisms, Judaism, Christianity, and Islam. The term "Theism" derives from the Greek "Theos" or "Theoi" meaning "God" or "Gods". The term theism was first used by Ralph Cudworth (1617–1688). In Cudworth's definition, they are "strictly and properly called Theists, who affirm, that a perfectly conscious understanding being, or mind, existing of itself from eternity, was the cause of all other things" Theism refers to any kind of belief in any god or gods, so it is difficult to make any other generalizations about it. Belief in God is also normally attached to other beliefs, such as belief in an afterlife or the soul. However, theism can also refer to religions with extremely different beliefs, such as reincarnation. • Types of Theism: You can subdivide theism in many ways. For example, you can divide it into separate historical / cultural traditions, such as Judaism, Christianity, Hinduism, and Islam (and each of these could be subdivided still further). You can also define types of theism by number of Gods: • Monotheism: Belief that only one God exists. • Ditheism: Belief that two Gods exist and they are both equal, usually one God and one evil. • Polytheism: believing that many Gods or Goddesses exist.

NSOU ? CC-ED-02 ? 35 Types of Theism Monotheism Ditheism Polytheism Basic Features of Theism: Some Basic Characteristics of Indian Theism Philosophy are: • Theism with optimistic view of life: Indian philosophy, in general, is found to start with optimistic view of life. A sense of satisfaction at the existing state of affairs can be noted in almost all the systems of Indian philosophy defined as Bliss, Truth and Beauty. Latter in case of Buddhism and after that Indian Philosophy opposing optimistic view of life and considered that suffering and the presence of evil that made man's life miserable on earth. They speculate over these issues and tried to find out the cause of these and, as a result, different philosophies developed. Buddha philosophy exemplifies this feature in the most conspicuous manner. It is to be noted, however, that the pessimistic note is only the initial note in Indian philosophy which generally concludes with the optimistic note. All the systems, in their own ways, have shown that we can get over the sufferings of life. There are ways that lead to freedom from the miserable state of existence on earth. • Belief in an Eternal Moral Order: Indian philosophy believes that the whole universe is being governed and sustained by a universal life cycle that is "Chakrabatparibartantesukhanichadukhanicha". This moral perspective of life is eternal and it cannot be violated by any body. In the Veda there is the concept which stands for such an eternal and inviolable moral order. Later on, in the different systems of Indian philosophy believing the cycle of life that is the law of karma which is accepted in one or the other form by almost all the systems of Indian philosophy, including the two heterodox systems, Jaina and Buddha. • Ignorance as the Root Cause of Suffering: Indian philosophy especially from Buddhist turn believes that ignorance is the root cause of human suffering. Ignorance about the true nature of things gives rise to attachment to the worldly objects as they can gratify the senses. Such attachment to objects of sense makes men slave to their desires, passions etc. This creates hindrance in the path of

NSOU ? CC-ED-02 ? 36 acquiring the true knowledge of ultimate reality. It is a state of bondage, according to Indian philosophical systems. Freedom from this state can be obtained only through right knowledge of things. • Liberation as the Ultimate Goal of Life: Liberation or freedom from bondage to be the ultimate goal of human life is accepted as ultimate goal of life by almost all the Indian schools of philosophy. Liberation means complete cessation of suffering. Different systems of Indian philosophy have given different views about the nature of liberation, but all agree in the point that liberation signifies an end to miseries of life. Indian philosophers recognize four ends (purushartha) of human life; they are—dharma (merit), artha (money), kâma (desire) and moksha (liberation). Of these four, liberation is regarded as the highest and ultimate goal of man's life. Different systems prescribe different paths for attainment of liberation, such as paths of knowledge (jñâna), devotion (bhakti) and action (karma). • Spiritualistic in Nature: Dr. S. Radhakrishnan characterizes Indian philosophy as "essentially spiritual". Indian philosophy is said to be spiritual because it regards spirit or soul as superior to body or matter. With the solitary exception of the Carvaka system, Indian philosophy puts emphasis upon the spiritual values and enjoins that life should be led with a view to realizing these values. The Carvaka system advocates materialistic philosophy and so it is an exception to Indian philosophy regarding this feature. Buddha philosophy too, does not recognize the existence of self, but unlike the Charvaka, it highlights the importance of spirituality for leading the disciplined moral life. All other systems believe in the superiority of spirit over matter. • Discussion on Epistemological Issues: All the systems of Indian philosophy make elaborate discussion on epistemological issues, like sources of valid knowledge (pramana), types of valid knowledge (prama), types of invalid knowledge (aprama) and other related problems. Starting with the Carvaka system, all the nine systems of Indian philosophy deal with the problem of sources of valid knowledge in great detail; in fact the Charvaka criticism of inference and other pramânas exhibits the use of high order of rational argument for refuting opponent's views. The Nyâya system is primarily concerned with the discussion of logical and epistemological issues. In fact all the systems of Indian philosophy put forward their epistemological standpoint in

NSOU ? CC-ED-02 ? 37 order to supplement their metaphysical doctrines. This feature shows that the Indian systems put equal emphasis upon both metaphysical and epistemological issues.

2.3.2 Atheism

Atheism means the absence of belief in the existence of God. Less broadly, atheism is the rejection of belief that any God exists. In an even narrower sense, atheism is specifically the position that there is no GOD. The etymological root for the word atheism originated before the 5th century BCE from the ancient Greek *atheos*, meaning "without God(s)". In antiquity it had multiple uses as a pejorative term applied to those thought to reject the gods worshiped by the larger society, those who were forsaken by the Gods, or those who had no commitment to belief in the gods. The term denoted a social category created by orthodox religionists into which those who did not share their religious beliefs were placed. The actual term atheism emerged first in the 16th century. With the spread of freethought, skeptical inquiry, and subsequent increase in criticism of religion, application of the term narrowed in scope. The first individuals to identify themselves using the word atheist lived in the 18th century during the Age of Enlightenment. The French Revolution, noted for its "unprecedented atheism," witnessed the first major political movement in history to advocate for the supremacy of human reason. Atheism is the view that there is no God. Unless otherwise noted, There have been many thinkers in history who have lacked a belief in God. Some ancient Greek philosophers, such as Epicurus, sought natural explanations for natural phenomena. Epicurus was also the first to question the compatibility of God with suffering. Forms of philosophical naturalism that would replace all supernatural explanations with natural ones also extend into ancient history. During the Enlightenment, David Hume and Immanuel Kant give influential critiques of the traditional arguments for the existence of God in the 18th century. After Darwin (1809-1882) makes the case for evolution and some modern advancements in science, a fully articulated philosophical worldview that denies the existence of God gains traction. In the 19th and 20th centuries, influential critiques on God, belief in God, and Christianity by Nietzsche, Feuerbach, Marx, Freud, and Camus set the stage for modern atheism. It has come to be widely accepted that to be an atheist is to affirm the non-existence of God. Anthony Flew (1984) called this positive atheism, whereas to lack a belief that God or Gods exist is to be a negative atheist. Parallels for this use of the term would be terms such as "amoral," "atypical," or "asymmetrical." So negative atheism would include someone who has never reflected on the question of whether or not God exists and has no opinion about the matter and someone who had thought about the matter a great deal and has concluded either that she has insufficient evidence to decide the question, or that the question cannot be resolved in principle. Agnosticism is traditionally characterized as neither believing that God exists nor believing that God does not exist.

Basic Features of Atheism:

- Atheism Schools of Philosophy generally opposing traditional way of interpreting Indian Philosophy.
- Atheism Schools of Philosophy basically hinders the Socialistics and Ritualistics believes.
- Atheism Schools of Philosophy upgrade the Social Movement.
- Atheism Schools of Philosophy mainly born in the Social Crisis.
- Atheism Schools of Philosophy created new rituals and rules from the existing social system.
- Atheism Schools made new creating in Society.
- Atheism Schools of Philosophy do not believe Spirituality.
- Atheism Schools of Philosophy are materialistic, skeptical and atheistic thought.

2.4 Epistemological Characteristics of Samkhya, Yoga and Nyaya Schools of Philosophy: Indian Schools of Philosophy Orthodox (Astic) (Samkhya, Yoga, Nyaya, Vaisheshika, Mimamsa, Vedanta Heterodox (Nastic) (Charvaka, Buddhism, Jainism)

NSOU ? CC-ED-02 ? 39

2.4.1 Concept of Samkhya Philosophy Introduction:

According to Wikipedia the word Samkhya means empirical or relating to number. Although the term had been used in the general sense of metaphysical knowledge before, in technical usage it refers to the Samkhya school of thought that evolved into a cohesive philosophical system in early centuries. The Samkhya system is called so because it 'enumerates' twenty-five Tattvas or true principles; and its chief object is to effect the final emancipation of the twenty-fifth Tattva, i.e. the soul. The Sankhya and Yoga philosophy admits the existence of Purusas and Prakriti. Dualistic purusa and prakriti are the ultimate reality in Sankhya and Yoga philosophy. The Orthodox (Astic) Samkhya, Yoga, Nyaya, Vaisheshika, Mimamsa, Vedanta Heterodox (Nastic) Charvaka, Buddhism, Jainism) Schools directly based on Vedic texts Vedanta) independent grounds Vaisheshika) dealing with the Ritualistic aspect of Vedas Mimamsa) Speculative Purusas + Mahat Ahamkar Sattava Rajas Tamas Five Tanmantras Five Mana Five Sense Organ Five Motor organ world manifests when Purusa come in contact with Prakriti. The union of Purusa and Prakriti is the reason for the evolution of the worldly things. The evolution system excluding purusas is given below: Manas, sensory organs and other motor organs are, the instrument of attaining knowledge. Purusas is conscious part but not active being which is activated through the reflection of Mahat or buddhi. The different qualities of prakriti are unconscious objects which constitute the material environment of the Purusa. Purusa is the cause and prakriti is the effect through which different attributes of life are expressed. Schools directly based on Vedic texts (Mimamsa, Vedanta) Schools based on independent grounds (Samkhya, Yoga, Nyaya, Vaisheshika) Schools dealing with the Ritualistic aspect of the Vedas (Mimamsa) Schools dealing with the Speculative aspect of the Vedas (Vedanta)

NSOU ? CC-ED-02 ? 40 2.4.2 Characteristics of Philosophy of Sankhya Now we are going to discuss the sources of knowledge in the Sankhya systems. The Sankhya theory of knowledge which explains dualistic realism. The Sankhya accepts only three independent sources of valid knowledge. These are perception, inference and scriptural testimony (sabda). The other sources of knowledge, like comparison, postulation and non-cognition, are included under these three, and not recognized as separate sources of knowledge. Valid knowledge (Prama) is a definite and an unerring condition of some object through the modification buddhi or the intellect which reflects the consciousness of the self in it. Consciousness or intelligence really belongs to the self. But the self control immediately which apprehends the objects of the world. The self knows objects through the intellect the manas, and the senses. We have a true knowledge of objects when, through the activity of the senses and the manas, their forms are impressed on the intellect which, in its turn, reflects the high or, consciousness of the self. In all valid knowledge there are three factors, namely, the subject (Pramata) the object (Prameya) and the ground or source of knowledge (Pramana). The modification (vritti) of the intellect, through which the self knows an object, is called Pramana. The object presented to the self through this~ modification is the Prameya. Prama or valid 'knowledge is the reflection of the self in the intellect as modified into the form of the object. Perception: Perception is the direct cognition of an object through its contact with some senses. When an object like the table comes within the range of your vision, there is contact between the table and your eyes. The table produces impressions or modifications in the sense organ, which are analysed and synthesized by manas or the mind just as a mirror reflects the light of a lamp and thereby manifests other things, so the material principle of buddhi, being transparent and bright, reflects the consciousness of the self and illuminates or cognizes the objects of knowledge. It is also called alocana or amere sensing of the object. The second kind of perception is the result or the analysis, synthesis and interpretation of sense-data by means or the mind. So it is called vivecana or a judgement of the object. It is the determinate cognition of an object as a particular kind of the thing having certain analysis and standing in certain relation to other things. The determinate perception of an object is expressed in the form of a Subject-Predicate Proposition, e.g. this is a cow, 'that rose is red'.

NSOU ? CC-ED-02 ? 41 Inference: Inference is the knowledge of one term of a relation, which is not perceived through the other which is perceived and known to be invariable by related to the first. Inference is first divided into two kinds, namely, vita and avita. It is called vita or affirmative when it is based on a universal negative proposition. The vita is subdivided into the purvavat and the samanyatodrsta. A purvavat inference is that which is based on the observed uniformity of concomitance between two things. Samanyatodrsta inference on the other hand is not based on any observation of the concomitance between the middle with such facts as are uniformly related to the major. The other kinds of inference, namely avita is what some Naiyayikas call sesavat. Sabda or testimony: The third pramana is Sabda or testimony. It is constituted by authoritative statements and gives the knowledge of objects which cannot be known by perception and inference. Sabda is generally said to be of two kinds, namely, laukika and vaidika. It is the testimony of sruti or the Vedas that is to be admitted as the third independent Parmana. The Vedas give us true knowledge about super sensus relatives which cannot be known by perception and inference. 2.4.3 Educational Implications of Sankhya Philosophy Sankhya has great relevance for contemporary education. If we consider the modern view of education as development, then Sankhya's postulate that development is only the unfolding of what already has potential existence needs no modification to suit today's world. Sankhya's psychological views also reflect modern learning theories. If knowledge leads to the modification of buddhi in the Sankhya system, then modern education aims at the modification of behaviour. If cognition is a function of buddhi or intellect in Sankhya, it is the formation of intellectual structure in modern education. Sankhya's theory that generalisation is the result not only of observation of elements but also non-observation of non-elements reflects the modern view of concept formation. A deeper study will yield many more similarities. Let us attempt to analyse in detail the implications of Sankhya for modern education: Aims of education: Sankhya states the ultimate aim as attaining the perfection of purusa through discrimination, leading to its salvation. Thus, the aim of education should be to create discerning individuals capable of attaining the perfection that exists within them, as Swami Vivekananda also put it. Methods: The methods are clearly indicated thorough study of authorities but keeping an open mind and using reason to validate their theoriesExperiential learning with maximum

NSOU ? CC-ED-02 ? 42 involvement of the sensesActivity based learning including projects, practical work, etc. enabling the development of observation and logical reasoning Curriculum: The curriculum will involve the study of all disciplines, with stress on the natural sciences, since to understand prakriti is to discriminate between purusa and prakriti, and the arts, so as Purusas + Prakriti+God Mahat Ahamkara 5 to develop an appreciation and understanding of the works of authorities. Physical sciences and the yoga will also form part of the curriculum since Sankhya believes only a healthy and focused individual can attain salvation. Discipline: Sankhya recommends a high degree of discipline. One can deduce that it should be self-imposed. Role of teacher: The teacher is to be a facilitator of the development of the innate potentiality of the child. Place of student: Since Sankhya believes in the multiplicity of purusas, it follows that education must be individualized and child-centred. Religious and moral education: It can be deduced that religious education will not have much importance but moral education involving the teaching of ethical values will definitely hold a central place in any system of education based on Sankhya. 2.4.5 Concept of Philosophy of Yoga In the previous study, you must have studied Samkhya philosophy in an elaborate manner. Their views on purusa, prakariti, pramanas (sources of valid knowledge), bondage, and liberation. In this unit you will be explained what are the eight-fold path of yoga, how liberation can be attained, how mind gets purified, how to control bodily act, and some more issues allied to Yoga School of thought. The Yoga philosophy speaks about the theory and practice for the realization of the ultimatetruth concerning human being and the world. In Vedanta, yoga is understood as 'union', i.e.spiritual union of the individual soul with the supreme soul. This view is not explained clearly. Patanjali, who is the founder of the Yoga System says, yoga is a spiritual effort to attain perfection through the control of sense organs, gross body, subtle mind, intellect and ego. It guides to achieve the highest wisdom through spiritual realization. The evolution system of yoga is given below: There are two parallel evolution processes are observed. Manas, sense organs and

NSOU ? CC-ED-02 ? 43 motor organs are the instruments of attaining knowledge. Patanjali's Yoga-Sutras consist of four parts. These are: i) Samadhipada ii) Sadhanapada iii) Vibhutipada iv) Kaivalyapada The first part deals with the introduction to the nature and methods of yoga in its various forms. It describes the various modifications of the organs including citta which is an internal organ of human being. The second part explains the causes of suffering and how to eradicate them. It explains about the law of karma and human bondage. The third part elucidates the concept how to achieve the supra-normal powers and in which ways yoga helps it. The last or the final part describes the nature of liberation and spiritual union with the supreme soul/self. 2.4.6 Characteristics of Yoga Philosophy 1. Prakriti and Purusas: The Yoga and Samkhya metaphysics are alike. The first one is with God and second one is without God. It is called the theistic Samkhya, while the Samkhya system is called the atheistic Samkhya. The Yoga recognizes the reality of prakrti and its evolutes, countless purusas, and God. Prakrti is the material cause of the world. God is its efficient cause. He is not the creator of prakrti nor is he the creator of purusas. Prakriti and purusas are co-eternal with God. He disturbs the equilibrium of sattva, rajas, and tamas, and starts the evolution of prakrti. He reveals them for enlightenment of purusas at the end of each cycle. He associates and dissociates purusas and prakrti in accordance with their merits and demerits (adi'sta), and brings about evolution and dissolution of the world. He removes obstacles to the evolution of prakrti. He removes obstacles to the achievement of liberation by purusas. The Samkhya believes in the reality of twenty-five principles, prakrti, mahat, ahankara, manas, ten external sense-organs, five tanmatras, five gross elements, and purusas. The Yoga assumes the reality of these twenty-five principles and adds the principle of God to them. It recognizes the reality of twenty-six principles. The Yoga adopts the Samkhya ontology with slight variations. It agrees with the Samkhya in holding that bondage is due

NSOU ? CC-ED-02 ? 44 to nondiscrimination (aviveka) between purusa and prakrti, and liberation is due to discrimination (viveka) between them. But it lays stress on the practice of yoga as an indispensable means to discriminative knowledge (vivekakhetyi). This is the special feature of the Yoga system. 2. Substance and Mode: The Yoga holds that modes are modifications of a substance (dharmin), which persists in them. Vyasa defines a substance (dravya) as an aggregate of generic and specific qualities. An earthy substance has the generic quality of earthness and the specific qualities of smell, taste, colour, touch, and sound. These qualities are its modes. They subsist in it. It persists in them. Though the modes change, the substance abides. A substance (dharmin) is characterized by generic and specific qualities (samanyaviesatma), and it persists in its manifest and unmanifest modes (dharma). There are no qualities apart from a substance. There are no self-subsistent modes. They subsist in a permanent substance. The Buddhists hold that there are only impermanent modes without any permanent substance. They come into being and pass away. A substance is a mere aggregate of passing modes. It is identical with them. There is no permanent substance apart from the modes. Being is change. Change is momentary. Nothing is permanent. There is no permanent substance which persists in the midst of the changing modes. There is no permanent self apart from a stream of momentary cognitions. There is no permanent thing apart from an aggregate of changing qualities or modes. Vyasa urges that if there were no permanent self, there would be no reaping of fruits of one's actions and there would be no recollection. If the self were a stream of cognitions, one cognition would perform an action and another would reap its fruit, and one cognition would perceive an object and another would remember it. Reaping the fruits of one's actions and recollection presuppose a permanent self. If there were no permanent thing, there would be no recognition of it (e.g., 'this is that jar'). But there is a distinct recognition of it as perceived in the past in spite of the change of its qualities or modes. This clearly proves that there is a permanent substance behind the changing modes. A substance is not identical with modes. It is not a mere aggregate of modes. The Buddhist view is wrong. The Vaiseshika holds that substance is a substratum in which its qualities abide. At the first moment of its production it is devoid of qualities. It is endowed with qualities at the second moment. Its qualities are destroyed when it is destroyed. So, it is a permanent entity in which qualities subsist. It is different from its qualities. Substance and quality are independent categories (padertha). Generic and specific qualities inhere in a substance. But the Yoga urges that though there is a permanent

NSOU ? CC-ED-02 ? 45 substance apart from its qualities or modes, it is not entirely different from them. A substance is partly different from and partly identical with, its qualities. There is not only difference but also identity between them. We distinctly Perceive; cloth as white. The cloth is different from its white colour but it is also identical with it. A substance is identical with its generic and specific qualities. It does not possess them. They do not inhere in it. There is identity between a substance and its qualities. The substance is sometimes spoken of as the generic character (samanya), since it is common to its qualities or modes (dharma). The qualities or modes are sometimes spoken of as the specific character (vis'esa), since they are its particular modifications. The Yoga holds that there is identity in difference between a substance and its qualities or modes. If there were absolute difference between them, they would not be related as substance and mode. If there were absolute identity between them, a substance could not be its own mode. A cow and a horse are different from each other. So, they are not related to each other as substance and mode. A horse is identical with itself. So, it cannot be its own mode. But a cloth is partly different from its white colour, and partly identical with it. So, a substance is partly different from and partly identical with, its modes. Vyasa says: "A quality is merely the nature of the substance. it is the changes in the substance that are manifested by the qualities." Substance (Dharmin) and Mode (dharma) are relative terms. The five tanmatras of sound, touch, colour, taste, and smell produce the atom of earth. So, they are a dharmin in relation to earth, which is a dharma. Earth produces a jar. so earth is a dharmin in relation to a jar, which is a dharma. 3. Whole and Part: An object of perception is a complex product of atoms. It is a whole composed of parts. The Yoga regards the whole (avayavin) as partly different from, and partly identical with, its parts (aveyava). If the whole were different from its parts or atoms, it could not subsist in them, and share in their nature. If it were identical with them, it would be subtle and manifold like its constituent atoms. So it is neither entirely different from, nor entirely identical with, its constituent parts or atoms. If the whole were different from its parts, it could not be their product. If it were identical with them, they could not produce it. So the whole is partly different from, and partly identical with, its parts. There is identity in difference between them. 4. Different Kinds of Modifications: Sattva, rajas, and tamas are the constituents of all phenomena in the world. They are the constituents of all physical and mental phenomena. All aspects are particular arrangements of the gunas. They undergo modifications and

NSOU ? CC-ED-02 ? 46 produce various effects. Modification is the production or appearance of one quality in a stable substance on the destruction or disappearance of another quality in it. Substance persists in the midst of its changing qualities. They constitute its nature whose change is manifested by them. The modification of the non-specific modes (avis'esa) into the specific modes (vis'esa) is called tattvantaraparinama. When egoism ahamkara is evolved from mahat or buddhi, or when the tanmatras or the sense-organs are evolved from egoism, or when the five gross elements are evolved from the five tanmatras, the modification is called tattvantaraparinama. It is the evolution of an entirely new category of existence (tattvantara). When the tanmatras are evolved from ahamkara, there is not merely a change of quality, but a change of existence. Though the tanmatras are evolved from ahamkara, the traces of ahamkara are not easily traceable in them. They acquire properties which differ widely from those of ahamkara. They are wholly different from ahamkara from which they are evolved. So when the atoms are evolved from the tanmetras, they are wholly different from the latter, since they acquire sensible properties which are absent from them. Thus the evolution of the specific modes (vis'esa) from the non-speciic modes (avisesa) is called tattvantaraparinama. No independent categories of existence are evolved from the specific modes. They undergo modiications by change of quality (dharmaparinama), change of mark (laksanaparinama), and change' of state (avastheparinama). 5. Power and Causation-Satkeryaviida: The Yoga advocates the theory of Satkaryavada or Parinamavada. There is no production of a non-existent thing. There is no destruction of an existent thing. A non-existent thing cannot be produced. What was existent in unmanifest condition appears in a manifest condition. Production is manifestation (avirbhava). Destruction is envelopment (tirobhava). A present cause contains its effect in a latent condition.' It is turned into what is already contained in its nature." Milk is turned into curd which it contained in a potential condition. All effects are particular collections of the gupas. Sattva, rajas, and tamas are the ultimate constituents of all phenomena. They are the material cause of all effects. They undergo various modifications but are neither generated nor destroyed. They appear to be generated and destroyed on account of their modes passing from the latent to the actual condition, and from the actual to the sublatent condition. 6. Non-existence: The Vaisesika regards non-existence (abhava) as an independent category. He recognizes four kinds of non-existence: (1) prior non-existence; (2) posterior non-existence; (3) mutual non-existence; (4) absolute non-existence. The Yoga does not recognize non-existence as a separate category. It identities nonexistence with a particular

NSOU ? CC-ED-02 ? 47 state of its locus. It agrees with Prabhakara who denies nonexistence and identities it with its locus. 7. Particularity: The Vaisesika recognizes particularity (vis'esa) as an independent category. It is the distinguishing mark of an eternal substance. Time, space, self, manas, ether, and atoms have particularity. Complex substances like a jar and a cloth can be distinguished from each other by their parts. But one atom of earth can be distinguished from another atom of earth by its particularity (vis'esa).

100%

MATCHING BLOCK 36/127

SA Check.pdf (D46440365)

All eternal substances have particularities which distinguish them from one another.

But the

yoga rejects the category of particularity. PSYCHOLOGY OF YOGA: Stages of Chitta: a. Ksipta (Restless) In this stage citta is very much distributed and attached with worldly objects. For example, Citta of those intoxicated by the possession of power and money. b. Mudha (Torpid) In this stage, tamas dominates the other two gunas; sattva and rajas. This stage of citta is known as mudha. For example, citta of the intoxicated persons. c. Viksipta (Distracted) This is the third stage of citta where sattva guna dominates the other two gunas. In this stage yoga begins and citta tries to attain god or supreme soul. Due to the sattva dominance, it is found that there is temporary ceasing of the modifications of the citta. d. Ekagra (concentrated) In this stage, citta is fixed to some object. It is known as ekagra. For example, the flame of a candle light remains always pointing up without flicking hither and thither. e. Niruddha (Restricted) The fifth and final stage of citta is niruddha. In this stage the impressions remain in the citta after the cession of modifications. This stage is known as yoga. Out of these five stages the last two are very helpful and hence useful in yoga. But the remaining stages are harmful for practicing in yoga and thus, these may be removed by practice.

NSOU ? CC-ED-02 ? 48 Forms of Citta The mind and its modes: Vacaspati defined citta as internal organ of buddhi. It is composed of three gunas sattva, rajas and tamas. Citta or mind is the evolute of prakriti. According to yoga philosophy modes are of three kinds: These are; i) Prakhyā and sukha: It is the principle of illumination (prakhyā) and pleasure state of sattva. ii) Pravṛti and pain: It is the principle of activity by Rajas. It is the principle of inertia when the mind is under control of tamas. Modifications of Citta: Patanjali holds mind is the summation of different mental modes. These are, i) Pramāna or valid knowledge ii) Viparyaya or illusion iii) Vikalpa or imagination iv) Nidra or sleep v) Smṛti or recollection Pramāna: Like Samkhya philosophy Yoga school believes in three pramanas and they are; perception, inference and sabda (verbal testimony). a. Perception is the valid knowledge apprehends a real object. b. Perception apprehends an external object directly. c. The form of cognition corresponds to the external object because it is not coming out from buddhi but modified in to its form. d. Perception is having both the quality of generality and particularity. e. Inference and testimony both apprehend generality. Viparyaya: Viparyaya is understood as doubt. It is not valid knowledge. To possess not determinate knowledge of an object is known as doubt. Vikalpa: It is the knowledge in which the object is known but the object does not exist. Thus, it is treated as merely a verbal cognition. For example, barren women's child, horses' horn, etc.

NSOU ? CC-ED-02 ? 49 Nidra: Yoga regards sleep as a distinct mental mode having absence of any cognition. It is a distinct apprehension having absence of all determinate cognitions. It is a mental mode which apprehends tamas. Tamas overpowers sattva and rajas of the mind in sleep. Smrti: Recollection or smrti is the recollection of past experiences. Recapitulation is possible through our impressions that we left on the objects while cognized. Thus in this stage some sorts of modifications are found in citta. Afflictions or Klesha There are several causes responsible for the disturbances in the Citta. Among those a few are; attachment with objects of the world, cognizing the objects wrongly, inactivity, doubt, carelessness, etc. These causes arise because citta imagines itself as the agent and the enjoyer because of Purusa's reflection on it. Hence, we find the earthly sufferings (klesas). The Yoga philosophy mentions that there are five kinds of klesas or suffering. These are; 1. Avidya or False Knowledge 2. Asmita or egoism 3. Raga or attachment 4. Dwesa or aversion 5. Abhinivesa or fear of death Avidya arises when we cognizing the self as non-eternal and material. But the real nature of the self is bliss, eternal, and possesses pure consciousness. Asmita is wrongly identifying Purusa and Prakrti, and further, bringing them in an equal platform. But in reality, Purusa and Prakrti are two distinct entities, thus, can't be equated with each other. Raga is the craving to get worldly pleasure like power, money, etc. Dwesa is anger in the means of suffering. The last, abhinivesa is fear of death which finds among all living beings in the earth. Epistemology - The Yoga Theory of Knowledge: Patanjali was the founder of the yoga system. The yoga is closely allied to the Sankhya system. It is the application of the theory of the Sankhya in practical life. The yoga mostly accepts the Sankhya epistemology and admits the three Parmanas of perception, inference and scriptural testimony. There are two kinds of perception, namely nirvikalpaka or the indeterminate and NSOU ? CC-ED-02 ? 50 savikalpaka or the determinate. The first arises at the first moment of contact between a sense and its object, and its antecedent to all mental analysis and synthesis of the sense data. The modification of the self is the apprehending mental mode which is considered as valid knowledge. The self is the knower and the object apprehended through the mental mode is the reflection of valid knowledge of an object. It admits external objects are real by which mental modes are modified and reflected through valid knowledge. Valid Knowledge (Prama) is a definite and an unerring cognition of some object through the modification of buddhi or the intellect which reflects the consciousness of the self in it. Consciousness or intelligence really belongs to the self. But the self cannot immediately apprehend the objects of the world. The self knows objects through the intellect, the manas and the senses. We have a true knowledge of objects when, through the activity of the senses and the manas, their forms are impressed on the intellect which, in its turn, reflects the light or consciousness of the self. In all valid knowledge there are three factors, namely, the subject (Pramata), the object (Pramaya), and the ground or source knowledge (pramana). The modification (vritti) of the intellect, through which the self knows an object, is called Pramana. The object Presented to the self through the modification is the prameya. Prama or valid knowledge' is the reflections of the self in the intellect as modified into the form of the object. Perception is the direct cognition of an object its contact with some sense. Just as a mirror reflects the light of a lamp and thereby manifests their things, so the material principle of buddhi, being transparent and bright, reflects the consciousness of the self and illuminates or cognizes, the objects of knowledge. There are two kinds of 'Perception' namely, nirvikalpaka or the indeterminate and savikalpaka or determinate. The first arises at the first moment of contact between a sense and its object, and is antecedent to all mental analysis and synthesizes of the sense-data. It is accordingly called alokana or sensing of the object. The second kind of perception is the result of the analysis, synthesis and interpretation of sense-data by manas or the mind. So it is called vivecana or a judgment of the object. Inference is the knowledge of one term of a relation, which is not perceived, through the other which is perceived and known to be invariably related to the first. Axiology: 1. The performance of eightfold path of yoga manifests right knowledge able to NSOU ? CC-ED-02 ? 51 differentiate between prakriti and itsevaluates, Practising yoga can liberate human being leading to focused values in

77%

MATCHING BLOCK 37/127

SA Abreivation.pdf (D46310548)

the way of life. 2. The yoga enjoins the path of action and the path of knowledge for the attainment of

liberation by means of kriyayoga and jnanayoga. 3. The path of mental discipline and cultivation of right knowledge can led to liberation. 4. The path of right knowledge includes yogic practices can liberate human being in terms of eight-fold path given below already discussed before: The Eight-Fold Path (Astanga Yoga) For Axiological Stand Point: We the human beings have body, sense organs, and mind, hence, it is obvious to have sensual attachment and passion towards worldly objects. As a result, we have drawn in the river of bondage and worldly sufferings. To get rid of earthly suffering and to remove the ignorance that find within us, we have to conquer our sense organs, mind and even our bodily act. To do so the citta needs to be controlled. In this respect, yoga philosophy prescribes eight-fold path which helps to control our passions and craving for worldly pleasures. These eight-fold path are as follows. • Yama • Niyama • Asana • Pranayama • Pratyahara • Dharana • Dhyana • Samadhi Now let us discuss these points one after another in a sequential manner. 1. Yama: It is the control of mind, body, and speech. The five yamas are: a) Ahimsa: It means non-violence. Violence is the root of all evils. So absolute non- injury is required for attaining controlling of mind.

NSOU ? CC-ED-02 ? 52 b) Satya: Truthfulness in thought and speech is required for absolute control over mind. A truthful person must have valid thoughts in his mind and have a pattern of life based on truthfulness. c) Asteya: It means the principle of non-stealing. This includes not desiring on others' wealth and lack of greed from others object. d) Brahmacharya: It is known as celibacy. It is based on education life and controlling over sexual organ. Sex restraint consists in restraining the sex organ and all other sense organs with regard to its object. e) Aparigraha: Non-acceptance of gifts and abstaining from acquiring objects of enjoyment. 2. Niyama: Niyama consists of the following points: a) Sauch: It is very much related to cleanliness which includes both external cleaning (e.g. bath, pure diet, hair cutting and cleaning, nail cutting etc.) and internal cleaning (e.g. friendliness, empathy, happiness, smile, etc. b) Santosh: It means contentment by satisfying with yourself whatever you attain or possess. In other word we should happy with what we are. c) Tapa: Tapa means the power of tolerance. To tolerate extreme and maximum cold and heat, one needs to do the hard practices and, this is possible through tapa. d) Swadhyaya: To study religious scriptures to develop spiritual knowledge. It is considered as one of the good principles to possess good conduct. e) Isvara Pranidhan: We have to remember God is the supreme authority and all mighty to surrender to him which helps for the development of good conduct by yoga philosophy. 3. Asana: Asana related to do various bodily postures which helps to retain concentration of citta and even helps to control the body as well as mind. There are various types of asana. The reason is, it not only controls the body such as keeps the body flexible, increase the immunity, etc. but also keeps the body free from diseases and make it strong and healthy. By doing regular asana one can control the different external and internal organs of the body. 4. Pranayam: Pranayama is understood as control of our breathing system. It suggests that practicing pranayama through inhaling and exhaling by the controlling time of inspiration, NSOU ? CC-ED-02 ? 53 the time of retention and the time of expiration of breath. This helps the citta to remain concentrate and focused. Pranayama has three steps. These are: • Puraka • Kumbhak • Recaka The first step puraka conveys to take as much air as possible. It is known as inhaling. The second step Kumbhak expresses after inhaling as much air as possible tries to retain it for half of the time taken in inhaling. The third step 'recaka' states that gradually exhale the air by taking the same time that you had consumed while taking inhalation. These three steps will gradually accelerate, so that in due course of time the agent may control his/her breath which helps the citta to remain concentrate and not disturbed. 5. Pratyahara: In this stage, one should withdraw himself/herself from sense organs for not being attracted by the worldly objects. If the mind is withdrawn from external sensible objects reversibly the mind will follow that approach. The restraint of the external senses depends upon the restraint of mind. 6. Dharana: The sixth discipline is Dharana which means concentrating our mind towards a particular object. It is one of the cognitive aspects of our mental discipline. One cannot have mental peace without proper cognition. 7. Dhyana: It is the continuous flow of the same cognition. Meditation is a process of fixing mind towards an object and complete exclusion of all other objects. Here we consider meditation is the complete withdrawing of all kinds of external objects. 8. Samadhi: The eighth discipline of yoga is known as samadhi. In this stage one can not differentiate between subject and object, realizes the true nature of the citta that how it attains the form of the object. Here, the process of concentration and the object becomes one and identical. This stage is known as cessation of modification of the citta and highest level of eight-fold path for attaining liberation. 2.4.7 Educational Implications According to Yoga Philosophy: Some educational implications of the Yoga systems are: i) Pragmatic view of life is supported by yoga philosophy. Educational objectives should be application based and activity oriented.

NSOU ? CC-ED-02 ? 54 ii) Physical development is given priority for concentrating oneself for gathering knowledge. iii) Moral development is being given highest priority in yoga philosophy reflected through the eightfold path to be followed in educational measures. iv) Self realization is the ultimate target in Yoga Philosophy. So educational objectives are also based on to develop self potentiality. v) Methodology - Moral training will be given for mental and physical development for awakening cognition. Methodology should be activity based. 2.4.8 Concept of Nyaya philosophy: The Naya and Vaisheshika Philosophy are the alike philosophy admitting pluralistic realism. For explaining reality, they admitted reality of God, the finite souls, physical things, atoms of earth, water, fire and air, space time and ether. They admit the same views regarding axiological stand point. Both the philosophy able to differentiate distinctness of finite souls and physical objects. Besides their similarity they differ in the following grounds: 1. Naya emphasizes Epistemology and logic and vaisheshika given thrust on metaphysical aspects. 2. Naya philosophy recognizes four means of valid knowledge perception, inference, comparison and testimony but the vaisheshika recognizes perception and inference as valid source of knowledge. 3. The Naya advocates sixteen categories while vaisheshika recognizes seven categories. Kanada considered six categories for explaining reality. They are the Substance (dravya), quality (guna), action or motion (karma), generality (samanya), particularity (visesa), Inherence (samavaya). Later on non existence was added as seventh category. Naya advocates sixteen categories for explaining reality given below: 1)

Abreviation.pdf (D46310548)

The instruments of valid knowledge (pramana) are perception, inference, comparison and testimony. 2) The

objects of valid knowledge (prameya) are self, body, sense-organs, objects, knowledge, manas, voluntary actions, faults, transmigration, fruits of actions, pain and liberation. Self comprises God and finite souls. Objects are the physical elements and their sensible qualities.

NSOU ? CC-ED-02 ? 55 3) Doubt (samsaya) is indefinite knowledge of an object as either one or ' the other, in which the mind oscillates between two alternatives. 4) Motive (prayojana) is the end of voluntary actions, which is the attainment of good or the rejection of evil. 5) An example (drstanta) is an instance in which a probans is found to be accompanied by a probandum, and which is admitted to be ' valid by a disputant and an opponent. 6) A tenet (siddhanta) is proved by pramanas and accepted as true. 7) The members (avayava) of a demonstrative inference are proposition, reason, exemplification, application, and conclusion. 8) Hypothetical reasoning (tarka) favours one of the two alternative hypotheses by showing the absurd consequences of the other. 9) Ascertainment (nirnaya) of the real character of an object is due to the consideration of a disputant's argument for a thesis and an opponent's counter argument for an antithesis. 10) Discussion (Vida) is a logical debate between a disputant and an opponent with the help of five-membered inferences for the ascertainment of truth without a desire for victory. 11) Wrangle (jalpa) is a debate actuated by a desire for victory, in which sophistical arguments are employed to vanquish an opponent. 12) Cavil (vitanda) is a wrangle in which a person merely refutes a disputant's thesis but does not establish his antithesis. 13) Faulty reasons (hetvabhasa) are non-reasons which appear to be valid reasons and correspond to fallacies of the middle term in western logic. 14) Quibble (chala) is refutation of an argument by taking a word in a sense different from what is intended by the speaker. 15) Futility (jati) is sophistical refutation of an argument on the ground of mere similarity or dissimilarity of the subject with an example. 16) Ground of defeat (nigrahasthana) is sophistical refutation due to non-comprehension of miscomprehension of the real character of an object. Ref: Indian Philosophy: Jadunath Sinha

NSOU ? CC-ED-02 ? 56 Reasoning in harmony with perception and Vedic testimony yields the knowledge of reality which leads to liberation. It should be stated in the form of five members, employ valid reasons, and avoid faulty reasons. Hypothetical reasoning is subordinate to it and conducive to the ascertainment of truth; Ascertainment is preceded by doubt, hypothetical reasoning, logical inference, and discussion. Wrangle and cavil are the means of protecting the knowledge of reality from attacks. Quibble, futility and ground of defeat are the means of sophistical refutation of an opponent's antithesis, which should be avoided in establishing one's thesis. Liberation is the highest end.' The methodology of the Nyaya consists of enunciation (uddesa), definition (laksana) and examination (pariksa). A subject is first enunciated, then defined, and finally examined by valid reasoning. Enunciation is the statement of a subject in a. general way. It comprises division (vibhaga) which is the enumeration of its different kinds. A subject in general is stated first, and then its subdivisions are stated. Metaphysics of Naya Philosophy: Naya theory of causation is known as 'astkaryavada' or 'arabhavada'. They viewed that effect is produced by a cause but the effect and the cause are not one and the same. The effect is a new product comes to the existence which was not their earlier in the cause. Hence, every effect is a new product which was not found previously in the cause. For example, a pot is made by clay. Here 'clay' is the cause and 'pot' is its effect. According to Nayikas, pot is a fresh creation, a new beginning which did not exist before in the clay. In this way they uphold the theory 'asatkaryavada'. Naya defend pluralistic realism and believing in metaphysics through the conception of Padartha having different categories are substance, quality, action, universal, inherence and absence. 2.4.9 Characteristics of philosophy of Nyaya – Epistemology: The Naya Philosophy was founded by the great sage Goutama. It

88%

MATCHING BLOCK 39/127

SA thesis final.docx (D31972321)

is primarily concerned with the conditions of correct thinking and the means of

acquiring a true knowledge of reality. The ultimate reality of this- philosophy deals with the objects through which knowledge is possible because all knowledge in any way related to objects but with an independent entity. In this reason Naya Philosophy described as pluralistic realism. Knowledge or Cognition is the manifestation of objects through our senses. In Naya Philosophy objects are nine

NSOU ? CC-ED-02 ? 57 (1) Prthibi (earth), (2) Ap (water), (3) Tejas (fire), (4) Vayu (air), (5) Akasa, (6) Kala (Time), (7) Dik (Space), (8) Ataman (Self), (9) Manas (Mind). The different objects (dravyas) with their attributes can explain the universe and that is the fundamental aspects of acquiring true knowledge in Naya Philosophy. The Naya theory of reality is based on the Naya theory of Knowledge. There are four distinct and separate sources of true knowledge. They are • Perception, • Inference, • Comparison and • Testimony. Now we are going to discuss different sources of knowledge from Naya Philosophy— (1) Perception: Perception is immediate Cognition. It is a form of knowledge which manifests by contact of a sense organ with an object. Classification of Perception Perception (Immediate Knowledge) A) Ordinary (Laukika) Extraordinary (Alaulika) (Perception when contact with objects) (Perception through unusual media) B) Ordinary Perception External (bakya) Internal (Manasa) (Perception through external sense (Concerned with physical organs that is through sight, hearing, state on Processes) touch, taste and smell) The ordinary or Laukika Perceptions are of six forms - Visual, auditory, tactual, gustatory, alfactory and the internal or mental. The extraordinary or alaulika perception are of three kinds - Samanyalaksana, Janaalaksana, Yaogaja. Three modes of ordinary Perceptions

NSOU ? CC-ED-02 ? 58 (i) The First is Nirvikalpa or indeterminate which is cognition of things without any explicit interaction or characterization. (ii) The second is Savikalpaka or determinate in which the object is judged as passed by some characters. (iii) The third is Pratyabhijna i.e. recognition in its literacy meaning. It is recognition of some object i.e. cognition which was cognized before. In another classification it is divided into three kinds of inference — • Kevalanuayi (Cause and effect positive relationship) • Kevalavyatireki (Besides causes and effect relationship) • Anavayavatireki (both Positive and Negative relationship present here) Comparison: Comparison is the third source of valid knowledge which means to place things together to estimate their similarity and dissimilarity. It is the relationship between a name and things. For example, a man who does not know what is a buffalo may be told that it is an animal like the cow. If the man meets faces such an animal in a place and can able to recognize it as a buffalo will be due to comparison with his previous knowledge of analogy between two things. Verbal Testimony (Sabda): Testimony or Sabda means Verbal knowledge which can communicate information to other. In Nyaya philosophy it is considered as a Pramana as an independent entity. The Naya admits verbal statement is valid when it works from a trustworthy person. Verbal knowledge may be classified in two ways — Testimony or Sabda are of two kinds according to another classification: (1) The scriptural - It is the words of GOD. It is thus perfect and infallible by its very nature. (2) The Secular - It is not valid knowledge. It

57%

MATCHING BLOCK 40/127

SA

thesis final.docx (D31972321)

is the testimony of human being and may be true or false. Only that which proceeds from trustworthy person is

valued. Inference: The conception literary means cognition or knowledge which follows another knowledge (anu means after and mana means knowledge). To explain the conception of inference we can consider the following syllogism: o The hill is fiery, because it smokes and whatever smokes is fiery. Here we pass
NSOU ? CC-ED-02 ? 59 from perception of smoke in -

62%

MATCHING BLOCK 41/127

SA

thesis final.docx (D31972321)

the hill to the knowledge of the existence of the fire in it. On the ground of our previous knowledge of the universal relation between smoke and fire,

it ascertains the presence of fire due to smoke as it confirms the presence of smoke is the medium through which attributes of fire is being confirmed. The constituent of the above syllogism is given below •

35%

MATCHING BLOCK 42/127

SA

thesis final.docx (D31972321)

The hill is the minor term i.e. subject under consideration. • Fire is the major term i.e. which we have to prove. • Smoke is the middle term indicates the presence of fire.

The first step (The hill is fiery) in inference

42%

MATCHING BLOCK 48/127

SA

thesis final.docx (D31972321)

is the apprehension of the hetu (smoke) in the Pakasa. The second step (Because the hill is smokey) is recollection of the universal relation between hetu and Sadhya (Smoke and Fire). The last step is the cognition of Sashya (fire)

as related to Pakasa. Gautama suggests to three types of Inferences — • Puravat (Reasoning based on resemblance) • Sesavat (Reasoning based on .elimination) • Samayatodrasta (Reasoning based on inner support) Besides this, we have two kinds of classification for inference of Nyaya • Svartha (Inference for self) • Parartha (Inference for others) These are the four valid sources through which knowledge can be attained. The greatest contribution of Naya Philosophy is in its methodology which is almost accepted by the other systems. The Naya view is undoubtedly a natural and necessary platform for the evolution of thought anjj its practice for humanizing the betterment of self and society. Axiology: 1. Liberation is absolute cessation of pain and sufferings according to Naya Philosophy. 2. True knowledge of the self ultimately leads to liberation. It destroys egoism and able to differentiate of the self with the body. 3. Liberation cannot be achieved by the performance of duties only. The practice of yoga, austerities, the performance of duties and abstention from sins subsidiary to the acquisition of true knowledge.

NSOU ? CC-ED-02 ? 60 4. According to Naya, the self can neither be identified with mind (manas) nor can be identified with pure consciousness, but understood as consciousness belonging to an individual/subject. This is so because mind is atomic and unperceivable and hence devoid from perceive equalities. On the other hand, consciousness belongs to the individual self but not same as self. 5. Thus, consciousness is not the self but only an attribute of the self. It is an accidental attribute of the self. The self in its original state has no consciousness and hence devoid of cognition and knowledge. But when it comes to contact with sense organs it acquires consciousness. 6. Liberation is the state refrain from all kinds of sufferings and bondage those arises because of the self's association with body and sense organs. Nayikas uphold association and attachment are the sources of pain and suffering. Hence, as long as self is attached with body and sense organs, it goes through the cycles of birth and death. This implies Nayikas believe in law of karma. Liberation, according to Naya, can be achieved when there is cessation of karmic chain or karmic influx. It is a state where self is detached from body and sense organs. 7. Voluntary actions only are the objects of moral judgments. The Naya seems to advocate the doctrine of self determinism. The self freely wills and acts to realize its own good. 2.4.10 Educational Implications of Naya Philosophy Aims: Emphasis should be given on: • Development of perception. • Development of argumentations through cause and effect relationship. • To promote verbal knowledge through real objects. • To develop reasoning ability among learners. • Learners will be able to compare different sources of knowledge. • Development of creative thinking by applying the process of inference. • Development of values through proper cognition. • The Nyaya epistemology deals with the nature of valid knowledge, its instruments, extrinsic validity and invalidity of knowledge and the tests of truth.

NSOU ? CC-ED-02 ? 61 • The Nyaya definitions of knowledge are realistic. Truth is correspondence of an apprehension with its object. Curriculum: According to Naya Philosophy curriculum should be based on realistic approach. To know the world through the objects is the ultimate reality of this philosophy. So the curriculum must follow the basic principles of the realistic world and the values of life. Methodology: Education is provided through discussion method. It helps learners to determine reasoning ability. Both inductive and deductive reasoning are used during argumentation to prove the; logic of any particular topic. 2.5 Epistemological Characteristics of Jainism, Buddhism and Islamic thoughts: We have shared with you some general ideas about the Indian Philosophy: Theism and Atheism. We hope, you would like to understand these two concepts more critically as well as to extent your knowledge. We also discuss the Basic Epistemological charecteristics of Samkhya, Naya and Yoga schools (Arthodox Schools) of Philosophy and their Applications in Education. Now we are going to discuss the heterodox schools of philosophy like Buddhism and Jainism in terms of their Epistemological Characteristics and their educational Implications. After that Islamic school of philosophy will be discussed. 2.5.1 Epistemological Characteristics of Buddha Philosophy: Introduction: Buddhism is one of the prominent schools of Indian philosophy. It originated as a result of revolt against the Vedic practices. It was against the violence, animal sacrifices, caste and class distinction and exploitations of the Vedic period. It was based on the principles of equal treatment of the people, non-violence and peace.

Gautam Buddha, the propounder of Buddhism believed that the world is full of miseries. Sight of old age, disease and dead body gave a great shock to the conscience of Gautam Buddha. He engaged himself in solving the problems of suffering and death by trying to discover their causes through meditation and yoga so as to attain Nirvana. All these gave rise to the philosophy of Buddhism. NSOU ? CC-ED-02 ? 62 Basic Principles of Buddhism: Buddhism is different from many other faith traditions in that it is not centered on the relationship between human and his God. Buddhism is a religion without God like Jainism. It believes in transmigration and future life, though it does not believe in the permanent self. It emphasizes the law of Karma or moral causation. It aims at the extinction of suffering by extinguishing desire. It aims at inner and outer purity of life, the purity of the heart and the purity of external conduct. It rejects rites, ceremonies, sacrifices and penances. It stresses like Jainism the ethics of ahimsa, non injury in thought, word and deed. It enjoins extraction of egoism and ignorance. It aims at enlightenment and Nirvana on earth. Nirvana is insight, peace and selfless will. Buddhism is a religion of self help. Liberation does not depend on the grace of God. It has to be worthy by one's own moral efforts. Basic principles of Buddhism are placed below— I. Enlightenment is the goal of Buddhism. It aims at removal of ignorance and achievement through enlightenment. II. The world is without beginning and end. All phenomenons are subject to the law of Causation. There is no first cause. III. All is transitory, impermanent. IV. There is no being. There is only becoming. V. There is no permanent ego of self. There is only an impermanent stream of consciousness. VI. Transmigration is due to Karma. Actions in empirical life produce Karma. Transmigration leads to suffering. VII. Eightfold Noble Path and the perfections destroy ignorance. Buddhism is more than a religion; It is a tradition that focuses on personal spiritual development. To many; it is more of a philosophy and a humanistic way of life which can be summed up as striving to lead a moral life; being aware of one's thoughts and actions; and developing wisdom, compassion and understanding. Metaphysics, Epistemology and Axiology of Buddhism:

his energy in elaborating the metaphysics. He clarified that in relation to the topic of beings and world, and soul and god, nothing can be said in definite form, and in order to make human life successful and acquiring nirvana, his knowledge is of no help, therefore it is useless to think over them. On the topic of world, he just said this much that in this world no object is everlasting and not altogether mortal. On the topic of world, his this moral is known as 'Pratitysamutpad'.

of Buddhism: In Buddhism there is feat conflict in the form of knowledge and the methods of acquiring it.

From the hinyanbuddhist school, 'Vebhashik' (brahmarthpratyakshvad) and 'Sotrantik' (brahmarthanumeyavad), these two philosophical groups were developed.

90%

MATCHING BLOCK 46/127

W

According to Vebhashiks there are two ways of acquiring knowledge—absorb and adhyavsay. Absorb means to accept through the organs, through this we get the knowledge about the common form of the material. To relate the material with a name and class etc is known as adhyavsay. Sotrantik on the basis of organs emphaise on approximating with chit. Yogachar and madhyamik Buddhist philosophies do not

believe

100%

MATCHING BLOCK 47/127

W

in the independent power of the world, they only believe in its physical dominance.

Generally in epistemology, the Buddha seeks a middle way between the extremes of dogmatism and skepticism, emphasizing personal experience, a pragmatic attitude, and the use of critical thinking toward all types of knowledge. Axiology of Buddhism : Buddhism accepts the inexorable law of karma. Though the world is a transient process and the self has no unity but only continuity, the continuity of a series entails and sustains the law of Karma. Thus each individual is responsible unto himself. The Buddha propounded 'Four Noble Truths about suffering'. They are dhukha- dhukhasamudays, dhukhanirodha, and dhukha-nirdhamarga (Suffering, the cause of suffering, possibility of the eradication of suffering and the path of liberation from suffering.). Dhukha-ninirodhamarga, the path of liberation from suffering in turn consists of Astangika- marga (an eight-fold noble path). The 'Four Noble Truths' and Eightfold noble Path' comprise the quintessence of Buddha Ethics.

NSOU ? CC-ED-02 ? 64 Salient Features of Buddhist Philosophy: The central doctrine of Buddhism is based upon the causal theory involving the formula 'this happening, that happens', which proceeds in a cyclic order in a sort of chain-reaction'. The start is made from the idea of ignorance (Avidya). From this proceeds greed, action, birth and rebirth and so on until the ultimate ignorance and greed are destroyed by knowledge. The salient features of Buddhist philosophy are– Four Noble Truths: One of the basic characteristics of the Buddhist philosophy is the four noble truths as consisted in the teachings of Lord Buddha. They are– • There is suffering (dukha), • There is a cause of suffering (dukhasamudaya), • There is cessation of suffering (dukkhanirodha), •

100%

Right understanding for realization of life (sammadhitti); 2. Right thought for realization of life (

sammasankappa); 3. Right speech for realization of life (sammavacha); 4. Right Action for realization of life (sammakammantha); 5. Right Livelihood for realization of life (sammaajeeva); 6. Right Effort for realization of life (sammavayayama); 7. Right Awareness for realization of life (sammamathi);

NSOU ? CC-ED-02 ? 65 8. Right Concentration for realization of life (samma samadhi). The above eight paths consist

54%

MATCHING BLOCK 52/127

SA

Prabhu Ph.D Philosophy.docx (D128720133)

of conduct, concentration and knowledge harmoniously cultivated. In Indian philosophy knowledge and morality are thought inseparable simply because morality or doing

of good, depends on the knowledge of what is good, about which all philosophers would agree, but also because perfection of knowledge is regarded as impossible without morality perfection, control of passions and prejudices. Buddha explicitly states in one of his discourses that virtue and wisdom purify each other and the two are inseparable. In the eight fold path one starts with 'right' views - a mere intellectual apprehension of the four fold truth. The mind is not yet purged of the previous wrong ideas and the passions or wrong-emotions arising therefore; moreover, old habits of thinking, speaking and acting also continue still. The last step of perfect concentration is thus made possible by the removal of all obstacles. The result of this unhampered concentration is perfect insight or wisdom, to which the riddle of existence stands, is clearly revealed once for all. Then

54%

MATCHING BLOCK 53/127

SA

Prabhu Ph.D Philosophy.docx (D128720133)

ignorance and desire are cut out from their roots and the source of misery vanishes. Perfect wisdom, perfect goodness and perfect

equality and complete relief from suffering are simultaneously attained. Non-existence of Soul and God: Buddha believes that all things are transient. So, there cannot be any permanent soul or God. Though denying the continuity of an identical substance in man, Buddha does not

88%

MATCHING BLOCK 55/127

SA

03 Analysis and result - BASKARAN.C.pdf (D61753646)

deny the continuity of the stream of successive states that compose his life.

In Buddhist philosophy, the place of God is taken by the universal doctrine of Karma, which governs the universe in such a way that every individual gets the mind, the body and the place in life that he deserves by his past deeds. Karma and Rebirth: According to this doctrine, the present existence of an individual is, the effect of its past Karma and its future would be the effect of its present Karma. It believes that a person is happy or miserable only because of his actions. It believes in rebirth too. Nirvana: Buddhist philosophy believes that attainment of Nirvana is the ultimate aim of life. Attaining Nirvana implies attainment of salvation, i.e. freedom from the attachments or bondages of ignorance.

NSOU ? CC-ED-02 ? 66 Non-violence: Non-violence is a basic value of Buddhism. It spreads the message of non-violence and peace. It is dead against the animal sacrifices performed in the Vedic practices. Against the caste (Varna) system: Buddhism is against the rigid classification on the basis of Varnas, as prevalent in the Vedic system. He established equality among the people.

96%

MATCHING BLOCK 54/127

W

The Buddhist philosophy is that form of Indian Philosophy which doesn't see the universe as having originated as an object neither a result of spirituality, but considers it rather Goal-headed and ensuant. It doesn't accept the concept of Spirit and the God and expresses the sole destination of a human life as the attainment of Nirvana, which can be attained by the Four-Holy Truths, the Eight- fold Path and the Three Gems. Characteristics of Buddhist

Education: The Buddhist system of education is the most important system of education in medieval period. Buddhist education came into the existence in the 5th century B.C. when in the later part of Vedic system of education deprived the common people of their right to education. Hence the emergence of Buddhism provided the opportunity to obtain education. Buddhist system of education was monastic. All castes were admitted to Buddhist Sangha, which served as the religious centres of Buddhism as well as educational institutions during the Buddhist period. The main characteristics of the Buddhist education system are- 1) Education in Monastery: Monasteries were the centre for imparting education during the Buddhist period. For admission the student had to present himself before the teacher and request him for giving education. The teacher was fully responsible for education of his pupil. In turn, the pupil had also to be responsive to the instructions received from the teacher. The student was not at all accountable to any other Bhikshuk in the monastery. 2) Pabbajja: Pabbajja was an accepted ceremony of the Buddhist monasteries. Pabbajja means going out. According to this ceremony the student after being admitted to a monastery had to renounce all his worldly and family relationship. An individual belonging to any caste could be admitted to a monastery and after being admitted he did not belong to any caste. After admission he had to change his old clothes and all old ways and the manners of living. For the Pabbajja ceremony the minimum age was eight years. 3) Upasampada: After the Pabbajja ceremony education continued for 12 years.

NSOU ? CC-ED-02 ? 67 When the students receive 12 years education he had to undergo the Upasampada ceremony. This ceremony was democratic in nature. The Shraman had to present himself before all other monks of the monastery. One could be admitted for the Upasampada ceremony only when the majority of the monks voted in favor of the same. After the Upasampada ceremony the Shraman was regarded as a full-fledged member of the monastery. On this occasion all his worldly and family relationship ended. 4) Qualities and Responsibilities of the Teacher: The teacher himself must spend at least 10 years as a monk and necessarily must have the purity of character, purity of thoughts and generosity. Both the teacher and student were responsible to the monastery. But regarding education, clothes, food and residence of the student monk, the teacher was fully responsible. The teacher was also responsible for any treatment of the student whenever he fell ill. 5) Daily Routine of Students: The daily routine of the students starts with arranging everything for the daily routine of the teacher. They cook food and clean his clothes and utensils. Whatever he acquired through begging alms, he would place before the teacher. The students always obeyed the teacher and none other. They were also responsible to keep the monastery and its surroundings clean. The students had to prepare themselves to receive education at any time whenever the teacher required him. Board and Lodging of the Students: In Buddhist period, education was imparted through monasteries and viharas. The teacher and the students lived together in these institutions. They followed simple living and high thinking principle. Their lives were full of purity, nobleness, dutifulness and humanity. Educational Implications of Buddhism: The principles of Buddhist philosophy have great educational implications. Therefore, Buddhist education system is revered as one of the prominent ancient educational systems of India. Aims of Education: The goal of Buddhist education is to attain wisdom. According to it, the main objective of our practice or cultivation was to achieve this ultimate wisdom. It believes that everyone has the potential to realize this state of ultimate wisdom, as it is an intrinsic part of our nature. The Buddhist education system aimed at regaining our intrinsic nature. It also teaches absolute equality which stemmed from Buddha's recognition that all sentient beings possess this innate wisdom and nature. Buddha's teaching helps us to realize that innate, perfect, ultimate wisdom. The aims of Buddhist system of education may be pointed out as–

NSOU ? CC-ED-02 ? 68 1) Nirvana: Education should aim at achieving Nirvana or self realization. It refers to emancipation from the earthly worries and miseries. Education should aim at giving eternal peace of mind and relieve oneself from physical sufferings. 2) Development of personality: Education was to control all the instinctive and physical needs and desires of man. Spiritual peace and happiness may be attained only through control of our senses. Education should train people to lead a simple life and a life of self discipline. 3) Physical and intellectual development: Jainism was in favour of both physical and intellectual development of the individual. 4) Religious and spiritual development: Another aim of Jainism was religious and spiritual development. Buddhist education aimed at propagation of the teachings of Buddhist religion as well as it emphasized on giving spiritual training to the learners. 5) Preservation and spread of culture: One of the main aims of the Buddhist education system was to propagate Buddhism in different parts of the world. 6) Development of attitude of non-violence: Education should generate the sense of non-violence in human mind. It should remove the narrow sense of killing of life for personal gain through the rituals of sacrifice. Curriculum The major objective of education being the spiritual development, study of religion naturally dominated the curriculum. It includes the study of the Tripitaka–Suttanta, Vinaya (precepts or rules) and Dhamma (Commentaries) which emphasize on meditation, discipline and wisdom respectively. The curriculum of Buddhist education system may be divided into two types– primary and higher education. In primary education, reading, writing and arithmetic were taught. Pali and regional languages were used as the medium of instruction. In order to fulfill the vocational needs of the common people spinning, weaving, tailoring, dyeing, printing, agriculture, commerce, accountancy and cottage industries were included. In higher education, curriculum had covered wide ranging subjects both intellectual and professional. They include philosophy, literature, logic, law, astronomy, medical science and warfare. Sanskrit used to dominate the higher studies. Provision was made for study of the four Vedas, Vedangas, Purana, Samkhya, Yoga, Tantra, Ayurveda & Vedanta, study of animals like elephants, horses and snakes. Everyone was free to choose his subject without any restriction.

NSOU ? CC-ED-02 ? 69 Methods of Teaching: The methods of teaching followed in the Buddhist education system are almost same as those used during Vedic period. Following were the methods of teaching of Buddhist period– 1) Oral Teaching: The art of writing had been well developed up to the Buddhist period. But due to the shortage and non availability of writing material verbal (oral) method of teaching was still more prevalent. The teachers used to give lessons to the students who learnt them by heart. The teachers used to put questions on learning the lesson by heart. 2) Discussion: Discussion was one of the methods of teaching in Buddhist period because it impressed the general public. Scholars discussed the important questions. Discussion continued till every kind of doubts is cleared. To establish the disputes point the following evidences of eight kinds were required theory, cause, example, parallelism, contradiction, evidence, argument and induction. The important of discussion encouraged the logic in the Buddhist period. The controversial matters could not be decided without logical arguments. 3) Tours: To fulfill the aim of propagating Buddhism and to give the students real and practical knowledge, tour was used as a method of teaching. Tours were given importance for educating people. After completion of the education the students were encouraged to undertake long tours. 4) Conferences: Conferences were arranged on full moon and first day of the month in Buddhist Sangha. The monks of different Sangha assembled and put forward their doubts freely. The attendance of every monk was compulsory in such conferences. An annual conference was arranged in which a well-renowned monk would challenge the whole Sangha to disprove his purity. 5) Meditation: Meditation was used as a method of attaining Nirvana. Women Education: Women education during Buddhist period was at its lowest ebb, as the women folk were despised in the sense that Lord Buddha had regarded them as the source of all evils. So, he had advised during his life time not to admit women in monasteries. But after some time due to the insistence of his dear pupil Anand, Buddha had permitted about 500 women along with his step mother for admission in the Vihars with many restriction and

NSOU ? CC-ED-02 ? 70 reservations. Strict rules were enforced for women monks. The first two years was their probation period. The women monks were not allowed to meet any male monk in loneliness and their residence was arranged separately at a distant place. They were not given any permanent post in the Sangha. Some monks could give them religious instruction twice a month in the presence of another monk. Critical Analysis of Buddhist Education: Merits of Buddhist Education: 1) Buddhist education was imparted in well organized centers, monasteries and Vihara which were fit places for educational purpose. Education was more democratic in its structure as well as function. 2) Buddhist education was free from communal narrowness. It was given to all sections of people irrespective of caste and creed. It gave more importance to genuine personality of the students while giving admission. It was also secular in nature. 3) The teachers and the students lived together and they led a simple life in the monasteries. The students were kept away from the life of temptation and public impurities. This kind of life had helped them for ideal education and meditation. 4) Buddhist education laid much emphasis on balanced physical, mental and spiritual development of the students. It aimed development of high moral character and ideal personality in the students. 5) Both the teachers and students led a controlled and disciplined life. They kept themselves away from instinctive pleasures like music, dance, fragrance, receiving gifts from others, etc. They were not allowed to contact women in the Sangha. 6) There was a cordial and pampered relationship between the teacher and the students. The teacher considered the students as his own sons and took all care and responsibility of them. The students also revered the teachers like their father. 7) There was no system of corporal punishment. The teachers completely trusted the personality of the students. The students also exhibited the sense of politeness, obedience and simplicity in their educational life. 8) Education was imparted through local languages which made education easily

NSOU ? CC-ED-02 ? 71 accessible to the common masses. No undue importance was given to Sanskrit which was used only by a small section of the society. 9) Buddhist education helped to gain international importance. Students used to come from other countries for higher education. It developed cultural exchange between India and other countries of the world. Demerits of Buddhist Education: 1) Buddhist education could not give the proper attention to the occupational, industrial and technical education. 2) It neglected social development because the Buddhist scholars devoted their whole lives to Sangha and Buddhism leaving their family life. 3) Following the principle of non-violence, Buddhist education system avoided military training which affected national defence. 4) The sanctity of the Sangha as an educational institution was destroyed as anti-social people were also given shelter in the Sangha. 5) Buddhist education system is considered undemocratic in nature as it totally discouraged women education. Girls were not allowed to get education in the Sanghas. 2.5.2 Epistemological Characteristics of Jainism: Concept of Jainism Jainism is considered as Non-Brahmanic or Sramanic system. It is a heterodox system in the sense that it is non-Vedic, ascetic and monastic in character. The basic ideas of Jainism are radically different from those of the so-called traditional and orthodox Brahmanism. It is quite independent of the Brahmanical system. Jainism does not acknowledge the authority of Vedic tradition. It is a system, which believes in non-theistic. Many scholars attempt to describe it, as an atheistic, religion discussing its origin and antiquity of Jainism. Jainism represents an important branch of Sramanic system of ancient India. Jainism is believed to be one of the oldest indigenous religions of India, probably to be a pre-Vedic religion. A Brief Account of Jainism: The origin of the Jaina faith can be traced out in the pre-historic time. The Jaina system

NSOU ? CC-ED-02 ? 72 believes in 24 Tirthankaras or the liberated propagators of the faith. Mahavira, the last Tirthankara, is not regarded as the founder of the system, because even before him Jaina teachings were existent. Although Mahavira is not regarded as the founder of the system, still his teachings gave a new outlook to Jaina system. Mahavira, who is also known as Vardhamana, was contemporary to Gautam Buddha. Jainism emphatically asserts that every soul is capable of attaining perfection if it wilfully exerts in that direction. But the real situation is that from time eternal the soul is bound with matter and it is the aim of every person to get the soul rid of matter so that soul can assume its true state. This spiritual emancipation requires the knowledge of the beatific condition and of the causes which stand in the way of its attainment. To find out these causes it is necessary to understand what are the existing elements or substances of nature and mode of their interaction. Basic Ideas of Jainism: Jainism believes that the whole universe can be divided into two categories, viz., Jiva, i.e., soul and Ajiva, i.e. non-soul. These two - Jiva and Ajiva - exhaust between them all that exists in the universe and Jaina philosophy is based on the nature and interaction of these two elements. It can be said in short that the living and the non-living, by coming into contact with each other, forge certain energies which bring about birth, death and various experiences of life; this process could be stopped, and the energies already forged destroyed, by a course of discipline leading to salvation. A close analysis of this brief statement shows that it involves following seven propositions. 1. Firstly, that there is something called the living. 2. Secondly, that there is something called the nonliving. 3. Thirdly, that the two (i.e. the living and nonliving) come into contact with each other. 4. Fourthly, that the contact leads to the production of some energies. 5. Fifthly, that the process of this contact could be stopped. 6. Sixthly, that the existing energies could also be exhausted; and 7. Lastly, that salvation could be achieved. These seven propositions are called the seven tattvas or realities in Jainism.

NSOU ? CC-ED-02 ? 73 Tattvas of Jainism: These seven tattvas are termed as follows: 1. Jiva (i. e. Living substance) 2. Ajiva (i. e. matter or non-living substance) 3. Asrava (i. e., the influx of Karmic matter in the soul) 4. Bandha (i. e., bondage of soul by Karmic matter) 5. Samvara (i. e., the stopping of Asrava) 6. Nirjara (i. e., the gradual removal of Karmic matter). 7. Moksha (i. e., the attainment of perfect freedom or salvation). It is clear that the first two of the tattvas deal with the nature and enumeration of the external substances of nature and the remaining five tattvas deal with the interaction between these two substances, viz., Jiva, i. e., spirit and Ajiva, i. e., matter. 1. Jiva: As regards the characteristics of Jiva, i.e., the soul, it is stated that there is an infinite number of souls; in fact, the whole world is literally filled with them. The souls are substances and as such they are eternal. Again, their characteristic mark is intelligence, which can never be destroyed. Further, the soul is ever all perfect, all powerful; but by ignorance it identifies itself with the matter and hence its degradation and troubles start. Furthermore, souls are of two kinds, viz., 1. Samsari, i. e., mundane souls and 2. Siddha or Mukta, i. e. liberated souls. Out of these, the samsarijivas, i. e. the mundane souls, are the embodied souls of living beings in the world and are still subject to the cycle of Births and Deaths and the Siddha or Mukta Jivas are the liberated souls and as such 1. they will not be embodied in future, 2. they have accomplished absolute purity, 3. they dwell in the state of perfection at the top of the universe, 4. they have no more to do with worldly affairs,

NSOU ? CC-ED-02 ? 74 5. they have reached Mukti or Nirvana or Nivrtti, i. e. liberation, and in their condition they have four enjoyments, viz., Ananta-darsana, i.e., unlimited perception, Ananta- jnana, i. e., perfect knowledge, Ananta-Virya, i.e., infinite power, and Ananta- sukha, i.e., unbounded happiness. In addition, from the Metaphysical point of view the difference between the Samsari-Jiva, i.e., the mundane soul, and the Mukta Jiva i.e. the liberated soul, consists in the fact that the former is permeated with subtle matter known as Karma, while the latter is absolutely pure and free from any material alloy. 2. Ajiva: Jaina philosophy starts with a perfect division of the universe into living and non-living substances, Jiva and Ajiva. The non-soul substances are of five kinds, viz., 1. Pudgala, i.e., matter, 2. Dharma, i.e., medium of motion, 3. Adharma, i.e., medium of rest, 4. Akasa, i.e., space, and 5. Kala i.e., time. These six living and non-living substances are called Dravyas in Jaina Philosophy. A Dravya has got three characteristics. First, Dravya has the quality of existence. Secondly, it has the quality of permanence through origination and destruction. Thirdly, it is the substratum of attributes and modes. The Dravya is thus un-created and indestructible, its essential qualities remain the same and it is only its Paryaya or mode or condition, that can and does change. 3. Asrava: The third principle Asrava signifies the influx of Karmic matter into the constitution of the soul. Combination of Karmic matter with Jiva is due to Yoga. Yoga is the activity of mind, speech and body. Thus Yoga is the channel of Asrava. The physical matter which is actually drawn to the soul cannot be perceived by the senses as it is very fine. 4. Bandha: When the Karmic matter enters the soul, both get imperceptibly mixed with each other. Bandha or bondage is the assimilation of matter which is fit to form Karmas by the soul as it is associated with passions. The union of spirit and matter does not imply a complete annihilation of their natural properties, but only a suspension of their function, in varying degree, according to the quality and quantity of the material absorbed.

NSOU ? CC-ED-02 ? 75 Thus, the effect of the fusion of the spirit and matter is manifested in the form of a compound personality which partakes of the nature of both, without actually destroying either. 5. Samvara: Effective states of desire and aversion, and activity of thought, speech or body are the conditions that attract Karmas, good and bad, towards the soul. When those conditions are removed, there will be no Karmas approaching the Jiva, that is complete Samvara — a sort of protective wall shutting out all the Karmas is established round the self. Thus Samvara is the stoppage of inflow of Karmic matter into the soul. There are several ways through which the stoppage could be effected. 6. Nirjara: Nirjara means the falling away of Karmic matter from the soul. The soul will be rendered free by the automatic falling out of the Karmas when they become ripe. But this is a lengthy process. The falling away may be deliberately brought through the practice of austerities. Thus, Nirjara is of two kinds. The natural maturing of Karma and its separation from the soul is called SavipakaNirjara and inducing a Karma to leave the soul, before it gets ripened by means of ascetic practices is called AvipakaNirjara. 7. Moksha: Moksha or liberation is the freedom from all Karmic matter, owing to the non-existence of the cause of bondage and the shedding of all the Karmas. Thus complete freedom of the soul from Karmic matter is called Moksha. Metaphysics of Jainism: The Jaina metaphysics holds that reality possesses innumerable qualities. So, an object possesses infinite number of characteristics of its own. Therefore,

83%

MATCHING BLOCK 56/127

SA

03 Analysis and result - BASKARAN.C.pdf (D61753646)

it is not possible for ordinary people to comprehend all the qualities of a thing. People can know only some qualities.

Therefore, the Jaina metaphysics is relativistic pluralism. It is also called anekantavada in the sense that an object or a thing includes infinite number of characteristics. Ordinary people cannot cover all the aspects of a thing. So, different standpoints or statements of a thing are called anekantavada. Again, Jaina metaphysics is relativistic in the sense that no statement or a standpoint of a thing can claim to be absolute. Therefore, all truths are relative in comparison to others. Every standpoints or statements are partially true. So, the Jaina metaphysics is called anekantavada or many ness of reality.

NSOU ? CC-ED-02 ? 76 The six constituents of the existence of Realities Soul or Consciousness Jiva Living Substance Matter Pudgala Non-living Subatance Space Akasa Non-living Substance Time Kala Non-living Substance Principle of motion Dharma Non-living Substance Principle of rest Adharma Non-living Substance ? UNIVERSE ? REALITY ? SUBSTANCE Conscious Unconscious Jiva Ajiva Pudgala Akasa Kala Dharma Adharma Doctrine of Anekantvada: Anekantavada is one of the most important and basic doctrines of Jainism. It refers to the principles of pluralism and multiplicity of viewpoints, the notion that truth and reality are perceived differently from diverse points of view, and that no single point of view is the complete truth. • Consequently, no single, specific, human view can claim to represent absolute truth.

NSOU ? CC-ED-02 ? 77 Application of Anekantavada: Anekantavada teaches us that the kingdom of truth can be reached through different ways. It also teaches us that we should not impose our own thoughts or views on others, but should try to reconcile with the thoughts or view-points of others. This principle, therefore, if earnestly put into practice shows us • How to remove our short-sighted, selfish and partial outlook. • How to remove discord and disharmony and establish concord and harmony in life, • How to respect candid opinions of all free thinkers of the world, and, therefore, the roots of modern democracy could be traced in this Jaina principle. It establishes unity in diversity. It promises reconciliation of divergent or conflicting statements, thoughts, ideologies, systems, religions etc. It can be a great instrument to peaceful co-existence and unity in the world. Epistemology of Jainism: The Jainas admit three sources of knowledge. They are respectively: Perception, inference and testimony. The Jaina shows that inference produces valid knowledge when it obeys the logical rules of correctness. Like inference, testimony also produces valid knowledge when it is the report of a reliable authority. From these sources of knowledge, it can be held that Jainas admit two kinds of knowledge. They are immediate and mediate or direct and indirect. The Jainas admit the twofold classification of knowledge — immediate and mediate. But they point out that what is ordinary regarded as immediate knowledge is only relatively immediate perception of external or internal object through the senses or mind is immediate as compared with inference. Still such knowledge cannot be said to be absolutely immediate, because even here the soul knows through the medium of something else. In addition to such ordinary or empirical immediate knowledge, there is also really or absolutely immediate knowledge, which a soul attains, by removing its Karma obstacles. In such knowledge the soul's consciousness becomes immediately related to objects, without the medium of senses, etc., simply by the removal of the Karmas that prevented it from reaching those objects. There are three kinds of really immediate knowledge -

NSOU ? CC-ED-02 ? 78 Avadhijana — when a person has partially destroyed and allayed the influences of Karmas, he acquires the power of knowing objects which have forms but are too distant or minute or obscure to be observed by the senses or manas. Such immediate knowledge by the unaided soul is, however, limited as its objects are limited and therefore, it is called avadhijana. Manah-parayaya — when a person has overcome hatred, jealousy, etc, he can have direct access to the present and past thoughts of others. This knowledge is called manah- Parayaya (entering a mind). Kevalajana— When all Karmas that obstructed knowledge are completely removed from the soul, there arises in it absolute knowledge or omnia science. This is called Kevalajana. Only the liberated souls have such knowledge. According to Jaina system, knowledge is again, divided into two kinds. • Pramana • Naya Pramana: The first one is Pramana. It means knowledge of a thing as it is. Pramana are of five kinds: Mati or "sensory knowledge", Sruta or "scriptural knowledge", Avadhi or "clairvoyance", Manahparayaya or "telepathy", and Kevala or "omniscience" Naya: The second one is Naya. It means the knowledge of a thing in its relation. Naya means a standpoint of thought about a thing. Nyaya, as a pramana, holds that we can get partial knowledge of a thing. So, Partial knowledge of different aspects of a thing is called Naya. It is not at all possible to get complete knowledge of a thing. Therefore, according to Jaina, truth is relative to our different standpoints of thought about a thing. The Jainas point out that the different kinds of immediate and mediate knowledge that we possess about objects show that every object has innumerable characters. It is viewed that an omniscient person is capable to

78%

MATCHING BLOCK 57/127

SA

Abreviation.pdf (D46310548)

obtain an immediate knowledge of an object in all its aspects but an imperfect being can

not do so. Such partial knowledge about someone

NSOU ? CC-ED-02 ? 79 is called 'naya'. Judgment based on such partial knowledge is also called a 'naya'. Judgment about any object is, therefore, true only in reference to the standpoint occupied and the aspect of the object considered. The Jainas insist that every judgment should be qualified by some word like 'somehow' or 'in some respect', so that limitations of this judgment and the possibility of other alternative judgments from other points of view may be always clearly borne in mind. It implies, then, a principle — certainty under some conditions, i.e. the judgmental approach is perhaps open or flexible. Doctrine of Syadvada: Syadvada is the theory of relativity of knowledge. It is also called saptabhanginaya or the seven fold judgment. The word 'syat' literally means 'may be', 'probable', 'perhaps'. Therefore, it is also known as the probability theory of knowledge. Jainism through the theory of 'syadvada' holds that reality has infinite number of characteristics. People cannot know all the characteristics of a thing. Therefore, human knowledge regarding the absolute nature of a thing is probable. The theory of Syadvada holds that all judgments are conditional, relative and limited. No judgment can be absolutely wrong or true. This indicates that judgments are partially true or partially false. It means that all affirmative judgments presuppose negations as well as all negative judgments presuppose affirmation. Affirmation and negation are the two edges of a judgment. In case of explaining the nature of Syadvada, Jainas put forward a story of the six blind men and an elephant. The blind men put their hands on the different parts of the elephants in order to describe the whole animal. The first blind man who touched the ear of the elephant opined that the elephant was like a- country made fan. The second blind man who caught the leg of the elephant viewed that the elephant was like pillar. The third blind man who touched the trunk of the elephant said that the elephant was like a python. The fourth blind man who caught the tail of the elephant viewed that the elephant was like a rope. The fifth one who touched the side said the elephant was like a wall. The last one who touched forehead opined that the elephant was like the breast. From the story of the six blind men and an elephant it is derived that each blind man thought that his explanation regarding the elephant was correct. But he, who can see the animal, can view that each explanation regarding the elephant was partially correct. Therefore, the syadvada theory of the jainas shows that our judgments or standpoints bring out the

NSOU ? CC-ED-02 ? 80 different aspects of reality. Our judgments express only partial truth. No judgments are absolutely true. The word 'syat' should be incorporated to all judgments to point out the conditional character of judgments. The Jainas distinguish seven kinds of Judgment including these two and the Jaina logic recognizes the following seven kinds of conditional judgments:-

- Somehow, S is P (Syatasli)
- Somehow, S is not P (Syatnasti)
- Somehow, S is P, and is also not P (Syatastica, nastica)
- Somehow, S is indescribable (Syatavaktavyam).
- Somehow, S is P and is also indescribable (Syatasli ca, avaktavyamca).
- Somehow, S is not P, and is also indescribable (Syatnastica, avklavyamca).
- Somehow, S is P, and is also not P, and also indescribable (syatastica, nastica, avaktavyam ca)

Now, we can explain the seven fold judgments of syadvada: Syadasti (Perhaps S is): This is an affirmative judgment. From the point of its own substance, place, time, and nature, a thing exists. The pot exists as an earthen substance possessing red colour in summer at Guwahati. Syannasti (Perhaps S is not): This is a negative judgment. From the

51%

MATCHING BLOCK 58/127

SA

Intro- Con.pdf (D132239883)

point of view of substance, place, time, and nature, a thing does not exist as other things. The pot does not exist as watery substance possessing dark colour in spring at Nagaon. Syadastinasti (

Perhaps S is, is not): The third is an affirmative and negative judgment in succession. The pot exists as its own substance in its own place at a particular time with its own nature. It does not exist as substance in another place at another time with another quality. Syadavaktavyam (perhaps, S is indescribable): This is simultaneously both affirmative judgment, and negative judgment. The presence nature of the pot as an earthen substance with its red colour and absence of its watery substance with dark colour inhere in a substance. But it cannot be expressed. But in another sense it cannot be absolutely indescribable. Like the concept of maya of Advaita Vedanta it includes both the thesis and the anti-thesis at the same time. Syadasti cha avaktavyam (perhaps, S is an indescribable): This is an affirmative judgment combined with simultaneous affirmative judgment and negative judgment. This indicates that

84%

MATCHING BLOCK 59/127

MATCHING BLOCK 60/127

SA

Intro- Con.pdf (D132239883)

and a predicate is affirmed of it as described above and denied of other things as different

substances in other places and times and with different natures simultaneously. Hence, we get affirmation and indescribability. Syadnnasti cha avaktavyam (perhaps S is and indescribable): This is a negative judgment combined with simultaneous affirmative and negative judgment. It shows that when a predicate is denied of other substances in different places at other times and with different natures and a predicate is simultaneously affirmed of the thing and denied of other things. Hence, we get negation and indescribability. Syadasti cha nasti cha avaktavyam: (Perhaps S is, is not, and indescribable): This is successive affirmative judgment and negative judgment combined with simultaneous affirmative and negative judgment. It indicates that when a predicate is affirmed of a thing as its own substance in its own place at its own time and with own nature, and the same predicate is denied of other substances in other places at other times and with other natures. So, affirmation and denial are made simultaneously. Here, we get affirmation, negation, and indescribability. From these seven fold judgments it is clear that an affirmative judgment holds that a thing exists in its own substance, its own place, its own time, and with its own nature. On the other hand, a negative judgment holds that a thing is non-existent in its other substances, other places, other times, and with other natures. The five other judgments are the combinations of affirmative and negative judgment. Affirmation implies negation and negation implies affirmation. It shows that a thing is existent with its own nature and non-existent with other natures. Therefore, it is clear that Jaina's concept of Syadvada advocates relative pluralism or a many-sided of reality. Seven Forms of Syadvada: The Jaina doctrine of Syadvada is the system of safeguards which aims at maintaining the proper consistency in metaphysical thought. It proceeds to unravel the theory of contradiction and points out that contradictory speech is resolvable ultimately in seven limbs or forms, as follows:

- Affirmance (of a proposition)
- Denial (of a proposition)
- Indescribability (simultaneous affirmance and denial)
- Affirmance + denial

NSOU ? CC-ED-02 ? 82 • Affirmance + indescribability • Denial + indescribability • Affirmance + denial + indescribability From the epistemological standpoint we can know only some characters of an object; this is called 'Syadvada'. Again, from the metaphysical standpoint this is called anekantavada, because an object has infinite number of characteristics. Indeed, the two doctrines like Syadvada and Anekantavada are the two sides of the same coin. We commit a mistake in Jain metaphysics when we regard a statement or a standpoint as an ultimate or absolute view regarding an object. Then we commit a fallacy of ekantavada. Ethics of Jainism: To govern the conduct of man in the society, ethics is emphatically considered to be a very important code of rules by all the great religions of the world. Ethics is the foundation of all religions indicating the relationship between man and the universe, and his goal in life. Jain ethics is not merely only a way of thought but also a way of life. It forms the general basis among the basic principles of Jain philosophy. The central problem in Jain ethics is liberation from misery. It finds greater emphasis among the religions of India because of their peculiar doctrine of Karma. Jainism believes that moral effort is sufficient for human progress. It doesn't consider personal God as necessary to fulfill all the desired demand of morality. The necessary is the isolation of the soul from the bondage of Karma. Therefore, in Jainism ethics assumes an over-riding importance over all other aspects of the religious life. Thus, the formulation of Jain ethical theory is stranded in Jain metaphysics. The Jain metaphysical outlook is known as Anekantavada or non-absolutism. However, it is to be noticed that Jain ethics is not only depending on the background of metaphysics but on epistemology also. According to Jainism, the universe is uncreated and real by virtue of its being existential and is, therefore, eternal everlasting, with a beginning and without an end. The Concept of God in Jainism: Jainism believes that universe and all its substances or entities are eternal. It has no beginning or end with respect to time. Universe runs on its own accord by its own cosmic laws. All the substances change or modify their forms continuously. Nothing can be destroyed or created in the universe. There is no need of someone to create or manage the affairs

NSOU ? CC-ED-02 ? 83 of the universe. Hence Jainism does not believe in God as a creator, survivor, and destroyer of the universe. However Jainism does believe in God, not as a creator, but as a perfect being. When a person destroys all his karmas, he becomes a liberated soul. He lives in a perfect blissful state in Moksha forever. The liberated soul possesses infinite knowledge, infinite vision, infinite power, and infinite bliss. This living being is a God of Jain religion. Every living being has a potential to become God. Hence Jains do not have one God, but Jain Gods are innumerable and their number is continuously increasing as more living beings attain liberation. The Concept of Soul in Jainism: The concept of soul has an enormous influence upon all the religious systems. It has become a curious important philosophical analysis in the history of human thought. According to Jainism, soul is a substantive reality. It is pure consciousness, that is to say, in other words, an embodiment of infinite knowledge, and a totally different kind of substance from matter. Jainism believes in plurality of soul. It means that every living being has its own individual soul. Not only human beings and animals, even trees, plants, bacteria and microscopic organism have souls. According to Jainism, the differentiating characteristic of a living being is its being a substratum of the faculty of cognition, which is only a manifestation of consciousness. All living beings, whether big or small, has a soul. All souls are equal.

Salil Samadhia.docx (D41727527)

to the obstacles of karma. The lowest souls which inhabit material atoms appear to be lifeless and unconscious, but in fact life and consciousness are present in them though in a dormant form. Purest consciousness is found in the emancipated souls, where there is no shred of karma. All souls are really alike. The degrees of consciousness are due merely to the karmic obstacles" (Sharma, 1987 :). Jainism

believes that the soul is absolute and permanent. The soul has the capability to obtain freedom elevating upwards to liberation through the destruction of its karma. Every soul in its essence and inherent nature possesses four infinities. These infinities are infinite knowledge, infinite intuition, infinite bliss and infinite power. Under some conditions, these characteristic are obscured by karma. Jainism, with its explicit believes that soul is potentially pure in its inherent form. The following are the qualities of soul: NSOU ? CC-ED-02 ? 84 1) The faculty of omniscience (Kevala-jnana) 2) The faculty of absolute undifferentiated cognition (kevala-darsana) 3) The superiority over joy and grief (avyababha) 4) The possession of complete religious truth (samyaktva) and irreproachable moral conduct (charitra) 5) The possession of eternal life (aksayasthiti) 6) Complete formlessness (amurtatva) 7) Complete equality in rank with other jivas 8) Unrestricted energy (virya) The Concept of Karma in Jainism: In Jainism, karma is the basic principle to reach the highest level. Karma is thought of as

85%

MATCHING BLOCK 62/127

W

a kind of pollution that taints the soul with various colors. Based on its karma, a soul undergoes rebirth and impersonate in various states of existence—like heavens or hells, or as humans or animals.

The Jain theory seeks to explain the karmic process by specifying the various causes of karmic influx and bondage (bandha), placing equal emphasis on deeds themselves, and the intentions behind those deeds. The Jain karmic theory attaches great responsibility to individual actions, and eliminates reliance on supposed existence of divine kindness.

98%

MATCHING BLOCK 63/127

W

The Jain doctrine also holds that it is possible for us to both modify our karma, and to obtain release from it, through the austerities and purity of conduct.

There are many types of karma. However they are broadly classified into the following eight categories: Mohniya karma: It generates delusion in the soul in regard to its own true nature, and makes it identify itself with other external substances. Jnana varaniya karma: It covers the soul's power of perfect knowledge. Darasna varaniya karma: It covers the soul's power of perfect visions. Antaraya karma: It obstructs the natural quality or energy of the soul such as charity and will power. This prevents the soul from attaining liberation. It also prevents a living being from doing something good and enjoyable. Vedniya karma: It obscures the blissful nature of the soul, and thereby produces pleasure and pain.

NSOU ? CC-ED-02 ? 85 Nama karma: It obscures the non corporeal existence of the soul, and produces the body with its limitations, qualities, faculties, etc. Gotra karma: It obscures the soul's characteristics of equanimity, and determines the family, social standing, and personality. Ayu karma: It determines the span of life in one birth, thus obscuring soul's nature of eternal existence. While traveling on the path of spiritual progress, a person destroys all eight types of his karmas in the following sequence: First Mohaniya (delusion), then Jnana varaniya (knowledge), Darasnavaraniya (vision), and Antaraya (natural qualities) all three together. At this time, he attains Kevalgnan and he is known as Arihant, which is also known as Tirthankara, Jina, Arhat, Kevali, or Nirgantha. Lastly the remaining four karmas namely Vedniya (pleasure and pain of the body), Nama (body), Gotra (social standing), and Ayu (life span) are destroyed. At this time, he attains total liberation and he is known as Siddha.

NSOU ? CC-ED-02 ? 86 Source : [wikimedia.org/wikipedia/commons/4/40/Types_of_Karma.JPG](https://commons.wikimedia.org/wiki/File:Types_of_Karma.JPG)

NSOU ? CC-ED-02 ? 87 Thus Jainism believes in the right faith, right knowledge, right conduct, non-injury, truthfulness, non-stealing, celibacy and non-adultery, non-acquisition of wealth, amity, appreciation, compassion, equanimity, forgiveness, humility, straightforwardness, purity of mind, control of senses, mercy, penance, renunciation, greedlessness, chastity, respect for other's view-points, etc. In short Jainism has advocated for all the best virtues required for peaceful and happy living for all the living beings and also required for the liberation of the soul from the cycle of birth and death. Jainism has thought of every possible situation in life, has elaborately analyzed them and has guided the followers of all categories towards the right path. The salient features of Jainism philosophy are discussed as under– Soul and Matter: According to the Jainism, the universe is eternal and uncreated and contains two types of entities– souls (jiva) and non-living matter (ajiva). The suffering individual is a Jiva or a living, conscious substance which is inherently perfect. But there are certain obstacles which rob the soul of its native perfection. The material body identifies itself with the soul. The body is made of particles of matter. This body seeks the guiding force in the soul's own passions. The inanimate aspect i.e. ajiva of the cosmos is basically made up of atomic matter, but Jainism also lists four other substances– space, time, the medium of motion (dharma) and the medium of rest (adharma). Anekantavada: Jainism holds

88%

MATCHING BLOCK 65/127

All objects of knowledge are manifold or multiform (anekanta). They have infinite qualities and relations which distinguishes them from other objects.

According to this principle, an object can be viewed from a number of perspectives. Jainism believes that perception gives only a partial view of what is perceived. Syadvada: It has been observed that absolute judgements are not possible in the Anekantaphilosophy, because all objects are believed to be multiform. Therefore, every judgement expresses one aspect of reality and it is therefore, relative and subject to some condition. Reality: According to Jainism, the world is composed of substances of different kinds. But every substance consists of two characters– essential and accidental. Essential characters (guna) are those which remain in the substance as long as the substance remains. Accidental Characters (paraya) come and go or they succeed one another. Karma: The relationship between jiva and ajiva is considered as the real bondage. It is believed that this bondage is due to deeds (karma). The jivas have to face the consequences

NSOU ? CC-ED-02 ? 88 of its deeds. Its colour, physical beauty, age and other senses are according to its deeds. Salvation: It is the separation of the soul from the inanimate. Detaching oneself from attachment and malice leads to salvation. Salvation brings an end to all the miseries and pains and one becomes a master of the supreme knowledge. Values: Ignorance is the cause of bondage. Right knowledge is the act of liberation. Right faith, right knowledge and right conduct are the three jewels of Jainism. So, it is primarily ethical. Discipline is enforced strictly. There are five vows– non killing (ahimsa), truth (Satya), non stealing (astaya), non possessing (aparigraha) and virtuous life (Brahmacharya). Educational Implications of Jainism: In view of Jainism, education is an important activity – a process of development, a path to the highest goal of life. Though Jainism has not directly propounded any educational theory, some educational implications may be derived from its principles. Aims of Education: Jainism does not have any predetermined absolute goals. It believes in the development of the self. The final aim is the development of personality. Individual and social aspects of Personality is equally emphasized. Some of the important aims of education propounded by Jainism are– Self-realization or Exaltation of Personality: Jainism emphasizes the work of man's personality and spiritual nature. Man's soul is more important than his material structure. The aim of human life, according to Jainism, is to acquire the knowledge of his soul. Therefore, self-realization is admitted as the aim of education according to Jainism.

SA

content.pdf (D123773782)

The aim of education is to enable the child to realize the soul; recognize his real form, and

proceed towards self knowledge. Preservation and enrichment of cultural environment: The child's environment is not merely physical or material but cultural also. To Jainism, the spiritual or cultural environment is the fruit of man's own creative activities. It belongs to all and it is the common heritage of mankind. The aim of education should be to enter into this cultural heritage to the best of its capacity, preserve it and improve upon it. Development of moral sense: Another aim of education

46%

MATCHING BLOCK 68/127

SA

content.pdf (D123773782)

according to Jainism is to develop the child's moral sense and thus enable him to distinguish right from wrong, to love good and despise evil. The goal of life as well as of education should be the realization of

NSOU ? CC-ED-02 ? 89

68%

MATCHING BLOCK 69/127

SA

content.pdf (D123773782)

moral values by developing the spiritual character of the learner. Development of inventive and creative powers: Man is not helpless like other beings. He has got certain inventive and creative powers.

Education should aim at developing these

80%

MATCHING BLOCK 70/127

SA

content.pdf (D123773782)

inventive and creative powers. Through these inventive and creative skills, he should change and modify the environment according to his needs and purposes. Development of

complete man: Education, according to Jainism, should aim at developing child into a complete man with full physical, intellectual, moral, spiritual, emotional and cultural uplift. Physically he must be stout; intellectually he must be alert and think like a philosopher, and scientist; morally he should have determination to follow good and to avoid evil; spiritually he should have the freedom of mind, freedom from ignorance, wants and passions. The aim of education should be to train the whole man completely and fully for manhood and not only some parts of man. Simple living and high thinking: Jainism regards that simple living and high thinking should be another aim of education. More than the environment it is the mind that needs to be controlled. Education should aim at training the mind to control itself. Curriculum Jainism believes that curriculum should be constructed on the basis of the learner's environment. Knowledge is relative. By knowing different parts, we may hope to get all about one relatively. It is possible to allot some place in the curriculum for those activities which cannot be said to be perfectly true. The multi-dimensionality of personality should be taken care of. According to Jainism the final truth in this material world should be acquired. Spiritual environment is more important but natural environment cannot be neglected. So, the curriculum should include ethics, religion, and philosophy but should not oppose science. Man's intellectual, aesthetic, moral and religious activities are included in the spiritual environment. More aspect of individual's growth was emphasized in terms of right conduct. Man is a combination of body and mind, of which

76%

MATCHING BLOCK 71/127

SA

content.pdf (D123773782)

the latter is more important. But even mental activity would be difficult if physical needs are not

fulfilled. Man can proceed towards self realization only when he controls his physical needs. Therefore, the knowledge of the material world is also necessary. From this point of the curriculum would also

75%

MATCHING BLOCK 72/127

SA content.pdf (D123773782)

include physical education. Knowledge of natural environment is acquired through natural sciences; therefore, Jainism does not condemn subjects like Physics, Chemistry, Biology, Geography, Astronomy, Geology, Botany and Zoology.

For spiritual development subjects like the art,
NSOU ? CC-ED-02 ? 90

67%

MATCHING BLOCK 73/127

SA content.pdf (D123773782)

literature, ethics, philosophy, religion, psychology and music are more important. The study of these subjects develops the soul of man. Without

the study of these subjects man would be confined to natural environment. The study of space and five elements are also emphasized in Jainism. Methods of Teaching: Jainism provides lofty aims of education but speaks very little about methods of teaching. It advocates concentration as a method of teaching by which to attain knowledge. The very essence of education is concentration of mind. According to Jainism

51%

MATCHING BLOCK 74/127

SA HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

the power of concentration is the only key to the treasure-house of knowledge. It advocates that the very essence of education is concentration of mind not the collection of facts.

72%

MATCHING BLOCK 75/127

SA content.pdf (D123773782)

One of the fundamental principles of education that Jainism follows is to see the best in every person. It believes that seeing and emphasizing

the strong points in an individual is the best way of building that individual. Therefore, Jainism is against all negative attitudes and expressions. Religion is nothing unless it is practiced. The educational system should plan and provide activities which will

67%

MATCHING BLOCK 76/127

SA content.pdf (D123773782)

develop such qualities. Progressive methods of education all over the world aim at making children active participants in the process

of learning instead of being passive recipients. With this end in view, various kinds of activities have been devised. Jainism has suggested that our daily duties could become the basis of designing learning activities in the school and the home. Based on the philosophy of Jainism, the following may be listed as the characteristics of the methods of teaching– • Teaching through senses • Teaching should be tolerant and social • Teaching should be ideally oriented • Teaching should be action based • Strong emphasis on memory • Spiritual aspect stressed in teaching • Mother tongue as the medium of instruction • Debate and discussion as method of teaching • Stressed residential life for students.

NSOU ? CC-ED-02 ? 91 Critical Analysis of Education in Jainism: Merits of Education in Jainism: 1) According to Jainism, education is free from any kind of discrimination. It was given to all sections of people. 2) Jainism emphasizes residential education which encourages students and teachers to live together. It helps the students to get more opportunities for learning. 3) The curriculum suggested by Jainism is comprehensive and includes both natural and spiritual elements. 4) Jainism gives a very important place to moral principles in education. It propagated the five vows. Demerits of Education in Jainism: 1) Jainism over emphasize on moral and spiritual education. 2) Following the principle of non-violence, education in Jainism also avoids military training. 2.5.3 Epistemological Characteristics of Islamic Philosophy: A Glimpse to Islamic Philosophy You may start your journey to the present discourse just recalling the name of the West Bengal Board of Madrasah Education which is holding five public examinations like High Madrasah, Alim, Fazil, Kamil, and M.M. Examinations and administering Madrasah education in this State and in 2001 about 18,000 students appeared in all of the five examinations. Moreover, the famous Calcutta Madrasah is acting as Centre of Research in Arabic, Persian and Islamic studies under the patronage of this State Government. Similarly, in some other States of India there are Madrasah Boards of Education. All these academic activities are connected with a common thread of thoughts which is Islamic philosophy. The cardinal points of the Islamic education as well as tradition are based on the Islamic Philosophy which is illuminating thoughts and beliefs of Muhammad (AD 571-632) embodied in the holy book Quran which means "The Reading". Originally written in classical Arabic it tells the followers of this great prophet (Muslims) that each person will be Tried in the Last Judgment, when Allah (one true God) will judge all souls. Those who have followed the will of Allah will be eternally rewarded. Islam is a comprehensive way

NSOU ? CC-ED-02 ? 92 of life and "... after all, makes it a duty for everyone to seek knowledge and discover facts, and increase the welfare of mankind" (Sardar, 1989, p.25). Some basic beliefs of the orthodox Islamic religion, according to Ozman & Craver consist of: One God; Sacred ground (All the earth belongs to Allah, so wherever one prays becomes holy ground); Equality before God; A life hereafter; Truthfulness; The sinfulness of adultery; Charity; Duty to animals; etc. In this connection the religious duties of Moslems are stated in the "Five Pillars" of Islam which govern the total life of its followers. 1. Belief: Moslems professes faith as, "I bear witness that there is no God but Allah, and that Muhammad is the prophet of Allah". 2. Prayer: Muhammad required formal prayer five times a day at sunrise, noon, midafternoon, sunset, and nightfall. 3. Fasting: A fast during the month of Ramadan is required for all. During that time one cannot take food or drink between sunrise and sunset. 4. Almsgiving: One is encouraged to share goods and money with the poor and to support Moslem schools and mosques. 5. Pilgrimage: Muhammad urged his followers to travel each year the sacred city of Mecca. At the very least, one should do this once during his lifetime. Like many other religions of the world Islamic religion has also experienced great reform but its cardinal faiths are more or less stable. Let us now advance into understanding Islamic philosophy of education in the lenses of Mohammad Iqbal, a renowned poet, thinker and philosopher of united India. In brief his reflections are presented in the next paragraphs. Khudi (literally, Selfhood or Individuality) is a real and pre-eminently significant entity which is the centre and basis of the entire organization of human life. The negation of Self, or its absorption into the Eternal Self should not be man's moral or religious ideal, he should, instead, strive to retain his infinitely precious Individuality and to strengthen it by cultivating his originality and uniqueness. In the word of Quran, man is held as the "trustee of a free personality which he accepted at his peril" and his

95%

MATCHING BLOCK 77/127

SA

POST DOCTORAL THESIS TOPIC SOME SIGNIFICANT AL ...
(D146512473)

unceasing reward consists in his "gradual growth in self-possession, in uniqueness and intensity of his activity as an ego". The

Self or individuality is not a datum but an achievement, the fruit of a constant, strenuous efforts in and against the forces of the external environment as well as the disruptive tendencies within man himself. The life of man 'is a kind of tension caused by NSOU ? CC-ED-02 ? 93 the Ego invading the environment and the environment invading the Ego'. Through this give-and-take between the individual and his many-sided environment, through establishing as many intensive and fruitful contacts with the surrounding reality as possible, the individual evolves the inner richness of his being. Moreover, life cannot unfold all its possibilities, nor can the individual develop his latent powers, except in an atmosphere of freedom-learning by direct, personal, first hand experience. Individuality is not divorced from community or culture. Readily equipped with a free personality (trust) and actively in contact with his environment, man sets his journey to unlimited development which, in its essence is the process of his education through reflective observation as revealed to one's sense perception, man grasps Reality piecemeal, temporal aspects, on the contrary, through intuition or Love or direct perception by the heart man apprehends and associates directly with Reality in its wholeness. Purpose of life is to be a good man. Education aims at developing good character. The good life must be a life of active effort and struggle, not one of withdrawal or seclusion or slothful ease. Secondly, the good man must learn to apply his intelligence increasingly to the exploitation of the forces of Nature, thus adding progressively his knowledge and power but it will be guided and controlled by Love (intuition). In order to develop such a good character exemplified by sensitiveness and strength- sensitiveness to the good of humanity and to ideal values, strength in carrying one's purposes the appropriate education must inculcate Courage, Tolerance and Faith (an inner attitude of detachment and superiority to man's material possession, a kind of intellectual and emotional asceticism which does not turn away man from the world as a source of evil and consumption but uses it for the pursuit of good and worthy end). "In power, it saves him from an attitude of arrogance and self-intoxication; in political subjection, it enables him to spurn the temptations, bribes, and snares with which the ruling power tries cynically to corrupt integrity and character of a subject people." (Saiyidain, 1965, 1988). From educational terms the character of the good man-the true Believer, the Momin. "He is a man who develops all his powers and strengthens individuality with contact with his material and cultural environment. His self-respect gives him courage, his tolerance and respect for the rights and personality of others makes him sensitive to the claims which their common humanity makes on him." (Saiyidain, 1965, 1988). Iqbal puts it as :He is a flashing sword against untruth. And a protecting shield for truth!

NSOU ? CC-ED-02 ? 94 Basic Tenets of Islamic Thought: • Man is a creation of God who can choose to conform to his ordinances. • Man has intelligence, will and speech. But man is also weak and forgetful. • Conformity with God's will determines a man's destiny in this life and the next. • The right way to live is according to God's will, which he has revealed through the prophets. • Islam is a restatement of what God has to say to man as a set of beliefs. • Right faith is essential for right action. Whether action is right or wrong will be judged on the basis of beliefs given in Quran and traditions of Prophet. • Islam has provided the social framework for a great culture for more than a thousand years. • The purpose of Islam is to create peace in the world and to establish sovereignty of God on earth. • Five fundamentals of Islam are Shahada (faith), Namaz or Salat (prayer), Zakat (Charity), Sawm or Ramadan (Fast) and Hajj (Pilgrimage to Mecca). Namaz is for God, Zakat is for helping poor and needy, Ramadan (fast) is for self purification and Hajj is for establishing universality of Islam. • Wiping out evils and flourishing good in the society are their important duties of Muslims on earth. It will be done in the same way as Prophet used to do during his life time. • Means and ends both should be pious and purpose of creating Muslims on earth is to establish peace and justice among humans irrespective of caste, creed or colour. • Jihad (Holy War) becomes incumbent on Muslims when people are not allowed to follow the fundamentals of Islam. Killing of innocent people even for the establishment of Islamic rule in the society is terrorism not jihad. Features of Islamic Thought • Islam is universal: The Islamic system is such that it makes all men as one community and does not make any distinction on the basis of language, race, colour, culture or history.

NSOU ? CC-ED-02 ? 95 • Islam is comprehensive: It provides a complete code of conduct for living. It is not merely for individuals but nations as well. • Islam is eternal: From the beginning of the universe, Islam has been the only true religion. Islam is not a novel religion that appeared in Arabia four centuries ago, preached by the prophet Muhammad. It is the religion God made known on the day when man first appeared on the earth. • Islam does not make any distinction on the basis of colour: Islam considers all human beings on the same footing and does not discriminate on the score of colour. Islam promotes harmony between the individual and the society, faith and science, the material and spiritual. • Islam is misunderstood: It has been the misfortune of Islam that it has been misunderstood by various religions and their followers. The causes of misunderstanding are improper interpretations of Jihad, the alleged use of sword in spreading Islam, imposition of Jizya, polygamy, divorce. Basic Philosophy of Islamic Thought: Islamic doctrine, law and thinking in general are based upon four sources or fundamental principles – (1) The Quran, (2) Sunnah, (3) Ijma, and (consensus) (4) Ijtihad (individual thought) • The Quran is regarded as the verbatim word, or speech, of God delivered to Muhammad by the archangel Gabriel divided into 114 chapters of unequal length, it is the fundamental source of Islamic teaching. • Sunnah was used by pre-Islamic Arabs to denote their Tribal or common law. In Islam it came to mean the example of the prophet – i.e. his words and deeds are recorded in compilations known as Hadith. Hadith provide the written documentation of the prophet's words and deeds. • The doctrine of Ijma, or consensus, was introduced in the 2nd century AH. Though conceived as a "consensus of scholars, Ijma was in actual practice a more fundamental operative factor Ijtihad, meaning "to endeavor" or "to exert effort" was required to find the legal or doctrinal solution to a new problem. • In the early period of Islam Ijtihad took the form of individual opinion there was a wealth of conflicting and chaotic opinions. The stream of Islamic education continued to flow in India for a period almost 500 years. Its system passed through the hands

NSOU ? CC-ED-02 ? 96 and religious education began and consequently a tendency toward professionalization or vocationalisation emerged. During this period, a great attention was paid to the growth of history and the art of writing history. The ethical philosophy of Islam is that God is one and he is supreme Lord of all creation. He has created the Universe and Heavens to reveal truth. Everything good and evil in this world exists by His will. The root of the doctrine of Islam is in the belief of – 1) Immortality of the soul. 2) The reality of a future life and 3) Predestination. The present life is momentary, is sport and past time. When death approaches a person, on Divine command, separates his soul from the body. The souls thus separated are preserved until the Last day i.e., "The Judgement Day" when the souls are reunited with the bodies for receiving the eternal rewards or punishment and it will be decided by the Divine Tribunal. Again, Islam is a religion of practices consisting of – a) The recitation of the confession of faith and serving God without associating anything with him. b) In performing the ritual prayer. c) In giving begging alms. d) In fasting during the month of Ramadan, e) Visiting al-Kaba in pilgrimage in the month of Dul-Haj. These five duties are the real foundations of the Islam and known as the Pillars of Islam (Arkan-Al-Din) Five Pillars of Islam: 1) Al-Shahada (Declaration of Faith): All must pronounce their faith to enter into Islam. In front of witnesses they are required to declare the following "I testify there is no God but Allah, and I testify that Muhammad is the Messenger of God." Pronouncing these words is not enough however, one must believe in his or her heart that is true. "I testify there is no God but Allah" is meant to mean that there is no one or thing worthy of worship but Allah, since there are many things human might worship instead of one God. (Five pillars of Islam: Shahada in). For Salat (prayer) to be valid there are several requirements. First, NSOU ? CC-ED-02 ? 97 purification, both spiritually and physically is of the utmost importance. Physically, purification is achieved through a complete, careful and regulated both hand and tooth brushing. Secondly, the body must be sufficiently and properly covered during prayer. The covering is known as Niqab or Sitr. For female this means covering all except the face, feet and hands. Male must only be covered from the navel to the knees. Finally when performing Salat, one must face Mecca. In mosques there is a marker showing them which way to face. This provides a unified focus for the Islamic nation. 2) Salat (Prayer): The word salat is thought to be derived from Persian word "Salwa". Salat means Du'a which is an important act of Islamic ceremonial prayer. Hence, the whole devotional exercise is called salat or worship. Salat is the first duty of a Muslim. 3) Zakat (Alms-giving): Muslims believe that all wealth belongs to God, and is only held by humans in trust. Therefore, Muslims are required to do with it what wishes and God wishes for a Muslim to be generous. 4) Sawm (Fasting): The fourth practical duty obligatory to the Faithful fasting during the Ramadan, the 9th month of the Islamic lunar calendar. Sawm is an Arabic word, means to the abandoning of the cravings of food for Allah's sake. Sawm is continued for one full month till the sighting of the moon of Shawwal. Next day is celebrated all over the Muslim world as one of the important festivals i.e. Id-ul-Fitr. During Ramadan, many devote Muslim invite the poor for meals. Fasting and Zakat – these are the two glories of Ramadan. The popular belief is the fasting will burn away the sins of men. 5) Hajj (Pilgrimage): All Muslims, except for those physically or financially unable, must make a pilgrimage to Mecca at least once in their life. Before performing the Hajj, all debts must be paid one's will must be order in case of death on the perilous journey, and there must be enough money to provide for one's family while gone. The annual Hajj takes place from the eight to the twelve days of the twelfth month of the Islamic calendar. People come from every continent in the world to perform the Hajj. This means all races languages and ethnic languages are represented.

Educational Implication of Islamic Philosophy: Some of the distinguishing features and constituent characteristics of Islamic system of education may be described below: 1) Aim of Education: Islamic education was basically aimed at development of religion. System of education was dominated by the royal authority for which their rulers were aiming

NSOU ? CC-ED-02 ? 98 at the spread of religion and culture in their newly established kingdom. Education was aimed at teaching the principles of Islam through study of Quran. In view of this aim every mosque or the place of worship had an educational institution attached to it. In fact the mosques were serving the purpose of schools. In order to propagate Islamic religion among the people, education was used as an instrument. Accordingly the religious leaders were playing the role of the teachers. Education was considered as act of developing the religious sentiment of people; child's education was therefore made a religious compulsion for the community people. Formation of desirable qualities of character was another aim of education. It believed that religious activity and behaviour can promote the moral standard of life of an individual. Accordingly more importance was given on teaching of the rules and behaviour of prayer. Development of material life and culture of the people was another significant aim of education. Education was not merely aimed at spiritual development but also for satisfaction of the material needs of life. 2) Curriculum: It should be noted that the Vedic and Buddhist curriculum did not have any impact on Muslim curriculum. Their religion, language and culture being basically different, curricular contents were prepared accordingly. Their curriculum may be broadly divided into primary and higher. Primary curriculum was meant for the Maqtabas where reading, writing and arithmetic were taught. Besides these, the principles of Quran and the procedures of worship were taught. The "Ayaats" of Quran were committed to memory, children were given moral education through study of "Gulistan" and "Bastan" of the famous poet Sheikh Shaddi. Moreover the story of "Laila-Majnu", "Poetry of Yusuf and Zulakha" and "Sikandarnama" were taught to children. The royal princesses were given training in administration and welfare in their own families. In Madrasa curriculum was of high order. It was divided into two types as religious and practical. Along with the study of Quran subjects like grammar, logic, science, medical, economics, politics, law, history, philosophy and music were included. King Akbar had modified the curriculum to make it more secular, practical and useful for life. He also included Sanskrit language and culture for study of the Hindu students. 3) Method of Teaching: Teaching method could not rise to the scientific level. Importance was given merely on verbal learning and its mechanical memory work. Most of the time and effort were spent on mechanically committing to memory of the "Kalimas" of

NSOU ? CC-ED-02 ? 99 Quran. No attention was given to students understanding of them. Akbar the great had realized futility of such mechanical learning and tried to introduce more objective method. He ordered that every student should at first learn to write letters and then try to understand the meaning of the words. Names and size of the letters should be learnt within the two days. Such improved method of teaching may be known from the famous book "Ain-E-Akbari." He also tried to simplify the method of writing letters. In higher education also the method of learning was mostly verbal. The word "Madrasa" comes from the word "Darsha" that means "delivering lecture." The learned scholars were invited to deliver lecture on different subjects. Method of experimentation was also used. One major characteristic of its teaching method was the use of the senior students to teach in the junior classes, popularly known as the "monitorial system." In the absence of the teacher the junior students were taught through this system. There was no method of annual examination. Students were promoted to the higher classes on opinion and impression of the teacher received in the total performances. 4) Discipline: Method of discipline in Muslim education may be known as repressive. It was the rule of rod in which the teacher believed in the maintaining of discipline. He had the right to give punishment. Indisciplined students were physically punished by applying various methods. Principle of using punishment was preventive rather than reformatory. Punishment was given so that it may serve as an example for others. Even the teachers were also subjected to punishment by the king. Although there were provision for giving reward to the meritorious students in their achievement for effective motivation. The royal authority used to give scholarship to such students on successful completion of their education. Provision was made for giving medal and certificate of merit. The individual showing scholarliness in the royal court was appointed in the high post of the government. So, it may be said that there was the system of giving reward and punishment in Muslim education. 5) Teacher-Pupil Relationship: As education was tempered by the religious sentiment, relationship between the teacher and the students was based on moral ideals. They were like the father and the son. Teachers were the religious leader and as such they were responsible persons in society. Their honesty and integrity of personality were beyond doubt. It was thought that education of the students was not possible without the blessings and good wishes of the teachers. Students naturally showed respect to the teacher and their bond on relationship was based on moral and religious sentiment. Although Muslim education was not residential like that of the Vedic and Buddhist system. As such cordial relation

NSOU ? CC-ED-02 ? 100 between them could reach the height of these system. 6) Women's Education: During the reign of Muslim rulers education of women in general was not encouraged. They had the Purdah system and the male members did not like the women going out of home for education a result women's education had suffered in general. More particularly the rural women were largely suffering from illiteracy. The British administration in the later period had also repeatedly drawn our attention to this situation. Although education of the Muslim women cannot be said as completely absent. The members of the royal families were given education privately. The girls were given education at home by private tutors. Rezia Sultana was a clear example in this regard. She not only got education of reading and writing but also had trained herself in administration and warfare. During the Mughal rule education of the royal princess and ladies was reaching a new height. Gulbadan the daughter of Babar, was highly educated who wrote the Humayunnama, the royal ladies like Salima Nurjahan Mumtazmahal and Jahanara were highly educated and cultured Muslim women of the royal families. There was limited system of education for the ladies in the middle class family also. The elderly ladies and the Widows used to give education to the girls of the neighbourhood in their houses. Such a system had served the need of woman's education to a considerable degree. 7) Useful Education: One significant feature of Islamic education was that their education was more practical and need based rather than being religious and spiritual. More importance was given on study of the practical subjects that serve the need of individual and society. They included warfare, use of weapons singing, dancing, fine arts, handicraft, sculpture and architecture. The Muslim rulers had felt the need of military education in order to conquer, expand and defend their kingdom. They were also lovers of music, art, culture and literature for which provision was made for their training. A group of artisans and sculpture were well trained and developed in order to construct buildings, royal palaces, mosques and tombs in the kingdom. The Tajmahal, Fatehpur-Sikri, Buland Darwaya, Lal Killah of Delhi etc. give clear evidence of this. 8) Organisational System of Education: Organisational set-up of Muslim education was basically different from that of the Vedic and Buddhist system. Education was controlled and regulated by the royal authority for which autonomy was absent. The king used to establish. Maqtabas and Madrasas, offered financial assistance, gave scholarship prizes and recognition to students.

NSOU ? CC-ED-02 ? 101 9) Development of Literature and History: Great attention was given to the growth of History and art of writing History in fact tradition of writing history had its root in this period. Various forms of Literature also underwent significant growth. 10) Encouragement to Persian language and Science: Persian language was the medium of education, so special emphasis was given on the teaching of Arabic and Persian language, and the study of science subject was emphasized. WAVES OF REFORM IN MADRASAH EDUCATION You must not think that Islamic education is deadwood and stable over ages and places. It has undergone many changes, modifications and reform and till it is undergoing reform. The issue of madrasah reform started about two hundred years ago has crucial implications for Muslim education, the nature of Muslim leadership, and for community agendas. The centrality of controversy lies on inclusion of two types of studies in the curriculum — "religious" (dint) knowledge and modern "worldly" (duniyavi) learning. Muslim advocates of reform in contemporary India include both trained ulema, products of madrasas, as well as men who have been educated in modern schools. While all of them seem agreed on the importance of the madrasas as institutions geared to preserving and promoting Islamic knowledge and Muslim identity, there is variation in their approaches and extent of the reform they advocate. The rationale for introducing modern disciplines in the madrasas is framed in principally three ways. 1. It is profitable to broaden the Islamic understanding of knowledge as all embracing, covering both 'ibadat (worship) as well as mu'amilat (social relations, worldly pursuits). 2. Introducing modern disciplines is valuable in order for Muslims to prosper in this world, in addition to the next. 3. It is seen as essential in order for the ulema to engage in tableeq, or Islamic missionary work. Therefore, the ulema are no longer to remain restricted to teaching in the madrasas. Rather, they are to play an important role as leaders of the community... Advocates for reform see the present syllabus used in the Indian madrasas is — generally stagnant, in many respects and hence no longer in tune with the demands and needs of the times. Presently the government's desire for the reform and modernization of madrasas to

NSOU ? CC-ED-02 ? 102 enable Muslims to enter the educational mainstream of the country puts the onus of Muslim educational backwardness largely on the madrasas themselves and to introduce modern subjects in the curriculum. In India today, various State governments, e.g., West Bengal, Bihar, Orissa, Assam and Uttar Pradesh have set up Boards of Madrasa Education that frame the syllabus of madrasas affiliated with them, consisting of both traditional Islamic as well as modern subjects. The boards also conduct the examinations, enabling the students to join secular schools after graduation. This has been welcomed by some, but others argue that in this way the religious content of the syllabus has been considerably watered down and that, burdened with the need to learn both religious as well as modern subjects, the students do well in neither. In recent years, the Government of India, as well as some State governments including West Bengal has launched some schemes ostensibly to assist some madrasas, such as providing them paid teachers to teach modern subjects. These efforts have, however, failed to make much of an impact all over India and only a ripple effect is felt. Some apprehend that governmental interference and control, which they see and probably rightly so as aimed at weakening their Islamic identity by introducing the teaching of government-prescribed books appears motivated by other factors. If promoting Muslim education was indeed a primary concern of the government, it should have paid more attention to setting up more modern schools in Muslim localities... Promotion of alternative education of various kinds for lifelong learning opportunities for all-age groups both male and females are to be ensured. Some critics of this Information Era considers that the learning 2.6 Summary We discussed the Basic characteristics of Indian Philosophy: Theism (Arthodox) & Atheism (Heterodox) schools of philosophy. In this unit also we discuss various Indian School of philosophy like: Samkhya, Yoga, Naya, Buddhism, Jainism and Islamic Philosophy and their application in Education. • The term theism derives from the Greek Theos or theoi meaning "God". The term theism was first used by Ralph Cudworth (1617–1688). In Cudworth's definition, they are "strictly and properly called Theists, who affirm, that a perfectly conscious understanding being, or mind, existing of itself from eternity, was the cause of all other things"

NSOU ? CC-ED-02 ? 103 • Theism refers to any kind of belief in any god or gods, so it is difficult to make any other generalizations about it. Two people may both say they believe in God, so they're both theists; but what they mean by "God" could be completely different. This does however raise the interesting question of what all gods have in common in order to be called gods; but since this is a matter of belief, not fact, we shall not attempt such a definition here. Belief in God is also normally attached to other beliefs, such as belief in an afterlife or the soul. However, theism can also refer to religions with extremely different beliefs, such as reincarnation. • The term "atheist" describes a person who does not believe that God or a divine being exists. Atheism is, in the broadest sense, the absence of belief in the existence of deities. Less broadly, atheism is the rejection of belief that any deities exist. In an even narrower sense, atheism is specifically the position that there are no deities. Atheism is contrasted with theism, which, in its most general form, is the belief that at least one deity exists. The etymological root for the word atheism originated before the 5th century BCE from the ancient Greek atheos, meaning "without god(s)". In antiquity, it had multiple uses as a pejorative term applied to those thought to reject the gods worshiped by the larger society, those who were forsaken by the gods, or those who had no commitment to belief in the gods. The term denoted a social category created by orthodox religionists into which those who did not share their religious beliefs were placed. • Metaphysically Samkhya Philosophy is regarded as dualistic realism. It believes two ultimate realities Prakriti and Purusa. But that reality is plural. They differ from each other, as like, subject and object. Purusa is having subjective reality and prakriti can be characterized by objective reality. Epistemologically Samkhya philosophy believes in three types of knowledge source- perception, Inference and verbal testimony. The ultimate aims of samkhya philosophy are Liberation or Moksha. • Sankhya has great relevance for contemporary education. If we consider the modern view of education as development, then Sankhya's postulate that development is only the unfolding of what already has potential existence needs no modification to suit today's world. Sankhya's psychological views also reflect modern learning theories. If knowledge leads to the modification of buddhi in the Sankhya system, then modern education aims at the modification of behaviour. If cognition is a function of buddhi or intellect in Sankhya, it is the formation of

NSOU ? CC-ED-02 ? 104 intellectual structure in modern education. Sankhya's theory that generalisation is the result not only of observation of elements but also non-observation of non- elements reflects the modern view of concept formation. • Patanjali was the founder of the yoga system. The yoga is closely allied to the Sankhya system. It is the application of the theory of the Sankhya in practical life. The Yoga philosophy speaks about the theory and practice for the realization of the ultimate truth concerning human being and the world. In Vedanta, yoga is understood as 'union', i.e. spiritual union of the individual soul with the supreme soul. This view is not explained clearly. Patanjali, who is the founder of the Yoga System says, yoga is a spiritual effort to attain perfection through the control of sense organs, gross body, subtle mind, intellect and ego. It guides to achieve the highest wisdom through spiritual realization. The yoga philosophy admits the metaphysics of Sankhya. In Sankhya we are discussing the twenty five principles including Prakriti, Mahat, Ahamkara, Manas, Ten external sense organs, five tanmatras, five gross elements and purusas. In yoga the dualistic purusa and prakriti is connected by another concept that is the concept of God besides twenty five principles mentioned above. The yoga mostly accepts the Sankhya epistemology and admits the three Parmanas of perception, inference and scriptural testimony. In this respect, yoga philosophy prescribes eight-fold path which helps to control our passions and craving for worldly pleasures. These eight fold path are as follows. Yama, Niyama, Asana, Pranayama, Pratyahara, Dharana, Dhyana, Samadhi. • The Sage Gautama is the founder of the Nyaya Philosophy. This school unlike other schools of Indian philosophy concerns on the valid reasoning to acquire knowledge of the reality. Epistemology: According to the Nyaya Philosophy, knowledge manifests with objects. There are two sorts of knowledge, valid and invalid. Valid knowledge is further divided into four; perception, inference, comparison, and verbal testimony whereas, invalid knowledge comprises memory, doubt, error, and tarka. Perception: It is the knowledge arises due to the association among self, mind, sense organs and objects. Perception is of two sorts: Ordinary and Extraordinary. Inference: There are there premises and three different terms required for an inferential argument. The premises are respectively named as; major premise, minor premise and conclusion. The three different terms are; major term, minor term, and the middle term. Vyapti relation subsists in an inferential argument. Comparison: Knowledge arises out of the relation between a name and

NSOU ? CC-ED-02 ? 105 the object it denotes is regarded as comparison. Sabda: Sabda is a valid source of knowledge. The Nyaya explains sabda is a reliable statement of anyone. Sabda is divided into two kinds: a) Drustartha and Adrustartha b) Laukika and Alaukika. Theory of Causation: The Nyaya Philosophy upholds astkaryavada which states that effect is not same as the cause. Effect is a new creation or a new bringing of its existence. The effect did not exist in the material cause prior to its production. Self and Liberation: There are innumerable self exists in the universe. Since the self possesses consciousness, it is trapped by the law of karma. • Hence, suffering and pain are the obvious phenomenon. To get rid from all sorts of sufferings the self seeks liberation. Liberation can be achieved when there will be cessation of law of karma. God:

iurkund CHAPTER III.docx (D37737041)

God is the creator, sustainer and destroyer of the universe.

He regulates the earth, solar systems and the movements of planets and becomes identified as an omnipresent and omniscience being in the cosmos. According to Nyayikas, the world is created out of the four eternal atoms as its material cause. These are; space, time, mind and soul. God is being the efficient cause of universe is responsible for its maintenance, and destruction. Thus God, as the first efficient cause of the universal forces, is

the creator of the world. God is one, infinite, eternal, and the universe of space and time, of mind and soul, does not limit him. God is said to possess six perfections: infinite glory, absolute sovereignty, unqualified virtue, supreme beauty, perfect knowledge,

and complete detachment. The Nyaya philosophy offers an argument to establish the existence of God known as causal argument. On the line of this argument, it is stated that the entire universe is constituted of enumerable elements both subtle and gross. A human being by possessing limited knowledge cannot be the creator of the vast universe. This implies the creator is one who is beyond space and time, must be eternal and devoid of all limitations. And, all these features are therein Supreme Being or God. Hence, God is the creator or designer of the universe. • Jain philosophy attempts to explain the rationale of being and existence, the nature of the Universe and its constituents, the nature of bondage and the means to achieve liberation. The metaphysics of Jain philosophy deals with the fundamental distinction between the living and non-living beings. The epistemology of Jainism is non-absolutistic and is with the specific logic of syadvada. They are respectively. • Jainas admit perception, inference and testimony as the sources of knowledge. NSOU ? CC-ED-02 ? 106 • Jainas divide knowledge into two kinds: Pramana and Naya. • Naya means knowledge of a thing in its relation. • Pramana means knowledge of a thing as such or as it is. • Jaina metaphysics holds that all judgments are relative. • From the epistemological standpoint knowledge is relative in the sense that we can know only partial nature of reality. It is called syadvada. • From the metaphysical standpoint reality has innumerable characteristics. It is called anekantavada. • Syadvada is the theory of relativity of knowledge. It is also called sevenfold judgment. • Jaina ethics is not merely only a way of thought but also away of life. • Jainism does not believe in God as a creator, survivor, and destroyer of the universe. • Jainism believes in plurality of soul. It means that every living being has its own individual soul. Not only human beings and animals, even trees, plants, bacteria and microscopic organism have souls • The Jain karmic theory attaches great responsibility to individual actions, and eliminates reliance on supposed existence of divine kindness. • Buddhism has been described as a very pragmatic Philosophy. It does not indulge in metaphysical speculation about first causes; there is no theology, no worship of a deity or deification of the Buddha. Buddhism takes a very straightforward look at our human condition; nothing is based on wishful thinking, at all. Everything that the Buddha taught was based on his own observation of the way things are. Everything that he taught can be verified by our own observation of the way things are. • The eightfold path consists of moral conduct, concentration and insight. Insight includes right belief and right resolve. Moral conduct comprises right speech, right conduct and right livelihood. Concentration comprehends right effort, right mindfulness and right Concentration. The eightfold Path is the best way to freedom from suffering. It leads to complete extension of suffering. Buddhism is pessimism in so far as it looks upon life as suffering. But it is optimism in so far as it aims NSOU ? CC-ED-02 ? 107 at extinction of suffering in this life. These are the basic aims of education as well as of life. • According to Buddhism Education is a developmental process as it believes in transient causation. Causation itself is development or transformation, education also being a dynamic process is the source of one's development technique. Education, then, facilitates individual development — continuous journey for attaining wisdom, perfect, knowledge in its entirety. • In the last spell we have been acquainted with the Islamic philosophy and its educational derivatives very meticulously and of course some problems relating to madrasah education of our country. Herein also the most precious aim of education is human well-being for all with the aid of two categories of knowledge: acquiring intellectual knowledge (through the application of reason and logic) and developing spiritual knowledge (institution or Love). Moreover, its curriculum is open to both theology and sciences- although from these two divisions controversy has originated to give momentum for incorporating necessary changes in curricula and methods of teaching. Finally, we have realised that the Islamic education is advocating equality, brotherhood and international understanding. 2.7 Self-Assessment Questions 1. Write the meaning and concept of Theism. 2. Discuss the basic features of Theism. 3. Write the meaning of Atheism. 4. Discuss the basic features of Atheism. 5. What do you mean by Panchabingsati tattva 6. Discuss the term Perception, Inference and Verbal Testimony. 7. Write the Axiological view of Sankhya Philosophy 8. Describe the Educational Implication of Sankhya Philosophy 9. What do you mean by Chitto? 10. What is Pancha Klesh 11. Discuss the Astangik Yoga NSOU ? CC-ED-02 ? 108 12. Describe the Educational Implication of Sankhya Philosophy 13. Discuss the Epistemological view of Naya Philosophy 14. What is Anu. 15. Describe the Educational Implication of Naya Philosophy 16. What do you mean by Nirban lav? 17. What is Probojja. 18. Discuss the Astangik Marg. 19. Describe the Educational Implication of Buddhist Philosophy 20. What do you mean by Anekantabad? 21. Discuss Syathbad in Jaina Philosophy. 22. Describe the Educational Implication of Jaina Philosophy 23. Explain the concept Islamic Philosophy? 24. Discuss the Epistemology Islamic Philosophy 25. Describe the Educational Implication of Islamic Philosophy. 2.8 References Aggarwal, J. C. (1998): Theory and Principles of Education, Vikas Publishing House Pvt. Objectives After going through this unit, you will be able to– ? Describe

the concept and characteristics of Western Philosophy ? Baic Features of Classical Western Philosophy ? Baic Features of Modern Western Philosophy ? To know the Epistemological Characteristics of Idealism. ? Understand the Educational Implication of Idealism. ? Elaborate the Epistemological Characteristics of Naturalism. ? To understand the Educational Implication of Naturalism. ? Explain the Epistemological Characteristics of Pragmatism. ? Understand the Educational Implication of Pragmatism. ? To know the Epistemological Characteristics of Humanism. ? Understand Educational Implication of Humanism. 3.2 Introduction We are bearing with you some general ideas about two terms, Modern and Classical Western Philosophy and their Basic Characteristics. Also, infrom you some general ideas about Western schools of Philosophy like-Idealism, Naturalism, Pragmatism and Humanism & their Epistemological Characteristics. We hope, you like to understand these concepts more critically as well as to extent your knowledge about Epistemological Characteristics of Western Schools of Philosophy (Idealism, Naturalism, Pragmatism and Humanism). 3.3 Basic Characteristics of Western Philosophy Western philosophy is a philosophy evolved from western civilization and its historical development. With changing socio- economic and political conditions, western philosophy too changed over a period of time. But it had maintained its continuity from Greek philosophy to the contemporary times. The approaches and styles of doing philosophy may vary, but we can identify certain features on which western philosophy got constructed. In the light of contemporary struggles, the very assumptions and foundations of philosophy are under

NSOU ? CC-ED-02 ? 112 scrutiny. It does not mean that it dismissing the philosophical thought of western society, but arguing for new methods of inquirers in understanding the western reality against the dominant view of western philosophy. Basic Features of Western Philosophy: Though it is a difficult task to characterize or identify the specific features of western philosophy, but we may mark some common features marked with western philosophy. Philosophical traditions may vary from ancient Greek philosophy to contemporary western philosophy, but there are efforts to construct the essential features of western philosophy. The idea of west got its prominence and distinctiveness in relation to other Afro-Asian nations, which are under the control of colonial rule of west. The following are some of the features of western philosophy: Philosophy as an Intellectual Speculation From the beginning, western philosophy characterizes as an intellectual enterprises in understanding the social reality. As Bertrand Russell viewed philosophy is something intermediate between theology and science. Like theology, it consists of speculations on matters as to which definite knowledge has so far, been unascertainable; like science, it appeals to human reason rather than to authority, weather that of tradition or that of revelation. As Russell argues all definite knowledge belonged to science, and all dogma as to what surpasses definite knowledge belonged to theology. All the questions of the most interest to speculative minds are such as science can not answer, and the confident answers of theologians no longer seem so convincing as they did in earlier times. Western philosophy from its very beginning maintained that philosophy is distinct from science and theology. Science is the realm of empirical investigation and attempts to understand the world explain the observable events and formulate the laws of nature, and a human experience has explained accordingly. We also find some of the questions answered differently from this. In some occasions the questions generated by science may pass beyond its ability to solve them. There are attempts to understand the world as whole and some times beyond this empirical phenomenon. However, Western philosophy for the most part consists of insightful remarks about the nature of reality or human beings ('everything changes' or 'the unexamined life is not worth living', or no decision is a decision), analyses the fundamental concepts ('knowledge is justified true belief'), and systematic treatments of the basic structures of reality ('everything is a body' or 'Only minds and ideas exists')

NSOU ? CC-ED-02 ? 113 The history of western philosophy reveals that, Plato has critically appraised. As Whitehead remarked that 'the safest general characterization of the European philosophical tradition is that it consists of a series of footnotes to Plato.' The earliest philosophers, the Milesians were concerned chiefly with the constitution of physical nature, not with foundations of morality. Similarly, the Eleatic philosophers Parmenides and Zeno were interested chiefly in arguing that reality consists of changeless, single reality, the one. Heraclitus and Pythagorean, on the other hand, considered reality as always changing, full of flux, and consisting of a vast multitude of different things. Socrates and sophists showed less interest in physical nature and instead, steered philosophy into arena of morality. Plato's great influence stems from the manner in which he brought all these diverse philosophic concerns into a unified system of thought. Plato argues that the kind of knowledge that helps one to distinguish between shadows, reflections, and real objects in the visible world is just the kind of knowledge that man needs to discriminate the shadows and reflections of the genuinely good life. Plato had argued that the truth of the world is not revealed to ordinary sense perception, but to reason alone; the truths of reason are necessary, eternal and a priori; that through the cultivation of reason man can come to understand him, God, and world as these things are in themselves, freed from shadowy overcast experience. Skepticism is doubting or denying the possibility of attaining true knowledge. In ancient Greece, the sophists provide their argument based on skepticism. The modern skepticism is associated with Hume, and J.S. Mill. It is reaction against dogmatic metaphysics and is the logical consequence of a through-going empiricism. Descartes introduced the method of doubt, which has influenced the western philosophy significantly. He considered doubt is the source of knowledge. To doubt was not an end in itself; it was a process of purification, of eliminating various false hoods, and of ultimately arriving at an unshakable foundations of truth. In fact, our doubt implies the reality of our thoughts. Doubting means thinking, this implies a self consciousness. Descartes regarded it as primary truth of reason. For Locke, skepticism was not an end in itself; it was prelude to a more scientific philosophy. Though out the western philosophy, one form or other skepticism has become one of its features. In fact, Western philosophy has progressed further with skepticism. Scientific Method Rational understanding of the world has one of the dominant features of philosophy. The rational understanding has enriched with scientific method against dogmatic and orthodox religious traditions. Descartes was a founder of seventeenth century continental rationalism. It was Descartes, Spinoza and Leibniz fashioned a new ideal for philosophy. In the wake of developments in science,

NSOU ? CC-ED-02 ? 114 it was inevitably philosophy was affected by this new ways of discovering facts. The early modern philosophers considered the methods of science a fresh way of developing knowledge. As Friedrich Mayer outlined in A History of Modern Philosophy, modern philosophy has reflecting the spirit of science. In 16th and 17th century's philosophy was influenced a lot by the development of natural and physical sciences. It has changed the perspective of philosophers. In 18th century the growth of the social sciences changed the outlook of philosophers. The optimism of 18th century philosophers was based on belief that progress can be achieved by making the world more rational, by eliminating obsolete traditions, and by destroying the spirit of prejudice. In 19th century, the growth of new biological concepts stimulated philosophical thinking, but the conclusions of biology were less comforting. The new scientific theories of Copernicus, Kepler, and Galileo revolutionized man's concept of the physical world. There is no doubt that the scientific discoveries and scientific methods of looking at world have changed the direction and conception of western philosophy in a significant way. Descartes described reality as dualism consisting of two basic substances, thought and extension; Spinoza proposed monism, saying that there is only a single substance, Nature, which has various attributes and modes; Leibniz was pluralist, saying that although there is only one kind of substance, the monad, there are nevertheless different kinds of monads accounting for the various elements in nature. It is evident that there are different philosophical methods adopted in the tradition of western philosophy. In modern philosophy, empiricism and rationalism are come with a distinct view of knowing the reality. The empiricists draw their model from empirical experience of everyday life. The rationalists draw their model from mathematics.

3.3.1 Basic Characteristics of Classical Western Philosophy: Greco-Roman Philosophy

The early Greek philosophers are concerned about the nature of things. What is everything made of, or what kind of stuff goes into the composition of things? What is permanent in existence? Thales considered the element 'water' as the foundation of all physical reality. Others were following Thales with alternative solutions. The Pythagoras came with mathematical basis of all things. There are attempts to explain change and permanence. Heraclitus came with a proposition that 'all things are in flux'. Parmenides, the founder of Eleatic school of philosophy is critical about both Heraclitus and Milesian philosophies that all things emerge out of something else. He rejects very notion of change

NSOU ? CC-ED-02 ? 115 and considered phenomenon of change is basically an illusion. For him, the concept of change was logically neither thinkable nor expressible. Whatever exists 'must be absolutely, or not at all. Thales believes that every thing is made up of water, Anaximenes believes everything is made of air, Anaximander believes that everything is made up of 'boundless', Democritus believes everything is made up of atoms. Ancient Greek philosophy may be divided into the pre-Socratic period, the Socratic period, and the post-Aristotelian period. The pre-Socratic period was characterized by metaphysical speculation, often preserved in the form of grand, sweeping statements, such as "All is fire", or "All changes". Important pre-Socratic philosophers include Thales, Anaximander, Anaximenes, Democritus, Parmenides, and Heraclitus. The Socratic period is named in honor of the most recognizable figure in Western philosophy, Socrates, who, along with his pupil Plato, revolutionized philosophy through the use of the Socratic Method, which developed the very general philosophical methods of definition, analysis, and synthesis. While Socrates wrote nothing himself, his influence as a "skeptical" survives through Plato's works. Plato's writings are often considered basic texts in philosophy as they defined the fundamental issues of philosophy for future generations. These issues and others were taken up by Aristotle, who studied at Plato's school, the Academy, and who often disagreed with what Plato had written. The post-Aristotelian period ushered in such philosophers as Euclid, Epicurus, Chrysippus, Hipparchia the Cynic, Pyrrho, and Sextus Empiricus. Medieval Philosophy: The medieval period of philosophy came with the collapse of Roman civilization and the dawn of Christianity, Islam, and rabbinic Judaism. The medieval period brought Christian scholastic philosophy, with writers such as Augustine of Hippo, Boethius, Anselm, Robert Grosseteste, Albertus Magnus, Roger Bacon, Bonaventure, Thomas Aquinas, John Duns Scotus, William of Ockham, Nicholas of Cusa, and Francisco Suárez. The philosophy of this period is characterized by analysis of the nature and properties of God; the metaphysics involving substance, essences and accidents. That is, qualities that is respectively essential to substances possessing them or merely happening to be possessed by them. Many of these philosophers took as their starting point the theories of Plato or Aristotle. Medieval philosophy had been concerned primarily with argument from authority, and the analysis of ancient texts using Aristotelian logic. The philosophy of medieval age was an attempt to construct religious thought with

NSOU ? CC-ED-02 ? 116 reasoned account of its various doctrines. In other words, it characterizes with synthesis of theology and philosophy. The doctrines of Plato and Aristotle were reinterpreted to fulfill their religious demands. In medieval age to a large extent the speculative theories of Aristotle combined with theological presuppositions in the Bible. The state has been subordinated to spiritual dominion, to the power of the Pope. Renaissance: The Renaissance saw an outpouring of new ideas that questioned authority. Roger Bacon (1214–1294) was one of the first writers to advocate putting authority to the test of experiment and reason. Niccolò Machiavelli (1469–1527) challenged conventional ideas about morality. Francis Bacon (1561–1626) wrote in favor of the methods of science in philosophical discovery. Renaissance, embracing the classical tradition, highlighted the Greek culture as supreme achievement in western civilization, and also had a stressing the importance of this world, by emphasizing the dignity of man, by championing the possibilities of reason and pointed to a new scientific age. The ideal of Humanism was the most important intellectual development emerged out of renaissance. It has belief in man and a passion for learning. Humanists believed that reason is self-sufficient and more important than faith. Though the ideals of humanism in renaissance age mostly confined to aristocratic class, it stresses exact knowledge, the validity of reason and need for moderation in making intellectual assertions. Interestingly, the period of renaissance coincided with an expansion of Western Europe. Nature was regarded as the standard of all things. The Machiavelli, the renaissance thinker believed that religion should be dominated by the state. It did not matter whether a religion were true or false. Machiavelli, the realist viewed man not an image of God but as a creature governed by self-interest. In philosophy, the Renaissance refers to the period of the break-up of feudalism (15th to early 17th century), when trade grew up around the merchants and craftspeople of Northern Italy particularly, and a bourgeois society began to flourish and gave rise to a humanist culture in opposition to the official scholasticism. 3.3.2 Modern Western Philosophy: The modern western philosophy has not only critical about orthodox religion but also came with ideals of secularism, humanism, scientific temperament, progress and development. Skepticism, rationality, individualism and scientific methods are influenced the human conception in understanding the world. Characteristics of the Modern Philosophy is a huge blanket term referring to roughly everything after Descartes. But it's good for a student to

NSOU ? CC-ED-02 ? 117 review his subject field. Here's a smattering of trends, subject and and features of modern philosophy I can think of. I'll try not to be too 20th century biased, and probably fail. Faction in the 20th Century - Analytic Philosophy vs. Continental Philosophy It should be well known to a modern student of philosophy that house currently stands somewhat divided on itself. In England and America, analytic philosophy in the tradition of Russell and others dominates. It has essentially taken over. But in the 20th century we saw the rise of philosophers rejecting "scientism", particularly in continental Europe. Names like Husserl, Kierkegaard and Sartre stand out prominently as examples of philosophers not plugged into the American/English tradition. Modern Logic: Between great thinkers like Frege, Gödel, Tarski, Kripke and Quine, in the 20th century we developed an unparalleled understanding of philosophical and mathematical logic. Model theory remains a hot topic in mathematical and philosophical circles. A basic understanding of the nature of incompleteness and completeness is becoming standard for student of philosophy and computer science. With the advance of logic philosophy over all has become a more formal discipline. Thinking in Terms of Language: Much of modern linguistics has philosophical fathers. Frege and Grice spring to mind, a strong case could also be made for Tarski. But the architect of a takeover of language analysis in the 20th century was Wittgenstein. His Philosophical Investigations lead philosophers to the idea that by analyzing so called language games, we could solve paradoxes and understand the world. This was something of a pre-occupation of philosophers in the 20th century. Epistemology - Empiricism vs. Rationalism before the 20th century: The early modern philosophers were deeply concerned with questions of epistemology. History class usually breaks them up into two approaches. One approach put "self-evident" truths into the center stage. This approach is called rationalism. The other approach put sense data as the primary source of knowledge. This approach is known as empiricism. The subject of many treatises has been based on argument for one side against another. Some of the great rationalist of history are Descartes and Leibniz. Some of the great empiricists are Hume and Locke. It is worth mentioning that Kant argued against rationalism on the basis of arguments with equal a priori support, which he dubbed "antinomies".

NSOU ? CC-ED-02 ? 118 Philosophy of Government: The idea of what makes a good government takes center stage from the enlightenment all the way to modern day. Hobbes, Rousseau, Locke, John Stuart Mill, Karl Marx, Robert Nozick and John Rawls are just a few names in a long, rich history of political philosophers. It might be worth mentioning that enthusiastic readers of author Ayn Rand, who go under the self-proclaimed name of Objectivists, count themselves as political philosophers (as well as philosophers of epistemology and ethics). As of right now, most philosophy departments ignore Objectivists. Science - What is it? What is Causality? What is a Scientific Explanation? In the 20th century, the philosopher Karl Popper raised the question "What makes something scientific?" and argued that Freudian psychology and Marxism are not scientific modes of thought, but that relativity, which were cutting edge at the time, is. His arguments were based on a principle of "falsifiability", namely that in order for some hypothesis to be scientific, it must be falsifiable. Other philosophers have grappled with the subject of causality, the earliest account I can think of in the 20th century belonging to Hume. Still others such as Hempel grappled with the notion of what is an explanation, giving rise to the idea of a Deductive- Nomological account of scientific explanation. Modern philosophers of science include Nancy Cartwright and Bas van Fraassen. Modern Epistemology - Justified True Belief: The subject of epistemology has been hot and remains hot throughout all of Modern philosophy. I have already mentioned some of the classical approaches to epistemology, namely rationalism and empiricism. The modern approach barrows from the seminal critique of modern epistemology by Edmund Gettier. Read up more on "Gettier cases" if you are curious. Much of epistemology is devoted to the question of "What makes a belief justified?"; but also shares topics in ontology (namely the question, "What is true?") and philosophy of mind (namely the subject, "What is a belief?"). A pioneer in our modern theory of knowledge would be W.V. Quine, who suggests that beliefs form webs with peripheries we are more likely to abandon in the face of conflicting evidence and cores we would essentially never abandon. Ethics - Cognitive (Utility vs. Obligation) vs. Non-Cognitive: In the 20th century the field of Meta-Ethics was formed, to answer the question "What is ethics anyway?" An early name in this subject was G.E. Moore. Essentially the question is split between ideas that ethical truths can be discerned objectively somehow, versus the idea that ethical statements mean "something else". An early Cognitivist contrast to Moore was the philosopher W.D. Ross, who gives the idea of candidate duties one must decide between in situations of seeming conflict of duty, or as he calls them prima facie duties. The Non-Cognitivist philosopher Ayer did not believe that there was any way of resolving ethical disputes. The Non-Cognitivist philosopher Stevenson thought that ethical statements were supposed to evince another person of some position. Philosophy of Mind: Another subject and perennial question of modern philosophy is "What is the thought?" The discussion almost always starts with Descartes Meditations. The view is typically split between Materialism, which holds that thoughts can be explained in terms of matter, and Dualism, which holds that thoughts can be explained in terms other worldly matter. Almost all 20th century analytic philosophers reject this view. Rationality and Economy: Ever since Adam Smith, we have been interested in asking what motivates people in economies, and what is best. A closely related question is "What is rationality". I will be honest, this subject matter is the focus of my study. Great reading can be found classically in Malthus and Hobbes and Smith, great modern reading would be in Von Neumann & Morgenstern, Luce & Raiffa, Kripke, David Lewis, Aumann, Kreps, Rubinstein, Amartya Sen, Schelling and Kahneman to misspell a few names off the top of my head. 3.4. Epistemological Characteristics of Idealism Philosophy 'Idealism' is an age-old school of thought originating in human nature itself. It has started its career since the dawn of human civilization and it continues till today in some modified form or the other. Greek philosophers Socrates and Plato were the great Idealists.

87%

MATCHING BLOCK 80/127

W

It has exercised a potent influence on the mind of man through the

age. Concept and Definition of Idealism: some concepts and definitions of Idealism are given below: a) Etymologically, 'Idealism' may be derived from the words 'idea' and 'ideals'. Idealism has the root from Greek word 'idein' meaning 'to see'.

88%

MATCHING BLOCK 81/127

W

From the epistemological standpoint it is better called idealism, implying thereby that thought or idea has greater validity than the physical objects. From the normative standpoint,

idealism attaches greater importance to ideal than facts. Thus, the term Idealism

NSOU ? CC-ED-02 ? 120 connotes different meanings when places in different contexts. Whatever it may be, in the philosophy of Idealism, both ideas and ideals are its central points. b) "Idealism means representation of things in an ideal form, imaginative treatment, system of thought in which the objective of external perception is held to consist of ideas."—The Oxford English Dictionary c) "Idealism contends that the material and physical universe known to science is an incomplete expression of reality that exists but to sub serve, it requires to complement it a higher type of reality, a spiritual universe."—Rusk d) "The idealists point out that it is the mind that is central in understanding the world. To them nothing gives a greater sense of reality than the activity of the mind engaged in trying to comprehend its world. For anything to give a greater sense of reality would be a contradiction in terms because to know anything more real than the mind would itself be a conception of the mind."—Brubacher e) In India, its origin may be traced to the Vedas, the Upanishads and the Bhagawad Gita a very comprehensive analysis of Idealism. In the West its echo is found in the writings of Plato. 1. Chief Exponents of Idealism: • The all Vedic Rishis and the authority of the Upanishads and the Bhagabat Gita. • Plato –a Greek philosopher (427-347 BC) • Kant- a German philosopher (1724-1804 AD) • Hegel-a German philosopher (1770-1831 AD) • Froebel- a German philosopher (1772-1852 AD) • William T. Haris-an American philosopher (1825-1890 AD) • M. K. Gandhi-an Indian statesman (1869-1948) • S. Dayananda- an Indian philosopher (1825-1883AD) • R. N. Tagore - an Indian philosopher (1861-1941AD) • Rishi Aurobindo Ghosh- an Indian philosopher (1872-1950AD) • Swami Vivekananda-an Indian philosopher (1863-1902AD) NSOU ? CC-ED-02 ? 121 3.4.1 Basic Tenets of Idealism: a) Ultimate reality is mental and spiritual. The real world of the mind-the realism of ideas and external qualities. b) Ideas are more important than objects. c) Man is a spiritual organism and is a supreme creation of God. d) Higher knowledge is the product of interactive thinking and reasoning-a product of mind. e) There is an essential unity in the scheme of things. f) Man is a part of this universe and it is the essence of his nature to work towards a rational unity in himself. g) Man has an innate capacity to apprehend the moral value of principles. h) The test of a good moral principle is its universal validity. i) Values are absolute and unchanging. j) The ultimate aim of life is to realize the ultimate values-truth, beauty and goodness. k) There is divine power behind all things in the world. 2. Forms/Types of Idealism: There are basically three types of Idealism. These are: a) Subjective Idealism: Famous philosopher of Ireland Bishop Berkeley is the chief exponent of Subjective Idealism. Subjective Idealism contends that things exist and have reality only when they are being perceived and that they have no existence. A part from my mind, your mind or a Universal mind perceives them. It says that individual perceives according to his mind and mental power. That is why phenomenon and appearance of physical world are observed on the basis of perceptibility of mind. In this way, an individual's sensation is so great and comprehensive and as per the sharpness and broadness of one's mental eye. So existence and reality of a thing depends on perceptibility of mind; things do not exist at all beyond the mental eye of the individual. b) Phenomenalistic Idealism: The chief exponent of phenomenalistic Idealism is Kant. He says things exist in themselves. He regards them as unknowable and unknown. We can see the phenomenal appearance of things throughout own forms and categories. c) Objective Idealism: Plato laid much stress on the Subjective Idealism. Hegel also

NSOU ? CC-ED-02 ? 122 extends his support to Plato in this respect. Biological need is fulfilled easily but cultural needs are to be fulfilled by education. Culture makes a man an individual. Human nature is divine and spiritual. Therefore, education is a complete essential requisite for the child to realize the divinity and spirituality in man. 3.4.2 Educational Implication of Idealism on Education Idealism and aims of Education: a) Exaltation of Personality: Aims of education are influenced by the aims of life. Idealism attaches greater importance to man. If human personality is of supreme value and constitutes the noblest work of God, the aim of education should be the exaltation of self. So, the aim of education should be the development of an integrated personality of the child. Education should enable an individual to become perfect pattern after his own self. b) Self-realization: When idealism stress on self, the aim of education is to enable the individual to realize his self. So, self-realisation is the aim of education. Individual should realize his self and should try to establish harmony with his own self and the universal Self i.e. God. According to the Upanishads, this means union of Jibatma to Paramatma. Indian idealists point out that the aim of education is emancipation of soul, i.e. salvation, mukti or nirvana or moksha c) Universal Education: Idealism advocates for self-realisation or salvation and education should not be confined to a chosen few or a monopoly of an elite group rather it should be meant for all irrespective of caste, creed, colour, sex or social status. Therefore, the aim of education is universal in character to enable one to go on the path of salvation. d) Enrichment of culture and its transmission: Idealists believe in man's superiority to other animals. Man has created his culture at a great cost of time and labour. It is the long-term product of his intelligence and mental power. He must not only preserve the inherited culture but

70%

MATCHING BLOCK 83/127

W

also make his own contribution to the enrichment of culture to enlarge the spiritual realm.

At the same time, he should transmit it to the generation to come. e) Development of morality: The aim of education should be to develop moral sense in child to enable him to differentiate between right and wrong, good and evil, and beauty and ugliness. Education should enable the child to follow the good and reject the evil, accept the right and disapprove the wrong, appreciate the beauty and avoid the ugliness. f) Realisation of higher values: The higher values are truth, beauty and goodness

NSOU ? CC-ED-02 ? 123 (Satyam, Sivam and Sundaram). These can be attained by spiritual activities-intellectual, aesthetic and moral. Truth, Goodness and Beauty are not different entities. Existence is only one; the same is Truth, the same is Goodness and the same is Beauty. According to individual ability, someone acquires the knowledge of truth, someone realizes goodness and others worship beauty. For example to philosophers, the knowledge of absolute existence is in the form of Truth. To social workers, absolute Truth appears in the form of Goodness. It appears to poets and men of literature as beauty. The poet lives in beauty, thinks beauty, and worships beauty. The poet sees the nature is beautiful but man is even more beautiful, so he attaches more importance to personality of man than to nature. g) Sublimation of animal instincts: At the time of birth, the child has certain natural instincts. Education should sublimate the animals' instincts and develop spiritual qualities in students. This is the truest, highest and fullest development of human personality. h) Development of complete man: Fullest development of child can only be possible if there is harmonious development of the individual-religious, moral, intellectual, aesthetic, physical, etc. Idealists do not give priority to the development of physical health but for pursuing spiritual values. Physical fitness of the body is no doubt inevitable. Can the mind be healthy if body is sick? Sound mind can only be found in a sound body. Therefore, one must have physical ability necessary for making one's spiritual pursuit. i) Development of inventive and creative power: The physical world is in a state of change. In order to change and modify the physical environment according to his needs and purposes, man should try to be creative and inventive. Thus, aim of education is to enable the child develop such powers in him to change the physical environment according to his needs. Idealism and Curriculum: The curriculum according to Idealism is given below: a) Plato believes that the highest idea is the attainment of the highest good. Hence, the curriculum should impart eternal values in order to enable the students to attain his highest good. The eternal values are truth, beauty and goodness. b) According to Ruskin, morality and religion are peculiar to man and differentiate him from animals. So, religion and moral instruction should have a prominent place in school curriculum. c) Ross talks of two types of activities in curriculum which would be as under:

NSOU ? CC-ED-02 ? 124 • Physical Activities-Physical care and Physical skill • Spiritual Activities- Intellectual, Moral, Religious and Aesthetic So, the Idealists attach importance to the study of gymnastics, athletics, physiology and hygiene. The Idealists attach greater importance to the study of humanities rather than positive sciences. Therefore, the idealistic curriculum should include subjects like art, history, music, philosophy, literature, moral sciences and religion. Method of teaching and Idealism: Different idealists advocate different methods of teaching. These are: a) Socrates advocated 'question-answer' method. This method may also be called 'Socratic Method'. b) Plato, a great disciple of Socrates, advocated 'Inductive and Deductive' method of teaching. c) Rene Descartes suggested 'Simple to Complex' method in teaching learning process. d) Hegel recommended 'Logical method' e) Froebel supports 'Kindergarten' method. f) Pestalozzi suggests 'Self-activity' method and 'Play-way' method. g) In addition to the methods, other idealists suggest Lecture method, Debate method, Discussion method, Memorization method, Imitation method etc. h) In ancient India, in the ashrams, education was based on Listening, Thinking and Meditation. So, the idealists do not favour any specific methodology. They have given lofty aims of education but failed to satisfy the reason so far as methods of teaching are concerned. However, the teacher can follow any method to suit him to direct the student towards the attainment of the goal of life. 3. Role of Teacher and Idealism: The role of an idealistic teacher are: a) It assigns a social role to the teacher; b) It considers teacher as a spiritual guide for the child; c) It accepts teacher as an ideal person;

NSOU ? CC-ED-02 ? 125 d) It regards the teacher as the priest of man's spiritual heritage; e) It holds the teacher as a friend, philosopher and guide etc. 4. Discipline and Idealism: a) Idealism believes in inner discipline of pupils; b) This philosophy advocates cultivation of higher values of life through moral religious instruction to students; c) It accepts restraint of freedom to students; d) It requires the teacher to present good examples because the child considers teacher to be an ideal person to be emulated by his pupils. 5. Contribution of Idealism to Education: a) Idealism has given higher place to mental and spiritual than to physical world. Thus the aim of education is the perfection of the individual. b) It requires that the past culture must be given its due place and accordingly education aims at primarily the means of acquainting the students with great achievement in literature, art, mathematics and science. c) It holds that every human being must receive a chance to be educated and the goal of idealists is universal education. d) It gives emphasis on humanities and ideals in life. e) It emphasizes spiritual side of human life which is the greatest contribution to the field of spiritualism. f) It lays stress on higher values of life viz. truth, beauty, goodness, wisdom, honesty, etc. g) It sounds a note of urgency of universal education which is inevitable to modern state. h) It highlights and glorifies the human and personal elements of life. 3.4.3 Critical Analysis of Idealism Limitations of Idealism: a) Though the aims of education are well laid, it lags behind in educational method.

NSOU ? CC-ED-02 ? 126 b) It is a rigid and dogmatic philosophy with immutable and fixed aims allowing the mental and moral energies to freeze instead of retaining an increasing impetus. c) It offers little in the practical fields of developing workable curriculum, organizing educational institutions and developing efficient methods. d) Idealistic education pays less attention to modern, industrial, social and economic environment. It is considered to be outmoded in the prevailing scientific world. e) Idealism maintains that ideals and morals are eternal and fixed. f) It neglects real possibilities, real ends and real moral life. g) It is based on mere intellectualism. At last Idealism is the most intellectual and oldest philosophical doctrine. According to the idealists the spiritual nature of man is to be unfolded by means of education. Idealistic education emphasizes the exaltation of personality of self-realization. The idealistic school curriculum should include subjects like Art, History, Philosophy, Literature, Religion and Morality. Idealism believes in inner discipline. The function of the teacher is to guide the child towards his utmost possible perfection. Idealism regards the teacher as the priest of man's spiritual heritage. However, in spite of lofty aims propounded by idealism, it is considered by some as outmoded in modern scientific world. 3.5 Epistemological Characteristics of Naturalism: The oldest philosophy in the West is Naturalism. It regards human life as a part of the scheme of nature. This is a type of philosophy to which 'nature is the whole reality'. Matter is supreme. Naturalism relegates man as a spiritual being to the background and disregards the existence of any spiritual potentialities in him. Naturalism is a philosophical doctrine. It is concerned with natural self or real self. It does not believe in spiritualism. According to it the material world is the only real world. This material world is being governed by a system of natural laws. The naturalists have regard only for the actual facts, actual situation and realities. For them nature is everything. 'Return to nature', 'break the chains of society' are its important slogans. Concept and Definition of Naturalism: a) "Naturalism is a philosophical position adopted by those who approach philosophy from purely scientific point of view".—Rusk

NSOU ? CC-ED-02 ? 127 b) "Naturalism is a metaphysics which considers nature as the whole of reality. It excludes what is supernatural of the world".—Hocking c) "Naturalism is a system whose salient characteristic is the exclusion of whatever is spiritual or indeed whatever is transcendental of experience from our philosophy of nature and man".—George Haward Joyce. d) "Naturalism is the philosophical generalisation of science, the application of the theories of science to the problems of philosophy". —R.B. Perry e) "Naturalism is an attitude rather than a specific system of philosophy". – Prem Nath. f) According to Ward, "

90%

MATCHING BLOCK 84/127

W

Naturalism is the doctrine which separates nature from God, subordinates' spirit to matter and sets up unchangeable laws as supreme". 1.

Chief Exponents of Naturalism: a) Democritus, a Greek philosopher (About 400BC). b) Epicurus, a Greek philosopher (342-270BC). c) Francis Bacon, an English philosopher (1561-1626AD). d) J.A. Comenius, a Czechoslovakian philosopher (1592-1670AD). e) Herbert Spencer, an English philosopher (1820-1903AD). f) Thomas Henry Huxley, an English Biologist (1825-1895). g) Jean Jacques Rousseau, a Swiss philosopher (1712-1778AD). 3.4.4 Basic features of Naturalism a) Nature is the base and essence of naturalistic philosophy. Nature is the final or ultimate

55%

MATCHING BLOCK 88/127

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

reality. b) All things come from matter, and are ultimately reduced to it. Matter in different proportion takes different

names. c) It does not approve the existence of soul or spirit. d) Mind is brain functioning. Brain is matter, experience, imagination; reasoning and mental activities are nothing but

73%

MATCHING BLOCK 89/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

the functions of brain. e) Laws of nature are unchangeable. The entire universe is governed

and guided by

NSOU ? CC-ED-02 ? 128 natural laws. Science unfolds the mysterious of nature. So, scientific knowledge is the real knowledge. f) Real knowledge comes through sense organs. In order to maintain effective learning, sensory experience should be performed. g) Naturalism sanctions utmost freedom to the child. For complete development of child's personality, freedom is an essential characteristic feature. h) Naturalism believes in evolution. Everything in nature is subject to change. i) Naturalists do not believe in the existence of God. j) They do not believe in higher spiritual values or eternal values. Man through his interaction with nature creates values. k) It does not give much importance to teacher and discipline. l) Individual is the real entity in nature. Society is merely an artificial structure for living together. m) It stands for the doctrine, 'follow nature', 'go back to nature' in education. n) Nature is the best book. Teacher has an insignificant place in naturalism. o) Man is essentially born good. It is the society that makes him bad. p) There is no God or any supernatural being. 2. Types/forms of Naturalism: Naturalism exists in different forms. From educational point of view naturalism may be grouped into: a) Physical Naturalism: Physical naturalism or material naturalism lays emphasis on physical nature. Man is only one of the objects of physical nature. He is governed by natural laws. The child should learn by himself in the lap of nature. Let him learn by his own experience. Follow nature is the watchword of naturalism. b) Biological Naturalism: Man is the highest form of living organism in the process of evolution. Like animals, man is endowed with instincts and impulses. Through education these animal instincts are to be sublimated. c) Mechanical Naturalism: This type of naturalism considers man as merely a machine. This machine is run by natural principles. The purpose of education should be to make this machine as capable and efficient as possible.

NSOU ? CC-ED-02 ? 129 d) Psychological Naturalism: Man is endowed with interests, urges, instincts and certain abilities. Instead of repression, these inherent natural qualities are to be developed properly through the right type of education. The school curriculum is to be framed according to the capacity of the child with proper attention to individual differences. The principles of naturalism have given birth to the school of Behaviourism. 3.4.5 Educational implication of Naturalism 3. Aims of education and Naturalism: If we analyse the tenets of different forms of naturalism, we find several aims of education. In short, the aims of education are: a) Make the human as machine: Man is a machine and the aim of education is to make the human machine as perfect and efficient as possible. With this end in view the students should learn some healthy habits which are useful in daily life. b) Self-preservation: Self-preservation constitutes the highest good in life. So, the aim of education should be to prepare the child for future struggle in life. According to Darwinian school of Naturalism, the aim of education should be to equip the individual for struggle for existence. c) Self-expression: The aim of education should be self-expression. According to P. Nunn, "Development of individuality is the central aim of education". d) Sublimation of the native instincts: According to McDougall, the aim of education should be the sublimation of the native instincts and energies of the individual. e) Development of child:

78%

MATCHING BLOCK 85/127

W

According to Rousseau, the aim of education should be the development of the child

in conformity with his nature.

f) Adjustment with the environment: The education should aim at developing such ability as to achieve adjustment with the environment. The ideal of education is to produce well-adjusted happy being. g) Happiness in mankind: The education should aim at establishing happiness in mankind. The education should create such an atmosphere in which children may enjoy their present as well as future happiness. h) Citizenship training: Development of qualities of successful citizenship is the aim of education.

NSOU ? CC-ED-02 ? 130 i) Proper utilization and enjoyment of leisure time: Education should train the child the manner how to spent leisure time profitably. Pleasure seeking should be the aim of education. 4. Curriculum and Naturalism: Aim of education determines the nature of the curriculum. The naturalists favour neither rigid nor fixed curriculum rather they support flexible and changeable curriculum. Different naturalists prescribe different curriculum. a) Naturalistic curriculum is based upon the psychology of the child. It gives importance to different age and stage of development. b) Naturalists advocate teaching of science which deals with nature e.g. Physics, Chemistry, Botany, Zoology along with art, craft and physical activities. c) For understanding science subjects better, study of Mathematics and languages are to be recommended. d) They give importance to subjects like nature study, Agriculture, Gardening, Craft, Art, Geology, Geography and Astronomy because these are in keeping with the nature of the child. These subjects are to be correlated with the play activities of the child and with the life around him. e) Conventional subjects, ideas, importance and knowledge built by sophisticated society should not be give any place in the curriculum. f) Naturalists' disfavour bookish education. g) For development of sense perception and practical judgement agriculture and carpentry are preferred. h) Astronomy and Geography are not to be studied from books but from the nature. i) Naturalists prefer the study of history and social studies to other subjects because they are the study of past experiences of the race. Past experiences explain the origin of the present. j) As the naturalists lay emphasis on the present life of the child, they want to include such subjects in curriculum which contribute directly to the development of health, vocational life, family life and social life. k) Physiology and hygiene are to be included in the curriculum for knowledge of body and health.

NSOU ? CC-ED-02 ? 131 l) For experimental activities, Arithmetic and Geometry are recommended. m) Naturalism does not give importance to spiritualism. Thus, there is no place for teaching about God and religion in school. n) According to naturalism, children do not like classical music and painting. These subjects should have no place in curriculum in curriculum because these are beyond their comprehension. But there are certain subjects like science, History, Geography, Language, Nature study, etc., which are to be given priority in mathematic curriculum. o) Rousseau favoured 'negative education' during childhood. The child should be subordinate to the natural order. When the child is left free to develop his body and senses, it is 'Negative Education'. 5. Methods of Teaching-learning process and Naturalism: a) Naturalism regards the child as the supreme centre of educational procedure. Methods of teaching in naturalistic school are guided by the principle of growth, pupil-activity and individualism. b) On the basis of the basic principles, teacher is not to impose anything even his teaching on the pupils. The child should be encouraged to discover things by himself. c) Child's need and interests should be given top priority in teaching process. d) Naturalists prefer self-education or auto-education. e) Naturalism employs no direct method of teaching through lecture or textbook. f) Emphasis is given laid on learning by doing. g) For teaching of science and mathematics, they advocate Heuristic method in place of Chalk and talk method. h) Prem Nath says, "Play-way is the supreme and valuable technique of teaching". Through play, the child acquires various competences. i) In addition to play-way method, naturalism advocates modern method of teaching like Kindergarten Method, Montessori Method, Activity Method, etc. j) Naturalism favours open door education or open air schools for natural development child's education.

NSOU ? CC-ED-02 ? 132 k) Naturalists do not support unnatural classroom method under the pattern of fixed timetable. l) Coercive or Deductive method is not preferred by naturalists. m) They favour lecture method for teaching of language and literature subjects. n) Experience, Observation, Learning by doing, Experiment in laboratory etc., are considered best method of teaching-learning process by naturalists. o) It favours students' self-government and co-education. Self-government will give direct experience of social life whereas co-education will develop right attitude towards community and family life. p) Learning through experience is one of the best method teaching-learning processes in naturalism. Regarding the method of teaching Rousseau advised, "

87%

MATCHING BLOCK 86/127

W

Give your scholar no verbal lessons, he should be taught by experience".

q) Rousseau encouraged Negative education. When the child is left free to develop his body and senses it is Negative education. 6. Role of Teacher and Naturalism: a) The teacher should not interfere in the natural development of the child. b) He should not impose ideals or ideas on students. c) He is only to help the child in the discovery of truth. d) Rousseau (1712-1778) and Fichte (1762-1814) are in favour of non-intervention of the teacher in the education

81%

MATCHING BLOCK 87/127

W

of the child. They think that the child's nature is essentially good, and any intervention is, therefore, harmful.

The teacher should treat the child as a small plant. His duty is like that of a gardener only. e) Ross thinks that the teacher has only to set the stage, supply the materials and opportunities provide an ideal environment and create conditions conducive to natural development, and then he is to recede in the background. 3.4.6 Critical Analysis of Naturalism Limitations of Naturalism: a) Naturalism keeps the child in the forefront of the entire process of education. It has sanctioned freedom to the child. It has succeeded in freeing the child from the NSOU ? CC-ED-02 ? 133 tyranny of teachers, rigidity, interference and strict control of society. b) It favours child-centric education instead of bookish and teacher-centred education. c) Child study movement or importance of study of child psychology has gathered momentum due to the naturalistic thought. d) Naturalism emphasizes the all-round development of child's personality in a natural way. e) Inflicting punishment on children is disfavoured and discarded by naturalistic education. f) Methods of teaching are the best contribution of naturalism. The methods like heuristic method, play-way method, learning by doing, etc. are recommended. g) Child-centred and diversified curriculum of naturalism have enriched and contributed a lot to modern education thought and practice. h) Open-air school is favourable for natural development which really deserves eulogy in underdeveloped countries. i) Residential school system advocated by naturalism has a complete bearing on modern public school system. j) It emphasizes practical knowledge than bookish knowledge. Knowledge gained through experiences is, beyond doubt, better than theoretical knowledge. k) Naturalistic methods of education are highly psychological as they are based on growth and development of the child, his interests and needs, his aptitudes and activities. In fine, it may be said that naturalism has secured freedom for the child. It has given an impetus to new psychological methods of education. Self-expression, follow nature, auto-education, play-way, paedacentricism, sense-training, self-discipline and learning by doing are some of the main features of modern education. But the concept of negative education cannot be fully accepted. It is said that whenever you carelessly leave the earth to nature, it bears weeds and thistles. Naturalism does not give any lofty ideal of education. For this we need to look at Idealism. Ross has rightly said, "Naturalism needs supplementing and correcting by Idealism because it is only Idealism that can give a clear vision of a satisfactory goal for educative effort. NSOU ? CC-ED-02 ? 134 3.4.7 Basic features of Pragmatism The word 'Pragmatism' is of Greek origin. It is the product of practical experiences of life. It arises out of actual living. It does not believe in fine and eternal values. It is dynamic and everchanging. There are no established systems of ideas, which will be true for all times. Pragmatism means action, from which the words practical and practice have come. Pragmatists are practical people. They face problems and try to solve them from practical point of view. Unlike idealists they live in the world of realities, not in the world of ideals. Pragmatists view life as it is, while idealists view life, as it should be. The central theme of pragmatism is activity. Exponents of Pragmatism Pragmatism accepts everything that has practical consequences. The chief exponents of pragmatism are Charles S. Peirce, William James, Schiller and John Dewey. Basic Principles of Pragmatism Some basic principles of Pragmatism are given below which will help make you the concept of. Pragmatism clearer: 1. The pragmatists believe that man is primarily a biological and social organism. 2. There are three inseparables - man & nature, individual & society & thought & action (or mind and body). 3. To the pragmatists, human beings are essentially active and incidentally contemplative. Action- not mere contemplation -is the aim of life. Activity is the means to attain the end of Knowledge, hence pragmatists believe in experimentalism. 4. There is no ultimate unchanging reality. Reality is that which is "experienced" by man. Since the experience of man is constantly changing; truths and reality are also changing constantly. Reality is manifold. 5. The pragmatists do not believe in any standard values in the world. Values are changeable. They change with the times, with the philosophy and with the circumstances. Values are testable. 6. To the pragmatists, mind is a dynamic process, which happens or functions within a man.

NSOU ? CC-ED-02 ? 135 7. There are many forms of pragmatism, a theory about reality, such as : humanistic pragmatism, experimental pragmatism, nominalistic pragmatism, biological pragmatism, American pragmatism, British pragmatism, etc. 3.4.8 Educational Implications of Pragmatism: Pragmatism and Aims of Education: 1. Education should be child centered: The child is a potential creator of values in the environment. So we should start with the child as he is, and provide suitable experiences and activities in which he can participate and thereby modify his original nature. 2. Education should be both for the child and the society: The social aspect of education should be emphasized. 3. Respect for child's freedom: The child's freedom must be respected. There should be no imposition of adult standard of authority. 4. Education should be based on child psychology: Education should be planned on the basis of psychological finding. Pragmatism and Curriculum: Pragmatists favour an educational curriculum which permits the educand to develop all his qualities and obtain all knowledge which may help him in creation of values, gaining social efficiency, developing harmonious personality, making proper adjustment and solving the problem of life. They have suggested the following principles in determining a curriculum: 1. Principle of Utility: Pragmatists state that curriculum should be utilitarian. Those subjects should be stressed in the curriculum which is useful in solving human problems and meeting life situations. For this reason, technical scientific education forms an important part of the Pragmatic curriculum. 2. Principle of child's nature and interests: Curriculum should be governed by child's natural interests, aptitudes and tastes at the successive stages of his development. In the words of Jon Dewey, "These natural interests are the natural resources, the uninvested capital upon the exercise of which depend on the actual growth of the child."

NSOU ? CC-ED-02 ? 136 Pragmatism and Methods of Teaching: Since Pragmatism emphasized the theory underlying successive practice, it makes significant contribution to the methods of teaching rather than its aims. Pragmatists detest all traditional methods, ready-made knowledge, and the notion of authority, bookish and passive learning. Traditional methods of teaching should not be dogmatically accepted. The following should be the principles or essential of teaching method: 1. Principle of Action or Learning by Doing: Pragmatists stress on action rather than reflection. They believe that the child learns best only through his activities or his experiences, he does not learn so much from books. 2. Principle of establishing relation with the life of the child: Pragmatists believe that methods of teaching should not be dogmatically accepted but they should be forged afresh in the light of real life situations. 3. Principle of Integration: The principle of integration is needed in the whole of the learning process. The human mind itself is a unity. There are not water-tight compartments in it. 3.4.9 Critical Analysis of Pragmatism The philosophy of pragmatism has been severely criticized on various grounds. Pragmatism does not advocate any absolute standards. Education is to help man to create his new standards of life. Eternal values create social cohesion and harmony. Without values, human conduct cannot be evaluated. Pragmatism neglects cherished values of humanity. Pragmatism opposes the spiritual values. It advocates extreme type of utilitarianism. Too much experimentalism is as bad as too much of faith and traditionalism. Pragmatism appears to be too radical and sceptical. It works towards denial of authority. Man has his limitations and to describe human purpose as the yardstick to perform actions, cannot be accepted as the whole story of human existence. The pragmatic aims of education are vague. Pragmatic methodology of teaching is also not free from criticism. Pragmatism tries to build knowledge through projects and experiments. The curriculum may be given or vocational and social efficiency bias, but wholesale condemnation of liberal studies and cultural subjects is not justified. Accomplishment of a task cannot be judged by results alone. Nevertheless, the philosophy of pragmatism has made important contributions to educational theory and practice and will continue to do so.

NSOU ? CC-ED-02 ? 137 3.5 Epistemological Characteristics of Humanism Humanism, a system of philosophical beliefs, that recognize man as the only worthy object of knowledge, has been the synthesis of ideas formulated by various great master thinkers like Socrates, Plato, Aristotle, Darwin, Maslow, etc. in the West and Buddha, Arabindo, Gandhiji, Tagore, etc. in the East. The concept of humanism is derived not from the experimental sciences, nor from the mathematical statistics, but from the great minds and works in oriental as well as western history and literature. Humanism is a movement to gain for man in a proper recognition in the universe. The English word humanism has been derived from the Latin term "Homo" which means human being. Thus literally meaning of the word "Humanism" is the philosophy in which man occupies a central place. Etymological meaning, however, is not the sufficient meaning of a term; it includes its historical usage as well. Thus in order to understand the full implication of the term "Humanism" one must take into account of historical evolution. In the historical evolution whatever has been, found to be useful for human welfare, has been attached with the concept of humanism such as the idea of social welfare, scientific attitude, progress of democratic institutions. Humanism is a very old philosophy. It has been interpreted in various ways, such as - a reasonable balance in life, vivid interest in all sides of life, freedom from religiosity, responsiveness to all human passions, a philosophy which holds that man is the centre and measure of all activities. In terms of the humanist thought, man is an end and not a means. 3.5.1 Basic features of Humanism The assumptions of humanism have distinctive connection with the conception of knowledge, truth and human values. Humanism believes that man's intelligence and conscience separate him from other animals and it is education in which such separation can be judged and maintained. This discussion concentrates mainly on rational humanism. Types of Humanism Secular Humanism: The branch of Humanism that rejects theistic religious belief and adherence to belief in the existence of a supernatural world. Secular Humanists (who are often scientists and academics) generally believe that following humanist principles leads to secularism (which asserts the right to be free from religious rule and teachings), on the basis that supernatural beliefs cannot be supported using rational arguments, and therefore the supernatural aspects of religiously associated activity should be rejected. The term "humanism" in general usually refers to Secular Humanism as a default meaning.

NSOU ? CC-ED-02 ? 138 Religious Humanism: The branch of Humanism that considers itself religious, or embraces some form of Theism, Deism or supernaturalism, without necessarily being allied with organized religion. It is often associated with artists, scholars in the liberal arts and liberal Christians (especially Unitarian Universalists, Quakers, Anglicans and Lutherans). Religious Humanists feel that Secular Humanism is too coldly logical and ignores the full emotional experience that makes humans human. Renaissance Humanism (often known as Classical Humanism or simply Humanism): The initial flowering of humanist thought in the 15th and 16th Centuries, in opposition to the dominant Scholastic philosophy of the day. Renaissance Humanists promoted human worth and individual dignity, and believed in the practice of the liberal arts for all classes. Post-Humanism (or Posthumanism): A late 20th Century philosophy which attempts to bring Renaissance Humanism up to date in a modern technological world, and to counter the allegations of speciesism (discrimination in favor of one species, usually the human species, over others) and anthropocentrism (the belief that human beings and human society are, or should be, the central focus of existence) which have been leveled at Humanism. Educational Humanism: A current in education which began to dominate school systems in the 17th Century. It held that the studies that develop human intellect are those that make humans "most truly human". It was based on the concept of faculty psychology (which views the mind as a collection of separate modules or distinct intellectual faculties, such as the analytical, the mathematical, the linguistic, etc), which has been largely discredited in the 20th Century. Marxist Humanism: A branch of Marxism that primarily focuses on Marx's earlier writings, (especially the "Economic and Philosophical Manuscripts" of 1844 in which he develops his theory of alienation), as opposed to his later works, which are considered to be concerned more with his structural conception of capitalist society. Integral Humanism: The political philosophy developed by the Jana Sangh movement in India in the 1960s, in opposition to Western political philosophies which it sees as preoccupied with materialism and over-looks of the social well-being of the individual. It sees both Capitalism and Socialism as essentially flawed, and as stimulating greed, class antagonisms, exploitation and social anarchy.

NSOU ? CC-ED-02 ? 139 Basic Principles of Humanism: Today the term "Humanism" is used to convey a philosophical belief, which believes in rendering service for the greater good of all humanity according to the demands of reason and democracy. Below, we mention the principal postulates of Humanism: 1. Humanism does not believe in supernaturalism. It regards nature as a system of constantly changing events. 2. Humanism believes in science and thinks that man, being a product of nature is a part of it. 3. Humanism considers that human thinking is a result of the interaction between the complex living organism and the environment. 4. Humanism thinks that man is competent to solve all his problems on the basis of his own reason and scientific method. 5. Humanism believes that man is the maker and master of his own destiny. 6. Humanism believes that man's happiness lies in this world. For the achievement of this happiness he should be free in this world to progress culturally, economically and ethically. Humanism as a philosophy - is social in origin and development. Education must preserve civilization through a concern for absolute values, and for the intellectual basis on which civilization stands. Humanists suggest that this respect must be inculcated in the young through three main directions. These are — (1) Respect for language, (2) Respect for ancient cultures, and (3) Respect for intellectuals and for literary scholarship. (1) Respect for Language The language used and taught at home and school should not be a fluctuating one. Correct form of language, which is found in ancient languages like Greek, Latin, Sanskrit and others should be taught to the student. Education must stress the use of correct and appropriate vocabulary and sentence structure through grammar and composition.

NSOU ? CC-ED-02 ? 140 (2) Respect for Ancient Cultures Education should foster an admiration and understanding of ancient cultures, which have contributed to the growth of human civilization. It is in these cultures that man finds the origin of his humanistic background, and hence it is essential for him to re-discover it for himself. (3) Respect for Intellectual and for Literary Scholarships The younger generation must learn to respect the wisdom of the scholars as it relates to the more important field of human values. Intellectuals through their vast knowledge and intellectual ability are in a favorable position to set goals for the society. These intellectual leaders and scholars must judge music, literature, religion and education. Society must learn to respect the wisdom of these scholars and it must realize that literary scholarship is on a higher intellectual. 3.5.2 Educational Implications of Humanism Aims and Ideal: If we analyse the tenets of different forms of naturalism, we find several aims of education. In short, the aims of education are: • According to humanism education aims at man making. • It attempts to be secular, rational and scientific. • It aims at realizing human values in the individual and society. According to it the education aims at complete development of human personality. • It directs man to solve individual and social problems. Its purpose is to increase efficiency and happiness of human beings. • It supports democratic philosophy of education since the values of liberty, equality and fraternity are fundamental human values. Thus, the educational institutions should be based upon democratic principles. It seeks to realize peace upon the earth. • The humanist tendency is rationalist and integral. • It is positivist since it supports meliorism. • Science alone can provide more leisure for cultural development. The individual and society are intimately related. Therefore, the children should develop team spirit and co-operation through play way method.

NSOU ? CC-ED-02 ? 141 • Community programmes should make community living easy and spontaneous. The society should be made conducive to all-round human progress. Integration of other Tendencies The humanist trend integrates psychological, sociological and eclectic tendencies in education. It makes human nature the basis of education. It emphasizes the value of individual differences in education. It makes education child-centered. While on the one hand the aim of education is the propagation of knowledge, social control, social development and preservation of social heritage, it also seeks to integrate all these. Thus, it is an integral approach to education. Its aim of education is integral. This aim of education is based upon integral psychology. Man according to the humanists, is a self having body as well as intellect. All these should be integrated. Curriculum: The humanist believes that in all educational endeavours the accent will be also social rather than only individualistic. This will imply more emphasis on the study of social studies, such as; sociology, politics and economic Ethics will be included in the curriculum in order to help the youth to imbibe broad humanist attitudes, which will imply loyalty to the social group and to mankind. The teaching of Science and Scientific method is also greatly emphasized. The curriculum is both liberal and extensive. Methods of Teaching: The humanist method of teaching is based on educational psychology. The teacher educates according to the principles of child psychology, developmental psychology and educational psychology. Besides, the theoretical instruction methods for development of social virtues are emphasized. Education is provided through the vernacular, since it encourages originality and creativity. National and international languages are also taught at higher stages since the humanist seeks to encourage human communications on national and international stage. Essentials of Humanism: The above discussion makes it clear that humanism is obviously against all types of super-naturalism or super-humanism. It cannot consider any man to be essentially greater than other human beings. In it the term human welfare means the welfare of ordinary human beings. It does not aim at superman but only at man. Its control standpoint is faith in the dignity of man. Since man is the creature of this earth, humanism is this - worldly and

NSOU ? CC-ED-02 ? 142 against all types of other - worldly theories. The humanist ethics is not governed by any religious faith other than faith in human dignity. So far as human welfare has been advanced by science, the humanist respects science but if science becomes an impediment in his progress he would not hesitate in criticizing it and fixing its limitations. The western humanists have been lagging behind in this particular function through today many Western thinkers have started pointing out to the evils and dangers of a cult of science. Since each human being is important for the humanist, humanism is against all distinctions among human beings on the basis of country, nation, race, class, caste, sex, religion, economic status, scholarship and abilities. As humanism supports the idea of world citizenship. But as has been already pointed out, the concept of humanism does not negate other human loyalties but fulfils them because unity in diversity is the basis of the richness of the human culture. 3.5.3 Critical Analysis of Humanism Merits of Humanism • Humanistic education is essential for preparing young people to be citizens in a democracy. If democracy is to work, its citizens must be educated. They must know how to gather information, distinguish fact from opinion, analyze propaganda, understand many different viewpoints, understand justice, think for themselves, communicate their opinions clearly, and work with others for the common good. These are among the most important skills that humanistic education seeks to teach our youth. • Humanistic education enhances the teaching of the basics. Many of the major books and articles on humanistic education show teachers how to do a more effective job of teaching reading, writing, math, social studies, etc. Many of the best traditional-subject-matter teachers integrate humanistic education methods and materials into their basic curriculum. Rather than ignoring the basics, humanistic educators seek to expand our concept of what basic education is, saying that basic skills for surviving in today's world go beyond reading, writing, computation, and vocational skills and include other skills for communicating, problem-solving and decision-making. • Humanistic education is not psychotherapy. It is not the goal of humanistic education to help students overcome deep-seated emotional problems. Rather, humanistic education seeks to help students to learn useful skills for living and to deepen their understanding of issues relevant to their academic and social development. Teachers

NSOU ? CC-ED-02 ? 143 do not need to be trained psychologists to conduct humanistic education activities. They do require sensitivity to students, classroom management skills, and the ability to conduct a class discussion. These skills are within the grasp of all good teachers. • Humanistic education is supported by years of research and experience. One of the strongest reasons for supporting humanistic education is that, when done effectively, students learn! Considerable evidence shows that cooperative learning structures higher self-concepts, and the student's motivation and interest in learning all are related to greater academic achievement. Studies also show that humanistic education can lead to fewer discipline problems, less vandalism and reduced use of illegal drugs...Such research findings do not prove that particular humanistic education methods should be used in all situation. • Humanistic education encourages parent involvement in the schools. What parent does not sometimes wish his or her children would listen more respectfully, choose less impulsively, calm down when overexcited, learn to be assertive without being aggressive, or make better use of their time? Many humanistic education methods teach students how to do these things.. Several humanistic education approaches teach students to relax and control their nervous energy and to plan and take more responsibility for their time • Humanistic educators believe that schools have a role to play in the "values education" of students. While the home and religion have the major responsibility in the value development and moral development of children, the school also has a legitimate role. Few parents have ever questioned the school's role in encouraging the values of punctuality, fairness, health, courtesy, respect for property, neatness and the like. Humanistic educators believe schools also should encourage the democratic and humanitarian values of tolerance, self-respect, freedom of thought, respect for others, social responsibility and the like. Schools cannot and should not be "value-free." Limitations of Humanism: • Humanism is often depicted as denying spiritual values and is accordingly "represented as discarding morality, and preaching what is reproachfully described as the principle of 'good and no conscience'". However, some scholars believe, however, that this is a misunderstanding of the Humanism position since "no serious

NSOU ? CC-ED-02 ? 144 thinker could have included such a teaching” Humanism believes not in the notion of stringent philosophy, but in liberal beliefs. Hence, they refute most of the already- established rules in the context of philosophy • Another criticism often leveled at the Humanism movement is that it is essentially anti-intellectual. While this is perhaps an overstatement, it is true that the main area of concern for Humanists is the marketplace of daily life. Thus, those philosophies oriented toward a rather rationalistic a priori type of thought will find the Humanists empirical and anti-intellectual. 3.6 Summary The above educational implications of humanism reveal that it is the best blue print for the planning of future education. It is the solid basis for development of values and culture. It is an integral approach to aims and ideals, means, curriculum and organization of education. In fact, humanism may be called the future philosophy of education acceptable and required everywhere. We discussed the basic Characteristics of Western Philosophy: Classical and Modern. Also discuss the Epistemological Characteristics of Idealism, Naturalism, Pragmatism, & Humanism and their Applications on Educaion. • The present Unit has attempted to give you the basic meaning and concept of some Westernschools of philosophy. We have seen in detail that the exponents, principles, characteristics, aims,methods of teaching and curriculum, etc. deduced from Idealism, The present Unit, hence, providesyou the necessary perspectives as well as the basic foundations of thoughts on ‘Education’ in theWestern world. You have been able to understand that the intimate relations of philosophy andeducation, to what extent those relationships are valuable to you as a student ofeducation,. Your present understanding, you may keep in your mind, will help you learn other Units of this Block. • The present Unit has attempted to give you the basic meaning and concept of Westernschools of philosophy - Naturalism. We have seen in detail that the exponents, principles, characteristics, aims,methods of teaching and curriculum, etc. deduced from Naturalism, The present Unit, hence, providesyou the necessary perspectives as well as the basic foundations of thoughts on ‘Education’ in theWestern world. You have been able to understand that the intimate relations of

Gain an understanding of Education

for inculcation of values ? Enumerate Values and Social Philosophy Enshrined in Indian Constitution ? Delineate and explain major provisions of Education in the Indian Constitution 4.2 Introduction You are bearing with you some general ideas about Education through Inculcation Values, Values and Social Philosophy Enshrined in Indian Constitution, Major provisions of Education in the Indian Constitution, We hope, you like to understand these two concepts more critically as well as to extent your knowledge about these content.

NSOU ? CC-ED-02 ? 148 4.3 Education for Inculcation of Values Values are defined in literature as everything from eternal ideas to behavioral actions. As used here values refer to criteria for determining levels of goodness, worth or beauty. Values are affectively-laden thoughts about objects, ideas, behavior, etc. that guide behavior, but do not necessarily require it (Rokeach, 1973). The act of valuing is considered an act of making value judgments, an expression of feeling, or the acquisition of and adherence to a set of principles. We are covering values as part of the affective system. However, once they are developed they provide an important filter for selecting input and connecting thoughts and feelings to action and thus could also be included in a discussion of the regulatory system. Values are a person's (a) Fundamental preferences and commitments, (b) Standards for determining worth or merit, and (c) Basic concepts of goodness, rightness, and fairness. Values serve as criteria that guide three kinds of choices an individual makes: What is preferable here? What is of highest quality? & What is right? The answers to these questions in specific instances the choices and conclusions and judgments a person makes, the actions she takes in her day-to-day life reflect this person's basic values. They represent them. They concretize them. As human beings, each of us has the power and, I believe, the responsibility to choose our values and then use them to guide our life. Values are those characteristics of human society which set norms, exert control and influence the thinking, willing, feeling and actions of individuals. 4.3.1 Types of Values 1. Human Values: Preparation of text-books and resource materials about environmental education can play an important role in building positive attitudes about environment. The basic human value 'man in nature' rather than 'nature for man' needs to be infused through the same. 2. Social Values: Love, compassion, tolerance and justice which are the basic teachings of most of our religions need to be woven into environmental education. These are the values to be

NSOU ? CC-ED-02 ? 149 nurtured so that all forms of life and the biodiversity on this earth are protected. 3. Cultural and Religious Values: These are the values enshrined in Vedas like 'Dehi me dadamite' i.e. "you give me and give you" (Yajurveda) emphasize that man should not exploit nature without nurturing her. Our cultural customs and rituals in many ways teach us to perform such functions as would protect and nurture nature and respect every aspect of nature, treating them as sacred, are it rivers, earth, mountains or forests. 4. Ethical Values: Environmental education should encompass the ethical values of earth-centric rather than human-centric world-view. The educational system should promote the earth-citizenship thinking. Instead of considering human being as supreme we have to think of the welfare of the earth. 5. Global Values: The concept that the human civilization is a part of the planet as a whole and similarly nature and various natural phenomena over the earth are interconnected and inter-linked with special bonds of harmony. If we disturb this harmony anywhere there will be an ecological imbalance leading to catastrophic results. 6. Spiritual Values: Principles of self-restraint, self-discipline, contentment, reduction of wants, freedom from greed and austerity are some of the finest elements intricately woven into the traditional and religious fabric of our country. All these values promote conservationism and transform our consumeristic approach. 4.3.2 Emerging Perceptions in Value Education Values education is an explicit attempt to teach about values and/or valuing. Superka, Ahrens, & Hedstrom (1976) state there are five basic approaches to values education: inculcation, moral development, analysis, values clarification, and action learning. Let us briefly look into these perspectives. Inculcation Most educators viewing values education from the perspective of inculcation see values as socially or culturally accepted standards or rules of behavior. Valuing is therefore considered a process of the student identifying with and accepting the standards or norms of the important individuals and institutions within his society. The student "incorporates" these values into his or her own value system. These

NSOU ? CC-ED-02 ? 150 educators take a view of human nature in which the individual is treated, during the inculcation process, as a reactor rather than as an initiator. Extreme advocates such as Talcott Parsons (1951) believe that the needs and goals of society should transcend and even define the needs and goals of the individuals. However, advocates who consider an individual to be a free, self-fulfilling participant in society tend to inculcate values as well, especially values such as freedom to learn, human dignity, justice, and self-exploration. Both the social- and individualistic-oriented advocates would argue the notion that certain values are universal and absolute. The source of these values is open to debate. On the one hand some advocates argue they derive from the natural order of the universe; others believe that values originate in an omnipotent Creator. In addition to Parsons (1951), the theoretical work of Sears and his colleagues (1957, 1976) and Whiting (1961) provide support for this position. More contemporary researchers include Wynne and Ryan (1989, 1992). The materials developed by the Georgia Department of Education (1997), the work of William Bennett (e.g., 1993) and The Character Education Institute (CEI) also promote the inculcation viewpoint. Moral Development: Educators adopting a moral development perspective believe that moral thinking develops in stages through a specific sequence. This approach is based primarily on the work of Lawrence Kohlberg (1969, 1984) as presented in his 6 stages and 25 "basic moral concepts." This approach focuses primarily on moral values, such as fairness, justice, equity, and human dignity; other types of values (social, personal, and aesthetic) are usually not considered. It is assumed that students invariantly progress developmentally in their thinking about moral issues. They can comprehend one stage above their current primary stage and exposure to the next higher level is essential for enhancing moral development. Educators attempt to stimulate students to develop more complex moral reasoning patterns through the sequential stages. Kohlberg's view of human nature is similar to that presented in the ideas of other developmental psychologists such as Piaget (1932, 1962), Erikson (1950), and Loevinger et al. (1970). This perspective views the person as an active initiator and a reactor within the context of his or her environment; the individual cannot fully change the environment, but neither can the environment fully mold the individual. A person's actions are the result of his or her feelings, thoughts, behaviors, and experiences. Although the environment can determine the

NSOU ? CC-ED-02 ? 151 content of one's experiences, it cannot determine its form. Genetic structures already inside the person are primarily responsible for the way in which a person internalizes the content, and organizes and transforms it into personally meaningful data. The moral development technique most often used is to present a hypothetical or factual value dilemma story which is then discussed in small groups. Students are presented with alternative viewpoints within these discussions which is in hypothesized to lead to higher, more developed moral thinking. There are three critical variables that make a dilemma appropriate: • The story must present "a real conflict for the central character", include "a number of moral issues for consideration", and "generate differences of opinion among students about the appropriate response to the situation." • A leader who can help to focus the discussion on moral reasoning. • A classroom climate that encourages students to express their moral reasoning freely (Gailbraith & Jones, 1975, p. 18). The analysis approach to values education was developed mainly by social science educators. The approach emphasizes rational thinking and reasoning. The purpose of the analysis approach is to help students use logical thinking and the procedures of scientific investigation in dealing with values issues. Students are urged to provide verifiable facts about the correctness or value of the topics or issues under investigation. A major assumption is that valuing is the cognitive process of determining and justifying facts and beliefs derived from those facts. This approach concentrates primarily on social values rather than on the personal moral dilemmas presented in the moral development approach. The rationalist (based on reasoning) and empiricist (based on experience) views of human nature seem to provide the philosophical basis for this approach. Its advocates state that the process of valuing can and should be conducted under the 'total authority of facts and reason' (Scriven, 1966, p. 232) and 'guided not by the dictates of the heart and conscience, but by the rules and procedures of logic' (Bond, 1970, p. 81). The teaching methods used by this approach generally center around individual and group study of social value problems and issues, library and field research, and rational class discussions. These are techniques widely used in social studies instruction. A variety of higher-order cognitive and intellectual operations are frequently used (similar in many ways to those advocated members of the critical thinking movement). These include: 1. Stating the issues; NSOU ? CC-ED-02 ? 152 2. Questioning and substantiating in the relevance of statements; 3. Applying analogous cases to qualify and refine value positions; 4. Pointing out logical and empirical inconsistencies in arguments; 5. Weighing counter arguments; and 6. Seeking and testing evidence. Values Clarification: The values clarification approach arose primarily from humanistic psychology and the humanistic education movement as it attempted to implement the ideas and theories of Gordon Allport (1955), Abraham Maslow (1970), Carl Rogers (1969), and others. The central focus is on helping students use both rational thinking and emotional awareness to examine personal behavior patterns and to clarify and actualize their values. It is believed that valuing is a process of self-actualization, involving the subprocesses of choosing freely from among alternatives, reflecting carefully on the consequences of those alternatives, and prizing, affirming, and acting upon one's choices. Values clarification is based predominately on the work of Rath, Harmin & Simon (1978), Simon & Kirschenbaum (1973), and Simon, Howe & Kirschenbaum (1972). Whereas the inculcation approach relies generally on outside standards and the moral development and analysis approaches rely on logical and empirical processes, the values clarification approach relies on an internal cognitive and affective decision making process to decide which values are positive and which are negative. It is therefore an individualistic rather than a social process of values education. From this perspective, the individual, if he or she is allowed the opportunity of being free to be his or her true self, makes choices and decisions affected by the internal processes of willing, feeling, thinking, and intending. It is assumed that through self-awareness, the person enters situations already pointed or set in certain directions. As the individual develops, the making of choices will more often be based on conscious, self-determined thought and feeling. It is advocated that the making of choices, as a free being, which can be confirmed or denied in experience, is a preliminary step in the creation of values (Moustakas, 1966). Within the clarification framework a person is seen as an initiator of interaction with society and environment. The educator should assist the individual to develop his or her internal processes, thereby allowing them, rather than external factors, to be the prime determinants of human behavior; the individual should be free to change the environment to meet his or her needs. Methods used in the values clarification approach NSOU ? CC-ED-02 ? 153 include large- and small-group discussion; individual and group work; hypothetical, contrived, and real dilemmas; rank orders and forced choices; sensitivity and listening techniques; songs and artwork; games and simulations; and personal journals and interviews; self- analysis worksheet. A vital component is a leader who does not attempt to influence the selection of values. Like the moral development approach, values clarification assumes that the valuing process is internal and relative, but unlike the inculcation and developmental approaches it does not posit any universal set of appropriate values. Action Learning The action learning approach is derived from a perspective that valuing includes a process of implementation as well as development. That is, it is important to move beyond thinking and feeling to acting. The approach is related to the efforts of some social studies educators to emphasize community-based rather than classroom-based learning experiences. In some ways it is the least developed of the five approaches. However, a variety of recent programs have demonstrated the effectiveness of the techniques advocated by this approach (e.g., Cottom, 1996; Gauld, 1993; Solomon et al., 1992). Advocates of the action learning approach stress the need to provide specific opportunities for learners to act on their values. They see valuing primarily as a process of self-actualization in which individuals consider alternatives; choose freely from among those alternatives; and prize, affirm, and act on their choices. They place more emphasis on action-taking inside and outside the classroom than is reflected in the moral development, analysis, and values clarification processes. Values are seen to have their source neither in society nor in the individual but in the interaction between the person and the society; the individual cannot be described outside of his or her context. The process of self-actualization, so important to the founders of the values clarification approach, is viewed as being tempered by social factors and group pressures. In this way it is more related to Maslow's (1971) level of transcendence which he discussed towards the end of his career. A problem-solving/decision making model and related techniques that can serve as a sound beginning for this approach is presented by Huitt (1992): Input Phase--a problem is perceived and an attempt is made to understand the situation or problem 1. Identify the problem(s) and state it (them) clearly and concisely 2. State the criteria that will be used to evaluate possible alternatives to the problem as well as the effectiveness of selected solutions; state any identified boundaries of acceptable alternatives, important values or feelings to be considered, or results

NSOU ? CC-ED-02 ? 154 that should be avoided 3. Gather information or facts relevant to solving the problem or making a decision. Processing Phase-alternatives are generated and evaluated and a solution is selected 4. Develop alternatives or possible solutions 5. Evaluate the generated alternatives vis-a-vis the stated criteria 6. Develop a solution that will successfully solve the problem (diagnose possible problems with the solution and implications of these problems; consider the worst that can happen if the solution is implemented; evaluate in terms of overall "feelings" and "values") Output Phase--includes planning for and implementing the solution 7. Develop plan for implementation (sufficiently detailed to allow for successful implementation) 8. Establish methods and criteria for evaluation of implementation and success 9. Implement the solution Review Phase--the solution is evaluated and modifications are made, if necessary. 10. Evaluating implementation of the solution (an ongoing process). 11. Evaluating the effectiveness of the solution 12. Modifying the solution in ways suggested by the evaluation process 4.4 Values and Social Philosophy enshrined in Indian Constitution 4.4.1 Constitutional Values The Constitution of any country serves several purposes. It lays down certain ideals that form the basis of the kind of country that we as citizens aspire to live in. A country is usually made up of different communities of people who share certain beliefs, but may not necessarily agree on all issues. A Constitution helps serve as a set of principles, rules and procedures on which there is a consensus. These form the basis according to which the people want the country to be governed and the society to move on. This includes not only an agreement on the type of government but also on certain ideals that the country should uphold. The Indian Constitution has certain core constitutional values that constitute its spirit and are expressed in various articles and provisions. But do you know what is the meaning of the word, 'value'? You may immediately say that truth, non-violence, peace,

NSOU ? CC-ED-02 ? 155 cooperation, honesty, respect and kindness are values, and you may continue to count many such values. In fact, in a layman's understanding, value is that which is very essential or 'worth having and observing' for the existence of human society as an entity. The Indian Constitution contains all such values, the values that are the universal, human and democratic of the modern age. Constitutional Values and the Preamble of the Constitution Have you read the Preamble to the Indian Constitution printed in the beginning of this material? As has been stated above, the constitutional values are reflected in the entire Constitution of India, but its Preamble embodies 'the fundamental values and the philosophy on which the Constitution is based'. The Preamble to any Constitution is a brief introductory statement that conveys the guiding principles of the document. The Preamble to the Indian Constitution also does so. The values expressed in the Preamble are expressed as objectives of the Constitution. These are: sovereignty, socialism, secularism, democracy, republican character of Indian State, justice, liberty, equality, fraternity, human dignity and the unity and integrity of the Nation. Let us discuss these constitutional values: Sovereignty: You may have read the Preamble. It declares India "a sovereign socialist secular democratic republic". Being sovereign means having complete political freedom and being the supreme authority. It implies that India is internally all powerful and externally free. It is free to determine for itself without any external interference (either by any country or individual) and nobody is there within to challenge its authority. This feature of sovereignty gives us the dignity of existence as a nation in the international community. Though the Constitution does not specify where the sovereign authority lies but a mention of 'We the People of India' in the Preamble clearly indicates that sovereignty rests with the people of India. This means that the constitutional authorities and organs of government derive their power only from the people. Socialism: You may be aware that social and economic inequalities have been inherent in the Indian traditional society. Which is why, socialism has been made a constitutional value aimed at promoting social change and transformation to end all forms of inequalities. Our Constitution directs the governments and the people to ensure a planned and coordinated social development in all fields. It directs to prevent concentration of wealth and power in a few hands. The Constitution has specific provisions that deal with inequalities in the Chapters on Fundamental Rights and Directive Principles of State Policy. Secularism: We all are pleased when anyone says that India is a home to almost all

NSOU ? CC-ED-02 ? 156 major religions in the world. In the context of this plurality (means more than one or two; many), secularism is seen as a great constitutional value. Secularism implies that our country is not guided by any one religion or any religious considerations. However, the Indian state is not against religions. It allows all its citizens to profess, preach and practise any religion they follow. At the same time, it ensures that the state does not have any religion of its own. Constitution strictly prohibits any discrimination on the ground of religion. 4. Democracy: The Preamble reflects democracy as a value. As a form of government it derives its authority from the will of the people. The people elect the rulers of the country and the elected representatives remain accountable to the people. The people of India elect them to be part of the government at different levels by a system of universal adult franchise, popularly known as 'one man one vote'. Democracy contributes to stability, continuous progress in the society and it secures peaceful political change. It allows dissent and encourages tolerance. And more importantly, it is based on the principles of rule of law, inalienable rights of citizens, independence of judiciary, free and fair elections and freedom of the press. Republic: India is not only a democratic nation but it is also a republic. The most important symbol of being a republic is the office of the Head of the State, i.e. the President who is elected and who is not selected on the basis of heredity, as is found in a system with monarchy. This value strengthens and substantiates democracy where every citizen of India is equally eligible to be elected as the Head of the State. Political equality is the chief message of this provision. Justice: At times you may also realise that living in a democratic system alone does not ensure justice to citizens in all its totality. Even now we find a number of cases where not only the social and economic justice but also the political justice is denied. Which is why, the constitution-makers have included social, economic and political justice as constitutional values. By doing so, they have stressed that the political freedom granted to Indian citizens has to be instrumental in the creation of a new social order, based on socio- economic justice. Justice must be availed to every citizen. This ideal of a just and egalitarian society remains as one of the foremost values of the Indian Constitution. Liberty: The Preamble prescribes liberty of thought, expression, belief, faith and worship as one of the core values. These have to be assured to every member of all the communities. It has been done so, because the ideals of democracy can not be attained without the presence of certain minimal rights which are essential for a free and civilized existence of individuals. Equality: Equality is as significant constitutional value as any other.

NSOU ? CC-ED-02 ? 157 The Constitution ensures equality of status and opportunity to every citizen for the development of the best in him/her. As a human being everybody has a dignified self and to ensure its full enjoyment, inequality in any form present in our country and society has been prohibited. Equality reflected specifically in the Preamble is therefore held as an important value.

Fraternity: There is also a commitment made in the Preamble to promote the value of fraternity that stands for the spirit of common brotherhood among all the people of India. In the absence of fraternity, a plural society like India stands divided. Therefore, to give meaning to all the ideals like justice, liberty and equality, the Preamble lays great emphasis on fraternity. In fact, fraternity can be realized not only by abolishing untouchability amongst different sects of the community, but also by abolishing all communal or sectarian or even local discriminatory feelings which stand in the way of unity of India.

Dignity of the individual: Promotion of fraternity is essential to realize the dignity of the individual. It is essential to secure the dignity of every individual without which democracy can not function. It ensures equal participation of every individual in all the processes of democratic governance.

Unity and integrity of the Nation: As we have seen above, fraternity also promotes one of the critical values, i.e. unity and integrity of the nation. To maintain the independence of the country intact, the unity and integrity of the nation is very essential. Therefore, the stress has been given on fostering unity amongst all the inhabitants of the country. Our Constitution expects from all the citizens of India to uphold and protect the unity and integrity of India as a matter of duty.

International peace and a just international order: The value of international peace and a just international order, though not included in the Preamble is reflected in other provisions of the Constitution. The Indian Constitution directs the state (a) to promote international peace and security, (b) maintain just and honourable relations between nations, (c) foster respect for international law and treaty obligations, and (d) encourage settlement of international disputes by arbitration. To uphold and observe these values is in the interest of India. The peace and just international order will definitely contribute to the development of India.

Fundamental Duties: Our Constitution prescribes some duties to be performed by the citizens. It is true that these duties are not enforceable in the court of law like the fundamental rights are, but these duties are to be performed by citizens. Fundamental duties have still greater importance because these reflect certain basic values like patriotism, nationalism, humanism, environmentalism, harmonious living, gender equality, scientific temper and inquiry, and individual and collective excellence. The discussion on the Preamble embodying constitutional values clearly demonstrates that these are important for the successful functioning of Indian democracy. Your understanding of these values will be further reinforced, when you will find in the following discussion that constitutional values permeate all the salient features of Indian Constitution.

The main features of the Constitution as shown in the illustration are as follows:

1. **Written Constitution:** As has been stated earlier, the Constitution of India is the longest written constitution. It contains a Preamble, 395 Articles in 22 Parts, 12 Schedules and 5 Appendices. It is a document of fundamental laws that define the nature of the political system and the structure and functioning of organs of the government. It expresses the vision of India as a democratic nation. It also identifies the fundamental rights and fundamental duties of citizens. While doing so, it also reflects core constitutional values.
2. **A Unique Blend of Rigidity and Flexibility:** In our day-to-day life, we find that it is not easy to bring about changes in a written document. As regards Constitutions, generally written constitutions are rigid. It is not easy to bring about changes in them frequently. The Constitution lays down special procedure for constitutional amendments. In the unwritten constitution like the British Constitution, amendments are made through ordinary law-making procedure. The British Constitution is a flexible constitution. In the written constitution like the US Constitution, it is very difficult to make amendments. The US Constitution, therefore, is a rigid constitution. However, the Indian Constitution is neither as flexible as the British Constitution nor as rigid as the US Constitution. It reflects the value of continuity and change. There are three ways of amending the Constitution of India. Some of its provisions can be amended by the simple majority in the Parliament, and some by special majority, while some amendments require special majority in the parliament and approval of States as well.
3. **Fundamental Rights and Duties:** You must be familiar with the term fundamental rights. We quite often find it in newspapers or while watching television. The Constitution of India includes these rights in a separate Chapter which has often been referred to as the 'conscience' of the Constitution. Fundamental Rights protect citizens against the arbitrary and absolute exercise of power by the State. The Constitution guarantees the rights to individuals against the State as well as against other individuals. The Constitution also guarantees the rights of minorities against the majority. Besides these rights, the Constitution

NSOU ? CC-ED-02 ? 159 has provisions identifying fundamental duties, though these are not enforceable as the fundamental rights are. These duties reflect some of the basic values embodied in the Constitution. 4. Directive Principles of State Policy: In addition to Fundamental Rights, the Constitution also has a section called Directive Principles of State Policy. It is a unique feature of the Constitution. It is aimed at ensuring greater social and economic reforms and serving as a guide to the State to institute laws and policies that help reduce the poverty of the masses and eliminate social discrimination. In fact, as you will study in the lesson on "India-A Welfare State", these provisions are directed towards establishment of a welfare state. 5. Integrated Judicial System: Unlike the judicial systems of federal countries like the United States of America, the Indian Constitution has established an integrated judicial system. Although the Supreme Court is at the national level, High Courts at the state level and Subordinate Courts at the district and lower level, there is a single hierarchy of Courts. At the top of the hierarchy is the Supreme Court. This unified judicial system is aimed at promoting and ensuring justice to all the citizens in uniform manner. Moreover, the constitutional provisions ensure the independence of Indian judiciary which is free from the influence of the executive and the legislature. 6. Single Citizenship: Indian Constitution has provision for single citizenship. Do you know what does it mean? It means that every Indian is a citizen of India, irrespective of the place of his/her residence or birth in the country. This is unlike the United States of America where there is the system of double citizenship. A person is a citizen of a State where he/she lives as well as he/she is a citizen of U.S.A. This provision in the Indian Constitution definitely reinforces the values of equality, unity and integrity. 7. Universal Adult Franchise: The values of equality and justice are reflected in yet another salient feature of the Constitution. Every Indian after attaining certain age (at present 18 years) has a right to vote. No discrimination can be made on the basis of religion, race, caste, sex, descent, and place of birth or residence. This right is known as universal adult franchise. 8. Federal System and Parliamentary Form of Government: Another salient feature of the Indian Constitution is that it provides for a federal system of state and parliamentary form of government. We shall discuss these below in detail. But it is necessary to note here that the federal system reflects the constitutional value of unity and integrity of the nation, and more importantly the value of decentralization of power. The parliamentary

NSOU ? CC-ED-02 ? 160 form of government reflects the values of responsibility and sovereignty vested in the people. The core principle of a parliamentary government is the responsibility of the executive to the legislature consisting of the representatives of the people. Justice ensures that the freedom of one does not become tyranny for another. The Justice to be truly meaningful needs sharing of power, compassion towards under-privileged and empathy towards the disadvantage. An education of rights and duties becomes important to ensure to fight for justice. Liberty of thought and action is a fundamental value embedded in our Constitution. It is the basis for creativity and exploration of new ideas and experiments that can advance social progress. Respecting the rights of others to liberty of thought and action are the hall marks of a civilized society. Ensuring that this liberty of thought and action is not used to belittle or diminish the beliefs and status of others is what constitutes a decent society. Democracy creates opportunity to pursue one's chosen ends as well as respect others' rights to do so. In a diverse country like India, exercising freedom with responsibility is a must for ensuring peace in the nation. Equality is another value enshrined in the Constitution. Freedom and justice remain mere words if equality is not ensured. It implies freedom from exploitation and ensuring to provide opportunities for individual's development, irrespective of the background, gender, cultural or socio-economic identity and status. Fraternity is at the heart of school, society and nation. Social solidarity is a vital part of a society that has place for the aspirations of all members of society. Understanding the importance of fraternity or solidarity and the knowledge that we all belong to a large community, a nation and the globe is also to discover our innate humanity. It is only we recognize our interdependence then we empower to help build a peaceful nation and a world. The citizens need to internalize the principals of equality, justice and liberty to promote fraternity among all, regardless of religious beliefs, regional and local diversity. As the Constitution encompasses the values for living in harmony with self and one's natural and social environment. It provides the baseline in working out the framework of values to be nurtured in students. If values like truthfulness, sense of responsibility, trustworthiness, loyalty, love, peace, respect for others etc. are nurtured right from the beginning, the efforts will go a long way to enable students abide by the Constitution and contribute to larger health of society and nation at large. In fact, promoting values at the school or societal level begins with the individual and the individual in relation to community,

NSOU ? CC-ED-02 ? 161 larger society, nation and the world. As desired earlier, value education does not take place in isolation. It must be set in the context of the world in which we live. Our choice to decide about the key value concerns in schools must also be firmly rooted in the contemporary challenges of society. Where there is terrorist's attack every now and then, women and girls are abused, where theft, murder and violence are so frequent, where many are marginalized and ignored by society as a whole, it is important that education for values is clearly set in the global as well as local contexts. Threats to humanity from climate change, globalization, emergence of technological choices, violence, terrorism, commercialization of education, the increasingly competitive environment and the aspirations of parents place a tremendous burden and add to the stress and anxiety on children. Schools are the microcosms of the world society. The disorder of the society and the world surfaces in schools in many ways. Further, there are disadvantages in education arising from inequalities of gender, caste, language, culture, religion, disabilities etc. These hierarchies deeply influence access to education and participation of children in schools which range from the high cost 'public' (private) schools to poorly functioning local body run primary schools. These realities tend to reinforce privilege and exclusion in schooling and undermine the constitutional values of equality of opportunity and social justice. All these conditions are detrimental to the personal growth and development of students and distortion of values leading to indiscipline, violence, lack of responsibility, lack of respect etc. Thus our efforts towards value education must be rooted in the context of the problems and issues facing teachers and pupils in the schools. 4.4.2 The Fundamental Duties as noted in Indian Constitution It shall be the duty of every citizen of India; The Fundamental Duties noted in the constitution are as follows: to abide by the Constitution and respect its ideals and institutions, the National Flag and the National Anthem; • To cherish and follow the noble ideals which inspired our national struggle for freedom; • To uphold and protect the sovereignty, unity and integrity of India; • To defend the country and render national service when called upon to do so; • To promote harmony and the spirit of common brotherhood amongst all the

NSOU ? CC-ED-02 ? 162 people of India transcending religious, linguistic and regional or sectional diversities; to renounce practices derogatory to the dignity of women; • To value and preserve the rich heritage of our composite culture; • To protect and improve the natural environment including forests, lakes, rivers and wild life, and to have compassion for living creatures; • To develop the scientific temper, humanism and the spirit of inquiry and reform; • To safeguard public property and to abjure violence; • To strive towards excellence in all spheres of individual and collective activity so that the nation constantly rises to higher levels of endeavour and achievement; • Who is a parent or guardian to provide opportunities for education to his child or ward, as the case may be, between the age of six and fourteen years

4.5 Major provisions of education in the Indian Constitution: 15th August 1947 is a red letter day in Indian History when India got freedom. The Constitution of the country was adopted on Nov. 26, 1949 and came into force on Jan 26, 1950. The Preamble of the Constitution outlines the social philosophy which should govern all our institutions including educational. Right to Education is one of the fundamental rights enshrined in the Constitution of India. The Constitution of India gives a few directions and suggestions for the development of education in the countries which are also called constitutional provisions. The following provisions have a great bearing on the functioning of the educational system in India: (A) Education of minorities: Article 28 of the Constitution has made certain provisions for the education of the minorities including (i) No religious instruction shall be provided in educational institutions wholly maintained out of state funds. (ii) If any institution has been established under any endowment trust even if administrated by state, can impart religious education. (iii) None person attending an educational institution recognized by the state or receiving

NSOU ? CC-ED-02 ? 163 funds from state government shall be required to take part in any religious worship or instruction that may be conducted in such institutions or in any premises attached there to unless such person or if such person in a minor and his guardian has given his consent thereto. (B) Cultural and Educational Rights: Under article 29 and 30 for the protection of educational interest of minorities viz. (i) Article 29 (i): Any section of citizen residing in the territory of India on any part thereof having a distinct language, script or culture of its own shall have the right to conserve the same. (ii) Article 30 (i): All minorities whether based on religion or language shall have the right to establish and administer educational institutions of their choice. (iii) Article 30 (ii): The state shall not in granting and to educational institution discriminate against any educational institution on the ground that it is under the management of a minority whether based on religion or language. (iv) To make any law providing for the compulsory acquisition of any property of any educational institutions established and administrated by minorities, the state shall ensure that the amount fixed by or determined under such law for acquisition of such property is such as would not restrict or abrogate the right guaranteed to them. (C)

Admissions: (i) Article 29 (II) states that no citizen of India can be denied admission into any educational institution, which is either maintained by the state or receiving aid out of state funds on ground only of religion, race, caste, language or any of them. (ii) Article 15 (III) states that to make special provisions for women. Hence, separate educational institutions for women can be established. (D)

Mother Tongue: For promotion of teaching of mother tongue the Constitution of India has made some provisions for Hindi language.

NSOU ? CC-ED-02 ? 164 Article 350 (A): It shall be endeavour of every state and local authorities with the state to provide adequate facilities for instruction in the mother tongue at the primary stage of education to children belonging to linguistic minority groups : the President may issue directions to any state as he considers necessary for recurring the facilities. Article 351: It is to promote the development of Hindi language and states that it shall be the duty of the Central Government to promote the spread of Hindi language in the entire country. (E) Right to Education: Article 41 of the Constitution provides that "All the citizens have equal right to education ". It states. "The state shall, within the limits of its economic capacity and development, make effective provisions for the right to work, to education and to public assistance in cases of employment, old age, sickness and disablement". (F) Weaker Section: Our Constitution has made some special provisions for the weaker sections of our society viz. Article 45: The state shall endeavour to provide within a period of ten years from the commencement of the Constitution for the free and compulsory education for all children until they complete the age of 14 years. Article 46: The state shall promote with special care the educational and economic interests of weaker sections of the people and, in particular, of the scheduled caste and scheduled tribes, and shall protect them social injustice and all forms of exploitations". The Supreme Court of India has given the following guidelines to promote education of the people: (i) The state can make regulatory measures to promote efficiency of education. (ii) Educational institutions of minority groups cannot claim immunity from general laws such as contract law, labour law and industrial law etc.

NSOU ? CC-ED-02 ? 165 (iii) The state can take over the management of the institutions of minority groups in case of irregularity and inefficiency. (iv) Teachers have the right to approach to the Arbitration Tribunal in case of any injustice to them by the institution. Some of the major constitutional provisions on education in India are as follows: There are some changes regarding the 42nd Amendment to the Constitution. During 1976 our constitution was amended in many of its fundamental provisions. Under the Constitution of India, the Central Government has been specifically vested with several educational responsibilities. Below are given constitutional provisions on Education: 1. Free and Compulsory Education: The Constitution makes the following provisions under Article 45 of the Directive Principles of State Policy that, "The state shall endeavour to provide within a period of ten years from the commencement of this Constitution, for free and compulsory Education for all children until they complete the age of fourteen years." The expression 'State' which occurs in this Article is defined in Article 12 to include "The Government and Parliament of India and the Government and the Legislature of each of the States and all local or other authorities within the territory of India or under the control of the Government of India." It is clearly directed in Article 45 of the Constitution that the provision of Universal, Free and Compulsory Education becomes the joint responsibility of the Centre and the States. In the Constitution it was laid down that within 10 years, i.e., by 1960 universal compulsory education must be provided for all children up to the age of 14, But unfortunately, this directive could not be fulfilled. Vigorous efforts are needed to achieve the target of 100 percent primary education. The Central Government needs to make adequate financial provisions for the purpose. At the present rate of progress it may, however, be expected that this directive may be fulfilled by the end of this century. 2. Education of Minorities: Article 30 of the Indian Constitution relates to certain cultural and educational rights to establish and administer educational institutions. It lays down: (i) All minorities whether based on religion or language, shall have the right to establish and administer educational institutions of their choice.

NSOU ? CC-ED-02 ? 166 (ii) The state shall not, in granting aid to educational institutions, discriminate against any educational institution on the ground that it is under the management of a minority, whether based on religion or language. 3. Language Safeguards: Article 29(1) states "Any section of the citizen, residing in the territory of India or any part thereof having a distinct language, script or culture of its own, shall have the right to conserve the same." Article 350 B provides for the appointment of special officer for linguistic minorities to investigate into all matters relating to safeguards provided for linguistic minorities under the Constitution. 4. Education for Weaker Sections: Article 15, 17, 46 safeguard the educational interests of the weaker sections of the Indian Community, that is, socially and educationally backward classes of citizens and scheduled castes and scheduled tribes. Article 15 states, "Nothing in this article or in clause (2) of Article 29 shall prevent the state from making any special provision for the advancement of any socially and educationally backward classes of citizens or for the scheduled castes and the scheduled tribes." Under Article 46 of the Constitution, the federal government is responsible for the economic and educational development of the Scheduled Castes and Scheduled Tribes. It states, "The state shall promote with special care the educational and economic interests of the weaker sections of the people and in particular, of the Scheduled castes and Scheduled Tribes and shall protect them from social injustice and all forms of exploitation." It is one of the Directive Principles of State Policy. 5. Secular Education: India is a secular country. It is a nation where spirituality based on religion, had always been given a high esteem. Under the Constitution, minorities, whether based on religion or language, are given full rights to establish educational institutions of their choice. Referring to the constitutional provisions that religious instructions given in institutions under any endowment or Trust, should not be interfered with even if such institutions are helped the State. Article 25 (1) of the Constitution guarantees all the citizens the right to have freedom of conscience and the right to profess, practice and propagate religion.

NSOU ? CC-ED-02 ? 167 Article 28 (1) states, "No religious instruction shall be provided in any educational institution if wholly maintained out of state fund." Article 28 (2) states, "Nothing in clause (1) shall apply to an educational institution which is administered by the State but has been established under any endowment or Trust which requires that religious instruction shall be imparted to such institution." Article 28 (3) states, "No person attending any educational institution by the state or receiving aid out of state funds, shall be required to take part in any religious instruction that may be imported in such institutions or to attend any religious worship that may be conducted in such institution or in any premises attached thereto unless such person or, if such person a minor, his guardian has given his consent thereto." Article 30 states, "The state shall not, in granting aid to educational institution maintained by the State or receiving aid out of State funds, on grounds only of religion, race, caste, language or any of them." 6. Equality of Opportunity in Educational Institutions: Article 29(1) states "No citizen shall be denied admission into any educational institution maintained by the State or receiving aid out of State funds, on grounds only of religion, race, caste, language or any of them." The Fundamental Rights of the Indian Constitution has also adopted the fourfold ideal of justice, Liberty, Equality and Fraternity. Our Constitution laid down that in the eyes of law, everyone should have an equal status, to no one the justice be denied, everyone should have liberty of thought, expression. The fundamental right of equality clearly signifies that in the eyes of law no distinction can be made on the basis of any position, caste, class or creed. Side by side the right of equality of opportunities to all is also provided. The equality of opportunity is meaningless, unless there are equal opportunities for one's education. The well-known Kothari Commission, 1964-66 recommended that Central Government should undertake the responsibility in education for the equalization of educational opportunities with special reference to the reduction of inter-state differences and the advancement of the weaker section of the community. 7. Instruction in Mother -Tongue: There is diversity of languages in our country. After the dawn of Independence, Mother-NSOU ? CC-ED-02 ? 168 Tongues have received special emphasis as medium of instruction and subjects of study. In the Constitution of India, it has been laid down that the study of one's own language is a fundamental right of the citizens. Article 26 (1) states, "Any section of the citizens, residing in the territory of India or any part thereof, having a distinct language, script or culture of its own, shall have the right to converse the same." Article 350 A directs, "It shall be the endeavour of every state and every local authority to provide adequate facilities for instruction in the mother-tongue at the primary stage of education to children belonging to linguistic minority groups." Secondary Education Commission, 1952-53 recommended that the mother tongue or the regional language should generally be the medium of instruction throughout secondary school stage subject to the provision that for linguistic minorities, special facilities should be made available. Kothari Commission, 1964-66 has also said that at college and university stage, mother-tongue should be the medium. The medium of instruction at school level is already mother-tongue. This is not a new proposal. 8. Promotion of Hindi: The Indian Constitution makes provision for the development and promotion of Hindi as national language. Article 351 enjoins the Union, the duty to promote the spread of the Hindi language. Hindi accepted as the Official Language of India as laid down by the Constitution in following words: "It shall be the duty of the Union to promote the spread of the Hindi language, to develop it so that it may serve as a medium of expression of all the elements of the composite culture of India." In practice, Hindi is already largely in use as a link language for the country. The educational system should contribute to the acceleration of this process in order to facilitate the movement of student and teacher and to strengthen national Unity. 9. Higher Education and Research: Parliament has the exclusive rights to enact legislation in respect of institutions and Union Agencies mentioned in entries 63, 64, 65, and 66 of List. The entries which give authority to the Government of India in education are mentioned below: Entry 63 of the Union List: The institutions known at the commencement of this Constitution as the Banaras Hindu

NSOU ? CC-ED-02 ? 169 University, the Aligarh Muslim and the Delhi University, and any other institution declared by Parliament by law to be an Institution of National importance. Entry 66 of the Union List: Co-ordination and determination of standards in institution for higher education or research and scientific and technical institutions. 10. Women's Education: One of the unique features of Modern Indian Education is the tremendous advancement of Women's Education. Education of the girls is considered to be more important than that of the boys. 6. Sharing of Responsibilities Jointly Through Meaningful Partnership between Central Government and State Government: The National Policy of Education (1986) revised in 1992 has described the relationship between the central and state government as that of a 'meaningful partnership'. The 1986 policy in part 3, para 13, has observed, "The constitutional Amendment of 1976, which includes education in the concurrent list, was a far-reaching step whose implications - substantive, financial and administrative-require a new sharing of responsibility between the centre government and the states in respect of this vital area of national life. While the role and responsibilities of the states in regard to education will remain essentially unchanged, the union Government would accept a larger responsibility to reinforce the national and integrative character of education, to maintain quality and standards, to study and monitor the educational requirements of the country as a whole with regard to manpower for development, to cater to the needs of research and advanced study, to look after the international aspect of education, culture and human resource development and, in general to promote excellence at all levels of educational pyramid throughout the country. Concurrence signifies a partnership which is at once meaningful and challenging. Sharing of Power for Different Educational Functions According to our constitution, Education is a state subject and the central government plays an advisory role. The constitution of India is federal. In this legislative power are divided between centre and state government. Some powers are laid in concurrent list. There are three lists- (i) List-I Union List (ii) List-II State List This work is licensed under a Creative Commons Attribution-ShareAlike 4.0 International License. (iii) List-III Concurrent List I. List-I Union List This list contains 96 subjects out of these subjects are related with education.

NSOU ? CC-ED-02 ? 170 Entry 13: Participation in international conferences, associations and other bodies and implementing of decisions made there at. This entry contains educational and cultural relationship with foreign countries. Entry 62: National libraries and national organizations come under this entry. Entry 63: Central Universities (Banaras Hindu University, Aligarh Muslim University, Delhi University and other Universities of National impact) comes under this entry. Entry 64: Institutions for scientific and technical education financed by the government of India wholly or in part and declared by parliamentary law to be institutions of national importance comes under this entry. Entry 65: Consists of Union agencies and institution for a) Professional, vocational or technical training, including the training of police officers; or b) The promotion of special studies or research. c) Scientific or technical assistance in the investigation or detection of crime Entry 66: Arrangement, for higher education and research comes under this entry. It contains coordination and determination of standards in institutions for higher education or research and scientific and technical institution. Article 239: Education in union territories comes under the central responsibility. II. List- II State List It consists of 61 subjects out of these 2 subjects are related with education. Entry 11: Contains university education. Entry 12: This contains library, museum and other memorable historical places which are not approved or we can say which are cared by both centre and state. III. List-III Concurrent List: This list is of 47 subjects, out of these following 6 subjects are related with education. Entry 25: Technical, medical and university education which is not related with centre list (63-66), so centre and state government both can make laws on it. Entry 26: According to this, centre and state government both can take necessary steps for the development of law, maintenance of health and of other professional education. Entry 39: Newspapers, books and printing presses. Entry 47: Fees in respect of any of the matters in this List, but not including fees taken in any court.

NSOU ? CC-ED-02 ? 171 Entry 28: Charities and charitable institutions, charitable and religious endowments and religious institutions. 4.6 Summary We have to discuss the values and education for inculcation of values. To elaborate the values and social philosophy enshrined in Indian Constitution, Also discuss the Major provisions of Education in the Indian Constitution. • Values are defined in literature as everything from eternal ideas to behavioral actions. As used here values refer to criteria for determining levels of goodness, worth or beauty. Values are affectively-laden thoughts about objects, ideas, behavior, etc. that guide behavior, but do not necessarily require it (Rokeach, 1973). The act of valuing is considered an act of making value judgments, an expression of feeling, or the acquisition of and adherence to a set of principles. • Values education is an explicit attempt to teach about values and/or valuing. Superka, Ahrens, & Hedstrom (1976) state there are five basic approaches to values education: inculcation, moral development, analysis, values clarification, and action learning • The Constitution of any country serves several purposes. It lays down certain ideals that form the basis of the kind of country that we as citizens aspire to live in. A country is usually made up of different communities of people who share certain beliefs, but may not necessarily agree on all issues. A Constitution helps serve as a set of principles, rules and procedures on which there is a consensus. These form the basis according to which the people want the country to be governed and the society to move on. This includes not only an agreement on the type of government but also on certain ideals that the country should uphold. The Indian Constitution has certain core constitutional values that constitute its spirit and are expressed in various articles and provisions. But do you know what is the meaning of the word, 'value'? You may immediately say that truth, non-violence, peace, cooperation, honesty, respect and kindness are values, and you may continue to count many such values. In fact, in a layman's understanding, value is that which is very essential or 'worth having and observing' for the existence of human society as an entity. The Indian Constitution contains all such values, the values that are the universal, human and democratic of the modern age.

NSOU ? CC-ED-02 ? 172 • Constitutional Values and the Preamble of the Constitution Have you read the Preamble to the Indian Constitution printed in the beginning of this material? As has been stated above, the constitutional values are reflected in the entire Constitution of India, but its Preamble embodies 'the fundamental values and the philosophy on which the Constitution is based'. The Preamble to any Constitution is a brief introductory statement that conveys the guiding principles of the document. The Preamble to the Indian Constitution also does so. The values expressed in the Preamble are expressed as objectives of the Constitution. These are: sovereignty, socialism, secularism, democracy, republican character of Indian State, justice, liberty, equality, fraternity, human dignity and the unity and integrity of the Nation. • 15th August 1947 is a red letter day in Indian History when India got freedom. The Constitution of the country was adopted on Nov. 26, 1949 and came into force on Jan 26, 1950. The Preamble of the Constitution outlines the social philosophy which should govern all our institutions including educational. Right to Education is one of the fundamental rights enshrined in the Constitution of India. The Constitution of India gives a few directions and suggestions for the development of education in the countries which are also called constitutional provisions. Article 28: provides freedom as to attendance at religious instruction or religious worship in educational institutions. Article 29: provides equality of opportunity in educational institutions. Article 30: right of the minorities to establish and administrate educational institutions. Article 45: Constitution for free and compulsory education for all children until they complete the age of 14 years." Article 46: promotion of education and economic interests of the scheduled caste, scheduled tribes and the weaker sections of society. Article 337: educational grants for the benefit of Anglo-Indian community. Article 350A: mother tongue at primary stage. Article 350B: It provides for a special offer for linguistic minorities. Article 351: This article relates to the development and promotion of the Hindi language.

NSOU ? CC-ED-02 ? 175 ? Describe the contributions of Rousseau and Dewey, in education; ? To know the educational thought of Ivan Illich ? To understand the aims of education according to Ivan Illich. ? To know the educational thought of Paulo Freire ? To understand the aims of education according to Paulo Freire. ? Know the Banking Education of Paulo Freire. 5.2 Introduction You are bearing with you some general ideas Indian educational thinkers; Rabindranath Tagore & Swami Vivekananda also to discuss the Western educationl thinkers: Rousseau and John Dewey & their educational Contribution. We hope, you like to understand these concepts more critically as well as to extent your knowledge. Intends to provide you information about Radical thinkers Paulo Friere and Ivan illich & their Educational Contribution. 5.3 Contribution of Indian Educational thinkers 5.3.1 Rabindranath Tagore Philosophy of Rabindranath Tagore: Rabindranath Tagore's (1861-1941) manifold reflective as well as creative expressions are embodied in his life-long literary works he composed, experiments in both Shanti Niketan (abode of peace) and Shri Niketan (abode of beauty and aesthetics) he did, addresses he delivered in home and abroad, his art works he did, the letters he composed, etc. If all these are critically analyzed, we become charmed to discover his inner voice and the very realization — a continuous endeavour in searching for a concept of a Universal Man who is endowed with potential — ability re- construct one world permeated through a sense of fraternity; and a divine power for reducing human sufferings and acquiring spirit of joy,love and enjoyment in life. "This discovery of truth is pure joy to man — it is a liberation of his mind." Thereby, man must clearly realize some central truth — the principle of unity that there is in every man. Man's highest joy is in losing his egoistic self and in the uniting with others. This power gives him a new power and insight and beauty of mind. To live in perfect goodness is to realize one's life in infinite. Then, education of man is the cultivation of his spirit, production of sensitivity towards life. Love for humanity implies the dignity of man. Man can be

NSOU ? CC-ED-02 ? 176 nourished by love and educating justice. Joy of work is the joy of action. Action pertaining to education is to be joyful — exploration of self. This travail is man's glory. Love for humanity implies the dignity. Tagore's concept of Universal Man is a hybrid conception of man of all ages, genders, strata, not restricted by any geo-political boundaries. His philosophical standing is grounded by the Upanisadic teachings, Vaishnava cult, Buddhism, colored with universal laws of nature of man expounded in human and material sciences of his days and what he grasped from numerous information sources, he observed in the countries he visited and experiences and he gained in his experiments on education. The problems to which Tagore addressed himself were education, caste, rural reconstruction, self-reliance and self-respect, the role of tradition, the fruitful blending of the cultures and the thoughts of East and West, the status of women, civic consciousness and self-government. Tagore not only professed revolutionary ideas but drew up programmes to give them practical and concrete shape. Therefore, in the philosophical parlance he deserves a unique position. Some of his philosophical thoughts are being summarized below: 1) Rabindranath's philosophy is rooted from the Upanishadas. He tries to take fragrance from the world of infinite to realize Satchidananda to his life and writings too. But mostly he applied the concept of 'Ananda' in his life philosophy, defined as Anandabad. 2) Tagore is greatly influenced by naturalistic philosophy. For him the inclusive and ultimate target of human life is to natural development of the individual. He promotes that nature should have freedom to educate the child through direct and personal experience from the nature itself. Tagore was naturalist but like a pragmatist he works on a vast canvas beyond the frontiers of a single individual to the universal human society. 3) Tagore's philosophy is keenly related to the concept of God and nature. Man is the highest creation of God in the universe. Man is, therefore, originated from his internationalism and humanism. Human being can be expressed through the creative activities like poetry, literature, different arts like painting, music, dramatics etc., Aesthetics and the science of beauty are the link between human and divine. To him the art of music which almost directly bridged the gulf between the man and divine. 4) Consciousness is the greatest gift of God according to Tagore. From his Consciousness ethics on morality which awakened the values of truth, beauty, goodness, love, etc.

NSOU ? CC-ED-02 ? 177 Educational Philosophy of Rabindranath Tagore: Now we are going to discuss educational philosophy of Tagore — 1) Tagore's idea about education is to cultivate human being through 'Communion with nature mingled with freedom and Joy and Cultural Collaboration with other people'. 2) Creative self-expression is one of the prominent educational philosophy of Tagore. He considered cultural practices as part and parcel of Curricula. To him dance, drama, recitation, singing and other performing arts are integral part of the education system. 3) Tagore's concept of national integration, international understanding leading to globalised world have been used in education as a tool for developing oneself. 4) Tagore's emphasis on the development of socialization, social awareness, skillfulness, productive ability and social usefulness through education is relevant in present day's context. 5) The basic principle of Tagore's educational philosophy are freedom and harmony with natural and human sunng. 6) The objective of education according to Tagore is to the all-round development of learners reflected through his words — "The ideal education must combine in himself the gifts of a philosopher, a poet, a mystic, a social reformer, a scientist and a veritable man action, because he has to take into account all types of men and their aspiration, all facts of human personality, all levels of man's experience, all fields of endeavour and achievement". Aims of Education: Aims of education, according to Tagore, can be deduced from his philosophical standing and thought on education. He has presented aims of education in multitude dimensions, all embracing life which vibrates with the hymn of Satyam, Sivam and Sundaram... The supreme aim of education is harmony of all existence. • Education aims at the creation of Universal Man (Vishvamanav). • Education aims at initiating and sustaining harmony and love between man and nature. • Education objects to offer man the unity of truth.

NSOU ? CC-ED-02 ? 178 • Education aims at developing full man. • Education is living, not alien from realities and cultural contexts." "True education consists in knowing the use of any useful materials that has been collected, to know its real nature and build along with life a real shelter for life." • Education must appreciate both the liberal and utilitarian aspects of human life. • Education must aim at developing men and women who may be able to fulfill the needs of the country. • Education aims at fostering physical, intellectual and emotional development of the child. • Education, what he calls 'total or natural education', consists of cultivation of knowledge together with the performance of manual labour in the natural surroundings. • Education aims at developing the spirit of nationalism as well internationalism education. Curriculum: The Santiniketan and Visvabharati introduced music, art, craft, dance, drama and mainly aesthetic approach in the mist of nature. He emphasized the vocational education also. At Sreeniketon he established the Vocational unit on the basis of work oriented education system. Other than Vocational and creative subjects, academic subjects are also given importance for imparting education. Tagore wished to equip his strength with the help of curricular and co-curricular activities for ensuring balanced education of the child. The curriculum consists of not only traditional subjects who can develop intelligence but also subjects like music and dance which helped to realize the all sided development of a learner. Tagore felt the need for introduction of modern sciences and technologies in curriculum of the students though he emphasized on the cultivation of the past treasure of India in child. In this way, he was an Indian Pragmatist. Methods of Instruction: There was a lot of novelty in his methods. According to Tagore Nature is a great book as well as a great teacher. Children should learn from direct experience of nature. The teacher and the pupils used to sit in the shade of a tree and the act of learning was executed in the open contact with nature. The students can enjoy full freedom. Children are also

NSOU ? CC-ED-02 ? 179 evaluated through examination but in a free and pressureless atmosphere. Mostly activity based education system have been followed. The activities are — (1) Academic enhancement related to individuals enrichment of life. (2) Activities related to Community development programmes. (3) Activities related to Vocational programmes. The medium of instruction is the mother tongue. Tagore's views that reward and punishment do not provide any effect but for teachers' initiation, inspiration and encouragement no material reward was needed to motivate the students, whereas punishment only deteriorated motivation. Here, the teachers role is as initiator and maintainer. Role of the Teacher: A teacher can not teach well unless he himself continues to learn just as "a lamp can never light another lamp unless it continues burn its own flame." A teacher does not merely inform but inspire his pupils. A real teacher is benevolent mentor-co-learner, co-discoverer as well as task master. He envisioned a true constructivist teacher devoted to flowering of the plant in pupil.

5.3.2 Swami Vivekananda: Introduction: Swami Vivekananda was born in 1863 in a Kshatriya family of Calcutta. Before he became amonk, his name was Narendra Nath Datta. While he was a student in college at Seventeen yearsof age, he came under the influence of Sri Ram Krishna Parmhansa. Narendra Nath was anearnest student of philosophy and poetry. He studied all the system of western philosophy. Oncethe principal of his college Mr. Hastie remarked. "Narendra Nath is really a genius. I havetravelled far and wide, but I have never yet come across a lad of his talents and possibilities, evenin German Universities amongst philosophical students. He is bound to make his mark in life.

PHILOSOPHY OF SWAMI VIVEKANANDA Swami Vivekananda (1863-1902) is known to the world as the patriot-saint of India, as the symbol of vigor, as a social reformer, as a religious leader, as a philosopher and so on. But he was an educationist who propounded original ideas on education, for ensuring an educational renovation from the height of his unquestioned love for country and humanity.

NSOU ? CC-ED-02 ? 180 He developed his ideas on education after Vedantic philosophical stances and ardently visualized the full manifestation of perfection endowed in man. According to Vedanta, man's real nature is pure consciousness, known as the Atman, which is beyond body and mind. To Swamiji, the Atman is the ultimate source of not only all knowledge and happiness, but also of all noble qualities and capacities inherent in man. Education is the process by which this innate perfection is manifested. Vivekananda's concept of 'potential divinity of the soul' gives a new, ennobling concept of man and that concept of potential divinity of the soul prevents this degradation, divinizes human relationships and makes life meaningful and worth living. Thus, Swamiji has laid the foundation for 'spiritual humanism', which is manifesting itself through several neo-humanistic movements and the current interest in meditation, Zen, etc. all over the world. In order for awaking his countrymen Swamiji attempted to do the following : ? to rouse the religious consciousness of the people and create in them pride in their cultural heritage; ? to bring about unification of Hinduism by pointing out the common bases of its sects; ? to focus the attention of educated people on the plight of the downtrodden masses, and to expound his plan for their uplift by the application of the principles of Practical Vedanta. But his formulation is not a revival of the ancient educational system, but its readjustment with the changed modern scenario. Netaji Subhash Chandra Bose wrote : "Swamiji harmonized the East and the West, religion and science, past and present. And that is why he is great. Our countrymen have gained unprecedented self-respect, self-reliance and self- assertion from his teachings." Long before the ideas of Karl Marx were known in India, Swamiji spoke about the role of the labouring classes in the production of the country's wealth. In brief his philosophical ideas may be summarized as: Let us discuss the educational philosophy of Swami Vivekananda. First let us concentrate on the life philosophy of Swami Vivekananda in a summarized form : (1) Swami Vivekananda was greatly influenced by the classical Indian philosophy being a student of philosophy as a subject and tried to apply those concepts for the good of the common people.

NSOU ? CC-ED-02 ? 181 (2) The philosophical thoughts of Vivekananda were shaped by Vedanta and these are generally called Neo-Vedantic. (3) Service and Renunciation were the two key words which he believed most and tried to apply for the development of our society. (4) The foundations of Vivekananda's Neo-Vedanta are the Upanishadas and their interpretations from his personal illumination. (5) Vivekananda tried to socialize the essence of his philosophy for the common people of India. (6) Thus, he was an idealist, nationalist as well as a humanist. Educational Philosophy of Vivekananda: From Swami Vivekananda's writings, speeches and practices of his own life the following ideas on education can be deduced. (1) Education is based on development of inner potentiality. (2) Education is man making. (3) Education is "

69%

MATCHING BLOCK 91/127

W

by which character is formed, mind of strength is increased and by which one can stand one's

leg." (4) Education is a tool for social development. (5) Upliftment of masses is also an emergent dimension of education. (6) Education is the training of the intellect and spiritual training for the learners. (7) Democracy is the best form of Government implying freedom which is inseparable from responsibility, the sources of which are morality, philosophy, law and other social factors. (8) The social progress is possible through mass education and woman's education. (9) He believes in the Universal brotherhood of man, and upliftment of man kind. 1. Knowledge resides within the individual: Most of western educationist believes that knowledge is born in man out of interaction with his environment while Vivekananda holds that knowledge is inherent in man, something inside him and not born out of the external environment. True knowledge does not come to the individual from outside. It is instead discovered within the individual because man `s soul within him is the source of all true knowledge.

NSOU ? CC-ED-02 ? 182 2. Self-education: Swami Vivekananda believes that the child learns through self education. The child teaches himself. Each one must teach. Things will be made clearer to the child by his own power of perception and thought. Like Froebel, Swami Vivekananda thinks that the child develops his own nature as a plant does his own. The teacher is to arrange the necessary environment for him so that he may do his growing. Man has all the knowledge. He requires only an awakening. Nothing should be forced on children. They should be left free to crave out their own path. 3. Education according to needs of children: Vivekananda advises us to regard every soul as the soul of God, and every child as God. So the teacher has only to serve children. Hence the teacher should be adjusted according to the needs of children. "These needs should be determined in terms of the

100%

MATCHING BLOCK 93/127

SA HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

tendencies inherent in children and not according to what the parents

or teachers think". It is foolish for the parent or teacher to think that they can determine the path which the child should follow. 4. Concentration of mind as the essence of education: Vivekananda considers concentration of mind as the essence of education. Everyone wants this power of concentration for success in his life. A man is called Superior to other if he has greater power of concentration. "The treasure-house of knowledge can be opened only through the key of concentration." 5. Brahmacharya for Concentration: Brahmacharya or continence is essential for developing the power of concentration. Brahmacharya gives mental and spiritual power of the highest kind. Vivekananda demonstrated how Brahmacharya helps to improve various psychological activities such as learning, remembering, thinking, etc. and thus facilitated the process of education. Aims of Education: Swami Vivekananda laid emphasis on the following aims of education: 1. Physical development Aim: Physical development of the individual is an important aim of education. Vivekananda felt that both the self-realization and character building are impossible in the absence of physical development and education. In a conversation Vivekananda said that people must know the secrets of making the body strong, and they should also convey this knowledge to others 2. Mental development Aim: Mental development of the individual is another important aim of education according to Vivekananda. He believed that knowledge is NSOU ? CC-ED-02 ? 183 inherent in man. It resides with the individual. Perfection is inherent in man and education is the manifestation of the same. Thus the aim of education is to discover or uncover the knowledge that lies hidden in our mind. 3. Moral, spiritual and character development: Vivekananda asserted that education should aim a development of character, morality and spirituality. He stated that we must have life-building, man making and character making education. In his opinion the chief aim of education is to create a human being, and the true mark of a human being is character. 4. Vocational Aim: Vivekananda gave important place to the vocational aim of education for harmonious development of personality. Education which does not enable the individual to stand on one's own feet is useless. But does not mean that one should be striving to amass wealth. 5. Aim of reaching perfection:

75%

MATCHING BLOCK 94/127

SA HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

According to Vivekananda one of the important aims of education is the manifestation of

the perfection. Every child has certain hidden powers. Education helps in the manifestation and development of these powers. 6. Aim of promoting universal brotherhood: For Vivekananda education is a means for establishing brotherhood in all mankind. Education must promote the spirit of universal brotherhood. Education must teach man that ATMAN (soul) is the same in all. Only that education is worth the name which imparts this spirit to man. Methods of Teaching: Vivekananda did not conclude his educational philosophy only by talking aim of education. He has also expressed his views on the methods of education. 1. Methods of Concentration: Vivekananda laid emphasis on concentration as a method of attaining knowledge. Concentration is the sole key to the treasure of knowledge. Vivekananda considers the concentration of mind as the essence of education. The literally figure and the scientist has to concentrate his attention on his subject for a long time, and only then he can hope to discover something new in the field. Greater attention always helps in working more. 2. Discussion and Contemplation: In addition to concentration, Vivekananda laid emphasis on the importance of discussion and contemplation as method of education. The pupil can remove the difficulties in his path by discussing them with his teacher in an informal atmosphere. 3. Method of individual guidance and counseling: Pupils can be kept on the right path through the method of individual guidance and counseling. NSOU ? CC-ED-02 ? 184 4. Freedom in Education: Vivekananda was a strong supporter of freedom in education because he believed that it was the first prerequisite of development. Hence no teacher should exert any kind of pressure on his pupils. Role of Teacher: Teacher is the Provider of Suitable environment. According to Vivekananda education is the process of self-development because child educates himself. The real task of the educator is to see that there are no obstacles in the child's path of self development. Just as the gardener prepares the ground for his plants, protects them from destructive hands and animals, and nourishes them with manure and water from time to time, in the same manner the educator takes care of the child and provides for him an environment in which he can develop without any hindrance. The child himself is a source of knowledge but it is far the educator to wake it from its dormant condition. The motivation exists in the child, the educator merely activates it. Hence the educator should try to encourage the children to use their body, sense organs and brain. Meaning of Education: Education according to Swami Vivekananda is self-realization which takes place from within. It brings perfection through the manifestation of one's potentialities. In his inimitable words — 'Education is the manifestation of the perfection already in man'. He states it more clearly — 'knowledge is inherent in man, no knowledge comes from outside; it is all inside'. What is learning? Vivekananda answers — "

93%

MATCHING BLOCK 95/127

SA HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

what a man 'learns' is really what he 'discovers' by taking the cover off his own soul, which is a mine of infinite knowledge.

Man manifests knowledge, discovers it within himself, which is pre-existing, through eternity. 'Education is nothing but the manifestation of the infinite power lying within the soul which involves the only question of being conscious of it. Every man is born with a light divine.' Thus education is self-revelation. Freedom in Education: Swami Vivekananda was a staunch supporter of freedom in education because he believed it the first requisite of development. Education must be based on the needs of the child. The task of education is to nurse the process with every care and assistance, but never through any force, artificial manipulation and interference. Education should provide the child ample scope for his free growth according to his nature. When freedom in education is given to a child, it is sure to say that the child will develop positive ideas, deep self-confidence and the spirit of independence. Self-activity is the pre-condition to realise one's freedom i.e., self-discovery.

NSOU ? CC-ED-02 ? 185 Teachers' Responsibility: Teacher plays an important role in the task of educating the child. According to Vivekananda a true teacher is one

62%

MATCHING BLOCK 96/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

who can come down, immediately; to the level of the student and can "transfer his soul to the student's soul", and see through the student's eyes, hear through his ears, and understand through his

understanding. A teacher, in its truest senses is a friend, philosopher and guide capable of providing proper direction and guidance to his pupils. He has to understand the needs of the pupil and to guide his learning and activities accordingly. The teacher, according to him, should be a 'role model' to his pupil. Guru Grahayasa is recommended by Swami Vivekananda, and is one of the best ways a teacher can help the pupil. So we can say that teacher's responsibility is to show the pupil light in order to lead a brighter future. Aims of Education: Swami Vivekananda

says — "The end of all education, all training, should be man- making.

100%

MATCHING BLOCK 97/127

SA

Salil Samadhia.docx (D41727527)

The end and aim of all training is to make the man grow."

Education he maintains, should help people to build up self-confidence and self-reliance, based on balanced human relationships. The ultimate goal of all educational effort is to strive towards character development characterized by the development of will-power, leading to courage, stamina and fearlessness. Through education the individual should develop adaptability and be able to meet the challenge of a changing society, and this can be able through education and training that he or she receives from his parents and teachers. Education should lead to a feeling of brotherhood and the unity of mankind. Education should teach us to serve humanity the hungry, the ignorant and the suffering masses. According to Swami Vivekananda, work is worship, so to serve the masses is to serve God, so education should lead us to recognize this and to fulfill this end. Education should lead us to acquire the spirit of renunciation. In India, he maintains, the important aim of education is self-sufficiency, each individual should be given practical and vocabulary training along with traditional, religious and cultural subjects. There should be workshops regarding pupil in order to train them in crafts and trades. Students must be given education in Western Science and technology, in order to advance our country in the field of science, technology and productivity for improving quality of life.

NSOU ? CC-ED-02 ? 186 Curriculum: Swami Vivekananda did not prescribe any specific curriculum, but some general instructions were given by him on the type of the subjects which the students would learn. According to him children should include cultural heritage in terms of history, geography, poetry, grammar and language. He also prescribed for every pupil to study various branches of modern science and equally gave importance in Western technology and engineering and said that it should be included in the curricula of schools and colleges, and it would aim at the economic development of the country. Education must be life-skills building process. Vocational subjects should be included in the curriculum for every child. He also gave stressed on skills, crafts, etc. along with others studies which would enable pupils to learn a living at the end of their studies and to make them self-supporting. He included cookery, needle-craft, child-rearing, economics and psychology should be included in the curriculum for girls. He laid special emphasis on physical education in the sense that a good physique beholds good mind. He not only asserted for Brahmacharya but also prescribed practice of yoga for the students. Moral and religious education were other dimensions of curriculum according to Swami Vivekananda. However, he advised that this part of curriculum should be free from any particular dogma or sectarian philosophy or theology. On the contrary, the subject matter of moral and religious education must be a synthesis of religion and science. It would help inculcation of universal values in all human beings. Thus, he pleaded for the education of unity of world's religion what his great master Sri Ramakrishna testified in his life. Therefore, the structure of curriculum of Vivekananda may be summarised as: 1. Curriculum as a part of social Unit: Vivekananda observes that Education is an indispensable part of life and hence education as a social unit must be supplemented by the social components blended with ethics and aesthetics. Language Policy: a. Common language: Vivekananda stressed the need for a common language for integrating the society. b. Regional language: In addition to common language, Vivekananda experienced that it was necessary to encourage every regional language where mother tongue is given importance.

NSOU ? CC-ED-02 ? 187 c. Sanskrit: Vivekananda believed that Sanskrit is the source of all Indian languages. Our cultural heritage and past greatness depended upon our knowledge of Sanskrit. He felt that in the absence of this language it would be impossible to protect Indian culture. It is Sanskrit which gives stability and permanence to the progress of our country. 5. Study of Social Science: Vivekananda also believed the study of subjects like history, geography, economics, mathematics, home science, psychology, and agriculture for exploring social science. 6. Physical and Vocational Education: He felt that both self-realization and character building are impossible in the absence of physical development. He also believed that vocational education should be imparted. It is man making religion that we want. It is man making education all round that we want. The Method of Instruction: The method of instruction what Swami Vivekananda proposed, is based on an ancient Indian tradition but still it has a great value. Swami Vivekananda gave more importance on Guru-pupil relationship, so that the pupil learns by example and precept rather than through books and lectures alone. According to him "

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

The practice of meditation leads to mental concentration." He holds that there is only one method which helps to attain knowledge that is concentration. He asserted that the more the power of concentration, the greater amount of knowledge an individual can acquire. Lack of concentration leads to wastage of power.

82%

MATCHING BLOCK 99/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Discussion among teacher and pupils is an effective method of instruction. The teacher should invite questions and stimulate the spirit of enquiry in the pupil.

For Vivekananda, travel was an ideal method of learning because he wished the teachers and pupils to go out and learn from outside, not only within India but to other countries too, so that they can communicate with each other and be able to share our knowledge and philosophy with people of other countries. Medium of Instruction: As regards to medium of instruction, Vivekananda strongly advocated for mother-tongue. He a true nationalist, and a champion of national education argued instruction through mother-tongue. He visualized to Indianise Indian education. He also wanted to spread mass education through mother-tongue so that it will reach to everyone.

NSOU ? CC-ED-02 ? 188 Students: Swamiji pleaded: One who solve own problems efficiently is the best students. So the development of our nation lies on the hands of the students. The characteristics of best students according to him are: (1)

83%

MATCHING BLOCK 101/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

In his own word — "Faith in our self and faith in God - this is the secret of greatness"

so each student must have faith in themselves and in God in order to reach their destiny. (2) Students must always have a will power and they should have self confidence within them in order to move forward in life. (3) Students must have a disciplined conduct and a good character and should be polite, humble, truthful, and follow what is good ; have a motivation for learning and cultivation of knowledge, cooperation and fellow feeling. (4) Each student must develop love for their country. (5) Students should always practice religion and should not perform any kind of evil deeds. Women's Education: Swami Vivekananda's worries as well as eagerness for women's education had been deep and genuine. As he was highly impressed to see the women of the progressive countries (America, England, Japan) working with men and, thereby immensely contributing to national advancement Vivekananda was greatly pained at the miserable condition of women in India. According to Swamiji — "The real strength or 'Shakti' of a country are its women." He quotes Manu — "Daughters should be supported and educated with as much care and attention as the sons." He wanted women to be free from all fetters as self-respecting persons, with their own individuality, and was in favour of women being given such training as would infuse them with strength so that they can tackle the problem that face them. So far, he opined : women had been down-trodden, and considered inferior to men, they could not enjoy equal rights and privileges with men, because of their denial to opportunities to education. His idea of women's education included fostering ideal daughters, ideal wives, and ideal mothers and of course building ideal nation and humanity. He strongly advocated that schools should be established for girls and educational

NSOU ? CC-ED-02 ? 189 centres for women. He prescribed teaching of History and purans, house keeping and the arts, the duties of home life and the principles that make for the development of character, so that women may grow up as ideal mothers of heroes and as women of courage and chastity. Thus, he visualized women as true partner of all-inclusive social development. Advancing his thoughts on women education much work has been done in the field of women's education after independence in India. The education policy adopted by the Government of India for equality of opportunities for the women education and empowerment has been saturated by Vivekananda's urge for women education. In this way he was so modern even in one hundred years ago. Mass Education: Swami Vivekananda's views on education will not be complete without touching upon his thoughts on mass education. At time when social leaders were busy with widow remarriage, abolition of idol worship and other social reforms mainly confined to the upper strata of the society, he felt that the neglect of the masses was the main cause of India's downfall. 'Our great national sin is the neglect of the masses and that is the cause of our downfall' said Swamiji. He fully realized that, "A nation is advanced in proportion as education and intelligence is spread among the masses." This reflects his urge for ensuring equity in educational opportunities to all for true national development. He respected human individuality and chanted the mantra, "each soul is potentially divine" and is endowed with capacity and creativity. According to Swamiji : Education is the birth right

100%

MATCHING BLOCK 102/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

of every human being; it is a biological, social economic and spiritual necessity. He

always wanted a process of 'leveling-up' and no 'leveling-down', so the only way to rise again was by spreading education. Education, to him was a comprehensive. To him true education was the powerful tool for arresting people's sufferings, discriminations, prejudices, human injustice and indignity. He also advocated for non-formal education for them. 5.4 Contribution of Western Educational Thinkers: Rousseau and John Dewey 5.4.1 Educational Philosophy of Rousseau Rousseau is regarded as the most important naturalist philosopher of education. His writings were published since 1750 A.D. onwards. Some of his famous works are: (1) The Progress of Arts and Sciences; (2) Social Contract; (3) New Heloise; and (4) Emile. Of NSOU ? CC-ED-02 ? 190 these, the most important are Emile and Social Contract. Emile is a novel in which the author has described the methods of bringing the child in contact with Nature and removing him from social evils. The child is left under the guidance of an ideal teacher away from school and society. The teacher teaches the child in a natural environment. The book Emile consists of five parts respectively devoted to infancy, childhood, adolescence, youth and the imaginary wife of Emile names Sofia. Rousseau was particularly impressed by the poverty and suffering of the people. He hated society for its evils and wanted to reform it. He realized, "

100%

MATCHING BLOCK 100/127

W

Everything is good as it comes from the hands of

the author of the Nature but everything degenerates in the hands of man". Thus, Rousseau, on the one hand, opposed society and praised Nature on the other hand. His book Social Contract portrays his ideas concerning society and politics. Rousseau had to leave France for England in 1766. He died in 1778. His thoughts influenced French revolution. He is acclaimed as a great revolutionary and reformer. Education and its successive transformation over the past four hundred years, have renewed educational theory and practices. Aims of Education In the opinion of Rousseau, education aims at the natural development of the child's inner faculties and powers. Education should help the child to remain alive. Life implies not merely taking of breath but working. To live is to work, to develop and to properly utilize the various parts of the body, the sense organs and the various other powers of the body. In his book Emile, Rousseau seeks to train Emile in the profession of living so that he may become a human being before becoming a soldier, a churchman or a magistrate. Education, thus, in Rousseau's opinion, must aim at making the child a real human being. But the aims of education proposed by him are observed to change at different stages of the child's development, because at each stage something different needs stress. Hence the change in aims of education are natural and conform to law of human development. The following are the various aims of education according to each level of the child's development. Infancy: This stage begins at birth and continues up to five years of age. The chief objectives of education during these five years is bodily development, the development and strengthening of every part of the body. This is essential if the child is to grow up healthy and strong. It forms the basis of subsequent healthy development of the mind. When the child is allowed to freely engage in playing and exercising his body, he remains active and

NSOU ? CC-ED-02 ? 191 has no time to indulge in desirable activities. Nothing need be done to develop his instincts other than to give him complete liberty. If such freedom is given, he naturally develops his own instincts as well as impulses. Childhood: This stage begins from the fifth year to the twelfth, and it is the period of developing the child's sense organs. This development is achieved through experience and observation. Hence, the child should be made to observe and experience those things in his environment, which will assist the development of his sense organs, i.e. refinement activities like smelling, seeing, hearing, touching, etc. Adolescence: For Emile, adolescence has been believed to last from the twelfth to the fifteenth year. The child has, by this time, achieved the development of this body and his sense organs, and is, therefore, prepared, for systematic education with the aids of tools of body parts and use of senses. At this stage, education aims at developing the adolescent personality through hard work, guidance and study. During adolescence the individual should be given knowledge of various kinds so that he is enabled to fulfill his needs of various kinds. Youth: The individual passes through his youth between his fifteenth and twentieth years and undergoes development of emotions and sentiments. Rousseau pointed out, "We have formed his body, his sense and intelligence, and it remains to give him a heart". Development of the sentiments will lead to development of moral and social qualities, but it is essential to pay attention to the development of religious emotions also. Summing up, the aim of education is to achieve the bodily, sensory, mental, social and moral development of the individual. In sum, aims of education at least four fold-education aims at developing the child's (1) body, (2) senses, (3) intellect, and (4) heart-sensitivity and affectivity. Education is programmed in conformity with the law of development of the child. Education is, then, natural. Curriculum of activities: It is possible to arrive at Rousseau's concept of a curriculum from an analysis of the various stages of development described in his Emile. Even in framing the curriculum, Rousseau paid attention to these four stages in development, and it will be better to consider the curriculum in the same fashion. Infancy: Rousseau was very critical of the contemporary curriculum laid down for the education of infants, because he advocated that infants should be treated as infants and not as adults in the miniature. The child is not a young adult, because his instincts and tendencies NSOU ? CC-ED-02 ? 192 are dissimilar to those of the adult. It is imperative to first understand the psychology of the child and then to frame a curriculum. Instead of giving him controlled information of various subjects at this stage, he advised to pay attention to the development of his body and his senses. In this age, the child can be taught a great deal through normal conversation carried on in the child's mother tongue, for developing his linguistic ability. It is better not to try and instill any kind of habits in the child at this stage. The curriculum is child's natural activities. Childhood: Even in childhood, Rousseau has objected to the use of any textbooks for education, because he has wanted to keep Emile away from books of any kind up to the twelfth year. He has thought it necessary to give the child a chance to learn everything through direct experience and observation. This is based on his concept of negative education, which suggests that the child's mind should not be stuffed with information of different kinds. Instead he should be given liberty to learn through experience, because it develops the sense organs, which in turn lead to mental development. When the child is free to play, move, act at his own will during his childhood, he goes through a variety of experiences and learns all kinds of activities. During childhood, he should not be given any verbal lesson on history; geography or even language; it is not desirable even to do any moral preaching. Rousseau opined that the child would learn his morality by the natural consequences of his own actions. Hence, up to the childhood stage no formal curriculum of any kind is required for his education. The stage appropriate normal activities of the child will be his curriculum. Adolescence: Having arrived at the appropriate level of bodily and sensory development, the child can be exposed to teaching according to a formal curriculum consisting of education in natural sciences, language, mathematics, woodwork, music, painting, social life and some kind of professional training. Even here, Rousseau opined, more stress should be laid on the use of the sense organ than books. The very object of training in all these various subjects is the training and development of these organs. The study of science will enhance the child's curiosity and his inclination towards research, invention and self-education. Painting helps to train the muscles and eyes. Handicrafts help in developing the ability to work, apart from the mental development, which is part of the process. Passing through various phase of social life, the individual learns that men depend upon each other, and thereby the child learns to assume and fulfill social responsibility. Rousseau believes that books do not give knowledge, but only train one to talk. Hence, it is better if the curriculum for adolescence is based on active work than on books. During this period the adolescent must get adequate opportunity and time for hard work, education and study. Thus, the curriculum is activity-based. NSOU ? CC-ED-02 ? 193 Youth: In the curriculum for youth, special stress has been laid on moral and religious education. But even moral education is to be derived through actual experience rather than through formal lectures. The youth learns a moral lesson when the sight of a physically handicapped person arouses in him the feelings of pity, sympathy and love. Religious education also follows the same pattern but the teaching of history, mythological stories and religious stories can assist it. The youth draws many lessons from these stories. Apart from moral and religious education, Rousseau gave appropriate importance to education in bodily health, music and sex. Thereby Rousseau has proposed a learner centric and life-centric curriculum for every 'Emile'.

Curriculum and Methods of Teaching The curriculum and methods of teaching as suggested by Rousseau were as Follows: Table 1: Curriculum and Methods of Teaching

Stages Curriculum Methods of Teaching Infancy Development of body and senses Training of sense organs (0-5 Years) Moral conversation through mother tongue Counselling method Debar from developing any habit Play way method Childhood Learn everything through direct Practical work (5-12 Years) experience and observation Self-learning method No prescribed text book Learning through self Negative education experience Free play, movement and action Learning by doing No rigid curriculum suggested at this stage Observation, enquiry and Adolescence Suggest formal curriculum including experimental method (12-15 Years) Natural Science Heuristic method Language, Mathematics, Woodwork, Demonstration of real Music, Painting, etc. Objects in teaching Active work based curriculum; not on books Youth Moral and religious education through (15-20 Years) actual experience not through formal lectures Education for bodily health, music and hands on activities (Source: Sharma, 2000)

NSOU ? CC-ED-02 ? 194 Rousseau's Influence and Contribution: Rousseau's contribution to the subsequent developments in the field of education is far-reaching. The subsequent educational theories and practices were immensely influenced by his lofty ideas. All the modern methods of education also originated in him. The child is the center of educational enterprises. Hence, "Treat your child according to his age". — is the most practical suggestion of Rousseau. It was Rousseau who emancipated the child from the trammels of the society and medieval restraint and gave the child his rightful place. Thus, Rousseau introduced psychological tendency in education. Pestalozzi in this respect followed his suit. Who put the theory of Rousseau into practice. A systematic theory of child's psychology began to develop since the time of Rousseau. As against verbalism and book learning, Rousseau emphasized the value of concrete objects. Learning by doing was his great principle. The greatest contribution of Rousseau was his emphasis that education should prepare the individual to live in society. Thus, he laid the foundation of the sociological tendency in modern education. Rousseau's emphasis on the phenomenal nature led to the scientific tendency in education. The 19th century witnessed various developments in the physical and biological worlds. This led to the development of the materialistic naturalism in education, of which Herbert Spencer and Huxley were the chief representatives. Some educators were greatly influenced by the doctrine of individuality propounded by Rousseau. He was an opponent of an artificial and repressive society. This resulted in the democratic movement in education individual worth is highly honored and valued. He revolted against the social inequalities of his age. Rousseau wanted not reform but revolution in the field of education. His main idea, education according to nature — has been universally accepted. He denounced the old and showed the new; this became the inspiration to all educational reformers of the future, which reduced his theories into practical procedure. In the word of Ross: "He was the fore runner of so many, who have followed in the trails he blazed through the forest, until now they have become the broad highway of common travel". Criticism of Rousseau's Educational ideas and practices: Dr. Graves has severely criticized the educational ideas and practices of Rousseau. Rousseau's ideas, according to him, are full of contradictions and inconsistencies. Rousseau himself said: "I rather to be a man of paradox than prejudices". The education advocated

NSOU ? CC-ED-02 ? 195 by Rousseau was anti social. His scheme of education has condemned social and cultural heritage, as he believes, society is subordinated to the individual who is supreme. Social environment is neglected. Rousseau's view of democracy is wrong in the present world. The individuals exist for the society; the society does not exist for the individuals. This is the present view of democracy. Rousseau held just the opposite view and hence he was erroneous. Rousseau vehemently opposed women's education. "A woman of culture is to be avoided like a pestilence". Rousseau was a theorist and not a practical educationist". Rousseau had great ideas but he had no ability to implement them. 5.4.2 Educational Philosophy of John Dewey: John Dewey is a great philosopher, educationist and thinker of the modern age. John Dewey's concept on education is based upon the philosophy of pragmatism. Dewey believed that knowledge is resultant of action. According to him, change is the reality of the world.

83%

MATCHING BLOCK 104/127

SA

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Defining education, he said, 'Education is the continuous reconstruction of experiences'. His

major conception education has been written in his books like: 'Democracy and Education' (1916), 'Logic' (1938), and 'Experience and Education' (1938). According to him, 'truth is an instrument used by human beings to solve their problems', since problems change, truth changes and therefore there can be no eternal reality. According to Dewey, change is the basic theory of education. Fact varies from person to person. Therefore a person develops theory on the basis of consequence of actions and experimentations. The main aim of education is to make child capable of solving problems of life with their experiences. The aim of education is to make human life prosperous and happy. So, John Dewey is called a pragmatist thinker. Educational Thoughts of John Dewey: The educational thoughts of John Dewey can be spelt along the following lines: • Dewey considers experience as the central concept of education. Child learns through experiences. • Problem solving and applying reflective or critical inquiry to solve the problems is the aim of education. • Dewey considers knowledge gains

80%

MATCHING BLOCK 105/127

SA

EDN-101-Philosophical Foundations of Education.pdf (D141385432)

through inquiry, reflective thinking, experimentation and fact finding. There is no ultimate truth

of knowledge. More and more scientific inquiry gives birth to new knowledge.

NSOU ? CC-ED-02 ? 196 • Change is necessary for individual and social developments; therefore, education system, methods, etc. should be changed as per the need of the times. Education is for child; the child is not for education. • Democratic society should be established on the basis of education. In an ideal

90%

MATCHING BLOCK 106/127

SA

EDN-101-Philosophical Foundations of Education.pdf
(D141385432)

society, there should be development of social and communal feelings, awareness of duties and rights, mutual

cooperation etc. • He believes in relativism, as nothing is absolute, rather it is relative as there is always scope for change. • He believes in instrumentalism as the objects are the existence to make the work done. To materialise ideas, we need tools/instruments. • In view of the above, John Dewey can be regarded as a pragmatist, instrumentalist, humanist, relativist, and experientialist. Curriculum and Methods of Teaching: Dewey suggested that the curriculum should be determined by the child's instincts and abilities. The need, abilities and interest of the child needs to be emphasized in the curriculum. He advocated that the curriculum should be child centred. He believed that curriculum should include social issues as the child is a part of society and ultimately the product of education should work for the development of the society. He stated four principles of formation of the curriculum i.e. Utility, Flexibility, Experiential and close to life. The principles clarify that curriculum should be the utility of the child; it can be changed as and when there is the need, provides ample scopes to the child to gather experiences and every activity in the curriculum should be suitably linked with the life of the child. Dewey emphasised on making the curriculum integrated in approach and using methods like learning by doing, field visit, project, problem solving, inquiry and problem-based learning, experimentation, observation, critical analysis, debate and discussion in the teaching learning process. Impact on Modern Education: John Dewey's philosophy on education has a great impact on the present-day education system. Present education process emphasizes on creating or constructs knowledge through experiences of the child. The child has every ability to construct their own knowledge. Teacher helps the child to construct their knowledge by using the experiences gained by the learner from their interaction with the environment, family, peers, society, play mates, etc.

NSOU ? CC-ED-02 ? 197 John Dewey's concept of education has contributed lot to Vygotsky's constructivist approach of learning. Criticism: Although Dewey's views on educational principles were enthusiastically received, they were also subjected to criticism on the following grounds: Materialistic bias: Pragmatism was born out of reaction to idealism, and consequently it manifests a distinctly materialistic bias, in contradiction of the spiritual bias of idealist philosophy. At the same time, Dewey wants to realize democratic ideals of freedom, equality and fraternity through education. But it is difficult to understand how this can be done unless he accepts an idealistic basis for his system of education. Absence of any aim of education: For him, education is life itself, and it is not possible to determine any objective for it. Most scholars disagree with this opinion because they believe that education can progress only when it has some definite aim and objective. Excessive emphasis upon individual difference: Modern educational psychology accepts in principle that the curriculum of education must take into account the individual differences of children and that children must be educated according to their individual and unique interest and inclinations both in respect of curriculum and also of the method of teaching. While in theory this is quite acceptable but any attempts, to apply in practice lead to immediate complications. It is almost, if not completely possible to provide a separate educational plan for every individual child in a school. Limitations in learning through doing: There are no doubt that the child should learn actually doing things, as Dewey suggested, yet the theory has its limitations. Many facts known to an individual are acquired from another person. It is almost impossible for one individual to experience every fact known to him. Thus, the educator should also try to benefit from the experience of his teacher, educator and colleagues. In fine, it is a fact that Dewey's philosophy of education has not had a truly systematic criticism because most critics have taken on only piecemeal aspects or have made no critical analysis. Nevertheless, this philosophy has made important contributions to educational theory and practices and will continue to do so.

NSOU ? CC-ED-02 ? 198 5.5 Contribution of Ivan Illich and Paulo Friere as Radical thinkers in education 5.5.1 Radical thoughts of Ivan Illich The book that brought Ivan Illich to public attention was *Deschooling Society* published in 1971. It was a groundbreaking critique of compulsory mass education. He argued that the oppressive structure of the school system could not be reformed but must be dismantled in order to free humanity from the crippling effects of lifelong institutionalization. The Myth of Institutionalized Values: This myth, according to Illich, is grounded in the belief that the process of schooling produces something of value. That belief generates a demand. It is assumed that the school produces learning. The existence of schools produces the demand for schooling. Thus the school suggests that valuable learning is the result of attendance, that the value of learning increases with the amount of this attendance,

78%

MATCHING BLOCK 107/127

SA

EDN-101-Philosophical Foundations of Education.pdf
(D141385432)

and that this value can be measured and documented by grades and certificates. Illich

takes the opposite view: that learning is the human activity that least needs manipulation by others; that most learning is the result not of instruction but of participation by learners in meaningful settings. School, however, makes them identify their personal, cognitive growth with elaborate planning and manipulation. The Myth of Measurement of Values: According to Illich, the institutionalized values school instils are quantified ones. For him personal growth cannot be measured by the yardstick of schooling but, once people have the idea schooled into them that values can be produced and measured, they tend to accept all kinds of rankings. People who submit to the standard of others for the measure of their own

78%

MATCHING BLOCK 108/127

SA

EDN-101-Philosophical Foundations of Education.pdf
(D141385432)

personal growth soon apply the same standard to themselves. They no longer have to be put in their place but put themselves into

their assigned slots, squeeze themselves into the niche which they have been taught to seek, and in the very process, put their fellows into their places, too, until everybody and everything fits. The Myth of Packaging Values: The school sells the curriculum, says Illich, and the result of the curriculum production process looks like any other modern staple product. The distributor/teacher delivers the finished product to the consumer/pupil, whose reactions are carefully studied and charted to provide research data for the preparation of

100%	MATCHING BLOCK 109/127	SA	EDN-101-Philosophical Foundations of Education.pdf (D141385432)
the next model, which may be 'ungraded', 'student-designed', 'visually-aided', or 'issue-centred'.			

NSOU ? CC-ED-02 ? 199 The Myth of Self-Perpetuating Progress: Illich talks not only about consumption but about production and growth. He links these with the race for degrees, diplomas and certificates, since the greater one's share of educational qualifications the greater one's chances of a good job. For Illich the working of consumer societies is founded to a great extent on this myth, and its perpetuation is an important part of the game of permanent regimentation. To smash it, says Illich, 'would endanger the survival not only of the economic order built on the co-production of goods and demands, but equally of

76%	MATCHING BLOCK 110/127	SA	EDN-101-Philosophical Foundations of Education.pdf (D141385432)
the political order built on the nation-State into which students are delivered			

by the school.'5 Consumers/pupils are taught to adjust their desires to marketable values, even though this cycle of eternal progress can never lead to maturity. In conclusion Illich points out that the school is not the only modern institution whose main purpose is to shape people's view of reality. Other factors contribute to this, factors related to social origins and family surroundings, the media and informal socialization networks. These, amongst others, are key elements in mouldingbehaviour and values. But he considers that it is the school that is most deeply and systematically enslaving. It alone is entrusted with the task of forming critical judgement, a task that, paradoxically, it tries to carry out by ensuring that learning, whether about oneself, about others or about nature, follows a predetermined pattern. Illich defends these opinions in his polemical and provocative style, affirming that, in his judgement, '

78%	MATCHING BLOCK 112/127	SA	EDN-101-Philosophical Foundations of Education.pdf (D141385432)
school impinges so intimately upon us that no one can hope to be freed from it			

by any external means'. And he adds: Schooling the production of knowledge, the marketing of knowledge, which is what the school amounts to draws society into the trap of thinking that knowledge is hygienic, pure, respectable, deodorized, produced by human heads and amassed in a stock. I see no difference between rich and poor countries in the development of these attitudes to knowledge. There is a difference of degree, of course; but I find it much more interesting to analyse the hidden impact of the school structure on a society; and I see that this impact is equal or, to be more precise, tends to be equal. It doesn't matter what the overt structure of the curriculum is, whether the school is public, whether it exists in a State that has the monopoly of public schools, or in a State where private schools are tolerated or even encouraged. It is the same in rich as in poor countries, and might be described as follows: if this ritual that I consider schooling to be is defined by a society as education then the members of that society, by making schooling compulsory, are schooled to believe that the self-taught individual is to be discriminated against; that learning and the growth of cognitive capacity, require a process of consumption of services presented in an industrial, a planned, a professional form;that learning is a thing rather than

NSOU ? CC-ED-02 ? 200 an activity. A thing that can be amassed and measured, the possession of which is a measure of the productivity of the individual within the society. That is, of his social value. Out of this analysis grew the strategies Ivan Illich proposes for 'deschooling' education and teaching. He himself tested these strategies on young people and adults taking part in the workshops and activities of CIDOC in Cuernavaca. We shall return to them later. 'Conviviality: The works that followed Deschooling society go beyond education to focus more broadly on the reorganization of society and work, in accordance with human needs. This is the message of Tools for conviviality (1973), Energy and equity (1974) and Medical nemesis: the expropriation of health (1982). In the last two works Illich asserts that, just as the school 'de-educates', institutionalized medicine has become a serious health problem. He also uses the example of transport to illustrate his view of the way continuing progress and increasing comfort, in the industrialized countries, lead to waste and the inability to make proper use of any energy source. His thinking on these subjects is to be found in Medical nemesis and Energy and equity. In these works, too, Illich leaves education and the school to take up the analysis of political and institutional problems that affect modern societies, with their high degree of technology and stratification, problems inescapable for countries that pursue their development on the pattern of today's industrialized countries. In Tools for conviviality Illich proposes a rival strategy calling for limits to the growth of industrialized societies and suggests a new kind of organization for them, to be achieved through, among other means, a new concept of work and the 'deprofessionalization' of social relations, not excluding education and the school. 'Convivial' institutions, as Illich defines them, are characterized by their vocation of service to society, by spontaneous use of and voluntary participation in them by all members of society. Illich, therefore, attributes the word 'convivial' to a society in which 'modern technologies serve politically interrelated individuals rather than managers'. And he adds 'a "convivial" society is one in which people control the tools'.⁸ What is fundamental to a 'convivial' society is not the total absence of those institutions which Illich calls manipulative, or of addiction to specific goods and services. What he proposes is a balance between institutions that create the specific demands they are specialized to satisfy and those that foster self-realization. A 'convivial' society, Illich insists, 'does not exclude all schools. It does exclude a school system which has been perverted into a compulsory tool, denying privileges to the drop-out.

NSOU ? CC-ED-02 ? 201 It is important to emphasize that Ivan Illich does not attack any specific political system or regime but rather the entire industrial mode of production and its consequences for humankind. His central thesis in this regard is that 'the means of production have technical characteristics that make them impossible to control by a political process. Only a society that accepts the need to agree on a ceiling for certain technical dimensions of its means of production enjoys political alternatives'. He calls the attention of developing countries to these dimensions and, in so doing, he throws down challenges to education. All these ideas find expression in Illich's thesis of 'conviviality', the main thrust of which is to call the attention of developing countries to the advantages and drawbacks of adopting the same style of development as the industrialized countries. At the time that he was putting forward these ideas the majority of these countries, especially in Latin America, had not reached the same stage of development as the industrialized countries and, in Illich's view, still had time to reverse the trend, to redefine their goals and priorities and select development styles that were more equitable, participatory and conducive to the preservation of natural balance and 'convivial' relations. 'Reconstruction for poor countries means adopting a set of negative criteria within which their tools are kept, in order to advance directly into a post-industrial era of conviviality. The limits to choose are of the same order as those which hyper-industrialized countries will have to adopt for the sake of survival. Conviviality, which will be immediately accessible to the "underdeveloped", will have to be bought by the "developed" at an exorbitant price'. These words of Illich's, written in the mid-1970s, are very similar to those being used now to show that, less than ten years from the end of the century, the countries of North and South, of East and West, are at last realizing that they form a universal whole and that they have more in common than they thought. Environmental problems and ecological imbalances impinge equally on all; a declining standard of living does not distinguish between developed countries and those still in search of sustainable development. All are equally concerned for the quality and effectiveness of learning inside or outside the school system, and no one can ignore that school and education are far from having adapted themselves to the pace of scientific and technological change or to the most immediate needs of those who look to them for their self-realization in the world of today. It is a fact that the search for solutions to these problems is no longer solely in the hands of developed countries, and here Illich's opinions contain a great deal of truth.

NSOU ? CC-ED-02 ? 202 Developing countries now not only form part of world problems but are also bound up with the solutions to those problems. The 'convivial' society may not be the answer. But it must be recognized that Illich dealt with these themes almost three decades ago. Whether because of the ideological context in which the ideas were born and developed, whether because of a lack of theoretical foundation to sustain them, or because of Illich's own personality, the themes of 'deschooling' society and building a 'convivial' society did not receive the attention they deserved, and there was no further development of a line of thinking that might have borne better fruit.

5.5.2 Radical Thoughts of Paulo Freire (1921-1997): Introduction/Short Biography: The Brazilian educator Paulo Freire's is one among the most of the influential educational thinkers of the late 20th century. Born in Recife, Brazil, on September 19, 1921, Brazil on May 2, 1997. He taught Portuguese in secondary schools from 1941-1947. He subsequently became active in adult education and workers' training, and became the first Director of the Department of Cultural Extension of the University of Recife (1961- 1964). Freire quickly gained international recognition for his experiences in literacy training in Northeastern Brazil. He was jailed by the new government and eventually forced into a political exile that lasted fifteen-years. In 1969 he was a visiting scholar at Harvard University and then moved to Geneva, Switzerland where he assumed the role of special educational adviser to the World Congress of Churches. He returned to Brazil in 1979. Finally, in 1988 he became the Minister of Education for Sao Paulo (Rage and Hope: Paulo Freire's, n.d.). Paulo Freire's Concept of Education: Freire's most well-known contribution is Pedagogy of the Oppressed (1970). Paulo Freire is neither an idealist, nor a realist. Freire denies the view that man is abstract,

NSOU ? CC-ED-02 ? 203 isolated, independent and unattached to the world. He also denies that the world exists as a reality apart from men. In his view consciousness and world are simultaneous. Consciousness neither precedes the world as the idealist hold nor it follows the world as the materialist believe, Paulo 's position is near to the existentialists who give much emphasis on existential man equipped with strong will power who can transform the world with his own efforts . In short, the role of man as a Subject in the world and with the world." Freire's work mainly concerned literacy and the desire to help men and women overcome their sense of powerlessness by acting in their own behalf. The oppressed, as he called them, could transform their situation in life by thinking critically about reality and then taking action. Freire believed that the educational system played a central role in maintaining oppression and thus it had to be reformed in order for things to change for the oppressed. A Set of Political and Pedagogic Principles a Set of Political Principles: ? The principal goal of popular education is to change the power relationships in our society. ? The objective is to create mechanisms of collective power over all the structures of society. ? The means of attaining this goal cannot be in contradiction with the final objective— to construct a really democratic society you cannot use authoritarian methods. ? The projects, strategies and tactics used in the political process have to be produced collectively by the participants themselves. A Set of Pedagogic Principles: ? The learners are the SUBJECTS, not the objects of the learning process; through this approach they can become the SUBJECTS of society ? The educator and the learners are equal participants in the learning process; all are the producers of knowledge ? The learning process is developed by a continuous dialogue between the educator and the learners ? The objective of the learning process is to liberate the participants from their external and internal oppression; to make them capable of changing their reality, their lives and the society they live in.

NSOU ? CC-ED-02 ? 204 Banking Education: In this form of education, it is the job of the teacher to deposit in the minds of the learners, considered to be empty or ignorant, bits of information or knowledge, much like we deposit money in a empty bank account. This is why Freire called this model of education 'banking education'. Freire criticized this model of education because he believed that it makes the students into passive objects to be acted upon by the teacher. He argued that the goal of 'banking education' is to demobilise the people within the existing establishment of power by conditioning them to accept the cultural, social, political status quo of the dominant culture. In the banking education model knowledge of education is seen as a gift given to the student by the teacher who considers the learner as marginal, ignorant and resource-less. Freire saw this as false generosity from the dominant group (oppressors) and a way of dominating and controlling the people (the oppressed) to improve or maintain their own interests. Freire put forward the notion that authoritarian forms of education such as banking education prevented learners from 'knowing' the world and from seeing it as something which can be changed. He believed that authoritarian forms of education inhibited the liberation and freedom of the oppressed. The banking education maintains and even stimulates the contradiction through the following attitudes and practices, which mirror oppressive society as a whole: (a) The teacher teaches and the students are taught; (b) The teacher knows everything and the students know nothing; (c) The teacher thinks and the students are thought about; (d) The teacher talks and the students listen-meekly; (e) The teacher disciplines and the students are disciplined; (f) The teacher chooses and enforces his choice, and the students comply; (g) The teacher acts and the students have the illusion of acting through the action of the teacher; (h) The teacher chooses the program content, and the students (who were not consulted) adapt to it; (i) The teacher confuses the authority of knowledge with his own professional authority, which he sets in opposition to the freedom of the students;

NSOU ? CC-ED-02 ? 205 (j) The teacher is the Subject of the learning process, while the pupils are mere objects. It is not surprising that the banking concept of education regards men as adaptable, manageable beings, The more the students work at storing the deposits entrusted to them, the less they develop the critical consciousness which would result from their intervention in the world. The more completely they accept the passive role imposed on them, the more they tend simply to adapt to the world as it is and to the fragmented view of reality deposited in them. Freire argued that change could come through a process of dialogue and reflection leading on to change through action or intervention and or political change. Freire called this process Praxis. A Problem-Posing Model: To challenge the banking education model, Freire proposed a problem-posing model of education. In this model, the teacher and the learner discuss and analyse their experiences, feelings and knowledge of the world together. Instead of the belief that learners' and teacher's situation in the world is fixed, as the banking model suggests, the problem-posing model explores problems or realities people find themselves in as something which can be transformed. Paulo Freire's "problem posing concept of education" is based on his "anthropological concept of culture" which is based on Freire's distinction between animals and humans. For Paulo Freire, man is the only one to treat not only his actions but his very self as the object of his reflection. Paulo Freire's "anthropological concept of culture" is It is not the job of the teacher to provide answers to the problems, but to help the learners achieve a form of critical thinking about the situation (Freire called this conscientization). This makes it possible to understand that the world or society is not fixed and is potentially open to transformation. It becomes possible to imagine a new and different reality. In order for students to be able to confront oppression, they must first become critical thinkers. Freire believes that critical thinking is not possible in a banking education framework, but only in a problem-posing educational framework. In the banking system of education, students are primarily asked to memorize and regurgitate often meaningless and disjointed facts; whereas in a problem-posing framework, students are asked to use critical thinking skills to investigate various problems that exist in the world. Freire made the distinction between these two types of educational frameworks in POTO (Pedagogy of the Oppressed)

NSOU ? CC-ED-02 ? 206 1. Whereas banking education anesthetizes and inhibits creative power, 2. Problem-posing education involves a constant unveiling of reality. 3. The former attempts to maintain the submersion of consciousness; 4. The latter strives for the emergence of consciousness and critical intervention in reality. Students under this framework would pose problems and then critically investigate why those problems exist. Freire believes that a problem-posing education will not only allow students to become critical thinkers, but reveal that the world is constantly undergoing change. In problem-posing education, people develop their power to perceive critically the problem. In order to undertake this process successfully, the people (oppressed) must challenge their own perception of the dominant group (oppressor) Freire argued that the oppressed think of themselves as 'less than' or something lacking. He suggested that they have been conditioned to view the practices and behaviours of the dominant groups as complete, whole and correct. To become whole complete and correct means to simulate the practices of the dominant culture. To counter this perception means engaging the learner in a process of dis-identification with dominant culture/oppressor and to help the learner to imagine a new being and a new life according to their own rationality. Learning Circles: The learning circle is a non-hierarchical 'class' model where participants can discuss generative themes which have significance within the context of their lives. This involves creating a democratic space where every one's voice has equal weight age. The conditions needed for this have to be actively created as it does not often occur naturally. This can mean challenging cultural, gender and other status related power relationships and stratifications. This critical and liberating dialogue, also known as culture circles, is the heart of Freire's pedagogy. This method of learning literacy through meaningful discussions generated from 'codifications' has been very successful. However, Freire emphasises that the process should not be carried out mechanically but through creatively "awakening the consciousness" of the learner. Codifications may be photographs, drawings, poems, even a single word. As representations, codifications abstract the daily circumstances. For example, a photograph of workers in a sugar cane field permits workers to talk about the realities of their work

NSOU ? CC-ED-02 ? 207 and working conditions without identifying them as the actual workers in the photograph. This permits the dialogue to steer toward understanding the nature of the participants' specific circumstances but from a more abstract position. Teachers and learners worked together to understand the problems identified by the peasants, a process that Freire calls decoding, and to propose actions to be taken to rectify or overturn those problems. The circles therefore have four basic elements: I. Problem posing, II. Critical dialogue, III. Solution posing, and IV. Plan of action. The goal, of course, is to overcome the problems, but it is also to raise the awareness, the critical consciousness (conscientization), of the learners so as to end oppression in their individual and collective lives. Teaching Aids: Some of the tools a banking education model might use include a pre-prescribed curriculum, syllabus or course book, which either takes no account or makes assumptions of learners' views or knowledge of the world. Freire called these pre-prescribed plans and course books as primers. Paulo Freire saw no use for traditional primers. How does a person benefit from repetition even saw the grape, this statement has nothing to do with reality. Freire stated that there will be no significant learning if the pupil fails to establish a relationship with the object, if he doesn't act towards it. ? As a result of this belief, Freire wrote cultural primers in the late 1950's with the object of building a revolutionary society. His basic objective with the primers was to present concrete reality to be transformed. Program content should be presented to allow the pupils to take control of it little by little rather than just receiving the content. Teaching materials should be written regionally or even locally. He believed that the universalization of teaching material to reading is an absurdity scientifically and an act of authority politically (Gadotti, 1994). ? The Freirean cultural circle made use of slide projectors – imported from Poland at – which were used to display film slides that were the centerpiece of Freire's literacy training because of their ability to foster a collective learning environment and amplify reflective distancing (Sayers & Brown, 1993, pp. 32-33). For the

NSOU ? CC-ED-02 ? 208 slides, Freire enlisted the well-known artist Francisco Brenand to create codified pictures' that were designed to help peasants semantically visualize the culture making capacities composed of situations that intended to reveal how peasant life is cultural (and not natural) and thus human (and not animal). Freire's film slides were displayed on the walls of peasants' homes, whereupon dialogues were conducted that analyzed the slides' various pictorial elements. The pictures themselves depicted a range of premodern and modern technologies, as well as other cultural artifacts. Freire's film slides were displayed on the walls of peasants' homes, whereupon dialogues adopt technology pedagogically to demonstrate people's inherent productive and communicative abilities, as well as the possibility of their utilizing modern technologies critically and as part of a means to rehumanized ends. Dialogue: A central theme of Paulo Freire is that of dialogue. Dialogue is a part of human nature, we need each other to discover and discovery is a social process and discussion is the cement. He thought that the moment of dialogue was the moment of transformation. Freire saw the dialogue of the elite as vertical. He called it banking pedagogy. The person who is learning only needs to listen while the educator deposits knowledge. This narrative form of education maintains the division between those who know and those who don't. Freire viewed dialogue as a horizontal relationship based on love respect and tolerance. It follows then that Banking education and problematization are opposite methods Finally, comments Freire, true dialogue cannot exist unless the dialoguers engage in critical thinking...thinking which perceives reality as process, as transformation, rather than as a static activity. True dialogue is for Freire what civic education must be about. If civic education does not include it, then there is little hope that the future will be anything for the oppressed but a continuation of the present. Authentic education is not carried on by A' for B' or by A' about B', but by A' with B'....Essential to such education are the experiences of the students, whatever their ages or situations. "The act of knowing involves a dialectical movement that goes from action to reflection and from reflection upon action to a new action." (Freire 1972). "If learning to read and write is to constitute an act of knowing, the learners must assume from the beginning the role of creative subjects. It is not a matter of memorising and repeating given syllables, words and phrases but rather, reflecting critically on the process of reading and writing itself and on the profound significance of language" (Freire 1985) That power is to be used to liberate themselves from oppression. This pedagogy to end oppression, as Freire writes, must be forged with, not for, the oppressed

NSOU ? CC-ED-02 ? 209 (1970, 48; emphases in original), irrespective of whether they are children or adults. Freire worked primarily with illiterate adult peasants in South America, but his work has applications as well to schools and school-aged children. It is to be a pedagogy for all, and Freire includes oppressors and the oppressed. Freire wanted his students, whether adult peasants or a country's youth, to value their cultures as they simultaneously questioned some of those cultures' practices and ethos. This Freire referred to as reading the word as in ending illiteracy and reading the world the ability to analyze social and political situations that influenced and especially limited people's life chances. For Freire, to question was not enough; people must act as well. Liberation, therefore, is a praxis, but it cannot consist of action alone, which Freire calls activism. It must be, instead, action combined with serious reflection (Ibid, 79, 65). This reflection or reflective participation takes place in dialogue with others who are in the same position of realization and action. The oppressed thereby use their own experiences and language to explain and surmount their oppression. They do not rely upon others, even teachers, to explain their oppressed circumstances. Through dialogue, the teacher-of-the-students and the students-of-the-teacher cease to exist and a new term emerges: teacher-student with students-teachers (Ibid, 80). The reciprocity of roles means that students teach teachers as teachers teach students. Dialogue encourages everyone to teach and everyone to create together. Leading the National Literacy Program: In 1962 the mayor of Recife appointed Freire as head of an adult literacy program for the city. In his first experiment, Freire taught 300 adults to read and write in 45 days. This program was so successful that during the following year the President of Brazil appointed him to lead the National Literacy Program. This program was on its way to becoming similarly successful, with expected enrollments to exceed two million students in 1964. Under Brazil's constitution, however, illiterates were not allowed to vote. The O Globe, an influential conservative newspaper, claimed that Freire's method for developing literacy was stirring up the people, causing them to want to change society, and fomenting subversion. As a consequence of a military overthrow of the government in 1964, Freire was jailed for 70 days, then exiled briefly to Bolivia and then to Chile for five years. Paulo and his group of Educators had a double task: to develop an efficient literacy method for adults, and to raise the social consciousness of the Brazilian workers. They found out that the workers were fatalists, resigned to their situation in society, and thinking that it was impossible to change this situation.

NSOU ? CC-ED-02 ? 210 It was only in 1969 that Paulo Freire wrote about his methodology in his book Pedagogy of the Oppressed, when he was a political exile in Chile. In this and his other books, Freire developed the theory of his practice as Popular Educator. They are books about the philosophy of this work, about the concepts, the general directives, not about the practice, the lessons, the activities in the classroom. And this has to be so: for each practical experience with each group of learners is different from the others. There are no ready-made formulas to apply the Paulo Freire methodology in the classroom and this is perhaps the biggest difficulty to many educators. 5.6 Summary We have to discuss the Indian Educational Thinkers Rabindranath Tagore, Swami Vivekananda and their contribution in Education & Society. We have to also elaborate the Western Educational Thinkers Rousseau & John Dewey and their contribution in Education & Society. Discuss the Radical thinkers : Ivan Illich & Paulo Freire's Educational and Philosophical thoughts. Educational philosophy of Tagore is influenced by his own life. Though Tagore was fully aware of the ideas of the western thinkers on education, he based his own ideas on the ancient Indian thought. Tagore was dead against the traditional system of education which confined the child within the four walls of the classroom or the home. According to him, nature is the best curriculum and teacher for the child. To analyse the educational principles of Tagore, it can be said that he was a follower of naturalism as well as pragmatism. But his educational philosophy is highly based upon the naturalistic system of education. Tagore believes self-education which is based on self-realisation. Tagore believed on complete freedom and independence of the child. These independence or freedom will be of intellect, decision, heart, knowledge, action and worship. Tagore believes in perfection of doing things. Hence only passing examination and getting a degree is not the aim of education. The concept of 'universality' has defined in Tagore's concept of education. He believes true education is something that the individuals think and act going beyond his/her individual soul and rather to faith and work for realising the universal soul. The principles of Tagore's educational philosophy are as follows: • Self-realisation should be one's goal of education. • He formulated goal of education by synthesizing the Ancient Vedantic education with the modern western scientific attitudes.

NSOU ? CC-ED-02 ? 211 • For developing creative faculties, the child should be provided opportunities for self-expression. • He supported integral development of human power including physical, intellectual, moral and religious development. • He supported harmony with the environment one lives in and to be in harmony with one's environment. • Children should not be forced to receive knowledge through books. • The aim of education is to make the child self-sufficient and to earn for livelihood. • Swami Vivekananda was a true Vedantist. He regards the Vedanta as perfectly impersonal. The Vedanta is eternal. It is not originated by any person or prophet. So it is built around any particular individual as the centre. The Dvaita, the visista- dvaita and the advaita are the different expressions of the Vedanta according to Swami Vivekanand. So to him, they are not opposed to each other. They are not absolute system. They are merely the stage for helping the individual to proceed progressively towards the realization of higher and higher ideas till everything is merged in the wonderful unity with the Creator. • Rousseau is regarded as the most important naturalist philosopher of education. Some of his famous works are: (1) The Progress of Arts and Sciences; (2) Social Contract; (3) New Heloise; and (4) Emile. Of these, the most important are Emile and Social Contract. Emile is a novel in which the author has described the methods of bringing the child in contact with Nature and removing him from social evils. The child is left under the guidance of an ideal teacher away from school and society. The teacher teaches the child in a natural environment. The book Emile consists of five parts respectively devoted to infancy, childhood, adolescence, youth and the imaginary wife of Emile names Sofia. Rousseau was particularly impressed by the poverty and suffering of the people. He hated society for its evils and wanted to reform it. He realized, "

100%

MATCHING BLOCK 111/127

W

Everything is good as it comes from the hands of

the author of the Nature but everything degenerates in the hands of man". Thus, Rousseau, on the one hand, opposed society and praised Nature on the other hand. His book Social Contract portrays his ideas concerning society and politics. Rousseau had to leave France for England in 1766. He died in 1778. His thoughts influenced French revolution. He is acclaimed as a great revolutionary and reformer. Education and its successive transformation over the past four hundred

NSOU ? CC-ED-02 ? 212 years, have renewed educational theory and practices. In the opinion of Rousseau, education aims at the natural development of the child's inner faculties and powers. • Education should help the child to remain alive. Life implies not merely taking of breath but working. To live is to work, to develop and to properly utilize the various parts of the body, the sense organs and the various other powers of the body. In his book Emile, Rousseau seeks to train Emile in the profession of living so that he may become a human being before becoming a soldier, a churchman or a magistrate. Education, thus, in Rousseau's opinion, must aim at making the child a real human being. But the aims of education proposed by him are observed to change at different stages of the child's development, because at each stage something different needs stress. Hence the change in aims of education are natural and conform to law of human development. The following are the various aims of education according to each level of the child's development. • John Dewey is a great philosopher, educationist and thinker of the modern age. John Dewey's concept on education is based upon the philosophy of pragmatism. Dewey believed that knowledge is resultant of action. According to him, change is the reality of the world.

HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

Defining education, he said, 'Education is the continuous reconstruction of experiences'. His

major concept on education has been written in his books like: 'Democracy and Education' (1916), 'Logic' (1938), and 'Experience and Education' (1938). According to him, 'truth is an instrument used by human beings to solve their problems', since problems change, truth changes and therefore there can be no eternal reality. According to Dewey, change is the basic theory of education. Fact varies from person to person. Therefore a person develops theory on the basis of consequence of actions and experimentations. The main aim of education is to make child capable of solving problems of life with their experiences. The aim of education is to make human life prosperous and happy. So, John Dewey is called a pragmatist thinker. • Ivan Illich was a Croatian- Austrian philosopher, who addressed contemporary practices in education, medicine, work, energy use, transportation, and economic development. The book that brought Ivan Illich to public attention was *Deschooling Society* published in 1971. It was a groundbreaking critique of compulsory mass education. He argued that the oppressive structure of the school system could not be reformed but must be dismantled in order to free humanity from the crippling effects of lifelong institutionalization. Ivan Illich's work in education criticism of the school, and the NSOU ? CC-ED-02 ? 213 'deschooling' of society, Ivan Illich's writings on education are made up of collections of articles and public speeches reproduced in various languages, as well as books, also distributed internationally, on subjects such as education, health and transport, and on ways in which future society might be organized. He presents the four central ideas that suffuse the whole of his work on education: 'universal education through schooling is not feasible. It would be more feasible if it were attempted by means of alternative institutions built on the style of present schools; neither new attitudes of teachers towards their pupils nor the proliferation of educational hardware or software, nor finally the attempt to expand the teachers' responsibility until it engulfs the pupils' lifetimes will deliver universal education; the current search for new educational funnels must be reversed into the search for their institutional inverse: educational webs which heighten the opportunity for learning, sharing and caring; the ethos, not just the institutions, of society ought to be 'deschooled'. • Illich's interest in the school and the processes of schooling, then, stemmed from his educational work in Puerto Rico, more specifically his work with American educators concerned about the direction they saw the public schools of their country taking. Illich himself acknowledges in the introduction to *Deschooling society*, that it is to Everett Reimer that he owes his interest in public education. He begins by denouncing institutionalized education and the institution of the school as producers of merchandise with a specific exchange value in a society where those who already possess a certain cultural capital derive the most benefit. • Freire's most well-known work is *Pedagogy of the Oppressed* (1970). Throughout this and subsequent books, he argues for system of education that emphasizes learning as an act of culture and freedom. Paulo Freire is neither an idealist, nor a realist or a mechanist. Freire denies the view that man is abstract, isolated, independent and unattached to the world. He also denies that the world exists as a reality apart from men. In his view consciousness and world are simultaneous. Consciousness neither precedes the world as the idealist hold nor it follows the world as the materialist believe, Paulo's position is near to the existentialists who give much emphasis on existential man equipped with strong will power who can transform the world with his own efforts. In short, the role of man as a Subject in the world and with the world." Freire's work mainly concerned literacy and the desire to help men and women overcome their sense of powerlessness by acting in their own behalf. The oppressed, as

NSOU ? CC-ED-02 ? 214 he called them, could transform their situation in life by thinking critically about reality and then taking action. Freire believed that the educational system played a central role in maintaining oppression and thus it had to be reformed in order for things to change for the oppressed. 5.7 Self-Assessment Questions 1. State the educational philosophies of Rabindranath Tagore. 2. Explain the aims of education according to Rabindranath Tagore. 3. Explain the Naturalistic Education according to Rabindranath Tagore 4. State the educational philosophies of Swami Vivekananda? 5. Explain the aims of education according to Swami Vivekananda. 6. Describe the contributions of Swami Vivekananda in education 7. Explain the educational thoughts of Rousseau. 8. Discuss the aims of education according to Rousseau. 9. Describe the contributions of Rousseau in education 10. Explain the educational thoughts of Dewey. 11. Discuss the aims of education according to Dewey 12. Describe the contributions of Dewey in education 13. What is the educational thought of Ivan Illich 14. Explain the aims of education according to Ivan Illich 15. Discuss the Educational Importance of Ivan Illich theory. 16. What is the educational thought of Paulo Freire 17. Explain the aims of education according to Paulo Freire. 18. Discuss the concept of Banking Education 5.8 References Bhatia & Bhatia (1996). National unity binds the citizens of a nation in unity, gives birth to the sense of oneness in them. With the development of this spirit a person not only takes care of his interests, but also takes care of the interests of society and the nation. He becomes ready to sacrifice his personal, family, ethnic and religious interests for the sake of nation.

One of the eminent Educationist explained that National Integration cannot be built by brick and mortar, by Chisel and hammer. It has to grow silently in the hearts and minds of man. It's a slow but steady process and it is possible through Education.

In National Integration conference held in 1961 the sense of national unity was explained in the following terms "National unity is a psychological and educational process by which sense of oneness, organization and cohesion is developed in all individuals. According to the above definitions, it can be said that nationality is a spirit, an inspiration, a plan, which binds the people of different casts, religion, community and linguistics living in a certain geographical range in unity. It develops the sense of boundless devotion, obedience, fidelity and sense of discipline in the people towards their nation, and inspires them to live together and always strive to for the nation's security and prosperity.

Need and Importance of National Integration: In Dr. Radhakrishnan's opinion, "National unity is a problem which has a close relationship with our existence as a civilized nation." National unity is essential for national security, integrity and growth. Following are the reasons behind its necessity and importance—

1. National unity is needed to avert a crisis arising from foreign powers and internal conflicts.
2. National unity is also needed to suppress disruptive forces for creating a peaceful environment.
3. National unity is required for the protection of independence, respect and interests of the nation.
4. National unity is required to preserve, development and transfer of culture.
5. National unity is required to abolish the social prejudices, superstitions, traditions and different types of inequalities to improve the lifestyle of the members of the society and to create a proper environment.
6. National unity is essential to stop the class-discrimination and exploitation and to remove the economic inequalities for the industrial progress of the nation.
7. National unity is required to get away from linguistic insanity, to establish linguistic integration and to develop the national language.
8. For the development of a common national culture with the help of all sub-cultures of the nation, national unity is needed.
9. National unity is required to generate faith in ideals, values and traditions in the citizens and to create commitment for progress and development of the nation.
10. National unity is required to develop self-sacrificing spirit to grow a sense of every sort of sacrifice for the nation.
11. Truth-integrity, cooperation, ability to adjust, fidelity, honesty, tolerance, foresight, a desire to bear social responsibility, sensitivity, friendly, critical thinking and the ability to make clear and accurate decisions to build balanced personality of the citizens, the national unity is needed.

National Integration and Education: Education is the most important means of to develop a sense of national unity. We can generate the necessary inspiration and properties among the citizens by education. Famous philosopher Dr. Radhakrishnan expressed the importance of education in the development of national unity as following, "National unity cannot be achieved, by chisel, hammer, brick and stone. It is born in the hearts and minds of the people gradually, and the education is the only instrument for the purpose. It may be a slow process but it is permanent and strong process in itself." The disruptive elements that are spread in the country and hampering the development of national unity. End of these disruptive elements is possible only by the education. People can be made aware of the evils of these deadly substances and unity can be established among them with the help of education. About the contribution of education to establish a national unity it was said in National Unity Conference that "Education is the most important means in creating national unity. Since the problem of unity or national organization is essentially related to the perspective of large parts of society and different groups and in its broadest sense the view of the education has been considered as a powerful tool to change or influence the attitudes. So according to the idea of the conference, the process of education and its purified form should be considered important wherever necessary."

To provide a feeling to serve the nation better. National Integration and Curriculum: Two things are involved in curriculum—

A) Reorientation of subjects The following reorientations should be done to develop national integrity in different curriculums—

1. Teaching of national language: Hindi has been accepted as the national language of India. Therefore the teaching of Hindi should be a necessary throughout the country. This will develop patriotism in students.
2. Moral and religious education: Religious education does not only mean to educate about a particular religion, but it also aims to introduce the students about the basic principles of different religions and create a faith in them. A development of qualities like truth, justice, duty, love, cooperation should be done in children through moral education.
3. Teaching of language and literature: The feeling of national integration can be developed easily in the students through teaching of language and literature. The lessons should be included in books of different languages in such a way through which students can get knowledge about the prestige and greatness of his country, and get a chance to understand about their culture and civilization and to know about the work done by great persons of their country. The sense of national integrity can be developed among the students through stories, plays, poems, etc.
4. Teaching of history: Students should not be educate about dates and events only, through teaching of history, but they also must be told that enemies had always taken the advantages of our infighting. They must be told about those kings, saints, social reformers that have an important role in the development and national integrity of the country. Students should also be given a detailed knowledge about the history of freedom fight of India. They must be told about those great persons and heroines who devoted their luxuries and also died for the freedom of India.
5. Teaching of Geography: The geographical subject matters should be viewed through national angle. Student must be told about the mutual boundaries, rivers, mountains, weather, minerals, crops, transportation and mutual dependency of the states. They should also be told that in spite of living in different states and having major differences in their eating habits, lifestyle, costumes and traditions, all the people of the country are same from the geographical angle.

NSOU ? CC-ED-02 ? 221

6. Teaching of Civics: The students must be educated to be a ideal citizen through civics. They must aware about their duties and rights. They must be encouraged to keep distance from the elements like casteism, sectism, province, terrorism, etc which harm national integrity. They must be told that they should not do any activity which is against national interest.
7. Teaching of Science: Teaching of science can also develop the sense of patriotism in students. They must be told that the scientific inventions are not related to a particular caste, religion, province, sector in the country. All the Indians are being benefited from them. Therefore they are the asset of India. C.V Raman, Meghnat Saha, Homi Bhabha are the scientists of India not from any particular state.
8. Teaching of music and arts: Music and different arts are also the binding forces which are capable to make unity in diversity. They are capable to join the hearts and they have a long lasting effect. Student must be told about the arts, music and dance of different states of the country. They must be told that Bhimsen Joshi, Begam Akhtar, Pt. Ravi Shankar, Amjad Ali Khan (sarod), Bismillah Khan (shehnai), Hari Prasad Chaurasia (flute), Shiv Kumar Sharma (santoor), Zakir Hussain (tabla), Jubin Mehta (violin) etc. are the prestige of India but they are not from a particular state, caste or province.

(B) Organization of co-curricular activities: The following co-curricular activities should be organized to develop national integration—

1. To celebrate national festivals: The students must be told about Independence Day, Republic Day, Martyr Day, Gandhi Jayanti, etc., and the history of freedom struggle and the freedom achieved after various sacrifices. They should pledge to safeguard the nation. For last few years a holiday is declared in schools on these occasions, which is not appropriate.
2. To celebrate birth anniversaries of freedom fighters and prominent persons: The birth anniversaries of freedom fighters and prominent persons should be celebrated in schools. On the anniversaries of Pt. Nehru, Sardar Patel, Dr. Radhakrishnan, Indira Gandhi, Lokmanya Tilak, Netaji Subhash Chandra Bose, Maulana Azad, Bhim Rao Ambedkar, Bhagat Singh, Chandra Shekhar Azad, Swami Vivekananda, Maharshi Arvind, Mahakavi Tulsidas, Nirala, etc the students must be told about the inspirational incidents about their life so that children should take an oath to do something for their country.

30 January (Father of nation), 31 NSOU ? CC-ED-02 ? 222

October (Indira Gandhi), 21 May (Rajeev Gandhi) should be celebrated as Sacrifice Day and the students should be told how antinational elements murdered these great personalities in an inhuman manner and tried to divide the country and destroy its reputation in other countries.

3. To celebrate religious functions: Religious festivals like Diwali, Holi, Eid, Dusshera, Guru-parv, Christmas, etc should be organized in schools as these festivals do not belong to particular religion but are festivals of every Indian.
4. To organize lectures by eminent scholars: The lectures on the subjects like the freedom, integrity, development and other national problems by eminent scholars should be organized from time to time. So that the national integration should be developed in students.
5. To organize different competitions: The lectures related to national integration, debates, letterwriting, essay, plays and other cultural and historical programs should be organized from time to time by which the development of national integration can be possible.
6. To organize exhibitions: Exhibitions should be organized from time to time in schools where a view of Indian culture and civilization is exhibited which may develop the feeling of prestige in students.
7. Exchange of teachers at national level: Primary, secondary, university level teachers should be exchanged at national level. When the teachers of different languages, caste, religion, groups and states go to other places they will know about other's view and try to understand them. Correlation between different cultures will be there and it will increase the level of national integration.
8. Inter-State games and sports and cultural programs: At least once in a year an inter-state games and sports competition and cultural programs should be organized by which the interaction between students will get broader. They will understand each other and we feeling will be generated and Note their heart will be filled with the feeling of devotion towards nation.
9. To organize educational tours: There are many historical, religious, cultural, industrial and very pleasant natural places in India which are knowledgeable and inspirational. The tour should be organized to go to these important national places from time to time. By organizing these educational tours about giving the knowledge

about the vast and variety of culture, a feeling of national love can be developed. 10. To organize inter-state camps: When the teachers and students of different states will take part in inter-states camps they will know about the living style, eating habits, costumes, language, folk music, folk dance etc. definitely by organizing these camps a feeling of national love in students and teachers will develop. 11. National and social service organizations: The NCC, NSS, scouting, girl guiding etc should be organized in schools by which students can be involved in social services and love towards nation can develop in them. 12. Use of Radio and Television: The programs on radio and television about the development of unity of nation and view of Indian culture should be broadcast and telecast, so that by listening and watching these programs, the feeling of devotion about nation should arise in students. Thus, the arrangements to listen and view these programs in schools should be organized. National integration and methods of teaching: There will be a need of systematic curriculum and appropriate methods of teaching to achieve the objectives of national integration. Thus, those teaching methods should be selected through which students can get a chance to develop their abilities. Students can be educated of the subjects related to national integrity through lectures, questioning methods and debates. They can morally speculate about the culture and civilization by self-study method. Planning method can be very much advantageous in this field. National integration and text books: In the view of national integration, necessary changes and amendments should be made in all related textbooks. The subject material which may create hindrance in national integration should be removed and study material which tells about the culture, civilization and the national pattern, should be added. Material which is correct, sufficient and is related to love towards nation should be added in the textbooks. 6.3.3 Role of teacher in the development of national integration: A successful education depends on a teacher. National integrity can be achieved only through education, when the teacher is able and master in his subject. He must have a detailed knowledge about prestigious culture and civilization of the nation, he must be fully aware about historical, geographical, political, social, economical and industrial problems, NSOU ? CC-ED-02 ? 224 he must also be capable to express his opinions firmly in front of others, he must be generous, open minded, sincere about his duties and there should not be difference in what he says and what he does, who believes social services as his religion, he must be full of patriotic feelings and is willing to die at the time of calamity. Students consider their teachers as their ideals and follow them. Thus, if we want to develop a feeling of patriotism and national integration in the students then the teacher must prepossess the feeling of patriotism and national integration. 6.4

Education for International Understanding Education for International Understanding means a cosmopolitan education which will produce a loyalty to world citizenship. There are some of the ways and means of organising education for promoting the feelings of internationalism and the teacher plays a very vital role in contributing international understanding 6.4.1 Concept Meaning of International Understanding: Education for International Understanding (EIU) is a value based approach to education where the children grow up with the values of culturing peace, respecting the essence of sustainable development, globalization, human right and cultural diversity. The world has become a global village and we all are mere global citizens today. Therefore, it becomes important to teach our younger kids in schools, the values of "Learning to live together". The Culture of Peace is a set of values, attitudes, modes of behaviour and ways of life that reject violence and prevent conflicts by tackling their root causes to solve problems through dialogue and negotiation among individuals, groups and nations. It is, therefore important to prepare our children for their future of vast diversity in respect to culture, religion, race and ethnicity. Dr. Radhakrishnan has rightly said- "It is essential for us not to live apart but to live together, understanding one another's fears and anxieties, aspirations and thought. We must work for racial harmony. We may be American, we may be Russian but we are essentially human beings. Let us learn to live in a world community." Education for International Understanding means a cosmopolitan education which will produce a loyalty to world citizenship. It also refers to international efforts at co-operation and harmony in the exchange of teachers and students, rehabilitation of backward cultural areas, mutual understanding through school instruction and the like.

NSOU ? CC-ED-02 ? 225 6.4.2 Importance Education is the way for development of International Understanding: Education for international understanding implies the promotion of democratic citizenship etc. The following are some of the ways and means of organising education for promoting the feelings of Internationalism: Aims: - i) Promotion of world citizenship ii) Promotion of world peace iii) Promotion of independent and critical thinking iv) Promotion of construction rather than destructive feeling v) Developing the student's faith. vi) Eradicating of racial, religious, cultural and national prejudices Redesigning the curriculum: The traditional curriculum followed in our schools and universities does not fulfill all the possibilities of internationalism. The redesigning curriculum should enable our students :- i) To learn that the earth is the home of man and other living things ii) To gain knowledge about the world we live in iii) To learn how to promote better understanding of the interdependence of the world iv) To inculcate respect for all major religions of the world v) To know something about the long strength of mankind to replace conflicts with cooperation vi) To develop a desire and the simple skills vii) Knowledge of various cultures of the world Instruction in various school subjects: i) Literature: A UNESCO publication states, "Extracts from the works of the writers such as Dickens, Gorky, Tolstoy, Tagore and Ibsen can be used to illustrate stages in social progress. So the best of literature of other nations must be included in the curriculum. ii) Art: True art should be included in the curriculum. The true haze of human feelings should be depicted and shown in art. It is beauty involved in the art that is significant. iii) Language: it can play a vital part in the peaceful intercourse of the people of the world. The study of modern languages should be the study of modern people. iv) Science: Students should be told how the scientists of various nations have contributed in fighting against disease. He nourishes in his heart goodwill to the whole of mankind. v) History: The field of history should be wide enough to enable the students to cultivate international outlook. History should be taught objectively and with a cultural bias. Students should be encouraged to study newspapers and magazines. vi) Economics: The knowledge of consumption, production, taxation, human resources etc can be given our international level. vii) Philosophy: Philosophers throughout the history of the world have been stressing mental peace as the human goal

NSOU ? CC-ED-02 ? 226 vi) Mathematics: The language of mathematics is universal, with largely the same symbols, through out the world. It should be impressed that almost all subjects and problems lend themselves to mathematical treatment. 4) Co - Curricular activities: Co - Curricular activities which go in the school from time to time can be geared to educating for international understanding. The following activities are suggested :- i) Celebrating birth anniversaries ii) Celebrating international week iii) Celebrating days of international importance iv) Organising and running UN societies v) Organising pen friend's club vi) Arranging exhibitions vii) Dramatic representation viii) School assembly ix) International games x) News of other countries 5) Face to Face contacts: Face to face contacts are of great help in broadening outlook, breaking rigid isolation of individual nation's and in removing imaginary fears and grievances. The following activities are useful in this regard:- i) International Camps ii) Cultural and study tours iii) Arranging visits and excursions to foreign students iv) International youth festivals v) Exchange of teachers and students 6.4.3 Role of teacher in International Understanding The teacher is even more important than the curriculum because he is medium through which the curriculum is implemented and its goals are achieved. A teacher can make the following contributions towards international understanding: - i) Broad Outlook: The teacher must have broad outlook among his students. He must have international outlook and world - mindedness to promote international understanding among his students. ii) To understand man as man: The major objective of the teacher should be to enable children to "understand man as man", first then as a Indian, American, Jew, Hindu or any other. iii) Wedding out the idea of violence and war: The teacher has to keep in mind that , "since war begins in the minds of men, it is in the minds of men that defence of peace must be constructed." Every person should grow up with faith in man and courage in him. iv) Emphasizing peace: The teacher must emphasize that the maintenance of peace is the only panacea for all the ills of the present sick world and to build that peace in the minds of man is our major task. v) Cultivating right values: The teacher should inculcate among children the right values of life, like co-operation, friendliness, love for justice, love for truth and love for humanity. vi) Educating adult society: The teacher should make an all out effort to educate the adult society for peaceful co-existence and international understanding. vii) Correct Interpretation: The teacher should not give a biased view of other countries. He should give correct facts, correct knowledge and correct interpretation of history, culture, life style etc. viii) Use

NSOU ? CC-ED-02 ? 227 of effective methods of teaching: The teacher should teach in such a way that ideal of 'world citizenship', 'live and let live' may be developed. 6.5 Education for Promotion of Peace and harmony: 6.5.1 Concept Peace Education is the process of promoting inner potentiality through epistemological upgradation. That is why peace Education requires cognitive support blended with social justice and human values. There is no universally accepted definition for Peace Education. There is good number of definitions available on the basis of different perceptions and approaches. Some of the definitions are given below: Betty Reardon defines "Peace Education is the attempt to promote the development of an authentic planetary consciousness that will enable us to function as global citizens and to transforms the present human condition by changing the social structures and patterns of thought that have created it". The concept of peace according to Grewl et. al, 2004 includes: ? Absence of tensions, conflicts or wars, ? Non-violent social system i.e., society without structural violence, ? Ecological balance and conservation, ? Absence of exploitation and any sort of injustice, ? International understandings and cooperation, ? Peace of mind. Peace education is a conceptual framework from which schools may practice a programme comprising the transmission of universal as well as national values and enduring attitudes and skills which enable our pupils to become active citizen of the country (Mayas, 2013). Ian Harris and John Synott have described peace education as a series of 'teaching encounters' that draw from people: ? the desire for peace, ? nonviolent alternatives for managing conflict, and

NSOU ? CC-ED-02 ? 228 ? skills for critical analysis of structural arrangements that produce and legitimize injustice and inequality (Harris and synott, 2002). James Page suggests peace education as – ? encouraging a commitment to peace as a settled disposition and enhancing the confidence of the individual as an individual performer of peace, ? informing the student on the outcomes of war and social injustice, ? informing the student on the value of peaceful and just social structures and working to uphold or develop such social structures, ? encouraging the student to love the world and to imagine a peaceful future, and ? caring for the student and encouraging the students to care for others (Page, 2008). Meaning of the peace Education: Peace Education is especially Western World's concept where Peaceful environment is required for transacting Education. Actually Education is a Social Process where there should be a planning strategy of eliminating the conflicts and violence caused by injustice, inequality and human rights violations, and implementing the ways and means of reducing the same through appropriate teaching and learning strategy by means of producing responsible global citizen to attain and spread the peace in the world. Peace Education is the process of promoting knowledge, Attitude, Values and skills to prevent violence and conflict. That is why peace Education requires cognitive support blended with social justice and human rights. There is no universally accepted definition for Peace Education. There is good number of definitions available on the basis of different perceptions and approaches. Some of the definitions given by eminent educationists are given below: Webster defines peace "as a state of quiet or tranquility, freedom from disturbance or agitation, calm repose". From the above definition it can be agreed that in the absence of elements such as tolerance, understanding, empathy, cooperation and respect for the difference in others, there cannot be peace. Any strategy or educational system helps to enhance the above said entities among the individuals could be known as peace education. According to John Dewey "Peace education is grounded in active citizenship,

NSOU ? CC-ED-02 ? 229 preparing learners for assiduous participation in a democracy, through problem posing and problem – solving education, and a commitment to transformative action in our societies.” From these definitions it is understood that the peace education inculcates the higher order human values among the individuals. Further, “Peace education definitions” reveal that it aims at the overall development of the individuals and helps to enhance eternal values in their minds. 6.5.2 Development of peace and harmony through Education: Cognitive Empowerment: Education is a powerful means to ensure peace, harmony and development in a democratic country. Without peace, harmony, and development democracy hardly has any meaning. For promotion of peace, harmony and development, education plays a very significant role by creating knowledge base of Individuals and society too.

Axiological Empowerment: Education only can make a man realize what activities and behaviour are expected of him as a human being. Education makes a person realize the difference between good and bad. There is little doubt to assert that the spirit of any values is to promotion of good causes. Thus education becomes a powerful tool to achieve the objectives. Thus peace, harmony and development are the manifestation of education. Social Empowerment: Democracy is in a way subject to peace, harmony and development and these are subject to education. It is not hyperbolic to mention that those countries which have got the real peace, both internal and external, harmony, sustainable development have the real democracy. The more a country is peaceful, harmonious and developed, the stronger are the chances of its being a vibrant democracy. Democracy is rooted in peace, harmony and development and they in education. Creating a supportive Classroom Environment: Peace education makes special demands of teachers to make sure that their own classroom practices promote peace. According to the principles of peace pedagogy, pupils can learn how to bring peace to the world not only by studying issues of war and peace but also by learning certain skills, behaviors , and dispositions from classroom climate, which is established by the teacher structures his or her lessons.

NSOU ? CC-ED-02 ? 230 Practical approaches to creating a supportive classroom: Ian Harris encourages that teachers should minimize or eliminate five unhelpful characteristics. In their place he advocates five peace – seeking qualities. Teachers could study the following table, thinking about where they would wish to locate their own practice along the continua: S.No. Unhelpful Characteristics Peace Making Qualities 1 Teacher’s claim to possession Respectful dialogue among teachers of the truth and learners 2 Competitive classroom learners Cooperation among climate 3 Student passivity Problem solving approaches to learning 4 Student powerlessness Affirmation of the worth of each learner 5 Teacher’s use of authoritative force Democratic boundary setting of classroom expectations He also suggests that teacher is always also a learner. The teacher should celebrate diverse abilities and interests among students. He should also encourage cooperative attitudes and activities build knowledge, involve students in for setting culture in the classroom. Practicing Peace: It could be helpful to think, “Practicing peace” begins with a search for “inner peace”. The search for “inner peace” has captured the imagination of many people today; particularly it seems in western societies where alienation and disaffection seem to sit uneasily alongside unprecedented levels of material possession and consumption. Thus, students need to be respectful and open-minded without being uncritically tolerant and accepting. They need to be cooperative and empathetic while still being assertive. Yet they need to be assertive without being aggressive or domineering. They need to develop a commitment to social justice, while realizing that can have a range of meanings. “Practicing peace” can be promoted through classroom activities that encourage self-esteem, trust, cooperation, empathy, assertiveness and an appreciation of differences and diversities. The peace - building approaches mentioned above can be matched by specific approaches to conflict resolution.

NSOU ? CC-ED-02 ? 231 The Guiding Principles: The following guiding principles have been taken from the covenants and agreements produced by the international community over the last 50 years. They are central to the education for peace program. Schools are encouraged to explore and analyze these principles within their communities so that they are accepted as the foundation for building a culture of peace. Structural Support for Values in Democracy: In school and academic institutions, children are members of a small society that exerts a tremendous influence on their moral development. Teachers serve as role model to students in school and academic institutions; they play a major role in inculcating their ethical behavior. Peers at school diffuse boldness about cheating, lying, stealing, and consideration for others. Though there are rules and regulations, the educational institutions infuse the value education to the children in an informal way. They play a major role in developing ethical behaviour in children. Responsibility: They should be encouraged to be responsible for their own actions and should learn to respect and treat others kindly. Appreciation: The teacher should appreciate the children for developing pro-social behaviour, especially for any specific action they have done to help others Assistance: The children should be taught by emphasizing the idea through many activities, stories and tales, which will encourage them to engage in more helping behaviors. The rights of every PEACE EDUCATION Dignity Equality Liberty Justice Responsibility Security Solidarity Democracy human being are safeguarded now a days and ‘the Universal Declaration of Human Rights’8 have details on this issue. Emulation: The educationists are the role model to the children outside their family. When the children see the model showing concern for others, motivating them for their good deeds and cooperating and helpful with their academic issues, the children learn them by observing and imitate it with fellow peers.

NSOU ? CC-ED-02 ? 232 Education Centric Principles: In India the five human values based on true education are 'Truth, religion, peace, love and non-violence. They can be compared to the five life principles of man. A true human being is one who practices the five human values. Today man does not speak truth due to being apprehensive of the consequences and does not practice Dharma as he does not know what it really means. Under any circumstances never give up human values. When we lose any of the five human values this amounts to compromising human values. If you do not speak the truth, you lose one of your life principles. Truth is your soul. So, till you breathe your last, uphold truth. The culture of India teaches, 'Speak truth and follow righteousness'. These values are the same for one and all. People all over the world are praying for peace. How can peace be attained? It is only through the practice of Satya and Dharma. Today man is leading a life bereft of Satya and Dharma resulting in lack of peace (Santi), and for any vibrant democracy peace is essential. The primary stage of education is the ideal time for laying the foundation of peace oriented personality. These years comprise the formative period in the lives of the students. At this stage, students are comparatively less burdened. The number of students who could be exposed to education for peace is at the maximum during this phase. Thereafter, students begin to drop out. Therefore, this is the stage at which focused attention should be paid to laying the foundation for a culture of peace through education. As the saying goes, "it is easier to build a child than it is to repair an adult". Therefore, peace education is important for each and every individual at different stage. The approach to peace education at early childhood, Elementary stage, secondary stage, Higher education stage and adult stage varies in different aspects. Peace education approach to early childhood Starting peace-building education in early childhood is of paramount importance. In yearly years a child's brain architecture is developing most rapidly, habits are formed, differences are recognized and emotional ties are build through social relationships and day-today in homes and neighborhoods. Parental practice and the environment that are most proximal to children are key determinants of their physical, social and emotional development. Proximal contexts, such as the home, family, early learning programmes and community protection programmes, play a key role in the children's ability to manage conflicts, reduce violence and shape key characteristics of the Children's moral behaviour therefore, the family members should create conclusive environment to enhance the above said behaviour among the children at early childhood stage.

NSOU ? CC-ED-02 ? 233 Peace education in Elementary: Peace education approach to elementary as children grow older and reach the Elementary school stage. They begin to grasp abstract thoughts. In a limited way they develop the capacity to think rationally and relationally about the various happenings in their surroundings. A crucial issue for children at this stage is that of relating to other children and their environment. Since, the school brings together children from environment backgrounds, streets need to be equipped with cognitive competence to understand the values underlying hygiene both of the self and of the surroundings, respect for others and for elders, recognition of the dignity of labour, honesty, love, sharing and cooperation, tolerance, regularity, punctuality, responsibility etc. Therefore, the education for peace for primary school children is about helping them enjoy and celebrate diversity, beauty, and harmony in nature. They must be encouraged to develop the skills it takes to be at home with others (especially the art of listening and with nature (aesthetic sensitivity and a sense of responsibility). Peace education approach to secondary stage: In the secondary and senior secondary stage students gradually become aware of their identity. They are on the threshold of becoming independent persons, though still deficient in maturity. The resulting confusion leads to conflict with peers, parents, and teachers. During this phase, their skills for rational thinking, communication, and self discipline are tested. They need training to resolve, through dialogue and negotiation, the conflicts they are sure to encounter in day-to-day interactions. They also need to develop awareness about inter – relationship and interdependence in the global and ecological context, so that they can form a wider perspective on justice, peace, and non-violence. It is important to enable them to be not only the recipients of peace but the active makers of peace, who can think for others and help them. Peace education approach to Higher Education Stage: Educators at all levels generally agree that students should be taught about peace. This is especially true in the current situation in the world. Higher education is perceived as extremely important, and the students in the higher education should be inculcated the knowledge, attitude and competencies in the area of peace keeping. These students are going to become a national builders and role models of the society. Therefore the students in the higher education should come out with all good entities of human beings. Further, the role of the teachers in the higher education is of paramount importance. The higher education

NSOU ? CC-ED-02 ? 234 teachers to be a role model for their students. The teachers need to be aware of the effect of their behavior on students. In this stage, the international understanding, universal brotherhood, human rights awareness, crisis and conflict management skills could be taught along with their other syllabus. The special elective subjects and major branch of studies in peace education courses would be more benefit to the students at higher education level. Peace Education Approach to Adult Education stage: As society continue to learn and develop their competencies in relation to the new realities and challenges ahead. This is where adult education plays a key role in meeting such demands in their more interconnected globalised world. Investment in adult education plays a critical role in supporting a society's capacity for adaptability and change, and helps create a competitive workforce which is essential in competing in the global economy and international challenges. Today we are living in the ever changing technology era with lot of human conflicts. The potential and capacity of adult education to enable people to realize their full human potential by drawing link between their individual experiences and relating it to wider structural factors around them. Further, developing self-confidence, social awareness, cultural understanding, communal harmony and prosperity among adult education curriculum would help to inculcate peace in the minds of the adults. Subject Context: Peace education can be introduced into a classroom as a program in itself. Peace education can also be a part of the ongoing curricula in a classroom, with concepts being introduced as they seem to fit. The conceptual framework of each subject should encompass the spread of peace values and enduring attitudes in the students' mind. Thus, the peace education messages can be woven into the content of the formal subjects taught in the school. For primary and secondary level, subjects like language, social science, mathematics, science, Arts and Design form core curricular subjects which can be used to infuse peace. Language: The integration of peace issues into the language syllabus can stimulate both learning and teaching, creating space in the classroom which is interactive, instructive and fun. The activities of reading, writing, speaking, listening, role play debates and negotiation related to peace issues would help the children to enhance their peace ability of conflict management in their life. Social Science: Students can study the role of peace makers and peace movements for non-violence in the past and present. The lesson could be focused on the right to life and responsibility not to kill, on the role of UN security council.

NSOU ? CC-ED-02 ? 235 Mathematics: Peace concepts can be effectively integrated in the mathematics. While teaching graphs, charts and so on, it could be produced to display some of the relationships of our country with others. Students could be made to be aware of the world problems involving cost of defense budgets and local impact. Science: Environmental protection, environmental sustainability, ethics of scientific research, Nuclear war effects and pollution control are the some of the topics could be included in the science subject. Art and Design: Future perceptions of peace could be revealed by diversity of societies through art and crafts. Students can be encouraged to do specific projects highlighting the necessity the peace of human community. Students could design their own symbol or logo to promote a culture of peace. Subject Perspectives: The subjects teaching in the educational institutions are meaningful and help the learners to attain their life goal. Both teachers and taught should understand the ultimate purpose of teaching learning process in the institutions. A subject is not learned merely for the subject's sake the teachers have to make a subject meaningful. The subjects have to be interpreted in such a manner so as contribute to learner's social, emotional, intellectual and moral self-development peace Education attempts to humanize subjects through bringing in human perspectives and effective dominion into learning. The activities can be planned to build peace vision attitude in Children. It strength lies in the affective component it inherits. The subjects such as Language teaching, social studies, religious education, mathematics and science teaching could be effectively taught with integration of peace components. Different instructional strategies appropriate to teach peace education could be adapted in teaching of all subjects in the educational institution. Peace-building activities, self-development, activities, story of civilization, religions harmony, all faith prayer, environmental awareness and self discipline activities could be integrated as hidden activities of all subject matters. Teaching Methods: Teaching

91%

MATCHING BLOCK 127/127

SA HC 1.1- Philosophy of Education (Eng).pdf (D142430200)

in the broadest sense is any act or experience that has a formative effect on the mind, character

and physical ability of an individual. In the process of integrating peace education, how to teach is more important than what to teach. The teaching methods already practiced by the teachers for the existing subjects can be used for teaching peace education also. But some of the specific teaching methods discussed below could be more useful. 1. Cooperative Learning 7.Story telling 2.Group Discussion 8.Service learning 3.Peer

NSOU ? CC-ED-02 ? 236 Teaching 9. Experimental Teaching 4. Brainstorming 10. Inquiry based learning and teaching 5. Roles play 11. Dialogues 6. Energizers These methods would be helpful in making peace a subject of study, concern and action, both in the classroom and beyond. But these methods should be used deliberately to support learning aims to relate the knowledge, skills, and attitudes of peace education.

1. Cooperative Learning: Cooperative learning is a successful teaching strategy in which small groups, each with students of different levels of ability use a variety of learning activities to improve their understanding of a subject. In cooperative learning environment, the teacher is a facilitator for the class, a mature trusted person who will guide and advise the students. This method increases problem – solving skills, enabling students to devise more solutions that demonstrate good creativity and practicality. All of these outcomes would be consistent with the aim of peace education.
2. Group Discussion: The class can be divided into small groups to discuss about the peace topics such as : a) What is peace b) Why is UNESCO necessary c) What is the purpose of rule and law ? d) What are the importance of social integration ? e) Discussion on conflict management f) International conflicts and solutions .
3. Peer Teaching: Peer teaching helps students share their knowledge, ideas and experience among themselves. In this technique the students are divided into small groups. Before the groups move off to discuss the topic, the teacher should give them an overview of the topic and provide each group with specific task they must meet within a given time frame. Topics such as how children learn violence from war toys, video games, the mass media contributions of Gandhi, Martin Luther King, and other great peace makers, could be taught by their own peers. Through peer teaching, both the peers and other students get benefits of imbibing peace values. Effective peer teaching provides students with opportunities to develop awareness and understanding of community issues, problems to develop social responsibility.
4. Brain Storming: It is famous techniques formally used by Socrates a great philosopher. In the field of psychology this method is used to foster the creativity among the students. Brain storming is a technique for creatively solving problems and breeding fresh ideas. The teacher's responsibilities are guiding the session, encouraging participation and writing ideas down. Teachers should devote most of their effort to design their teacher to bring peace to the classroom. The first stage in the Brain storming technique is "identifying problem". In this phase, the individual will identify the problem in well-defined manner. The second phase in the "Consolidation phase". In this phase, a well – defined topic should be developed by merging the ideas into one large idea map. During this consolidation phase, students may discover a common understanding of the issue as they share the meanings behind their ideas. The third and final phase is the "Assessment Phase". After refining the problem students should be made to draw a mind map which should have principles of analyzing the problem in the context of causes, consequences, impact of the problem and finding solution to the problem, emotions to be managed during the process, human values to be cultivated and sustained and the ways to explore the problem in depth.
5. Role play: Role play in general refers to situations when a participant assumes a "role" by playing a part in a specific situation or scenario. In the context of peace education, students can also play the role of ministers who offer advice to country to avoid participation in terrorism. Students can play the role of amazing peace heroes such Gandhi, Luther King, Nelson Mandela, Mother Teresa, Swami Vivekananda and other heroes, who have made significant contributions to peace during their lives.
6. Energizers: School can become quite a bore, if students are not able to stretch and move during class. Students of all ages are better learners if they take periodic rests. Motivational activities can be used throughout the day and after some practice, it will only take 5-10 minutes to energize the students. The students can be asked to watch the clippings, news, journals and magazines regarding peace education. This activity can be used to motivate the student in peace education.
7. Story Telling: Story telling is considered as far-reaching teaching methodology for education for peace, whereby listening to and vocalizing the lived experiences of those in dominated roles within society counters the power of "Conscientised" minds. Teacher can make use of this method in unique and innovative ways to promote positive social change for peace. Peace building stories need to be shared in as many different ways as possible.
8. Service Learning: Service Learning is a teaching and learning strategy that integrates meaningful community service with instruction and reflection to enrich the learning experience, civic responsibility, and strengthen communities, providing service experience to students would help them to understand diversity and mutual respect among all individuals. And also it helps the students develop interpersonal skills in conflict resolution skills and group decision making skills. Therefore "service learning activities enhance the peace building behaviour among the individuals.
9. Experiential Teaching: Experiential teaching is a model which promotes learning

NSOU ? CC-ED-02 ? 238 by doing. During experiential learning, students are not necessarily taught how to do something but how to find out the answer to problem they are looking for through trial and error. According to Pfeiffer and Jones, 1981, the five step experiential model includes: Experience (doing activity), share (Communication with others), process (analyse and reflect on experience), Generalise (relate experience to real word), and Apply (use what was learned in a different situation). Hence, teaching becomes an interaction between the leader and student awakening the learner's curiosity and intelligence, through experiential learning. 10. Inquiry-based learning and Teaching: As inquiry – based learning and teaching has to begin with questions; teacher can make students answer the questions. By asking critical questions and actively participating with their communities in the classroom, students are made to be engaged with issues at the core of contemporary society. Through this inquiry-based method of learning, sharing of personal knowledge and experiences, ability to ask critical questions and active listening would increase. Moreover, students can experience a range of thoughts and perspectives for cultural understanding, non-violent communication and learn conflict management skills. Dialogues Dialogues is the highest form of communication, it involves there two-way communication where each student draws the other out, searches for new meaning, voices ones own opinion with integrity, all in search for truth or a mutually – acceptable course of action. Dialogue creates a shared space where students can come together through discussion. The dialogues related for promoting the principles of tolerance, peace, respect for diversity, human rights and citizenship and for promoting the peace process between the two nations. Openmindedness and tolerance will enhance through dialogue method by perceiving the world openly and providing the ability to accept differences. Therefore, it is clear that Concept of peace Education is multifarious. One cannot have peace without combining different global, social and individual components. Different ways for attaining peace have been classified into three categories discussed below: A) Cognitive Empowerment: Education is a powerful means to ensure peace, harmony and development in a democratic country. But for having peace meta cognitive development of any individual is very much urgent. Because it directs our mind and shaping personality. Violent is external but making peace is an internal understanding of human being guided by our cognitive processes. Cognitive Empowerment means cognitive upgradation and it is in the form of empowerment when it will be practiced in a society or in case of education it will be

NSOU ? CC-ED-02 ? 239 explored in a classroom situation. Peace and wellbeing cannot be claimed without the development of inner sense. But it is not possible inner enlightenment without cognitive development and its practice within a social periphery be ensured. The dimensions of cognitive empowerment were listed below on the basis of review of related literature: ? Practical Knowledge: ? Analytical Thinking: ? Experiential Learning: ? Perceptual Vision ? Inner potentiality B) Social Empowerment: In Indian context peace is the product of internal enlightenment of individual within a social set-up. Internal and external, harmony is possible only in a democratic environment. The more a country is peaceful, harmonious and developed, the stronger are the chances of its being a vibrant democracy. Democracy is rooted in peace, harmony and development. But still democracy is not the final word for happening peace. Most of the intollerent incidents in school environment occurred in western world where democracy is their National Philosophy. The following guiding principles may be taken as central guidelines to the education for peace program: ? Cooperative Attitude ? Extension Programme ? Student Teacher Relationship ? Social Interaction ? Social Motives By exploring and analyzing these principles within a school environment foundation for building a culture of peace may be materialized. B) Axiological Empowerment: Values are essential key points for keeping and maintaining peace. Education makes a person realize the difference between good and bad. There is little doubt to assert that the spirit of any values is to promotion of good causes. Thus, education becomes a powerful tool to achieve the objectives. Thus peace, harmony and development are the manifestation of education.

NSOU ? CC-ED-02 ? 240 They play a major role in developing ethical behavior in children. ? Self Esteem ? Self-Concept ? Ethical value ? Aesthetic Value ? Self-Consciousness Strategies for Creating a supportive Classroom Environment: So according to the principles of peace pedagogy, pupils can be empowered not only by cognitive issues of peace but also by practicing certain skills and values leading to peace. Peace Education should be based on student's experience, a range of thoughts and perspectives for cultural and social communication to reduce conflict. Peace education may be materialized by integrating cognitive, axiological and social empowerment in an institutional set up. Therefore, society and institutions play a very significant role for actualizing peaceful environment besides cognitive empowerment. Therefore, we can focus our attention to the following table, thinking about where we would wish to locate our own perception for integrating cognitive, axiological and social empowerment for making peace into social reality: Sl.No. Cognitive Axiological Social Empowerment Empowerment Empowerment 1 Practical Knowledge Self-Esteem Cooperative Attitude 2 Analytical Thinking Self-Concept Extension Programme 3 Experiential Learning Ethical values Student Teacher Relationship 4 Perceptual Vision Aesthetical Practice Social Interaction 5 Inner Potentiality Self-Consciousness Social Motives 6.6 Summary We have to discuss the national Integration and Education for development of national Integration. To understand the concept of International Understanding and Education of

NSOU ? CC-ED-02 ? 241 development of International Understanding. Also we discuss the peace education & Education for promotion of Peace

98%

MATCHING BLOCK 125/127

W

and Harmony. • Education is the most important means of to develop a sense of national unity. We can generate the necessary inspiration and properties among the citizens by education. Famous philosopher Dr. Radhakrishnan, expressed the importance of education in the development of national unity as following, "National unity cannot be achieved, by chisel, hammer, brick and stone. It is born in the hearts and minds of the people gradually, and the education is the only instrument for the purpose.

The following objectives can be prescribed for the development of national integration— 1. To awake the feeling of respect for different cultures in students. 2. To develop a desired behavior in student. 3. To develop the feeling of patriotism in students. 4. To develop the business skills in students. 5. To develop democratic citizenship in students. 6. To develop the faith towards humanism in students. 7. To develop the aspiration and capacity to fight against terrorism, anti-social elements in students. •

Education for International Understanding (EIU) is a value based approach to education where the children grow up with the values of culturing peace, respecting the essence of sustainable development, globalization, human right and cultural diversity. The world has become a global village and we all are mere global citizens today. Therefore, it becomes important to teach our younger kids in schools, the values of "Learning to live together". The Culture of Peace is a set of values, attitudes, modes of behaviour and ways of life that reject violence and prevent conflicts by tackling their root causes to solve problems through dialogue and negotiation among individuals, groups and nations. It is, therefore important to prepare our children for their future of vast diversity in respect to culture, religion, race and ethnicity. Education for international understanding implies the promotion of democratic citizenship etc. The following are some of the ways and means of organising education for promoting the feelings of Internationalism:- i) Promotion of world citizenship ii) Promotion of world peace iii) Promotion of independent and critical thinking iv) Promotion of construction rather than destructive feeling v)

NSOU ? CC-ED-02 ? 242 Developing the student's faith. vi) Eradicating of racial, religious, cultural and national prejudices • Education is a powerful means to ensure peace, harmony and development in a democratic country. Without peace, harmony, and development democracy hardly has any meaning. For promotion of peace, harmony and development, education plays a very significant role. Education only can make a man realize what activities and behaviour are expected of him as a human being. Education makes a person realize the difference between good and bad. There is little doubt to assert that the spirit of any democracy is to promote and champion good causes. Thus education becomes a powerful tool to achieve the objectives. Thus peace, harmony and development are the manifestation of education. Democracy is in a way subject to peace, harmony and development and these are subject to education. It is not hyperbolic to mention that those countries which have got the real peace, both internal and external, harmony, sustainable development have the real democracy. • Peace education makes special demands of teachers to make sure that their own classroom practices promote peace. According to the principles of peace pedagogy, pupils can learn how to bring peace to the world not only by studying issues of war and peace but also by learning certain skills, behaviors, and dispositions from classroom climate, which is established by the teacher structures his or her lessons.

6.7 Self-Assessment Questions

1. What is National Integration?
2. Write the Aims and Objectives of National Integration
3. How can development of National Integration through Education
4. What do you mean by International Understanding?
5. Discuss the Education is the way for development of International Understanding
6. What is peace education?
7. How to develop peace education?
8. Enumerate the roles of Education for promotion of peace and harmony

Need and Importance of National Integration: In Dr. Radhakrishnan's opinion, "National unity is a problem which has a close relationship with our existence as a civilized nation." National unity is essential for national security, integrity and growth. Following are the reasons behind its necessity and importance— 1. National unity is needed to avert a crisis arising from foreign powers and internal conflicts. 2. National unity is also needed to suppress disruptive forces for creating a peaceful environment. 3. National unity is required for the protection of independence, respect and interests of the nation. 4. National unity is required to preserve, development and transfer of culture. 5. National unity is required to abolish the social prejudices, superstitions, traditions and different types of inequalities to improve the lifestyle of the members of the society and to create a proper environment. 6. National unity is essential to stop the class-discrimination and exploitation and to remove the economic inequalities for the industrial progress of the nation. 7. National unity is required to get away from linguistic insanity, to establish linguistic integration and to develop the national language. 8. For the development of a common national culture with the help of all sub-cultures of the nation, national unity is needed. 9. National unity is required to generate faith in ideals, values and traditions in the citizens and to create commitment for progress and development of the nation. 10. National unity is required to develop self-sacrificing spirit to grow a sense of every sort of sacrifice for the nation. 11. Truth-integrity, cooperation, ability to adjust, fidelity, honesty, tolerance, foresight, a desire to bear social responsibility, sensitivity, friendly, critical thinking and the ability to make clear and accurate decisions to build balanced personality of the citizens, the national unity is needed.

	<p>National Integration and Education: Education is the most important means of to develop a sense of national unity. We can generatethe necessary inspiration and properties among the citizens by education. Famous philosopher Dr. Radhakrishnan expressed the importance of education in the development of national unity asfollowing, "National unity cannot be achieved, by chisel, hammer, brick and stone. It is born in thehearts and minds of the people gradually, and the education is the only instrument for the purpose. Itmay be a slow process but it is permanent and strong process in itself." The disruptive elements that are spread in the country and hampering the development of nationalunity. End of these disruptive elements is possible only by the education. People can be made awareof the evils of these deadly substances and unity can be established among them with the help ofeducation. About the contribution of education to establish a national unity it was said in National Unity Conference that "Education is the most important means in creating national unity. Since theproblem of unity or national organization is essentially related to the perspective of large parts of society and different groups and in its broadest sense the view of the education has been considered asa powerful tool to change or influence the attitudes. So according the idea of the conference, the processof education and its purifi ed form should be considered important wherever necessary."</p> <p>W https://www.lpude.in/SLM/Master%20of%20Arts%20(Education)/Sem_1/DEDU411_PHILOSOPHICAL_FOUNDATIONS ...</p>		<p>National Integration and Education Education is the most important means of to develop a sense of national unity. A) Reorientation of subjects The following reorientations should be done to develop national integrity in different curriculums—

1. Teaching of national language: Hindi has been accepted as the national language of India. Therefore the teaching of Hindi should be a necessary throughout the country. This will develop patriotism in students.
2. Moral and religious education: Religious education does not only mean to educate about a particular religion, but it also aims to introduce the students about the basic principles of different religions and create a faith in them. A development of qualities like truth, justice, duty, love, cooperation should be done in children through moral education.
3. Teaching of language and literature: The feeling of national integration can be developed easily in the students through teaching of language and literature. The lessons should be included in books of different languages in such a way through which students can get knowledge about the prestige and greatness of his country, and get a chance to understand about their culture and civilization and to know about the work done by great persons of their country. The sense of national integrity can be developed among the students through stories, plays, poems, etc.
4. Teaching of history: Students should not be educated about dates and events only, through teaching of history, but they also must be told that enemies had always taken the advantages of our infighting. They must be told about those kings, saints, social reformers that have an important role in the development and national integrity of the country. Students should also be given a detailed knowledge about the history of freedom fight of India. They must be told about those great persons and heroines who devoted their luxuries and also died for the freedom of India.
5. Teaching of Geography: The geographical subject matters should be viewed through national angle. Student must be told about the mutual boundaries, rivers, mountains, weather, minerals, crops, transportation and mutual dependency of the states. They should also be told that in spite of living in different states and having major differences in their eating habits, lifestyle, costumes and traditions, all the people of the country are same from the geographical angle. NSOU ? CC-ED-02 ? 221
6. Teaching of Civics: The students must be educated to be a ideal citizen through civics. They must aware about their duties and rights. They must be encouraged to keep distance from the elements like casteism, sectism, province, terrorism, etc which harm national integrity. They must be told that they should not do any activity which is against national interest.
7. Teaching of Science: Teaching of science can also develop the sense of patriotism in students. They must be told that the scientific inventions are not related to a particular caste, religion, province, sector in the country. All the Indians are being benefited from them. Therefore they are the asset of India. C.V Raman, Meghnath Saha, Homi Bhabha are the scientists of India not from any particular state.
8. Teaching of music and arts: Music and different arts are also the binding forces which are capable to make unity in diversity. They are capable to join the hearts and they have a long lasting effect. Student must be told about the arts, music and dance of different states of the country. They must be told that Bhimsen Joshi, Begam Akhtar, Pt. Ravi Shankar, Amjad Ali Khan (sarod), Bismillah Khan (shehnai), Hari Prasad Chaurasia (flute), Shiv Kumar Sharma (santoor), Zakir Hussain (tabla), Jubin Mehta (violin) etc. are the prestige of India but they are not from a particular state, caste or

(B)

province. (B) Organization of co-curricular activities: The following co-curricular activities should be organized to develop national integration—

1. To celebrate national festivals: The students must be told about Independence Day, Republic Day, Martyr Day, Gandhi Jayanti, etc., and the history of freedom struggle and the freedom achieved after various sacrifices. They should pledge to safeguard the nation. For last few years a holiday is declared in schools on these occasions, which is not appropriate.
2. To celebrate birth anniversaries of freedom fighters and prominent persons: The birth anniversaries of freedom fighters and prominent persons should be celebrated in schools. On the anniversaries of Pt. Nehru, Sardar Patel, Dr. Radhakrishnan, Indira Gandhi, Lokmanya Tilak, Netaji Subhash Chandra Bose, Maulana Azad, Bhim Rao Ambedkar, Bhagat Singh, Chandra Shekhar Azad, Swami Vivekananda, Maharshi Arvind, Mahakavi Tulsidas, Nirala, etc the students must be told about the inspirational incidents about their life so that children should take an oath to do something for their country.
- 30 January (Father of nation), 31 October (Indira Gandhi), 21 May (Rajeev Gandhi) should be celebrated as Sacrifice Day and the students should be told how antinational elements murdered these great personalities in an inhuman manner and tried to divide the country and destroy its reputation in other countries.
3. To celebrate religious functions: Religious festivals like Diwali, Holi, Eid, Dusshera, Guru-parv, Christmas, etc should be organized in schools as these festivals do not belong to particular religion but are festivals of every Indian.
4. To organize lectures by eminent scholars: The lectures on the subjects like the freedom, integrity, development and other national problems by eminent scholars should be organized from time to time. So that the national integration should be developed in students.
5. To organize different competitions: The lectures related to national integration, debates, letter writing, essay, plays and other cultural and historical programs should be organized from time to time by which the development of national integration can be possible.
6. To organize exhibitions: Exhibitions should be organized from time to time in schools where a view of Indian culture and civilization is exhibited which may develop the feeling of prestige in students.
7. Exchange of teachers at national level: Primary, secondary, university level teachers should be exchanged at national level. When the teachers of different languages, caste, religion, groups and states go to other places they will know about other's view and try to understand them. Correlation between different cultures will be there and it will increase the level of national integration.
8. Inter-State games and sports and cultural programs: At least once in a year an inter-state games and sports competition and cultural programs should be organized by which the interaction between students will get broader. They will understand each other and we feeling will be generated and their heart will be filled with the feeling of devotion towards nation.
9. To organize educational tours: There are many historical, religious, cultural, industrial and very pleasant natural places in India which are knowledgeable and inspirational. The tour should be organized to go to these important national places from time to time. By organizing these educational tours about giving the knowledge

Organization of co-curricular activities The following co-curricular activities should be organized to develop national integration—

A correlation between different cultures will be there and it will increase the level of national integration.
8. Inter-State games and sports and cultural programs—At least once in a year an inter-state games and sports competition and cultural programs should be organized by which the interaction between 260 LOVELY PROFESSIONAL UNIVERSITY Unit 18 : Education for National Integration Notes students will get broader. They will understand each other and we-feeling will be generated and their heart will be filled with the feeling of devotion towards nation.
9. To organize educational tours—There are many historical, religious, cultural, industrial and very pleasant natural places in India which are knowledgeable and inspirational. The tour should be organized to go to these important national places from time to time. By organizing these educational tours about giving the knowledge

about the vast and variety of culture, a feeling of national love can be developed. 10. To organize inter-state camps: When the teachers and students of different states will take part in inter-states camps they will know about the living style, eating habits, costumes, language, folk music, folk dance etc. definitely by organizing these camps a feeling of national love in students and teachers will develop. 11. National and social service organizations: The NCC, NSS, scouting, girl guiding etc should be organized in schools by which students can be involved in social services and love towards nation can develop in them. 12. Use of Radio and Television: The programs on radio and television about the development of unity of nation and view of Indian culture should be broadcast and telecast, so that by listening and watching these programs, the feeling of devotion about nation should arise in students. Thus, the arrangements to listen and view these programs in schools should be organized. National integration and methods of teaching: There will be a need of systematic curriculum and appropriate methods of teaching to achieve the objectives of national integration. Thus, those teaching methods should be selected through which students can get a chance to develop their abilities. Students can be educated of the subjects related to national integrity through lectures, questioning methods and debates. They can morally speculate about the culture and civilization by self-study method. Planning method can be very much advantageous in this field. National integration and text books: In the view of national integration, necessary changes and amendments should be made in all related textbooks. The subject material which may create hindrance in national integration should be removed and study material which tells about the culture, civilization and the national pattern, should be added. Material which is Correct, sufficient and is related to love towards nation should be added in the textbooks. 6.3.3 Role of teacher in the development of national integration: A successful education depends on a teacher. National integrity can be achieved only through education, when the teacher is able and master in his subject. He must have a detailed knowledge about prestigious culture and civilization of the nation, he must be fully aware about historical, geographical, political, social, economical and industrial problems, NSOU ? CC-ED-02 ? 224 he must also be capable to express his opinions firmly in front of others, he must be generous, open minded, sincere about his duties and there should not be difference in what he says and what he does, who believes social services as his religion, he must be full of patriotic feelings and is willing to die at the time of calamity. Students consider their teachers as their ideals and follow them. Thus, if we want to develop a feeling of patriotism and national integration in the students then the teacher must prepossess the feeling of patriotism and national integration. 6.4

about the vast and variety of culture, a feeling of national love can be developed. 10. To organize inter-state camps—When the teachers and students of different states will take part in inter-states camps they will know about the living style, eating habits, costumes, language, folk music, folk dance etc. definitely by organizing these camps a feeling of national love in students and teachers will develop. 11. National and social service organizations—The NCC, NSS, scouting, girl guiding etc should be organized in schools by which students can be involved in social services and love towards nation can develop in them. 12. Use of Radio and Television—The programs on radio and television about the development of unity of nation and view of Indian culture should be broadcast and telecast, so that by listening and watching these programs, the feeling of devotion about nation should arise in students. Thus, the arrangements to listen and view these programs in schools should be organized. 18.6.4 National integration and methods of teaching There will be a need of systematic curriculum and appropriate methods of teaching to achieve the objectives of national integration. Thus, those teaching methods should be selected through which students can get a chance to develop their abilities. Students can be educated of the subjects related to national integrity through lectures, questioning methods and debates. They can morally speculate about the culture and civilization by self-study method. Planning method can be very much advantageous in this field. 18.6.5 National integration and textbooks In the view of national integration, necessary changes and amendments should be made in all related textbooks. The subject material which may create hindrance in national integration should be removed and study material which tells about the culture, civilization and the national pattern, should be added. Material which is Correct, sufficient and is related to love towards nation should be added in the text- books. 18.6.6 Role of teacher in the development of national integration A successful education depends on a teacher. National integrity can be achieved only through education when the teacher is able and master in his subject. He must have a detailed knowledge about prestigious culture and civilization of the nation, he must be fully aware about historical, geographical, political, social, economical and industrial problems, he must also be capable to express his opinions firmly in front of others, he must be generous, open minded, sincere about his duties and there should not be difference in what he says and what he does, who believes social services as his religion, he must be full of patriotic feelings and is willing to die at the time of calamity. Students consider their teachers as their ideals and follow them. Thus, if we want to develop a feeling of patriotism and national integration in the students then the teacher must prepossess the feeling of patriotism and national integration.

PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific / generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes of all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually,

the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this, we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success. Prof. (Dr.) Subha Sankar Sarkar Vice-Chancellor

After going through this unit, you will be able to - ? define the

concept, nature and scope of sociology ; ? discuss the Education and Society ; ? elucidate the idea of sociology of education. 1.2 Introduction In this unit, we shall discuss the concept, nature and scope of sociology. The relationship between education and society has been discussed in detail like linkages between society and education, the role of different social institutions like family, religion economy, polity and education. Another important aspect of this unit is a discussion of major functions of the society. Last part of the unit examines the affiliation of sociology and education. Thus, this unit provides an in-depth understanding of concept of sociology and its relationship with society and education.

NSOU ? CC-ED-03 ? 8 Man is a social animal. He is born and brought up in society. He spends his whole life in society. Hence, we cannot think of a human life without a society. In the time of birth, a child only has biological impulses and need. Gradually he regulates his impulsiveness under the guidance of his mother as well as family. From this phase the socialization of a child begins in an informal manner. In the same way without education there is no society. Along with that, formally a school extends its hand to make child a social being. Therefore, Society and education both are very closely related. Education is a social process, socially manifested, socially oriented and socially controlled for maintenance of social order and achieving social goals in shaping the structure of society. Society needs education, and education performs its role to fulfill social needs. Education modifies people's behavior according to the needs and aspirations of the society. In order to realize the role and function of every child and make them a responsible citizen of the society, the importance of school in a societal context has to be realized first. In this aspect, before discussing the term "educational sociology", it is necessary to understand the meaning of the word 'sociology'. August Comte, the well-known French philosopher, used the word 'sociology' for the first time in his lecture in 1837. He coined the word 'sociology' by combining the Greek word 'Societus' meaning society and the Latin word Logos meaning 'science' or 'study'. He recognized sociology as a fundamental science which deals with the application of scientific method to study the relationship between society and the individual. Hence, sociology is the scientific study of society or it may be called the science of society. However, educational sociology is a branch of sociology which has come into existence as a synthesis between Education and Sociology. In this aspect, E.George Payne is regarded as the father of educational sociology. According to him, "Educational sociology is the applied science in the field of sociology". It emphasizes that the aims of sociology should be achieved through educational processes. Thus, educational sociology is that science which studies social activities, human groups, social institutions and agencies which fulfill the needs of education (society) through educating its future citizen. It deals with the development of individuals and society. Education is the gateway towards making a perfect society, the superstructure of a strong and sustainable society. It is necessary in order to understand the customs, folkway, mores, traditions, various social institutions, social rules, codes and norms of behavior which affects human progress and development through various educational activities and experiences to make a synthesis in the process of life. Whereas Sociology of Education is a branch of Sociology, like any other branch of

NSOU ? CC-ED-03 ? 9 study as anthropology, psychology, economics, clinical sociology or sociology of politics. Education is a very important element for a person to be a social being in the society. (Education is the goldsmith and society is the receiver of it and human child is transformed into gold in this process called socialization). Therefore, sociology as a subject of the study of society has always been a big concern for the education of the people of society. Sociology of education deals with the learning and behavior modification of the individual will be discussed in details in this unit. 1.3 Sociology 1.3.1 Concept of Sociology Sociology is a new social science. French sociologist Auguste Comte coined the term sociology in 1839. The term 'sociology' is derived from the Latin word 'societus' meaning 'society' and the Greek word 'logos' meaning study or 'science'. Etymologically sociology means the 'science of society' sociology concerns itself with an analysis and explanation of social phenomena. It studies social life, actions, behaviors and incidents. Sociology is the study of social relationships, groups and societies. Ross has said. "Individuality is of no value and personality a meaningless term apart from social environment in which they are developed and made manifest." Sociologists differ in their opinions about the definition of sociology. Sociology has been defined as the science of society. Some others have defined sociology as the scientific study of social relationships or activities. In this context, it is necessary to discuss some of the definitions of sociology. Definition of Sociology: Auguste Comte, "sociology is the science of social phenomena subject to natural and invariable laws, the discovery of which is the object of investigation". Emile Durkheim "Sociology is the science of social institutions". Max-Weber, "sociology is the science which attempts an interpretative understanding of social action". Morris Ginsberg, "sociology is the study of human interactions and inter-relations their conditions and consequences". J.F. Culler, "sociology may be defined as the body of scientific knowledge about human relationships.

NSOU ? CC-ED-03 ? 10 Gillin and Gillin, "sociology in its broadest sense may be said to be the study of interactions arising from the association of living beings". An analysis of the above definitions shows that sociologists differ in their opinion about the definition and the subject matter of sociology. But the common idea underlying all these is that sociology is concerned with human beings and their relationships. It gives stress on the social aspect of these relationships. MacIver opines that whatever subject may be included in the subject matter, its real subject matter are social relationships. This social relationship is the basis of social interaction of social processes. That is why man becomes a social animal only when he enters into these social relationships. Hence, studying sociology means studying social relationships.

1.3.2 Nature of Sociology Human life is unthinkable in outside the society. No individual can exist in an Island, alone in complete and permanent isolation from other individuals. Each of us may have different dimension and status in life, but we are above all human beings. This mutual dependence makes the periphery of society and hence forms social interdependence. We are born in a social environment (i.e. a community or other group to which we belong) and culture (social heritage, i.e. the arts, devices, techniques, myths, values, traditions, mores and institutions); we become genuinely human by adapting the norms, cultures and customs of society and adjusting with others by accepting their also. In order to survive, to procure the means of living, humans must live together. But, as it is said, "Man does not live by bread alone" animals also live together. Animal life revolves around the fulfillment of immediate necessities. He wants to link himself with other through knowledge, work and thinking and by expressing himself. This desire is no less important than the desire to satisfy his immediate needs. The desire to express himself in and through the company of others leads him to realize the virtue of cooperation; he understands that he is one among many. Man has thus formed families, built societies. There exists a bewildering variety of moral principles, religion, ideals, institutions, group and organization, norms and customs. The desire to link oneself with others of similar kind has given birth to a variety of governmental system, legal system, administrative system and educational system. Clashes of interest, tensions and conflicts among men abound and sometimes erupt, threatening the very existence of humanity. But man continues to survive because of the propensity to live together, the desire to unite with others. Man survives in an ensemble of relations based on cooperation; it is here where he gets opportunity to express himself, he

NSOU ? CC-ED-03 ? 11 becomes genuinely human. There are several cases of extreme isolation like the "wolf children" of India which illustrate the fact that if the child is abstracted from contact with its fellow at birth, it will grow up into a "feral man" -without knowledge of human speech, without any idea of "right" and "wrong", without being aware of or able to use cultural techniques. Indeed, we are the product of social living. Society provides opportunities to develop our innate abilities and become truly human. What we think, what we feel and how we feel, what we say and what we do are all shaped by our interaction with other people in collective living. Life goes on within the web of relationships created as a result of interaction of people with one another. This human interaction and the structural arrangements that evolve out of it constitute the essential components of sociology. It focuses in particular on the social life in the modern world a world created by the sweeping changes which have occurred over the past two centuries. Interest in understanding the nature of human beings and their social arrangements has a long past. Why people behave as they do? Why they form groups? Why they marry? Why they go to war or worship? How and why societies differ in the ordering of social arrangements? How social arrangements are maintained and how they change? Why some people break social rules? Thinking minds of all ages have addressed to these questions and others. They have tried to explain what is happening around us and how behavior, experiences and ideas about the social world are shaped by social influences.

1.3.3 Scope of Sociology Since the days of Comte and Marx, Spencer and Giddins, Durkheim and Weber, sociologists have attempted to define, limit and scope of the field of sociological enterprise. Even so there is still little agreement among sociologists about the proper field of sociology. There are as many definitions of sociology as there are number of sociologists. "Sociology is a very broad and diverse subject", as the British sociologist Anthony Giddens writes, "And any simple generalizations about it as a whole are questionable". Giddins however points out that the definition of sociology as the science of society is very broadly accepted. Though this short hand definition is essentially accurate, it may seem rather vague or not sufficiently precise as to distinguish sociology from other disciplines. Sociology is one of a family of disciplines including economics, history, psychology, political science and social anthropology which are known as "social sciences". The most important and distinctive feature of sociology is not so much what is studied but how it is studied,

NSOU ? CC-ED-03 ? 12 i.e. what is the particular perspective of sociology, its distinct way of looking at the individual and society. Hence, let us discuss in details scope and the field of sociology. There is no one opinion about the scope of Sociology. V. F. Calberton writes, "Since Sociology is as elastic as a science, it is difficult to determine just where its boundaries begin and end, where sociology becomes social psychology and where social psychology becomes sociology, or where economic theory becomes sociological doctrine or biological theory becomes sociological theory, something, which is impossible to decide." It is maintained by some that Sociology studies everything and anything under the sun. This is rather too vague a view about the scope of sociology. As a matter of fact, sociology has a limited field of enquiry and deals with those problems which are not dealt with by other social sciences. In the broadest sense, Sociology is the study of human interactions and inter-relations, their conditions and consequences. Thus ideally Sociology has for its field the whole life of man in society, all the activities whereby men maintained 'themselves in the struggle for existence, the rules and regulations which define their relations to each other, the systems of knowledge and belief, art and morals and any other capacities and habits acquired and developed in the course of their activities as members of society. But this is too wide a scope for any science to deal with properly. An attempt has, therefore, been made to limit and demarcate the field of Sociology. There are two main schools of thought among sociologists on this issue. One group of writers headed by German sociologist, Simmel, demarcates Sociology clearly from other branches of social study and confines it to the enquiry into certain defined aspects of human relationship. They regard sociology as pure and independent. The other group maintains that the field of social investigation is too wide for any one science and that if any progress is to be made there must be specialization and division and insists that in addition to special social sciences such as Economics, Anthropology, History etc. there is need also of a general social science, i.e. Sociology whose function it would be to inter- relate the results of the special social sciences and to deal with the general conditions of social life. In the opinion of this group Sociology is a general science.

1.4 Education and Society

The relationship of antecedence between the concepts "education" and "society" is one that can be a challenge for social scientists. Anthropologists, sociologists, or other social

NSOU ? CC-ED-03 ? 13 scientists may be on conflicting sides of the argument. Some may argue there is no society without education. Therefore, education comes first, and is more important than society. Others may argue that a society must exist before there can be education. Furthermore, education is a reflection of a society, or is influenced by society. Therefore, the society comes first and is more important. Regardless of the side of the argument supported by one group of scholars or another, there is an evident consensus that education and society are interconnected. As a social process, education helps the individuals to lead a purposeful life by moulding and shaping the society with the help of education, society delivers its knowledge, skills, customs, values and behaviour patterns to its generations after generations. Therefore, education helps the society to preserve and continue its culture and creed and helps to sustain purposefully. Again with the changing scenario of the society, education reshapes itself and turns into complex in nature. Society is a 'web of relationship' and these relations are fundamental for understanding human behavior and different institutions of society. You must be aware about different forms of relations in your family, community and society. Within the family, there are relations like mother, father, son, daughter, husband, wife, brother, sister which we put under primary relations whereas uncle, aunt, nephew, niece are called secondary relatives. There are also tertiary relatives like friends, neighbourhood relations and many other similar relations. These social relations can be understood with role and status in society. Role is a set of actions of an individual. A teacher in school performs various actions pertaining to teaching, evaluation, group activity in the classroom situation and actions concerning school administration. Similarly, he/she also performs actions within family and other situations. Thus, one individual performs multiple roles in everyday life. For instance- A person is playing roles of father for his children, son for his parents, husband for his wife, brother for his siblings, teacher for his students and other roles. This shows that role is changing with changing social context and each role attached with certain position in society called social status. Both role and status are regulated by certain norms and values of the society. In other word, we can say that norms and values are collective conscience and unwritten constitution of any society, largely known among members of society as well as attached with sanctions (reward and punishment). Therefore, the understanding of social relations, role and status, norms and values are core concern of understanding of society. The term "society" is rooted in Latin word societies, means friend and ally. The terms used to describe a relation or interaction among group. The concept of society defined by a large number of thinkers- sociologists, social anthropologist and other social scientists. Among these definitions mostly follow two ways as basic unit in society- first is 'social action' and

NSOU ? CC-ED-03 ? 14 another is 'interaction'. American sociologist Maclver and Page consider, "society as a system of usage and procedures, of authority and mutual aid, of many groupings and divisions, of controls of human behavior and of liberties". Hence, we can see society as a large group of people who interact with each other, share the same culture, territory and way of life. Its usage is very wide and ranges from one small community. But, the concept of community and society are not same. Society is an abstract, broad and general concept whereas community is constituent of society and characterized with definite territory, close relationship called 'we feeling' and cultural similarity. Talcott Parsons, American sociologist, used term social system for society and considered 'interaction' is the basic unit to explain the human behaviour. For him, every action is not social unless multiplicity of people involved in interaction. Every individual is a member one society or other society. As a member of society, you must be aware of different institutions of society playing significant contribution towards continuity. To understand society, social relationship and its dynamics, it is pertinent to know its basic constituent units i.e. social institutions and social processes. Social institution refers to 'a set of norms' applied to various aspects of human behaviour regulated by well established, easily recognized and relatively stable norms for smooth functioning of society and social relations. There are some important institutions like family, education, religion, economy, polity which play different roles following the norms and values of one particular society. Now we will study these institutions in detail. 1. Family: It is the first school where children start their initial learning. It is called primary socialization agency and parents are called primary socialization agent. The role of teacher is played by mother and other members of family. Even in the formal school system, different roles like teacher, pupil and parents are members of society and always carry their cultural baggage and values of same society. This common cultural baggage also led to common reference of learning and similar constructions. Throughout the ages the family has been a fundamental social institution at the core of the society. Family is a basic unit of any community and society which acts as joining institution between individual and society. It has almost universal existence across the world. It discharges many functions to society and individual from regulating marital bond, legitimate reproduction, care for young, controls human behavior and functioning as an economic unit at least for consumption. It discharges this role with other associated institutions, like marriage and kinship. Family exist almost all human society, however, varies in terms of structure and function from society to society and time to time. 2. Religion: Religion is also one universal institution that exists from primitive to post-

NSOU ? CC-ED-03 ? 15 modern society.

French sociologist Emile Durkhiem defined religion as unified system of beliefs and practices related to sacred things. Except Karl Marx, there is consensus that religion has functional role in society. One of the most important functions of religion is social control. 3. Economy: Economic institution refers to the rules, procedures and norms of production, distribution, consumption as well as working system and patterns. Economic activities and needs are very of any society irrespective of its stages of development. Karl Marx considered economy is the basic structure of any society on which other institutions are dependent. 4. Education: The process of education takes place in every society. However, its forms may vary from one society to another society. There are two common functions of education in every society. First universal function of education is to socialize the members of society and transmit the culture to the next generation. Second is to fulfill society's needs pertaining to human resource. Major socializing agencies are community, family, peer group and formal educational institutions. Besides this, there are many other functions of education are social mobility and intergenerational change. Present democratic system based on the principle of equal opportunity, competition and achievement, therefore, any educated and competent can enhance his/ her status. Child acquires the values of productive society like achievement, orientation, discipline, liberalism and rationality through this institution. 5. Polity: Each society has some or other system of rules. Political institutions are defined as a system of control through its organizations and legal or legitimate use of force. According to T. B. Bottomore, polity is mainly concerned with division of power and authority in society. These are basic institutions whose prevalence is almost universal with little variation. The structure and functions of these institutions vary with time and can be understood through social processes. Social process describes dynamics of social interactions and social interactions takes place within structure consists of various institutions. Two important social processes are socialization and social control that we will study later on. Secondly, the interaction between School and community has become increasingly formal and bureaucratic. Following this process, schools are becoming mega structure keeping a distance from community and society. John Dewey writes that 'we are apt to look at the school from an individualistic standpoint, as something between teacher and pupil, or between teacher and parent'. The result of this changing situation led to deviation of it role and responsibility. If we consider society as a social system then we may divide it into five sub-systems known as family, education, religion, economy, and politics. Each sub-system

NSOU ? CC-ED-03 ? 16 plays its own functions to sustain and maintain the society as a whole. In this way, we can say that all educational institutions are very much part of society. Society and Education Linkages Education is generally seen as the foundation of society which brings economic wealth, social prosperity and political stability. It is a major aspect of development of any modern society and most significant indicator of overall development of any region. Emile Durkheim emphasizes the role of education system in the preservation of society and culture, particularly, it is very important in complex societies where families and other primary groups are not fully equipped to prepare the young for adulthood that is expected by larger society. John Dewey wrote extensively on this theme and his two contributions are very appropriate here, the School and Society (1899), Democracy and Education (1916). He argues that school is a miniature and reflection of society rather individual. The ultimate objective of school and schooling process is to foster the growth of social progress and expansion of democracy. Many other thinkers or practices has been contributed and discussed the relationship between education and society such as Leo Tolstoy, Antonio Gramsci, Paulo Freire, Brasil Bernstein, Ivan Illich, Pierre Bourdieu, Rabindranth Tagore, Sarvepalli Radhakrishnan, M. K. Gandhi etc. Education is concerned with all people and considered as basic social need of all societies. John Dewey viewed that being a social need it performs major functions to the society as following. (a) Transmission of culture: Human beings are world building creature. The sum total of such creations, its preservation and transmission to the next generation are the core concern of any culture. The culture makes a distinction with other creatures. Each society has its own cultural heritage which they preserve and transmit to next generation. The most important role of education is to transmit the tradition, culture, skill and knowledge to the new members of the society. Thus culture is the most common link between society and education. Now you must be interested to know what is culture and its relation with society and education. Culture is a broad term which includes everything of human society. E.B. Tylor, British social anthropologist, defined culture as 'a

84%

MATCHING BLOCK 5/51

W

complex whole which includes knowledge, belief, art, law, morals, customs, and any other capabilities and habits acquired by man as a member of society'.

Since inception of society itself, we can see that each society has some or other mechanism to educate and train their members through various agencies of society, like family, community, and other formal institutions. (b) Reduce inequality and disparity: Education gives us knowledge and knowledge is power. Education plays a significant role to society by solving the problems which raise

NSOU ? CC-ED-03 ? 17 question about its sustainability and stability of society. Rabindrinath Tagore writes "In finding the solution to our problem, we shall have helped to solve the world problem as well....If India can offer to the world her solution, it will be a contribution to humanity." Through education one can acquire knowledge and participate in the process of empowerment. Indian traditional education system was neither open to all nor it had any uniformity. It was elitist in character and supported with religious purpose rather based on rationality which has created socioeconomic inequality. It was introduced to make so called elite group of people who carried the wheel of British Government on their shoulders. After independence, constitutional provisions (Article 21-A and 45) changed this elitist approach to egalitarian approach and the process of empowerment observed in various empirical studies. UN Millennium Development Goals (2000) targeted eight goals in which two are significant here- first is to achieve universal primary education and secondly, gender equity. These have been accepted by 189 countries of the world including India. Following this goal Sarva Sikhsa Abhiyan (SSA) as a national flagship programme was launched. For female literacy many initiatives were taken such as Mahila Sankhya, Kasturba Gandhi Balika Vidyalaya (KGBV) etc. So far as concern of regional disparity, development of any region is directly correlated with education status of that region. Thus, regional development is very much dependent on education, health and economic status of any region. (c) Social mobility and social change: Education in the present day context is the most important and dynamic force in the life of individual, influencing his/her social development. It functions more as an agent of social change and mobility in social structure. Social stratification is a universal social fact. Social mobility refers the movement of individual and group position or status in the social hierarchy of any society. There are two important factors of social mobility-education and income status. Now, free and compulsory education to all provides opportunity to enhance one's educational and income status to improve the standard of life. Social mobility gives birth another type of socialization called 'anticipatory socialization'. Individual's devotion to particular society gets weaken due to belong to another strata because of social mobility and try to follow the values, cultures and creeds of other strata in which he now belongs to it. (d) Development of new knowledge: Education is the way to acquire knowledge to achieve success in its life. Through education we develop new knowledge or addition to the existing knowledge to fulfill our new necessity. As we know that necessity is the mother of inventions, from simple savage society till present postmodern society, we can

NSOU ? CC-ED-03 ? 18 observe the drastic changes due to many inventions and discoveries to satisfy our needs and for sustainable growth. The initial knowledge of metals, fire and wheel played critical role in ancient development throughout world civilization. It acted as the turning point from food gathering to settled agriculture society. Similarly, there are many other examples of new knowledge in the history of mankind. Contemporary technological revolution through internet, multimedia and communication transform the whole world into global village. Education is very important for an individual's success in life. Education provides pupils teaching skills that prepare them physically, mentally and socially for the world of work in later life. Higher education helps in maintaining a healthy society which prepares health care professionals, educated health care consumers and maintaining healthy population. If there is a deficit of educated people then society will stop its further progress. Therefore, we can see the role played by the education process towards society as a whole. Here, Education system included all forms, formal, informal and non-formal education. The combination of these forms may vary with time and space. Informal education process is the oldest form and its existence is as long as society itself. Formal and non-formal are forms of later development. Informal education is characterized with changed relationship between learner and teacher in informal learning context, while the goals of informal education are always rooted firmly in value system. It has no direct concern with degrees or diplomas and supplements both formal and non-formal education.

1.5 Sociology of Education Every society has its own changing socio-cultural needs and requires an education to meet these needs. Today's needs are conservation of resources, environmental protection, global citizenship etc. Therefore education caters towards meeting of these different needs. Since the needs of the society change, education also changes to coincide with it and satisfies the needs of the society. Hence there is need for studying sociology of education. It helps in understanding in a nutshell: ? Work of School and Teachers and its relation to society, social progress and development ? Effect of Social Elements on the working of school and society ? Effect of Social Elements on the life of individuals

NSOU ? CC-ED-03 ? 19 ? Construction of Curriculum in relation to the cultural and economic needs of the society ? Democratic ideologies present in different countries ? Need for understanding and promoting international culture ? Development of Society through the formulation of various rules and regulations and understanding of culture and traditions ? Need for Promotion of Social Adjustment ? The effect of social groups, their interrelation and dynamics on individuals

Scope of Sociology of Education: The scope of sociology of education is vast. ? It is concerned with such general concepts such as society itself, culture, community, class, environment, socialization, internalization, accommodation, assimilation, cultural lag, subculture, status, role and so forth— ? It is further involved in cases of education and social class, state, social force, cultural change, various problems of role structure, role analysis in relation to the total social system and the micro society of the school such as authority, selection, and the organization of learning, streaming, curriculum and so forth. ? It deals with analysis of educational situations in various geographical and ethnological contexts. For e.g. educational situations in rural, urban and tribal areas, in different parts of the country/world, with the background of different races, cultures etc. ? It helps us to understand the effectiveness of different educational methods in teaching students with different kinds of intelligences. ? It studies the effect of economy upon the type of education provided to the students, for e.g. education provided in IB, ICSE, SSC, Municipal schools. ? It helps us to understand the effect of various social agencies like family, school on the students. ? It studies the relationship between social class, culture, language, parental education, occupation and the achievement of the students. ? It studies the role and structure of school, peer group on the personality of the students.

NSOU ? CC-ED-03 ? 20 ? It provides an understanding of the problems such as racism, communalism, gender discrimination etc.

1.6 Summary Sociology is the study of human interactions and inter-relations, their conditions and consequences. In this unit we have learnt about the various definitions of sociology and about its nature and scopes. We have discussed about the relationship between education and society and major functions of the society. We have also elaborated the idea of sociology of education along with the scope of educational sociology.

1.7 Self-Assessment Questions

1. What is sociology?
2. Do you think each definition is enough to throw light on what is sociology or rather every definition is necessary to grab the concept clearly? Discuss in three lines what is meant by sociology.
3. Who is E. George Payne?
4. Who is the founder father of sociology?
5. What is the nature of sociology?
6. What is sociological imagination?
7. Name any two aspects which sociology has strengthened among individuals?
8. What are the three major scopes of sociology?
9. Why sociology is regarded as pure and independent?
10. Who opined sociology is a science of society?
11. How culture is transmitted from generation to generation?
12. What is social mobility?
13. Name any two linkages of society?
14. What do you mean by educational sociology?
15. Write two scopes of educational sociology?

After going through this unit, you will be able to ... ?

discuss sociology as the foundation of educational studies; ? understand the approaches of sociology; ? define the equilibrium and the role of education; ? understand the concept of sociological assumptions. 2.2 Introduction In this unit, we shall discuss various aspects of sociology. It includes the notion how sociology builds the superstructure of education. The relation of education and sociology

NSOU ? CC-ED-03 ? 23 is again emphasized and discussed here. It assembles different approaches, concepts of sociology. Another important aspect of this unit is a discussion of different sociological assumptions. Thus, this unit provides an in depth understanding in the field of sociology. 2.3 Sociology as the Foundation of Educational Studies Sociology and Education as two branches of knowledge, concerned essentially with man and his life. Relationship between sociology and education has always been a subject of debate. Education and sociology are mutually interrelated and interdependent disciplines. They are so closely intertwined and interconnected that their subject matter and method of study are often overlapped to a great extent. All societies have their own ways and means of meeting this need .Education is an effective process of meeting this need. Education does not only transmit the past cultural heritage but also helps to develop the basic criteria which help us to adopt and adjust with our modes of living. It may help in developing new social patterns in the areas of health, leisure, vocation and family life. Reconstruction and adaptation are necessary but with the advent of scientific developments, industrialization and technological advancements, the wise use sometimes use as a weapon of misuse which are disturbing the urban as well as rural pattern of living. The relationship of education and sociology can be cleared through following points. ? Sociology is the science of society and education in an implicit aspect of any social system. ? Sociology studies the structure and functions of social system, while education is one of the important functions of any social system. ? The prime concern of sociology is socialized individuals. Education is the means for achieving the goals of sociology. ? Education is the laboratory and workshop of sociology. ? Sociology attempts to ascertain the functions performed by the educational system while education adopts the principles of sociology to improve its functioning. ? In the modern society, sociology generates the data base which is consumed by educational system to realize the goal of social life. ? Sociology develops the law and principles which are adopted by the educational system for its improvement. ? Education preserves the social and cultural heritage which is owned by sociology.

NSOU ? CC-ED-03 ? 24 Society is the prime factor in determining the educational patterns so that its socio cultural needs may be satisfied and continues to grow. Emile Durkhiem who first clearly indicated the need of a sociological approach to the study of education. He considered that education to be something essentially social in character, in its origin and its function and that as a result of theory of education relates more clearly to sociology than any other science. Sociology and Curriculum: Sociology helps us to conceptualize curriculum. According to educational sociology, Curriculum is organized so that it may help in achievement of social aims. The social progress of the society and the nation depends upon the curriculum in the schools and colleges, due to this reason the sociologist consider it is essential to organize the curriculum carefully and properly. In the word of eminent educationist, "Education is not to be confined to the study of a few subjects alone is to be present any epitomized study of the diversified social life." Following sociological principles should be kept in view while construction curriculum. ? The curriculum should be such that it helps in achievement of the social aim of education. The curriculum should be chosen on the basis of the problems and the needs of society. ? But it should also pay the attention to the real problems and interest of the pupils. Curriculum should be so organized and its relationship with instructional methods should be such that the curriculum becomes effective medium to keep a control over society. ? Through curriculum the cultural values should be brought to light and through it the high ideals of the society should be transmitted to the new generation. ? The curriculum should be such that it develops an attitude of respect to all vocations. It should develop a sense of dignity of labor among students. ? The stress should be on a futuristic social change rather than bringing immediate change in individual's behavior. ? The curriculum should be dynamic flexible and changing in nature. ? The curriculum should be able to develop a problem solving attitude among the students, they should understand and solve the problem independently.

NSOU ? CC-ED-03 ? 25 ? There should be provision of social programs for participation in social life. ? The curriculum should be flexible and changeable. ? It should change continuously according to changing social objectives. ? Curriculum planning should be based on the problems and need of society on the immediate concerns, problems and interest of pupils. ? The curriculum should reflect the basic cultural values of the society and should be an agent in the transmission of the highest values. ? Curriculum should include subjects like music, art, vocational subjects, physical education, language, physical sciences as well as biological sciences. Sociology and Method of Teaching: Educational sociologist advocates the use of project method, socialized techniques, Group discussion and techniques of group dynamics. They also encourage co-operative learning, problem solving and democratic method of teaching. Those educational methods are good which gives knowledge to the individual who will enable the students to adapt and adjust to different social situations. Sociology gives importance to group methods of teaching. Methods which are able to develop democratic attitude among children should be the good method of teaching. According to sociological point of view, the method of instruction is effective only when the skill and knowledge acquired in the classroom are actually use by the individual in the adjustment to social situation. An individual should be able to achieve social correlation by use of knowledge and skill received in the school. The method of teaching should be stress on the social behavior outside the class while teaching. The method of teaching should make use of all possible social resources and social operative force in the social life in order to develop the capacity in every individual for social adjustment. The social powers currents in the society should be used in teaching system for increasing the social co-relationship. Sociologist suggests that teaching should be done through cultural and social programs.

NSOU ? CC-ED-03 ? 26 In teaching teacher will develop problem solving and constructive thinking. For this socialized techniques, project and group methods fulfill most of the conditions. Student reacts better to co-operative learning in which there is sharing in the teaching learning process. Co-operative group patterns of learning lay emphasis on group interaction. Sociology and Teacher: Following are the important sociological aspect and consideration for a teacher to be followed before teaching such as. ? Teacher should be committed to society. ? He/she should know the main institution and powers that mainly influence a student. ? He/she should know the instruments of social development, available in extramural environment. ? He/she should have capacity to use this knowledge in school Education. ? A teacher should know about the process of socialization among students and the method of interaction and programs for social development. Education as a Process of Social System and Socialization: Social system can be explained as an interconnected and organized activities which consist of parts that are inter-dependent, to produce common results , Social systems are created by human beings and are strengthened by man's attitudes, perceptions, beliefs, habits and expectations. In social system two or more people are constantly interacting and practice similar approaches attitudes and social values. Society transmits its knowledge, skills, values and behaviour pattern to its younger generation ensuring preservation and continuity. Education as a social process: ? Education takes place in the society and therefore it is influenced by society. ? School as a social institution educates its younger members. ? Education helps to mould the society by moulding its younger members. Education as a process of Socialization: ? Education takes place through social interaction.

NSOU ? CC-ED-03 ? 27 ? Informal education takes its place outside the school. ? It is more than mere giving instruction. ? Formal education has definite direction and definite purpose. Education as a Social System: The education system is composed of many distinct sub-system or parts, each with their own goals. Together these parts makeup a functioning whole .Each part is dependent on the other for smooth functioning. Willard Waller gives five reasons for education to be regarded as social system: ? In education different personnel are working, who contributes towards educational goals. ? Education has a social structure as the result of social interaction within the school. ? It has bound by strong social relationship. ? It is bound by a feeling of belonging. ? It possesses its own culture, tradition, and way of doing things. ? Education helps in transmitting folkways, more institutional patterns in social organization. It has a close relationship with the environment and they complement each other, Education in school prepare students with living skills, knowledge and expertise necessary for the society .The education is provided with resources, building and personnel (parents, teachers, students) in order to functioning. As a social system education has a formal and informal structure, the formal structure refers to the role and function of the administration. The informal system refers to its social relationship that helps the organization to function. When you enter in school we see office, member of the school staff, classrooms takes up the most of the physical structure of school. Within a classroom, the teacher and students are the main personnel. We see specific order in the classroom, seating arrangement work groups, location, style of leadership, class size, types of students. All the factors in education system affect the relationship between position holders and the other .Each classroom has a distinct climate and social structure. The education system exists in a larger societal context, including the local community, state and central governments rules and regulations and funding.

NSOU ? CC-ED-03 ? 28 Therefore, an education system is where peoples, pupils, building, textbooks, and equipment interact with each other in a social environment. According to Getzels, social system model is best suited for education system, because it emphasize on process of synthesizing the society with its culture, values, socioeconomics, political system with the need of the individuals. Every school member, student, teacher, head, and other staff play their important roles towards achieving the educational goals. In school teacher manages his classroom, interact with students and the environment, he carries all responsibility required for his positions. In school different activities are organized, all the activities are influenced by society's culture, policies, values and are undertaken by the individual as part of social process. So the success of the individual and the organization are based on factors like expectations, need, satisfaction, role and goal. Within the education system the school has certain roles and expectations that are designed to fulfill the goals of the system. Each school consists of individuals with certain personalities and need whose interaction make up what is commonly known as social behavior. Education system is also under pressure from the community members to take over greater roles in child care program. Each society has certain goals for its educational system that are put in to practice in school and classroom. In the school the stated goals must be translated in to action. Members of the educational organization holding different roles, teachers and administrators desire high quality education but they also have personal motivation. Schools bring peer together in classroom and for other school related activities. Thus group sub-culture flourishes in schools. School plays an important part in helping diverse individuals to see themselves as citizens and therefore to internalize skills. From above we can say that in education system, school performs many roles and play different activities, as a school system has its roles and function of administration while the system has a network of social interaction and relationship for it to function. It emphasizes on the process of interaction of individuals and the role of each individual play in the school system. In the school there are teachers principals, students, etc. each has a defined social position. These social positions are distributed from top to bottom, in hierarchical order. All individuals interact with one another. This human interaction within an education system may be described as social system hence we say that education is a social system. From the above discussion it may be stated that without sociological understanding, the educational studies is incomplete. From the very beginning of the civilization the importance of learning was realized by the society. As a result, learning, training as well as teaching have been the inseparable part of the social aspirants. So, sociology as a subject which deals with the society as well performs as a foundation of educational studies.

NSOU ? CC-ED-03 ? 29 2.4 Approaches of Sociology Sociology is the scientific study of the individual and group behavior within society. A standard textbook approach emphasizes several theoretical approaches to understanding human behavior; however, there are four main approaches: Structural-Functionalism, Social- Conflict, Symbolic- Internationalism and Feminism. The structuralism-functionalism has been discussed below: 2.4.1 Structuralism-Functionalism Structural-Functionalism is often referred to as Functionalism and is considered an objective means to understanding macro aspects of human behavior in the context of society. This theory adopts the notion that society is made up of parts that contributes to stability in society. Society is thus considered to be a whole unit, which includes many parts interrelated and works together to function. Structural-functionalist believes that society is like a human body, in which each part plays a role and all are dependent on each other for survival. Institutions such as education are like important organs that keep the society/ body healthy and well. Social health means the same as social order, and is guaranteed when nearly everyone accepts the general moral values of their society. Structural functionalists believe the aim of key institutions, such as education, is to socialize children and teenagers. Socialization is the process by which the new generation learns the knowledge, attitudes and values that they will need as productive citizens. . Although this aim is stated in the formal curriculum, it is mainly achieved through "the hidden curriculum", a subtler, but nonetheless powerful, indoctrination of the norms and values of the wider society. Students learn these values because their behavior at school is regulated until they gradually internalize and accept them. Education must, however perform another function. As various jobs become vacant, they must be filled with the appropriate people. Therefore the other purpose of education is to sort and rank individuals for placement in the labor market. Those with high achievement will be trained for the most important jobs and in reward, be given the highest incomes. Those who achieve the least, will be given the least demanding (intellectually at any rate, if not physically) jobs, and hence the least income. Emile Durkheim (1858-1917), is considered to be the first person to recommend that a sociological approach be used in the study of education. He said that society can survive only if there exists among its members a sufficient degree of homogeneity. Education

NSOU ? CC-ED-03 ? 30 perpetuates and reinforces this homogeneity by fixing in the child, from the beginning, the essential similarities that collective life demands. Durkheim attempted to understand why education took the forms it did, rather than judge those forms. He points out that, Education is the influence exercised by adult generations on those that are not yet ready for social life. Its object is to arouse and to develop in the child a certain number of physical, intellectual and moral states which are demanded of him by both the political society as a whole and the special milieu for which he is specifically destined. Durkheim observed that education takes different forms at different times and places showing that we cannot separate the educational system from the society for they reflect each other. He stressed that in every time and place education is closely related to other institutions and to current values and beliefs. Durkheim outlined his beliefs about the functions of schools and their relationship to society. Durkheim argued that education has many functions: 1. To reinforce social solidarity: Learning about individuals who have done good things for the many makes an individual feel insignificant. Makes individuals feel part of a group and therefore less likely to break rules. 2. To maintain social role: School is a society in miniature. It has a similar hierarchy, rules, and expectations to the "outside world." It trains young people to fulfill roles. 3. To maintain division of labor: School sorts students into skill groups, encouraging students to take up employment in field's best suited to their abilities. According to him, moral values are the foundations of the social order and society is perpetuated through its educational institutions. Any change in society reflects a change in education and vice versa. In fact education plays an active role in the process of change. Durkheim was interested in the way that education could be used to provide French citizens the sort of shared, secular background that would be necessary to prevent anomie in modern societies. He equated classrooms to small societies 'or agents of socialization. The school acts as an intermediary between the affective morality of the family and the rigorous morality of the life in society.

NSOU ? CC-ED-03 ? 31 Durkheim spoke about issues which are real even today, the needs of different segments of society with respect to education, discipline in schools, the role of schools in preparing young people for society, the relationship of education to social change, cross- cultural research and the social system of school and classroom. Drawback of Durkheim's Functionalism Durkheim did not deal with some aspects of education such as the function of selection and allocation of adult roles, the gap between societal expectations of schools and actual school performance. It does not adequately explain how social change occurs. Furthermore, dysfunctions may continue, even though they don't perform or act according to their expected levels. Drawback of Structural Functionalism According to Sennet and Cobb, to believe that ability alone decides who is rewarded is to be deceived. Meighan agrees, stating that large numbers of capable students from working class backgrounds fail to achieve satisfactory standards in school and therefore fail to obtain the status they deserve. Jacob believes this is because the middle class cultural experiences that are provided at school may be contrary to the experiences working-class children receive at home. In other words, working class children are not adequately prepared to cope at school. They are therefore culled out from school with the least qualifications, hence they get the least desirable jobs, and so remain working class. Sergeant confirms this cycle, arguing that schooling supports continuity, which in turn supports social order. Criticism of Functionalism Functionalism fails to recognize the number of divergent interests, ideologies and conflicting interest groups in society. In heterogeneous societies each sub-group may have its own agenda to further its own interests. It is difficult to analyze individual interactions such as classroom dynamics of teacher- student or student-student interactions from this perspective. It does not deal with the content of the educational process- what is taught and how it is taught.

NSOU ? CC-ED-03 ? 32 Individuals do not merely carry out roles within the structure, they create and modify them. 2.5 Sociological Assumptions Structural Functionalism is a sociological theory that explains why society functions the way it does by emphasizing on the relationships between the various social institutions that make up society (e.g., government, law, education, religion, etc). The structural-functional approach is a perspective in sociology that sees society as a complex system whose parts work together to promote solidarity and stability. It asserts that our lives are guided by social structures, which are relatively stable patterns of social behavior. Social structures give shape to our lives - for example, in families, the community, and through religious organizations. And certain rituals, such as a handshake or complex religious ceremonies, give structure to our everyday lives. Each social structure has social functions, or consequences for the operation of society as a whole. Education, for example, has several important functions in a society, such as socialization, learning. Functionalism also states that society is like an organism, made up of different parts that work together. Thus one of the key ideas in Structural Functionalism is that society is made-up of groups or institutions, which are cohesive, share common norms, and have a definitive culture. Assumptions There are a number of key assumptions in Structural Functionalist theory. Structural Functionalists look at institutions individually as though they are divorced from other institutions. This is a mistake, as institutions are interlinked in society and those employing a structural functionalist approach should be taken into consideration the network of relationships that exist between these institutions. The key Assumptions of the structural functionalist theory are discussed below- 2.5.1 Social cohesion Social cohesion describes the bonds that bring people together in a society, it refers to the extent of connectedness and solidity among groups. It identifies two main dimensions ? The sense of belonging to a community ? The relationships among the members of community In order for groups to be cohesive in a social context, positive membership attitudes NSOU ? CC-ED-03 ? 33 and behaviors have to be produced and maintained. Social cohesion can be looked at both an individual and group level. Individual-levels include an individual's desire or intention to remain a part of a group, her attitudes and beliefs about the group, the individuals' intention to sever, weaken, maintain, or strengthen her membership or participation in a group, and her susceptibility to group influence. Social cohesion at a group level is directly affected by the individual members. 2.5.2 Social inequality Social inequality refers to any scenario in which individuals in a society do not have equal social status. It is characterized by the existence of unequal opportunities and rewards for different social positions or status within a group or society. Areas of potential inequality include voting rights, freedom of speech and assembly, the extent of property rights and access to education, health care, quality housing and other social goods. Social inequality is an important characteristic of Structural Functionalism as the theory assumes, since inequality exists, there needs to be a certain level of inequality in order for a society to operate. One possible function of inequality is to motivate people, as people are motivated to carry out work through a rewards system. Rewards may include income, status, prestige, or power. Gender inequality offers a good illustration. According to Structural Functionalist perspective, women being subordinate to men, allows the wage-earners to function smoothly as everyone in the society knows his or her respective position in the hierarchy. The implication is that, because society is functioning smoothly with gender stratification, such stratification is acceptable and efforts should not be made to change the arrangement. This example illustrates that Structural Functionalism is generally seen as being supportive of the status quo. 2.5.3 Interdependence Interdependence is a central theme in structural functionalism; it refers to the parts of society sharing a common set of principles. Institutions, organizations, and individuals are all interdependent with one another. 2.5.4 Equilibrium and Role of Education Another key characteristic of Structural Functionalism is that it views society as constantly striving to be at a state of equilibrium, which suggests there is an inherent drive within human societies to cohere or stick together. This is known as the cohesion issue.

NSOU ? CC-ED-03 ? 34 Societies strive toward equilibrium, not through dictatorial mandate by the leaders of society but rather because the social structure of societies encourages equilibrium. Structural Functionalism does much to explain why certain aspects of society continue as they always have, despite some phenomena being clearly less beneficial for society as a whole (e.g., Jim Crow laws). However, Structural Functionalism falls short in explaining opposition to social institutions and social structure by those being oppressed. Fig. : General Diagram of Structural-Functionalism.png - Source : Wikimedia Commons 2.6 Summary In this unit, we have discussed about sociology as the foundation of educational studies and curriculum and Teaching methodologies depend on sociology. We have learnt about education as a process of socialization and also about the structuralism and functionalism approaches of sociology. This unit has tried to explain the sociological assumptions, social cohesion, social inequality, interdependence in Structural Factionalism.

NSOU ? CC-ED-03 ? 35 2.7 Self-Assessment Questions 1. Define education as a process of social change? 2. State the relation between education and sociology? 3. Do you think if we don't get educated, social change can happen? 4. Write the difference between structuralism and functionalism? 5. Name any two agents of socialization. 6. State any one function of education according to Durkheim. 7. What is social cohesion? 8. What is social inequality? 9. Define social interdependence. 10. Which one, according to you is the best approach to understand the individual and group behavior within society? 11. Do you think that there is any linkage between society and education? 2.8 References Aggarwal, J.C. (2002). Theory and principles of education(13th ed.). New Delhi: Vikash Publishing House. After going through this unit, you will be able to - ?

acquaint with the concept and characteristics of social Group; ? discuss the types of Social Group; ? explain the concept and process of of socialization.

NSOU ? CC-ED-03 ? 37 3.2 Introduction In unit one and two, we provided you a detailed understanding of the concept, nature, scope and approaches of sociology. In this unit we shall study the concept and characteristics of Social groups, the types of Social group. This unit also throws light on the socialization process and the role of family and school. When a baby takes birth, he/she becomes the member of a family and takes identity from the family. But the baby is not confined to the family throughout its life. He/she goes out of the family and shares the experiences of the people in the world outside. Man is a social animal; he is not only a member of the family. The Greek philosopher Aristotle said that Man is a social animal. He who does not live in society is either as a beast or as an angel. Man live in the society by maintaining and following some social relationships. Society starts with and for the people. The members of the society interact and establish relationship with the other member of the society to keep the society alive. These relationships and interactions in the society between and among the members take place through some forms. These forms are named as social group. Every individual belongs to one or the other group. His behavior pattern is influenced by the functioning of the group to a great extent. The study of group has, hence, achieved great significance these days. The process of socialization is another aspect in this unit. A child becomes the member of the society by the process of socialization. Socialization is the process by which the new generation learns the knowledge, attitudes and values that they will need as productive citizens. Socialization is the process by which an individual becomes a recognized, cooperative and able member through his interaction with social environment. Socialization is a process through which an individual learn kind of behavior, values and other's expectations. In details about social group along with the concept of socialization will be discussed in this unit 3.3 Social Group 3.3.1 Concept of Social Group Groups are the salient feature of the complex social set up. We know that society is composed of people. When the members of the society make "contact" and "communicate" directly or indirectly with the other members of the society, it takes the form of Social Group. These groups of the society are considered as the social group when the members

NSOU ? CC-ED-03 ? 38 stimulate and respond to one another in a meaningful way. Men everywhere live in group. The life of man is to an enormous extent a group life. Social groups are the essential part of our social arrangement. Social group is the collection of people who interact with one another directly or indirectly. We should remember that mere congregation of people in physical area does not form social group unless the member contact and communicate with others. Social relationship in the form of social contact and communication are the essential feature of social groups. Social groups are established to realize some common interest of the group. Let us know about few definitions of group. Definition of Social Group: To be clear about the concept of Social Group, we can go through the various definitions given by some eminent sociologists- Ogburn and Nimkoff, "Whenever two or more individuals come together and influence one another, they may be said to constitute a social group." Sheriff and sheriff, "A group is social unit which consists of number of individuals who stand in (more or less) definite status and role relationship to one another which possess a set of values or norms of its own regulating the behavior of individual members at least in matters of consequence to the group." Harry M Johnson, "A social group is a system of social interaction." William: "A social group is a given aggregate of people playing inter-related roles and recognized by themselves or others as a unit of inter-action." R. M .MacIver and Page, "Social group is any collection of human beings who are brought into human relationships with one another." The above definitions help us to get a clear concept of social group. 3.3.2 Characteristics of Social Group The following features are reflected in the Social Groups. Without these, the groups lack the social significance. Collection of individual: Social groups are the collection of individuals; without individual, there can be no group. Thus, collection of people is the most significant feature of social group.

NSOU ? CC-ED-03 ? 39 Inter-relation of members: Without interaction and interrelation, mere collection of members cannot be considered as social group. To be a social group, members must interact among themselves. Feeling of unity: Another essential characteristic of social group is the feeling of unity. This feeling develops a sense of sympathy and co-operation among the members. Mutual awareness: In social group, members are aware of the other members' interest, need and expectation. Common purpose: The most significant feature of social group is common purpose. Each social group is established with a common objective in view and the members work for its realization. Common behaviour: The members of the group behave in a more or less similar way. Collective behaviour is the feature of social group. Organization: A social group is always organized. It cannot remain unorganized. Group norms/standards: As the social groups are organized groups, they are determined by some norms which the members have to observe. Control over members: The groups have control over the members so that the norms of the group are not unobserved and destroyed. Size of the group: Variation in size is another feature of social group. Every group involves an idea of size. A group may be small, consisting of two people or large, consisting of lakhs of members. Duration: The stability or duration of the social groups varies from each other. Some groups are temporary unstable but some groups are stable like family.

NSOU ? CC-ED-03 ? 40 Changeability: The social groups are dynamic in nature, adaptable to changes. Old members die, new members are born. They are subject to change. 3.3.3 Social Group and Role of Education Social group provides requirement to the needy people belonging to this community. The satisfaction of this need plays a pivotal role and works as a force among individuals and unites them in the social groups. Society has divided people into different groups according to their needs and interests. These groups have reciprocal role in the society. They help one another and satisfy the need of the society and its people. The function of the institution depends upon the groups of people working in them. Education plays a vital role in regulating individual behaviour through transmitting a way of life and communicating ideas and values to the new generation. One way that education contributes to the regulation of society conducts as well as on the other side, it transmit its social heritage and helps to survive the social order by preparing the younger ones for their adult roles to maintain the society. Through the process of education society regulates the behaviour of social groups and enforces conformity to its norms. 3.4 Types of Social group Man's life is a group life to a large extent. If a person lives in society, he typically is also a member of a number of groups which may themselves be considered as existing in a society. A group is a number of people involved in a pattern of association with one another. Typical groups are a clique of friends, a political party, and a sports club. Two or more persons in interaction constitute a social group. It has common aim. In its strict sense, group is a collection of people interacting together in an orderly way on the basis of shared expectations about each other's behavior. As a result of this interaction, the members of a group feel a common sense of belonging. The key to the nature of human grouping is the notion of association. Groups are created and maintained because they enable individual members to attain certain goals or interests which they hold in common. Our social behavior and personalities are shaped by the groups to which we belong. Throughout his life, individual is a member of various groups, some are chosen by him, others are assigned to him at birth. Groups constitute the complex pattern of the 'social structure'. Groups are a part of society.

NSOU ? CC-ED-03 ? 41 Two or more persons in interaction constitute a social group. It has common aim. In its strict sense, group is a collection of people interacting together in an orderly way on the basis of shared expectations about each other's behaviour. As a result of this interaction, the members of a group, feel a common sense of belonging. A group is a collection of individuals but all collectivizes do not constitute a social group. A group is distinct from an aggregate (people waiting at railway station or bus stand) member of which do not interact with one another. The essence of the social group is not physical closeness or contact between the individuals but a consciousness of joint interaction. This consciousness of interaction may be present even there is no personal contact between individuals. For example, we are members of a national group and think ourselves as nationals even though we are acquainted with only few people. "A social group, remarks Williams, "is a given aggregate of people playing interrelated roles and recognized by themselves or others as a unit of interaction. The Sociological conception of group has come to mean as indicated by Mckee, " a plurality of people as actors involved in a pattern of social interaction, conscious of sharing common understanding and of accepting some rights and obligations that accrue only to members. According to Green, "A group is an aggregate of individuals which persist in time, which has one or more interests and activities in common and which is organized." According to MacIver and Page "Any collection of human beings who are brought into social relationship with one another". Social relationships involve some degree of reciprocity and mutual awareness among the members of the group. Thus, a social group consists of such members as have reciprocal relations. The members are bound by a sense of unity. Their interest is common, behavior is similar. They are bound by the common consciousness of interaction. Viewed in this way, a family, a village, a nation, a political party or a trade union is a social group. In short, a group means a group of associated members, reciprocally interacting with one another. Viewed in this way, all old men between fifty and sixty or men belonging to a particular income level are regarded as ' aggregates' or 'quasi-groups'. They may become groups when they are in interaction with one another and have a common purpose. People belonging to a particular income level may constitute a social group when they consider themselves to be a distinct unit with special interest.

NSOU ? CC-ED-03 ? 42 There are large numbers of groups such as primary and secondary, voluntary and involuntary groups and so on. Sociologists have classified social groups on the basis of size, local distribution, permanence, degree of intimacy, type of organization and quality of social interaction etc. 3.4.1 Primary Group No two groups are created equal. Each typically has its own purpose, culture, norms, etc. Sociologists differentiate between several different types of social groups. Primary groups are those that are close-knit. They are typically small scale, include intimate relationships, and are usually long lasting. The members of primary groups feel a strong personal identity with the group. In that case, the nuclear family is considered the ideal primary group by some sociologists, it is not the only example. Many people are also a member of a group of close friends. This group is usually small, and the relationships are still close-knit and enduring, so it is also a primary group. The term 'primary' is used with these groups because they are the primary source of relationships and socialization. The relationships in our primary groups give us love, security, and companionship. We also learn values and norms from our family and friends that stay with us for most, if not all, of our lives. The concept of primary group was introduced by Charles Horton Cooley, in his book "Social Organization" published in 1909. Though Cooley has never used the term 'secondary group', but while discussing the groups other than those of primary, some sociologists like K. Davis, Ogburn and McIver have popularized other groups such as secondary groups. Hence, the classification of primary and secondary groups is made on the basis of the nature of social contact, the degree of intimacy, size and the degree of organization etc. The Primary group is the most simple and universal form of association. It is nucleus of all social organizations. It is a small group in which a small number of persons come into direct contact with one another. They meet "face to face" for mutual help, companionships and discussion of common questions. They live in the presence and thought of one another. The primary group is a small group in which the members live together. In the words of C.H. Cooley "By primary groups I mean those characterized by intimate face to face association and cooperation. They are primary, in several senses, but chiefly in that they are fundamental in framing the social nature and ideal, of the individual". Such groups in Cooley's phrase are "the nursery of human nature" where the essential Sentiments of group loyalty and concern for others could be learned. C.H. Cooley regards

NSOU ? CC-ED-03 ? 43 certain face-to-face associations or groups like the family, tribe, clan, play groups, the gossip groups, kinship groups, the community groups, etc, as primary groups. These groups are primary because they are always "first" from the point of view of time and importance. "It is the first and generally remains the chief focus of our social satisfactions". Characteristics of a Primary Group Primary Group possesses certain essential traits. The following are the characteristics of Primary group.

1. Closeness or Physical Proximity: Physical proximity or presence provides an opportunity for the development of intimate and close relations. In order that relations of the people may be close, it is necessary that their contacts also should be close. Seeing and talking with each other makes exchange of ideas and thoughts easy. It is because the members of primary group meet and talk frequently that a good feeling and a sense of identify develop among them quickly. Prof. K. Davis remarked that physical proximity or face-to-face relation is not indispensable for establishing close contact or intimacy. For example, we may have face-to-face relations with our barbers or laundrymen; there may not be intimacy or primary group relationship with them. On the other hand, we may establish contact with our close friends through the correspondence of letter even though we may not have seen for many years. Relationships among primary group members are based on intimacy not on contractual obligations.
2. Smallness: Primary groups are smaller in size. The smaller the size of the group, the greater will be the intimacy among its members. Relationship can be intimate and personal only in a small group. It is a fact that intimacy declines as the size of the group increases. The limited size of the group facilitates the participation of all its members in its common activity. Better understanding and fellow feeling among the members can be possible only when the group is small in size.
3. Durability: Primary group is relatively, a permanent group. Intimacy between the members becomes deeper because they meet frequently and are closely associated with one another. The longer is the duration of the acquaintance, the greater the intimacy. All the members of the

NSOU ? CC-ED-03 ? 44 primary group try to fulfill the condition of continuity or durability of relationship.

4. Identity of Ends: Members of a primary group have similar attitudes, desires and objectives. They all work together for the fulfillment of their common end. Every member tries to promote the common welfare of his group. The experiences, pain and pleasure, success and failure, prosperity and adversity of an individual member is shared by all the members of the group. The interests of one are the same as the interests of other. Kingsley Davis has rightly remarked "the child's needs become the mother's ends". Such a complete and mutual identity of ends is seldom found.
5. Relationship is an end in itself: The Primary relationship is regarded not as a means to an end but rather as an end itself. If the people make friends for specific purpose or means, we cannot regard their friendship as genuine. A genuine friendship or true love is not formed for a purpose. It is above the consideration of any selfish interest or interests. Friendship is a source of pleasure, it is intrinsically enjoyable. The primary relations are voluntary and spontaneous because they possess intrinsic value.
6. Relationship is Personal: The primary relationship is a matter of persons. It exists because of them and it is sustained by them. It should be noted that this relationship comes to an end as soon as one of the partners disappears from the primary group. The personal relationship is non transferable and irreplaceable. One individual cannot be substituted by another individual in the same relationship, for example, no one can take the place of our dead friend. The vacuum created by his death cannot be filled in, nor can anybody establish and continue the same kind of relationship with us after his death. If the particular person in whom our interest is centered disappears, the relationships also disappear. Such are the relationships between friends, husband and wife.
7. Relationship is Inclusive: In the primary group, we face our fellows as total human beings. A person comes to know his fellow in all the details of his life, as a whole being. A person in the primary group

NSOU ? CC-ED-03 ? 45 is not merely a legal entity, an economic cipher or a technological Cog. He is all of these, rolled into one. He is the complete concrete person. It is thus become clear that primary relationships are non-contractual, non-economic, non-political and non-specialized; they are personal, spontaneous, sentimental and inclusive.

Importance of Primary Group: The primary group is considered to be equally important both for the individual and society. **Individual point of view:** The primary group plays a commanding role in the development of human personality. It is fundamental in forming the social nature and ideal of the individual. It is regarded as a nursery of human nature. The development of "self" - the core of personality depends on close, intimate and personal contacts. It is in the primary group - the family - that the individual in his formative stages identifies him with others and takes over their attitudes. In the family the child acquires all his fundamental habits-those of his bodily care, of speech, of obedience or disobedience, of right or wrong, of sympathy, of love and affection. Similarly, in the primary group - the play group, the child learns to give and take with other children. The play group affords him early training in meeting his equals, learning to cooperate, to compete and to struggle. The primary groups, such as family or the play group, are pre-eminently the agencies of socialization. That is why the family is often said to be the foundation of society and the play group, the best school for the future citizen. The primary groups not only satisfy the human needs but also provide a stimulus to each of its members in the pursuit of interest. The face-to-face association-ship or the close physical presence of others acts as a stimulus to each. One feels that he is not alone pursuing the interest but there are many others who along with him are devoted to the same pursuit. "Through participation of all, the interest gains a new objectivity". This feeling stimulates one to keener efforts, by enlarging and enriching the character of the interest. **Societal point of view:** Primary groups are important not only from the individual's point of view, they are equally important from societal point of view. Primary group acts as an agency of social control. It not only provides security to the members but also controls their behaviour and regulates their relations.

NSOU ? CC-ED-03 ? 46 The primary groups, such as the family or the play group, are pre-eminently the agencies of socialization. They transmit culture and in this respect they are irreplaceable. They help the individuals to acquire basic attitudes towards people, social institutions and the world around him. The attitude of kindness, sympathy, love, tolerance, mutual help and sacrifice which provide the cementing force to social structure are developed in the primary groups. From such experiences and attitudes spring the desire for democracy and freedom. The members are taught by the primary groups to work in the society according to their roles with efficiency. In this way, primary groups run the society smoothly and maintain its solidarity. "It is the first and generally remains the chief focus of our social satisfactions."

3.4.2 Secondary Group The Secondary groups are of special significance in modern industrial society. They have become almost inevitable today. Their appearance is mainly due to the growing cultural complexity. Secondary groups may be defined as those associations which are characterized by impersonal or secondary relations and specialization of functions. K. Davis says that "The secondary groups can be roughly defined as the opposite of everything already said about primary groups." They are also called "special interest groups" or "self-interest groups". The examples of secondary groups include a city, a nation, a political party, corporation, labor union, an army, a large crowd etc. These groups have no direct bearing on the members. Here members are too many and too scattered. Here human contacts are superficial, undefined and mechanical. Different sociologists have defined secondary group in different ways. Some of the important definitions are given below. According to C.H. Cooley, "Secondary groups are wholly lacking in intimacy of association and usually in most of the other primary and quasi-primary characteristics". As Ogburn and Nimkoff say, "The groups which provide experience lacking in intimacy are called secondary groups". According to Kingsley Davis, "Secondary groups can be roughly defined as the opposite of everything said about primary groups". Robert Bierstedt says, "Secondary groups are all those that they are not primary".

NSOU ? CC-ED-03 ? 47 Characteristics of a Secondary Group: The characteristics of secondary group are as follows: 1. Large in Size: Secondary groups are relatively large in size. These groups comprise a very large number of persons. For example, a political party, a trade union, international associations, such as Rotary Club, Lions Club, the Red cross Society which consists of thousands of members scattered all over the world. 2. Formality: The relations of members in a secondary group are of a formal type. It does not exercise primary influence over its members. Secondary groups exert influence on the members indirectly. They are controlled by formal rules and regulations. Informal means of social control are less effective in regulating the relation of members. Formal social controls such as law, legislation, police, court etc. are very much important for the members. Moral control is only secondary. A formal authority is set up with designated powers in secondary groups. Here man is a legal and not a human entity. 3. Impersonality: Secondary relations are impersonal in nature. In the large scale organization, there are contacts and they may be face-to-face, but they are, as says K. Davis, of "the touch and go variety." Here contacts are chiefly indirect. The two persons may never see each other. Relations among them are impersonal, because members are not very much interested in other members as 'persons'. They are more concerned with their self-centered goals than with other persons. There is no sentiment attaching to the contacts. It is not required that the parties know each other. For example, in the large scale factory organization, the members are known to each other as the boss, the foreman, skilled workers, ordinary workers etc. The secondary relations are viewed as a means to an end and not an end in itself. 4. Indirect Cooperation: Indirect cooperation is another characteristic of secondary groups. In it, members do different things interdependently. All contributes to the same result, but not in the same process. They do unlike things together. In the large scale organization where division of labour is complex, the members have not only different functions but different powers, different degrees of participation, different rights and obligations.

NSOU ? CC-ED-03 ? 48 5. Voluntary Membership: The membership of most of the secondary groups is not compulsory but voluntary. Individuals are at liberty to join or to go away from the groups. It is not essential to become the member of Rotary International or Red Cross Society. However, there are some secondary groups like nation or the State whose membership is almost involuntary. 6. Status Depends upon Role: In secondary groups the status or position of every member depends on his role. The determination of his status is not influenced by ascription or by his birth or personal qualities but by the achievement or the role he plays. For example, the status of the President in a trade union depends upon the role he plays in the union and not upon his birth. Importance of Secondary Group: The secondary groups occupy a dominant place in modern civilized and industrial societies. Where life is relatively simple or where the number of people is small, the face to face group may be sufficient for most purposes. But as the society expands demanding more and more division of labour and specialization of functions, the large-scale secondary groups become necessary. The small communities have now given way to large communities. In place of cottage industry we have now grant corporations employing thousands of people. Population has moved from the village to the city. The changing trends of modern society have swept away primary groups. Man now depends more on secondary groups for his needs. The child was formerly born in the warm atmosphere of the family, now he is born in the cold atmosphere of the hospital. The followings are the advantages of secondary groups: 1. Efficiency: The secondary group helps its member to improve their efficiency in their specific field of activity and in consequences, they become experts. The emphasis is on getting the job done. Sentiment, emotion is subordinated to achievement. A formal authority is set up with the responsibility of managing the organization efficiently. The secondary relationships are instrumental in accomplishing certain specific tasks. In this sense, they may be regarded as functional in character. 2. Wider Outlook: The secondary group broadens the outlook of its members. It accommodates a large

NSOU ? CC-ED-03 ? 49 number of individuals and localities which widens the outlook of its members. It is more universal in its judgment than the primary group. 3. Wider Opportunities: The secondary groups have opened channel of opportunities. A large number of professions and occupations are opening the way for specialized careers. Secondary groups provide a greater chance to develop individual talents. The talented individual cannot rise from an unknown background to the highest position in business, industry, civil and technical services. The functions of secondary groups are essential for our society if we wish to enjoy our current life styles. The people are becoming more and more dependent on these groups. The tremendous advances in material comfort and in life expectancy in modern world would be impossible without the rise of goal-directed secondary groups. Difference between Primary Group and Secondary Groups: It is important to mention here that dichotomy between primary and secondary' groups were perceived by Cooley but it was not elaborated by him. However, the following are the chief points of difference between the primary group and secondary group. 1. Size: A primary group is small in size as well as area. The membership is limited to a small area. It is not spread over the whole world. At the other end in a secondary group the membership is widespread. It may contain thousands of members scattered in different parts of the world as is the case with a corporation. 2. Physical Proximity: Primary groups are based on close contacts. People in these groups do not merely know one another and interact frequently. But they know one another well and have strong emotional ties. Secondary groups do not give its members feeling of close proximity that primary groups give. In primary group, one is concerned with the other person as a person, but as a functionary who is fitting a role. 3. Duration: Primary groups exist for a longer period. Relationships in primary group are permanent in nature. Secondary groups, on the other hand are based on temporary relationship. For example, members of a club frequently come and stay only for a few hours at a time. NSOU ? CC-ED-03 ? 50 4. Kinds of Cooperation: In a secondary group, the cooperation with the fellow members is direct. The members cooperate only to achieve the objective of the group. In a primary group, on the other hand, the members directly cooperate with each other participating in the same process. They sit together, discuss together and play together. 5. Types of Structures: Every secondary group is regulated by a set of formal rules. A formal authority is set up with designated powers and a clear cut division of labour in which the function of each is specified in relation to the function of all the rest fellows. The primary group is based on an informal structure. The members participate in the same process. No formal and detail rules are drafted. The structure is simple. 6. End in itself versus Means to an End: Primary groups are an end in themselves. Individuals enter into primary relations because such relations contribute to personal development, security and well-being. Secondary group on the other hand is goal oriented. Membership is for some limited and well-defined objective. For example, if marriage is done purely with an economic gain, it lacks warmth and quality which we think should go into marriage. On the other hand, members of the secondary group value extrinsic political, economic or other benefits of the relationship rather than relationship itself. 7. Position: In primary groups, the position or status of a person is fixed according to his birth, age and sex. But in secondary groups, the position of a person is determined by his roles. For example, in family, the position of father is based upon birth, whereas in a trade union the position of the president depends upon the roles he plays in the union. 8. Difference in Development of Personality: Primary group is concerned with the total aspects personality of a person and it develops his whole personality. Secondary group, on the other hand, is concerned with a particular aspect of personality and it develops only that aspect. In this way, the qualities live, love, sympathy, obligation, mutual help, and tolerance etc. flourish in primary groups, while secondary groups promote self-interest and individuality.

NSOU ? CC-ED-03 ? 51 9. Relationship: The relationship of members with each other in primary group is direct, intimate and personal. They meet face to face and develop direct contacts. A secondary group is based on impersonal relationships. It does not exercise a primary influence over its members because they do not live in presence and thought of one another. They perform their jobs, carry out the orders, pay their dues and contribute to the group interest, still may never see each other. Paul Landis Says, "Secondary groups are those that are relatively casual and impersonal in their relationships - Relationships in them are usually competitive rather than mutually helpful. People in primary group share their feelings, thoughts, fears and doubts without worrying that others will think less of them. On the other hand, in secondary group individual interact with part of their personality. There is a feeling of external constraints between members. The relations between a customer in a restaurant and a waiter are may be the example. Each member of a Secondary group is involved with only a segment of the other's lives and sometimes that segment is very small. The relations are unsentimental and limited in scope. 10. Social Control: The mode of recruitment to the primary group is formal. Therefore, formal means of social control are more effective. As members have closeness and greater intimacy, there is great control over a member. Neighborhood and family control is very complete control and the individual sometimes wishes to escape it by getting into more impersonal life of a larger setting such as a big city. Secondary group on the other hand, uses formal means of checking deviation of violation of norms. Formal agencies of social control are more effective as formal relations exist between the members. 3.4.3. Tertiary group Any group accepted as model or guide for shaping one's attitude, behavior and evaluations is called a tertiary group or reference group. For members of a particular group another group is a tertiary group if any of the following circumstances prevail— ? When members of the first group aspire membership in the second group, the second group becomes the tertiary group,

NSOU ? CC-ED-03 ? 52 ? When members of the first group strive to be like members of the second group, ? When the members of the first group derive some satisfaction from being unlike the members of the second group in some respect and even strive to maintain the difference between themselves and the members of the second group. 3.5 Socialization Process Concept: After taking birth the child engages himself in the fulfillment of animal needs. As he grows up, he undergoes changes according to the desires, recognitions, and ideals of his society. Adults are inspired with the ideals of the society. The child has to learn all these social processes, and then only he would achieve proper development of his personality. It is a lifelong process through which people learn the values and norms of a given society. According to Drever, "Socialization is a process by which the individual is adapted to his social environment (by attaining social conformity), and becomes a recognized, co-operating and efficient member of it." Definition: According to the anthropologists like Margaret Mead and Linton, socialization is the process of adopting the culture of any group. Under culture we include the traditions, attitudes, habits, knowledge, art and conventions of a group. According to Ross, socialization involves the development of a feeling and ability of companionship and intention of working together. According to Cook, as consequences of the process of socialization the child himself takes social responsibility and contributes in the development of the society. Process of Socialization: Among the various factors which play vital role in this process, the following are the prominent one - 1. Child Rearing: The upbringing of a child plays a significant role in the socialization of a child. As the way in which the parents bring up the child and as the atmosphere which is available to the child in his early childhood, accordingly the feelings and experiences develop in the child. Parents build cultures, norms, customs among their children through this process of socialization which in education termed as informal education.

NSOU ? CC-ED-03 ? 53 2. Sympathy: Like upbringing, sympathy also plays an important role in the socialization of a child. It may be noted that during infancy, a child is fully dependent on his family for the fulfillment of all his needs requirements. Not only the fulfillment of the needs enough, others should also show full and real sympathy with the child. It is sympathy which develops we- feeling in the child and he learns to discriminate between his real well-wishers and other members of society. He begins to love those persons more and more who behave with him sympathetically. 3. Co-operation: Society makes the child social. In other words, the co-operation of society plays an important part to socialize the child. As the child receives co-operation of others towards him, he also begins to extend his hearty co-operation towards other members of society. 4. Suggestion: Social suggestions powerfully influence the socialization of a child. It is natural fact that a child acts according to the suggestion received from his well-wishers. Thus, suggestion determines the direction of social behavior. 5. Identification: Sympathy, love and suggestion of parents, relations and well-wishers develop in the child a feeling of identification with others. Those who behave with the child sympathetically, the child considering them as his well-wishers, begins to act according to act according to their ideals, language and standard of living. 6. Imitation: The basic factor in socialization is the process of imitation. This is the most potent way of learning by a child. He imitates the behavior, impulses and feelings of his family members. In this way, learning by imitation is the most powerful means of socializing a child. 7. Social Teaching: Besides imitation, social teaching also influences the socialization of a child. It may be noted that social teaching takes place in the family, among friends and relations who guide the child in one way or the other.

NSOU ? CC-ED-03 ? 54

8. Reward and Punishment: Reward and punishment have a great influence on the socialization of a child. When a child behaves according to the ideals and belief of society, people appreciate and approve his behavior. On the contrary, when he does some anti-social act, he is criticized and condemned by society. This type of punishment weans the child away from unsocial activities leading towards proper socialization.

3.5.1 Role of Family in Socialization: Family is a fundamental social institution in society, the family, is considered the primary and most important agent of socialization. Family typically consists of a man and woman and their children or two or more people who usually reside in the same home and share same goals and values. Traditionally, in all societies, the family has always been seen as a social institution; that has the biggest impact on society. Everyone is born into some form of family, with the family taking the responsibility of nurturing, teaching the norms or accepted behaviors within the family structure and within society. Basically it may be say that the process of socialization begins for every one of us in the family. Here, the parental and particularly the maternal influence on the child are very great. The intimate relationship between the mother and the child has a great impact on the shaping of child's abilities and capacities. The parents are the first persons to introduce to the child the culture of his group. The child receives additional communications from his older siblings, i.e. brothers and sisters, who have gone through the same process - with certain differences due to birth order and to the number and sex of the siblings.

3.5.2. Role of School in Socialization: School is the essential part of the society. It works like the social organization because school. Provides an exposure to every individual and it prepares the students to learn social roles according to their capacities in the school. Every student passes most of the time of his day in school and this time is utilized to learn different social things. Every individual learns about social life, social norms and social believes in school. Hence, in the process of socialization school plays a very significant role. Most important function of school is preservation of culture and civilization: Every society has own customs, convention, traditions, norms, art, religion, which has inherited from ancient period, in this process of socialization school help us to hand over the cultural values and behavior patterns of the society to his young generation. In this process of socialization student acquire the knowledge of cultural values and different norms of the society. Through education students get knowledge of 3R's i.e. Reading, writing and arithmetic which help students to work skillfully in day to day life and live happily in the society. It is a only school education which convert these 3R's in to 7R's i.e. Reading, writing and arithmetic relationship, responsibilities, recreation and reorganization. Only through school education students make familiar about social responsibilities as social being. School provide democratic climate which helps student to acquire democratic norms. Students learn how to live with democratic norms and how to behave with each other which help in the process of socialization. School education is a process of living through continuous reconstruction of the individual which enable students to control his environment and fulfill possibilities. School encourages students to participate in various kinds of co-curricular activities; these activities help students to develop leadership among them. The school provides social environment before children by organizing community work, social service camp and social functions and annual functions, so that all the social norms and values namely sympathy, co- operation, tolerance, social awareness in them, thus school develops social dealing in all children. In the light of above discussion we can say that school has special significance in the socialization process. Whereas education is a continuous and dynamic process, which develops thinking and reasoning ,problem solving, skills, cultural values, democratic values, adjustment among the students to behave properly in the society, this shows that education as a process of socialization. In the light of this, Emile Durkheim, a French educational sociologist has explained the role of education in socialization of child as "Education is the influence exercised by adult generation on those that are not yet ready for social life. Its object is to arouse and to develop in the child a certain number of physical, intellectual and moral traits that are demanded of him by the society". More briefly education is a socialization of the young generation. Schools socialize children in several ways. First, students learn a formal curriculum, informally called the "three Rs": reading, writing, and arithmetic. This phase of their socialization is necessary for them to become productive members of their society. Second, because students interact every day at school with their peers, they ideally strengthen their social interaction skills. Third, they interact with authority figures, their teachers, who are not their parents. For children who have not had any pre-schooling, their teachers are often the first authority figures they have had other than their parents.

NSOU ? CC-ED-03 ? 56 The learning they gain in relating to these authority figures is yet another important component of their socialization. Functional theorists cite all these aspects of school socialization, but conflict theorists instead emphasize that schools in the United States also impart a hidden curriculum by socializing children to accept the cultural values of the society in which the schools are found. To be more specific, children learn primarily positive things about the country's past and present; they learn the importance of being neat, patient, and obedient; and they learn to compete for good grades and other rewards. In this manner, they learn to love their own country and not to recognize its faults, and they learn traits that prepare them for jobs and careers in future to be a productive citizen of the country. By transmitting the culture of the society - both material and non-material -- the education system ensures continuity of norms and values and the handing-on of skills. Social influences begin long before the start of formal education and goes on long after it. However, the education system remains central, for it is the means by which society consciously sets out to transmit values and norms to a new generation.

3.6 Summary A group becomes social when interaction interplays among its participants. Social interactions are the basic condition of social group. People walking in markets, in fairs, travelling in train are not social groups. The main reason is that there is no social interaction taking place among them. Two persons, one in Ahmedabad and the other in New York, having interactions on telephone forms it although they are far away from each other. Therefore social interaction is the basic condition of social groups. Social group is the foundation of society and culture. Man is also a product of group life. Most of the Anthropologists believe that humankind is a successful animal in this planet because of their living together on this earth. Man has always been dependent upon his fellow beings for defense, food and shelter. They mutually satisfied their various needs by cooperation among various people in society. This mutual help brought them into social contact with one another and the social group was formed. It was the real foundation of human society. On the basis of the frequencies of the contact, social groups may be categorized in various ways namely primary, secondary, formal and informal, in and out, reference, ethnic and tertiary etc. in this discourse the primary, secondary and tertiary groups will be discussed. This unit has been concerned with the concepts and changes. It has focused how social group operates and how socialization process influencing

NSOU ? CC-ED-03 ? 57 process in several ways at various levels. Our discussion was also focused the entire process of socialization.

3.7 Self-Assessment Questions 1. What is social group? 2. Write any two characteristics of social group? 3. What is the role of education towards social group? 4. What is primary group? 5. Write one characteristics of primary group. 6. State one example of primary group. 7. What is secondary group? 8. Write one characteristics of secondary group. 9. State one example of secondary group. 10. State one advantage of secondary group. 11. Write one difference between primary and secondary group. 12. What is tertiary group? 13. State anyone example of secondary group. 14. What is socialization? 15. Name any two agents of socialization? 16. What is the role of family in the process of socialization? 17. State role of school in socialization.

After going through this unit, you will be able to ?

state about G.S.Guhurye's and Radhakamal Mukherjee's contributions and approaches as Indian Social Thinkers ; ? describe about Durkheim and Cooley as the Western Social Thinkers ; ? elucidate theoretical paradigms of sociology.

NSOU ? CC-ED-03 ? 60 4.2 Introduction There is an old story of describing elephants by seven blind men who had not seen it and had any idea regarding that. Touching the trunk, someone said that it was like a serpent, touching the body, one narrated it as a wall, touching the tail someone perceived it as a long rope. Thus like the huge body of elephant, sociology is interpreted differently in different ideologies.

In describing Ghurye, two approaches may be approximated. First, one may divide the entire range of Ghurye's writing into a number of broad themes and analyze each of these items showing how Ghurye discussed the institutions and processes. As the following unit will reveal a thematic analysis of Ghurye's writing as an imperative necessity to assess him properly.

His

MATCHING BLOCK 6/51

W

major writings have been arranged thematically. Thus caste, tribes, family and kinship, culture and civilization, religious institution, social tensions etc have been separately analyzed in the body of this unit. An attempt has also been made to explain not only the thoughts of writing of Ghurye but also to make a critical assessment of them vis-à-vis contemporary sociological thinking and researches obviously, the present author tried to be as much as analytic as possible in accepting or confuting Ghurye's contributions. Secondly, the question whether Ghurye's writings can be divided into different phases is also relevant here. The question is important because Ghurye was a prolific writer and had written for more than sixty years. We know that there are writers who have changed their opinion and even approaches in different phases of their life. Hardel Laski, for example, possessed an acute, an analytical and receptive mind and one is to take into consideration the different phases of life in order to analyze his thoughts. 4.3

Indian Social Thinkers 4.3.1 G. S. Guhurye Biographical Sketch

74%

MATCHING BLOCK 8/51

SA Assignment Dr kale02.docx (D30266375)

Ghurye stands as the commander in the Indian Sociological frontiers. He has often been acclaimed as the 'father of Indian Sociology'. Ghurye was the first scholar, who had built up the entire first generation of Indian Sociologists in Post- independent period, almost single handedly. Ghurye backs the credits of being the founders of Indian Sociological Society and the Sociological Bulletin. Ghurye is often accredited as "Theoretical Pluralist" because he tried to study Indian Society and culture through multiple methods.

He relied

Ghurye was initially influenced by the diffusionist approach of Anthropology and later on he switched to the study of Indian

Social reality from Ontological and Anthropological perspective.

100%

MATCHING BLOCK 11/51

SA Sampat Kale.docx (D30266262)

Ghurye's Indological Approach hovers around the study of Indian Culture and Social Structure drawing its sustenance from sanskritic literature base. He

was more influenced by the writings of Indologists of Bhandarkar Institute of Bombay rather than the British writings established by Sir William Jones or Max Muller. So he is often said to be relying on indigenous Indology. Ghurye tried to make a judicious blending between the Indological and Sociological discipline.

94%

MATCHING BLOCK 12/51

SA Sampat Kale sir Assignment.pdf (D30263465)

Ghurye's "Caste and Race in India" tried to make a reconstruction of a very orthodox traditional and age old social institution of India i.e. Caste. In

this land mark work he made a long journey from the traditional textual interpretation of caste from sanskrit literature base to its modern social reality with changing function. According to Ghurye Sociology of India is not static, it emanates from the ancient India, travels through mediaval India and reaches Modern India. Ghurye realized that if an institution cannot be studied in those three distinct phases then we cannot make a claim that we have made a study in totality. Phrasal study of an institution makes a study fragmented and haphazard.

100%

MATCHING BLOCK 13/51

Caste in India Ghurye's understanding of caste is comparative, historical and Indological as well.

Unlike his contemporaries he doesn't glorify or condemn caste, rather

100%

MATCHING BLOCK 17/51

SA SYBA SOC PAPER - II.pdf (D111235031)

he considers caste as a product of Indian culture, changing with the passage of time.

Hence, it is a subject of sociological interest. Ghurye studies caste mostly as a diffusionist and a historian than as an Indologist.

100%

MATCHING BLOCK 18/51

SA sampat kale.docx (D30262031)

In his book "Caste and Race in India", he agrees with Sir Herbert Risley that caste is a product of race that comes to India along with Aryans.

100%**MATCHING BLOCK 19/51****SA** Sampat Kale sir Assignment.pdf (D30263465)

Ghurye considers it as unfortunate that caste system is mostly understood in terms of Brahminic domination. Caste has gone through the process of fusion and fission in different ways in Indian history.

During Vedic period caste was a product of race. Aryans distinguished themselves from non-Aryans just

84%**MATCHING BLOCK 20/51****SA** sampat kale.docx (D30262031)

in terms of color but subsequently different ethnic groups developed alliance/relationship with each other and Hindu culture and

values moved from Aryan community to non-Aryan communities. Aryans never introduced themselves as Brahmins or as a superior race as against

85%**MATCHING BLOCK 21/51****SA** sampat kale.docx (D30262031)

non- Brahmins. Aryan society itself practiced different kinds of occupations which were allocated to different individuals and families. On the basis of their occupation caste names were allocated to different groups. Therefore Aryans society had architects, peasants, warriors, artisans and

their society was highly disciplined, organized and progressive.

100%**MATCHING BLOCK 22/51****SA** Sampat Kale sir Assignment.pdf (D30263465)

Ghurye tells that it may be a matter of fact that caste evolved in India with the advent of Aryans, as their racial character was different from Indians. But at the same time there were different racial categories present in India prior to coming of the Aryans.

India was not the home land of one racial group. Aryans advent added one more race to the already existing ones. Caste was not a

95%**MATCHING BLOCK 23/51****SA** sampat kale.docx (D30262031)

hierarchical exploitative system. Aryans carried with them caste system which promoted discipline in their life giving them specialization over particular occupation. No caste was superior or inferior. Occupation change was

possible. Hence Aryans became highly specialized and indigenous. People looked forward to Aryans for progress. Therefore they started imbibing these elements into their life. Rulers were taught the virtues of Aryans by the Brahmins who glorified the Aryan culture. These mobile saints spread the embodiment of caste to non Aryans. Ghurye points out that caste was considered as

98%**MATCHING BLOCK 24/51****SA** Assignment, Indian Society.pdf (D30266641)

central to organized form of division of labor in Aryan society. When Aryans and indigenous communities developed interpersonal relationship through communication and warfare, the disciplined nature of Aryan society was appreciated by indigenous rulers who injected the elements of caste into their social life. In addition to that, priests, monasteries and travelers glorified the virtues of Aryan caste system. Hence the element of caste radiated from northern India to other parts of the country.

NSOU ? CC-ED-03 ? 63 Features of Caste:

95%**MATCHING BLOCK 25/51****SA** Assignment, Indian Society.pdf (D30266641)

Ghurye explained caste in India on the basis of six distinctive characteristics: ? Segmental division of society ? Hierarchy ? Civil and religious disabilities and privileges ? Lack of unrestricted choice of occupation ? Restriction on food, drinks and social intercourse ? Endogamy.

100%**MATCHING BLOCK 26/51****SA** Sampat Kale sir Assignment.pdf (D30263465)

Segmental division of the society: Segment is the compartmentalization of the population into groups. It is basically horizontal in character. It generates social grouping but not labelling.

The membership is ascribed in character, i.e. it is based on birth and flows from generation to generation. Based on the membership every member has fixed status, roles and tasks. According to the roles assigned they have to perform it. There are moral ethics, obligations and justification value behind these roles.

100%**MATCHING BLOCK 27/51****SA** Sampat Kale sir Assignment.pdf (D30263465)

Hierarchy: It is the second major characteristic of caste through which Hindu social organization and Indian Society penetrates. After the segmental divisions of the society, they are put in a pyramidal structure then it is called as hierarchy.

Certain cultural principles like purity and pollution, prioritization of certain group, preferences of the society, determine the positioning of the social segments in the hierarchy in layer. The layering of the segments is basically vertical in nature. This caste hierarchy is responsible for spelling out the access and prevention of caste and it becomes the primary consideration for role allocation, responsibility sharing and the imposition of restrictive rules. Hierarchy determines caste norms. According to Ghurye hierarchy becomes the major consideration for deciding all these aforesaid variables. It basically implies the Division of Labour. The entire gamut of activities in the society is divided into four types like religious, governance, maintenance and menial. Among all these activities the religious activities are given the highest position in society. Therefore Brahmin are given this responsibility. The second major activity is governance, NSOU ? CC-ED-03 ? 64 which implies for managing the state craft and defending the populace from external aggression. So it is accorded to Khatriyas. The managerial activities are fixed on Vaishyas, who have to generate sustenance for the society. And the menial activities though an integral part of the society, are given the least priority and accorded to the shudras. Thus it is the hierarchy that determines the roles. The higher the position in the hierarchy the greater is the role and higher is the responsibility. Hierarchy also determines the individual's access to life chances (education, health, nutrition) and life resources (wealth, power, property). The higher the position in caste hierarchy the easier becomes the access and vice-versa. The concept of distributing justice was never prevalent but was ever violated in caste system. It was not the productive contribution but the preferential caste position that determines the caste rights. Rights were never demanded in caste society but were preferentially imposed on certain caste. Prevalence was for higher caste and prevention was for the lower caste. Restrictive rules were hierarchically driven in character. Every caste had got its typical culture. It formulates its own rules to govern the activities, behavior, attitude, perception of its own members. Restrictive rules in general had its own inter-caste and intra-caste implications. Restrictive rules were more for the Shudras in terms of taboos set for them. Restrictive rules did not have rigor or figure in the middle of hierarchy like Khatriyas, Vaishyas but restrictive rules were again strengthened for the higher caste like Brahmin. Civil and religious disabilities: Civil and religious disabilities expressed the rigidity of the caste system.

100%**MATCHING BLOCK 28/51****SA** Sampat Kale sir Assignment.pdf (D30263465)

To Ghurye the general reflection of Hindu social life was observed and felt through such disabilities. The

disabilities were common to caste in different parts of the country but the caste groups included in it were not common, rather there are variations. Civil and religious disabilities basically came from

96%**MATCHING BLOCK 29/51****SA** Understanding the society.docx (D30262447)

the concept of purity and pollution. Disabilities were for impure and polluted caste and privileges were for pure/higher castes. Lack of unrestricted choice of occupation: The occupations

have been fixed by heredity.

100%**MATCHING BLOCK 30/51****SA** Sampat Kale sir Assignment.pdf (D30263465)

Generally they have not been allowed to change their traditional occupations.

Members of a caste maintain their supremacy and secrecy in their jobs and do not allow the other caste group to join in. The upper caste people like Brahmins are free to opt for study of religious books, while this cannot be done by other classes. The lower ranking activities like sweeping bathrooms, washing clothes, scavenging etc have been kept in untouchable category.

NSOU ? CC-ED-03 ? 65

91%**MATCHING BLOCK 31/51****SA** Sampat Kale sir Assignment.pdf (D30263465)

Restriction on food, drinks and social intercourse: Some rules have been imposed upon all caste people. Restriction on feeding and social intercourse is still prevalent in Indian society. There are two types of food i.e. Kachha (Raw) food and Pakka (cooked) food upon which certain restrictions are imposed with regard to sharing,

for example: ? Caste groups from whom twice born caste people can accept Kachha food; ? Caste group from whom twice born caste people can accept Pakka food; ? Caste groups from whom twice born caste people can accept water but no food; ? Caste groups from whom twice born caste people do not accept water or food and maintain distance.

100%**MATCHING BLOCK 36/51****SA** Sampat Kale sir Assignment.pdf (D30263465)

Endogamy: Indian caste system is also polarized due to endogamy being determined primarily by Caste. People can marry within caste only. To disobey the caste rule is not only treated as a crime but is also condemned as a sin. The caste panchayat not only denounces inter- caste marriages but also imposes severe punishment upon those who break these rules.

Tribes in India:

98%**MATCHING BLOCK 32/51****W**

Ghurye's works on the tribes were general as well as specific. He wrote a general book on Scheduled Tribes in which he dealt with the historical, administrative and social dimensions of Indian tribes. He also wrote on specific tribes such as the Kolis in Maharashtra. Ghurye presented his thesis on tribes at a time when a majority of the established anthropologists and administrators were of the opinion that the separate identity of the tribes is to be maintained at any cost. Ghurye, on the other hand, believed that most of the tribes have been Hinduized after a long period of contact with Hindus. He holds that it is futile to search for the separate identity of the tribes. They are nothing but the 'backward caste Hindus'. Their backwardness was due to their imperfect integration into Hindu society. The Santhals, Bhils, Gonds, etc., who live in South-Central India are its examples (Ghurye, 1963). There has been fierce debate between G.S. Ghurye and Verrier Elwin. Elwin in his book 'Loss of Nerve' said that tribals should be allowed to live in isolation, whereas Ghurye argued that tribals should be assimilated into Hindu castes. Thus, Ghurye holds the view that a grand historical process of merger between two

NSOU ? CC-ED-03 ? 66

100%

MATCHING BLOCK 33/51

W

communities has almost been completed. Consequently, tribes, now, may be regarded as 'backward Hindus'. The incorporation of Hindu values and norms into tribal life was a positive step in the process of development. The tribes in India had slowly absorbed certain Hindu values and style of life through contact with the Hindu social groups. Today, it is being considered

as

96%

MATCHING BLOCK 34/51

W

a part of Hindu society. Under Hindu influence, the tribes gave up liquor drinking, received education and improved their agriculture. In this context, Hindu voluntary organizations, such as Ramakrishna Mission and Arya Samaj, played a constructive role for the development of the tribes. In his later works of north-eastern tribes, Ghurye documented secessionist trends. He felt that unless these were held in check, the political unity of the country would be damaged. Ghurye presented a huge data on the thoughts, practices and habits of the tribes inhabiting the Central Indian region. He quoted extensively from various writings and reports to show that Kataris, Bhuiyas, Oraons, Khonds, Gonds, Korkus etc. have substantially adopted Hinduism as their religion. Ghurye suggested that the economic motivation behind the adoption of Hinduism is very strong among the tribes. They can come out of their tribal crafts and adopt a specialized type of occupation, which is in demand in society. Rural-Urbanization: Ghurye remained occupied all through his life with the idea of

rural urbanization

96%

MATCHING BLOCK 35/51

W

securing the advantages of urban life simultaneously with nature's greenery. Therefore, he discussed the process of rural-urbanization in India. He viewed that the urbanization in India was not a simple function of industrial growth. In India, the process of urbanization, at least till recent years, started from within the rural area itself. He traced Sanskrit texts and documents to illustrate the growth of urban centers from the need for market felt in a rural hinterland. Development of agriculture needed more and more markets to exchange the surplus in food grains. Consequently, in many rural regions, one part of a big village started functioning into a market. This led to a township, which in turn developed administrative, judicial and other institutions. In the past, urban centers were based on feudal patronage, which had demands for silk cloths, jewellery, metal artifacts, weapons etc. This led to the growth of urban centres such as Banaras, Kanchipuram, Jaipur, and Moradabad etc.

NSOU ? CC-ED-03 ? 67

98%

MATCHING BLOCK 37/51

W

In brief, it may be said that Ghurye's approach to 'rural-urbanization' reflected the indigenous source of urbanism. During colonial times, the growth of metropolitan centres altered the Indian life. The towns and cities were no longer the outlets for agricultural produce and handicrafts but they became the major manufacturing centres. These centres used rural areas for producing raw materials and turned into a market for selling industrial products. Thus, the metropolitan economy emerged to dominate the village economy. Therefore, the urbanization started making inroads into the rural hinterland in contrast to previous pattern. A large city or metropolis also functioned as the centre of culture of the territory encompassing it. For Ghurye, the large city with its big complexes of higher education, research, judiciary, health services, print and entertainment media is a cradle innovation that ultimately serves cultural growth. The functions of the city are to perform a culturally integrative role, to act as a point of focus and the centre of radiation of the major tenets of the age. Not any city, but large city or metropolis having an organic link with the life of the people of its region can do this work well. According to Ghurye, an urban planner must tackle the problems of: (1) sufficient supply of drinking water, (2) human congestion, (3) traffic congestion, (4) regulation of public vehicles, (5) insufficiency of railway transport in cities like Mumbai, (6) erosion of trees, (7) sound pollution, (8) indiscriminate tree felling, and (9) plight of the pedestrians. Culture and Civilization: There are two conflicting views about the growth and accumulation pattern of culture. One theory maintains that in any community culture grows quite independently of similar events happening elsewhere or predominantly with reference to local needs and local situation. The other group believes that culture grows by diffusion. A single invention or

NSOU ? CC-ED-03 ? 68

97%

MATCHING BLOCK 38/51

W

discovery is made at one place and ultimately this cultural trait diffuses throughout the world. Sir G.E. Smith was the most ardent advocate of the diffusion theory. In one of his papers, "The Disposal of Human Placenta", published in 1937, Ghurye examines the practices of human beings with regard to the disposal of discard of human body like first out hair, nail pairing, first fallen teeth and the after birth. The purpose of this paper is, as he says, to compare the methods of disposal of the human placenta in the different regions of the world to see if they shed any light on the problem of diffusion of culture. Culture diffusion is essentially an anthropological theory, which is concerned with the nature of culture contact operating principally among the preliminary people. According to Ghurye, culture constitutes the central or core element for understanding society and its evolution. In fact, culture is a totality involving the entire heritage of mankind. Ghurye's abiding interest was to analyse the course of cultural evolution and the nature of heritage which mankind has denied from the past. Culture relates to the realm of values. It is a matter of individual attainment of excellence and creativity. Ghurye had a strong faith in the power of man to preserve the best of his old culture, while creating from his own spirit of new culture. He was more concerned with the process of evolution of Hindu civilization, which was termed as a 'complex civilization'. And, Ghurye thought that for analyzing the dynamics of culture in such a long historical civilization the process of acculturation is more relevant than the process of diffusion. He thought that the challenging task of a sociologist is to analyze this complex acculturation process in India. According to him, India has been the home of many ethnic stocks and cultures from pre-historic times. In his analysis of caste, Ghurye referred to how caste system was developed by the Brahmins and how it spread to other sections of the population. The operation of the process of Hinduization also provided the general backdrop of his analysis of the tribal phenomenon. Ghurye was promoted by the belief that there is a "common heritage of modern civilization" and that civilization is a "collective endeavour of humanity". He held that behind the rise and fall of civilization, there has occurred a steady growth of culture. Cutting across the vicissitudes of civilization growth, there are certain values, which have been established as final. These values have been termed by Ghurye as the 'foundations of culture'.

He delineates five such values or foundations of culture. These are: 1. Religious consciousness 2. Conscience 3. Justice 4. Free pursuit of knowledge and free expression 5. Toleration According to Ghurye, "civilization is the sum total of social heritage projected on the social plane". It is also an attribute of the society. Different societies can be differentiated with reference to their

attainment. Ghurye made four general conclusions with regard to the nature of civilization: i. Firstly, as yet, there has been no society, which has been either completely civilized or very highly civilized. ii. Secondly, Ghurye believed in the law of continuous progress. iii. Thirdly, gradation of civilization is also correlated with the distribution of values. In a high civilization, the humanitarian and cultural values will be accepted by a wide cross-section of population. iv. Fourthly, every civilization, high or low, possesses some distinctive qualities. Sociology of Religion: Religion is fundamental to man. Man becomes conscious of some power beyond his comprehension almost at the dawn of civilization. This field has drawn the attention of sociologists like Weber (The Protestant Ethic and Spirit of Capitalism, 1930) and Durkheim (The Elementary Forms of Religious Life, 1915). Ghurye thought that religion is at the centre of the total cultural heritage of man. He gave the five foundations of culture as mentioned earlier in the description of culture and civilization, out of which 'religious consciousness' is most important. It moulds and directs the behaviour of man in society.

All these works reflect Ghurye's interest related to the sociology of religion. For example, in Gods and Men, Ghurye discussed the nature of the Hindu ideas of Godhead and the relations, if any, between the climate of an age and the type of Godhead favoured. NSOU ? CC-ED-03 ? 70 In Religious Consciousness, Ghurye analysed the three oldest human civilizations, viz., the Mesopotamian, the Egyptian and the Hindu, in their various aspects of mythological beliefs, speculation, cosmology, life after death, view of Godhead, temple architecture, etc. And, in the Indian Sadhus, Ghurye considered the genesis, development and organization of asceticism in Hindu religion and the role ascetics have played in the maintenance of Hindu society. Indian Sadhus: Indian Sadhus (1953 and 1964) is an excellent sociography of the various sects and religious centres established by the great Vedantic philosopher Sankaracharya and other notable religious figures. In this work, Ghurye highlighted the paradoxical nature of renunciation in India. A sadhu or sannyasin is supposed to be detached from all castes, norms and social conventions, etc. Strikingly enough, since the time of Sankaracharya, the Hindu society has more or less been guided by the sadhus. These sadhus were not the lonely hermits. Most of them belonged to monastic orders, which have distinctive traditions. The monastic organization in India was a product of Hinduism and Buddhism. The rise of Buddhism and Jainism marked the decline of individual ascetics like Viswamitra. Indian sadhus have acted as the arbiters of religious disputes, patronized learning of scriptures and the sacred lore and even defended religion against external attacks. National Unity and Integration: Ghurye had interest in contemporary Indian situations. As a sociologist, he had been extremely concerned with the concept of integration, the process of national unity in India, and the contemporary challenges to the situation. This concern became apparent even at the time he wrote Caste and Race in India in 1932 and The Aborigines-so-called-and their Future in 1943. However, this concern with the present 'disturbing trends' in Indian society has come back in a big way in the later writings of Ghurye (Pramanick, 1994). There are three books of Ghurye, known as his 'triology' in this field, which are relevant in this connection. These are 'Social Tensions in India' (1968), 'Whither India' (1974) and 'India Recreates Democracy' (1978). In these books he has developed a theoretical framework to explain unity at the social or cultural level. Ghurye held that though groups play an

93%

MATCHING BLOCK 42/51

W

role in society, this is true only up to a certain extent. NSOU ? CC-ED-03 ? 71 In modern society, there are five sources of danger for national unity coming as they do form a sense of excessive attachment with groups: (1) The Scheduled Castes (2) The Scheduled Tribes (3) The Backward Classes (4) The Muslims as religious minority groups (5) The linguistic minorities As we know, the main focus of Ghurye's writings was on culture. He thought that it is largely as a result of Brahminical endeavour that cultural unity in India has been built up. All the major institutions of Hindu society originated among the Brahmins and gradually they were accepted by other sections of the community. Though Ghurye called it process of acculturation, it was basically a one-way flow, in which the Brahminical ideas and institutions infiltrated among the

non-Brahmins.

92%

MATCHING BLOCK 43/51

W

It is the background of such an approach that Ghurye analyzed the problems and prospects of Indian unity in contemporary India. Ghurye's concept of cultural unity is new one and is not secular in orientation. He is concerned with India of 'Hindu culture' and used the terms 'Indian culture' and 'Hindu culture' synonymously. He was concerned with India,

and

provided an excellent normative base for maintaining social and political unity in the country. Hinduism had brought within its fold widely different groups in India. The various sects of Hinduism constitute vast mosaic holding together millions of people in different parts of India. First, he analyzed the normative structure of Hinduism, and the teaching of sacred religious texts such as the Vedas, the Upanishads, and the Brahmins etc., to show how they provided the common cultural foundation. Second, the role of such great Hindu thinkers as Panini, Patanjali, Tulsidas etc. has also been discussed by Ghurye. He blames the political leaders for this, because they followed a course of action, which was more or less exactly the one which should have been avoided but the foundation for this national cultural unity had been built and maintained by the Hindus for one hundred years. According to Ghurye, society is not just an aggregation of isolated individuals but that group life, which provides the bridge between the individual and society. NSOU ? CC-ED-03 ? 72 An individual acquires social attributes and is socializes through groups. This is the integrative function of groups in society. When groups perform the function efficiently, integration is achieved. Tensions in the process of this integration in India arise today because the various groups of people have failed to transient their narrow group loyalties. Religious and linguistic minorities are the most potential source of danger to the unity in modern India. Religion and linguistic groups are the prime areas which came disintegration to India's cohesion. Ghurye gave great importance to the role of language in the process of

nation-building

the view that the regional language has a symbolic integrational value of the region. The regional languages ensure the unity of territory at the local level and all efforts should be made to improve. 4.3.2

Radhakamal Mukerjee (1889-1968) Radhakamal Mukerjee was pioneer in the areas such as social ecology, interdisciplinary research and the social structure of values. We will first describe the biographical sketch and then discuss his central ideas. Biographical Sketch Radhakamal Mukerjee was born in 1889 in a large Bengali Brahmin family, in a small country town of West Bengal called Berhampur. He spent the first sixteen years of his life in this town. His father was the leader of the bar that is a lawyer and was an accomplished scholar with a great interest in history. Mukerjee, while describing his early years, says that his home was full of books on history, Literature, law and Sanskrit (Singh 1956: 3). The general atmosphere in which he grew up was scholarly. His elder brothers were always reading books from which he, being a child, was kept at a distance. His father used to have long meetings with clients throughout the day and long intellectual and religious discussions during the evening. The interior of the house where the ladies of the house presided, there were rituals, ceremonies and devotional songs. Mukerjee's early memories, which left an imprint on his mind, consisted of the picture of sorrow and misery of a large population devastated by famine in Madras and Orissa during the early years of the twentieth century. He was deeply moved by the pictures of human skeletons on the verge of starvation and death published in the newspapers. This was further deepened by the Bengal famine of 1942-43 which he had witnessed in Calcutta.

NSOU ? CC-ED-03 ? 73 He also vividly recalled the childhood experiences of Muharram processions, Durgapuja festivals, and so on. It was during the same period of his life that Bengal saw its socio- cultural and intellectual renaissance. In 1905 every city in Bengal was in a state of intellectual and political fervent. The partition of Bengal into East and West Bengal, introduced by Lord Curzon, led to a mass uprising against this event. Political meetings, street processions and singing parties, boycott of British goods and propagating swadeshi products introduced him to the mass movement of time. Mukerjee had his early education in Berhampur. He went to the Krishnath College in Berhampur. He got an academic scholarship in the leading educational institution in India, the Presidency College in Calcutta. He took his honours course in English and History in this college. Here he came in contact with such scholars as H.M. Percival, M.Ghosh , brother of Sri Aurobindo Ghosh and the linguist Harinath De. He admired these scholars very much. It was here that he read books by Comte, Herbert Spencer, Lester Ward, Hobhouse and Giddings, besides many others, from cover to cover. As you must be aware by now many of these scholars are the leading men of sociology in Europe and America. During this period of his life, Mukerjee launched himself into the area of adult education which remained his interest till the end. The country was going through a political and cultural upheaval during this period which, according to Mukerjee, completely changed the scale of values. This change was seen far more outside the Governmental institutions, taking the form of a literary and artistic renaissance. This renaissance slowly took the form of a mass movement. It was in order to help the process that Mukerjee started an Adult Evening School in 1906 in the slums of Mechaubazar of Calcutta. He wrote simple texts for adult education which sold in thousands. This school became a Community Centre and even the local physicians started taking interest in this movement of social education. They treated without charging any fee the adults and children of the slums (Singh 1956:). Mukerjee valued his early training in the discipline of History very much but "the face-to-face contact with misery, squalor and degradation in the slums of Calcutta" turned the focus of his interests towards the disciplines of Sociology and Economics. He wrote that there was a definite call in the country for the tasks and responsibilities of education of the masses, and that call could be answered by an Indian student best through the knowledge of the social sciences (Singh 1956: 5). Social sciences during Mukerjee's time in Calcutta University included the disciplines of Economics, Politics and Sociology at M.A. level. It was during this period that Mukerjee came in close association with Benoy Kumar Sarkar. Mukerjee and Sarkar shared the same flat and B.K. Sarkar was at that time Professor at Bengal National College, an institution which had given support to such leading thinkers of Bengal as Tagore and Aurobindo Ghosh. Mukerjee,

NSOU ? CC-ED-03 ? 74 like many other Indians of his time, was impressed by the fiery political speeches of Bipin Chandra Pal, one of the Congress extremists. But the main interest of Mukerjee was at that time educational rather than political. He and his friends called themselves "Ministers of the Poor" and dressed poorly, giving up western dresses like shirts, coats and shoes (Singh 1956:). In 1910 Mukerjee went back to his old college in Berhampur as a teacher in Economics. He says that this was the busiest period of his life and it was during this period that he wrote his early works in Economics, such as the Foundations of Indian Economics. His interest in social ecology and the study of regions also originated during this period. The Principal of his College, Rev. E.M. Wheeler, was deeply interested in the sciences, especially Botany. Therefore, the teachers, including Mukerjee, spent a lot of time collecting specimens of plants and insects of all kinds and studying them. This experience developed Mukerjee's interest in ecology and he became aware of its link with human community. At this time Mukerjee also became the editor of the renowned Bengali monthly, Upasana. He wrote for this monthly regularly and kept in touch with the literary development in Bengali literature. He was a voracious reader and his interest in literature was very deep. During 1915 when there were persecutions by the British Government, Mukerjee was once arrested for a day and all his adult schools were liquidated. The charges against him were that he was a "terrorist" or had sympathy with terrorism under the disguise of adult education. Thanks to his lawyer brother he was released very soon. He was offered a position in Lahore College in Punjab and he went there thus, nipping in bud any interest in politics. He went back to the University of Calcutta where Asutosh Mookerji had established in 1917 the Post- Graduate Council of Arts and Science. He stayed here for five years and taught Economics, Sociology and Political Philosophy. In 1921 he went to the University of Lucknow as Professor and Head of the Department of Economics and Sociology on the very day when the university started functioning (Singh 1956:). He introduced an integrated approach in Economics, Sociology and Anthropology in both research and teaching in Lucknow university. According to Mukerjee, using comparative methods in the study of social sciences in India, we must aim at the scientific study of the race and culture origins. In his intellectual career he was deeply influenced by three social thinkers. First was Professor Brajendra Nath Seal; second was Professor Patrick Geddes; and the third one was an old, intimate colleague who died early, Narendra Nath Sen Gupta. The first two, Prof. Seal and Prof. Geddes contributed to the establishment and development of sociology as a discipline in the Indian Universities. Mukerjee always consulted Seal in all his works. His stress on comparative method in cultural sciences was due to Seal's influence on his work. Patrick

NSOU ? CC-ED-03 ? 75 Geddes too, influenced Mukerjee's work on study of regions, ecology and population while Narendra Nath Sen Gupta helped generate Mukerjee's interest in Social Psychology. Besides these Indian thinkers there were many Western social thinkers with whom Mukerjee worked and who influenced his writings. Some of these were sociologists like, Edward Allsworth Ross, Robert Ezra Park of Chicago, Mckenzie and P. Sorokin. Most of these Americans sociologists were interested in the study of region, urban disorganisation, human ecology, social change and so on. The friendship and intellectual interaction with these sociologists stimulated Mukerjee's own efforts in social sciences to which he gave due credit (Singh 1956:). Mukerjee taught economics and sociology in Lucknow University for nearly thirty years. He also became the Vice-Chancellor and Director of the J.K. Institute of Sociology and Human Relation of the University. Mukherje wrote erudite volumes on several issues. The basic nature of his writings is the integration of the social sciences and he has been a path-finder in many fields. Many of his students and associates reflect this approach in their writings (Singh 1956: 3-20). He died in the year 1968 but his contributions have left a deep imprint on the students of sociology. Central Ideas In the Indian universities, the compartmentalization of disciplines has dominated the scene. Disciplines such as sociology, psychology and statistics have existed side by side in the same college or university but there has been very little interaction between them. In his teachings and writings, Mukerjee emphasized the need for mutual interaction between social sciences on the one hand and between social sciences and physical sciences on the other. For example, Indian economics, modeled on British economics, mostly neglected the traditional caste networks in indigenous business, handicrafts and banking. Economic development was mainly viewed as an extension of monetary economics or market phenomenon. The Western model in economics focused on the urban-industrial centres. Relationship between Economic and Social Behavior: In a country like India where many economic transactions take place within the framework of caste or tribe, the "market model" has a limited relevance. Mukerjee tried to show the relationship between traditional networks and economic exchange. The guilds and castes of India were operating in a non-competitive system. The rules of economic exchange were derived from the normative Hinduism, in other words, according to the norms of Hindu religion wherein interdependence between groups was emphasized. Hence, to understand rural India, the economic values should be analyzed with reference to social norms. Religious and/ or ethical constraints have always lent a direction to economic

NSOU ? CC-ED-03 ? 76 exchange. Values enter into the daily life of people and compel them to act in collectively sanctioned ways. For example, a hungry upper caste Hindu would not eat beef; likewise, an orthodox Muslim or Jew would not eat pork, however urgent may be the need for food. Therefore, it is wrong to always treat economic behavior as separate from social life or collectivity. Social Ecology: Social Ecology was another theme which preoccupied Mukerjee. He wrote a number of books on the theme. For him social ecology was a complex formulation in which a number of social sciences interacted. The geological, geographical and biological factors worked together to produce an ecological zone. In its turn, ecology is conditioned by social, economic or political factors. For example, in the past many Indian ecological regions were opened up for human settlement and agrarian development through political conquests. As there is a definite link between ecology and society the development of ecological zones must be seen in terms of a dynamic process: that is, challenge of the environment and response of the people who establish a settlement. Ecological balance is not a mechanical carving out of a territory and settling people thereon. Such an attempt weakens or destroys social fabric. For example, in building irrigation dams in India, very often people of the concerned locations are moved to new settlements. The lack of a proper perspective on involuntary resettlement and rehabilitation has often caused damage to social life of these people. In many parts of India, there is a traditional system of interdependence known as *jajmani* in the north or by its equivalents in other regions. If people are moved into other locations such arrangements abruptly come to an end. Only by planning suitable alternatives in advance, can this disruption be overcome. For example, the cooperatives can help people, in the absence of old social patterns of interdependence. Hence, social perspective is necessary for orderly and systematic transformation of India into an urban-industrial economy. According to Mukerjee, social ecology was the better alternative to the havoc caused by rapid industrialization. India, with its long history, was a storehouse of values. Therefore, in building a new India the planning must not be confined to immediate and concrete problems but must be directed towards value-based developments. As part of his interest in social ecology, Mukerjee developed the regional sociology. He argued for a better understanding of regional dimensions of national development. If the regions in modern India were developed so as to make them self-sufficient, then the nation as a whole would stand to benefit. Otherwise, some regions would dominate the rest resulting in a lopsided development. As India was a country of diverse regions, each with

NSOU ? CC-ED-03 ? 77 a distinctive ethno-history i.e. the history of its various ethnic groups, it was imperative to coordinate the developments schemes for maintaining ecological balance. In sum, he stood for a balance between economic growth and ecological fitness. In achieving this end, many skills, such as weaving, engraving etc., were inherited by caste groups in India. These crafts could be well incorporated into the modern cooperatives. In other words, the modernization of Indian society should not neglect its traditional economic networks. Incidentally, in the post-Independent India, the traditional crafts have been organized into handloom cooperatives, etc. in Tamil Nadu and other states. Likewise, the Khadi Gramodyog has also used the traditional skills for modern production. Plea for conservation of forests Mukerjee wrote extensively on the danger of deforestation. The cutting of trees subjects the soil to the fury of floods and reduces the fertility of soil. The topsoil which is washed away by floods or excess rainfall cannot be replenished. Therefore, the forest and woods of India was an ecological asset. His plea for conservation has been taken up at present by a number of activists, voluntary organizations such as Chipko and Apko, which focus on halting the destruction of trees. Mukerjee also referred to the danger of mono-cultivation that is, raising a single cash crop (such as cotton or sugarcane) to the detriment of rotation of crops. Such practices as deforestation and mono-cultivation disturbed the fragile ecosystem and gave rise to severe environmental problems. Every year some parts of India especially in the north suffer either from floods or from droughts. Of course, cyclones of the coastal regions are beyond human control, but the manmade disasters, such as the depletion of natural resources through deforestation can be slowed down or prevented. Mukerjee advocated the integration of village, town and nation into a single, broad-based developmental process. Urban development at the expense of the village should be kept in check. Agriculture should be diversified and industries decentralized. A more equitable distribution of wealth and resources, not only between sections of people but also between regions, would bring about a more balanced development. An Ameliorative Approach to Urban Social Problems Mukerjee was also interested in the ameliorative approach to the problems of working class. The industrialization in India, which has been taking place during the last several decades, succeeded in bringing together people from diverse regions and languages. But the living conditions of workers in the urban centers such as Mumbai, Kanpur, Kolkata and Chennai were adversely affected by slum life. In the early days of industrialization, urban slums gave rise to vices such as prostitution, gambling and crime. It was, therefore, necessary to bring about drastic changes

NSOU ? CC-ED-03 ? 78 in the lives of workers to improve their economic and moral conditions. Therefore, Mukerjee's analysis of the working class is relevant even for the present industrial organisation in India. Theory of Values as noted previously, Radhakamal Mukerjee had a sustained interest in the impact of values on human society. In the middle of the twentieth century, the notion of a value-free social science became dominant in academic circles both in the West and in India. Mukerjee held that a separation between "fact" and "value" was arbitrary. The facts and values could not be separated from each other in human interactions. Even a simple transaction like taking food, wearing dress or greeting others was a value based or normatively conditioned behavior. Each society has a distinctive culture and its values and norms guide the behavior. Therefore, the positivistic tradition of the West which (on the analogy of sciences) wanted to separate facts from values was not tenable to R.K. Mukerjee, especially in the study of a society like India. R.K. Mukerjee underlined two basic points in relation to values. Firstly, values are not limited only to religion or ethics. Economics, politics and law also give rise to values. In other words, human needs are transformed into social values and are internalized in the minds of members of society. Older civilizations such as India and China were stable. Hence, values were formed and organized into a hierarchy of higher and lower levels. Secondly, values are not a product of subjective or individualistic aspirations. They are objectively grounded in humankind's social aspirations and desires. In other words, values are both general and objective i.e., measurable by empirical methods. In general, the great civilizations of the world have subordinated instrumental or materialistic goals to intrinsic or spiritual goals. To sum up, there are three salient points in Mukherjee's theory of values. Firstly, values satisfy the basic impulses of men and women in an orderly fashion. This means that the selfish desires and interests are modified by collective living, wherein people give and take from each other. Secondly, values are generic in scope and include both individual and social responses and attitudes. This means that the values are shared by all through their symbolization. The national flag, for example, is a common symbol for all individuals and groups who constitute a nation. Thirdly, in spite of diversities of human society, some universal values are discernible. The major religions of humankind are repositories of these universal values and norms. A dynamic approach to society will aim at an adaptation of inherited values to the needs of contemporary times.

NSOU ? CC-ED-03 ? 79 Indian Culture and Civilization: Mukerjee also wrote extensively on Indian art and architecture, history and culture. Mukerjee (1964) believed that Asiatic art aimed at collective developments and wrote, "Art in Asia became the torch-bearer of social and spiritual upheavals for millionsOriental art is most intensely charged with community feeling and is thus chiefly responsible for the historical continuity of Oriental Cultures". In contrast, such artistic endeavour in the West had been dominated either by individualism or the feeling that art was an end in itself. This was just not conducive to either social solidarity or spiritual development. Indian art was embedded in social or ethical sphere. R.K. Mukerjee wrote "The myriad temples, stupas and viharas of India bear witness to the link between art and ethics, religious and social values. Art in India is an enduring component of people's interaction with each other which shows in concrete forms the active relationship between people's aspirations and their artistic creativity". Indian art was constantly associated with religion. In his historical study of India Mukerjee was impressed by the non-aggressive nature of Indian religions such as Hinduism, Jainism, and Buddhism. The remarkable quality of Indian religions was their insistence on ultimate truth rather than on a particular set of beliefs or rituals. The Indian influences spread to many countries not through war or conquest but through friendship and goodwill. Right from the time of Ashoka, the peaceful "colonisation" of Sri Lanka, Cambodia, Tibet, and other countries of Outer India took place. Indian art and religion enriched the local cultures and by doing so gave rise to a new culture. For example, even today, different styles of Ramayana, the Hindu religious epic, are performed in these countries and several others like Indonesia, Sumatra, Trinidad. Thus, there was the harmony between foreign and indigenous elements. In India itself, the Hindu legal texts such as Dharmasastra are flexible codes to accommodate the ethnic diversities of India. Correctly interpreted, these texts provide a framework of values and norms for the orderly living of diverse groups. Thus, art and religion in India have been tolerant of diverse forms and styles. Mukerjee's Concept of Universal Civilization: Mukerjee's general theory of society sought to explain the values of a universal civilization. He used the term "civilization" in an inclusive sense; culture was part of it. He proposed that human civilization should be studied on three inter-related levels. These are: i) Biological Evolution: The biological evolution of human beings has facilitated the rise and development of

NSOU ? CC-ED-03 ? 80 civilization. They have the capacity to change the environment as an active agent. The animals can only adapt to an environment; but human beings can mould it in different ways. The human beings, as a biological species, are capable of overcoming competition and conflict and attain cooperation (symbiosis). ii) Psycho-social Dimension: There is a psycho-social dimension. In social psychology the people are often depicted within the framework of race, ethnicity or nationhood. Human beings are seen as prisoners of little selves or egos, whose attitude is parochial or ethnocentric. On the contrary, human beings have the potentiality to overcome the narrow feelings and attain universalisation that is, to identify oneself with the larger collectivity such as one's nation or even as a member of the universe itself. In the process, common values help to subordinate the particularistic values to universal values. According to Mukerjee, ethical relativism which means that values vary from society to society) is not helpful in the present times; there is need for ethical universalism which affirms the unity of the humankind. In the new perspective, men and women become free moral agents who are capable of recognizing the common strands binding the humanity. They are no longer dictated by divisiveness or relativity. iii) Spiritual Dimension: In Mukerjee's views, the civilization has a spiritual dimension. Human beings are gradually scaling transcendental heights. That is, they are moving up to the ladder of spirituality by overcoming the constraints of biogenic and existential levels i.e. the physical and material limitations. In this endeavour, art, myth and religion provide the "impulsion" or the force to move upward. As the social sciences have hitherto ignored these cultural elements, they are incapable of providing a spiritual perspective. Incidentally, a similar observation was made by Karl Mannheim, a German sociologist, who wrote on sociology of culture. Mannheim noted that the Western social sciences had neglected cultural dimensions (arts, myths, symbols, etc.) under the rigid code of positivism or structural functionalism. This resulted in a lopsided view of social reality. According to Mukerjee, humankind's search for unity, wholeness and transcendence highlight the spirituality of civilization. In this respect, he commended the Indian and Chinese civilizations which had endured as stable entities since sixth century B.C. Their strength is derived from their universal myths and values which foster spiritual quest. Mukerjee noted with satisfaction that the search for universality was embodied in the Declaration of Human Rights by the United Nations Organization (U.N.O.) in the twentieth century. These rights upheld liberty and dignity of people, in whichever country they might be living. Mukerjee's emphasis on spirituality was

NSOU ? CC-ED-03 ? 81 not an escapist dream. He stated that human progress (in the ultimate sense) was possible only if glaring disparities of wealth and power between countries were reduced. So long as poverty persisted or political oppression continued, further integral evolution of mankind was not a practical proposition. The persisting human awareness of misery in the world had stimulated the search for universal values and norms. Some Important Works of Radhakamal Mukerjee Important works in sociology are: i) The Regional Balance of Man (1938) ii) Indian Working Class (1940) iii) The Social Structure of Values (1955) iv) Philosophy of Social Sciences (1960) v) Flowering of Indian Art (1964) 4.4 Western Social Thinkers 4.4.1 Emile Durkheim Sociology as a Discipline and Social Facts Emile Durkheim (1858-1917) is considered one of the "fathers" of sociology because of his effort to establish sociology as a discipline distinct from philosophy and psychology. This effort is evident in the two main themes that permeate Durkheim's work: the priority of the social over the individual and the idea that society can be studied scientifically. Durkheim's concept of social facts, in particular, differentiates sociology from philosophy and psychology. Social facts are the social structures and cultural norms and values that are external to, and coercive over, individuals. Social facts are not attached to any particular individual; nor are they reducible to individual consciousness. Thus, social facts can be studied empirically. According to Durkheim, two different types of social facts exist: material and immaterial. Durkheim was most interested in studying the latter, particularly morality, collective conscience, collective representation, and social currents. The Division of Labor: In this work Durkheim discussed how modern society is held together by a division of labour that makes individuals dependent upon one another because they specialized in different types of work. Durkheim is particularly concerned about how the division of labour changes the way that individuals feel they are part of society as a whole. Societies

NSOU ? CC-ED-03 ? 82 with little division of labour (i.e., where people are self-sufficient) are unified by mechanical solidarity; all people engage in similar tasks and thus have similar responsibilities, which builds a strong collective conscience. Modern society, however, is held together by organic solidarity (the differences between people), which weakens collective conscience. Durkheim studied these different types of solidarity through laws. A society with mechanical solidarity is characterized by repressive law, while a society with organic solidarity is characterized by restitutive law. Suicide Durkheim's goal to differentiate sociology from psychology is perhaps best seen in this work on how social facts can be used to explain suicide rates. This work is also important because of the historical comparative method that Durkheim uses to show that suicide rates vary across societies and over time. According to Durkheim, suicide cannot simply be explained by individual psychological problems-otherwise suicide rates would be static. Durkheim argues that two social facts, in particular, influence suicide rates: integration, or the strength of attachment people feel to society, and regulation, or the degree of external constraint on people. Durkheim distinguished between four types of suicide that correlate to these two social facts. Egoistic suicide is a result of a lack of integration; altruistic suicide is a result of too much integration; anomic suicide is a result of too little regulation; and fatalistic suicide is a result of too much regulation. *Elementary Forms of Religious Life*: This is perhaps Durkheim's most complex work, as he attempted to provide both a sociology of religion and a theory of knowledge. In this work, Durkheim studied primitive society to demonstrate that an enduring quality of all religions, even the most modern, is the differentiation between the sacred and the profane. The sacred is created through rituals, and what is deemed sacred is what morally binds individuals to society. This moral bond then becomes, according to Durkheim, a cognitive bond that shapes the categories we use to understand the social world. The development of religion is not simply based on the differentiation between the sacred and the profane, but also on religious beliefs, rituals, and the church. The latter two conditions are particularly important to Durkheim because they connect the individual to the social; individuals learn about the sacred and religious beliefs through participating in rituals and the church. The most primitive form of religion is totemism, which is connected to the least complex form of social organization, the clan. The totem is the actual representation of the

NSOU ? CC-ED-03 ? 83 clan-it is the material representation of the nonmaterial, collective morality of the clan. Totemism is important to Durkheim's theory of knowledge in that it is one of his categories of understanding: classification. Other categories of understanding include time, space, force, causality, and totality. These six categories may be abstract concepts, but they are all derived from social experiences, particularly rituals. Durkheim acknowledged that it is possible for moral and cognitive categories to change or be created new through what he called collective effervescence, or periods of great collective exaltation. *Cult of the Individual*: Although Durkheim focused much of his attention on the social, he did not dismiss the idea of individualism. Indeed, he believed that in modern society the individual has become sacred, and he called the modern form of collective conscience the cult of the individual. According to Durkheim, humans are constituted by two beings or selves: one is based on the isolated individuality of the body, and the other is based on the social. These two beings may be in a continual state of tension, and they are connected in that individuality develops as society develops. For example, it is only in modern society, characterized by the division of labour, that people even come to understand themselves as distinct individuals. Durkheim argued that individuality has both positive and negative consequences. Egoism, or the selfish pursuit of individual interests, is at odds with moral individualism, the ability to sacrifice self interest for the rights of all other individual human beings. *Moral Education and Social Reform*: Durkheim believed that society is the source of morality; therefore, he also believed that society could be reformed, especially through moral education. According to Durkheim, morality is composed of three elements: discipline, attachment, and autonomy. Discipline constrains egoistic impulses; attachment is the voluntary willingness to be committed to groups; and autonomy is individual responsibility. Education provides children with these three moral tools needed to function in society. Adults can also acquire these moral tools by NPTEL (A project funded by MHRD) Humanities and Social Sciences - Introduction to Sociology Joint initiative of IITs and IISc - Funded by MHRD Page 3 of 6 joining occupational associations. According to Durkheim, these associations would include members of a particular occupation regardless of class position and could provide a level of integration and regulation, both of which tend to be weakened by the division of labour. Criticisms: Durkheim is often criticized for being a functionalist and a positivist. However, his

NSOU ? CC-ED-03 ? 84 historical comparative methodology puts him at odds with functionalists and positivists who believe that invariant social laws exist that can explain social phenomenon across all societies. Durkheim does tend to emphasize the objective nature of social facts; thus, he neglects the subjective interpretations that social actors may have of a particular social phenomenon and the agency of individuals in general to control social forces. Furthermore, Durkheim's basic assumption about human nature - that people are driven by their passion for gratification that can never be satisfied is not empirically substantiated in any of his work. Finally, Durkheim's understanding of the relationship between morality and sociology has been critiqued as being conservative.

4.4.2 Cooley as Western Social Thinker Charles Horton Cooley (August 17, 1864 - May 7, 1929) Charles Horton Cooley was an American sociologist and the son of Michigan Supreme Court Judge Thomas M. Cooley. He studied and went on to teach economics and sociology at the University of Michigan, was a founding member of the American Sociological Association in 1905 and became its eighth president in 1918. He is perhaps best known for his concept of the looking-glass self, which is the concept that a person's self grows out of society's interpersonal interactions and the perceptions of others. Cooley's health began to deteriorate in 1928. He was diagnosed with an unidentified form of cancer in March 1929 and died two months later.

Charles Horton Cooley was born in Ann Arbor, Michigan, on August 17, 1864, to Mary Elizabeth Horton and Thomas M. Cooley. Thomas Cooley was the Supreme Court Judge for the state of Michigan, and he was one of the first three faculty members to found the University of Michigan Law School in 1859. He served as dean of the law school from 1859-1884. Cooley's mother, Mary, took an active interest in public affairs and traveled with her husband to several cities around the United States in relation to the Interstate Commerce Commission. His father was a very successful political figure that stressed the importance of education to his six children. Nevertheless, Cooley had a difficult childhood, which exacerbated his feelings of detachment towards his father. The intimidation and alienation he felt towards his own father caused him to suffer from a variety of illnesses for fifteen years during his adolescence, some appearing to be psychosomatic. He developed a speech impediment, among other insecurities, due to his lack of interaction with other children. Cooley was a daydreamer and much of his "dreaming-life" had a substantial influence to his sociological works. As a child, he dealt with feelings of isolation and

NSOU ? CC-ED-03 ? 85 loneliness, which led him to develop an interest in reading and writing. At the age of sixteen, Cooley began attending the University of Michigan. Chronic constipation negatively affected his life in college since it constantly distracted him from his studies. Due to his medical condition, Cooley graduated from the University of Michigan seven years later in 1887, and continued with a year's training in mechanical engineering. Cooley returned to pursue a master's degree in political science and sociology in 1890. Following completion, he began teaching economics and sociology at UMich in the fall of 1892. Cooley went on to receive a Ph.D. in philosophy in 1894. At this time he was interested in the subject matter of sociology, but due to the University of Michigan not having a sociology department, he had to continue the examination of his Ph.D. through Columbia University. There, Cooley worked closely alongside American sociologist and economist, Franklin Henry Giddings and developed his doctoral thesis, *The Theory of Transportation in economics*. Since his father was honored nationwide, Cooley feared the idea of failure. He lacked direction in life and contemplated science, mathematics, social science, psychology or sociology as his field of study. He wished to write and think, and after reading philosopher Herbert Spencer's works, Cooley realized he had an interest in social problems. He shared his reflections of the works of Spencer in 1920, citing that while he brought many valuable viewpoints with the subject of Darwinian principles, he lacks sympathy and the appropriate usage of the sociological perspective. Cooley decided that he wanted to study sociology because it gave him the ability to analyze social discrepancies. He taught the University of Michigan's very first sociology class in 1899. He also played a prominent role in the development of symbolic interactionism, in which he worked heavily with another fellow staff member from the University of Michigan, psychologist John Dewey. Family life Cooley married Elsie Jones in 1890, who was the daughter of a professor of medicine at the University of Michigan. Mrs. Cooley differed from her husband in that she was outgoing, energetic, and capable of ordering their common lives in such a manner that mundane cares were not to weigh heavily on her husband. The couple had three children, a boy, and two girls, and lived quietly and fairly withdrawn in a house close to the campus. The children served Cooley as his own domestic laboratory subjects for his study of genesis and growth of the self. He would observe imitation behavior in his three children

NSOU ? CC-ED-03 ? 86 and analyzed their reactions based on age. Even when he was not engaged in the observation of his own self and wished to observe others, he did not need to leave the domestic circle. Cooley also found pleasure in amateur botany and bird-watching in spare time away from his research. Theory Cooley's methodology Cooley is noted for his displeasure at the divisions within the sociological community over methodology. He preferred an empirical, observational approach. While he appreciated the use of statistics after working as a statistician in the Interstate Commerce Commission and Census Bureau, he preferred case studies: often using his own children as the subjects on his observation. He also encouraged sociologists to use the method of sympathetic introspection when attempting to understand the consciousness of an individual. Cooley thought that the only practical method is to study the actual situation "closely" and "kindly" with other people involved, then gradually work out the evil from the mixture and replace it with good. Basically, the only way to understand a grotesque human being is to identify how and why his human nature has come to work that way. He felt it was necessary in order to truly understand the activities taken from the actor, effectively separating Cooley from a majority of sociologists who preferred more traditional, scientific techniques. Theory on transportation and the shift to sociology Cooley's first major work, *The Theory of Transportation* (1894), was his doctoral dissertation on economic theory. In his thesis, he discussed industrial growth and expansion during the nineteenth century. This piece was notable for its conclusion that towns and cities tend to be located at the confluence of transportation routes-the so-called "break" in transportation. Cooley soon shifted to a broader analysis of the interplay of individual and social processes. In *Human Nature and the Social Order* (1902) he foreshadowed George Herbert Mead's discussion of the symbolic ground of the self by detailing the way in which an individual's active participation in society affects the emergence of normal social participation. Cooley greatly extended this conception of the "looking-glass self" (I am, who I think you think, that I am) in his next book, *Social Organization* (1909), in which he sketched a comprehensive approach to society and its major processes. Social organization The first sixty pages of the *Social Organization* (1909) were a sociological antidote to

NSOU ? CC-ED-03 ? 87 Sigmund Freud. In that much-quoted segment, Cooley formulated the crucial role of primary groups (family, playgroups and community of elders) as the source of one's morals, sentiments, and ideals. Primary groups are the first groups of individuals one is introduced to and are also influenced in their ideas and beliefs. They are the result of intimate association and corporation, along with coinciding ideals and values. He argued that individuals have two different channels of life- one from heredity and the other from society. Heredity is biological and predisposed; it is the human nature that people are born with. Society is the human nature that is expressed in primary groups that we can find in all civilizations. But the impact of a primary group is so great that individuals cling to shared beliefs in more complex associations, and even create new primary groupings within formal organizations. In the *Social Organization*, Cooley asked what made up a society? He focused on the relationship between the individual and the larger unity of the society. He viewed society and the individual as one since they cannot exist without one another: where society has a strong impact on individual behavior and vice versa. He also concluded that the more industrialized a society becomes, the more individualistic its inhabitants are. Cooley viewed society as a constant experiment in enlarging social experience and in coordinating variety. He, therefore, analyzed the operation of such complex social forms as formal institutions and social class systems and the subtle controls of public opinion. Class differences reflect different contributions to society, as well as the phenomena of aggrandizement (the increase of power or reputation of individuals and values) and exploitation. Cooley and social subjectivity Cooley's theories regarding social subjectivity were described in a threefold necessity that had developed within the realm of society. The first of which was the necessity to create an understanding of social phenomena that highlighted the subjective mental processes of individuals. Yet, Cooley realized that these subjective processes were both the causes and effects of society's processes. The second necessity examined the development of a social dynamic conception that portrayed states of chaos as natural occurrences which could provide opportunities for "adaptive innovation." Finally, a need to manifest publics that were capable of exerting some form of "informed moral control" over current problems and future directions. In regards to these aforementioned dilemmas, Cooley responded by stating "society and individual denote not separable phenomena but different aspects of the same thing, for a separate individual is an abstraction unknown to experience, and so likewise is society

NSOU ? CC-ED-03 ? 88 when regarded as something apart from individuals." From this, he resolved to create a "Mental-Social" Complex of which he would term the "looking-glass self." The looking-glass self is created through the imagination of how one's self might be viewed through the eyes of another individual. This would later be termed "empathic introspection." This theory not only applied to the individual, but to the macro-level economic issues of society and macro-sociological conditions that develop over time. To the economy, Cooley presented a divergent view from the norm, stating that "...even economic institutions could not be understood solely as a result of impersonal market forces." With regard to the sociological perspective and its relevancy toward traditions he states that the dissolution of traditions may be positive, thus creating "the sort of virtues, as well as of vices, that we find on the frontier: plain dealing, love of character and force, kindness, hope, hospitality and courage." He believed that sociology continues to contribute to the "growing efficiency of the intellectual processes that would enlighten the larger public will." The "looking-glass self" The "looking-glass self" is undoubtedly Cooley's most famous concept, and is widely known and accepted by psychologists and sociologists today. It expanded William James's idea of self to include the capacity of reflection on its own behavior. Other people's views build, change and maintain our self-image; thus, there is an interaction between how we see ourselves and how others see us. Through these interactions, human beings develop an idea of who they are. He argued that when we feel shame or pride, it is due to what we think others view us as. He also mentioned that we do not always perceive someone's impressions correctly. For example, if a student incorrectly answers a question in class, they might later question their own intelligence or capacity to prepare sufficiently. The notion of the looking-glass self applies throughout an individual's life: interactions with new people time and again encourage self-evaluation based on a presumed impression given off. In other words, one's self-identity can be socially constructed. In his 1902 work, 'Human Nature and the Social Order', Cooley defined this concept as: "... a somewhat definite imagination of how one's self-that is, any idea he appropriates-appears in a particular mind, and the kind of self-feeling one has is determined by the attitude toward this attributed to that other mind... So in imagination, we perceive in another's mind some thought of our appearance,

NSOU ? CC-ED-03 ? 89 manners, aims, deeds, character, friends, and so on, and are variously affected by it." Thus, the three stages observed in the looking-glass self are outlines as: ? You imagine how you appear to the other person. ? You imagine the judgment of the other person. ? You feel some sense of pride, happiness, guilt, or shame. A self-idea of this sort seems to have three principal elements: the imagination of our appearance to the other person; the imagination of his judgment of that appearance, and some sort of self-feeling, such as pride or mortification. Social process Cooley's Social Process (1918) emphasized the non-rational, tentative nature of social organization and the significance of social competition. Social Process was an essay-based work that expressed Cooley's social theories. It was more philosophical than sociological. He interpreted modern difficulties as the clash of primary group values (love, ambition, loyalty) and institutional values (impersonal ideologies such as progress or Protestantism) (See also The Protestant Ethic and the Spirit of Capitalism). As societies try to cope with their difficulties, they adjust these two kinds of values to one another as best they can. Cooley also mentioned the idea of heroes and hero worship. He believed that heroes were an aide or a servant to the internalization of social norms because they represent and serve as an example to reinforce social values. The Social Process was Cooley's last major work, heavily influenced by Darwinian principles of natural selection and adaptation to collective (social) existence. 4.5 Theoretical Paradigms of Sociology 4.5.1 Symbolic Interactionist Perspective Symbolic Interactionism: Symbolic Interactionism is a social theory that focuses on the analysis of the patterns of communication, interpretation and adjustment between individuals. The theory outlines the understandings on how individuals interact with one another and inside the society by attaching meanings to various symbols. Both the verbal and nonverbal responses that a listener listens then delivers are likewise built up in anticipation of how the original narrator will respond.

NSOU ? CC-ED-03 ? 90 Here we have tried— ? To provide the meaning and explanation of the theory of symbolic interactionism; ? To let the reader know about the various exponents of the theory; ? To provide the basic premises and approach of the theory; ? To provide the key ideas of the theory among the various schools of thought in the discipline of Sociology. Symbolic Interactionism elucidates social behavior in terms of interactions between the people through symbols and it also views that the viable way to understand social structures are through such individual interactions. During the 20th century, thinkers like George Herbert Mead and Herbert Blumer developed this school of thought. They believed that such social interactions help in the development of one's self and the manner in which people communicate and interact with each other relies on their interpretation of the factors such as actions, language and statuses etc. It could be best defined as a synthesis of intellectual thought and rational method with realistic actions. The ongoing process of Symbolic Interaction is like the game of charades; only it is a full-fledged conversation. Even though there are quite many editions of interactionism thought, some deriving from phenomenological writings by philosophers, the following description offers a basic merger of these thoughts, engaged in points of union. The term "symbolic interaction" refers, of course, to the peculiar and distinctive character of interaction as it takes place between human beings. The peculiarity consists in the fact that human beings interpret or "define" each other's actions instead of merely reacting to each other's actions. Their "response" is not made directly to the actions of one another but instead is based on the meaning which they attach to such actions. Thus, human interaction is mediated by the use of symbols, by interpretation, or by ascertaining the meaning of one another's actions. This mediation is equivalent to inserting a process of interpretation between stimulus and response in the case of human behavior. Historical Background Conceivably the most significant sociological standpoint from North America has been that of Symbolic Interactionism which traces its roots in the pragmatist philosophers such as Peirce, Dewey, Cooley, and Mead. This sociological perspective has a stretched academic account, commencing with the German sociologist and economist, Max Weber (1864-1920) and the American philosopher, George H. Mead (1863-1931), both of whom highlighted the subjective meaning of human behavior, the social process and pragmatism.

NSOU ? CC-ED-03 ? 91 The early proponents of the theory of Symbolic Interactionism were George Herbert Mead and Charles Horton Cooley. G. H. Mead opined that the accurate analysis of any theory lies in the fact that it should be helpful in cracking the other intricate social problems. The impact of Mead's analysis of the Symbolic Interactionism was said to be so commanding that other sociologists considered him as the one "true founder" of Symbolic Interactionism school of thought. The term Symbolic Interactionism was coined by Blumer in 1937. He kept this sociological viewpoint animate through the early 1950s at Chicago, and then in California where he was a professor at the University of California in Berkeley. Though Holton and Cohen argue that Blumer took only certain ideas from Mead, but it was Blumer who developed specific aspects that formed the basis for later symbolic interaction approaches. Two other theorists who have influenced Symbolic Interactionism theory are Yrjö Engeström and David Middleton. Engeström and Middleton explained the usefulness of symbolic interactionism in the communication field in a "variety of work setting including, courts of law, health care, computer software design, scientific laboratory, telephone sales, control, repair, and maintenance of advance manufacturing system. Other scholars credited for their contribution to the theory are Thomas, Park, James, Horton, Cooley, Znaniecki, Baldwin, Redfield, and Wirth. In addition, these focuses on interaction and on the connotation of events to the participants in those events (the definition of the situation) drift the concentration of interactionists away from steady norms and values toward more unstable and repeatedly readjusting social processes. While for the functionalists socialization generates solidity in the social system, for interactionists, on the other hand, negotiation among members of society creates momentary, socially constructed relations which linger in invariable fluctuation, despite relative stability in the fundamental framework governing those relations. These stresses on negotiated reality, symbols and the social construction of society lead to an interest in the roles people play. To sum up, the characteristics of the symbolic interaction point of view are prominence on interactions among people, application of symbols in communication and interaction, interpretation as a fraction of action, self as constructed by others through communication and interaction, and flexible and adaptable social processes. It is primarily concerned with the interaction patterns of day to day life and experiences, rather than the structures associated with large scale and relatively fixed social forces and laws. There are five central ideas to Symbolic Interactionism according to Joel M. Charon, author of Symbolic Interactionism. 1. The human being must be understood as a social person. It is the constant search for social interaction that leads us to do what we do. Instead of focusing on the

NSOU ? CC-ED-03 ? 92 individual and his or her personality, or on how the society or social situation causes human behavior, symbolic interactionism focuses on the activities that take place between actors. Interaction is the basic unit of study. Individuals are created through interaction; society too is created through social interaction. What we do depends on interaction with others earlier in our lifetimes, and it depends on our interaction right now. Social interaction is central to what we do. If we want to understand cause, focus on social interaction. 2. The human being must be understood as a thinking being. Human action is not only interaction among individuals but also interaction within the individual. It is not our ideas or attitudes or values that are as important as the constant active ongoing process of thinking. We are not simply conditioned, we are not simply beings who are influenced by those around us, we are not simply products of society. We are, to our very core, thinking animals, always conversing with ourselves as we interact with others. If we want to understand cause, focus on human thinking. 3. Humans do not sense their environment directly, instead, humans define the situation they are in. An environment may actually exist, but it is our definition of it that is important. Definition does not simply randomly happen; instead, it results from ongoing social interaction and thinking. 4. The cause of human action is the result of what is occurring in our present situation. Cause unfolds in the present social interaction, present thinking, and present definition. It is not society's encounters with us in our past, that causes action nor is it our own past experience that does. It is, instead, social interaction, thinking, definition of the situation that takes place in the present. Our past enters into our actions primarily because we think about it and apply it to the definition of the present situation. 5. Human beings are described as active beings in relation to their environment. Words such as conditioning, responding, controlled, imprisoned, and formed are not used to describe the human being in symbolic interaction. In contrast to other social-scientific perspectives humans are not thought of as being passive in relation to their surroundings, but actively involved in what they do. 4.5.2 Functionalist Perspective The functional perspective has considered society as a complex system whose components work together to promote sustainable growth and stability. It is a micro level

NSOU ? CC-ED-03 ? 93 orientation which focuses on social structure as well as social functions. Functionalism addresses society in terms of function of its constituent components such as : norms, cultures, traditions, castes, creeds and institutions. Herbert spencer presents these parts of sociology as 'organs' which work together for the proper functioning of the body as a whole. For example, crime is dysfunctional in that it is associated with physical violence, loss of property and fear. According to Durkheim, crime is also a necessary part in society because it focuses on the awareness of sharing moral bonds and social cohesion. Again, the Government provides free education to the children and when the children become adult, they pay taxes and help the country to progress. Functionalists believe that society is held together by collectivism, in which members of the society agree upon and work together for the progress of the society. Functionalism draws its inspiration from the very concept of Durkheim. He was concerned with the question of how society maintains its stability and survives over time. He explains the stability of society using two coinages, such as: mechanical solidarity and organic solidarity. More primitive and traditional society were held together by mechanical solidarity. Members of primitive society lived in relatively small and undifferentiated groups, where they shared strong family ties and performed similar daily tasks by sharing common values and symbols. Where modern society relies on organic solidarity; because of the extensive division of labours, members of society are forced to interact and exchange with one another to provide the things they need. In the 1950, Robert Merton elaborated the functionalist perspective by proposing a distinction between manifest and latent functionalisms. Manifest functions are the intended functions of social institutions whereas latent functions are unintended functions which may have relations with dysfunctional activities. Crime in the Functionalist perspectives is viewed as the latent function of providing examples that demonstrate the boundaries of acceptable behaviour and the function of these boundaries to maintain social norms. 4.5.3 Conflict Perspective Third important sociological framework is the conflict theory which interprets society as a struggle for power between groups engaging in conflict for limited resources. Karl Marx, the founder of complex theory has categorized the people in two groups: the capitalist class and the social class. According to conflict theory, social problems are created when dominant groups exploit or oppress subordinate groups. Therefore, basic premise of conflict theory is that individuals and groups within the society will work to

NSOU ? CC-ED-03 ? 94 maximize their own wealth and power. Weber beliefs about conflict extend beyond Marx's because they suggest that some forms of social interaction, including, generate belief and solidarity between individual's reactions to inequality might be different depending on the groups with which they are associated. Conflict theorists of the later 20th and 21st centuries have continued to extend conflict theory beyond the strict economic classes posited by Marx, although economic relations remain a core feature of inequalities across groups in the various branches of conflict theory. Conflict theory is highly influential in modern and post modern theories of inequality, peace, conflict studies and the many varieties of identity studies that have arisen across Western academia in past several decades.

4.6 Summary In this unit we have learnt about two Indian sociologists Ghurye and Mukherjee and two western sociologists Durkheim and Cooley through their life sketches and works. We have tried to understand the different aspects of their sociological concepts. Ghurye explains the caste system in India, Indian tribes and Rural-urbanization. He also elaborates the idea of culture and civilization and about the Indian Sadhus in the context of sociology of religion. Radhakamal Mukherjee tells us about the social ecology and universal civilization. On the other hand Emile Durkheim explains about the suicide rate, the division of labour and the elementary forms of religious life. We have then learnt about Charles Horton Cooley and his theory of transportation. At last we have focused on the different theoretical paradigms of sociology like Symbolic Interactionism, Functionalist Perspective and Conflict Perspective.

4.7 Self-Assessment Questions

1. What are the distinctive characteristics of Indian Caste system according to Ghurye?
2. What are the five source of danger as identified by Ghurye as the threat for Indian national unity?
3. Why Ghurye is called the father of Indian Sociology?
4. What is process of acculturation?
5. Write two interrelated components of civilization according to Radhakamal Mukerjee?
6. What is the concept of ecology?
7. What is spiritual dimension?
8. Write about the suicide theory of Durkheim?
9. What is Totemism?
10. What is mechanical solidarity?
11. What is organic solidarity?
12. What is morality according to Durkheim?
13. Write about the cooley's theory of looking glass?
14. What is Social subjectivity?
15. What is 'transportation' according to Cooley?
16. What is symbolic interaction in communication?
17. Give one example of functionalist perspective?

After going through this unit, you will be able to— ? understand the

Concept, Scope of Social change and the Role of Education in social change; ? explain the concept of Modernization, Urbanization and Westernization with reference to Indian society; ? state the concept of Social Communication namely Formal and Informal.

NSOU ? CC-ED-03 ? 97 5.2 Introduction Change is the permanent quality of nature, hardly anything in our nature is static, time and world do not stand still. Change is the law of life. And who look only to the past or the Present are certain to miss the future. Society is dynamic, man always looks forward to the future in order to adjust himself with the environment, and interaction occurs and whenever there is an interaction there is a change. Sometimes changes are so slow people do not realize them, and some time they are so rapid and drastic. Each society developed gradually some customs, traditions, values, and style of living we call this as culture of society, different type of culture flourished in the world in the course of time. Culture of some societies prospered and some lagged behind. There are changes from time to time in features of a society that makes society mobile. Each society is subject to change. The change that occurs in customs, activities of people, structure of society, style of living in any society are called social changes. Education is considered the most power full instrument of social change. The social changes to a great extent are brought about through the process of education. In the words of secondary education commission report "Education is expected to change the attitudes and values among people and create in them desirable progress". Some thinkers identify social change with cultural change which in the narrow sense refers to Changes in custom, speech and literary forms, language, dress or hair styles. Cultural change is an important aspect of social change and occurs in a seizes influences by others forms of culture. Social change is a continuous process. Social change implies change in the social structure and functions of various aspects which form society. Social structure includes family, the marriage system, caste system, educational institutions, customs etc. 5.3 Social change: Concept, Scope and Role of Education Change in the composition of society is the basic meaning of social change- View of Dr. Henry. Social change means variation or modifications in any aspect of social process, pattern or form—View of Fairchild. Society is a complex network of patterned relationship in which all the members participating in varying degree. These relationship change and the behavior changes at the same time. These changes we refer to as social changes—View of Merrill. "Social change refers to pattern of social relationship in a given setting"—Miller.

NSOU ? CC-ED-03 ? 98 "Social change refers to the modifications in the organization and behavior of the group as expressed in its laws, customs, modes and beliefs"—B.B.Mathur. "Social change is a process responsive to many types of changes - changes in the manmade conditions of living, changes in the attitude of man and changes that go beyond human control to the biological and physical nature"—MacIver & Page Thus, we can say that when change involves an alteration in the structure and functioning of social process, modifying or replacing the old in the life of people, and changes in relationship, behaviour pattern, then we can speak it as social change. 5.3.1 Concept of Social Change: The International Encyclopedia of the Social Science (IESS 1972) looks at change as the important alterations that occur in the social structure, or in the pattern of action and interaction in societies. Alterations may occur in norms, values, cultural products and symbols in a society. Other definitions of change also point out that change implies, above all other things, alteration in the structure and function of a social system. Institutions, patterns of interaction, work, leisure activities, roles, norms and other aspects of society can be altered over time as a result of the process of social change. Social change is essentially a process of alteration with no reference to the quality of change. A change in societies is related/linked to changes in culture, so that it would be sometimes useful to talk about 'socio-cultural change. Some sociologists, however, differentiate between social change and cultural change. Social change is defined as alterations in the social structure, (including the changes in the size of society) or in particular social institutions, or in the relationship between institutions. They feel that social change refers mainly to actual human behaviour. Cultural change, on the other hand, refers to variation in cultural phenomena such as knowledge and ideas, art, religion moral doctrines, values, beliefs, symbol systems and so on. This distinction is abstract, because in many situations it is difficult, or nearly impossible to decide which type of change is occurring. For instance, growth of modern technology as part of the culture has been closely associated with alterations in the economic structures, on important part of the society. Social change can vary in its scope and in speed. We can talk of small scale or large scale changes. Changes can take a cyclical pattern, e.g. when there is the recurrence of centralization and decentralization in administrative organizations. It can also be revolutionary. Revolutionary change can be seen when there is an overthrow of government in a particular nation. Change can also include short term changes (e.g. in migration rates) as well as long

NSOU ? CC-ED-03 ? 99 term changes in economic structures. We can include in social change, both growth and decline in membership and size of social institutions. Change may include continuous processes like specialization, and also include discontinuous processes such as a particular technical or social invention which appears at some point of time.

5.3.2 Scope of Social Change The process of social change is continuous and slow process. There is need of social change in society. Society cannot stop a social change. Change is the essential part of society. Social change can be associated with either the whole structure of a society or part of the structure. The speed of social change varies society to society or in different period of time in society. Change in one society encourages other society. Change is a deviation from traditions as some retained while the undesirable ones is dropped. Social change involves not only economic, political, scientific changes but it also involves changes in mode of socialization of individual and a basic change in personality structure of the individual. Social change can be brought about by intelligence and with certain determination. Every individual has certain goal and he want to achieve them. In attempt to achieve goal, he bring about certain social changes. This indicates that there is definite purpose behind the process of social change. When individuals are concern with the modification in status and role, the stress and strain are produced in them and thereby social change takes place. Social change can be brought by any factor like technology, industrialization, religion and ideology, Change begins with the process of innovation. Innovations involve variation, invention in social customs, conventions, traditions character and conduct of the individual. But we cannot say that any one is prominent than the other. It is difficult to tell about the possible changes in future. Change is the law of nature social change is inevitable, social change means discarding some old thing or elements or addition of new things. Social change may be for the good of society or otherwise. It is possible to know that there will be some changes in our tradition though it is difficult to pin point social change.

5.3.3 Role of Education in Social Change Education has brought about phenomenal changes in every aspects of human life. Education can be used to empower the individual. Societal change comes from the collective transformation of the individuals inside a society. Education being the chief instrument for the development of science and technology is the most vital forces which can change a society positively or negatively depending on the inner structure of that society. Francis J. Brown remarks that Education is a process which brings about changes in

NSOU ? CC-ED-03 ? 100 the behaviour of society. It is a process which enables every individual to effectively participate in the activities of society and to make positive contribution to the progress of society. Education has been accepted as one major agency of socialization, and teachers and educational institutions as socializing agents. In describing education as an instrument of social change, three things are important: the agents of change, the content of change, and the social background of those who are sought to be changed, i.e. students. Educational institutions under the control of different cultural groups reflect the values of those groups which support and control education. According to this situation the teachers Impart specific values, aspirations and to the children. The educated Social reformers emphasized values like removal of caste restrictions, equality of women, doing away with social evil social customs and practices, voice in the governance of the country, establishing democratic institutions and so on. They, thus, wanted to teach liberal philosophy through education for changing society. In other words they regarded education as a flame or light of knowledge which dispelled the darkness of ignorance. In a static society, the main function of the educational system is to transmit the cultural heritage to the new generations. But in a changing society, these keep on changing from generation to generation and the educational system in such a society must not only transmit the cultural heritage, but also aid in preparing the young for adjustment to any changes in them that may have occurred or are likely to occur in future. In contemporary societies, "The proportion of change that is either planned or issues from the secondary consequences of deliberate innovations is much higher than in former times." This is more so in societies that has newly become independent and are in a developing stage. Thus, the relationship between educational system and society is mutual; sometimes the society influences changes in educational system and at other times the educational system influences changes in the society.

5.4 Social Change in India: Sanskritization, Westernization, and Globalazitaion Today's world is like an interconnected world. Any incidents somewhere in the world impact the other parts of the world. The traditional ideas everywhere are being replaced by more modern ideas. However, some people are trying it hard to reserve their traditional way of living. But the powerful countries having their impact felt on the relatively less powerful nations making the world a cultural colony. In this respect we will now discuss about Sanskritization, Westernization and Globalization.

NSOU ? CC-ED-03 ? 101 5.4.1 Sanskritization As a social process Sanskritization is unique to Indian subcontinent. Sanskritization is a theory of social change advanced by the sociologist M.N. Srinivas in 1952 to describe how upward mobility occurs in India's caste society, previously thought to be static. It is the process by which lower caste groups attempt to raise their status and position within the caste hierarchy by emulating upper caste social norms, such as the adoption of vegetarianism and the worship of Brahminical Gods. The theory of Sanskritization recognizes the great regional variation of caste groups across linguistic, ethnic, and geographical boundaries, and the local power struggles that may shift a sub caste group's position in the hierarchy, even if it does not lead to any structural change in the overarching caste schema. The theory also reinforces the idea of a Brahmin-centric society that relegates the lower castes to the role of imitators, thereby making it out of step with contemporary caste politics. Sanskritization is the process by which lower caste groups attempt to raise their status and position within the overarching caste hierarchy by emulating upper caste social norms. The classical delineation of caste comes from the Sanskrit Vedic period (1200-500 bce) and is embodied in the concept of varna, which literally means "color." There are four varnas in descending order of supposed ritual purity: (1) Brahmins (priests and scholars), (2) Kshatriyas (rulers and warriors), and (3) Vaishyas (merchants and traders), who represent the "twice-born" upper castes and whose male members have donned the sacred thread after going through a ritual "second" birth; followed by (4) Shudras (laborers and servants) and Dalits (formerly "untouchables" or "harijans"), the latter of whom are technically considered to be outside the varna schema. But if one considers the Dalit movement in India today, it is clear that Sanskritization is not the sole motor of social change. Rather, Dalit and other lower caste groups are working toward social mobility and uplift in legal and other systems that would allow for better and more equitable access to education, including the study of English, health care, clean water, and jobs, to name a few areas. Models of Sanskritization: 1. Cultural Model Castes have been assigned high or low status according to the cultural characteristics of Hindus. The wearing of sacred thread, shunning the use of meat and liquor, observing endogamy, prohibition of widow-marriage, observing the restrictions imposed by caste NSOU ? CC-ED-03 ? 102 system, worship according to the modes and methods described in the religious text books daily, an inclination and respect for religious texts and mythological stories, giving alms and gifts, use of incense, lamp, flowers, grains and oblation at the time of worship, going to temples and on pilgrimages etc. have been given sanctity in traditional culture. They are considered to be the measuring standards of sacredness and purity. Therefore adopting in one's life style the way of higher castes and accepting the mandates of Varnas, Ashramas, Karma and Rebirth etc. and showing faith in the thoughts given in Sanskrit literature regarding religion, vice and virtue, salvation, maya and Brahma are a form of Sanskritization. In short accepting the behaviour and code of highness and purity as described in religious texts is a form of Sanskritization. 2. Varna Model: In the Varna system the highest status is that of a Brahman followed by Kshatriya, Vaishya and Shudra. Antyaja (or the lowest) is the fifth varna which is the lowest and untouchable. At different places Brahmins, Kshatriyas or Vaishyas acquire high respect in the society. The lower castes copy the ideals and life styles of the superior class, where Kshatriyas enjoy of 'superiority' their ideals are copied. Similarly where Vaishyas enjoy superiority the lower castes copy their life-style and ideals. Only the lowest castes (Antyaja) copy the Shudras. There is to say emulating the life-style or ideals of a varna on the basis of honour and superiority enjoyed by that class is called the varna model of Sanskritization. 3. Local Model: In every community, some castes are considered to be more respectful than others on account of their numerical or economic power. Not caring for the caste hierarchy, people rest of the community as superior or higher. This caste may be called the "master-class" or in the language of Srinivas "the dominant caste". In a village community, agriculturists castes get the dominance. The lower castes copy the life style of this Dominant-caste and try to rise in status. The local dominant castes serve as the reference group model for the aspirant caste. If the locally dominant caste is a Rajput or a Baniya it will transmit the Kshatriya or Vaishya model. Thus, models of Sanskritization vary according to the dominant caste. Dominant castes play an important role either advancing or retarding the process of Sanskritization. For a caste to be dominant, it should own a sizeable amount of arable land locally available, have strength of number and occupy a high place in the local hierarchy. New factors of dominance include western education, jobs in administration and urban source of income. These dominant castes stimulate in the lower castes a desire to imitate their prestigious style of life and thereby improve upon their social status. In some places

NSOU ? CC-ED-03 ? 103 the dominant castes were reported to have harassed the lower castes and dissuaded them from following their life styles by means of force and threat. Motivation for Sanskritization: One of the motivating factors behind the process of Sanskritization is the raising of one's social status in the local caste hierarchy and enjoyment of the same political and economic power which the higher castes used to enjoy. This motivation to raise one's own standard comes from a sense of relative deprivation, because the Hindu society has been rigidly stratified by caste system. Life-chances, social opportunities, economic positions and political privileges everything was determined by caste system. Rigid caste norms created a wide distance between castes. The higher castes used to enjoy all kinds of social privilege whereas the lower castes were deprived of getting the same; it therefore, was considered the best way of increasing one's social position by taking to the customs and ways of life of a higher caste. Another motive behind Sanskritization is the manifestation of suppressed inter-class hostility. The victims wish to have control over caste system and thereby expiate their frustration on the same battlefield where they acquired them. Factors facilitating Sanskritization: Some factors have been singled out as contributory to the process of Sanskritization in modern India. Some of them are discussed below: 1.

83%

MATCHING BLOCK 48/51

W

British Rule: With the establishment of the British rule in India, the

lower castes got more opportunities to Sanskritize themselves and subsequently raise their status as the Britishers were unmindful to this phenomenon and were least involved in the dynamic of caste system. 2. Development of Communication: Development of road and transportation in the areas previously inaccessible accelerated the process of Sanskritization. The railways and other improved means of communication enabled people to visit religious centres like Mathura, Dwaraka, Gaya, Kashi, Puri etc. 3. Development of the Mass Media of Communication: The radio, the cinema, the microphone, newspaper, religious journals have been contributing to the popularization of Sanskritic values and ideologies. 4. Political Factors: The political institution of parliamentary democracy in free India has contributed to increased Sanskritization. Prohibition, a Sanskritic value, has been endorsed in our constitution. The ideal of equality of all men before the law and the abolition of

NSOU ? CC-ED-03 ? 104 untouchability have spring up a culture which was the monopoly of the higher castes beforehand. 5. Educational Factor: As a result of western education, socio-religious movements like the Arya Samaj, the Brahma Samaj and the Prathana Samaj came into being and which, in turn, contributed much to the process of Sanskritization. Besides, spread of literacy among the low caste groups made Sanskritization feasible. 6. Cultural Institution: Every temple and pilgrim centre also acts as a source of Sanskritization. During the periodic festivals and other occasions when pilgrims gather at the centre they get opportunity for the spread of Sanskritic ideas and beliefs. Several other cultural institutions such as the sanyasis and other religious mendicants also help spread ideas and beliefs of sanskritic Hinduism. 7. Economic Factor: Better economic conditions also facilitate enhancement of the status of a caste in the local caste hierarchy. But acquisition of wealth is not always a necessary pre-condition to Sanskritization. Srinivas has rightly cited the case of untouchable caste of Mysore who got itself sanskritized even though its economic position remained almost fixed. However, the fact is that Sanskritization becomes easy if economic power is acquired. 8. Sectarian Movements: Sectarian movements also acted as agents of Sanskritization and when they attracted members from the low castes, they helped raise their status. For example the Bhakti movement geared by the saints embraced all people into its fold ignoring diversities of cults and castes and thereby proved a great sanskritizing force. Effects of Sanskritization on Social Change: If Indian culture is chiefly confined to the cultural ideals of twice-born Varnas (Brahmans, Kshatriya and Vaishyas), then we may say that the process of Sanskritization is going on for a thousand years, because foreign invaders instead of spreading their own culture adopted the twice-born culture of India. That is the reason that there is no sign of Salukas who was the successor of Sikander the Great coming from Greece. The Shuk and Huns foreigners who were considered to be low caste or class either by religion or by culture, adopted Indian culture and become Sanskritized. Muslims and Britishers got political hold hence they had no need to Sanskritize. Sanskritization in Religious field: Lower castes have erected their own temples like twice born castes they have put the

NSOU ? CC-ED-03 ? 105 status of their own Great men along with the idols of God and Goddess. Many of them put on sacred thread. They go to their temples regularly and perform Arti and Bhajan. They have engaged priests of their own caste. In temples belonging to the middle castes, even Brahman priests are engaged. They perform ceremonies like twice-born castes. Sacrifices and Hawan are performed on the naming ceremony of children. The custom of observing fast has increased. They celebrate all festivals like twice-born varnas. They are advancing towards cleanliness. They have left prohibited food. They also do not like dirty occupations. They take care of the cleanliness of their clothes and utensils. The Hinduization of Tribal castes is an example of religious Sanskritization. The members of middle castes have become office holders of different religious institutions. They have specialized in performing ceremonies like Brahmins. Sanskritization in Social field: The social aspect of Sanskritization is more important from the viewpoint of change. Sanskritization appears to be more closely related to religious system but the chief aim of Sanskritization is social. The low caste individuals are inclined towards Sanskritization because that way they can elevate their social status and get higher up and caste-hierarchy. They want a place equal to that of Brahmins and Kshatriyas. Not only that some castes claim to be twice-born but some of them have practically acquired that status. Sanskritization in Economic field: Sanskritization can be observed in the change of occupations also. Clean trades are a symbol of social height. In the cities of west Uttar Pradesh, Bhangis are working as vegetable and chat hawkers. Members of backward classes are entering into higher posts. Scheduled castes and scheduled tribes get reservation in services. Twice-born or Brahmin clerks and peons work under officers belonging to scheduled castes. Sanskritization in Living: The conditions of living have also been sanskritized. Lower castes get Pucca houses built for them. They have got a drawing room like twice born castes. They are attracted towards chair. Now they sit along with higher castes on the cots without is a sense of fear or hesitation. They also keep their houses clean. They put the pictures of leaders and Hindu gods and goddesses on the walls. They take regular bath and put on clean clothes. Formerly they remained semi-naked due to poverty or were compelled to remain so. Now they put on dresses like higher caste and talk in the same language.

NSOU ? CC-ED-03 ? 106 Other Effects of Sanskritization: Sanskritization has brought hardship for the lower caste women. Prior to Sanskritization, they were following the caste codes which were not so much rigid. But as they got sanskritized they imitated the sex and marriage codes of the Brahmins which were harassing. For example, pre puberty marriage, ban on widow remarriage, shaving the hair of widow etc. were copied from the Brahmins by the ambitious lower castes. Second, Sanskritization has significant effects on conjugal relation. At times a wife is enjoined to practice the ideal of Pativrata and show extreme fidelity to the husband. Third, Sanskritization has prompted the untouchable castes to give up the consumption of liquor, beef, domestic pork or toddy. On this basis Srinivas predicts that "in the next twenty or thirty years the culture of untouchables all over the country will have undergone profound changes."

Criticisms: Sanskritization as a concept of cultural change has been criticized by many on several grounds. First, it has been alleged that Sanskritization is an extremely complex and heterogenous concept. Srinivas himself admits that Sanskritization is not a single concept but a bundle of concepts. Second, Sanskritization is a theoretically loose term. Third, Sanskritization, in legal sense, is a truth-asserting concept which oscillates between the logics of ideal-typical and nominal definitions of phenomena. Fourth, Sanskritization fails to account for many aspects of the cultural changes in the past and contemporary India as it neglects many non-sanskritic traditions. Fifth, D.N.Majumdar in his study of Mohana village has shown that there is no tendency among the low castes to adopt the customs and manners of the higher castes nor do these help in elevating the status of any caste. Sixth, Lynch comments that Sanskritization is culture-bound and is not that much useful to explaining all movements for social mobility in the post-independent India. Seventh, Chauhan prefers the use of another concept enhanced ritualization to Sanskritization. Because the former concept can take care of the non-sanskritic elements which can not be accommodated by the concept of Sanskritization. Eighth, Prasand criticizes the concept of Sanskritization on linguistic ground and suggests

NSOU ? CC-ED-03 ? 107 Kulinization in place of Sanskritization. Kulinization is the process by which the lower status Brahmins acquired higher status by marrying Kulin Brahmins. Ninth, Patel and Singh, while describing the changing portrait of the Lewa Patidar caste of North Gujarat, mention that Sanskritization as well as contra-Sanskritization is operative in the case of Lewa Patidars and certain western factors are responsible for this contra-Sanskritization process. Tenth, K.L.Sharma, prefers the concept of reference group to Sanskritization to explain mobility; because in his views, Sanskritization is of ad-hoc nature, it lacks refinement at the conceptual level. Mobility at the individual level can be better understood with the help of reference group behaviour. 5.4.2. Westernization Quite like sanskritisation the concept of westernization is also employed for evaluating social change in rural India and elsewhere in the country. The concept was also constructed by M.N. Srinivas to describe the process of social and cultural mobility in the traditional social structure of India. It has also emerged, in Srinivas' study of the Coorgs of south India. The author has defined westernization as:...

88%**MATCHING BLOCK 49/51****W**

the change brought about in Indian society and culture as a result of over 150 years of British rule,

the term subsuming changes occurring at different levels of technology. The emphasis was given by Srinivas on westernization basically included

99%**MATCHING BLOCK 50/51****W**

humanitarianism and rationalism. Commenting on the broader dimensions of westernization, Yogendra Singh (1994) writes: Emphasis on humanitarianism and rationalism is a part of westernization which led to a series of institutional and social reforms in India. Establishment of scientific, technological and educational institutions, rise of nationalism, new political culture and leadership in the country, are all by-products of westernization.

Srinivas argues that the acceleration in westernization does not slow down the process of sanskritisation. As a matter of fact, both the processes go hand in hand. It is found that sometimes increase in westernization also boosts the process of sanskritisation. A cursory view of the impact of westernization including communication and transport facilities has modernized the sanskritic institutions, such as pilgrimages and caste associations. It is a common observation that in the last three or four decade's new religious celebrations have emerged. The deities which were oblivious have now become target of

NSOU ? CC-ED-03 ? 108 popular celebrations. The caste associations have received better organization. At empirical plane it is found that with the increase in westernization sanskritic ties have also got solidarity. Origin: Srinivas has given details about the development of westernization in India. He traces it from the period of British Raj. Surely, the colonial rule brought with it exploitation and suppression of the masses of people both at the rural and urban levels. At the same time, it also brought certain radical changes in Indian society and culture. The British rule initiated a period of new technology, institutions, knowledge, beliefs and values. The colonial rule, thus, integrated the different segments of Indian society. The modern state actually got its beginning from this period. The land was surveyed, revenue was settled, a new bureaucracy emerged, and army, police and law courts were established. The British rule also developed communications, railways, post and telegraph and also started schools and colleges. "One obvious result was that books and journals, along with schools, made possible the transmission of modern, as well as traditional knowledge to large numbers of Indians-knowledge which could no longer be the privilege of a few hereditary groups-while the newspapers made people in different parts of the far-flung country realise that they had common bonds, and the events happening in the world outside, influenced their lives for good or ill." Yet another force released by the British rule was the working of Christian missionary. The Christian missionaries worked in the different parts of the country, particularly in those which were backward and inhabited by tribals and untouchables. This brought the weaker sections closer to westernization. In contemporary India, when we talk about westernization, a tremendous change has come in rural India. The impact of five year plans has brought the village people in the wider network of communication and modernization. The democratic institutions such as Panchayati Raj and massive spread of education have brought the villagers to come closer to westernization. What is interesting in the concepts of sanskritisation and westernization is that in the former, is observed within the caste structure while in the latter, is observed beyond the caste system.

NSOU ? CC-ED-03 ? 109 Characteristics: Srinivas has commented on westernization from time to time. These comments have come as a result of the academic responses given by other Indian and foreign some of the important characteristics of westernization included by Srinivas are discussed below: 1. Humanitarianism: Westernization is loaded with certain value preferences. "A most important value, which in turn subsumes several other values, is what may be broadly characterised as humanitarianism, by which is meant an active concern for the welfare of all human beings, irrespective of caste, economic position, religion, age and sex." Srinivas has argued that the term 'humanitarianism' is quite comprehensive. It is inclusive of a large number of other values, the important being the welfare of all. 2. Equalitarianism: Westernization has another value of equalitarianism. It is a democratic value and stands for minimizing inequality, removal of poverty and liberty to all. The humanitarianism, as a characteristic of westernization, stands for a society which could be called as a socialist society in the long run. 3. Secularization: Both the British rule and at a later stage the Constitution of India introduced a new value of secularization. Secular India is conceived as a nation charged by the idiom of a rational and bureaucratic society. Accordingly, the state is required to have respect for all the religions of the society. It also includes the value of scientific ethics. 4. Initiation of social reforms: The idea of westernization which was propagated by the British rule struck hard on social evils which eroded the Indian society. The introduction of British law put an end to certain inequalities that were part of Hindu and Islamic jurisprudence. The evil institutions of sati, untouchability and purdah got condemnation from the spread of the notions of equalitarianism and secularisation. 5. Predominance of science and technology: The British rule also introduced science and technology in Indian society. This brought railways, steam engines and technology. As a result of this, the Indian society moved towards industrialization. Though, science and technology came as a setback to village

NSOU ? CC-ED-03 ? 110 industries and local arts and artifacts, the industrial growth increased. This also gave encouragement to urban development. Migration from village to town and city also increased. There was a take-off from tradition to modernity during this period. Industrialization and urbanisation also introduced new values in society. Many of the traditional institutions like untouchability and caste received new interpretation. Clearly, the concept of westernization introduced by M.N. Srinivas is meant to measure the social change which came in India during the British period. In post-independent India westernisation got accelerated. The Indian society came in contact with other countries also. The United States had a profound impact on our society. At a later stage Srinivas was suggested to review the concept looking to the new impact of modernization. For instance, Daniel Lerner, after considering the suitability of 'westernization' as well as 'modernization', has opted for the later. Modernization also includes urbanization. It also enhances media exposure and wider economic participation. "Modernization also implies social mobility. A mobile society has to encourage rationality for the calculus of choice which shapes individual behaviour and conditions its rewards. People come to see the social future as manipulable rather than ordained and their prospects in terms of achievement rather than heritage." If we examine M.N. Srinivas' concepts of sanskritisation and westernization, we will be able to find out that in the assessment of rural change westernization is not much significant. Both the concepts are loaded with sanskritic and western values. The concepts also carry certain ideologies. Yogendra Singh argues that the use of the term 'westernization' is pejorative for Indian elites. In place of westernization, modernization appears to be a better term. He observes: "...modernization in India cannot be adequately accounted for by a term like westernization. Moreover, for many new elite in India as also in the new states of Asia, the term westernization has a pejorative connotation because of its association with former colonial domination of these countries by the West. It is, therefore, more value-loaded than the term modernization, which to us appears as a better substitute. 5.4.3 Globalization The term "Globalization" has got extensive treatment in the hands of many sociologists. The sociologists perceive that though economic in origin, the term has enormous social

NSOU ? CC-ED-03 ? 111 implications. To cite some examples, to George Ritzer globalization refers to the rapidly increasing worldwide integration and interdependence of societies and cultures. Scholte defines globalization as deterritorialization or the growth of 'supraterritorial' relations between people. Globalization refers to a far reaching change in the nature of "social space". To quote Albrow globalization includes "all those processes by which the peoples of the world are incorporated into a single society, global society". In the languages of Ronald Robertson "Globalization as a concept refers both to the compression of the world and the intensification of consciousness of the world as a whole." To Anthony Giddens, "Globalization can thus be defined as the intensification of worldwide social relations which link distant localities in such a way that local happenings are shaped by events occurring many miles away and vice versa". Water defines globalization as "a social process in which the constraints of geography on economic, political, social and cultural arrangements recede, in which people become increasingly aware that they are receding and in which people act accordingly". To quote Held et al, "Globalization can be thought of a process (or set of processes) which embodies a transformation in the spatial organization of social relations and transactions - assessed in terms of their extensity, intensity, velocity and impact - generating transcontinental or interregional flows and networks of activity, interaction, and the exercise of power". U. Beck has underlined the differences among 'globality,' 'globalism' and 'globalization.'

According to him, "'globality' refers to the fact that individuals are increasingly living in a 'world society' in the sense that 'the notion of closed spaces has become illusory. Meanwhile, 'globalism' is the view that the 'world market' is now powerful enough to supplant (local and national) political action;" and "'globalization' is the blanket term to describe 'the processes through which sovereign national states are criss-crossed and undermined by transnational actors and varying prospects of power, orientation, identities and networks'.

Distinctive Characteristics of Globalization

- 1. Borderless world:** The most outstanding economic characteristic of globalization is the introduction and practice of a borderless world. Notions of a "borderless world" simply mean political "deterritorialization". "Deterritorialization" concept implies territorial component in world affairs is of much reduced significance. The territorial structures and compartments which have, for the past few hundred years, formed a basic component of the state system experience structural change under the process of globalisation. It evokes images of a world in which goods, services, capital, and information flow across national borders. In this world, the choices over where to produce, where to establish shop, invest, and save are no longer confined within national borders. They have taken on a decidedly
- 2. Liberalisation:** Globalization and liberalization are concepts closely related to one another. Globalisation can occur only under the situation of liberalisation. Liberalization refers to the relaxing social and economic policies which results in better integration of an economy with the global economy. Globalization and liberalization both occur as a result of modernization. Liberalisation is a process of liberalising the economic, industrial, investment, financial and business policies to enhance the business, export, per capita of a particular region. In general, it refers to the removal of restrictions; usually government rules and regulations imposed on social, economic, or political matters. Liberalization may be trade, economic, or capital market related. Trade liberalization may be with regard to reducing restrictions on imports or exports and facilitating free trade. Economic liberalization generally refers to allowing more private entities participate in economic activity, and capital market liberalization refers to reducing restrictions imposed on debt and equity markets. Thus, liberalisation provides ample freedom to the industrialist/businessman to establish industry, trade or commerce either in his country or abroad; free exchange of capital, goods, service and technologies between countries. Globalisation cannot take place without liberalisation.
- 3. Free Trade:** Free trade symbolises a liberal economic order that prevents protectionism and isolation. Simply speaking, globalization is the process of changing to the world into an integrated world from an isolated one. Globalization is a long-term process of change towards greater international cooperation in economics, politics, idea, cultural values, and the exchange of knowledge. The core features of globalization are increased free trade between nations, easier movement of capital between borders, and a massive increase in foreign investment. This results in growth for both small businesses and multinational companies, which can access new markets across the world. It also results in increased transport and communication between countries and continents.
- 4. Globalization of Economic Activities:** Globalization as a process widens, intensifies speeds up, and increases world-wide interconnectedness. It is characterized by four types of change. First, it involves a stretching of social, political and economic activities across frontiers,

NSOU ? CC-ED-03 ? 113 regions and continents. Second, it is marked by the intensification, or the growing magnitude, of interconnectedness and flows of trade, investment, finance, migration, culture, etc. Third, it can be linked to a speeding up of global interactions and processes, as the development of world-wide systems of transport and communication increases the velocity of the diffusion of ideas, goods, information, capital and people. And, fourth, it results in the growing extensity, intensity and velocity of global interactions. In this sense, the boundaries between domestic matters and global affairs become increasingly fluid. Globalization refers to the increasing interdependence of world economies as a result of the growing scale of cross-border trade of commodities and services, flow of international capital and wide and rapid spread of technologies. It reflects the continuing expansion and mutual integration of market frontiers, and is an irreversible trend for the economic development in the whole world at the turn of the millennium. The general characteristics of globalization go beyond their economic characteristics and include the following. 1. Globalisation is a universal process, but not uniform in its result. Globalisation is a historical process, 2. Globalization is both developmental and detrimental for the society, 3. Globalization is a long term process, 4. Globalization is an irreversible process, 5. Globalization leads to hybridisation, homogenisation and harmonisation, 6. Globalisation leads to dispersion and diffusion, 7. Globalization is a multidimensional process, 8. Globalization is a top down process, 9. Globalization results in deterritorialisation. Dimensions of Globalization: 1. Economic Dimension of globalization. 2. Social Dimension of globalization. 3. Political Dimensions of globalization. NSOU ? CC-ED-03 ? 114 4. Cultural Dimension of globalization. 5. Technological Dimension of globalization. 6. Environmental Dimension of globalization. Arguments in favour of globalization Include: ? The economies of countries that are more engaged with the global economy have consistently grown much faster than those that have maintained closed economies - on average by about 2.5 percent. Faster economic growth resulting from globalization, usually leads to increases in peoples' living standards. Improved wealth leads to better health care and cleaner water, increasing peoples' life expectancy under globalization. ? Increased foreign direct investment in countries due to the reduction in investment barriers has also fuelled growth, development and progress. ? Globalization has resulted in improved environmental awareness as the internet has increased access to information and helped for diffusion of safe environment related knowledge. ? Increased trade integration has brought integrity, interdependence among nations. It has reduced hegemonic attitude of the supposed rich nations and has reduced the threat of war and promoted peace. ? Improved technology has reduced costs and changed the way the world communicates. It has connected the people and parts of the planet. ? Adult illiteracy rates are falling in developing countries. ? Democracy is making headway. Modern communications and the global spread of information have led to the toppling of undemocratic regimes. ? Multinational companies have adopted improved standards for workplaces and wages - usually paying more than local companies in developing countries. ? International migration has led to greater recognition of diversity and respect for cultural identities, which is improving democracy and access to human rights. Arguments against globalization include: The social and economic costs of globalisation are very high. This causes people to suffer hardship. Countries unable to take advantage of globalisation fall further behind.

NSOU ? CC-ED-03 ? 115 ? Global rich poor divide grows. ? Increased trade and travel have increased the spread of human, animal and plant diseases, like AIDS. ? Increased interdependence of countries has greater vulnerability to economic problems - like the recent global recession. ? It also reduces the self sufficiency of the nations. ? The environmental costs of globalisation are very high. Multinational companies defeat the environmental codes in developing countries. The hitherto safe planet becomes an unsafe habitation for humanity. ? Major economic powers control the international economic bodies which become hegemonic over the developing world. This leads to economic colonization. They treat the developing countries not as their partners, but parasites. ? Trade liberalisation and technological improvements change economies and can lead to unemployment. Modern communications have spread an awareness of the differences between countries and increased demand for migration to richer countries. Barriers to migration have been increased in richer countries leading to more people smuggling. ? Globalisation has caused a brain drain to richer countries making the poor countries drained off their talents. ? Indigenous and national culture and languages are eroded by the modern globalised culture. ? Globalization has heightened cross border terrorism, trafficking which are putting the lives of millions in misery. 5.5 Social communication : Formal and Informal Social communication refers to the emergence of verbal and non-verbal skills, social interaction and social cognition. Social communication is important in order to be able to build social relationships with other people. Social communication is a social exchange between two or more individuals. These communications build the basis for social structure and culture. By communication, society designs rules, institutions and systems within which we seek to live. Thus communication is the basic ingredients of social relationships. Society is rooted in communication. Social communication produces some definite influence upon

NSOU ? CC-ED-03 ? 116 social relations that exist among human beings. It establishes mental relations among persons. It is the reciprocal influence mutually exerted by human beings through their stimulation and mutual response.

Communication could be verbal, or non verbal i.e using sign language, body movements, facial expressions, gestures, eye contact or even with the tone of voice. There are two types of communication - formal communication and informal communication. 5.5.1 Formal Social Communication Formal communication refers to the flow of official information through proper, predefined channels and routes. The flow of information is controlled and needs deliberate effort to be properly communicated. Formal communication follows a hierarchical structure and chain of command. The structure is typically top down, from leaders in various departments and senior staff in the organization, which funnel down to lower level employees. Employees are bound to follow formal communication channels while performing their duties. Formal communication is considered effective as it is a timely and systematic flow of communication. 5.5.2 Informal Social Communication In comparison, informal social communication refers to communication which is multi-dimensional. Informal communication moves freely within the organization and is not bound by pre-defined channels and communication routes. Informal communication is particularly quick. Informal communication is far more relational than formal communication and is by nature, a very natural form of communication as people interact with each other freely and can talk about a diverse range of topics, often extending outside of their work duties. Due to the inherent nature of informal communication, it moves a lot faster and does not have a paper trail. Informal communication in the workplace is often called the 'grapevine' and generally begins with employees through social relations. In many cases informal communications can turn to formal communication if they are added in to the formal communication information flow of a company. Informal communication is considered effective as employees can discuss work-related issues which save the organization time and money. It also helps to build more productive and healthy relationships in the workforce.

NSOU ? CC-ED-03 ? 117 Key differences between Formal and Informal communication Here's a brief list of some of the key differences between formal and informal communication: ? Formal communication is the more reliable form, as there is a paper trail. Compared to informal communication which has comparatively less reliability, and is very unlikely to have a paper trail. ? Formal communication is slower, sometimes feeling unbearably slow due to bureaucracy. On the other hand, informal communication is very quick, often being instantaneous. ? Formal communication requires a number of different processes before the whole communication flow is complete, whereas informal communication requires very little process time. ? Information through formal communication is only through predefined channels, whereas information through informal communication moves freely. ? Secrecy is maintained with formal communication, whereas informal communication makes it hard to maintain full secrecy due to its reliance on individuals. Types of Formal Communication ? Memos ? Intranet ? Meetings ? Conferences ? Formal One-on-Ones ? Bulletin Boards ? Handouts ? Letters ? Presentations ? Speeches ? Notice Boards

NSOU ? CC-ED-03 ? 118 ? Organizational blogs ? Emails from managers and leaders Types of Informal Communication ? Gossip ? Single Strand - a form of informal communication wherein each person communicates with the next in a single sequence. ? Cluster - a very common form of informal communication, in cluster networks a person will receive information and choose to pass it on to their cluster network or keep the information to them. Each individual will pass on the information to the next cluster network ? Probability Chain - each individual randomly tells another individual the same piece of information. 5.6 Summary In the above unit we have discussed about the concept, nature and the scope of social change as well as the role of education in the process of social change. This unit has also tried to discuss the issues of Sanskritization, Westernization and Globalization and their role in the process of social change. At the end of the unit, the concept, importance and the types of social communication have been discussed. 5.7 Self-Assessment Questions 1. What is social change? 2. What are the causes of social change? 3. What is the role of education in the process of social change? 4. The concept Sanskritization was developed by whom? 5. What is Sanskritization? 6. What is the impact of sanskritization on social change? 7. Write any two effect of Sanskritization. 8. What is Globalization?

NSOU ? CC-ED-03 ? 119 9. What are causes of globalization? 10. What is the effect of globalization on social change? 11. Write two dimensions of globalization. 12. What is Social Communication? 13. What do you mean by formal communication? 14. What is meant by informal communication? 15. Mention any two differences of formal and informal communication. 5.8 References Bhattacharyya, D.C. (1996). W

After going through this unit, you will be able to - ?

understand what a pluralistic society is; ? explain the concept of diversity and inclusion; ? recognize and apprehend the contemporary social issues and understand the impact of education on these issues. 6.2 Introduction From the ancient past India has been a real plural society. It is rightly characterized by its unity in diversity and an open minded acceptance for vivid opinions. A grand synthesis of cultures, religions and languages of the people belonging to different castes and communities has upheld its unity and cohesiveness. Inspite of several foreign invasions, NSOU ? CC-ED-03 ? 121 Mughal rule and the British rule, national unity and integrity have been maintained. It is this synthesis which has made India a unique mosaic of cultures. India fought against the British Raj as one unified entity. Foreign invasions, immigration from other parts of the world, and the existence of diverse languages, cultures and religions have made India's culture tolerant, on the one hand, and a unique continuing and living culture, with its specificity and historicity, on the other. Hinduism, Jainism, Buddhism, Islam, Sikhism and Christianity are the major religions. There is diversity not only in regard to racial compositions, religious and linguistic distinction but also in patterns of living, life styles, land tenure systems, occupational pursuits, inheritance and succession law, and practices and rites related to birth, marriage death etc. Post-Independent India is a nation united against several odds and obstacles. The idea of unity of India is inherent in all its historical and socio-cultural facts as well as in its cultural heritage. India is a secular state. It has one Constitution providing guarantees for people belonging to diverse regions, religions, cultures and languages. It covers people belonging to all socioeconomic strata. The Five Year Plans and several other developmental schemes are geared to the upliftment of the poor and weaker sections of society. Hence, in this unit we will discuss about this unique characteristic of India in details. 6.3 India as a Pluralistic Society Plural society is simple words mean the integration of different communities who practice different culture, languages, and beliefs. For example, in any school, it is not mandatory to collect students from the same language or culture. Different students belonging to different class study altogether and it can be seen as the very basis of teaching everybody values regarding respect and humbleness. Many sociologists suggested plural society was a balance between economy and ecology but R.T. Smith in 1958 criticized this system because according to him it highlighted the differences and does not contribute to unity in diversity. In 1967 Dahl presented his ideation of plural society where he mentioned that it could better be understood as the division of power fairly. The major advantage of plural society was that everybody's opinion was heard and there was not an inequality unlike another system of stratification. From the earlier times, the debate was on about the class division being same only. But differences were there as one hand class division saw economic differences and on the other hand plural society consisted of groups which were together irrespective of economic, class or any barrier. Plural society effect can be seen in India; in fact, the country is called by unity in diversity. There are more than 2400 castes, many religions but people meet each other as

NSOU ? CC-ED-03 ? 122 an individual. For example in any shop, there can be many people of different religion working under the same roof. Another example is Lebanon where there are two major Muslim segments Shia and Sunni with Christian community as a minority. This builds up a peaceful environment in the society. It emphasized on multiculturalism. Although it is impossible to build up an egalitarian society, still Plural society comes to an aid for erasing the differences.

6.4 Social Diversity and Inclusion Social diversity is a feature of a society which is determined by caste, class, religion, occupational pattern in a given territory. In the social sphere, the general customs and manners of the people greatly differ. People of different regions use different types of dresses, their eating habits and customs differ. Certain people are quite civilized while others are very backward in their customs. India has been considered as perhaps the largest and most plural society in the world. In India, people speak an array of languages and use a wide range of scripts. As a country, India has major religions - Buddhism, Christianity, Hinduism, Islam, Sikhism, and Zoroastrianism - living side by side. India is the world's most complex and comprehensively pluralistic society, home to a vast variety of castes, tribes, communities, religions, languages, customs and living styles. It was estimated by the Anthropological Survey of India that there are nearly 4,599 separate communities in India with as many as 325 languages and dialects in 12 distinct language families and some 24 scripts. The mosaic of identities that constitute the meaning of Indianness has been on display on Republic Day every year. Moreover the National Anthem emphasizes diversity in a similar manner with the first verse being a series of names of different geographic regions, ethnicities and cultures.

Meaning and Nature of Social Diversity By 'social diversity', we mean co-existence of different social groups within a given geo-political setting or in simpler terms, differentiation of society into groups. Other terms such as, 'plurality', 'multiculturalism', 'social differentiation' etc. are also interchangeably used to explain this feature. The diversity may be both functional and dysfunctional for a society depending on its composition. The question that may arise at this stage is 'how much pluralist a society can become without losing its organic unity?' Despite divisions of groups, an underlying unity runs through the whole Indian social system. In order to understand the nature of social diversity in India, it is important to understand the nature of group identities that form the diversity.

NSOU ? CC-ED-03 ? 123 **Types of Social Diversity** The main sources of social diversity are ethnic origins, religions and languages. According to Sorokin, the social differentiation can be classified into two types: a) intra-group (i.e. differentiation within a group and b) inter-group differentiation (i.e. differentiation among the groups). Further groups may also be classified as: a) unibound (i.e. groups whose members are bound into a solidarity system by one main value or interest such as, race, sex and age; b) multibound (i.e. groups formed by the coalescence one of two or more unibound values such as castes, tribes, classes etc. Intra-group differentiation means a division of the group into subgroups that perform different functions and are not graded superior or inferior to each other. However, when subgroups are ranked 'superior and inferior' or 'higher and lower', intergroup differentiation becomes intergroup stratification such as castes in the Indian Caste System.

Language Language is one of the main markers of group solidarity in any society. The social categorization in terms of languages is much stronger than any other social markers such as religion, class, caste, tribe etc. Group identities are expressed in stronger terms when language identities are combined with other types. India is highly diversified in terms of languages. Despite language based reorganisation of states, India has not been able to solve many language related problems. Under the state reorganisation, only a few major languages have been given official recognition and resource support. The following issues need to be looked into: Language nationalism operates at the regional level rather than at the national level; Three-language formula devised for imparting education at different levels is still not fully implemented; The states have not devised their policy for protecting the educational, cultural and economic interests of the language minority groups who inadvertently have fallen in particular state territory. Educational implication of the language diversification has not been worked out and incorporated into the education system. Unity at the national level should have national language component in the policy framework. The Indian constitution lists 15 languages as major languages. All major languages have regional and dialectal variations. Besides these, 227 languages/dialects have also been recognized as mother tongues making the task of language planning and promotion more difficult. Furthermore, diversification of tribal groups in terms of languages make the situation that much more complicated.

Religion Religion is an important binding force of social integration among individuals and groups. By religion, we generally mean belief in supernatural being or entities. Religion has

NSOU ? CC-ED-03 ? 124 been playing an important role in Indian society from the very evolution of human society. It has never been static. India is a multi-religious society. Changes have taken place in religions from time to time. Religious reform movements have been integral parts of India's sociocultural life. The 1961 Census of India listed 7 religious categories, Hindus, Muslims, Christians, Jains, Buddhists, Sikhs and other religions and persuasions. However, there are other religious groups such as, Jews, Zorastrians and tribals which find mention in the 1931 Census. Religion is a complex phenomenon in India. Conservative and progressive elements are found among different groups highlighting intra-religious differentiation. Religious conversion has been a controversial issue throughout the Indian history. It still draws attention even in the contemporary situation. In recent years, religious conversion of tribals has generated a considerable antipathy and conflict. Religion also brings out internal cohesion by cementing internal class, language and other divisions. Even the introduced religions such as, Islam, Christianity, Zorastrian etc. have developed Indian character. Hinduism, the main religion has allowed other religions to grow alongside. It not only affected other religions, but has also been affected by other religions. The Bhakti movement and the Sufi tradition are a testimony to this give-and-take situation. The Constitution of India considering the country as secular has treated all religious groups on equal terms. It has made provision for freedom to all religious groups to hold and practise their beliefs and rituals. Secularism has been ingrained in the national policies and planning of education and development. Caste Caste is a system of social relations. It is an important feature of Indian society based on endogamy, hierarchy, occupational association, purity and pollution, and inscriptive status. Although caste seeks ideological roots in the varna scheme of Hinduism, it is an all pervasive and a very complex phenomenon which holds its sway till today. It has provided internal structure and social base to Indian Society sometimes cutting across religious barriers. The social system that emerged out of social division of labour has received perpetual religious sanction. The caste system has been responding to empirical realities and has been changing. The four fold varnas have given ways to several castes often addressed as jatis. The inscriptive status (i.e. caste ranking based on birth) has made the caste system a bit inflexible. However despite the inscriptive nature of caste ranking, the caste has never been static. The prevalence of thousands of subcastes, clans and subclans within a caste is a testimony of diversification, differentiation and change in the caste system. The Indian caste system has also been analyzed from the class point of view by several social scientists. The caste and class debate has arisen to analyze social differentiation within the caste system.

NSOU ? CC-ED-03 ? 125 According to some sociologists, caste and class are two different forms of social stratification; and changes are taking place from caste (ranking of groups) to class (ranking of individuals). The following need to be taken into account: Despite transformation and changes, the caste system has persisted as an ideology, social structure and practices; The caste system inherits problems related to economic, political and social domination and privileges, subjugation and deprivation etc; The Constitution of India has made special provisions for protection of the deprived castes mainly the Scheduled Castes (SC) and Other Backward Castes (OBC). Tribe Tribal people are other important sociocultural groups in India, constituting over 8 per cent of the Indian population (2001 Census). However, given the current classification of tribal groups in India, it is difficult to define the term 'tribe'. In the Imperial Gazetteer, the word 'tribe' has been defined as 'a collection of families which have a common name and a common dialect and which occupy or profess to occupy a common territory and which have been endogamous'. In fact, with regard to tribal groups, the task has often been to identify the tribal groups, rather than to define them. The academic considerations have not been given due attention in identifying these groups (Beteille, 1986). According to Singh (1994). 'tribe' is an administrative and political concept in India. The categorization of tribal groups has been done state-wise and has not been uniform. There are cases of the groups that have been classified, as scheduled tribes in one state, have not been categorized as the tribes in other states. The tribal groups are much behind their non-tribal counterparts in terms of their educational attainment. With regard to tribal's, the following issues need to be looked at: The tribal groups differ from other disadvantaged groups in terms of their cultural specificities. The tribal people in themselves are highly diversified groups. The degree of tribalism varies from the extremely primitive isolated tribal groups located in the Andaman Islands to the modern developed tribal groups such as the Meena in Rajasthan. The tribal groups are further differentiated in terms of size, territorial locality, racial features, marriage and kinship patterns, languages/dialects, economy, religious beliefs and practices, development and educational attainment etc. The tribes being a local community perceive their identity largely at the regional and local levels than at the national level. The problems faced by the tribal groups vary from region to region, state to state, and from one tribal group to another. Gender Gender is a form of socio-biological difference between man and woman. The sexual

NSOU ? CC-ED-03 ? 126 difference is socially constructed contrasting characteristics labeled as masculine and feminine. Conceptually the term 'gender' differs from 'sex', as the latter refers mainly to bimodal distribution of biological and demographic characteristics between male and female. In the case of gender differences, it is the socio-biological differences that have been historically conditioned and are accepted as part of the social institutions. The elements of power and control are embedded in the gender difference. Although both sex and gender differences are universal, the nature and degree of difference varies from one social group to another. The educational development in India is characterized by widening gender gap in education. The picture is dismal, as the female literacy is 54.16 per cent as against 75.85 per cent for males (2001 Census). The gender disparities exist at all levels of education. For example, the gender gap at the primary enrolment level was 22 per cent (Haq and Haq, 1998). The gender gap in education needs to be understood in terms of disadvantaged position of women in Indian society. Although the Indian women suffer from biases in almost all spheres of their social life, the nature and intensity of this biasness may however vary across different social groups. The problem is intensified further, when gender disadvantage is combined with class, caste, religious and other disadvantages. For instance, the dropout rate at the elementary schooling stage is the highest among rural ST female children social diversity resulting from social differentiation is characterized by the problems of disparities and disadvantages. Very often, these group disparities get reflected in regional imbalances, if there is concentration of disadvantaged groups in certain pockets or regions. So 'region' although not a social category, shows a certain pattern indicating a particular socioeconomic status, because of certain categories of social groups inhabiting the region. For instance, the northern and eastern regions are backward in terms of educational and economic development, as the regions have higher proportions of the disadvantaged groups. Disparities within and among different groups need to be studied from different angles. The following section deals with the impact of social diversity on education.

Disabilities There are many types of disabilities which can be recognized as an instrument to form diversity among the mass. There are various types of disabilities or special abilities such as physical, mental or situational. We should consider these especially abled people as socially diverse people and on the basis of their disabilities they should be accommodated in our society. In addition to the above described major forms of diversity, we have diversity of many other sorts like settlement patterns - rural, urban; marriage and kinship pattern along religious and regional lines and so on.

NSOU ? CC-ED-03 ? 127 In this way diversity pervades on the whole of Indian subcontinent. And such diversities are not the hallmarks of Indian culture. The main theme of Indian culture is unity which absorbs all these diversities. Social Inclusion In every country, certain groups confront barriers that prevent them from fully participating in their nation's political, economic, and social life. These groups may be excluded not only through legal systems, land and labor markets, but also through attitudes, beliefs, or perceptions. Disadvantage is often based on social identity, which may be derived from gender, age, location, occupation, race, ethnicity, religion, citizenship status, disability, and sexual orientation and gender identity (SOGI), among other factors. Exclusion can rob individuals of dignity, security, and the opportunity to lead a better life. Acknowledging this, the United Nations has committed to "leaving no one behind" in an effort to help countries promote inclusive growth and achieve the Sustainable Development Goals (SDGs). Social inclusion is also an integral part of it. The World Bank Group defines social inclusion as: 1. The process of improving the terms for individuals and groups to take part in society, and 2. The process of improving the ability, opportunity, and dignity of those disadvantaged on the basis of their identity to take part in society. Socially an inclusive society is that society which can accommodate everyone without any discrimination. In human history, social inclusion as a policy instrument comes up only in recent times with the advancement of democracy and new phase of capitalism. It has otherwise been rare that the political ruling groups would adopt a policy of social inclusion. It would sound strange as most political system were based on social division and the ruling groups thrived on divided social fabric. On the other hand, however, there have been attempts from within the societies to usher new ways and principles of accommodating individuals, communities and groups. This accommodation proceeded both horizontally as well as vertically. New groups, or foreign elements either migrating from other locale required horizontal inclusion into societies. Indian society has been a very good example where principles and processes to assimilate, or include and accommodate groups or people have been in operation for centuries. Many tribal groups, for example, Sakas and Hunas, from central and west Asia and beyond came and settled in different parts of India. Society, over the time, absorbed

NSOU ? CC-ED-03 ? 128 them through different mechanisms. There were new terms coined to regulate the social interaction with these new groups. Mlecchas was not only the term for the foreign elements but also signified the code of relationship that was designed between the native and the foreign elements. In the course of time, the foreign elements lose their traces and become part of the local community. The medieval history too witnessed such incorporations by different groups. In the nineteenth century the British writers and administrators thought that the Indian society was immobile and non-change was its defining characteristic. The 'unchanging village community' with its 'self-sufficient economy' was thought to be the example par excellent of this. Theories about caste, religion, etc., by many foreign scholars were based on these assumptions. In reality, however, there were very dynamic interactions between institutions and human groups and this relationship transcended villages, regions and quite often had continental dimensions. Pilgrimage sites were of such interesting networks. Many groups and ideas and values had their entry into the societies in this horizontal interaction. What, however, is more intricate is the basis and processes of inclusion vertically. Historians, for example, pointed out that in modern times colonialism produced the most intense unequal relationship between societies, between the one which was colonial and exploited the resources of the colonized societies through various instruments. The colonial system, in its turn, legitimized this unequal relationship on the basis of race, technology or civilizing mission. Delving deeper into the working of both the colonial and colonized societies, one soon discovers that the unequal relationship was based on the unequal ownership of the factors of production which historian Bipan Chandra had first pointed out as 'colonial mode of production'. It was further argued that this inequality characterized even the pre-colonial social order in the colonized societies. Historian Irfan Habib, for example, showed how the Mughal Empire and economy was an exploitative economy so far as the poor were concerned. Later day historians showed how the contemporary society remained anchored on unequal relationship and perpetuated this unequal economic order, locally, regionally, nationally and globally. It is generally argued that it was very significant that bases of this unequal order be understood properly so that appropriate response can be created. Forms of Inclusion As we know the process and the basis of exclusion, we understand the way inclusion principle works. Interestingly, there has always been very powerful movement to protest the state of exclusion, thereby making the society more inclusive of the diverse communities, and groups. However, in a society defined and divided by caste, it was always very difficult to include people without defining their exact location. In 1941, N.K.Bose talked about the NSOU ? CC-ED-03 ? 129 Hindu ways of absorption and how different tribes have been absorbed within Hindu society by accommodating them as a group practising the particular specialised crafts. This was a significant mode of inclusion that was historically obtained. Historians have pointed out that the most significant process of inclusion, both vertically and horizontally, for centuries, had been through assumption of particular jati name and become part of the large pantheon of Indian society. Many have suggested that with Conversion to another religion one has introduced a new element and organisation principle but a careful observation would suggest that even after conversion many groups have retained their previous jati identity to preserve its domain and space in the larger social frame. With the widening of the Indian national and social horizon, new elements like, for example, Naga, Mizos, or other tribes from extreme East came under the national rubric who were socially not part of the erstwhile socio-cultural setting based either on jati or dharma. The ethnic variety from north-eastern part brought a fresh new component and was to be accommodated in the social horizon. It remains an extremely significant issue as to what facilitates inclusion of the new groups into a new national space coming to life during the last 100 years or so. The idea of a nation in India, with its distinctive inclusive appeal, has helped to bring many groups and people to a common world of economy, polity and in many cases a cultural dialogue. The democratic template provides this new nation with its distinct inclusiveness. The modern base of the nation in the Indian setting in fact allows one to avoid two particular extremes, i.e, identity-based exclusive nation and second, the exacerbation of the primordial identity to the exclusion of all others. Historically, religious movements like Bhakti movement in the 8th to 12th and later during 15- 17th centuries provided strong critique of the principle of exclusive and orthodox social order. The Veersaiva movement in the South and Nanak, Kabir, Ravi Das, provided strong indictment of the existing social order and brought a new social philosophy of openness. Coming of Islam, with its strong emphasis on a new social order based on equality, too brought openness which was further advanced by the Sufi orders which went far and beyond to bring many groups into close proximity a prerequisite for a sense of togetherness. Social reforms were integrally connected with religious reforms. That is why when in the nineteenth century social reform movement phase came, the reformers clearly attacked the religious core of the legitimizing principles inherent in social inequalities. It is significant here that the attack on the Hindu social order and its practice of exclusion of lower castes by the Christian missionaries since the nineteenth century, an attack which is continued even today by the evangelists, provided one of the major thrust for the religious and social

NSOU ? CC-ED-03 ? 130 reformers to work for removing inequalities from the Hindu social order. It is no wonder that from 1820s onwards, many intellectuals and social leaders like Raja Rammohun Roy, Jyotiba Phule, Sri Narayan Guru, Ayothiadas, Dayananad Saraswati, Dadabhai Naoroji and others saw the urgency of changing the existing social order. In this they all attacked caste system and practices like untouchability prevalent in India. Raja Rammohun Roy, for example, attacked the prevailing social division based on caste as antagonistic to any new vision of a new world. It was later when the Indian Social Conference was set up with the efforts of the great reformer of India, M.G.Ranade, N.G. Chandravarkar, etc., that a dedicated modern movement to change such practices came into mainstream. In the meantime, however, individual efforts to empower groups and communities were carried on by individuals and groups with tremendous zeal and sacrifice. Jyotiba Phule in Maharashtra, for example, opened school for women and through his writings, carried on campaign to attack the basis of inequality. The Indian national movement was the largest mass movement and this led to its acquiring its democratic, open and inclusive character. In a mass movement people join the movement breaking all boundaries of class, caste, region etc. As Visalakshi Menon opines, during the non-cooperation movement and civil disobedience movement a large number of women had come out in public breaking the gender prejudice and went to jail. Similarly, different shades of the communist and socialists who tried to mobilize the peasants, the working class during the national movement helped in bringing large sections of the marginalized people into the democratic mainstream of the nation. Gandhi's intervention has been truly phenomenon in the realm of social inclusion. His success in bringing people of all hues to the national movement and thereby enlarging the space of further extending the frontiers of freedom was enormous. By bringing up the social issues to the centre of his movement, he provided that space with a social conscience. This defined the democratic order later. He brought issues of untouchability and Hindu-Muslim divide at the highest priority level and did not prioritise freedom from colonial rule at the cost of these issues. He argued that freedom from foreign rule is meaningless unless accompanied by freedom from our own ills. The Anti-caste movement led by Gandhi can be said to be unique in the history of movement for a human society based on the principle of non-hierarchical arrangement. Gandhi personally led the movement to mobilize public opinion for such a society and particularly against the prevailing practice of untouchability. In 1924-25 and again in 1934-35 he toured the whole country to mobilise opinion against untouchability- a practice which saw a major chunk of humanity being treated as beyond sub-human level.

NSOU ? CC-ED-03 ? 131 The thrust of Gandhi was that the savarnas or the upper caste who perpetrated the treatment should own up the responsibility for their acts of omission and commission and take initiative to end the practice in such a way that the fundamental principle behind the exclusion is wiped out. He argued that it was the idea of hierarchy that underlies the practice of untouchability. Once this principle is wiped out of existence, the caste system can be said to have purged of this principle. He therefore considered other practices as a symbol or symptom of the disease while the disease was the idea of hierarchy. One of the areas that symbolically attacked was the temple entry movement in Guruvayur and Vaikom. Gandhi wanted the upper caste who practised discrimination to change and invite those who were denied admission. Thus he wanted the social inclusion to take place not on the basis of the right but of acceptance because he felt that right-based approach does not endure but the change of heart and mind would. Gandhi made the Hindu Muslim divide a major political plank and advocated that the divide needs to be broken and both begin to respect each other's religion and live like brothers. In Noakhali, which was affected by riots, he asked the Hindu women to make the Muslim women literate as this not only brings education but also brings down the walls of separation. He negotiated with Jinnah and resigned to the fact of partition, which he felt, was not to be based on the Two-Nations theory as that would have been exclusionary. On the issue of the dalits being converted to Christianity, he attacked the idea of conversion as he thought that was a wrong way to address the issue. He argued that it shows disrespect to other religion as it privileges one religion over the other. It does not address the question of correcting the aberration if any that has crept in any religious practice. In practice too, one found that conversion- instead of creating a more inclusive principle- brings a new exclusionary base to come into operation. This also meant that the process of inclusion should be without violence. However, what is unique in the Gandhian approach was the attack of the very foundation of the principle of exclusion. Mandela adopted this approach during the anti-apartheid struggle. Martin Luther King had approached the issue of blacks in the US similarly Democratic inclusion Gandhi's idea of inclusion through non-violent means also foresees a democratic system to operationalise it. He was in favour of broad-based democratic order reaching up to the villages. Non-violent inclusion was in some way coterminous with the democratic ways of inclusion. This interestingly was also the basis on which most of the Indian leaders fought for inclusion, including Nehru who wanted a socialistic order, Ambedkar who wanted the current caste-based exclusion to be eliminated, and many others. Democracy and

NSOU ? CC-ED-03 ? 132 development seemed to all of them to be the guaranteed way to bring inclusion without violence and in the most effective way. The idea of justice and equity was to be prioritised over anything else. Therefore, from the beginning, at the international level, it argued for nonracial organization of the world institutions and polity. India was the first country to raise the voice of anti-racial and anti-colonial world. A very critical component was the tradition and traditional institutions like community, caste etc. were found to be legitimising the social order based on discrimination. It is here the role of the education and educational institution was most critical. The public institution has done the most effective inclusion throughout the world and the independent India tried to imbibe socially inclusive educational policy. There are heavy roadblocks as nearly 40% of Indian school going children do not go to school. Experiments involving millions of children by groups like MV Foundation in Andhra Pradesh have found that it is not poverty but wrong policy that prevents children from going to school. Thus education remains the most significant inclusive agenda as it not only brings different social groups onto a single platform but it also fosters modern ideas of democracy, gender equality, justice which would sustain the inclusive ideas for the generation. Ambedkar for example argued that Hindu religion legitimized castes and untouchability; the communists argued that communities based on religion hide the fact of internal exploitation based on gender or class. The template of modernization was adopted along with development so that the idea of citizenship is developed and idea of justice and democracy takes deep root.

6.5 Education and Contemporary Social Issues 6.5.1 Population Explosion The relationship between education and population has attracted the attention of both scholars and policymakers, especially since the mid-1970s. The rate of population growth and the number of people living on earth have both increased spectacularly since the beginning of the nineteenth century. During the twentieth century, the human population increased at an average annual rate that was about fifty times as fast as the rate over the previous 10,000 years. Between 1800 and 2000, the number of people alive increased nearly seven-fold. Following World War II, the rate of population growth exploded-during the 1970s it was about four times as great as it had been a century earlier. By 2000, the living population exceeded the entire population born between the beginning of settled agriculture and the year 1900-a period of 10,000 years. The implications of this explosive growth for both the physical environment and human wellbeing alarmed many observers and prompted an intense public policy debate. Many scholars and policymakers noted that high levels of educational achievement were associated with more

NSOU ? CC-ED-03 ? 133 moderate rates of population growth, suggesting that important opportunities for alleviating population pressures might be found in ensuring greater access to education, particularly for females. The ensuing public policy debate has prompted an examination of how education affects the birth rate. The explosive growth of the human population in the nineteenth and twentieth centuries was the result of a historically unprecedented decline in the rate of mortality, rather than an increase in the birth rate. The proportion of children dying before reaching the age of five fell from nearly one in three in most of the world to less than one in one hundred in the most advanced societies over this period, and to one in ten in low-income countries. In the wealthiest countries, birth rates adjusted quickly to restore a balance between births and deaths and establish a rate of population growth of less than 1 percent a year. In economically advanced societies, the average number of children born to each woman over her reproductive life has fallen from about seven to less than two. However, in the poorest countries, a sharp drop in death rates has not been accompanied by a corresponding fall in birth rates. As a result, the rate of population growth-the difference between the average birth rate and the average mortality rate-has increased dramatically in most of the world. The growth of population has been greatest in countries that are both poorest and least able to invest in social and educational services. The combined effects of these forces seem to imply that the gulf between rich and poor is likely to widen over the foreseeable future if aggressive policy measures are not introduced. These facts suggest that the key to ensuring a sustainable rate of population growth lies in reducing the fertility rate. However, in a highly influential 1979 review of the research literature on the relationship between education and fertility, the economist Susan Hill Cochrane concluded that too little was known about the mechanisms through which education affects population growth to allow policymakers to rely on improvements in educational opportunities to slow the rate of population growth. Since 1976 a large number of scholars have focused on the impact of education-especially the education of the girl child-on fertility, mortality, and population growth. The central purpose of these studies has been to determine whether the nearly universal association of low fertility and high levels of educational attainment are causally linked or merely the result of their association with other forces that directly affect fertility. For example, the inverse relationship between female literacy and fertility might have nothing to do with education as such, but might instead simply reveal that societies that seriously attempt to educate females also care about the welfare of women and therefore seek to control fertility in order to protect their health.

NSOU ? CC-ED-03 ? 134 6.5.2 Unemployment A high level of unemployment is a key social problem in many countries. For individuals, unemployment is usually an undesirable state that increases economic insecurity and, when prolonged, has negative effects on a wide variety of life opportunities and living conditions. Unemployment is a serious problem that India has been facing since Independence. The unemployment problem is also severe in India because of growing population and demands of job. Slow economic growth, seasonal occupation, slow growth of economic sectors, fall of cottage industry etc are the reasons which work behind as reasons. The situation has become so drastic that highly educated people are ready to do the job of sweeper. A large portion of population is engaged in the agriculture sector and the sector only provides employment in harvest and plantation time. Unemployment gives raises a number of social issues: an increase in crime rate, exploitation of labour, political instability, and loss of skills which eventually lead to the demise of the nation. 6.5.3 Poverty Poverty is a social condition that is characterized by the lack of resources necessary for basic survival or necessary to meet a certain minimum level of living standards expected for the place where one lives. People in poverty typically experience persistent hunger or starvation, inadequate or absent education and health care, and usually alienated from mainstream society. Poverty is a consequence of the uneven distribution of material resources and wealth, of the deindustrialization of Western societies and the exploitative effects of global capitalism. Poverty may correspond not only the lack of opportunity to improve one's standard of living and acquire resources. Economic measures of poverty include access to material needs, typically necessities such as food, clothing, shelter, safe drinking water, measures of income. Social measures of poverty include access to information, education, health care and political power. Roles of culture, power, social structure and other factors largely out of control of the individuals are the main forces which sociologist uses to explain poverty. In India, about two third of people live under poverty. Sociologist generally recognizes two definition of poverty: a) Absolute Poverty: Absolute poverty is grounded in the idea of material subsistence-the basic needs which must be in order to sustain a reasonably healthy existence, mainly food, shelter and clothing. Absolute poverty is also known as 'subsistence poverty' for it is based on assessments of minimum subsistence requirements or basic 'physical needs'.

NSOU ? CC-ED-03 ? 135 b) Relative Poverty: Most sociologists today use the concept of relative poverty, which relates poverty to the standards of living in a particular society. The main reason for using relative poverty as a measurement is that as societies 'develop', people tend to adjust their ideas of what count as a necessity upwards-for example in poor areas of less developed countries, running water and flush toilets are not generally regarded as necessities, while in more developed countries refrigerators and telephones may be regarded as necessities. 6.5.4 Illiteracy Illiteracy is the quality or condition of being unable to read and write. Illiteracy is a major problem throughout the world. Illiteracy in individuals' stems from different generally inter related causes which together create a series of often insurmountable barriers for those concerned. For instance, for someone born into an under privileged milieu to parents with little formal schooling, the likelihood of illiterate or experiencing serious learning difficulties will be higher. This is known as intergenerational transmission of illiteracy. Illiteracy in India is more or less concerned with different forms of disparities that exist in the country. There are gender imbalances, income imbalances, caste imbalances, technological barriers which shape the literacy rates that exist in the country. 6.6 Summary In the above unit we have tried to understand what a pluralistic society is and how India is the best example of it. We have learned about social diversity and its various markers like language, religion, caste, tribe, gender, and disabilities that categorize society and brings in plurality and diversity. Then we have learned about social inclusion and its various forms. After that we have focussed on the various contemporary social issues like- population explosion, unemployment, poverty, illiteracy etc. and their impact on education. 6.7 Self-Assessment Questions 1. Define Indian society as a pluralist. 2. What is social diversity? 3. Write names of the type of social diversity. 4. Write your opinion about gender inequality?

NSOU ? CC-ED-03 ? 136 5. What is the role of language in Indian social perspective? 6. What role does religion play in Indian society? 7. What is social inclusion? 8. What is the adverse effect of social exclusion? 9. What do you understand by democratic inclusion? 10. What is population explosion? 11. Mention any two problems created due to over population. 12. Is there any adverse affect on education due to population explosion? Discuss. 13. What do you mean by unemployment? 14. What is absolute poverty? 15. What is meant by illiteracy? 6.8 References Bhattacharyya, D.C. (1996). Sociology (6th ed.). Calcutta: Vijaya Publishing House. Choudhury, R.K. (year?). 	<p>major writings have been arranged thematically. Thus caste, tribes, family and kinship, culture and civilization, religious institution, social tensions etc have been separately analyzed in the body of this unit. An attempt has also been made to explain not only the thoughts of writing of Ghurye but also to make a critical assessment of them vis-à-vis contemporary sociological thinking and researches obviously, the present author tried to be as much as analytic as possible in accepting or confuting Ghurye's contributions. Secondly, the question whether Ghurye's writings can be divided into different phases is also relevant here. The question is important because Ghurye was a prolific writer and had written for more than sixty years. We know that there are writers who have changed their opinion and even approaches in different phases of their life. Hardel Laski, for example, possessed an acute, an analytical and receptive mind and one is to take into consideration the different phases of life in order to analyze his thoughts. 4.3</p> <p>W https://kipdf.com/development-of-society-in-india-an-overview_5ac9e8911723dd00365031a8.html</p>		<p>major writings have been arranged thematically. Ghurye presents a huge data on the thoughts, practices and habits of the tribes inhabiting the Central Indian region. He quotes extensively from various writings and reports to show that Katauris, Bhuiyas, Oraons, Khonds, Gonds, Korkus etc. have substantially adopted Hinduism as their religion. Ghurye suggests the Privacy - Terms economic motivation behind the adoption of Hinduism is very strong among the tribes. They can come out of their tribal crafts and adopt a specialized type of occupation, which is in demand in society. Rural-Urbanization: Ghurye remained occupied all through his life with the idea of</p>

	<p>securing the advantages of urban life simultaneously with nature's greenery. Therefore, he discussd the process of rural-urbanization in India. He viewed that the urbanization in India was not a simple function of industrial growth. In India, the process of urbanization, at least till recent years, started from within the rural area itself. He traced Sanskrit texts and documents to illustrate the growth of urban centers from the need for market felt in a rural hinterland. Development of agriculture needed more and more markets to exchange the surplus in food grains. Consequently, in many rural regions, one part of a big village started functioning into a market. This led to a township, which in turn developed administrative, judicial and other institutions. In the past, urban centers were based on feudal patronage, which had demands for silk cloths, jewellery, metal artifacts, weapons etc. This led to the growth of urban centres such as Banaras, Kanchipurum, Jaipur, and Moradabad etc.</p> <p>securing the advantages of urban life simultaneously with nature's greenery. In brief, it may be said that Ghurye's approach to 'rural-urbanization' reflected the indigenous source of urbanism. During colonial times, the growth of metropolitan centres altered the Indian life. The towns and cities were no longer the outlets for agricultural produce and handicrafts but they became the major manufacturing centres. These centres used rural areas for producing raw materials and turned into a market for selling industrial products. Thus, the metropolitan economy emerged to dominate the village economy. Therefore, the urbanization started making inroads into the rural hinterland in contrast to previous pattern. A large city or metropolis also functioned as the centre of culture of the territory encompassing it. For Ghurye, the large city with its big complexes of higher education, research, judiciary, health services, print and entertainment media is a cradle innovation that ultimately serves cultural growth. The functions of the city are to perform a culturally integrative role, to act as a point of focus and the centre of radiation of the major tenets of the age. Not any city, but large city or metropolis having an organic link with the life of the people of its region can do this work well. According to Ghurye, an urban planner must tackle the problems of: (1) sufficient supply of drinking water, (2) human congestion, (3) traffic congestion, (4) regulation of public vehicles, (5) insufficiency of railway transport in cities like Mumbai, (6) erosion of trees, (7) sound pollution, (8) indiscriminate tree felling, and (9) plight of the pedestrians. Culture and Civilization: There are two conflicting views about the growth and accumulation pattern of culture. One theory maintains that in any community culture grows quite independently of similar events happening elsewhere or predominantly with reference to local needs and local situation. The other group believes that culture grows by diffusion. A single invention or

discovery is made at one place and ultimately this cultural trait diffuses throughout the world. Sir G.E. Smith was the most ardent advocate of the diffusion theory. In one of his papers, "The Disposal of Human Placenta", published in 1937, Ghurye examines the practices of human beings with regard to the disposal of discard of human body like first out hair, nail pairing, first fallen teeth and the after birth. The purpose of this paper is, as he says, to compare the methods of disposal of the human placenta in the different regions of the world to see if they shed any light on the problem of diffusion of culture. Culture diffusion is essentially an anthropological theory, which is concerned with the nature of culture contact operating principally among the preliminary people. According to Ghurye, culture constitutes the central or core element for understanding society and its evolution. In fact, culture is a totality involving the entire heritage of mankind. Ghurye's abiding interest was to analyse the course of cultural evolution and the nature of heritage which mankind has denied from the past. Culture relates to the realm of values. It is a matter of individual attainment of excellence and creativity. Ghurye had a strong faith in the power of man to preserve the best of his old culture, while creating from his own spirit of new culture. He was more concerned with the process of evolution of Hindu civilization, which was termed as a 'complex civilization'. And, Ghurye thought that for analyzing the dynamics of culture in such a long historical civilization the process of acculturation is more relevant than the process of diffusion. He thought that the challenging task of a sociologist is to analyze this complex acculturation process in India. According to him, India has been the home of many ethnic stocks and cultures from pre-historic times. In his analysis of caste, Ghurye referred to how caste system was developed by the Brahmins and how it spread to other sections of the population. The operation of the process of Hinduization also provided the general backdrop of his analysis of the trial phenomenon. Ghurye was promoted by the belief that there is a "common heritage of modern civilization" and that civilization is a "collective endeavour of humanity". He held that behind the rise and fall of civilization, there has occurred a steady growth of culture. Cutting across the vicissitudes of civilization growth, there are certain values, which have been established as final. These values have been termed by Ghurye as the 'foundations of culture'.

All these works reflect Ghurye's interest related to the sociology of religion. For example, in *Gods and Men*, Ghurye discussed the nature of the Hindu ideas of Godhead and the relations, if any, between the climate of an age and the type of Godhead favoured. NSOU ? CC-ED-03 ? 70 In *Religious Consciousness*, Ghurye analysed the three oldest human civilizations, viz., the Mesopotamian, the Egyptian and the Hindu, in their various aspects of mythological beliefs, speculation, cosmology, life after death, view of Godhead, temple architecture, etc. And, in the *Indian Sadhus*, Ghurye considered the genesis, development and organization of asceticism in Hindu religion and the role ascetics have played in the maintenance of Hindu society. *Indian Sadhus*: *Indian Sadhus* (1953 and 1964) is an excellent sociography of the various sects and religious centres established by the great Vedantic philosopher Sankaracharya and other notable religious figures. In this work, Ghurye highlighted the paradoxical nature of renunciation in India. A sadhu or sannyasin is supposed to be detached from all castes, norms and social conventions, etc. Strikingly enough, since the time of Sankaracharya, the Hindu society has more or less been guided by the sadhus. These sadhus were not the lonely hermits. Most of them belonged to monastic orders, which have distinctive traditions. The monastic organization in India was a product of Hinduism and Buddhism. The rise of Buddhism and Jainism marked the decline of individual ascetics like Viswamitra. Indian sadhus have acted as the arbiters of religious disputes, patronized learning of scriptures and the sacred lore and even defended religion against external attacks. *National Unity and Integration*: Ghurye had interest in contemporary Indian situations. As a sociologist, he had been extremely concerned with the concept of integration, the process of national unity in India, and the contemporary challenges to the situation. This concern became apparent even at the time he wrote *Caste and Race in India* in 1932 and *The Aborigines-so-called-and their Future* in 1943. However, this concern with the present 'disturbing trends' in Indian society has come back in a big way in the later writings of Ghurye (Pramanick, 1994). There are three books of Ghurye, known as his 'trilogy' in this field, which are relevant in this connection. These are 'Social Tensions in India' (1968), 'Whither India' (1974) and 'India Recreates Democracy' (1978). In these books he has developed a theoretical framework to explain unity at the social or cultural level. Ghurye held that though groups play an

PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific / generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes of all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this, we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

Unit 1 ? Education and Psychology Structure 1.1 Objectives 1.2 Introduction 1.3 Psychology: Concept, Nature and Scope 1.3.1 Concept of Psychology 1.3.2 Nature of Psychology 1.3.3 Nature of Psychology 1.4 Psychology as the Foundation of Education 1.5 Educational Psychology: Concept, Nature and Significance 1.5.1 Concept and Definition of Educational Psychology 1.5.2 Nature of Educational Psychology 1.5.3 Significance of Educational Psychology 1.6 Summary 1.7 Self Assessment Questions 1.8 References 1.1 Objectives After the completion of the course, the learners are expected to – ? understand the concept of Psychology and its relation with Education; ? realize the Psychological knowledge as the foundation of Education; ? be acquainted with the developmental stages, its theories and applications in Education; ? understand about the Psychology of learning and its impact on Education; ? be acquainted with the aspects of human abilities and its impact on Education; ? understand different aspects of Psychology of learning and its relation with Education.

NSOU ? CC-ED-04 ? 8 1.2 Introduction Broadly, education refers to any act or experience that has a formative effect on the mind, character, or physical ability of an individual. In its technical sense, education is the process by which society, through schools, colleges, universities, and other informal and formal institutions, deliberately transmits socio-cultural heritage – its accumulated knowledge, values, and skills—from one generation to another” (George F. Kneller,1975). Education, in its general sense, is a form of learning in which the knowledge, skills, and habits of a group of people are transferred from one generation to the next through teaching, training, and/ or research. Thus, Education is also a product. It frequently takes place under the guidance of teachers, parents, seniors, peers and other members of the society, but it may also be auto-didactic. The Education, as an academic discipline traditionally stands on four basic foundational areas, namely, Philosophical Foundation, Historical Foundation, Sociological Foundation and Psychological Foundation. The present course material has been developed focusing on the basic concepts of Psychological Foundation of Education. For better comprehension of the Psychological Foundation of Education some basic areas of Educational Psychology we should study at the under graduate level. The identified areas of study related to Education are – (i) Psychology, Education and Educational Psychology, (ii) Perspectives of Educational Psychology, (iii) Developmental Theories of Educational Psychology, (iv) Psychology of Personality, (v) Human Abilities and (vi) Psychology of Learning. 1.3 Psychology : Concept, Nature and Scope Psychology is undoubtedly a very significant academic discipline with its different branches of study. To understand the importance of Psychology, it is necessary to understand first the gradual conceptual evolution of the term Psychology. Psychology is basically the study of human behavior. The basis of the study of Psychology is the micro-level study of the inner mental incidents that takes place within a human mind. The human behavior is found both natural and acquired; thus, these two areas are studied scientifically within the fold of Psychology. Animal behavior is studied as well so that a comparison can be drawn between the human and animal behaviors to draw the conclusive inferences. In the field of Psychology, various knowledge areas and techniques have been developed to study the human behavior intensively as well as extensively. To study Psychology as an academic

NSOU ? CC-ED-04 ? 9 discipline, its conceptual frame, nature and method of study are very important to understand first. 1.3.1 Concept of Psychology The word 'Psychology' has been derived from two Greek words—'Psyche' which means soul and 'logos' which means study. According to the literal meaning of Psychology, it is an academic discipline that studies human behavior. The famous ancient philosophers like Aristotle and Plato considered Psychology a subject that studies about the 'soul' by keeping its literal meaning. The definitions given by these ancient thinkers and philosophers is now considered obsolete but those are significant as historical definitions. The contributions of philosophers of the 17th and 18th century like Leibnitz, Hobbes, Locke, Kant, Hume etc. are worth mentioning. These philosophers said that the word 'Psyche' is mind and the object of study of Psychology is 'Mind'. Therefore, Psychology was accepted as the study of 'mental science', in other words 'study of mind'. Till 1870 this primary definition given by the philosophers was accepted and psychology was studied as a branch of Philosophy and its object of study was the mind. There were basically two limitations found in the definition given by these Philosophers. Firstly, 'Soul' or 'Mind' is very abstract idea that can neither be seen nor heard. Therefore, the studies using scientific methods and techniques are not possible nor any kind of practices can be applied on it. Secondly, after accepting psychology as study of 'mind' or 'soul' its object remains unclear as these words are used in different meanings and it is difficult to say in which context it is used in Psychology. In 1879, Wilhelm Wundt set up the first laboratory of philosophy at the then Lipzig University in Germany. Through various objective studies, gradually psychology became an independent subject of study. As a result the subject matter of psychology was not restricted only to the mind or the soul; it further extended to 'mental activities' and the 'conscious experiences'. Then the 'Structuralists' first advocated the theory of psychology. Wilhelm Wundt and Titchener are the standing pioneers of the theory based on structuralism. According to them, Psychology is the study of the 'conscious experiences'. Here the meaning of conscious experience or immediate experience is related to sensation, imagination, image, feeling and other mental activities. According to Wundt, "sensation is called as the objective element of conscious experience, whereas feeling is the subjective element of conscious experience". But there were many limitations in this definition of 'structuralism'. The major limitation was described that, because the conscious experience cannot

NSOU ? CC-ED-04 ? 10 be studied through objective method, hence this definition of psychology is not able to explain the practical nature of psychology. This definition only emphasizes on the study of conscious experiences, however all experiences of human are not conscious but they are mainly unconscious. So, this definition gives a clear picture that psychology studies all aspects of human mind. Since there were many defects in the definition of structuralists so another definition of psychology was introduced by 'behaviorists'. J. B. Watson is important among the behaviorists. They accepted psychology as 'positive science of behavior'. This definition clarifies that conscious experience is diversified from the object of psychology and behavior replaced it, which is found more objective because that can be seen and heard. Running, crying, smiling, thinking etc. are the few main examples of behavior. In this definition, Psychology is accepted as 'positive science', because it studies all three aspects, such as what, why, and how related to the human behavior. In this definition the main defect was described that the behavior alone is meaningless. The fact is that the explanation of any kind of behavior is based on the foundation of our own experiences, and then only we can get the real meaning. The meaning of Psychology introduced by the Modern Psychologists seems to be the juncture of all the definitions mentioned above. Atkinson, Smith and Hilgard have described, "Psychology is the scientific study of behavior and mental processes." This definition explains that Psychology is not only the study of behavior but also studies about those mental processes that cannot be seen but only be assumed on the basis of the expressed behavior. Morgan, King, Weisz and Schopler have also clarified that psychology is the science of study of human and animal behavior. They have further explained that while defining Psychology as a science of behavior, mind or internal mental events are not being differentiated but it is also included in the same. In the words of Morgan, King, Weisz and Scoplal – "When we define psychology as a science of behavior, we do not differentiate mind we only say that whatever human does means his behavior is the avenue through which the study of internal mental event is being done." Thus, we can say that in the modern era "Psychology means a science in which both behavior and mental processes are studied." 1.3.2 Nature of Psychology In understanding the nature of Psychology, apart from meaning of Psychology, let us try to find out answers of a few basic questions - What is Psychology all about? What kind of science is it? What are its purposes and problems? What is

NSOU ? CC-ED-04 ? 11 human being according to psychology? What is the contribution of psychology to the mankind? By studying these aspects the nature of psychology can be better understood. For centuries Psychology was considered as a part of Philosophy. In the past fifty years, psychologists have introduced it as an independent subject and gave it a nature of science. The nature of psychology that we have now was different in the beginning. When it was considered as a science of 'soul', the purpose was investigation and thinking about soul. Thus, the psychology was related to spiritualism and was a part of philosophy. Till sixteenth century, psychology was considered as science of the soul. People could neither see the soul nor define it. Therefore, they became hesitant to accept it as the science of soul. In order to bring out the change people started calling it 'Science of mind'. But the nature of mind is also not certain like soul and so cannot be defined. That is why Psychology was not accepted as the science of mind and till now psychology could not get the place as pure science, it is considered as natural science. i. Psychology as a Science After studying intensively, psychologists observed there are influences of 'consciousness'. on human behavior. Therefore, psychology has also been accepted as 'science of consciousness', but few psychologists observed that the behavior of human is not always overpowered by consciousness, sometimes influence of unconscious thinking takes place in human behavior. Thus, psychology has also been accepted as the 'science of unconsciousness', but this definition creates some debates among the academicians and nature of psychology kept on changing. Now psychology is considered as the science of human and animal behavior. In psychology the goal is to study human behavior, but the basis of this study includes animal behavior too. Initially with the help of psychology, the experimental study of animal behavior takes place and then the comparison between human and animal behavior brings success in the study of human. There are two kinds of human behavior, 'natural' and 'learned' or acquired. The study of both types of human behavior consists in modern Psychology. ii. Psychology as a Natural Science Modern Psychology is now considered as a complete science. As in pure sciences, certain principles and rules and theories are being set on the basis of experiments. The study of human behavior is being done on the basis of these rules and principles. These bases conclude the discovery of the reason of behavior and the possibilities of past and future of behavior are also predicted and determined. Psychology is not the subject of mere thinking but these evidences are collected by

NSOU ? CC-ED-04 ? 12 using scientific experimental methods. Whatever responses human reflects against one's own environmental stimuli, psychology studies the same. Therefore, we can say—"Psychology is the science of human behavior or is the study of the science of its own reflection of responses towards the stimulants based in the environment." In fact, Psychology can be considered as the 'Natural Science'. There is a specific and fundamental difference between the material science and natural science. In material science we can keep control over the matter or substance and attain success by doing desirable experiments in the laboratory. Opposite to that Psychology taken as subject is human instead of substance which is not controllable as substance. Speed of mind is not controllable. One moment you think of New York and the next New Delhi or New Town. If someone is busy in listening in the classroom, something else instantly revolves around one's thought of mind. Thus, it is not possible to control the human mind like substance. When mental behavior is being studied or mind related rules and principles are determined on the basis of psychological experiments the inferences and the possibilities are necessarily be present. Universality is found in material science, while individuality and individual differences are always there in psychology. For example, when a psychologist studies human behavior in the laboratory his subject would be the mind of a particular human through which his/her behavior would be conducted to study. Psychology accepts three main methods of natural science – Observation, Experimentation, and Description. That is why it is called natural science. iii. Branches of Psychology Keeping objects in mind we can divide psychology into two main branches— (1) Normal or General Psychology (2) Abnormal Psychology. Normal or general psychology is the scientific study of entire behavior of human and animal. But abnormal psychology is the study of sick or abnormal state of human. In general, these two branches are further divided into other sub-branches like, general or normal psychology is divided into individual, group, social, applied and other sub-branches. Abnormal psychology is divided into only two sub- branches individual and group. There are a few more sub-branches other than these. Applied psychology influences only these scopes like educational psychology, Industrial Psychology, religious Psychology are the other sub-branches of applied psychology. iv. Methods of Psychology: Psychologists use many scientific methods for research purposes to understand various psychological issues more scientifically. These scientific methods reduce bias and errors in understanding various behavioral aspects. The relevance of these

NSOU ? CC-ED-04 ? 13 scientific methods extends beyond testing and evaluating theories and hypotheses in psychology. Though there are many such methods used by psychologists, each has its own advantages and disadvantages. Some of the important methods are:

a. **Introspection Method** Introspection or self-observation may be considered as an old method but it is something we are doing almost constantly in our everyday life. Introspection is a method of studying the consciousness in which the subjects report on their subjective experiences. It is a method that requires long and difficult training. It gives in-depth information about the individual. In introspection, the subject is taught to achieve a state of 'focused attention' in which he/she can closely observe his/her own conscious experiences. Thus, he/she will be able to report the smallest possible elements of awareness. Hence, the goal of introspection is to learn about the basic building blocks of experience and the principles by which they combine to give us our everyday consciousness.

b. **Observational Method** This is the most commonly used Psychological method especially in relation to behavioral science, though observations are very common in everyday occurrences and specific observations are formulated in researches. It is systematically planned, recorded to check and control its validity and reliability. In this method, we not only ask the subject to report his/her experiences, but also gather information by direct observation of overt behavior. When observations are carried out under standard conditions they should be observed with a careful understanding of the units, that is the style of recording observed information and the selection of dependent or related data of observation concerned, then it is called 'structured observation'. But observation takes place without these considerations it is called 'unstructured observation'. Structured observation is useful in descriptive studies, while unstructured observation is useful in exploratory studies. Another way of classifying observation is that of participant and non-participant types of observation. In participant observation the observer makes himself/herself a member of the group which is being observed. In non-participant observation, the observer detaches himself/herself from the group that is being observed. Sometimes, it so happens that the observer may observe in such a way that his/her presence is unknown to the people he/she is observing. This is called 'disguised observation'.

NSOU ? CC-ED-04 ? 14 The method of participant observation has a number of advantages, the researcher can record natural behavior of the group and he/she can gather information which cannot be easily obtained; if he/she stays outside the group, and also he/she can verify the truth of statements made by the subjects in the context of schedule or questionnaire.

c. **Experimental Method:** The Experimental method is most often used in the laboratory. This is the method of observation of the behavior or the ability of the individual under controlled condition of fixed circumstances. It is based on conducting of an experiment that is rigidly controlled with highly structured observation of variable change. It allows researchers to infer the causes of a phenomenon. It basically aims to investigate a relationship between two or more variables by deliberately producing a change in one variable and observing the effects of other variables. The person who conducts the experiment is called the 'experimenter' and one who is being observed is called the 'subject'. An experiment begins with a problem. Experimenter wishes to study the related variables of the problem. Then on the basis of existing knowledge base in the field, a 'hypothesis' is formed as suggested solution to the problem under experimentation. To test the hypothesis, relationship between/ among variables are examined. There must be at least two variables. An 'independent variable' is a variable that the experimenters selects to control that according to the requirements of the experiment. The 'dependent variable' that varies with the changes in the independent variable, i.e., subjects behavior. From this method, it is possible to predict the nature of response(s) that may occur to a given stimulus (independent variable). The changes observed in the dependent variable may be influenced by the number of independent variables (factors). To establish a clear relationship between independent and dependent variables and all other possible influences must be controlled or eliminated.

d. **Case-study Method:** It is a detailed description of a particular individual. It may be based on careful observation or formal psychological testing. For example, it may include information about the person's childhood dreams, fantasies, experiences, relationships, hopes etc., that throw light into the person's behavior. Case studies on subject's memories of the past and such memories are highly reliable to understand deep into the problems. As case studies focus on individuals, so we cannot generalize about human behavior.

NSOU ? CC-ED-04 ? 15 e. Questionnaire Method: Questionnaire is a tool of data collection. It is also a method of data collection through which both the 'qualitative' and 'quantitative' data are collected by formulating a set of interrelated questions. A questionnaire consists of a number of questions in a definite order to which the respondents are supposed to response independently by writing the answers or verbally or through e-mails. This method of data collection is especially popular when large scale enquiries have to be made. This is considered as the heart of the survey method. f. Interview Method: This involves collection of data by having a direct verbal communication between two people. Personal interviews are popular but telephonic interview can also be conducted as well. This method is also called 'face-to-face' method. In personal interviews an interviewer asks questions generally in a face-to-face contact with the person being interviewed. In direct personal interview, the investigator collects information directly from the sources concerned. This is used when intensive investigation is required. But in some cases, an indirect interview is conducted where the interviewer cross-examines other persons who are supposed to have knowledge about the problem under investigation. If the interview involves the use of the standard techniques recording against the predetermined questions, known as 'structured interview'. Whereas, the 'unstructured interview' is flexible in its approach of questioning, where the interviewer is allowed greater freedom to ask supplementary questions, omit or change the sequence of questions, if necessary. Other types of interview are (a) Focused interview, (b) Clinical interview, (c) Non- directive interview etc. g. Survey Method: This method involves in asking large number of individuals to complete the given questionnaire(s) by interviewing people directly about their experiences, attitudes or opinions. Since surveys can provide more accurate prediction it is widely used for determining public opinion and prediction on different personal and social issues. For example, the method is used for determining prediction of exit poll (election preference), consumer reaction, health practices, public opinion, attitude etc. h. Testing Method: This method uses the carefully devised and standardized tests for measuring different psychological constructs or variables, viz., attitude, interest, achievement, intelligence, creativity of individuals.

NSOU ? CC-ED-04 ? 16 Adopting any of the above methods in psychology, data are collected about human behavior to study that systematically. 1.3.3 Scope of Psychology The field of psychology can be applied in different fields of human life making an attempt in meeting the comprehensive goals of psychology. i. Physiological Psychology: In the most fundamental sense, human beings are biological organisms. Our behavior depends upon our Physiological structure and functions that work together. 'Bio-psychology' is the branch that specializes in the area. Bio-psychologists can examine the ways in which specific sites in the brain which are related to disorders such as Parkinson's disease or they may try to determine how our sensations are related to our behavior. ii. Developmental Psychology: It covers the studies with respect to how people grow and change throughout their lives from prenatal stages, through childhood, adulthood and old age. Developmental psychologists work in a variety of educational settings like schools, colleges, healthcare centres, business centres, government and non-Govt. and voluntary organizations, etc. They are also very much involved in studies of the disturbed children and advising parents about helping such children. iii. Personality Psychology: This branch helps to explain both consistency and change in a person's behavior over time, from birth till the end of life, through the influence of parents, siblings, playmates, school, society and culture. It also studies the individual traits that differentiate the behavior of one person from that of another person. iv. Health Psychology: This explores the relations between the psychological factors and physical ailments and diseases. Health psychologists focus on health maintenance and promotion of behavior related to good health such as exercise, health habits and discouraging unhealthy behaviors like smoking, drug abuse and alcoholism. Health psychologists work in healthcare setting and also in colleges and universities where they conduct research. They analyse and attempt to improve the healthcare system and formulate health policies.

NSOU ? CC-ED-04 ? 17 v. Clinical Psychology: It deals with the assessment and intervention of abnormal behavior. As some observe and believe that psychological disorders arise from a person's unresolved conflicts and unconscious motives, others maintain that some of these patterns are merely learned responses, which can be unlearned with training, still others are content with the knowledge of thinking that there are biological basis to certain psychological disorders, especially the more serious ones. Clinical psychologists are employed in hospitals, clinics and private practice. They often work closely with other specialists in the field of mental health. vi. Counseling Psychology: This focuses primarily on educational, social and career adjustment problems. Counseling psychologists advise students on effective study habits and the kinds of job they might be best suited for, and provide help concerned with mild problems of social nature and strengthen healthy lifestyle, economical and emotional adjustments. They make use of tests to measure aptitudes, interests and personality characteristics. They also do marriage and family counseling; provide strategies to improve family relations. vii. Educational Psychology: Educational psychologists are concerned with all the concepts of education. This includes the study of motivation, intelligence, personality, use of rewards and punishments, size of the class, expectations, the personality traits and the effectiveness of the teacher, the student-teacher relationship, the attitudes, etc. It is also concerned with designing tests to evaluate student performance. They also help in designing the curriculum to make learning more interesting and enjoyable to children. Educational psychology is used in elementary and secondary schools, planning and supervising special education, training teachers, counseling students having problems, assessing students with learning difficulties such as poor writing and reading skills and lack of concentration. viii. Social Psychology: This studies focus on the society - social thoughts, feelings and actions of people. Our behavior is not only the result of just our personality and predisposition. Social and environmental factors also effect predominantly the way we think, say and do. Social psychologists conduct experiments to determine the effects of various groups, group pressures and influence on behavior. They investigate on the effects of propaganda, persuasion, conformity, conflict, integration, race, prejudice and aggression. These investigations explain many incidents that would otherwise be difficult to understand. Social psychologists work largely in colleges and universities and also in other organizations. ix. Industrial and Organizational Psychology: The private and public organizations apply psychology to management and employee training, supervision of personnel, improve communication within the organization, counselling employees and reduce industrial disputes. Thus, we can say that in organizational and industrial sectors not only the psychological effects of working attitude of the employees are considered but also the physical aspects are given importance to make workers feel healthy. x. Experimental Psychology: It is the branch that studies the processes of sensing, perceiving, learning, thinking, etc. by using scientific methods. The outcome of the experimental psychology is cognitive psychology which focuses on studying higher mental processes including thinking, knowing, reasoning, judging and decision-making. Experimental psychologists often do research in labs by frequently using animals as their experimental subjects. xi. Environmental Psychology: It focuses on the relationships between people and their physical and social surroundings. For example, the density of population and its relationship with crime, the noise pollution and its harmful effects and the influence of overcrowding upon lifestyle, etc. xii. Psychology of Women: This concentrates on psychological factors of women's behavior and development. It focuses on a broad range of issues such as discrimination against women, the possibility of structural differences in the brain of men and women, the effect of hormones on behavior, and the cause of violence against women, fear of success, outsmarting nature of women with respect to men in various accomplishments. xiii. Sports and Exercise Psychology: It studies the role of motivation in sport, social aspects of sport and physiological issues like importance of training on muscle development, the coordination between eye and hand, the muscular coordination in track and field, swimming and gymnastics.

NSOU ? CC-ED-04 ? 19 xiv. Cognitive Psychology: It has its roots in the cognitive outlook of the Gestalt principles. It studies thinking, memory, language, development, perception, imagery and other mental processes in order to peep into the higher human mental functions like insight, creativity and problem-solving. The names of psychologists like Edward Tolman and Jean Piaget are associated with the propagation of the ideas of this school of thought. 1.4 Psychology as the Foundation of Education In English, the word 'Education' has been derived from the Latin word 'Educare', 'Educere' or 'Educatum'. The terms Educare and Educere mean 'to bring up', 'to lead out', 'to draw out' or 'to propulsion from inward to outward'. Whereas, the term 'Educatum' denotes as 'the act of teaching'. It also means 'to train' or 'to mold'. All these terms mainly indicate the development of latent faculties of the child. In Indian point of view, the term 'Siksha' has come from the Sanskrit word 'Shiksh', which means 'to acquire knowledge' or 'to make others learn to attain knowledge'. The term education stands for both the study of the field and for the system that is being studied. To understand this dual meaning, let us consider the basic definitions of Education. The first is a standard definition from American Heritage Dictionary: (i) The act or process of educating or being educated. (ii) The knowledge or skill obtained or developed by learning process. (iii) A program of instruction of a specified kind or level. (iv) The field of study that is concerned with pedagogy of teaching and learning. (v) An instructive or enlightening experience. The second one is from the essay on 'Education' William Frankena in the Dictionary of 'History of Ideas' : i. Relation between Education and Psychology Education is closely related to Psychology. If Education is the modification of behavior in a desirable direction or in a controlled environment, Psychology is the study of behavior or science of behavior. To modify the behavior or to bring about some changes in the behavior, it is necessary to study the science of behavior. Thus,

NSOU ? CC-ED-04 ? 20 Education and Psychology are logically related. The characteristics of developmental stages of children are very essential factors which the teachers must know in order to be a successful teacher. The traditional Education was subject centered and teacher dominated. But the modern concept has been changed into learning centered to learner centered. a. Learner Centered Education: It is the child who has to learn according to his/her needs, interests and capacities. Hence, there is no doubt that knowledge is quite essential for planning and organizing any educative effort. For this purpose all the great educators emphasize that Education must have a Psychological base. Pestalozzi tried to psychologize Education. Montessori and Froebel also advocated that Education must be based on Psychological principles. b. Different Aspects of Psychological Principles: i. The objectives of Education at different stages should have a Psychological base. ii. Curriculum development for different stages should be as per age, ability and capacities of the learners based on some Psychological principles. iii. Suitable methods of teaching, appropriate motivational techniques and teaching devices etc. are the contributions of Educational Psychology. iv. Research based Solutions of different educational problems are the applications of theories of Educational Psychology. v. Preparation of school timing and class time-tables has also the Psychological base. vi. Effective institutional administration and organization need the knowledge of Psychology. vii. Knowledge of Psychology is necessary to study the gifted, the retarded or the mal-adjusted children. viii. The problem of maintaining discipline in the classrooms can be solved Psychologically without any corporal punishment. ix. Educational Psychology provides knowledge about mental health of students and teachers. x. Psychology provided knowledge about scientific evaluation procedure for better assessment of learning output. xi. Better counseling and guidance can be provided for effective learning on the basis of Educational Psychology.

NSOU ? CC-ED-04 ? 21 Besides the above, better student participation in classroom teaching, individualized learning, group activity, learning by doing etc., has a Psychological base. So, we cannot think without Education in modern. The role of school is to help in harmonious development of the personality of the child. So, it becomes the duty and task of the teacher to guide child according to Psychological norms. Therefore, for every teacher, study of Psychology is essential in its Educational applications. Thus, Skinner had justly said, "Educational Psychology covers to entire range of behavior and personality as related to education." 1.5 Educational Psychology: Concept, Nature and Significance Education and Psychology are closely related two disciplines. Thus, Educational Psychology is an applied branch of Psychology. Through psychology we gain knowledge about human mind. Therefore, its relationship with education is mandatory. In the field of Psychology, Psychologists have explained behavior through different means. Educational Psychology is applied branch of psychology. To study the behavior of people from different point of views and instructor needs to have a thorough knowledge of serial development of psychology. So that he brings change in the behavior of his or her pupil by influencing him/her in order to attain the desirable goal. Difference in the ideas of psychologists in the development of psychology and the explanation of behavior resulted the origin of different schools. These schools explained not only the nature of behavior but also brought changes in the ideas of educational psychology. As soon as a child takes birth, he/she becomes connected with the society in some way. How the individual or social human behavior is and what should be is determined by the educational processes. The basic goal of Educational Psychology is to bring changes in human behavior according to one's optimum ability and for the overall benefit of the society through the medium of Education. Understanding the meanings of Education and Psychology that Education is a social process, whose objective is to transform the human behavior in a desirable way for the benefit of the society. Psychology as a science of behavior is also related to change in human behavior. Thus, Educational Psychology studies the various aspects related to the actions of learner, learning and teaching.

NSOU ? CC-ED-04 ? 22 1.5.1 Concept and Definition of Educational Psychology Educational Psychology takes its meaning both from Education and Psychology as both are related to the development of human personality. In the words of Skinner, "Educational Psychology utilizes those findings that deal with specifically with the experiences and behavior of human beings in educational situations." Psychologists and Educationists have defined Educational Psychology in different ways: "Educational Psychology describes and explains the experiences of an individual from birth to old age." (Crow & Crow) "Educational Psychology is primarily concerned with the study of human behavior as it is changed and directed under the special process of Education," (Knall et.al.) "The major of Educational Psychology is learning. It is that field of Psychology which is primarily concerned with scientific investigation of the Psychological aspects of Education." (Sware & Telford) "Educational Psychology represents the application of scientifically derived principles of human reactions that affect teaching and learning" (Alice Crow) "Educational Psychology is the application of findings and theories of Psychology in the field of Education." (Kalsanik) According to 'Encyclopedia of Educational Psychology', this is such a field of study, in which experimental work is done to determine the procedures of studying behavioral concepts in Education. On the basis of above definitions, let us discuss about the Nature of the Educational Psychology: 1.5.2 Nature of Educational Psychology The nature of Educational Psychology is considered to be very scientific. Educational Psychology has established its general principles through the scientific studies of its problems and their solutions and can predict the behavior related to the process of Education. The Educational Psychology is now a major behavioral science as it studies the 'what', 'why' and 'how' in human behavior. In dealing with problems in Education, the approach of Educational Psychology is essentially scientific. It seeks

NSOU ? CC-ED-04 ? 23 to predict and control human behavior in educational situations. It assumes that all human behavior is the result of certain causes and influences and since these are very complex and largely unanalyzed, human behavior is not as predictable as some of the natural phenomena. But the study is nevertheless inspired by the same scientific spirit, and the body of knowledge called Educational Psychology is carefully organized and systematized based on observations and experiments in the classrooms, schools, Laboratories or counseling clinics. Since Education is as large as life, its study is closely aligned to, and draws heavily upon all systems of knowledge which deal with human living. While facts of general and applied Psychology, Physiology, Abnormal Psychology, Social Psychology, Sociology, and Anthropology have a special relevance for Educational Psychology. Thus, it may be said that although Educational Psychology is a branch of Psychology, yet it delivers its principles independently by resolving educational problems on the basis of researches. Thus, newer laws, principles, models and theories have been developing in the field of Educational Psychology.

1.5.3 Significance of Educational Psychology The study of Educational Psychology can and should make a difference in individual learning of the learners and professional life of the teacher. With a better understanding of the springs of human behavior and its important influences in human life, the quality of teaching-learning process or education may be changed in a positive way. All the schools of educational psychology have respective different ideologies to resolve the education related problems. These schools can be helpful in the process of education by giving contribution in their own specific field. The main motto of educational psychology is to help in the holistic development of a child. The different schools of psychology try to understand human mind through their own point of views. Each school has studied the mental problems minutely. In the field of education a few schools have researched on the areas related to learning process, mental development, personality development etc. and thus influenced the process of education. The root of psychology lie deep in our curiosity to know ourselves and our fellow beings, to reach deeper and fuller understanding of the psychological principles that govern human and animal behavior. Etymologically the word 'psychology' was derived from Greek word 'psyche' means 'soul' and 'logos' mean 'study'.

However

NSOU ? CC-ED-04 ? 24 the meaning and interpretation of the concept has been in a state of changing from time to time leading to subsequent changes in the ways of defining the term Educational 'psychology' as may be evident from the following:

I. Nature of Educational Studies: At the heart of Educational studies lies a critical analysis of key issues such as the nature of education, the content and development of curricula, teaching and learning, the relationship between ability, opportunity and success, and the policy issues encompassing all of these. But it must not be assumed that educational studies are essentially school focused. The subject has enormous scope from the development of young children, through learning in Higher Education, to the workplace and a study of lifelong learning. The subject is significant with respect to many aspects of individual and social life.

II. Evolution of Educational Studies: Education Studies as a subject of study, evolved from the pedagogical background of teacher training. The study developed to include many exciting new approaches to teaching and curriculum development, a variety of innovative assessment techniques. It provides teacher educators with a comprehensive preparation to be educators in a classroom or community setting. According to John Dewey, education is "freeing of individual capacity in a progressive growth directed to social aims." Education studies as a subject, equips students with the knowledge that would enable them to be actively involved in elements that create not only just a democracy, but also an equitable social order.

III. Characteristics of Educational Studies: Whilst this rich diversity can be seen as a strength of the subject, the isolation of practitioners has caused problems and for many academics their initial introduction to the subject still proves a steep learning curve as their newly validated programmes grow rapidly. But there can not be no denying the fact that the subject has immense academic as well as practical significance. Educational studies promote the analytical, critical and logical aspects of learning thereby leading to overall growth and development of an individual. It enlightens the teaching fraternity to share the current educational practices, types of methodology, validations, examinations etc. Education has a wider meaning and application. Philosophy of education covers

NSOU ? CC-ED-04 ? 25 aims of education, nature of education, importance of education, and function of education are its very old and essential part of education. Scope of education can be defined as availability of different forms of educational operations in terms of different learning environments, major focus of the study of knowledge or the mode of imparting education. Educational Studies is a program designed to help you graduate with a major and a minor in education with a non-license teaching degree. This major supports students who might be interested in working in the private education field but are not ready to fully teach in a public teaching setting. IV. The future of Educational Studies: Education studies as a subject of study has expanded rapidly over a comparatively short period of time. The initial Educational Studies courses often began on a very small scale. Practitioners tended to be isolated, working alone or in small teams, and as such the courses developed in very different ways depending upon institutional and regional circumstances. V. Concept of Educational Psychology While general science deals with behaviour of the individuals in various spheres, educational psychology studies the behaviour of the individual in educational sphere only. The scope of educational psychology is ever-growing due to constantly researches in this field. Educational psychology is that branch of psychology in which the findings of psychology are applied in the field of education. It is the scientific study of human behaviour in educational settings. According to Charles. E. Skinner, "Educational psychology deals with the behaviour of human beings in educational situations". Thus, educational psychology is a behavioural science with two main references– human behaviour and education. In the words of E.A. Peel, "Educational Psychology is the science of Education".

Education by all means is an attempt to mould and shape the behaviour of the pupil. It aims to produce desirable changes in him for the all-round development of his personality.

The essential knowledge and skill to do this job satisfactorily is supplied by Educational Psychology. In the words of E.A. Peel, "Educational psychology helps

NSOU ? CC-ED-04 ? 26 the teacher to understand the development of his pupils, the range and limits of their capacities, the processes by which they learn and their social relationships." In this way, the work of the Educational Psychologists resembles with that of an Engineer, who is a technical expert. The Engineer supplies all the knowledge and skill essential for the accomplishment of the job satisfactorily, for example, construction of a bridge. In the same way, Educational Psychologists, who is a technical expert in the field of Education, supplies all the information, principles and techniques essential for understanding the behaviour of the pupil in response to educational environment and desired modification of his behaviour to bring an all-round development of his personality. In this way, it is quite reasonable to call Educational Psychology as a science and also a technology of Education. Thus, Educational Psychology is concerned primarily with understanding the processes of teaching and learning that take place within formal environments and developing ways of improving those methods. It covers important topics like learning theories; teaching methods; motivation; cognitive, emotional, and moral development; and parent-child relationships etc. In short, it is this scientific discipline of study that addresses various questions related with the process and product of Education: "Why do some students learn more than others?" or "What can be done to improve the learning?" VI. Nature of Educational Psychology: Its nature is scientific as it has been accepted that it is a Science of Education. We can summarize the nature of Educational Psychology in the following ways:

W.A. Kelly (1941) listed the nature of Educational Psychology as follows: i. To give a knowledge of the nature of the child ii. To give understanding of the nature, aims and purposes of education iii. To give understanding of the scientific methods and procedures which have been used in arriving at the facts and principles of educational psychology iv. To present the principles and techniques of learning and teaching v. To give training in methods of measuring abilities and achievement in school subjects vi. To give a knowledge of the growth and development of children

NSOU ? CC-ED-04 ? 27 vii.

To assist in the better adjustment of children and to help them to prevent maladjustment viii. To study the educational significance and control of emotions and ix.

To give an understanding of the principles and techniques of correct training. Thus, educational psychology is an applied, positive, social, specific and practical science. While general science deals with behaviour of the individuals in various spheres, educational psychology studies the behaviour of the individual in educational sphere only. VII.

Scope of Educational Psychology: The scope of educational psychology is ever-growing due to constant researches in this field. The following factors will indicate the scope of educational psychology: i.

The Learner: The subject-matter of educational psychology is knitted around the learner.

Therefore, it is the need of knowing the learner and the techniques of knowing well.

The topics include – the innate abilities and capacities of the individuals, individual differences and their measurements, the overt, covert, conscious as well as unconscious behaviour of the learner, the characteristics of his growth and development and each stage beginning from childhood to adulthood. ii. The Learning Experiences: Educational Psychology helps in deciding what learning experiences are desirable, at what stage of the growth and development of the learner, so that these experiences can be acquired with a greater ease and satisfaction. iii. Learning process: After knowing the learner and deciding what learning experiences are to be provided, Educational Psychology moves on to the laws, principles and theories of learning. Other items in the learning process are remembering and forgetting, perceiving, concept formation, thinking and reasoning, problem solving, transfer of learning, ways and means of effective learning etc. iv. Learning Situation or Environment: Here we deal with the environmental factors and learning situations which come midway between the learner and the teacher. Topics like classroom climate and group dynamics, techniques and aids that facilitate learning and evaluation, NSOU ? CC-ED-04 ? 28 techniques and practices, guidance and counselling etc. for the smooth functioning of the teaching-learning process. v. The Teacher: The teacher is a potent force in any scheme of teaching and learning process. It discusses the role of the teacher. It emphasizes the need of 'knowing thyself' for a teacher to play his role properly in the process of education. His or her conflicts, motivation, anxiety, adjustment, level of aspiration etc. It throws light on the essential personality traits, interests, aptitudes, the characteristics of effective teaching etc. so as to inspire for becoming a successful teacher. Though the entire scope of Educational Psychology has included in the above mentioned five key-factors, it may be further expanded by adding the following: It also studies (a) Human Behaviour in educational situations, (b) Growth and Development of the child, (c) Contributions of Heredity and Environment towards the growth of the individual, (d) Nature and Development of the Personality of an individual, studies individual difference, (e) Intelligence and its measurement, (f) Guidance and Counselling etc. We can conclude by saying that Educational Psychology is narrower in scope than general psychology. While general psychology deals with the behaviour of the individual in a general way, educational psychology is concerned with the behaviour of the learner in an educational setting. The scope of Educational Psychology is securing greater and greater importance in the field of education. Educational psychology is the combination of two i.e. Education and Psychology. So, educational psychology is the study of behavior of the teacher, taught and persons connected to educational environment. Educational psychology is, therefore, that branch of educational content, which deals with human behavior and its modification. 1.6 Summary Psychology is basically the study of human behavior. The basis of the study of Psychology is the micro-level study of the inner mental incidents that takes place within a human mind. In modern times, the application of psychology has been increased as an interdisciplinary study i.e., educational psychology, social psychology, cognitive psychology etc. The concept, nature and scope of psychology have been discussed in the beginning of the unit. Psychology plays its role as a major foundation NSOU ? CC-ED-04 ? 29 of education has been discussed in the middle of the unit. At the end, the concept, nature and significance of the educational psychology have been discussed. 1.7 Self Assessment Questions 1. What do you mean by psychology? 2. Define psychology. 3. Write any two scopes of psychology. 4. State any two nature of psychology. 5. What is psychological foundation of education? 6. What is educational psychology? 7. Define educational psychology. 8. State any two nature of educational psychology. 9. Discuss the importance of educational psychology. 1.8 References Agarwalla, Dr. Sunita: Psychological Foundation of Education and Statistics, Bookland 2008. Aggarwal, J. Objectives After going through this unit, you will be able to — ? understand

growth and development of a child; ? be acquainted with the perspective of Educational Psychology: Biological, Behavioral and cognitive; ? realize developmental stages and its impact on education. 2.2 Introduction Changes are the characteristics of life. All the living beings of this planet are changing continuously. You know that a large banyan tree grows from a very small seed. Similarly, all animals including the human beings have been changing themselves. Some changes may remain unnoticed, suddenly that come to our notice. Such as, language development, decision-taking ability, control of emotion etc. Hence, changing is the natural quality of life. Education helps in desirable changes in human life. Modern educationists believe that ultimate qualitative

NSOU ? CC-ED-04 ? 31 changes in human beings are possible through proper education only which is the combination of natural direction of individual development along with the individual and social aspirations. Scientific fusion between these two is one of the major goals of education. These changes may be of two types – (i) Growth and (ii) Development. 2.3 Growth and Development of a Child Let us first understand the meaning of two important terminologies of the Sub-unit, viz., ‘

Growth’ and ‘Development’, which are apparently used as synonymous terms. But, in fact, growth is different from development. Growth means an increase in size, height, weight,

length etc. which can be measured quantitatively. Development, on the other hand, implies change in shape, form or structure resulting in improved working or

in functioning. Improved functioning implies certain qualitative changes leading to maturity. Growth and Development both are the important characteristics of any living organism. But development involves a series of progressive, orderly and meaningful changes leading to the goals of maturity. Normally, growth contributes to Development. In reality though growth and development are different, but they are inseparable. Generally, both the processes of growth and development goes on simultaneously. I. Concept of Growth and Development: Human life starts from a single fertilized cell. This cell goes under constant changes interacting with the environment within the mother’s womb and after birth with the outside world. This interaction leads to the Growth and Development of the child. Division of each cell and its growing into thousands and thousands in number, or their changing tissues, blood or bone, is part of the process of Development. The increasing size and weight of an organism or limb of the baby, is known as Growth. Growth and Development are the continuous progressive changes in the organism. “Development means a progressive series of changes that occur in an orderly predictable pattern as a result of maturation and experience” (

Hurlock). In the words of Piaget, “In reality, development is the essential process and the total development happens with the cumulative effects of the smallest units of learning.” The primary elements of development are – Maturation, Experience, Social Transmission and Equilibrium in life. Human development occurs with the cross- interactions among these four elements in the appropriate educational environment.

NSOU ? CC-ED-04 ? 32 II. Nature of Growth and Development: Changes may be of any type - external, internal, quantitative or qualitative, but common nature of change would be a continuous, progressive, natural and controllable process. According to research findings of Sears, Erikson, Bandura, Piaget and Kohlberg, some basic principles have been identified. Those are: i. Interactions for Development: Development is the product of interactions. It is also the result of continuous interactions between heredity and environment. Human development does not depend only on heredity or the inborn ability or potentiality, but also on how the present environment is influencing. It depends on their cross-interactions. ii. Continuity: In human life, development is a continuous process. The continuous changing process of development starts from birth and that continues till death. But the rate of development is not constant. Sometimes, it is slow and sometimes it is fast. Sometimes it is explicit and sometimes it is implicit. But it is always continuous. iii. Orderliness: Generally, the nature of human development follows a definite order. As for example, the child who cannot sit independently would not be able to stand or run alone. Generally, the primary level of development influences the next level development. iv. Definite Direction: Always human development occurs in definite direction. It has basically two directions - Cephalocaudal and Proximodigital. During early stage of development, the head is proportionately larger than the whole body. So, at this stage the other portion of the body develops rapidly than the head (bottom to up) to make it a balance. This is known as Cephalocaudal development. Similarly, when the developmental process starts from the middle axis of the body and gradually it extends towards the extreme ends, is known as Proximodigital development. v. Cumulative: Development of an individual at any stage depends on the level of maturity, previous experiences, body balance etc. of the just previous stage. It has been proved by Hurlock that behavioural experience at any stage of development is the sum total experiences of previous stages.

NSOU ? CC-ED-04 ? 33 vi. Individuality: Though there are certain common characteristics of development, but it is also simultaneously controlled by the characteristics of individuality. Differences in Body structure, mental ability, experience, will-force, emotional expression or social expression are the characteristics of individuality which effects on developmental process. vii. Complexity: Human being himself is the complex combination of various dynamic entities. Each of these entities does not affect equally on the individual development. Besides that, there are some external factors like, nutrition, healthy environment, social environment, illiteracy etc. that influence upon the individual development. There is also a significant effect of 'critical period', in the process of developmental continuity. viii. Unification: Developmental process of an individual maintains a balance and the developmental factors influence each other. It tries to bring balance in life among different factors and forces of development. ix. Context of Development: Based on Heredity and Environment, there are three inter-connected contexts of Development, which normally influence each other. Education plays as the most important factor to bring harmony and stability in individual life. These dimensions are - Physical Development, Cognitive Development and Social-Emotional Development. III. Principles of Development: We should keep in our mind that there are several underlying principles of human development, those are: a. Development is a life-long process and change is apparent across the whole lifespan. b. Early experiences always affect on later development. c. Development is multi-directional though each of those follows respective uniform rate. d. The multi-dimensional Developments are held across the three basic dimensions, viz., Physical, Cognitive and Social-Emotional.

NSOU ? CC-ED-04 ? 34 e. Development is characterized by plasticity or our individual ability to change. f. Development is multi-contextual, that means, influenced by both nature and nurture or by heredity and environment. IV. Dimensions of Development: Development in human life is a multi-dimensional process. Hence, the total development of human beings cannot be explained by the single dimension. The multi-dimensional nature of human development is basically considered by following four dimensions: a. Physical Development (Growth): Every girl child thinks that she would be like her mother whenever she becomes adult. Similarly, a boy thinks he would be like his father later in his life. This type of thinking is primarily the thinking of growth or Physical Development. The growth of organs and sub-organs and its corresponding effect on explicit changes in human behavior from beginning to end of human life is known as Physical Development or Growth. So, growth is the structural, quantitative and qualitative changes in the body of a child. It may be related with the external structure (viz., height, weight, shape etc.), or it may be related with the internal systems of the body (viz., nervous system, muscular system, digestive system, skeleton system, reproductive system etc.). b. Cognitive (Intellectual) Development: It is an astonishing fact that a child who cannot speak a few days back, how the baby learns to organize own thinking and able to speak with logic within a few months; or another child, who used to fail in remembering simple digits, how can she solve the complex mathematical problems easily. How are these possible? The mental processes within a neo-natal baby exist in a very simple form. Gradually, with the increase in age and experience, the maturation comes within the body in one hand, and on the other hand, child tries to interact with the immediate environment for adaptation as a living organism. According to the natural law of life, different types of simple mental activities gradually become logic based and more complex in nature. Generally, such type of development is known as Cognitive or Intellectual Development. It is not only related with intelligence, but also with the cumulative development of logic based mental processes, which continuous from birth to death in human life. According to Piaget, Cognitive mental processes of an individual are related with perception, learning, memorization, thinking, imagination, intelligence, concept formation etc. of an individual.

NSOU ? CC-ED-04 ? 35 c. Emotional Development: The sensation driven force behind our expressed behavior is emotion. So, emotion is a type of drive-feeling that facilitate as well as control the level of expressed behavior. It is a type of functional experience that tries to adapt and generalize internally and stimulates the mental structure in such a way that expressed any explicit style of behavior. Pleasure, sadness, arrogance etc. are the examples of emotional feelings. Sharpness of explicit feelings gradually changes with the learning, experience and time. The overall specific direction of this change is known as emotional development. Actually, the main purpose of emotional development is to make dynamic adaptation of individual's feelings with the maturity. d. Social Development: Man is a social being. As it is not possible to live alone in this world, human beings have learned to form groups to live together. By birth, child is socially neutral. That means, during birth, child has only biological entity, no social base. To maintain the existence of biological entity, the child needs supports from parents and others. On the other hand, the biological entity has an infinite internal power of adaptation with the world. So, with the time, from the social entity gradually the social development occurs. Hence, the social development is a conscious effort of gradual progression towards the socially desired goals. V. Stages of Growth and Development: Both Growth and Development are continuous processes. So. It is very difficult to find out distinct stages of Growth and Development. We can take an example of clock for measuring time to understand this complexity. Let us imagine the 'continuity of time'. We do not know when it has been started and how long it will continue, but, to understand the segments of time at present and to utilize that in our daily life, we have made it artificially divided the continuous time-flow into century, year, month, week, day, hours, minutes, seconds etc. Similarly, the process of Growth and Development of Human Life has been divided by the Psychologists and Educationists into the following stages: i. Heredity and Pre-natal Growth (About 266 Days in Mother's Womb): Now, we should look at what happens genetically during conception and what happens during Pre-natal Development. Let us discuss the impact that both father and mother equally effect on developing the fetus. We know Development is the product of 'Heredity' (Nature) and 'Environment' (Nurture). It is difficult to isolate the root of a single characteristic of development either from Heredity or from

NSOU ? CC-ED-04 ? 36 Environment. In fact, almost all human features are 'Polygenic' (a result of many genes) and multi-factorial (a result of both Genetic and Environmental factors). This bi-directional interplay between Nature and Nurture is known as 'Epigenetic Framework' which suggests that environment can affect the expression of Genes as Genetic Predispositions which can also impact upon person's potential. During the beginning of life, normally the 'zygote' with single nucleus having the genetic information from the parents is formed to start its journey of development at the safe environment in the mother's womb (Uterus). The embryo takes about 38 weeks for total development into a fetus ii. Physical Development in Newborn (Birth to 2 Months): After around 266 days inside the mother's womb, comes the child birth by arduous process. After birth, new born has to regulate his/her own body temperature, breathe for oneself and take in the nutrition through feeding. The 'Apgar Assessments' are conducted at one minute and five minutes just after the birth. This is a very quick way to assess the newborn's overall physical conditions on the basis of five primary measures, viz., (a) Heart Rate, (b) Respiration, (c) Muscle Tone, (d) Reflex Response and (e) Color. Newborns are also routinely screened for different conditions. It is very important to locate genetic or congenital at the early stage for proper treatment. The dimensions of physical characteristics of newborn are – Size, Weight, Body proportion, Brain development, Skull change, Sleep, Reflexes, Sensory capacities, Vision, Hearing, Touch & Pain and Taste & Smell. iii. Physical Development in Infancy and Toddlerhood (2 Months to 24 Months): The development from infancy through toddlerhood, from birth continues until about two years of age. This part of the life span draws more attention by the contemporary educationists. Healthcare Providers and Parents are being focused in this period because they build the foundation for one's life to come. Major characteristics of this period are: a. Rapid Physical Changes due to Human Growth Hormone (HGH) , b. Proportionate Development of the Body, c. Child becomes equipped with a number of Reflexes (Non-voluntary responses to stimuli), viz., sucking or grasping, d. Gross Motor Skills are acquired by the Infants and Toddlers very first. The description is given in the following table:

NSOU ? CC-ED-04 ? 37 iv. Physical Development in Early Childhood (3 to 5 Years): In an effort to better understand the large spectrum of cognition that Infants and Toddlers go –

NSOU ? CC-ED-04 ? 38 v. Physical Development in Middle Childhood (6 to 11 years): Children at this stage go through tremendous changes in the growth and development of the brain. Gradually they become physically more capable and coordinated. Children are more mindful of their greater abilities in school and are becoming more responsible for their health and diet. i. Brain Development: The Brain reaches about its adult size at about the age of 7 yrs. Between 10-12 years of age, the Frontal Lobes become more developed and thus improved processes of logic, planning and memorization are evident. The child is better able to plan and coordinate activity using both the left and right Hemispheres of the Brain, which control the development of Emotion, physical abilities and intellectual capabilities. ii. Physical Growth: Children come out with all shapes and sizes – height, weight, abilities and disabilities. Growth rate at this stage is generally slow but steady. A child gains weight about 5-7 Pounds and 2 inches a year on an average. They also tend to be slim down and gain muscle strength. The rate of growth for the extremities is faster than the trunk, which results in more adult-like proportions. iii. Development Development refers to the qualitative changes in the organism as whole. Development is a continuous process through which physical, emotional and intellectual changes occur. It is a wider and comprehensive term than growth. It is also possible without growth. In Webster's dictionary development is defined as "the series of changes which an organism undergoes in passing from an embryonic stage to maturity." In Encyclopedia Britannica, the term development has been defined as "the progressive change in size, shape and function during the life of an organism by which its genetic potential are translated into functioning adult system." So, development includes all those psychological changes that take in the functions and activities of different organs of an organism. Development is continuous and gradual process (Skinner). According to Crow and Crow (1965), "development is concerned with growth as well as those changes in behavior which results from environmental situation." Thus, development is a process of change in growth and capability over time due to function of both maturation and interaction with the environment.

NSOU ? CC-ED-04 ? 39 Table : Comparison between Growth and Development 2.4 Perspectives of Educational Psychology: Biological, Behavioral and Cognitive 2.4.1 Biological Perspectives of Educational Psychology Biological perspective is one amongst the various perspectives in psychology, which has helped the psychologists in understanding the association between physiological forces, brain, neuro-transmitters and human behavior. The perspective has helped researchers in discovering real world solutions or practical applications for dealing with behavioral or psychological problems. It is a way of looking at psychological issues by studying the physical basis for animal and human behavior.

100%

MATCHING BLOCK 2/177

W

It is one of the major perspectives in psychology and involves such things as studying the brain,

nervous system, immune system, genetics and effects of biological variables. Biological perspective of genetic studies is considered as the most scientific form of investigation in the modern world, as it relies heavily on experimental techniques which provide validity to this approach. Studies which are held using this approach are performed in controlled lab settings Growth Refers to physiological changes in the individual. Quantitative changes Growth stops after maturity. Growth occurs due to

the multiplication of cells. Growth is one of the parts of the develop-mental process.

Growth is cellular. The changes produced by growth are observable, measureable, and quanti- fiable. Development Refers to overall changes in the individual. Qualitative changes Development continues progressively throughout life. Development occurs due to both maturation and interaction with the environment. Development is a wider and com- prehensive term. Development is organizational. Development brings qualitative changes which are difficult to measure directly, but may be assessed through keen observations.

NSOU ? CC-ED-04 ? 40 and their research results are reliable as well as predictable. The research results achieved are also objective as the findings are based on scientific investigation of the biological variables instead of subjective factors or mere observations. As a result of which, biological perspective has excellent contributions towards treatment of serious psychological or mental activities and its disorders. One of the major limitations of this approach is that it is considered to be restrictive as the biological perspective fails to take into consideration the other influences on behavior such as environmental factors, socio-cultural factors, childhood experiences, human emotions and the like. The Biological Perspective or Biopsychology is a latest development in the field of psychology which has acquired increasing importance as a specialized branch of psychology in recent times. This branch of psychology is also known by different names like Psycho-biology, Biological Psychology, Behavioral Neuroscience and Physiological Psychology. The Biological Psychology attempts to analyze the relationship between physiological or biological processes on the behavior or psychological processes of the individual. This specialized branch of psychology studies how our brain or the neurotransmitters and other biological parameters influence our psychology and behavior, feelings as well as thoughts. Bio-psychologists pay attention to understanding how various biological factors or parameters influence our mental processes, emotions and cognitive functioning 2.4.2 Behavioral Perspective of Educational Psychology Behaviorism defines learning as observable behavioral change that occurs in response to environmental stimuli. Positive stimuli — or “rewards” — create positive associations between the reward and a given behavior; these associations prompt one to repeat that behavior. Behaviorism, also known as behavioral psychology,

There are various approaches in contemporary psychology. An approach is a perspective (i.e., view) that involves certain assumptions (i.e., beliefs) about human behavior; the way they function, which aspects of them are worthy of study and what research methods are important for undertaking the study. There may be several different theories within an approach, but they all share these common assumptions. NSOU ? CC-ED-04 ? 41 The six major perspectives in educational psychology are Behaviorist, Psychodynamics, Humanisticl, Cognitive, Biological and

Evolutionary .

87%

MATCHING BLOCK 5/177

W

Most psychologists would agree that no one approach is correct, although in the past, in the early days of psychology, the behaviorist used to say that their perspective was the most scientific one. Each approach has its own strengths and weaknesses, and brings something different to our understanding of human behavior. For this reason, it is important that psychology does have different perspectives on the understanding and study of human and animal behaviors. Below is a summary of the six main psychological approaches (sometimes called perspectives) in psychology: i. Behaviorist Perspective

95%

MATCHING BLOCK 6/177

W

Behaviorism is different from the most other approaches because they view people (and animals) as controlled by their environment and specifically that we are the result of what we have learned from our environment. The behaviorist perspective is concerned with how environmental factors (called stimuli) affect observable behavior (called the response). This perspective proposes two main processes whereby people learn from their environment: namely, classical conditioning and operant conditioning. Classical conditioning involves learning by association, and operant conditioning involves learning from the consequences of behavior.

92%

MATCHING BLOCK 7/177

W

Behaviorism also believes in scientific methodology (viz., controlled experiments), and that only observable behavior should be studied because this can objectively be measured. Behaviorism rejects the idea that people have free will, and believes that the environment determines all behavior. Behaviorism is the scientific study of observable behavior working on the basis that behavior can be reduced to learn S-R (Stimulus-Response) units only. Behaviorism has been criticized in the way it under-estimates the complexity of human behavior. Many studies used animals which are hard to generalize to humans, and it cannot

be explained. ii. Psychodynamic Perspective

100%

MATCHING BLOCK 8/177

W

Freud believes that events in our childhood can have a significant impact on our behavior as adults. He also believed that people have little free will to make choices in life. Instead, our behavior is determined by the unconscious mind and childhood experiences.

100%

MATCHING BLOCK 9/177

W

Many expressions of our daily life come from Freud's theories

NSOU ? CC-ED-04 ? 42 of

psychoanalysis - subconscious, denial, repression and anal personality to name only a few.

100%

MATCHING BLOCK 10/177

W

Freud's psychoanalysis is both a theory and therapy. It is the original psychodynamic theory and inspired

other

100%

MATCHING BLOCK 11/177

W

psychologists such as Jung and Erikson to develop their own psychodynamic theories. Freud's work is vast, and he has contributed greatly to psychology as a discipline. Freud, the founder of psychoanalysis, explained the human mind

is

96%

MATCHING BLOCK 12/177

W

like an iceberg, with only a small amount of it being visible, that is our observable behavior, but it is the unconscious, submerged mind that has the most, underlying influence on our behavior. Freud used three main methods of accessing the unconscious mind: free association, dream analysis and slips of the tongue. He believed that the unconscious mind consisted of three components: the 'id', 'ego' and the 'super ego'. The 'id' contains two main instincts: 'Eros' is the life instinct, which involves self-preservation and sex which is fuelled by the 'libido' the energy force. 'Thanatos' is the death instinct, whose energies, because they are less powerful than those of 'Eros' are channeled away from ourselves and into aggression towards others. The 'id' and the 'superego' are constantly in conflict with each other and the 'ego' tries to resolve the discord. If this conflict is not resolved, we tend to use defense mechanisms to reduce our anxiety. Psychoanalysis attempts to help patients to resolve their inner conflicts. An aspect of psychoanalysis is Freud's theory of psychosexual development. It shows how early experiences affect adult personality. Stimulation of different areas of the body is important as the child progresses through the important developmental stages. Too much or too little can have bad consequences

in later
life.

96%

MATCHING BLOCK 13/177

W

The most important stage is the phallic stage where the focus of the libido is on the genitals. During this stage little boys experience the 'Oedipus complex' and little girls experience the 'Electra complex.' These complexes result in children identifying with their same-sex parent, which enables them to learn sex-appropriate behavior and a moral code of conduct. However, it has been criticized in the way that it over emphasizes the importance of sexuality and under emphasized the role of social relationships. The theory is not scientific, and can't be proved as it is circular. Nevertheless, psychoanalysis has been greatly contributory to psychology in that it has encouraged many modern theorists to modify it for the better, using its basic principles, but eliminating its major flaws. NSOU ? CC-ED-04 ? 43 iii. Humanistic Perspective: Humanistic psychology is a psychological perspective that emphasizes the study of the whole person (known as holism). Humanistic psychologists look at human behavior, not only through the eyes of the observer, but through the eyes of the person doing the behaving. Humanistic psychologists believe that an individual's behavior is connected to his

or her inner feelings and self-image. The humanistic perspective centers around the thought

96%

MATCHING BLOCK 14/177

W

on the view that each person is unique and individual, has the free will to change at any time in his or her life. The humanistic perspective suggests that we are responsible for our own happiness and well-being as humans. We have the innate (i.e., inborn) capacity for self-actualization, which is our unique desire to achieve our highest potential as human. Because of this focus on the person and his or her personal experiences and subjective perception of the world the humanists regarded scientific methods as inappropriate for studying human behavior. Two of the most influential and enduring theories in humanistic psychology that emerged in the 1950s and 1960s are those of Carl Rogers and Abraham Maslow. iv. Cognitive Perspective Psychology was institutionalized as a science in 1879 by Wilhem Wundt, who found the first psychological laboratory. His initiative was soon followed by other European and American Universities. These early laboratories, through experiments, explored areas such as memory and sensory perception, both of which Wundt believed to be closely related to physiological processes in the brain. The whole movement had evolved from the early philosophers, such as Aristotle and Plato. Today this approach is known as cognitive psychology. Cognitive Psychology revolves around the notion that if we want to know what makes people tick then the way to do it is to figure out what processes are actually going on in their minds. In other words, psychologists from this perspective study cognition which is 'the mental act or process by which knowledge is acquired.' The cognitive perspective is concerned with 'mental' functions such as memory, perception, attention, etc. It views people as being similar to computers in the way we process information (e.g., input-process-output). For example, both human brains and computers process information, store data and have input

and

90%

MATCHING BLOCK 15/177

W

output procedure. This had led cognitive psychologists to explain that memory comprises of three stages: encoding (where information is received and attended to), storage (where the information is retained) and retrieval (where the information is recalled). NSOU ? CC-ED-04 ? 44 It is an extremely scientific approach and typically uses lab experiments to study human behavior. The cognitive approach has many applications including cognitive therapy and testimony. v. Biological

Perspective The biological psychology states that all thoughts, feeling and

97%

MATCHING BLOCK 16/177

W

behavior ultimately have a biological cause. It is one of the major perspectives in psychology and involves such things as studying the brain, genomics, hormones, and the immune and nervous systems. Theorists in the biological perspective who study behavioral genomics consider how genes affect behavior. Now that the human genome is mapped, perhaps, we will someday understand more precisely how behavior is affected by the DNA we inherit. Biological factors such as chromosomes, hormones and the brain all have a significant influence on human behavior, for example, the

97%

MATCHING BLOCK 17/177

W

gender psychology. The approach believes that most behavior is inherited and has an adaptive (or evolutionary) function. For example, in the weeks immediately after the birth of a child, levels of testosterone in fathers drop by more than 30 percent. This has an evolutionary function. Testosterone-deprived men are less likely to wander off in search of new mates to inseminate. They are also less aggressive, which is useful when there is a baby around. Biological psychologists explain behaviors in neurological terms, i.e., the physiology and structure of the brain and how this influences behavior. Many biological psychologists have concentrated on abnormal behavior and have tried to explain it. For example, biological psychologists believe that schizophrenia is affected by levels of dopamine (a neurotransmitter). These findings have helped psychiatry take off and help relieve the symptoms of mental illness through drugs. However, Freud and others argue that this just treats the symptoms and not the cause. This is where health psychologists take the finding that biological psychologists produce and look at the environmental factors that are involved to get a better picture. vi. Evolutionary

Perspective

96%

MATCHING BLOCK 18/177

W

A central claim of evolutionary psychology is that the brain (and therefore the mind) evolved to solve problems encountered by our hunter-gatherer ancestors during the upper Pleistocene period over 10,000 years ago. The Evolutionary approach explains behavior in terms of the selective pressures that shape behavior. Most behaviors that we see/display are believed to have developed during our EEA (environment of evolutionary adaptation) to help us survive. NSOU ? CC-ED-04 ? 45 Observed behavior is likely to have developed because it is adaptive. It has been naturally selected, i.e., individuals who are best adapted to survive and reproduce. Behaviors may even be sexually selected, i.e., individuals who are most successful in gaining access to mates leave behind more offspring. The mind is therefore equipped with 'instincts' that enabled our ancestors to survive and reproduce. A strength of this approach is that it can explain behaviors that appear dysfunctional, such as anorexia, or behaviors that make little sense in a modern context, such as our biological stress response.

91%**MATCHING BLOCK 19/177****W**

Therefore, in conclusion, there exist so many different perspectives in psychology to explain the different types of behavior and viewed from different angles. No one perspective has explanatory powers over the rest. Only with all the different approaches of psychology, which sometimes contradict one another (nature-nurture debate), overlap with each other (e.g. psychoanalysis and child psychology) or build upon one another (biologist and health psychologist) can we understand and create effective solutions when problems arise, so we have a healthy body

in

100%**MATCHING BLOCK 20/177****W**

a healthy mind. The fact that there are different perspectives

that represent

100%**MATCHING BLOCK 21/177****W**

the complexity and richness of human (and animal) behavior. A scientific approach, such as Behaviorism or cognitive psychology, tends to ignore the subjective (i.e., personal) experiences that people have. 2.4.3

Cognitive Perspectives of Educational Psychology Among the current educational psychologists, the cognitive perspective is more widely held than the behavioral perspective, perhaps because it admits causally related mental constructs such as traits, beliefs, memories, motivations, learning, emotions etc. The cognitive perspective is basically

100%**MATCHING BLOCK 22/177****W**

concerned with 'mental' functions such as memory, perception, attention, etc. It views people as being similar to computers in the way we process information (e.g., input-process-output).

100%**MATCHING BLOCK 23/177****W**

The cognitive approach has many applications including cognitive therapy and

eye witness testimony. Cognition refers to mental activity including thinking, remembering, learning and using language. When we apply a cognitive approach to learning and teaching, we focus on the understanding of information and concepts. If we are able to understand the connections between concepts break down information and rebuild with logical connections, then our retention of material and understanding will increase. When we are aware of these mental actions, monitor them and control our learning processes it is called meta-cognition, which varies from situation to situation, will greatly affect how individuals behave in a given situation. Understanding of

NSOU ? CC-ED-04 ? 46 language, or psycholinguistics, is essential to our understanding of print and oral acquisition of knowledge. Comprehension and perception will allow individuals to interpret information. 2.5 Developmental Stages and its Impact on Education "Is this child's development on track?" A question may often be asked by parents, relatives, pediatricians, educators, or caregivers over and over again in different forms as child grows and changes. To help to provide exact answer to this significant question, child development experts have created lots of different charts and checklists that can help us to keep track of child development across the several broad key-domains, like: ? Physical development ? Cognitive development (thinking skills) ? Language development ? Social-emotional development It may also help to think of development as an individual progression, rather than as a list of boxes you should tick at certain prescribed intervals. If progress stops or seems to stop, it's time to talk to your child's healthcare provider. If there is a delay, identifying it early can sometimes make a big difference for the child. I. Milestones of Human Development Milestones are the targets of different phases that a child can achieve or perform by a certain age. Most children develop skills and abilities roughly in the same order, but the timeframes are not exact. They vary from child to child, just as height and colors do. Every child grows and develops at an individual pace. Here's a quick look at some common milestones for each age period of development. i. Birth to 18 months During this period of profound growth and development, babies grow and change rapidly. Doctors recommend that parents speak to their baby a lot during this phase, because hearing your voice will help your baby to develop communication skills. Other suggestions include: ? Short periods of tummy time to help strengthen your baby's neck and back muscles — but make sure baby is awake and you're close by for this playtime.

NSOU ? CC-ED-04 ? 47 ? Respond right away when your baby cries. Picking up and comforting a crying baby builds strong bonds between the two of you. ii. Development table: Birth to 18 months Shows interest in objects and human faces May get bored with repeated activities Tries to look at you or other people Starts to smile at people Begins to coo and make vowel sounds Becomes calm when spoken to Cries differently for different needs Turns toward sounds Follows objects with eyes Grasps objects Gradually lifts head for longer periods 1-3 months 4-6 months 5-9 months 9-12 months 12-18 months Recognizes familiar faces Notices music Responds to signs of love and affection Responds to facial expressions Enjoys playing with people Responds differently to different voice tones Begins to babble or imitate sounds Laughs Sees things and reaches for them Pushes up with arms when on tummy Might be able to roll over Brings hands up to mouth Passes things from one hand to the other Enjoys mirrors Knows when a stranger is present Responds to hearing their name May add consonant sounds to vowels May communicate with gestures Starts sitting up without support May bounce when held in standing position Rolls in both directions Watches things fall Looks for hidden things May be clingy or prefer familiar people Points Knows what "no" means Imitates sounds and gestures Pulls up into standing position Crawls Has learned how to use some basic things like spoons Can point to named body parts May engage in simple pretend games May have tantrums May cry around strangers Knows how to say several words Says "no" Waves bye-bye Walks holding onto surfaces Stands alone May climb a step or two May drink from a cup Cognitive Language Movement / Physical Social and Emotional

NSOU ? CC-ED-04 ? 48 iii. Development during Toddler Year from 18 months to 2 years During the toddler years, children continue to need lots of sleep, good nutrition, and close, loving relationships with parents and caregivers. Doctors generally offer the following advice to mothers for creating a safe, nurturing space to maximize your child's early growth and development: ? Create predictable routines and rituals to keep your child feeling secure and grounded. ? Toddler-proof your home and yard so kids can explore safely. ? Use gentle discipline to guide and teach children. Avoid hitting, which can cause long-term physical and emotional harm. ? Sing, talk, and read to your toddler to boost their vocabularies. ? Watch your child for cues about the warmth and reliability of all caregivers. ? Take good care of yourself physically and emotionally, because your child needs you to be healthy. May identify familiar things in picture books. Knows what common objects do Scribbles. Follows single-step requests like "Please stand up" May help with tasks like putting away toys. Is proud of what they have accomplished Recognizes self in mirror; may make faces May explore surroundings if parent stays close by Builds towers from blocks. May follow simple two-part instructions. Groups like shapes and colors together. Plays pretend games Enjoys play dates. Plays beside other children; may start playing with them. May defy directions like "sit down" or "come back here" 18 months 24 months Cognitive Social and Emotional

NSOU ? CC-ED-04 ? 49 iv. Development during Pre-School Stage from 2 years to 5 years During these pre-school years, children grow more and more independent and capable behaviours. Their natural curiosity is likely to be stimulated because their world is expanding: new friends, new experiences, new environments like daycare or kindergarten. During this period of development of the child, parents or care givers can — ? Keep reading to your child daily. ? Show them how to do simple chores at home. ? Be clear and consistent with your expectations, explaining what behaviors you want from your child. ? Speak to your child in age-appropriate language. ? Help your child problem solve when emotions are running high. ? Supervise your child in outdoor play spaces, especially around water and play equipments. ? Allow your child to have choices about how to interact with family members and strangers. 18 months 24 months Knows several words. Follows simple directions. Likes hearing short stories or songs. Can help in getting dressed. Begins to run. Drinks well from a cup. Eats with a spoon. Can walk while pulling a toy. Dances. Gets seated in a chair. May ask simple questions. Can name many things. Uses simple two-word phrases like "more milk". Says the names of familiar people. Runs. Jumps up and down. Stands on tip-toes. Can draw lines and round shapes. Throws balls. May climb stairs using rails to hold on Language Movement / Physical

NSOU ? CC-ED-04 ? 50 a. Normal Development Table: Can put together a 3-4 part puzzle Can use toys that have moving parts like buttons and levers Can turn door knobs Can turn book pages Shows empathy for hurt or crying children Offers affection Understands "mine" and "yours" May get upset if routines are changed Can get dressed Knows how to take turns Talks using 2-3 sentences at a time Has the words to name many things used daily Can be understood by family Understands terms like "in," "on," and "under" May be able to count Can draw stick figures May be able to predict what will happen in a story May play simple board games Can name a few colors, numbers, and capital letters May play games that have roles like "parent" and "baby" Plays with, not just beside, other kids Talks about their likes and dislikes Pretends; may have trouble knowing what's real and what's pretend Can talk about what happens in daycare or at school Speaks in sentences May recognize or say rhymes Can say first and last name Draws more complex "people" Counts up to 10 things Can copy letters, numbers, and simple shapes Understands the order of simple processes Can say name and address Names many colors Is aware of gender Likes to play with friends Sings, dances, and may play acting games Switches between being compliant and being defiant Can tell the difference between made-up and real May tell stories that stay on track Recites nursery rhymes or sings songs May be able to name letters and numbers Can answer simple quest- ions about stories 3 years 4 years 5 years

NSOU ? CC-ED-04 ? 51 b. School-age Development During 6 to 18 Years During the school years, children gain independence and competence quickly. Friends become more important and influential. A child's self-confidence will be affected by the academic and social challenges presented in the school environment. As kids mature, the parenting challenge is to find a balance between keeping them safe, enforcing rules, maintaining family connections, allowing them to make some decisions, and encouraging them to accept increasing responsibility. Despite their rapid growth and development, they still need parents and caregivers to set limits and encourage healthy habits. Here are some tips you can do to ensure that your child continues to be healthy: ? Make sure they get enough sleep. ? Provide opportunities for regular exercise and individual or team sports. ? Create quiet, positive spaces for reading and studying at home. ? Limit screen time and monitor online activities carefully. ? Build and maintain positive family traditions. ? Talk to your children about consent and setting boundaries with their bodies. 3 years 4 years 5 years Can walk up and down steps with one foot on each stair Runs and jumps with ease Catches a ball Can slide down a slide Dances. Gets seated in a chair. Can hammer a peg into a hole Walks backwards Climbs stairs confidently Can hop Pours liquids with some help May be able to somersault Uses scissors Hops or stands on one foot for about 10 seconds Can swing on swingset Goes to the bathroom in the toilet Dances. Gets seated in a chair.

NSOU ? CC-ED-04 ? 52 Can complete instructions with 3 or more steps Can count backward Knows left and right Tells time Cooperates and plays with others May play with kids of different genders Mimics adult behaviors Feels jealousy May be modest about bodies Can read books at grade level Understands speech and speaks well Internalize work and study habits Can explain their positions and choices Continue to differentiate from parents Increased interest in dating and sexuality Spends more time with friends than family Growth in ability to empathize with others Can speak, read, listen, and write fluently and easily Can have complex conversations Can speak differently in different groups Can write persuasively Can understand proverbs, figurative language, and analogies Develops views and opinions that may differ from parents' ideas Grows awareness that parents aren't always correct Can understand figurative language Ability to think logically is improving, but prefrontal cortex is not yet mature May become more independent from parents Displays moodiness Increased need for some privacy Can use speech that isn't literal Can use tone of voice to communicate intentions; i.e. sarcasm Can use common devices, including phones, tablets, and game stations Writes stories and letters Maintains longer attention span May have a best friend Can see from another person's perspective Experiences more peer pressure Listens for specific reasons (like pleasure or learning) Forms opinions based on what's heard Can take brief notes Follows written instructions Draws logical inferences based on reading Can write about a stated main idea Can plan and give a speech 6-8 years 9-4 years 12-14 years 15-18 years Cognitive Social and emotional Language

NSOU ? CC-ED-04 ? 53 Can jump rope or ride a bike Can draw or paint Can brush teeth, comb hair, and complete basic grooming tasks Can practice physical skills to get better at them Continues to mature physically, especially boys Many females will have started periods Secondary sex characteristics like armpit hair and voice changes continue Height or weight may change quickly and then slow down May experience signs of early puberty like breast development and facial hair growth Increased skill levels in sports and physical activities 6-8 years 9-4 years 12-14 years 15-18 years Movement / Physical c. What to do if you are concerned: If you're wondering whether some aspect of a child's development may be delayed, you have several options: First, talk to your child's pediatrician and ask for a developmental screening. The screening tools used by doctors are more thorough than online checklists, and they may give you more reliable information about your child's abilities and progress. You can also ask your pediatrician for a referral to a developmental specialist like a pediatric neurologist, occupational therapist, speech/language therapist, or a psychologist who specializes in evaluating children. If your child is under the age of 3, you can reach out to the early intervention as far as possible. If your child is 3 yr. or older, you can speak to the special education director at the public school near your home (even if your child isn't enrolled at that school) to ask for a developmental evaluation. Make sure you write down the date and director's name so you can follow up, if necessary. It's really important that you act right away if you suspect a developmental delay or disorder, because many developmental issues can be addressed more effectively with early intervention. During a screening, the healthcare provider may ask you questions, interact with your child, or conduct tests to find out more about what your child can and cannot yet do.

NSOU ? CC-ED-04 ? 54 If your child has a medical condition, was born early, or was exposed to an environmental toxin like lead, the doctor might conduct developmental screenings more often. Significance of Development in Human life Growth and development go together but at different rates. The assessment of growth and development is very helpful in finding out the state of health and nutrition of a child. Continuous normal growth and development indicate a good state of health and nutrition of a child. Abnormal growth or growth failure is a symptom of disease. Human resource development is essential for any organization that desires to be dynamic and growth-oriented. Human resources have unlimited potential capabilities that can only be used by creating a workforce that can continually identify, bring to the surface, and use the capabilities of individuals. The importance of human development in terms of living conditions in different countries, human development is very important in terms of living conditions in different countries. The statement "any society committed to improving the lives of its people must also be committed to full and equal rights for all" is true. 2.6 Summary Human growth and development have become very important issue to be discussed not only for medical science but equally important in the field of psychology and education. The entire issue of human growth and development have been discussed in brief in this unit. Along with the human growth and development, the perspective of educational psychology like biology, behavioural and cognitive have also been discussed in this unit. At the end of the unit, developmental stages and its impact on education like right direction of development and potentiality of acquiring knowledge through education have been explained. 2.7 Self-Assessment Questions 1. What are the basic differences between growth and development? 2. What is physical development? 3. What do you mean by cognitive development?

NSOU ? CC-ED-04 ? 55 4. Elucidate the concept emotional development. 5. Illustrate at least two principles of development. 6. What do you mean by perspectives of educational psychology? 7. Explain cognitive perspective of educational psychology. 8. What do you mean by milestones of human development? 9. Write the importance of psychology in education. 2.8 References Agarwalla, Dr. Sunita: Psychological Foundation of Education and Statistics, Bookland 2008.

Questions 3.8 References 3.1

Objectives After going through this unit, you will be able to – ?
 understand

Piaget's Cognitive Developmental Theory; ? be acquainted with Erikson's Psycho-social Developmental Theory; ? analyze Kohlberg's Moral Developmental theory. 3.2 Introduction Psychological development is the development of human beings' cognitive, emotional, intellectual, and social capabilities and functioning over the course of a normal life span, from infancy through old age. It is the subject matter of the discipline known as Developmental Psychology. Traditionally, the Child psychology has been the major focus of research for long days, but since the mid-20th century much has been learned about infancy and adulthood as well and its developmental phases. In educational Studies, the study of developmental psychology is essential in understanding how humans learn, mature and adapt. Educationists conduct researches to help to people reach their full potential — for example, studying the difference between learning styles in babies and adults. Theories of development play an important role in understanding different aspects of human development scientifically. In the following sections, three important theories NSOU ? CC-ED-04 ? 57 of psychological development have been discussed to have a basic idea of human learning, namely, (i) Piaget's Cognitive Development Theory, (ii) Erickson's psycho- Social Development Theory, and (iii) Kohlberg's Moral Development Theory. 3.3 Piaget's Cognitive Development Theory Piaget believed that children take an active role in the learning process, acting much like little scientists as they perform experiments, make observations, and learn about the world. As kids interact with the world around them, they continually add new knowledge, build upon existing knowledge, and adapt previously held ideas to accommodate new information. Piaget was born in Switzerland in the late 1800s and was a precocious student, publishing his first scientific paper when he was just 11 years old. His early exposure to the intellectual development of children came when he worked as an assistant to Alfred Binet and Theodore Simon as they worked to standardize their famous IQ test. Much of Piaget's interest in the cognitive development of children was inspired by his observations of his own nephew and daughter. These observations reinforced his budding hypothesis that children's minds were not merely smaller versions of adult minds. Based on his observations, he concluded that children are not less intelligent than adults, they simply think differently. Albert Einstein called Piaget's discovery "so simple only a genius could have thought of it."

GE-PSY-01_Block 3.edited.docx (D44253053)

Piaget's stage theory describes the cognitive development of children. Cognitive development involves changes in cognitive process and abilities. In Piaget's view, early cognitive development involves

the processes based upon actions and later progresses to changes in mental operations. Piaget's theory of cognitive development is a comprehensive theory about the nature and development of human intelligence. It was originated by the Swiss developmental psychologist Jean Piaget (1896–1980). The theory

100%

MATCHING BLOCK 28/177

SA

submission.docx (D130893464)

deals with the nature of knowledge itself and how humans gradually

come to acquire, construct, and use it. Piaget's theory is mainly known as a developmental stage theory. In 1919, while working at the Alfred Binet's Laboratory School in Paris, Piaget was intrigued by the fact that "children of different ages made different kinds of mistakes while solving problems". His experience and observations at the Alfred Binet Laboratory were the beginnings of his theory of cognitive development.

NSOU ? CC-ED-04 ? 58 Piaget believed that children are not like 'little adults' who may know less; children just think and speak differently. By thinking that children have great cognitive abilities, Piaget came up with four different cognitive development stages, which he put out into testing. Within those four stages he managed to group them with different ages. In each stage he realized how children managed to develop their cognitive skills. For example, he believed that children experience the world through actions, representing things with words, thinking logically, and using reasoning. I. Progressive Reorganization:

To Piaget,

cognitive development was a progressive reorganization of mental processes resulting from biological maturation and environmental experience.

He believed that

97%

MATCHING BLOCK 26/177

W

children construct an understanding of the world around them, experience discrepancies between what they already know and what they discover in their environment,

and then adjust their ideas accordingly. Moreover, Piaget claimed that cognitive development is at the center of the human organism, and language is contingent on knowledge and understanding acquired through cognitive development. Piaget's earlier work received the greatest attention. Child-centered classrooms and open education are direct applications of Piaget's views. Despite its huge success, Piaget's theory has some limitations that Piaget recognized himself; for example, the theory supports sharp stages rather than continuous development (horizontal and vertical. II. Reality to Child: Piaget noted that reality is a dynamic system of continuous change. Reality has been defined with reference to the two conditions that define dynamic systems. Specifically, he argued that reality involves transformations and states. 'Transformations' refer to all manners of changes that a thing or person can undergo. States refer to the conditions or the appearances in which things or persons can be found between transformations. For example, there might be changes in shape or form (for instance, liquids are reshaped as they are transferred from one vessel to another, and similarly humans change in their characteristics as they grow older), in size (a toddler does not walk and run without falling, but after 7 yrs of age, the child's sensory motor anatomy become well developed and now acquires skill faster), or in placement or location in space and time (e.g., various objects or persons might be found at one place at one time and at a different place at another time). Thus, Piaget argued, if human intelligence is to be adaptive, it must have functions to represent both the transformational and the static aspects of reality. He

NSOU ? CC-ED-04 ? 59 proposed that operative intelligence is responsible

100%

MATCHING BLOCK 30/177

SA

chap 2 finale .docx (D40522406)

for the representation and manipulation of the dynamic or transformational aspects of reality,

and that figurative intelligence is responsible for the representation of the static aspects of reality. III. Operative intelligence: It is the active aspect of intelligence. It involves all actions, overt or covert, undertaken in order to follow, recover, or anticipate the transformations of the objects or persons of interest. Figurative intelligence is the more or less static aspect of intelligence, involving all means of representation used to retain in mind the states (i.e., successive forms, shapes, or locations) that intervene between transformations. That is, it involves perception, imitation, mental imagery, drawing, and language. Therefore, the figurative aspects of intelligence derive their meaning from the operative aspects of intelligence, because states cannot exist independently of the transformations that interconnect them. Piaget stated that the figurative or the representational aspects of intelligence are subservient to its operative and dynamic aspects, and therefore, that understanding essentially derives from the operative aspect of intelligence. At any time, operative intelligence frames how the world is understood and it changes if understanding is not successful. Piaget stated that this process of understanding and change involves two basic functions – Assimilation and Accommodation. IV. Assimilation and Accommodation: Through his study in the field of education, Piaget focused on two processes, viz., assimilation and accommodation. Assimilation means integrating external elements into structures of lives or environments, or those we could have through experiences. It is the process of fitting new information into pre-existing cognitive schemas through perception and adaptation. Assimilation, in which new experiences are reinterpreted to fit into, or assimilate with, old ideas and It occurs when humans are faced with new or unfamiliar information and refer to previously learned information in order to make sense of it. In contrast, accommodation is the process of taking new information in one's environment and altering pre-existing schemas in order to fit in the new information.

This

100%

MATCHING BLOCK 29/177

W

happens when the existing schema (knowledge) does not work, and needs to be changed to deal with a new object or situation. Accommodation

is imperative because it is how people will continue to interpret new concepts, schemas, frameworks, and more. Piaget believed that the human brain has been programmed through evolution to bring equilibrium, which is what he believed ultimately influences structures by the internal and external processes through assimilation and accommodation. Assimilation and accommodation cannot exist without the other. They are like two sides of a coin. For instance, to NSOU ? CC-ED-04 ? 60 recognize (assimilate) an apple as an apple, one must first focus (accommodate) on the contour of this object. To do this, one needs to roughly recognize the size of the object. Development increases the balance, or equilibration, between these two functions. When in balance with each other, assimilation and accommodation generate mental schemas of the operative intelligence. When one function dominates over the other, they generate representations which belong to figurative intelligence. V. The Stages of Cognitive Development: Through his observations of his children under study, Piaget developed a stage theory of intellectual development that included four distinct stages: a. The Sensory-motor Stage (Birth to 2 years) Major Characteristics and developmental changes of this stage are: i. The infant knows the world through their movements and sensations; ii. Children learn about the world through basic actions such as, sucking, looking, and listening; iii. Infants learn that things continue to exist even though they cannot be seen (Object permanence); iv. They are separate beings from the people and objects around them; v. They realize that their actions can cause things to happen in the world around them. During this early stage of cognitive development, infants and toddlers acquire knowledge through sensory experiences by manipulating objects. A child's entire experience at the earliest period of this stage occurs through basic reflexes, senses, and motor responses. It is during the sensory-motor stage that children go through a period of dramatic growth and learning. As kids interact with their environment, they are continually making new discoveries about how the world works. The cognitive development that occurs during this period takes place over a relatively shorter period of time and involves a great deal of growth. Children not only learn how to perform physical actions such as crawling and walking; they also learn a great deal about language from the parents and others with whom they interact. Piaget also broke this stage down into a number of six sub-stages. It is during the final part of the sensory-motor stage that early representational thought emerges.

NSOU ? CC-ED-04 ? 61 Sensory-Motor Development Simple reflexes First habits and primary circular reactions phase Secondary circular reactions phase Coordination of secondary circular reactions stages Tertiary circular reactions, novelty, and curiosity Internalization of schemas "Coordination of sensation and action through reflexive behaviors". Three primary reflexes are described by Piaget: sucking of objects in the mouth, following moving or interesting objects with the eyes, and closing of the hand when an object makes contact with the palm. Over the first six weeks of life, these reflexes begin to become voluntary actions. For example, the palmar reflex becomes intentional grasping. "Coordination of sensation and two types of Schema: habits (reflex) and primary circular reactions (reproduction of an event that initially occurred by chance). The main focus is still on the infant's body". As an example of this type of reaction, an infant might repeat the motion of passing their hand before their face. Also at this phase, passive reactions, caused by classical or operant conditioning, can begin. Development of habits. "Infants become more object-oriented, moving beyond self-preoccupation; repeat actions that bring interesting or pleasurable results" This stage is associated primarily with the development of coordination between vision and apprehension. Three new abilities occur at this stage: intentional grasping for a desired object, secondary circular reactions, and differentiations between ends and means. At this stage, infants will intentionally grasp the air in the direction of a desired object, often to the amusement of friends and family. Secondary circular reactions or the repetition of an action involving an external object begin; for example, moving a switch to turn on a light repeatedly. The differentiation between means and ends also occurs. This is perhaps one of the most important stages of a child's growth as it signifies the dawn of logic. "Coordination of vision and touch—hand-eye coordination; coordination of schemas and intentionality". This stage is associated primarily with the development of logic and the coordination between means and ends. This is an extremely important stage of development, holding what Piaget calls the "first proper intelligence". Also, this stage marks the beginning of goal orientation, the deliberate planning of steps to meet an objective. "Infants become intrigued by the many properties of objects and by the many things they can make happen to objects; they experiment with new behavior". This stage is associated primarily with the discovery of new means to meet goals. Piaget describes the child at this juncture as the "young scientist," conducting pseudo-experiments to discover new methods of meeting challenges. "Infants develop the ability to use primitive symbols and form enduring mental representations". This stage is associated primarily with the beginnings of insight, or true creativity. This marks the passage into the preoperational stage. Birth– 6 weeks 6 weeks– 4 months 4–8 months 8–12 months 12–18 months 18–24 months Sub-stage Period Activity 1. 2. 3. 4. 5. 6.

NSOU ? CC-ED-04 ? 62 Piaget believed that for developing object permanence or object constancy, understanding of that objects continue to exist even when they cannot be seen, was found an important element at this point of development. By learning that objects are separate and distinct entities and that they have an existence of their own outside of individual perception, children are then able to begin to attach names and words to objects. Piaget's theory of cognitive development is a comprehensive theory about the nature and development of human intelligence. The theory

100%

MATCHING BLOCK 31/177

SA submission.docx (D130893464)

deals with the nature of knowledge itself and how humans gradually

come to acquire, construct, and use it. Piaget's theory is mainly known as a developmental stage theory. b. The Pre-operational Stage (2 to 7 years) Major Characteristics and developmental changes of this stage are: i. Children at this stage tend to be egocentric and struggle to see things from the perspective of others; ii. While they are getting better with language and thinking, they still tend to think about things in very concrete terms; iii. The foundations of language development may have been laid during the previous stage, but it is the emergence of language that is one of the major hallmarks of the preoperational stage of development; iv. Children become much more skilled at pretend play during this stage of development, yet continue to think very concretely about the world around them. v. Child begins to learn to speak and lasts up until the age of seven. vi. Children do not yet understand concrete logic and cannot mentally manipulate information. vii. Children's increase in playing and pretending takes place in this stage. However, the child still has trouble seeing things from different points of view. The children's play is mainly categorized by symbolic play and manipulating symbols. Such play is demonstrated by the idea of checkers being snacks, pieces of paper being plates, and a box being a table. Their observation of symbols exemplifies the idea of play with the absence of the actual objects involved. They also often struggle with understanding the idea of constancy. For example, if you take a lump of clay, divide it into two equal pieces and give two children separately with a choice between two pieces of clay to play with.

NSOU ? CC-ED-04 ? 63 One piece of clay is rolled into a compact ball while the other is smashed into a flat pancake shape. Since the flat shape looks larger, the pre-operational child being confused likely to choose the flat shaped clay as a larger one though the two pieces are exactly the same volume. c. The Concrete Operational Stage (7 to 11 years) Major Characteristics and developmental changes of this stage are: i. During this stage, begin to think logically about concrete events; ii. They begin to understand the concept of observation; that the amount of liquid in a short, wide cup is equal to that in a tall, skinny glass, for example; iii. Their thinking becomes more logical and organized but still not very concrete; iv. Children begin using inductive logic. Or reasoning from specific information to a general principle. v. While children are still very concrete and liberal in their thinking at this point of development, they become much more adept at using logic. vi. The egocentrism of the previous stage begins to disappear as kids become better at thinking about how other people might view a situation. vii. They become much more logical during the stage and kids at this point in development

90%

MATCHING BLOCK 32/177

SA

Unit 3.docx (D30009870)

tend to struggle with abstract and hypothetical concepts. viii. Children also become less egocentric and begin to think about how other people might think and feel.

Kids in the concrete operational stage also

100%

MATCHING BLOCK 33/177

SA

Unit 3.docx (D30009870)

begin to understand that their thoughts are unique to them and that not everyone else necessarily shares their thoughts, feelings, and opinions.

ix. They start solving problems in a more logical hypothetico-deductive reasoning. The children undergo a transition where the child learns rules such as inductive reasoning and conservation. For example, a child will understand that "A is more than B" and "B is more than C". However, when asked "is A more than C?", the child might not be able to logically figure the question out mentally. Two other important processes in the concrete operational stage are logic and the elimination of egocentrism. d. The Formal Operational Stage (12 years and above) Major Characteristics and developmental changes of this stage are: i. At this stage, the adolescent or young adults begin to think abstractly and reason about hypothetical problems;

NSOU ? CC-ED-04 ? 64 ii. Abstract thoughts emerge; iii. Teens begin to think more about moral, philosophical, ethical, social and political issues that require theoretical and abstract reasoning; iv. Begin to use deductive logic, or reasoning from a general principle to specific information. v. The ability to thinking about abstract ideas and situations is the key hallmark of the formal operational stage of cognitive development. vi. The ability to systematically plan for the future and reason about hypothetical situations are also critical abilities that emerge during the stage.

MATCHING BLOCK 38/177

SA

Unit 3.docx (D30009870)

The final stage of Piaget's theory involves an increase in logic, the ability to use deductive reasoning, and an understanding of abstract ideas. At this point, people become capable of seeing multiple potential solutions to problems and think more scientifically about the world around them.

It is important to note that Piaget did not view children's intellectual development as a quantitative process; that is, kids do not just add more information and knowledge to their existing knowledge as they get older. Instead, Piaget suggested that there is a qualitative change in 'how' children think as they gradually process through these four stages. A child at age 7 doesn't just have more information about the world than he did at age 2; there is a fundamental change in 'how' he/she thinks about the world. d. Some Important Concepts of Piaget's Cognitive Development Theory: To better understand some of the things that happen during cognitive development, it is important first to examine a few of the important ideas and concepts introduced by Piaget. The following are some of the factors that influence how children learn and grow: i. Schemas A schema describes both the mental and physical actions involved in understanding and knowing. Schemas are

87%**MATCHING BLOCK 34/177****W**

categories of knowledge that help us to interpret and understand the world.

100%**MATCHING BLOCK 35/177****W**

In Piaget's view, a schema includes both a category of knowledge and the process of obtaining that knowledge. As experiences happen, this new information is used to modify, add to, or change previously existing schemas.

NSOU ? CC-ED-04 ? 65

100%**MATCHING BLOCK 36/177****W**

For example, a child may have a schema about a type of animal, such as a dog. If the child's sole experience has been with small dogs, a child might believe that all dogs are small, furry, and have four legs.

Suppose, then that the child encounters an enormous dog. The child will take

76%**MATCHING BLOCK 37/177****W**

in this new information, modifying the previously existing schema to include these new

observations. Schemas Play following important roles in the Learning Process

76%**MATCHING BLOCK 42/177****SA**

GE-PSY-01_Block 3.edited.docx (D44253053)

of the learner ii. Assimilation The process of taking in new information into our already existing schemas is known as assimilation.

The process is somewhat

64%**MATCHING BLOCK 39/177****W**

subjective because we tend to modify experiences and information slightly to fit in with our preexisting beliefs.

In the example above, seeing a dog and labeling it "dog" is a case of assimilating the animal into the child's dog schema.
iii. Accommodation Another part of

88%**MATCHING BLOCK 40/177****W**

adaptation involves changing or altering our existing schemas in light of new information,

a process

92%**MATCHING BLOCK 46/177****SA**

GE-PSY-01_Block 3.edited.docx (D44253053)

known as accommodation. Accommodation involves modifying existing schemas, or ideas, as a result of new information or new experiences. New schemas may also be developed during this process. iv. Equilibration Piaget believed that all children try to strike a balance between assimilation and accommodation, which is achieved through a mechanism Piaget called equilibration.

As children progress through the stages of cognitive development, it is important to maintain a

100%**MATCHING BLOCK 41/177****W**

balance between applying previous knowledge (assimilation) and changing behavior to account for new knowledge (accommodation).

Equilibration helps to explain how children can move from one stage of thought to the next. v. Educational Implications: One of the most important elements to remember Piaget's theory is that it takes the view that creating knowledge and intelligence is an inherently 'active' process. Piaget said, "I find myself opposed to the view of knowledge as a passive copy of reality," He explained. "I believe that knowing an object means acting upon it. Piaget's theory of cognitive development helped to add our understanding of children's intellectual growth. It also stressed that children are not merely passive recipients of knowledge. Instead, kids are constantly investigating and experimenting as they build their understanding of how the world works.

NSOU ? CC-ED-04 ? 66 Piaget stated that – ? Hypothetico-deductive reasoning becomes important during the formal operational stage with the following mental operations; ? Abstract thought emerges during the formal operational stage. Children tend to think very concretely and specifically in earlier stages, and begin to consider possible outcomes and consequences of actions; ? Metacognition, the capacity for "thinking about thinking" that allows adolescents and adults to reason about their thought processes and monitor them; ? Problem-solving is demonstrated when children use trial-and-error process

100%**MATCHING BLOCK 50/177****SA**

GE-PSY-01_Block 3.edited.docx (D44253053)

to solve problems. The ability to systematically solve a problem in a logical and methodical way emerges. Children

in primary school years mostly use inductive reasoning, but adolescents start to use deductive reasoning. Inductive reasoning is when children draw general conclusions from personal experiences and specific facts. Adolescents learn how to use deductive reasoning by applying logic to create specific conclusions from abstract concepts. This capability results from their capacity to think hypothetically. 3.4 Erikson's Psycho-Social Development Theory Erik Erikson (1902–1994) was a stage theorist who took Freud's controversial theory of psychosexual development and modified it as a psychosocial theory. Erikson emphasized that the ego makes positive contributions to development by mastering attitudes, ideas, and skills at each stage of development. This mastery helps children grow into successful, contributing members of society. During each of Erikson's eight stages, there is a psychological conflict that must be successfully overcome in order for a child to develop into a healthy, well-adjusted adult. The key idea in Erikson's theory is that the individual faces a conflict at each stage of life, which may or may not be successfully resolved within that stage. For example, he called the first stage 'Trust vs. Mistrust'. If the quality of care is good in infancy, the child learns to trust the world to meet her needs. Erikson's psycho-social theory essentially states that each person experiences eight 'psychosocial crises' (internal conflicts linked to life's key stages) which help to define his or her growth and personality.

NSOU ? CC-ED-04 ? 67 I. Stages of Psycho-social Development Erikson's stages of psycho-social development are based on (and expand upon) Freud's psychosexual theory. Erikson proposed that we are motivated by the need to achieve competence in certain areas of our lives. According to his psychosocial theory, we experience eight stages of development over our lifespan, from infancy through late adulthood. At each stage there is a crisis or task that we need to resolve. Successful completion of each developmental task results in a sense of competence and a healthy personality. Failure to master these tasks leads to feelings of inadequacy. He also added to Freud's stages by discussing the cultural implications of development; certain cultures may need to resolve the stages in different ways based upon their cultural and survival needs.

i. Trust vs. Mistrust: From birth to 12 months of age, infants must learn that adults can be trusted. This occurs when adults meet a child's basic needs for survival. Infants are dependent upon their caregivers, so caregivers who are responsive and sensitive to their infant's needs help their baby to develop a sense of trust; their baby will see the world as a safe, predictable place. Unresponsive caregivers who do not meet their baby's need can engender feelings of anxiety, fear, and mistrust; their baby may see the world as unpredictable. If infants are treated cruelly or their needs are not met appropriately, they will likely grow up with a sense of mistrust for people in the world.

ii. Autonomy vs. Shame/Doubt: As toddlers (ages 1–3 years) begin to explore their world, they learn that they can control their actions and acts on their environment to get results. They begin to show clear preferences for certain elements of the environment, such as food, toys, and clothing. A toddler's main task is to resolve the issue of autonomy vs. shame and doubt by working to establish independence. This is the "I do it" stage. For example, we might observe a budding sense of autonomy in a 2-year-old child who wants to choose her clothes and dress herself. Although her outfits might not be appropriate for the situation, her input in such basic decisions has an effect on her sense of independence. If denied the opportunity to act on her environment, she may begin to doubt her abilities, which could lead to low self-esteem and feelings of shame.

iii. Initiative vs. Guilt: Once children reach the preschool stage (ages 3–6 years), they are capable of initiating activities and asserting control over their world through social interactions

NSOU ? CC-ED-04 ? 68 and play. According to Erikson, preschool children must resolve the task of initiative vs. guilt. By learning to plan and achieve goals while interacting with others, preschool children can master this task. Initiative, a sense of ambition and responsibility, occurs when parents allow a child to explore within limits and then support the child's choice. These children will develop self-confidence and feel a sense of purpose. Those who are unsuccessful at this stage—with their initiative misfiring or stifled by over-controlling parents—may develop feelings of guilt.

iv. Industry vs. Inferiority: During the elementary school stage (ages 6–12), children face the task of industry vs. inferiority. Children begin to compare themselves with their peers to see how they measure up. They either develop a sense of pride and accomplishment in their schoolwork, sports, social activities, and family life, or they feel inferior and inadequate because they feel that they don't measure up. If children do not learn to get along with others or have negative experiences at home or with peers, an inferiority complex might develop into adolescence and adulthood.

v. Identity vs. Role Confusion In adolescence (ages 12–18), children face the task of identity vs. role confusion. According to Erikson, an adolescent's main task is developing a sense of 'self'. Adolescents struggle with questions such as "Who am I?" and "What do I want to do with my life?" Along the way, most adolescents try on many different selves to see which one fits; they explore various roles and ideas, set goals, and attempt to discover their "adult" selves. Adolescents who are successful at this stage have a strong sense of identity and are able to remain true to their beliefs and values in the face of problems and other people's perspectives. When adolescents are apathetic, do not make a conscious search for identity, or are pressured to conform to their parents' ideas for the future, they may develop a weak sense of self and experience role confusion. They will be unsure of their identity and confused about the future. Teenagers who struggle to adopt a positive role will likely struggle to "find" themselves as adults.

vi. Intimacy vs. Isolation: People in early adulthood (20s through early 40s) are concerned with intimacy vs. isolation. After we have developed a sense of self in adolescence, we are ready to share our life with others. However, if other stages have not been successfully resolved, young adults may have trouble developing and maintaining successful relationships with others. Erikson said that we must have a strong sense of self before we can develop successful intimate relationships. Adults who do not develop a

NSOU ? CC-ED-04 ? 69 positive self-concept in adolescence may experience feelings of loneliness and emotional isolation. vii. Generativity vs. Stagnation: When people reach their 40s, they enter the time known as middle adulthood, which extends to the mid-60s. The social task of middle adulthood is generativity vs. stagnation. Generativity involves finding your life's work and contributing to the development of others through activities such as volunteering, mentoring, and raising children. During this stage, middle-aged adults begin contributing to the next generation, often through childbirth and caring for others; they also engage in meaningful and productive work which contributes positively to society. Those who do not master this task may experience stagnation and feel as though they are not leaving a mark on the world in a meaningful way; they may have little connection with others and little interest in productivity and self-improvement. viii. Integrity vs. Despair: From the mid-60s to the end of life, we are in the period of development known as late adulthood. Erikson's task at this stage is called integrity vs. despair. He said that people in late adulthood reflect on their lives and feel either a sense of satisfaction or a sense of failure. People who feel proud of their accomplishments feel a sense of integrity, and they can look back on their lives with few regrets. However, people who are not successful at this stage may feel as if their life has been wasted. They focus on what "would have," "should have," and "could have" been. They face the end of their lives with feelings of bitterness, depression, and despair. II. The Strengths of Erickson's Psycho-social Theory: ? As a stage theory, it explains developmental stages of individual; ? Explains Ego-identity formation right from birth; ? Every individual has to go through crisis in his/her life. III. The Weaknesses of Erickson's Theory: ? Focus on competing forces rather than emotional development of individual; ? Difficult to be tested scientifically as it is not possible to measure some of the concepts upon which the theory is based; ? Fails to specify the effect of failure in one stage impacts with other stages.

NSOU ? CC-ED-04 ? 70 IV. Educational implications of Erickson's Theory: ? These are possible depending upon the age group of the learner and the tasks they are expected to perform; ? Allowing the child to play with various natural, simple materials, and role- playing for the expression of fantasy and imagination; ? Games, stories and songs can be used. ? Real-life activities like serving, chopping vegetables or making tea, prepare children for preparation in the community around them; ? Child-directed activities where the child chooses his or her activity and repeats it as often as they want must be encouraged. ? Educational Implications ? Erikson mentioned that personality develops in a predetermined order through the eight stages of psychosocial development, from infancy to adulthood. According to the

100%

MATCHING BLOCK 43/177

W

theory, successful completion of each stage results in a healthy personality and

the acquisition of basic virtues. ? Provide a portion of the day when children can choose their own activities. ? Have a classroom library where children can pick their own books during reading time. This allows children the opportunity to learn how to make decisions for themselves. Break instruction and activities down into small steps. From the above discussions, it may be concluded that Erickson's Psycho-social theory is a very powerful way for building self-awareness and for improving oneself, as it helps to understand a person's learning according to his / her personal uniqueness. 3.5 Kohlberg's Moral Development Theory Lawrence Kohlberg was a 20th century psychologist known primarily for his research into moral psychology and development. He was born in Bronxville, New York on October 25, 1927. Kohlberg enrolled in the University of Chicago with high examination scores, he was excused from many required courses and received his bachelor's degree in just one year. He received his PhD in psychology from the University of Chicago in 1958. His dissertation was based on his research into the moral choices of adolescent boys and led to a life devoted to the exploration of moral and ethical development in young people. In 1959, Kohlberg joined the Yale University as an assistant professor of

NSOU ? CC-ED-04 ? 71 psychology. Over several years, he worked as an associate professor and director of Child Psychology Training Program at the university level. The remainder of his career was spent as a professor of education and social psychology at Harvard University between 1968 and 1987. I. Kohlberg's Contribution to Psychology Kohlberg's stages of moral development were influenced by the Swiss psychologist Jean Piaget's stage-based theory. He expanded on Piaget's two stages, identifying six stages of moral development. He argued that correct moral reasoning was the most significant factor in moral decision-making, and that correct moral reasoning would lead to ethical behavior. Kohlberg believed that individuals progress through stages of moral development just as they progress through stages of cognitive development. I. Kohlberg's theory of Moral Development The theory of moral development includes three levels and six stages: Level I : Pre-conventional Morality: Stage one : Obedience and Punishment The child is motivated to avoid punishment and has little or no independent moral reasoning. Stage two : Individualism and Exchange Individuals are focused on fulfilling their own self-interests, while acknowledging that different people have different views. Level II: Conventional Morality: Stage three : Maintaining interpersonal relationships At this stage, individuals emphasize the importance of being kind to other people, engaging in 'good' behavior and showing concern for others. This stage includes a strong emphasis on gaining approval. Stage four : Law and order The individual is determined to obey the rules, focusing on the value that the law adds to human life. A person at this stage might argue that breaking the law is wrong because the law is designed to protect people. Individuals focus on maintaining the social order and upholding cultural norms.

NSOU ? CC-ED-04 ? 72 Level III : Post-Conventional Morality Stage five : Social contract Individuals at this stage of development focus on doing what is best for society as a whole and respecting individual rights. Civil disobedience would be endorsed by people in both stages of post-conventional morality. Stage six : Universal principle At this stage, individuals are focused on upholding principles of universal justice, fairness, and ethics. They believe in the democratic process, but also endorse disobeying unjust laws. According to Kohlberg, few people reach stages five and six; most tend to stay within stage four. II. Kohlberg's Assumptions of Moral Development In his unpublished 1958 dissertation, Kohlberg wrote what are now known as Kohlberg's stages of moral development. These stages are planes of moral adequacy conceived to explain the development of moral reasoning. While studying psychology at the University of Chicago, the theory was inspired by the work of Jean Piaget and a fascination with children's reactions to moral dilemmas. Kohlberg proposed a form of 'Socratic' moral education and reaffirmed John Dewey's idea that development should be the aim of education. He also outlined how educators can influence moral development without indoctrination and how public school can be engaged in moral education consistent with the State Constitution. Kohlberg's approach begins with the assumption that humans are intrinsically motivated to explore, and become competent at functioning in their environments. In social development, this leads us to imitate role models we perceive as competent and to look to them for validation. Thus, our earliest childhood references on the rightness of our and others' actions are adult role models with whom we are in regular contact. Kohlberg also held that there are common patterns of social life, observed in universally occurring social institutions, such as families, peer groups, structures and procedures for clan or society decision-making, and cooperative work for mutual defense and sustenance. Endeavoring to become competent participants in such institutions, humans in all cultures exhibit similar patterns of action and thought concerning the relations of self, others, and social world. Furthermore, the more one is prompted to imagine how others experience things and imaginatively to take their roles, the more quickly one learns to function well in cooperative human interactions.

NSOU ? CC-ED-04 ? 73 The sequence of stages of moral development thus corresponds to a sequence of progressively more inclusive social circles (family, peers, community, etc.), within which humans seek to operate competently. When those groups function well, oriented by reciprocity and mutual care and respect, growing humans adapt to larger and larger circles of justice, care, and respect. Each stage of moral cognitive development is the realization in conscious thought of the relations of justice, care, and respect exhibited in a wider circle of social relations, including narrower circles within the wider one. Kohlberg's theory holds that moral reasoning, which is the basis for ethical behavior, has six identifiable developmental constructive stages – each is more adequate at responding to moral dilemmas than the last. Kohlberg suggested that the higher stages of moral development provide the person with greater capacities/abilities in terms of decision making and so these stages allow people to handle more complex dilemmas. In studying these, Kohlberg followed the development of moral judgment beyond the ages originally studied earlier by Piaget, who also claimed that logic and morality develop through constructive stages. Expanding considerably upon this groundwork, it was determined that the process of moral development was principally concerned with justice and that its development continued throughout the life span, even spawning dialogue of philosophical implications of such research. His model "is based on the assumption of co-operative social organization on the basis of justice and fairness." Kohlberg studied moral reasoning by presenting subjects with moral dilemmas. He would then categorize and classify the reasoning used in the responses, into one of the six distinct stages, grouped into three levels: pre-conventional, conventional and post-conventional. Each level contains two stages. III. Moral Education : Kohlberg is well known among psychologists for his research in moral psychology, but among educators he is also known for his applied work of moral education in schools. The three major contributions Kohlberg made to moral education were the use of Moral Exemplars, Dilemma Discussions, and Just Community Schools. i. Kohlberg's first method of moral education was to examine the lives of moral exemplars who practiced principled morals such as Martin Luther King, Jr., Socrates, and Abraham Lincoln. He believed that moral exemplars' words and deeds increased the moral reasoning of those who watched and listened to them. Kohlberg never tested to see if examining the lives of

NSOU ? CC-ED-04 ? 74 moral exemplars did in fact increase moral reasoning. Recent research in moral psychology has brought back the value of witnessing moral exemplars in action or learning about their stories. Witnessing the virtuous acts of moral exemplars may not increase moral reasoning, but it has been shown to elicit an emotion known as moral elevation that can increase an individual's desire to be a better person and even has the potential to increase pro-social and moral behavior. Although Kohlberg's hypothesis that moral exemplars could increase moral reasoning might be unfounded, his understanding that moral exemplars have an important place in moral education has growing support. ii. Dilemma discussion in schools was another method proposed by Kohlberg to increase moral reasoning. Unlike moral exemplars, Kohlberg tested this method by integrating moral dilemma discussion into the curricula of school classes in humanities and social studies. Results of this and other studies using similar methods found that moral discussion does increase moral reasoning and works best if the individual in question is in discussion with a person who is using reasoning that is just one stage above their own. iii. The final method Kohlberg used for moral education was known as "just communities". In 1974, Kohlberg worked with schools to set up democracy- based programs, where both students and teachers were given one vote to decide on school policies. The purpose of these programs was to build a sense of community in schools in order to promote democratic values and increase moral reasoning. Kohlberg's idea and development of "just communities" were greatly influenced by his time living in an Israeli kibbutz when he was a young adult in 1948 and when he was doing longitudinal and cross-cultural researches of moral development. Kohlberg's theory states that moral growth begins early in life and continues in stages throughout childhood, adolescence, and adulthood. Understanding Kohlberg's theory of moral development can help to teachers to guide the moral development of their students in the classroom. He argued that correct moral reasoning was the most significant factor in moral decision-making, and that correct moral reasoning would lead to ethical behavior. Kohlberg believed that individuals progress through stages of moral development just as they progress through stages of cognitive development. Moral development occurs as we grow and helps us to choose between right and wrong. There are three levels (pre-conventional, conventional, and post- conventional moral development) and six stages (following rules, self-reward, social conformity, law and order, cultural norms, and universal justice).

NSOU ? CC-ED-04 ? 75 Moral development is an important part of the socialization process. The term refers to the way people learn what society considered to be 'good' and 'bad', which is important for a smooth functioning society. The theory also suggests that moral logic is primarily focused on seeking and maintaining justice. By using children's responses to a series of moral dilemmas, Kohlberg established that the reasoning behind the decision was a greater indication of moral development than the actual answer.

He used Piaget's storytelling technique to tell people stories involving moral dilemmas. In each case, he presented a choice to be considered, for example, between the rights of some authority and the needs of some deserving individual who is being unfairly treated. 3.6

Summary In the first sub unit Piaget's theory of cognitive development has been discussed in details. Piaget was born in Switzerland in the late 1800s and was a precocious student, publishing his first scientific paper when he was just 11 years old.

100%

MATCHING BLOCK 44/177

Piaget's stage theory describes the cognitive development of children.

His early exposure to the intellectual development of children came when he worked as an assistant to Alfred Binet and Theodore Simon as they worked to standardize their famous IQ test. Erik Erikson is also important in the field of educational psychology. Erik Erikson (1902–1994) was a stage theorist who took Freud's controversial theory of psychosexual development and modified it as a psychosocial theory. In the last sub unit, Lawrence Kohlberg's theory of moral development has been discussed. Lawrence Kohlberg was a 20th century psychologist known primarily for his research into moral psychology and development. 3.7 Self Assessment Questions 1. What is schema according to Piaget? 2. What do you mean by assimilation? 3. Discuss two characteristics each of sensory motor stages. 4. What do you mean by objective permanence? 5. How many stages are there in the psychosocial theory of Erikson?

NSOU ? CC-ED-04 ? 76 6. What is meant by autonomy vs guilt? 7. What is moral development? 8. What is moral education according to Kohlberg? 3.8 References Bee, H. L. (1994). Lifespan development. Unit 4 ? Psychology of Personality Structure 4.1 Objective 4.2 Introduction 4.3 Psychology of Personality 4.3.1 Concept & Characteristics 4.3.2 Types & Significance in Human Life 4.4 Basic Theories of Personality Development: 4.4.1 Allport 4.4.2 Eysenck 4.5 Personality Measurement (Types only) and its Impact on Education. 4.6 Summary 4.7 Self-Assessment Questions 4.8 References 4.1 Objectives After the completion of the Course, the learners will be able to – ? Know the meaning and concept of personality, its characteristics, types and significance in human life; ? Understand theories of personality proposed by Allport and Eysenck and their applications; ? Assess the personality based on Type Theory and its impact on Education. 4.2 Introduction If you ask a man about the meaning of the term 'Personality', probably in most of cases he/she would not be able to give specific answer to this simple question, though we use the term at random. The reason behind it is that there are different connotations of the term and that is why it is used in different perspectives. NSOU ? CC-ED-04 ? 78 Thus, it has become one of the most fascinating topics of Psychology and its related disciplines. Tremendous researches have been going on the topic, but final conclusion in definite terms yet to be determined, though the term 'personality' is closely associated with our day to day life. Thus, Human personality is so complex a phenomenon that it can be interpreted in many ways. In this unit, an attempt has been made to understand the concept of personality and its significance, Basic Theories of Personality, Measurement of Personality and its impact on Education. 4.3 Psychology of Personality Concept and Characteristics, Types and Significance in human Life Personality is the combination of behavior, emotion, motivation, and thought patterns that define an individual. Personality psychology attempts to study similarities and differences in these patterns among different people and groups. To arrive at its meaning of 'personality', we have to trace the historical root of

88%

MATCHING BLOCK 45/177

W

the word. The term personality has been derived from the Latin word 'Persona',

which means mask, generally used by the actors in the Greek theatres.

95%**MATCHING BLOCK 47/177****W**

The mask, worn by the actors, was called 'persona'. According to the concept of mask, personality was thought to be the effect and influence which the individual wearing a mask left on the

audience. Even today,

it is commonly said that the mask for persona of the actor implied a cover for the real person behind it. It was developed on the basis of Plato's Idealistic Philosophy who believed that personality is a mere facade for some substance. 4.3.1 Concept and Characteristics of Personality I. Various Approaches to define the term Personality : i. Personality as a Social

86%**MATCHING BLOCK 48/177****W**

Stimulus : Some Psychologists define personality in terms of its social stimulus. How an individual affects other persons with whom he/she comes in contact, whether he/she is impressive or repulsive, dominating or submissive

can determine his/her personality. It considers the total picture of the individual's organized behavior. ii. Personality as a

78%**MATCHING BLOCK 49/177****W**

Summative Approach : It emphasizes the importance of sum total of different processes and activities of the individual. As for example, innate dispositions, habits, impulses, emotions

etc. This approach was criticized by Gestalt Psychologists who

72%**MATCHING BLOCK 52/177****SA**

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

objected to the idea of aggregation or sum total of parts without introducing the concept of organization and integration of parts into a total whole. NSOU ? CC-ED-04 ? 79 iii. Integrative Approach : The definitions of this category lay emphasis on the integrative aspects of personality

and definite pattern of organization. It

91%**MATCHING BLOCK 51/177****W**

is the integrative organization of all the cognitive, affective, cognitive and physical characteristics of an individual as it manifests itself in focal distinction from others. iv. Totality View :

In this approach, personality puts more emphasis on integration, unlike the summative approach. It forgets the part. According to this view, the general characterization or pattern of an individual's total behavior is his/her personality. Thus, personality is

51%**MATCHING BLOCK 54/177****SA**

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

the characteristic pattern of behaviors, cognitions and emotions which may be experienced by the individual and/or manifest to others. v. Personality as Adjustment : An individual since birth, attempts to adjust to his or her

environment. Behavior of an individual can be defined as an adjustment to the environment. Every individual develops his own unique way of adjustment in the society. According to this approach,

88%**MATCHING BLOCK 53/177****W**

personality is an individual's characteristic pattern of behavior. Individual, through continuous reactions, attempts to adjust himself

or herself with the environment. Thus, it may be said that sum of the individual's movements to adopt oneself with the environment is individual's personality. II. Comprehensive Definitions of Personality: We have discussed the various approaches to define the term Personality. Below we may examine some important definitions of Personality: Fredenburgh,

63%

MATCHING BLOCK 55/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

in his book, The Psychology of Personality and Adjustment tried to summarize the various definitions in a single definition – "Personality is a stable system of complex characteristics by which the life pattern of

the individual may be identified." Allport (1961), who most of his time engaged for research on personality defines, "

75%

MATCHING BLOCK 57/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Personality is the dynamic organization within the individual of those psychophysical systems that determine individual unique adjustment to his environment."

Guilford (1959) defines personality as, "a trait is any distinguishable, relatively enduring way in which one individual differs from another."

96%

MATCHING BLOCK 56/177

W

Though there is diversity of views, but even then psychologists agree on certain common basic characteristics

of Personality. Those are:

NSOU ? CC-ED-04 ? 80 (a) Personality is unique. No two individuals, even the identical twins have alike personality. (b) Personality is the product of one's own functioning with the surrounding environment. It is dependent on our accumulated experiences of the past. (c) It stresses importance of the characteristics of individual differences. 4.3.2 Types of Personality and its Significance : Psychologists have developed several theories of Personality to study the structure and growth of it. Following theories have been identified to describe different types of Personality: i. Type Theory : From ancient times, it has been the nature of persons to name and classify objects in the universe as well as human beings into different categories called 'Types'. The old system of typology still continues even in the modern times. Physicians and Psychologists have developed various typologies. Greek physicians were the first in the fifth B.C., who classified people into four broad categories on the basis of Emotional and Temporal characteristics. (a) Traditional Types : Aristotle and his disciples theorized that human body consists of four fluids, the dominance of any fluids determine the temperament and characteristics of personality characteristics. In ancient India, we had

85%

MATCHING BLOCK 58/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

an advanced system of Ayurveda, in which our ancient physicians broadly categorized all human beings on the basis of three elements –

Pitt, (Bile), Bate (Wind) and Kuf (Mucus). Apart from that a number of typologies have been attempted by Philosophers and Psychologists. Some of those are discussed below: (b) Constitutional Type : Ernest Kretschmer, a German Psychiatrist, classified human beings on the basis of physical constitution. He attempted to establish relationship between personality characteristics and body build. Those are:

NSOU ? CC-ED-04 ? 81 S. No. Type Characteristics 1. Pyknic Stocky, Full-chested, Popular 2. Aesthetic Weak, Tall-sensitive, thin 3. Athletic Strong, Well-built body structure 4. Dysplastic Mixed type (c) Somatic Type: Dr. W.H. Sheldon, an American Surgeon, divided all human beings into three broad categories of physical dimensions and their corresponding temperamental characteristics. He believes that physical structure of the body is the determinant of personality characteristics : S.No. Physical Characteristics Temperament 1. Endomorphic (soft, round) Viscerotonic (sociable, extrovert, affectionable) 2. Mesomorphic (muscular, strong) Somatotonic (energetic, muscular, prefer risk/ chance) 3. Ectomorphic (thin,tall) Cerebrotonic (fearful, artistic, introvert, restrained) (d)

68%**MATCHING BLOCK 59/177****SA**EDN-103- Psychological Foundations of Educatio ...
(D141387240)

Spranger's Type : German philosopher E. Spranger divided human beings on the basis of interests in the following categories: 1. Theoretical – neglects social and political participations. 2. Economic – interested in money-hoarding. 3. Aesthetic – lover of beauty and is busy in sensuous gratification. 4. Social – interested in social activities. 5. Political – dominating and desirous of power. 6. Religious – devote themselves to religious activities and

believes in mysticism. (e) Jung's Typology: Jung, a Swiss Psychiatrist, attempted to classify human beings into two behavioral dimensions – (1) Introvert and (2) Extrovert:

NSOU ? CC-ED-04 ? 82 1. Introvert – A man who tends to withdraw into himself, especially when faced by

30%**MATCHING BLOCK 60/177****SA**EDN-103- Psychological Foundations of Educatio ...
(D141387240)

emotional conflicts and stress in his environment. Introvert individual is shy, avoids people and enjoys to be alone. By nature, many scientists and philosophers are found introverts. 2. Extrovert – in contrast, extrovert persons' orientation is towards the external world. They deal people intelligently in social situations.

They are conventional, outgoing, social, friendly and free from worries. Social Workers, Politicians, Business Executives are generally found extroverts. (f) Freud's Typology: Freud, on the basis of his theory of Psycho-sexual development, identified three types of personality. The types are dependent on the fixation of sexual energy (libido) at a particular stage of development. The five types are as follows: 1. Oral-Erotic Type : Sex in infancy is located in mouth. Membrane in mouth, when irritated gives pleasure to the infant, sexual gratification at this stage involves activities related to mouth. Oral-erotic type of personality shows excessive degree of pleasure associated with the oral activity. Sucking or putting anything in the mouth gratifies the sex in infancy. Fixation at the oral stage results in two types of personality in later life – Oral Passive Type and Oral Sadistic Type. 2. Anal Type : It

66%**MATCHING BLOCK 61/177****SA**EDN-103- Psychological Foundations of Educatio ...
(D141387240)

is the second stage of sex development, when the child obtains gratifications through anal activities.

Some traits of personality develop due to fixation of sex energy at this stage. These include obstinacy, miserliness, orderliness etc. in later life. 3. The Genital Stage : At this stage, the child's interest gets shifted from the eliminating organs to the genitals. The children now come to note the biological differences between the sexes and derive pleasure from playing and manipulating the genital organs. 4. The Latency Stage : this period starts from six years in the case of girls and seven to eight years in the case of boys and extends till the onset of puberty. 5. Phallic Type : The third stage of psycho-sexual development is Phallic. In this type person shows self-love, exhibitionism etc. usually they draw the attention of others. These characteristics are found in the early adolescence. In modern Psychology, Type approach is not so widely used, rather it focuses on other scientific theories. NSOU ? CC-ED-04 ? 83 (b) Trait Approach : The 'Trait' in daily life is used simply to indicate the nature of a person. In the simplest sense by 'Trait' we mean a mode of behavior which is manifested in number of the situations consistently. It is any distinguishable relatively enduring way in which one individual varies from other. "

90%**MATCHING BLOCK 62/177****SA**EDN-103- Psychological Foundations of Educatio ...
(D141387240)

Trait may be defined as a property within the individual that accounts for his unique but relatively stable reactions to environment."

Some properties of Traits are – 1. Scialability – Traits are scialable and that can be measured quantitatively. 2.

78%**MATCHING BLOCK 63/177****SA**EDN-103- Psychological Foundations of Educatio ...
(D141387240)

Inference from Behavior – Personality traits are not directly observable but they are manifested in a number of activities and behavioral expressions. 3.

Flexibility – Traits are not static in nature. The more flexible traits in the childhood become stable with maturity and experience, but some variability is always there. 4. Universality – There are certain traits which are universal in nature as height and weight. 5. Functional Unity – it means that there must be different indications which may vary or are

68%

MATCHING BLOCK 64/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

manifested consistently in behavior of the individual. 6. Traits as higher order habits – Guthrie conceived that a trait is a higher order habit which recurs in

the behavior frequently. 7. Traits as mental sets – Trait has been defined as mental set of an individual. It is a readiness to respond to any variety of situations in a consistent way. 8. Traits as

85%

MATCHING BLOCK 65/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

frame of reference – Personality of an individual is an organized whole of beliefs, emotions

etc. about the environment. In this reference, traits are organized frame of references. 9. Traits are learned – Traits are learned in the interaction with the environmental stimuli. They are biologically determined as the disposition and intellectual potentialities of the individual. Two significant basic Trait Theories of Personality proposed by G.W. Allport and H.J. Eysenck have been discussed in details in the next sub-unit. (c) Psychoanalytic Approach : The Psychoanalytic theory of personality has important explanations on the dynamics of human behavior. Freud was the first psychologist who systematically attempted to explore the unconscious part of the human personality. According to NSOU ? CC-ED-04 ? 84 him, greater part of our personality lies buried in unconscious state of our mind. He compared mental phenomenon with an iceberg floating on the surface of the ocean whose greater portion remains under the surface of the water. We cannot study a human being by observing his overt behavior only, because most of the repressed desires, thoughts and feelings remain in unconscious mind and continually influence our behavior. Freud placed great importance on instincts as the determinant of human behavior. He proposed two instincts – (i) Eros, the love and the self-preservation and (ii) Thanatos, the death instinct, as the ultimate cause of all human activity. Psychic Energy comes from Libido, which denotes as sexual energy. It is defined as the energy of all the life instincts. It is the primary driving force of the personality. The Id is inborn, the function of which is to discharge the psychic energy to produce tension through the personality system. It cannot differentiate between good and bad and operates on pleasure principle. The Ego is an organized portion of the Id, which becomes modified by the contact of external reality and experience. It

68%

MATCHING BLOCK 66/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

distinguishes between subjective reality and things in the external environment. The Ego is called the executive of personality. It

formulates a plan for the satisfaction of the need and executes it, keeping into consideration

76%

MATCHING BLOCK 67/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

the reality principle. It often integrates the conflicting demands of Id, the Super Ego and the external world. The

Super Ego is the agency, which internalizes the parental influences and ideals of society through early childhood experiences. It

50%

MATCHING BLOCK 68/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

represents the ideal rather than the real and strives for perfection. It works in accordance with the moral standards authorized by

the agents of society. The dynamics of personality, as explained by Freud is that

76%

MATCHING BLOCK 69/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

human organism is a complex energy system which derives its energy from food it consumes.

This biological energy is transformed into Psychic Energy. The dynamics of personality involves

90%

MATCHING BLOCK 70/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

a continuous interaction and clash between Id impulses seeking release and inhibition imposed by the

Super Ego. (d) Phenomenological Approach : Personality has been explained on the basis of several models of human behavior developed by philosophers, with the development of scientific psychology in the beginning of last century. Thus, models have been evolved by psychologists as Behaviouristic, Humanistic, Existential or Phenomenological human behavior. Carl

NSOU ? CC-ED-04 ? 85 Rogers, G.Kelly and Kurt Lewin had developed the concept of the Phenomenological theory. The common characteristics of Phenomenological Theories are: 1. It emphasizes the importance on subjective experiences of person instead of objective approach of learning theory. 2. It emphasizes the importance of perception, organization and structuring of experiences. Perceptual process is the essential determinant of personality. 3. More emphasis is given on the self-concept in the development of personality. 4. Emphasis is given on the importance of present experiences, the way in which a person perceives events in his/her environment, determines and his/her mode of action. (e) Learning Theory Approach : Psychologists, notably Pavlov, Watson, Guthrie, Thorndike, Skinner, Dollard & Miller, and others considered the study of personality as a branch of general field of learning. They worked on the problems of behavior changes through experiences and attempted to integrate those characteristics in the development of personality. Almost all learning theorists agree on two basic assumptions in explaining personality – (1) all behavior is learned by the organism in the process of constant interactions with external stimuli; (2) objectivity of behavior is important to understand personality. Experimental psychologists are convinced that learning theory is the most reliable and objective approach to understand personality. (f) Social Behavior Approach : According to Bandura and Walters, the most fundamental and significant principle of social learning is the principle of reinforcement. Reinforcement is the most significant component of social behavior. Since the scope of response acquired through reinforcement is unlimited, different types of behavior patterns are expressed. Bandura and his associates emphasized four interrelated sub-processes in observational learning – (1) Attention Process, (2) Retention Process, (3) Motor Reproduction of Skills and (4) Role of Reinforcement. (g) Rotter's Model of Expectancy-Reinforcement Approach: J.B. Rotter, a leading social learning theorist emphasizes the importance of the interactions of the individual with his/her meaningful environment. According to him, personality is stable and independent behavior. He further assumes that personality can change only with the new experiences. Behavior is a goal directed movement towards the goal and is governed by two variables – (1) Reinforcement

NSOU ? CC-ED-04 ? 86 and (2) Individual's Expectancy level to achieve the goal. On the basis of these two concepts, he developed the 'Expectancy-Reinforcement model of personality. Four basic aspects of the approach are discussed below: 1. Behavioral Potential (BP) – refers to the potential for a behavior to occur in a specific situation as a function of its relationship to a specific set of reinforcement. 2. Expectancy (E) – as a concept means

52%

MATCHING BLOCK 71/177

SA

personality all.docx (D28144935)

the probability held by the individual that a particular reinforcement will follow; a specific behavior in a specific situation.

This expectancy is to be independent of the value of the reinforcement. 3. Reinforcement Value (RV) – refers to one's personal preference for one reinforcement over the other reinforcement if the possibility of occurrence for each reinforcement is equal. 4. Psychological Situation (S) – refers to any part of the situation to which the individual is responding in terms of his subjective reaction to that situation. The essential component of this concept is the meaning that the individual gives to the situation. According to Rotter, behavior of the organism occurs in a situation and is influenced by the perception of that situation. 4.4 Basic theories of Personality Development : Allport and Eysenck

100%

MATCHING BLOCK 72/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Initially, Allport used the word trait for personal characteristics but later he substituted the word dispositions for traits and usage of traits was reserved for common traits.

Let us now see the important features of above definitions of Personal Traits and Dispositions: a.

100%

MATCHING BLOCK 73/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

A personal disposition produces equivalences in function and meaning between various perceptions, beliefs, feelings, and actions that are not necessarily equivalent in the natural world, or in anyone else's mind. Personal dispositions have also been termed as 'Morphological Traits'.

b.

88%

MATCHING BLOCK 74/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Personal dispositions guide and motivate a person's specific acts of adjustment. c. Personal dispositions are important as they reflect the structure and organization of personality.

99%

MATCHING BLOCK 75/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

A person with the personal disposition of fear of certain phenomenon, as for example fear of speaking in public, may consider all persons who hesitate to speak in public as similar to himself and respond to them in the same way. But according to Allport it must be kept in mind that one person may be basically an introvert and may not want to talk in public, another may have no idea about the language and so may not want to talk in public and yet the third person may find the topic uninteresting and so may not want to talk in public. Hence the individual concerned will have to interact with them differently and not in the same manner as he would respond to a person like him who is afraid of talking in public. Thus the personal dispositions are concrete, can be easily recognized and they are invariably consistent. e. Allport

also

96%

MATCHING BLOCK 76/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

believes that traits are essentially unique to each individual, as for example, one person's "fear of speaking in public for instance may not be the same for two different individuals, as mentioned above. If one has to understand the person and his behavior, it is important to study the individual in detail and in depth. This can be done by interviewing the person, or observing the person or analyzing his speeches and writings to get a clear view of what is making the person afraid to speak in public. This method was termed as the idiographic method by Allport. 4.4.1 Allport'

95%

MATCHING BLOCK 77/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

s Trait Theory of Personality Gordon Allport's theory is considered to be one of the more scientific theories which has put forward the concept of traits in understanding personality. He takes the biological approach to an extent and mentions about how children are born with reflexes and as they use the reflexes continuously, how in course of time, these reflexes become a habit and how habits by indulging in them continuously turn into traits, which are relatively permanent entities in the individual and which are reflected in the individual's behaviors in different situations. Allport's theory puts forward the new idea of 'functional autonomy' in which he says a particular behavior indulged in initially for some specific purpose, becomes the constant behavior in the individual in course of time. For instance, a person who initially goes to a hill station because the doctor advised, later on goes to the hill station every year as it gives him a satisfaction and his urge gets fulfilled.

The theory is considered 'humanistic' in

89%

MATCHING BLOCK 79/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

one sense and 'personalistic' in another sense. He combines the opposites in his theory such as 'objectivity and subjectivity', 'rationality and irrationality' etc. Here, we will discuss (1) Definition and Structure of Personality as conceived by Allport, his ideas about (2) traits, the (3) types of

NSOU ? CC-ED-04 ? 88 traits and (4) personal dispositions, etc. We may also consider

95%

MATCHING BLOCK 78/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

the dynamics of personality and how traits help in making a person behave in a certain way. We will deal with the concept of Program and functional autonomy which are

the two important concepts of Allport's theory. i.

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Definition of Personality : According to Allport (1938), "personality is the dynamic organization within the individual of those psycho-physical systems that determine his unique adjustment to his environment." This definition has put forward many aspects. Let us

have a look at these aspects – a. Psychophysical Systems - consists of

79%

MATCHING BLOCK 81/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

both psychological and physical aspects, those interact between themselves. The interacting factors include at the physiological level on the endocrinal system. As for the interacting factors in the psychological aspects these include, traits, emotions, intellect, temperament, character and motives. All these interact with the physiological aspects and contribute to the personality development and behavior. b. Dynamic Organization - of different elements of psychological system is independent but functions in an interlocking manner with physiological and other systems amongst themselves and is subject to change. However, this change can take place in a gradual manner over a long period of time. c. Unique Adjustment to Environment - is characterized by a dynamic organization of psychological traits that makes his/her adjustment. The reason for this is that experiences of every person are unique and therefore, their reaction to the environment is also unique. It is well known that the identical twins though are from the same fertilized egg; do show considerable variations in their behavior because of such unique aspects within them.

ii. Personality

(D98843051)

Traits or Dispositions : According to Allport, traits constitute the basic unit of individual's personality. He defined traits as the predisposition to respond and react in the same or similar manner to stimuli in the environment. According to him, there are two types of Traits (i) Common Traits

and (

100%

MATCHING BLOCK 83/177

ii) Personal Traits or Dispositions. Some of the important characteristics of

Common Traits and Personal Traits are as given below: a. Common Traits: 1. Common

86%

MATCHING BLOCK 84/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Traits are not theoretical structures or constructs but are real and found within the individual. NSOU ? CC-ED-04 ? 89

2. Traits guide and direct behavior and enable the individual to behave in a particular manner. 3. Traits are verified empirically. 4. Different traits are not absolutely independent of each other but have overlapping functions. 5. Stable traits can also be changed over time. 6. Persons belonging to a certain country or a community within a society behave similarly in a number of situations. They hold the same view points and behave in like manner as others. This is so because cultural factors play a very significant role in the development of personality.

These are known as Common Traits. b.

91%

MATCHING BLOCK 85/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Personal Traits : 1. Allport was of the view that personal disposition is something unique to the individual and this disposition makes him/her behave consistently in the same way in a number of situations that are similar. 2. It is a generalized neuro-psychic structure that is unique to the individual concerned and this makes for the difference in the behaviors of many individuals even though they may face the same situation. For example, in a TV program when a sad scene is shown one person cries, another turns the other way from the TV not wanting to see the scene, and the third criticizes the scene as most unreasonable and unrealistic. These three different reactions are typically due to the personal disposition of the three different individuals. In his own words, 3. Allport defined (1938) this disposition as "a generalized neuro-psychic structure, unique to the individual, with the capacity to render many stimuli functionally equivalent, and to initiate and guide consistent or equivalent forms of adaptive and stylistic

behavior." c. Personal Dispositions : 1.

97%

MATCHING BLOCK 86/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Cardinal Traits : These are central to the individual and these traits manifest themselves in almost all situations and in the individual's very personality. For instance, if we take compassion as a cardinal trait in one person, you will see that this compassion is manifested in almost all aspects of the individual's behavior, as for instance, if he sees a child begging, he will offer her some eatable or money. Such a person may also join many NGOs that are dealing with orphans and destitute, so as to help these needy persons. He would also write in newspapers and magazines about the conditions of

individual's personality. When you describe someone, you are likely to use words that refer to these central traits: aristocratic, street smart, timid, aggressive, arrogant etc. According to Allport each individual has about 5 to 10 such cardinal traits in them. One of these is indeed dominant while others do dominate but do not have the overriding influence on the person's behavior. Through such traits one can define the personality of the individual concerned. These central traits reveal the structure and organization of personality. 2.

Central

is, for instance showing a disdainful attitude towards a particular community person. These are rather too general and are not as consistent as the cardinal traits. They can also change in certain special situations. For example, the negative disdainful attitude may not be obvious when the person is with others who are in favor of that community person and his contributions.

II. Development of Personality : According to Allport, personality develops through following seven stages— i.

90%

MATCHING BLOCK 92/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Sense of Body (First 2 years of life) : As pointed out earlier, the child in the beginning stages has no idea about which is his/ her body and what is that of another. Even

he/she thinks a pillow is part of himself/ herself. As he/she

86%

MATCHING BLOCK 93/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

experiences over a period of time, when the pillow is taken away by the mother, he/she realizes that it is not

a

100%

MATCHING BLOCK 94/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

part of his body. This idea of the sense of one's own body develops as a result of experiences that the child goes through in

his/her interactions

100%

MATCHING BLOCK 95/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

with the environment. Allport went ahead and said that the aspects the child experiences as the most essential and which is warm and central and which gives him comfort are the most central aspects of his/

her

100%

MATCHING BLOCK 96/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

experience. The sense of body has boundaries, that is, we all feel the pain, touch and many other sensations including movement, etc. which all contribute to our becoming.

94%

MATCHING BLOCK 97/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

ii. Self-identity : Another aspect that develops during the first two years is what Allport called as 'Self-identity'. In course of his experience, the child is able to become aware that pillow is not himself and mother is not himself. This kind of realisation through experience continues on and the person is able to develop a sense of his own self called as self-identity. This self- awareness leads to the recognition of oneself as having a past, present and a future. The person is able to see himself as a separate entity who is separated from the pillow, from the mother and various others in his environment. This differentiation of the self from the whole is an important aspect of the development of self-identity. Every individual has a name and a family and this identity is entirely the individual's own. iii. Self-esteem (2 to 4 years of age) : This aspect develops in the individual around the age of two to four years. The child is able to move around now and is able to accomplish many things that he never used to in the past due to the non-maturation of many of the organ systems. As the child is growing and many of his organs are maturing he is able to make many movements both refined and non-refined and is able to reach his goals, as for instance NSOU ? CC-ED-04 ? 92 to fetch a toy from another corner of the room etc. As the child experiences many achievements and accomplishments he feels good about himself, becomes more confident and tries to do things like climbing the stairs and reaching the rooms on the first floor etc. He is able to control also many of his reflexes in terms of controlling his bowel and bladder. All these are appreciated by the caregivers and the child feels good about himself/ herself and thus develops a good concept about himself that he/she is capable. Thus, he develops self-esteem which is positive. On the other hand, if the experiences were in the negative direction the self-esteem would also have been negative. iv. Self- extension (4 to 6 years) : The extension to one self-develops between four to six years of age. There are many things in the environment which are supplementary and complementary to the growth and development of the individual. The individual is able to understand that Mr. X and Ms. Y are his parents. They are his own. He lives in a place which again is his own, he has a room in which he studies and does a lot of things including listening to music etc. and these are all his own. Thus, there is an extension of self here into many things in the environment which all are identified with

the self.

97%

MATCHING BLOCK 98/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Some people as they grow up may even identify themselves with being a sportsman, an athlete or a swimmer etc. Some belong to a group or a clan or a gang and identify themselves with the same. Some identify themselves with an occupation such as being a psychologist or a doctor or a lawyer. Thus, there is self extension into many aspects of the environment. v. Self-Image (4 to 6 years) : Self-image means, the self of the person as others see it. It is a mirroring of one's image by others. The impression that the individual makes on others by looks, clothes, behavior etc. In addition other aspects of self that are important include the social esteem or status one enjoys in the society and in the social circle. It also includes the person's sexual identity. Many times the ideal self and self-image may not be the same. While one may have an ideal image in mind as for example, one wants to be like Amitabha Bachhan in look and behavior, the actual image may not be anywhere near it. In some cases, others may consider the individual as resembling someone in looks and behavior, but the person concerned may consider his self-image as different. Thus, there could be a discrepancy in the self-image and what others think about the person. vi. Rational coping (6-12 years): As the individual grows up and his personality develops he is able to have higher cognitive functioning with increase in

NSOU ? CC-ED-04 ? 93

98%

MATCHING BLOCK 99/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

his thinking abilities, decision making and memory capacities. These in turn help the individual to make decisions on many matters related to that age level. The person is able to now think rationally on many issues and is able to understand the pros and cons and takes relatively more appropriate decisions as compared to the earlier age levels. He puts in efforts to understand things and is able to accomplish far more tasks than before. This ability to cope with life related situations rationally is an important development that takes place during these years. vii. Proprium : Every individual has to finally take charge of his life. The individual has to be responsible for his thinking, actions and behaviors. After the varied experience in life the individual is able to look back on his goals, achievements and accomplishments, and then say now is the time he would try to spend on activities that gives him internal satisfaction and a sense of fulfillment. This is almost akin to that of self-actualisation as put forward by Maslow, though in a number of ways it is different. The propiate striving starts only after the age of 12 years and the individual is able to clearly identify his goals, what his future plans are and in which direction think he like to move and what is the purpose of his life etc. He is able to now say that he is the man in charge of his life and would like to do things as he wishes and desires. In all this, of course, the person acts rationally and logically.

(D98843051)

example fear of speaking in public, may consider all persons who hesitate to speak in public as similar to himself and respond to them in the same way. But according to Allport it must be kept in mind that one person may be basically an introvert and may not want to talk in public, another may have no idea about the language and so may not want to talk in public and yet the third person may find the topic uninteresting and so may not want to talk in public. Hence the individual concerned will have to interact with them differently and not in the same manner as he would respond to a person like him who is afraid of talking in public. Thus, the personal dispositions are concrete, can easily be recognized and they are invariably consistent. Allport also believes that traits are essentially unique to each individual, as for example, one person's "fear of speaking in public for instance may not be the same for two different individuals, as mentioned above. If one has to understand the person and his behavior, it is important to study the individual in detail and in depth. This can be done by interviewing the person, or observing the person or analyzing his speeches and writings to get a clear view of what is making the person afraid to speak in public. This method was termed as the idiographic method by Allport.

In his theory,

95%

MATCHING BLOCK 105/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Allport's has put forward three basic concepts as underlying dynamics of personality and these are - (i) Functional Autonomy, (ii) Conscious and Unconscious Motivation,

and (

96%

MATCHING BLOCK 106/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

iii) Psychological Maturity. Allport described personality dynamics in terms of functional autonomy, conscious and unconscious motivation and psychological maturity. These dynamics are being explained below: (i) Functional Autonomy : Allport did not believe in looking too much into a person's past in order to understand his present. This belief is most strongly evident in the concept of functional autonomy: Your motives today are independent (autonomous) of their origins. In other words the means employed for the attainment of a goal are now themselves a Personality goal. For example, a person develops and inculcates discipline and hard work in his/

her

97%

MATCHING BLOCK 107/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

life to become rich and famous. But even after becoming rich and famous he/she continues to live with discipline and hard work. Actually, discipline and hard work are no longer the means for being rich and famous but they have replaced the goal of being rich and famous in that discipline and hard work by themselves are goals. What is now is more important than what was in the past or what is going to be in the future. A person may have been persuaded by parents to become a lawyer, but as the individual practiced law, it was so interesting and so satisfying, that there was no need for the parents' persuasion any more, being a lawyer and practicing law by itself has become a goal for this individual.

NSOU ? CC-ED-04 ? 95 (ii)

71%

MATCHING BLOCK 108/177

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Types of functional autonomy : There are two types of functional autonomy. Let us see, what these

are: (a)

88%

MATCHING BLOCK 109/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Perseverative functional autonomy refers to various behaviors in which a person continues to indulge. These behaviors really have no purpose at the present moment yet; we continue to indulge in these

behaviors. (b)

95%

MATCHING BLOCK 110/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Propriate functional autonomy, on the other hand, refers to the values that the person holds. This comes about as a result of socialization and child rearing practices in which parents incorporate values of honesty, hard work, diligence, generosity, compassion etc. in children through both rewards and punishment. The children internalize the values as they want to be appreciated and rewarded and also want to avoid punishment. (

iii) Propriate functional autonomy is controlled by three principles: (

84%

MATCHING BLOCK 111/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

a) Principle of organizing: Here the organizing refers to the organization of one's energy into different activities. The energy is organized into many novel and creative activities which are productive and not in activities which are non productive. (b) Principle of Mastery: Competence refers to the person's efforts to satisfy his/her needs at a higher cognitive levels and higher levels of satisfaction. He/She, therefore, not only masters and competently deals with various situations, he/

she also continues to refine and enrich whatever he/she

96%

MATCHING BLOCK 112/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

is doing. This gives satisfaction to the individual at the highest level. This is another important principle of propriate functional autonomy. (c) Principle of propriate patterning: Self is most important in the proprium of an individual. This self consists of all perceptual and cognitive processes of the individual's higher level cognitive functions. In other words the various cognitive functions are organized around this self. Since every behavior cannot be explained by functional autonomy principles many of these patterning if understood can explain a person's

behavior. (iv) Value Content of Personality :

96%

MATCHING BLOCK 113/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Allport and his colleagues also categorized as per the contents of the values: (

a) A business person

100%

MATCHING BLOCK 114/177

93%**MATCHING BLOCK 117/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Allport in his theory laid emphasis on conscious motivation stating that an adult individual is fully aware of what he/she is doing. But, he also gave due recognition to the concept of unconscious motivation. In fact, all the conscious motivations are somehow influenced by desires hidden in the unconscious. He refuted Freud's claim that ego does not have energy of its own and personality is controlled by the unconscious

state.

100%**MATCHING BLOCK 118/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Problem-centeredness, and the development of problem-solving skills; (f) Self-objectification - insight into one's own behavior, the ability to laugh at oneself, etc. (g) A unifying philosophy of life, including a particular value orientation, differentiated religious sentiment, and a personalized conscience. IV. Evaluation of Allport's Theory : A careful analysis of the

Allport's Theory of Personality reveals certain merits and demerits: a.

88%**MATCHING BLOCK 122/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Merits : Allport developed his personality theory in academic settings instead of psychoanalytic settings. For this reason, this theory gained much importance and recognition among educational psychologists. According to Allport, present and future are more important in understating personality than past of an individual. Motivations NSOU ? CC-ED-04 ? 97 and behavior of an individual can be better understood by present and future. This characteristic of Allport's theory helps

to

95%

MATCHING BLOCK 123/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

understand the structure of personality more scientifically. His idiographic approach to personality research is quite praiseworthy as it aids understanding and detailed analysis of personality. He made an important contribution to the field of psychology through his explanation of personality in terms of traits. b. Demerits: Feist criticized Allport's theory saying that it is grounded more in philosophical speculations and common sense than in scientific research. Psychoanalysts objected to Allport's concept of proprium which puts more emphasis of present and future and ignores his past. They say that such ignore of past hinders complete understanding of personality. Past events and experiences that went into the shaping of present personality can't be totally delinked from the present personality. Allport's theory describes the functionally autonomous motives of a psychologically healthy person but motive of children, psychotics and neurotics do not find any mention in his theory. Allport in his theory failed to explain their behavior. Allport in his theory does not mention how an original motive develops into a functionally autonomous motive. For example, discipline and hard work which originally acted as means to get rich and famous become functionally autonomous once the person is rich and famous. Thus, it is difficult to predict which motive of childhood develops into autonomous motive during adulthood. Critics also point to the idiographic approach taken to the personality taken by Allport. According to them nomothetic approach which requires study of several persons at the same time and subjecting the data so gathered to statistical analysis is the only right method for studying personality. Allport's theory is based only on the study of normal and psychologically healthy persons and does not take account of neurotics and others. This fact limits its applicability. Some of the concepts in Allport's theory do not lend themselves to empirical testing. For example, functional autonomy is a concept that can't be manipulated in experimental conditions. Psychologists also refute Allport's claim of discontinuity in the personality of children and adults and normal and abnormal. Furthermore, Allport did not make any sense about the impact of social factor on personality. 4.4.2

Eysenck's Trait-Type Theory of Personality

91%

MATCHING BLOCK 124/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Eysenck, Hans Jurgen (1916-97), was a British psychologist. He was known for his theory of human personality. He suggested that personality is basically determined biologically and is arranged in a hierarchy consisting of types, traits,

NSOU ? CC-ED-04 ? 98

100%

MATCHING BLOCK 125/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

habitual responses and specific responses. Eysenck did not believe in Freudian Psychoanalysis as he considered it rather unscientific. i. Hierarchical Taxonomy

of Personality:

100%

MATCHING BLOCK 126/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

According to Eysenck, Personality can be studied from either temperamental or cognitive

point of view,

88%

MATCHING BLOCK 127/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

or both. He focused on the temperament aspect of personality in his PEN (

Psychoticism, Extraversion and Neuroticism)

87%

MATCHING BLOCK 128/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

model. For better understanding of the model, therefore, the concept should begin with its description or 'taxonomy of personality or temperament'. As Eysenck (1991) stated, "In any science, taxonomy precedes

the

89%

MATCHING BLOCK 129/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

causal analysis." In the course of taxonomy (classification), any organisms can be organized into groups based on characters and their relationships. Eysenck describes in plain terms how taxonomy in the study of personality can be achieved using the correlation technique called factor analysis. In case of personality study, the organisms concerned are human beings; their characters are traits, measured by experiment, by rating, by self-rating, or in some other way. Traits can be related with subjects, or subjects

with

82%

MATCHING BLOCK 130/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

traits, giving us groups of people showing similarity over traits, or groups of traits, cohering as factors over people. We can then look at the traits (or people) having the highest factor loadings in order to better identify the trait clusters. (Eysenck, 1991) Individual differences in personality or temperament are analyzed in terms of traits, which can be defined as theoretical constructs based on "co-variation of a number of behavioral acts" (Eysenck & Eysenck, 1985). However, Eysenck (1991) further supposes that traits themselves inter-correlate and make up higher-order factors or

super-factors, which Eysenck calls as 'Types.' As a result, the PEN

88%

MATCHING BLOCK 131/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

model proposes a hierarchical classification of personality containing four levels. At the very bottom level of the hierarchy are behaviors such as talking with a friend on a single occasion. At the second level are habits such as talking with friends on multiple occasions, which are comprised of recurring behaviors. The third level of the hierarchy is that of traits or factors such as sociability, which are comprised of inter-correlated sets of habits. At the top of the hierarchy are super-factors or dimensions of personality such as extraversion, which are inter-correlated sets of traits or factors. Eysenck suggests three such

super-factors:

95%

MATCHING BLOCK 132/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Extraversion (E), Neuroticism (N), and Psychoticism (P). These three superfactors or dimensions of personality are orthogonal to each other, which mean that they do not correlate with each other (Eysenck & Eysenck, 1985).

ii. Theories of Personality:

(D98843051)

The PEN model is based on the principle of 'aggregation', in which measures will have higher reliability if they are comprised of many items (Eysenck, 1990). NSOU ? CC-ED-04 ? 99 That is, each super-factor in the PEN model is comprised of many different factors, habits, and behaviors, and thus reliability of measurement is increased. The

super- factors

95%

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

of extraversion, neuroticism, and psychoticism at the top level of the hierarchy are stable, whereas behaviors, such as, talking with a friend on a single occasion at the bottom of the hierarchy are changeable across time and situation. In this respect, the distinction between levels is very important for the analysis of personality in the PEN model. iii. Three Dimensions of Personality: Eysenck strongly advocates that there are only three major dimensions or

super- factors in the description of personality: (i) Extraversion-Introversion; (ii) Emotional stability versus Instability, or Neuroticism; and (iii)

92%

MATCHING BLOCK 135/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Psychoticism versus Impulse control (Eysenck & Eysenck, 1985). In the PEN model, these dimensions or super- factors are based on "constitutional, genetic, or inborn factors, which are to be discovered in the physiological, neurological, and biochemical structures of the individual" (Eysenck & Eysenck, 1985). Each person does not necessarily have either 100 percent or zero percent of Extraversion, Neuroticism, or Psychoticism. An individual may show some degree of these

super-factors

100%

MATCHING BLOCK 136/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf

psychosis - (i) Psychotic symptoms and illnesses do not form completely separate diagnostic entities, (

ii)

96%

MATCHING BLOCK 138/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Psychosis is not a separate diagnostic entity which is categorically separated from normality, (iii) This continuum is co-linear with the concept of Psychoticism embodied in the P scale of the EPQ. On this continuum, a person with high Extraversion is sociable, popular, optimistic, and rather unreliable, whereas a person with low Extraversion is quiet, introspective, reserved, and reliable. A person with high Neuroticism is anxious, worried, moody, and unstable, whereas a person with low Neuroticism is calm, even-tempered, carefree, and emotionally stable. A person with high Psychoticism is troublesome, uncooperative, hostile, and socially withdrawn, whereas a person with low Psychoticism is altruistic, socialized, empathic, and conventional (Eysenck & Eysenck, 1985). iv. Causal Aspects based on a three-dimensional description of personality: The PEN model further attempts to provide causal explanation of personality. The PEN model looks for Psycho-physiological, hormonal, and other biological mechanisms responsible for the personality dimensions, so that the theory can be tested by scientific experiments. Eysenck and Eysenck (1985) clearly contend that "no theory would be considered valid that did not make testable and verified

NSOU ? CC-ED-04 ? 100

97%

MATCHING BLOCK 139/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

predictions." Consequently, Eysenck (1990) proposes the arousal theory, by modifying his inhibition theory to explain the causal roots of the three dimensions of personality.

Eysenck also made an attempt to specify a Neuro-physiological

98%

MATCHING BLOCK 140/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

basis for each of his three personality super traits or types. According to him, the super trait Introversion-extraversion is closely related to levels of cortical arousal as indicated by electroencephalographic recordings. Eysenck(1982) used the term arousal to denote a continuum of excitation, ranging from a lower extreme (e.g., sleep) to an upper extreme (e.g., state of panic). He was of the view that introverts are over aroused and thus are highly sensitive to incoming stimulation. For this reason, they avoid situations that are apt to overwhelm them. Extraverts are under aroused and thus are highly insensitive to incoming stimulation and thus they constantly seek out situations that are apt to excite them. Eysenck hypothesized those individual differences in stability vs neuroticism reflected the degree to which the autonomic nervous system reacts to stimuli. He linked this dimension with the limbic system, the brain's visceral or feeling system, which influences motivation and emotional behaviour. He pointed out that persons high on neuroticism tend to react more quickly to painful, novel, disturbing, or other stimuli than do more stable persons. Such persons also exhibit a more persistent reaction (even after the stimulus has disappeared) than do highly stable persons. Eysenck's

neuro physiological

91%

MATCHING BLOCK 141/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

interpretation of the dimensions of personality is closely related to his theory of psychopathology. He was of the view that the symptoms or disorders that befall a person are related to the combined impact of personality traits and nervous system functioning. For instance, the person who is high on the dimensions of introversion and neuroticism is more prone to develop anxiety disorders such as phobias, obsessions, and, compulsions. On the other hand, the person who is high on the extraversion and neuroticism dimensions is at a risk for psychopathic (antisocial) disorders. Eysenck stated that psychological disorders do not automatically occur as a result of genetic predisposition. These genetic predispositions when interact with the environment or a certain situation produce psychological disorders. v. Extraversion and Cortical Arousal According to the Arousal Principle: Eysenck (1990) provides a biological explanation of extraversion in terms of cortical arousal via the ascending reticular activating system (ARAS). Activity in the ARAS stimulates the cerebral cortex, which, in turn, leads to higher cortical arousal. Cortical arousal can be measured by skin conductance, brain waves, or sweating (Eysenck, 1990). Because of the different levels of ARAS activity, "Introverts are characterized by higher levels of activity than extraverts and so are NSOU ? CC-ED-04 ? 101 chronically more cortically aroused than extraverts" (Eysenck & Eysenck, 1985) emphasis added). Based on the Yerkes-Dodson law, which suggests that arousal and performance have an inverted-U relationship, the arousal theory of the PEN model assumes that "some intermediate level of arousal is optimal for performance" (Eysenck & Eysenck, 1985). vi. Neuroticism and Visceral Brain Activation: Eysenck (1990) also explains neuroticism in terms of activation thresholds in the sympathetic nervous system or visceral brain. The visceral brain is also referred to as the limbic system, which consists of the hippocampus, amygdale, septum, and hypothalamus, and regulates such emotional states as sex, fear, and aggression. It is responsible for the fight-or-flight response in the face of danger. Heart rate, blood pressure, skin conductance, sweating, breathing rate, and muscular tension in the forehead can measure activation levels of the visceral brain. Neurotic individuals have greater activation levels and lower thresholds within the visceral brain. They become easily upset in the face of very minor stresses. However, emotionally stable people are calm under such stresses because they have lesser activation levels and higher thresholds. vii. Psychoticism and Gonadal Hormones: Eysenck (1990) also provides a biological explanation of Psychoticism in terms of gonadal hormones such as testosterone and enzymes, monoamine oxidase (MAO). Eysenck (1992) reports that "low platelet monoamine oxydase (MAO) has been found in psychotic patients, and also in their relatives and inpatients who have recovered, suggesting that low MAO activity may be

an indicator of '

82%

MATCHING BLOCK 142/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

vulnerability'. Considering all, the PEN model has contributed to the study of personality in

the following

100%**MATCHING BLOCK 143/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

ways – i. It combines both descriptive and causal aspects of personality in one theory (Eysenck, 1997 & Stelmack, 1997). This characteristic clearly distinguishes the PEN model from most

of the

93%**MATCHING BLOCK 144/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

other trait theories such as the five-factor model (Costa & McCrae, 1992a, 1992b; Eysenck, 1991, 1992b, 1992c). ii. It provides causal explanations in addition to the description of personality. iii. The PEN model is supported by more credible evidence than purely descriptive models. iv. The PEN model is comprehensive in description by proposing a hierarchy of four levels and by making a clear distinction among those levels.

v.

100%**MATCHING BLOCK 145/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Finally, the PEN model becomes most compelling because of its experimental approach to the study of personality, which makes the model

NSOU ? CC-ED-04 ? 102

95%**MATCHING BLOCK 146/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

more testable. Consequently, the PEN model is likely to generate more specific predictions about personality. Thus, the essence of Eysenck's Trait-Type theory is that – (i) Elements of personality can be arranged hierarchically; (ii) Certain

super-traits

100%**MATCHING BLOCK 147/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

or types, such as, Extraversion exert a powerful influence over

behavior; (iii) These super-traits

100%**MATCHING BLOCK 148/177****SA**DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

comprised of several component traits, and these component traits either

have

97%

MATCHING BLOCK 149/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

more superficial reflections of the underlying type dimension, or are specific qualities that contribute to that dimension. According to Eysenck, traits are composed of numerous habitual responses, which, in turn, are derived from a multitude of specific responses. The trait of sociability correlates with such response dispositions as activity, liveliness, assertiveness etc. Taken together, these traits define a super trait or type Eysenck calls extraversion. In considering Eysenck's hierarchical model of personality structure, it should be noted that the word 'type' refers to dimensions of personality that he regards as normally distributed along a continuum. This is almost equivalent to traits. Thus, for example, the type concept of extraversion is a dimension with a low end and a high end along which people may fall at various points between the two extremes. It is not a dimension on which people can be classified as either low or high. Eysenck does not imply discontinuity when he uses the word 'type'. Personality Types Eysenck used a variety of methods for gathering information about people in order to delineate their personality. These methods included self-report, observer ratings, biographical information, assessments of physique and physiology, and objective physiological tests. These data are factor analyzed to determine the structure of personality. Initially Eysenck found two basic

types of

96%

MATCHING BLOCK 150/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

dimensions that he labeled as introversion-extraversion and neuroticism-stability (a factor sometimes called instability-stability). Eysenck (1976) added a third type dimension of personality, which he called psychoticism-superego strength. People high on this super-trait dimension tend to be egocentric, impulsive, sensitive to others, and opposed to social customs. They are often seen as – (i) troublesome, (ii) not fitting in well with others, and (iii) intentionally upsetting other people. Eysenck suggested that psychoticism is a genetic predisposition toward becoming either psychotic or psychopathic. He regarded psychoticism as a personality continuum along which all people can be located. He also added that this trait is found more commonly in men than in women. NSOU ? CC-ED-04 ? 103 4.5 Measurement of Personality

Personality tests are the techniques designed to measure one's personality. They are used to diagnose psychological problems as well as to screen candidates for academic and employment purposes. There are two major types of personality tests – (i) Self-report Inventories and (ii) Projective tests. I. Self-report Inventories Self-report Inventories are a kind of objective test used to assess personality. They typically use multiple-choice items or numbered scales, which represent a range from 1 (strongly disagree) to 5 (strongly agree). They often are called Likert scales after its developer, Rensis Likert (1932). Self-report inventories are generally easy to administer and cost-effective. There is also an increased likelihood of test takers being inclined to answer in ways that are intentionally or unintentionally more socially desirable, exaggerated, biased, or misleading. For example, someone applying for a job will likely try to present oneself in a positive light, perhaps as an even better candidate than they actually are. One of the most widely used personality inventories is the Minnesota Multiphasic Personality Inventory (MMPI), first published in 1943, with 504 true/ false items, and updated to the MMPI-2 in 1989, with 567 questions.

100%

MATCHING BLOCK 151/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

The original MMPI was based on a small, limited sample, composed mostly of Minnesota farmers and psychiatric patients; the revised inventory was based on a more representative, national sample to allow for better standardization. The MMPI-2 takes 1–2 hours to complete. Responses are scored to produce a clinical profile composed of 10 scales: Hypochondriasis, Depression, Hysteria, Psychopathic Deviance (social deviance), Masculinity versus Femininity, Paranoia, Psychasthenia (obsessive/compulsive qualities), Schizophrenia, Hypomania, and Social Introversion. There is also a scale

to ascertain

83%

MATCHING BLOCK 152/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

risk factors for alcohol abuse. In 2008, the test was again revised, using more advanced methods,

to

100%

MATCHING BLOCK 153/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

the MMPI-2-RF. This version takes about one-half the time to complete and has only 338 questions. Despite the new test's advantages, the MMPI-2 is more established and is still more widely used. Although the MMPI was originally developed to assist in the clinical diagnosis of psychological disorders, it is now also used for occupational screening,

such as in

100%

MATCHING BLOCK 154/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

law enforcement, and in college, career, and marital counseling (Ben-Porath & Tellegen, 2008).

In addition to clinical scales, the tests also have validity and reliability scales.

NSOU ? CC-ED-04 ? 104 II. Projective Tests : Another method for assessment of personality is projective testing. This kind of test relies on one of the defense mechanisms proposed by Freud—Projection—as a way to assess unconscious processes. During this type of testing, a series of ambiguous cards is shown to the person being tested, who then is encouraged to project his feelings, impulses, and desires onto the cards—by telling a story, interpreting an image, or completing a sentence. Many projective tests have undergone standardization procedures and can be used to access whether someone has unusual thoughts or a high level of anxiety, or is likely to become volatile. Some major examples of projective tests are discussed below: Rorschach Inkblot Test : It was developed in 1921 by a Swiss psychologist named Hermann Rorschach. It is a series of symmetrical inkblot cards that are presented to a client by a psychologist. Upon presentation of each card, the psychologist asks the client, "What might this be?" What the test-taker sees reveals unconscious feelings and struggles (Piotrowski, 1987; Weiner, 2003). The Rorschach has been standardized using the Expert system and is effective in measuring depression, psychosis, and anxiety. Thematic Apperception Test (TAT) : A second projective test is the Thematic Apperception Test (TAT), developed by Henry Murray (1930), an American psychologist, with a psychoanalyst named Christiana Morgan. A person taking the TAT is shown 8–12 ambiguous pictures and is asked to tell a story about each picture. The stories give insight into their social world, revealing hopes, fears, interests, and goals. The storytelling format helps to lower a person's resistance divulging unconscious personal details (Cramer, 2004). The TAT has been used in clinical settings to evaluate psychological disorders; more recently, it has been used in counseling settings to help clients gain a better understanding of them and achieve personal growth. Standardization of test administration is virtually non-existent among clinicians, and the test tends to be modest to low on validity and reliability. Despite these shortcomings, the TAT has been one of the most widely used projective tests. Rotter Incomplete Sentence Blank (RISB) : It was developed by Julian Rotter in 1950. There are three forms of this test for use with different age groups: the School form, the College form, and the Adult form. The tests include 40 incomplete sentences that people are asked to complete as quickly as possible. The average time for completing the test is approximately 20

NSOU ? CC-ED-04 ? 105 minutes, as responses are only 1–2 words in length. This test is similar to a word association test, and like other types of projective tests, it is presumed that responses will reveal desires, fears, and struggles. The RISB is used in screening college students for adjustment problems and in career counseling. For many decades, these traditional projective tests have been used in cross-cultural personality assessments. However, it was found that test bias limited their usefulness. TEMAS Multicultural Thematic Apperception Test It is another projective tool designed to be culturally relevant to minority groups, especially Hispanic youths. TEMAS—standing for "Tell Me a Story" but also a play on the Spanish word temas (themes)—uses images and storytelling cues that relate to minority culture (Constantino, 1982). Though the Projective tests are more time consuming for the evaluator than self-report inventories, still it is widely used by evaluators as it is considered more valid. 4.6 Summary

98%

MATCHING BLOCK 155/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

Allport is one of those theorists who was so right about so many things that his ideas have simply passed on into the spirit of the times. His theory is one of the first humanistic theories, and would influence many others, including Kelly, Maslow, and Rogers. One unfortunate aspect of his theory is his original use of the word trait, which brought down the wrath of a number of situationally oriented behaviorists who would have been much more open to his theory if they had bothered to understand it. But that has always been a weakness of psychology in general and personality in particular: Ignorance of the past and the theories and research of others. In the present unit we studied Allport's theory of personality. We studied about his definition

96%

MATCHING BLOCK 156/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

regarded traits as the building blocks of personality and mentioned two types of them, namely – common traits and personal dispositions or traits. Personal traits were further sub-divided into cardinal, central and secondary traits. We studied dynamics of personality and within it we introduced ourselves to the concepts of functional autonomy, the principles upon which it operates, conscious and unconscious motivation and psychological maturity. In the end we made an evaluation of Allport's theory in the light of criticism done by various psychologists.

87%

MATCHING BLOCK 157/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

The trait-type theory of Eysenck is based on factor analysis. His hierarchical model of personality structure includes the dimensions of types, traits, habitual responses, and specific responses. Types represent super-trait dimensions along which

NSOU ? CC-ED-04 ? 106

100%

MATCHING BLOCK 158/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

people may be located at various points between two extremes. Eysenck suggests that personality types are dimensional and that most people do not fall into separate categories. Eysenck sees only two major types or traits as underlying personality structure: introversion-extraversion and stability-neuroticism. At a later stage he also added one more dimension that is psychoticism and super ego strength. The differences in these two

super-traits,

100%

MATCHING BLOCK 159/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

as well as a third factor called psychoticism- superego strength, are closely related to differences in

neuro-physiological

86%

MATCHING BLOCK 160/177

SA

DPSY405_PERSONALITY THEORIES (1)(1).pdf
(D98843051)

functioning. Eysenck places far more emphasis on the genetic foundations of traits than does Cattell. However, according to Eysenck, the genetic predisposition when interacts with the environmental factors produce the requisite behaviors which may be normal or abnormal. Eysenck has developed several questionnaires to assess the three major super-traits underlying his hierarchical model of personality. EPQ is the most important tool to assess the differences between introverts and extraverts. 4.7 Self Assessment Question 1) Discuss the Type theory of personality highlighting its characteristic features. 2) How does type theory differ from trait theory of personality? 3) Discuss and compare the Sheldon somatotype personality with that of Ayurvedic body type. 4) Discuss Jungian Personality types and indicate how the EPQ was devised. 5) Elucidate Eysenck's trait type theory of personality. 6) Give neuro-physiological explanations for neuroticism, extraversion and psychoticism. 7) How do you measure personality according to Eysenck? 8) What are the basic personality types? 9) Differentiate between extraversion and introversion personality types. 4.8

Understand Creativity as human ability with its Concept, Characteristics and Significance in Education.

NSOU ? CC-ED-04 ? 109 5.2 Introduction Our knowledge of human abilities has been accelerating rapidly in recent decades and it is now substantial. It is established that abilities develop quite slowly across the years, but once developed, enable the individual to deal with one's social and physical world more effectively. Teachers may use the knowledge of abilities to organize teaching-learning process effectively for every individual learner. This sub- unit deals with the concept, characteristics and types of human abilities. Intelligence as a concept is used very commonly in our day to day life. We often make comments that this person seems to be very intelligent or seems to be dull. Because of this intelligence we human beings are considered superior to the animals. But what this intelligence is? Different people would give different meaning of Intelligence. Similarly, psychologists have attributed a variety of factors to the concept of intelligence. 5.3 Psychology of Human Abilities: Concept, Characteristics and basic Types Meaning of Human Ability: Human ability is the existing competence or skill to perform a specific physical or mental act. Although ability may be either innate or acquired through experience, it is distinct from capacity to competence. It is a union of a native process (or processes) in humans and a content (or contents) inferred from relatively permanent changes in behavior. Abilities are of two kinds: Cognitive and Psychomotor. Both abilities are the products of maturation and learning. When a child understands the meaning of a statement in acquiring language or comprehending a word, his understanding means a process or operation and also certain content i.e., words or their meaning is an example of Cognitive Ability. A psychomotor ability, on the other hand, helps a human being to acquire specific skill for a specific work, e.g., manual dexterity needs acquisition of skill as well as well-coordinated arm-hand-mind movement while manipulating an object. Persons high in this ability are able to perform any specific task involving manual dexterity. Skills and abilities are the tasks that you naturally do well, talents and strengths that you bring to the table as a student and/or an employee. These include

NSOU ? CC-ED-04 ? 110 natural capabilities you've always had, in addition to specific knowledge and skills you've acquired through experience and training. 5.3.1 Concept Human Ability : Human ability is a union of a native process (or processes) in humans and a content (or contents) inferred from relatively permanent changes in behavior. Abilities are of two kinds: Cognitive and Psycho-motor. When a child understands the meaning of a statement in acquiring language or comprehending a word, his understanding means a process or operation and also certain content, i.e., words or their meaning. Through intelligence, humans possess the cognitive abilities to learn, form concepts, understand, apply logic, and reason, including the capacities to recognize patterns, plan, innovate, solve problems, make decisions, retain information, and use language to communicate. Human intelligence is also interpreted as the intellectual capability of humans, which is marked by complex cognitive feats and high levels of motivation and self- awareness. Through intelligence, humans possess the cognitive abilities to learn, form concepts, understand, apply logic, and reason, including the capacities to recognize patterns, plan, innovate, solve problems, make decisions, retain information, and use language to communicate. Nature of Human Ability : The identification of abilities by scientific methods is a complex process. Ability is, in fact, a configuration of abilities, identified through co-relational and Experimental researches. Any single ability needs consistency among separate performances involving that ability. In that sense, ability is a mediator which helps the individual to interpret the ideas and actions of others as well as to take all actions by self. It has been established that abilities develop quite slowly across the years, but once developed they enable the individual to deal with his physical and social world more effectively. The present knowledge can enable us to hypothesize the abilities, using various theoretical frameworks need to be explored. 5.3.2 Characteristics of Human Abilities: An ability, or configuration of abilities, such as speaking English fluently, is a mediator, identified through correlation and experimental research, which accounts

NSOU ? CC-ED-04 ? 111 for consistencies among separate performances. Thus, the ability to speak English well underlies the many separate encounters and experiences one has with others who speak English. In this sense it mediates, or helps the individual to interpret, the ideas and actions of others and also helps him to take action based on what they say. Fleishman and Bartlett (1969) in a comprehensive review of research on human abilities identified five basic characteristics of abilities as given below: i. Abilities are a product of maturation and learning. Much practice and learning are required to comprehend the concepts and principles of any subject. The maturational level of an individual child limits what he or she can learn. Thus, abilities develop at different rates from birth through adolescence. For example, verbal comprehension develops more rapidly than arithmetic in early childhood. ii. Abilities developed during the formative years persist into adulthood. For example, manual dexterity is quite stable from year to year. It is resistant both to improvement and deterioration in adulthood. iii. The ability and task performance are complementary to each other. The present abilities of the individual affect the rate at which he/she learns new tasks. Thus, the student high in spatial ability and arithmetic reasoning achieves higher in physics than the one low in both, motivation and other factors being equal. Equally important is that the study of physics will probably contribute to further development of both abilities. iv. Ability may be transferred to the learning of a greater variety of specific tasks than another. Abilities may vary from specific to general, and thus, the more general the ability the greater is its transfer. Arithmetic computation, an ability, facilitates only the learning of new tasks involving computation, whereas spatial ability facilitates the learning of broad classes of tasks in mathematics, science, engineering and other technical areas. v. Abilities are more fundamental than skills. The term 'skill' refers to the level of proficiency on a unitary task or a configuration of tasks. Driving, swimming, typing are skills acquired at varying levels of proficiency. In acquiring each of these skills, the individual learns a sequence of activities and executes them rapidly and perfectly. Involved in performing each skill, however, are more basic abilities, finger dexterity and finger speed are two of the more basic psychomotor abilities that underlie typing and handwriting; cognitive abilities are also involved in performing these skills.

NSOU ? CC-ED-04 ? 112 5.3.3 Basic Types of Human Abilities We shall now examine five different basic types of human abilities regarding the nature of cognitive ability. They proceed in an order – (i) a single unitary ability, (ii) a set of primary abilities, (iii) a larger number of specific abilities, (iv) an indefinite number of specific abilities related to learning hierarchies, and (v) a hierarchical structure involving both general and specific abilities. a. General Intellectual Ability or 'G' as the single unitary ability or intelligence is an unchanging rate of intellectual growth. It has been widely accepted as universal

capacity of an

individual to act purposefully, to think rationally, and to deal effectively with

the environment. b. Primary Mental Ability was identified on the basis of Thurstone's study (1938) on administration of a large number of separate tests that tapped various mental functions. Through factor analysis he identified a few primary mental abilities. These may be separate in kind but parallel in structure. The five most prominent abilities are - (a) Verbal Meaning, (b) Number Facility, (c) Reasoning, (d) Perceptual Speed, and (e) Spatial Relations. c. Specific Ability was developed by Guilford (1967) from his model of 'Structure of Intellect'. He defines an ability as a union of an operation, a content, and a product. There are five Operations, four types of Content, and six products; therefore, there are $5 \times 4 \times 6$ or 120 Specific Abilities. d. Divergent-Product Ability (Creativity) is the most important contribution of the 'Structure of Intellect Model' as a new way of thinking about the ability of the individual. Human beings can be placed from high to low on a single continuum of general intellectual ability and should be treated accordingly in educational and vocational settings. Some students may be stronger in divergent than in convergent-production abilities, and vice-versa. In this connection, the identification of the divergent-production (or creative) abilities has already made some impact on educational practices. e. Hierarchical Structure of Abilities was formulated by Vernon (1950), Smith (1964) and others. They indicated that the general and group factors are widely accepted by the psychologists. It is not to imply that the abilities as stated at any level in the hierarchy are themselves fully understood. There may be unresolved differences of opinion about how the abilities are manifested in the performance of individuals, which may be considered hypothetical.

NSOU ? CC-ED-04 ? 113 I. Determinants of Intellectual Abilities : The basic determinants of intellectual abilities were classified by Bayley (1970) as follows: a. Role of Heredity operates to influence both nature and the level of mental abilities of individuals to an unspecified extent. b. Socio-economic Background status of the family in which the child is reared may be an important determinant of intelligence. It includes the combined effect of family income, father's education, mother's education, father's occupation etc. c. Environmental Impoverishment, apparently contribute to low intelligence and greater the impoverishment, the greater is the deleterious effect. d. Interventions may improve motivational conditions; create better opportunities for children to learn, reduce anxiety, or eliminate debilitating diseases and malnutrition also raise IQ scores. e. Emotional Climate in which the child is reared affects mental development. IQ fluctuations are found parallel to fluctuations in the emotional climate in the home. II. Significance of Human Abilities in Education Human abilities develop over a period of many years through study and practice. Abilities underlie more specific achievements and skills of all kinds in the cognitive and psychomotor domains. Abilities are identified scientifically through controlled experimentation and factor analyses. Abilities are also identified through careful observation and analysis of the performance of many students. Many psychologists have formulated ideas about the organization of intellectual abilities. Two important contributions of this model to education, more important than the identification of the many separate abilities, are a different way of looking at the nature of intelligence, and an emphasis is given on the nurturing of divergent production, or creative abilities. Cognitive abilities underlie educational achievements and that may be nurtured through education is illustrated by the work of project talent. Thus, consistent progress is being made in identifying and cataloging human abilities. The results of this work, in turn, provide a better foundation for organizing educational programs.

NSOU ? CC-ED-04 ? 114 5.4 Intelligence : Concept, Basic Theories (Spearman, Thorndike and Guilford), Types and Uses of Intelligence Tests 5.4.1 Concept of Intelligence The study of human intelligence dates back to the late 1800s when Sir Francis Galton (the cousin of Charles Darwin) became one of the first people to study intelligence. He was interested in the concept of a gifted individual, so he created a lab to measure reaction times and other physical characteristics to test his hypothesis that intelligence was a general mental ability, a product of biological evolution as the concept was given by Darwin. Galton theorized that because of quickness and other physical attributes were evolutionarily advantageous, they would also provide a good indication of general mental ability (Jensen, 1982). Thus, Galton operationalized intelligence as reaction time. Operationalization is an important process in research that involves defining an unmeasurable phenomenon (such as intelligence) in measurable terms (as reaction time), allowing the concept to be studied empirically (Crowthre-Heyck, 2005). Galton's study of intelligence in the laboratory setting and his theorization of the heritability of intelligence paved the way for decades of future research and debate in this field. Basically, intelligence is the ability to think, to learn from experience, to solve problems, and to adapt to new situations. Psychologists believe that there is a construct, known as general intelligence (g) that accounts for the overall differences in intelligence among people. As two concepts are very close, a distinction is to be made between the intelligence and aptitude. Intelligence is the capacity or the potentiality that a person has, whereas the aptitude is the capacity that predicts what one can accomplish with learning and training. An aptitude is a combination of characteristics indicative of an individual's capacity to acquire some specific knowledge, or skill. i. Definition of Intelligence Most commonly accepted view is that intelligence is a general capacity for comprehension and reasoning that manifests itself in various ways. The most widely accepted definition is "

Intelligence is the global capacity of an individual to act

NSOU ? CC-ED-04 ? 115

purposefully, to think rationally and to deal effectively with his

or her environment. It includes the power of adaptation of an individual to his milieu and his ability to learn and abstract thinking." Intelligence has been defined in many ways: (a) higher level abilities (such as abstract reasoning, (b) mental representation, (c) problem solving, (d) decision making), (e) the ability to learn, (f) emotional knowledge, (g) creativity, and (h) adaptation to meet the demands of the environment effectively. Psychologist Robert Sternberg defined intelligence as "the mental abilities necessary for adaptation to, as well as shaping and selection of any environmental context (1997, p. 1) ii. Nature of Intelligence Nature of intelligence can be understood by the different theories, thoughts or ideas in the following sub-sections. Have you ever consciously considered following questions? • Am I an intelligent person? • How intelligent am I? • How do we judge if someone is intelligent or not? • How can we measure the intelligence of a person? And any more of similar type. Let us think about the following to understand the nature of Intelligence: a. Intelligence is the capacity to acquire and apply knowledge. b. Intelligence, According to Feldman, is the capacity to understand the world, think rationally, and use resources effectively when faced with challenges. c. Intelligence, according to educationists is the capacity for learning, reasoning, understanding, and similar forms of mental activity and also aptitude in grasping truths, relationships, facts, meanings, etc. d. American Psychologists mostly believe intelligence as a Mental process and they devised mental test to measure intelligence. e. The concept of Crystallize and Fluid Intelligence (Cattell & Horn). Crystallized intelligence determines accumulation of information, skills, and strategies that are learned through experience and can be applied in problem solving situations. Fluid intelligence indicates intelligence that reflects information processing capabilities, reasoning, and memory, viz., solving puzzle, analogy, or remembering a set of numbers. NSOU ? CC-ED-04 ? 116 f. Cognitive psychologists examine the processes underlying intelligent behaviors rather than focusing on the structure of intelligence. They emphasize more on initial encoding as Information processing approaches. g. Applying their abilities to the kinds of problems that confront them in everyday life, that is the practical intelligence - the art of common sense or practical intelligence. h. Capacity of individuals to recognize their own and other people's emotions is known as Emotional Intelligence (EI) - Goleman's Theory of Emotional Intelligence. i. Eysenck (1973) distinguishes between speed and power components of intelligence. Speed is measured by the time required to complete the task and power is measured through untimed test of reasoning. j. Jensen splits intelligence into two levels: 'associative ability' being the capacity to learn, remember and recall information. It represents the lower level of continuum. 'Cognitive ability' is concerned with reasoning and is located at the higher level. It depends upon associated ability but not the vice versa. k. Hebb (1966) has distinguished two meanings of intelligence on neurological basis. Intelligence 'A' is the innate potential based on the development process. This type of intelligence is dependent upon the possession of a good brain and a good neural metabolism. Intelligence 'B' involves the functioning of the brain, and is observable indirectly from the individual's behavior. Intelligence 'A' is not observable and cannot be measured, whereas intelligence 'B' is measured through tests. 5.4.2 Basic Theories of Intelligence Some researchers argue that intelligence is a general ability; whereas others make the assertion that intelligence comprises specific skills and talents. Some psychologists contend that intelligence is genetic, or inherited, and others claim that it is largely influenced by the surrounding environment. As a result, psychologists have developed several contrasting theories of intelligence as well as individual tests that attempt to measure this very concept. Three basic theories of Intelligence, namely, (i) Spearman's Two-factor Theory, (ii) Thorndike's Multi-factor Theory and (iii) Guilford's Structure of Intellect are discussed below: I. Spearman's Two-Factor Theory of Intelligence Charles Spearman, an English psychologist, established the two-factor theory of intelligence back in 1904. To arrive at this theory, Spearman used a statistical

NSOU ? CC-ED-04 ? 117 technique known as factor analysis. It is a procedure through which the correlation of related variables is assessed to find out an underlying factor that explains this correlation index. In the case of intelligence, Spearman noticed that those who did well in one area of intelligence tests (for example, mathematics), may also did well in other areas such as science or music (Kalat, 2014). In other words, there was a strong correlation between performing well in mathematics and music, and Spearman then attributed this relationship to a central factor, that of general intelligence (g). Spearman concluded that there is a single g-factor which represents an individual's general intelligence across multiple abilities, and that a second factor 's' refers to an individual's specific ability in one particular area (Spearman, as cited in Thomson, 1947). He further proposed that individuals possess general intelligence factor (g) in varying (degree) amount. This determines the individual's overall ability. In addition to 'g', individuals also possess specific abilities (s), 'g' is universal inborn ability, known as general mental ability. The amount of 'g' differs from individual to individual. Higher the 'g' in an individual, greater is the success in life. The 's' factor is learned and acquired in the environment, which varies from activity to activity even in the same individual; the individuals themselves differ in the amount of 's' ability. Two individuals in a class may be comparable on their 'g' factor, yet may vary with 's' factors, one may be very good with numbers while the other possesses higher musical ability.

II. Thorndike's Multi-Factor Theory of Intelligence One of the sharpest critics of Spearman's two-factor theory was E. L. Thorndike (1926), who believed that the inter correlations studied by Spearman were too small to test the question of a common factor. He objected very strongly to the idea of the existence of a characteristic such as general intelligence. Instead of one kind of factor, he maintained that there are a large number of separate characteristics that make up intelligence. He argued that instead of generality of intelligence, communality in the acts of people to perform intelligently needed to be looked into. According to Thorndike, the common element does not reside in the individual but in the nature of the tasks themselves. People differ in their ability to perform any specific act in terms of the level of difficulty they can manage. They also differ in the range or number of tasks they can or cannot perform. For Thorndike, intelligence was more like a series of skills or talents and several or many tasks might call for the same kind of ability. According to him, the correlations between NSOU ? CC-ED-04 ? 118 various tests are the result of the fact that the tests have features in common with each other even though they are called as measures of different aspects. Thorndike's contention that there is no general intelligence but very specific acts has, however, does not hold water in view of the fact that some tasks have so many elements in common that it is desirable to classify them into groups such as arithmetical reasoning, visual perception, word meaning, analogy, etc. Thorndike believed that there was nothing like General (g) Ability. Each mental activity requires an aggregate of different set of abilities. He distinguished the following four attributes of intelligence: (a) Level—refers to the level of difficulty of a task that can be solved; (b) Range—refers to a

85%

MATCHING BLOCK 165/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

number of tasks at any given degree of difficulty; (c) Area—means the total number of situations at each level to which the individual is able to respond;

and (d) Speed—is the rapidity with which we can respond to the items. Thorndike assumed that intelligence involves three mutually independent abilities: (a)

93%

MATCHING BLOCK 166/177

(D141387240)

Abstract intelligence - the ability to verbal and symbolic thinking; (b) Mechanical intelligence - the ability to effectively control your body and manipulate objects;

and (c)

100%

MATCHING BLOCK 167/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

Social intelligence - the ability to communicate with people, understand and perform in social relations.

One can notice that the discrepancy of point of view between Spearman and Thorndike is basically a theoretical one and the types that interested Thorndike are essentially the same as the measures which Spearman used in his correlation matrix.

In human resources management it is used in job creation and staffing - in job analysis. The individual components are relatively independent of each other. During various work tasks and activities, different forms of intelligence

apply in different degrees. III. Guilford's Structure of Intellect : Guilford, (1983) in his book, "Frames of Mind", puts forth a new and different view of human intellectual competencies. He argues boldly and cogently that we are all born with potential to develop a multiplicity of Intelligence, most of which have been overlooked earlier. He concluded that every intellectual activity involves three different basic parameters, known as, (a) Content, (b) Operations and (c) Products. Each of the intellectual abilities in the structure of mind is characterized in terms of types of content, operation and product which result. The fluid aspect of this theory says that intelligence is a basic capacity due to genetic potentiality. While this is affected by the past and new experiences, the

NSOU ? CC-ED-04 ? 119 crystallized intelligence is a capacity resultant of experiences, learning and environment. Three Dimensions of Intellect are discussed below: (a) Content : The Content may be of following five types — 1. Figure-visual (Fv) – It is concrete material to be perceived through visual organs/ senses. Visual material has attributes as size, form, colour etc. 2. Figural-audio (Fa): Concrete materials are to be perceived through auditory senses. A person hears and feels, provides figural-audio materials. 3. Symbolic (S): The material is composed in the form of signs and symbols, i.e., letters, digits and other conventional signs organized in general pattern. 4. Semantic (M): This is in the form of verbal meanings or ideas. 5. Behavioural (B): Matters may be the social behavior in the social context. (b) Operation : It involves following intellectual behaviours: 1. Cognition (C): It is the most fundamental operation in a learning process. 2. Memory (M): It is a primary mental process, which means retention of what is recognized. 3. Divergent Production Thinking (Dt): In this operation, mainly creative potential thinks in different directions, searching and seeking some variety and novelty. 4. Convergent Production Thinking (Ct): In this operation, the given operation guides a person to achieve at accepted best outcomes. 5. Evaluation (E): In evaluation, a person reaches conclusion and decisions concerning criterion satisfaction of information. (c) Product : If a particular operation is applied to a definite type of content, six general kinds of products are involved. These are: 1. Units (U), 2. Classes (Cl) 3. Relations (Rl) 4. Systems (Sy) 5. Transformations (Tr) 6. Implications (I) Fig 1 : Structure of Intellect Model FFv Fa S N B Content Cl V Rl Sy I Tr Operation CM DATE PRODUCT

NSOU ? CC-ED-04 ? 120 Thus, the SI Model consists of 150 primary factors (5X5X6). Later Guilford showed the possibility of one more category of Contents, namely, 'Kinesthetic' and thus th Model consisting of 180 (5X6X6) primary mental abilities. As for example, each ability is described by the combination of three factors representing three letters like Cognitive Behavioural Transformaton (CBT) or DFT (Divergent Figural Transformation) or NST (Convergent Symbolic Transformation). 5.4.3 Types of Intelligence and their Uses Eight basic types of intelligence are described below : i. Logical-mathematical Intelligence Logical-mathematical learning style refers to our ability to reason, solve problems, and learn using numbers, abstract visual information, and analysis of cause and effect relationships. Logical-mathematical learners are typically methodical and think in logical or linear order. Applications : ? Solving logical and mathematical puzzles ? Research projects - collecting statistics and analyzing them ? Measurements and surveys ? Complex scientific and mathematical theories ? Experiment to discover cause and effect relationships ? Classify various objects using diagrams - Venn diagrams, trees etc., ? Using abstract symbols and formula ? Any type of calculation. ii. Linguistic intelligence Linguistic intelligence is how we use language, to express one's thoughts and feelings with clarity so others may comprehend, understand, even enjoy them. This can be verbal or in written form. This is an integral part of conventional intelligence and is well understood by parents. For a child, who is strong in linguistic intelligence, here are some ways in which you can provide interesting learning opportunities. Strengths of the Linguistic intelligence are: Applications : ? Reading books. ? Reading aloud

NSOU ? CC-ED-04 ? 121 ? Hear stories – Oral or even on tape/CD. ? Debating and discussing various issues. ? Writing poems, short stories ? Reading newspapers and magazines. ? Word games like Scrabble. ? Public speaking about issues.

iii. Spatial Intelligence Spatial intelligence, or visuo-spatial ability, has been defined as “the ability to generate, retain, retrieve, and transform well-structured visual images” (Lohman 1996). It’s what we do when we visualize shapes in our “mind’s eye.” It’s the mental feat that architects and engineers perform when they design buildings. Applications : ? It’s what we do when we visualize shapes in our “mind’s eye.” ? It’s the mental feat that architects and engineers perform when they design buildings. ? The capacity that permits a chemist to contemplate the three-dimensional structure of a molecule, or a surgeon to navigate the human body. ? It’s what Michelangelo used when he visualized a future sculpture trapped inside a lump of stone. ? It’s also the mode of thought we use to imagine different visual perspectives. ? This is a classic mental rotation test – one measure of visuo-spatial ability. Another spatial intelligence test presents a figure made of blocks, and asks the test taker to create an exact copy. ? Such skills are only one aspect of a person’s overall intelligence. Research suggests that spatial thinking is an important predictor of achievement in STEM, or science, technology, engineering and mathematics. iv. Musical Intelligence Musical intelligence is dedicated to how skillful an individual is performing, composing, and appreciating music and musical patterns. People who excel in this intelligence typically are able to use rhythms and patterns to assist in learning. Applications : ? Including music in lessons/ education system where appropriate

NSOU ? CC-ED-04 ? 122 ? Allowing learners to include music for independent projects ? Connecting music to a lesson, such as talking about what music was popular during historical periods ? Using songs to help students study for examinations ? Playing Mozart or Beethoven as students study in class ? Studies show that listening to classical music benefits the brain, sleep patterns, the immune system and stress levels in students ? Music therapy is now a very treatment for the deviated people. v. Bodily-kinesthetic Intelligence Bodily kinesthetic learning style or intelligence refers to a person’s ability to process information physically through hand and body movement, control, and expression. It is also known as the physical learning style or tactile-kinesthetic learning style. Applications : ? The bodily kinesthetic learning style student may be drawn to the careers that involve physical interactions. ? In health professions, these can include surgery, nursing, physical therapy, occupational therapy, emergency medical technician, and recreation therapy. ? In the arts, this can include being an actor, dancer, artist (painting, sculpting), craft artist, or designer. ? Physical education and sports professions include athletic coach, personal trainer, aerobics instructor, physical education teacher, and professional athlete. ? Trades include carpentry, woodworking, mechanic, and factory work with moving systems. ? Other professions include a postal carrier, firefighter, police officer, forest ranger, or the military vi. Intrapersonal Intelligence Intrapersonal intelligence is the capacity to explore one’s inner world and feelings. This type of intelligence can help a person focus on planning and managing their life. Children with high intrapersonal intelligence potential have an idea of what they want to achieve and how they can achieve it.

NSOU ? CC-ED-04 ? 123 Applications : ? With the intrapersonal intelligence, you may become aware about your own strengths and weaknesses and thus you can appreciate yourself objectively. ? You can embrace other’s feelings, fears and motivations without hesitation. You’ll be a better leader. And you’ll more easily contribute and communicate your ideas to the team. ? Through intrapersonal intelligence you can – — Combat Your Negative Self-Talk — Self-Care and Being Kind to Yourself — Mindfulness and Effective Multitasking — Improve Your Interpersonal Communication vii.

Interpersonal Intelligence Interpersonal intelligence is the ability to understand and interact effectively with others. It involves effective verbal and nonverbal communication, the ability to note distinctions among others, sensitivity to the moods and temperaments of others, and the ability to entertain multiple perspectives. Applications : ? It refers to the ability of a person to relate well with other people and manage relationships. ? It enables people to understand the needs and motivations of those around them which help in strengthening their overall influence. ? It seems to stand out in a crowd as people with lots of friends and can easily adapt to social situation. ? They communicate effectively and enjoy participating in discussions and debates. ? Individuals with interpersonal intelligence are characterized by their sensitivity to other people’s moods, temperaments, motivations, and feelings. viii. Naturalistic intelligence According to Gardner, naturalistic intelligence is the ability to identify, classify and manipulate elements of the environment, objects, animals or plants. They care about the environment and like to be in touch with nature. They are good at identifying fauna and flora.

NSOU ? CC-ED-04 ? 124 Application : ? Physically/emotionally adverse to pollution ? Intense interest in learning about nature ? Dramatic enthusiasm when in contact with nature ? Powers of observation in nature ? Awareness of changes in weather ? Attending class outside ? Illustrate discoveries in nature ? Read books and articles about nature and the environment ? Write articles about nature (poems, short stories, news articles) ? Giving lessons on weather and nature ? Conduct research on local foliage

5.4.3 Types and Uses of Intelligence Test; i. Individual Verbal Tests: In this type of intelligence tests, one person appears the test at a time for whom it is meant. The testee is required to use language while attending the test items. Here the subject's response may be given in oral or written form. The Individual Verbal Tests may act as suitable instrument for literate challenged children of lower age group Examples: a. Stanford-Binnet Test of Intelligence b. Wechsler Intelligence Scale for Children (Verbal Scale) ii. Individual Non-verbal Tests: These tests are administered to one person at a time for whom it is meant. It is also designed for that person who is unable to read and write the language of the test and it is meant for young children also. It includes different activities like completing pictures correctly, setting blocks, cubes etc. it is best suited performance test and appropriate to measure intelligence rather language skill. Examples: a. Wechsler Intelligence Scale for Children (Performance Scale)

NSOU ? CC-ED-04 ? 125 b. Pintour Peterson's Scale iii. Group Verbal Tests: This type of intelligence tests is administered to a large number of subjects at a time who can read and write the language of the test. The subjects are warned to make their pencils and pens ready before the administration of the test. Here time limit of response to the test is almost equal to every student. Mainly the tests are available for adult and literate group only. But tests are economic as well as time saving. Examples : a. Jalota's Scale of Intelligence b. Desai's Verbal Group Test of Intelligence c. CIE Verbal Group Test of Intelligence d. Samoochika Buddhi Parikshan iv. Group Non-verbal Tests: In this category, tests are administered in a group. A large number of subjects who are illiterate, deficient in language appear the test. This test has the features of both group and non-verbal tests of intelligence. Examples : a. Raven's Progressive Matrices Test b. Cattle's Culture Free Test c. Pinter Patterson Scale of Performance Test d. Bhatia's Battery of Performance Test. v. Uses of Intelligence Test: Intelligence Tests are widely used for different purposes: a. Classification of students on the basis of intelligence Test Scores; b. Measurement of the learning readiness of students at different age levels; c. Selection of subjects, courses and careers; d. Diagnosis of reading disability and educational backwardness; e. Prediction of future progress of student;

NSOU ? CC-ED-04 ? 126 f. Selection of candidates for training in defense services; g. Ascertaining the magnitude of individual difference; h. Prediction in vocational success of students in occupational life; i. For the preparation of case study report; j. Providing educational, vocational and personal guidance.

5.5 Creativity: Concept, Characteristics and Significance in Education; Paul Torrance (1995) Quotes: "You need courage to be creative. Just as soon as you have a new idea, you are a minority of one. And being a minority of one is uncomfortable – it takes courage!" "One of my first challenges was to find some way of measuring creative talent, because I knew that the key to progress in any field was measurement." "Creativity defies precise definition. This conclusion does not bother me at all. In fact, I am quite happy with it. Creativity is almost infinite. It involves every sense – sight, smell, hearing, feeling, taste and even perhaps the extrasensory. Much of it is unseen, nonverbal and unconscious. Therefore, even if we had a precise concept of creativity, I am certain we would have difficulty putting it into words." "Don't waste a lot of expensive energy in trying to do things for which you have little ability or love. Do what you can do well and do what you love, giving freely of the infinity of your greatest strengths and most intense loves." "Outstanding creative achievement involves being different, testing known limits, attempting difficult jobs, making honest mistakes and responding to challenge." "People prefer to learn creatively – by exploring, questioning, experimenting, manipulating, re-arranging things, testing and modifying, listening, looking, feeling – and then thinking about it – incubating."

5.5.1 Concept of Creativity The English word creativity comes from the Latin term 'creare', means "to create or to make. The word "create" appeared in English as early as the 14th century, notably in Chaucer (in The Parson's Tale), to indicate 'divine creation'. However, its modern meaning as an 'act of human creation' did not emerge until the Enlightenment

NSOU ? CC-ED-04 ? 127 Teresa Amabile and Pratt (2016) defines creativity as production of novel and useful ideas and innovation as implementation of creative ideas. Innovation is more than a new idea or an invention. An innovation requires implementation, either by being put into active use or by being made available for use by others. There is also an emotional creativity which is described as a pattern of cognitive abilities and personality traits related to originality and appropriateness in emotional experience. Torrance (1995) chose to define creativity as a process because he thought if we understand the creative process, we could predict what kinds of person could master the process, what kind of climate made it grow and what products would be involved. Creativity is defined as the tendency to generate or recognize ideas, alternatives, or possibilities that may be useful in solving problems, communicating with others, and entertaining ourselves and others. It is the tendency to generate or recognize ideas, alternatives, or possibilities that may be useful in solving problems, communicating with others, and entertaining ourselves and others. Guilford (1959) stated, "Creativity is the capacity to produce ideas that are both new and useful through divergent thinking". Drevdahl (1956) defined, "

the power of human mind to create new contents by transforming relations and generating new correlates

Creativity happens when - Creative people tend to possess a variety of traits that contribute to their innovative thinking. Some of these key-traits include: ? Energy : Creative people tend to possess a great deal of both physical and mental energy. However, they also tend to spend a great deal of time quietly thinking and reflecting. ? Intelligence : Psychologists have long believed that intelligence plays a critical role in creativity. In Terman's famous longitudinal study of gifted children, researchers found that while high IQ was necessary for great creativity, not all people with high IQs are creative. He believes that creative people must be smart, but they must be capable of looking at things in fresh, even naïve, ways.

NSOU ? CC-ED-04 ? 128 · Discipline : Creative people do not just sit around waiting for inspiration to strike. They are playful, yet they are also disciplined in the pursuit of their work and passions. While some people seem to come by creativity naturally, there are things that you can do to increase your own creativity. Creativity requires both a fresh perspective combined with previous one.

5.5.2 Characteristics of Creativity

Creativity is the ability and disposition to produce novelty. Children's play and high accomplishments in art, science, and technology are traditionally called creative, but any type of activity or product, whether ideational, physical, or social, can be creative.

a. Creative Process: Paul Torrance (1966, 1993) identified four major characteristics of the creativity process, including originality (having unique ideas), flexibility (alternative thinking about ideas), fluency (abundant idea generation), and elaboration (adding complexity and richness to ideas.)

b. Creativity as Ability: All individuals with healthy brains have some degree of creative potential, but individuals vary in how much novelty they in fact produce. Psychometric measures of creativity are based on the hypothesis that the ability to create is general across domains of activity (art, business, music, technology, etc.) and stable over time. This view implies that a person whose creativity is above average in one domain can be expected to be above average in other domains also.

c. Creativity and Intelligence: Correlations between two abilities Creativity and Intelligence vary in magnitude from study to study and depend on which tests are used. Some correlations are no smaller than correlations among creativity tests, so they do not provide strong evidence that IQ and creativity are distinct dimensions. The findings can be understood in terms of a so-called triangular correlation (also known as the threshold hypothesis); Individuals in the lower half of the IQ distribution lack the requisite cognitive capacity to create and hence necessarily exhibit low creativity; individuals in the upper half of the IQ distribution have the requisite capacity but may or may not develop a disposition to create. Consequently, creativity and IQ are highly correlated at low IQ levels but weakly correlated at high IQ levels. Alternative

NSOU ? CC-ED-04 ? 129 interpretations of the relation between creativity and intelligence have been proposed, including that they are two aspects of the same ability, that they are unrelated, and that they are mutually exclusive. d. Creativity as Process: The fact that the human mind can generate novel concepts and ideas requires explanation. Cognitive psychologists aim to infer the relevant mental processes from observations of how individuals solve problems that require creativity. One hypothesis states that creation is a process of variation and selection, analogous to biological evolution. The mind of a creative person spontaneously generates a large number of random combinations of ideas, and a few chosen combinations become expressed in behavior. An alternative hypothesis is that a creative person is able to override the constraining influence of past experiences and hence consider a wide range of actions and possibilities. The moment at which a previously unheeded but promising option comes to mind is often referred to as insight. A closely related hypothesis is that creative individuals are more able to break free from mental ruts—trains of thought that recur over and over again even though they do not lead to the desired goal or solution. It has also been suggested that people create by making analogies between current and past problems and situations, and by applying abstractions—cognitive schemas—acquired in one domain to another domain. e. Creativity in Relation to Imagery: There is widespread belief that highly creative individuals think holistically, in visual images, as opposed to the step-by-step process that supposedly characterizes logical thinking. Although consistent with often quoted autobiographical comments by Einstein, Mozart, and others, systematic support for this belief is lacking. There is strong research support for a function for visual imagery in memory recall, but its relevance for creativity is unclear. f. Creativity in Relation to Knowledge: Cognitive and biographical studies have shown that creative problem solutions require thorough knowledge of the relevant domain and domain-specific strategies. For example, scientific discovery depends, in part, on knowing what the current theory predicts, plus the strategy of paying close attention to data that deviate from those predictions; creativity in other domains requires other strategies. It is possible that creativity is not a general ability or process, but that creative behaviors and products emerge when a competent and knowledgeable person is motivated to engage in a cumulative effort over a long period of time. If so, a person who is unusually creative in one domain of activity is not necessarily unusually creative in other domains.

NSOU ? CC-ED-04 ? 130 g. Types of Creativity: Arne Dietrich (2004) identifies 4 different types of creativity with corresponding different brain activities. Think of it like a matrix: Cognitive Thomas Edison Newton and the Apple Therapeutic A-ha Moment Artists, Musicians Deliberate Emotional Spontaneous Creativity can be either emotionally or cognitively based, and it can also be spontaneous or deliberate. That gives you the above four quadrants. 5.5.3 Significance in Education Although it is unclear whether the ability to create can be enhanced, there is consensus that the disposition to create can be suppressed. Creativity and discipline are not antithetical—creative individuals practice much and work hard, but extensive reliance on overtly structured activities can thwart the impulse to create, with negative effects on students' well-being. Students with high ability will perform better than others in activities that require design, imagination, or invention, but participation in such activities encourages the disposition to create in students at any level of ability. There is a widespread concern among educators that the trend to define the goals of schooling in terms of standardized tests forces teachers to prioritize fact learning and analytical ability over creativity. Participation in creative activities is emphasized in schools that implement particular pedagogical theories, for example, the Montessori and Waldorf schools. A good classroom environment always has some elements of creativity which makes the lessons more interesting and interactive. The right mix of creativity along with curriculum helps the students. Critical thinking skills positively reflect on our academic progress. These skills

NSOU ? CC-ED-04 ? 131 help learn new material quicker, improve learning skills, understand science, and other important points. The proper development of these skills determines our success. 5.6 Summary Human abilities develop over a period of many years through study and practice. Abilities underlie more specific achievements and skills of all kinds in the cognitive and psychomotor domains. Abilities are identified scientifically through controlled experimentation and factor analyses. Abilities are also identified through careful observation and analysis of the performance of many students. The concept of intelligence affects the content and organization of the intelligence tests. Hence, it is necessary to examine some of the definitions of intelligence in order to have a clear idea about the nature of intelligence. Intelligence

100%

MATCHING BLOCK 171/177

SA

EDN-103- Psychological Foundations of Educatio ...
(D141387240)

is the aggregate or global capacity of the individual to act purposefully, to think rationally, and to deal effectively with his environment.

There is no difference in intelligence due to differences in sex. Heredity exercises a good deal of influence on intelligence. Creativity is one of the distinguishing characteristics of human beings. Creativity

100%**MATCHING BLOCK 173/177****SA**EDN-103- Psychological Foundations of Educatio ...
(D141387240)

is the act of turning new and imaginative ideas into reality. It is characterized by the ability to perceive the world in new ways, to find hidden patterns, to make connections between

the seemingly unrelated phenomena, and to generate solutions. The degree and quality of creative expression is relative. It varies from individual to individual and from age to age, as one grows in years, experience and maturity. Creativity means original thinking, new types of associations, divergent thinking and behaviour, new solutions of old problems, flexibility and a new approach in different fields of life. Creativity is considered a highly particularized and substantive capacity. It is characterized by universal, novelty, divergence, requires free atmosphere, wide scope, innate as well as acquired, relationship with intelligence, adventurous and open thinking. 5.7 Self Assessment Questions 1) What do you mean by human ability? 2) What is psycho-motor ability? 3) What is intelligence? 4) What are the two factors of Spearman's intelligence?

NSOU ? CC-ED-04 ? 132 5) What are the three parameters of Guilford's idea of intelligence? 6) What is meant by creativity? 7) What is kinesthetic intelligence 8) What is group non-verbal test? 9) Mention any one verbal intelligence test. 5.8 References / Bibliography

Unit 6 ? Psychology of Learning Structure 6.1 Objectives 6.2 Introduction 6.3 Psychology of Learning: Concept, Characteristics and Factors of Learning: Attention, Thinking, Memorization, Emotion and Motivation (Basics only) 6.3.1 Concept 6.3.2 Characteristics 6.3.3 Factors of Learning 6.4 Behaviouristic Theories of Learning and its Educational implications: Connectionism, Classical and Operant Conditioning: 6.5 Cognitive Theories of Learning (Insightful and Information Processing) and its Educational Implications. 6.6 Summary 6.7 Self assessment Questions 6.8 References 6.1 Objectives After the completion of the Unit, learners will be able to: ? Explain Concept, Characteristics and Factors of Learning; ? Understand Behaviorist Theories of Learning and its Educational Implications: Connectionism, Classical Conditioning and Operant Conditioning; ? Understand Cognitive Theories of Learning and their Educational Implications.

NSOU ? CC-ED-04 ? 134 6.2 Introduction The psychology of learning is a science that covers the various psychological theories that relate learning. Throughout history, there have been many various psychological learning theories. Some take on a more behaviorist approach which focuses on inputs and reinforcements. Other approaches, such as theories related to neuro-science and social cognition, focus more on the brain's organization and structure to define learning. Some psychological approaches, such as social constructivism focus more on one's interaction with the environment and with others. Other theories, such as those related to motivation, like the growth mindset, focus more on the individual. Psychology of learning is also very applicable today. There has been extensive research in recent years that looks closely at how students are learning both inside and outside the classroom. This information is then used to present new and more cooperative approaches to homework, tests and the student's ability to learn. Theories related to the psychology of learning can also help explain and improve student performance, motivation, and investment in their learning. 6.3.1 Concept Learning is the fundamental process of life. Every individual learns and through learning develops modes of behavior by which he/she lives. It is the term applied in modification of behavior of the learner which occurs as a result of training or experience. With the modification of behavior the learner can do what he/she could not do earlier. Some Definitions of Learning: Encyclopedia of Educational Research has stated, "learning refers to the growth of interests, knowledge and skills and to transfer of these to new situations". According to Wordsworth, "any activity can be called learning

71%**MATCHING BLOCK 172/177****W**

so far as it develops the individual and makes his behavior different from what that would otherwise have been".

In the words of Crow and Crow, "learning is a sequence of mental events or conditions leading to changes in the learner". Gates defines; learning is the modification of behavior through experience and training. In the words of

97%**MATCHING BLOCK 174/177****W**

Hilgard, "learning is the process by which an activity originates or is changed through reacting to an encountered situation, provided that the characteristics of the change in activity cannot be explained on the basis of native tendencies, maturation or temporary states of organism".

NSOU ? CC-ED-04 ? 135 In the views of Gooch, learning as we measure it, is more or less a permanent change in behavior which occurs under motivational conditions of practice. Peal, E.A. states, "learning is a change in the individual following upon changes in the environment". According to Melvin, "learning is relatively enduring change in behavior which is the function of prior behavior". 6.3.2 General Characteristics of Learning General characteristics of learning are multi-dimensional. Those are mainly – a. Purposeful: Human beings are purposive in nature. Thus, true learning is also based on some specific purpose, which plays a very significant role in learning. According to Ryburn, the purpose is always connected with the use of some instinctive power and energy, with which are endowed with at birth. b. Intelligent: Meaningless efforts cannot produce any permanent result. Only efforts made intelligently have lasting effects as it has a basic mental drive to change the permanent behavior. c. Active: Learning does not take place without a purposeful self-activity. Children learn quickly when they participate in some learning activity. They do things with their own hands and thus learn more perfectly. There is better coordination of hands, sense organs and the brain during activity. d. Both Individual and Social: Learning is more than an individual activity. It is a social activity too. Individual mind is always influenced by the social environment either consciously or unconsciously. Thus, learning is both individual and social. e. Product of the Environment: The infant individual starts learning through the interactions with his/her immediate environment. Environmental stimuli are the primary sources of the stimulus-response learning. Hence, learning is the product of environment. f. Development: The learning process starts with the new-born child and it continues throughout

NSOU ? CC-ED-04 ? 136 the life till death. So, life is synonymous with learning and fullest development of the life is possible through learning only. g. Adjustment: Learning helps the individual to adjust himself/herself adequately to the new situations. Life is full of experiences and each experience leaves behind some effects in the mental structure that effect to modify our behavior to adjust the newer situations in life. h. Organization of Experience: Learning is not mere acquisition of facts, skills or experiences in life. It is not even addition of knowledge. It is the organization and reorganization of previous knowledge and experiences for preparation to face the future life. i. Life-long Process: Learning starts from the birth of a child and it continues till death. At every stage the individual faces problems and tries to solve them. Through this process, the individual modifies and improves his/her behavior pattern. One keeps on learning as long as one breathes. j. Universal: All animals in this world can learn. Human beings are rational animals. They are, thus, try to get the maximum benefit from the learning process. So, the learning is universal. 6.3.3 Factors of Learning a. Attention: Attention is the selective process of mind. Without this activity we cannot observe any stimulus as a result we cannot have any experience of the stimulus. Through learning our change in behavioural experience is very essential. So, we can say that without attention learning cannot take place. Attention depends upon motivation, mental environmental factors like distraction or irrelevant stimulus, etc. which affect the efficiency of learning. b. Maturation: Learning starts at birth and continues till death. But a small infant cannot learn whatever we want him to learn. Learning depends on the maturation of central nervous system and other physiological system of the body, e.g., 6 months old baby cannot be made to walk or write because his system has not achieved the maturity

NSOU ? CC-ED-04 ? 137 level for these tasks. If an individual reaches the required level of maturation, learning will be effective and efficient. c. Thinking: Thinking enables us to solve problems and to achieve future plans in life. Critical thinking is an ability which is essential to have successful performance in learning and in solving problems. Through thinking, learners can understand the realities of the world from their respective view points. It is a process within the mind at the same time. Reading, writing and and thinking are the related mental processes so that learning skill as a whole is also another factor. Critical thinking is an ability which is essential to have successful performance in learning and in solving problems. Critical thinking is not limited to a specific subject but it is the capacity of a student to think in a more rational and clear way. Critical thinking is important for students as it gives the ability to think in the right way and solve problems in a more efficient and methodical way d. Memorization: Memory is an active, subjective, intelligent reflection process of our previous experiences. Memory has a fundamental role in life, reflecting the past as the past, and offering the possibility of reusing all past and present experiences, as well as helping to ensure continuity between what was and what was going to be. Memory is essential to learning, as it depends on past learning experience because the information stored in one's memory creates the basis for linking new knowledge by association. It is a symbiotic relationship which continues to evolve throughout our lives. Memory is the superior (logical or intellectual) cognitive process that defines the temporal dimension of our mental organization. It is our ability to encode, store, retain, and retrieve to past recall information and experiences. Five factors that can influence the functioning of the memory: The degree of attention, vigilance, awakening concentration, interest, motivation, need or necessity. The emotional state and emotional value attribute to the learning process. Memory is related to learning but should not be confused with learning. There are three main processes involved in human memory:

NSOU ? CC-ED-04 ? 138 e. Emotion: Emotion has a substantial influence on the cognitive processes in humans, including attention, perception, reasoning, learning, memorizing, and problem solving. It may also facilitate emotions and helps retrieval of past experience efficiently. Emotions stimulate learners' attention and trigger the learning process. They affect what is learned and what is retained. Numerous studies across a range of disciplines including neuroscience, education, and psychology have revealed that emotions play an important role in learning. Positive feelings toward learning can make students more motivated. This in turn can help students engage with learning materials longer. With positive emotions, we can expect less students skipping classes or dropping out altogether. Students always want to be engaged with the learning process, which would be beneficial for student learning in the long run. f. Motivation: Learning has a goal. We try to modify our behaviour either for our own satisfaction or to please others or with a purpose behind it. This shows that a force that directs us towards a goal controls our learning, e.g. a student wants to perform well, motive behind his hardworking is to gain recognition. If we analyze our own behavioural changes we observe that our own motives helped us in acquiring new behaviour. 6.4 Behaviouristic Theories of Learning and its Educational implications: Connectionism, Classical Conditioning and Operant Conditioning I. Theories of Learning Key-Theories in the discipline of Educational Psychology include numerous theories; many experts identify five main schools of thought: Behaviorism, Cognitive, Constructivist, Experiential, and Social-contextual learning theories. Educational psychologists study learners and learning contexts — both within and beyond traditional classrooms — which can influence programs, curricula, and lesson development, as well as classroom management approaches. They leverage educational theory and practice based on the latest research related to human development to understand the emotional, cognitive, and social aspects of human

NSOU ? CC-ED-04 ? 139 learning. Educators can use concepts from educational psychology to understand and address the ways rapidly changing technologies for their students' learning. In addition, educational psychologists play an important role in educating teachers, parents, and administrators about best practices for learners who struggle with conventional education methods. There are five key theories of learning applied in educational psychology, viz., Behaviourism, Cognitivism, Constructivism, Experientialism and Social- contextualism. In the present Sub-unit of the Course, we would discuss about the Behaviourist Theories of Learning and other selected theories in the present Sub-unit: II. Behavioristic Theories of Learning and its Types Behaviorist learning theories first emerged in the late 19th century from the work of Edward Thorndike and Ivan Pavlov. They became popular during the first half of the 20th century through the works of John B. Watson, B.F. Skinner, and others. Behaviorism defines learning as observable behavioral change that occurs in response to environmental stimuli. Positive stimuli or "rewards" create positive associations between the reward and a given behavior. These associations prompt one to repeat that behavior. Meanwhile, negative stimuli or "punishments" discourage the behaviors associated with those stimuli. Through this process of conditioning, people learn to either repeat or avoid behaviors. Because early behaviorists tried to legitimize psychology as a science, their theories emphasized external, scientifically measurable behavioral changes in response to similarly measurable stimuli. Although they admit that thought and emotion influence learning, behaviorists either dismiss these factors as phenomena beyond the realm of scientific inquiry (methodological behaviorism) or convert internal factors into behavioral terms (neo-behaviorism/radical behaviorism). Assuming that changes in behavior signify learning, methodological behaviorists see no fundamental difference between human and animal learning processes, and they often conduct comparative research on animals. a. Thorndike's Connectionism: The theory of Connectionism was first announced by Edward L. Thorndike in his book 'Animal Intelligence' (1898). His experiments on animals had a very profound influence upon human learning and further thinking about learning. He applied an experimental approach by measuring achievement outcomes

NSOU ? CC-ED-04 ? 140 ? Trial-and-Error Learning: In his book of three-volume series 'Educational Psychology' (1914), Thorndike postulated that most fundamental type of learning involves the forming of associations (connections) between sensory experience (perceptions of stimuli or events) and neural impulses (response) that manifest themselves behaviorally and studied the learning process with a series of experiments on animals. He concluded that trial- and-error learning occurs gradually (incrementally) as successful responses are established and unsuccessful ones are abandoned. On the basis of his experiments, Thorndike drew two types of Laws – (i) Primary Laws and (ii) Subordinate Laws. Primary Laws: Thorndike first identified three basic laws as Primary laws. Those are: (i) The Law of Exercise: It has two parts – when a response to a stimulus strengthens their connection with the repetitive uses is based on the Law of Uses, but when a response is not made to a stimulus, the connection is weakened (forgotten) is known as the law of Disuse. (

50%

MATCHING BLOCK 176/177

W

ii) The Law of Effect: When a modifiable connection is made between a stimuli (situation) and a response accompanied by a satisfying state of affairs, that connection strength is

increased. But when followed by an annoying state of affair, its strength is decreased. (iii) The Law of Readiness: It characterizes the circumstances under which a learner tends to be satisfied or annoyed. It gives arousal of strong impulse to a particular sequence as the basic of learning activity. Subordinate Laws: Later Thorndike added five Subordinate Laws. Those are – (i) Law of Multiple Response, (ii) Law of Set or Attitude, (iii) Law of Prepotency of Elements, (iv) Law of Response by Analogy, and (v) Law of Associative Shifting. b. Pavlov's Classical Conditioning: Ivan Pavlov, a Russian physiologist, who won the Nobel Prize in 1904 for his work on digestive system. His experimental legacy to learning theory was his work

NSOU ? CC-ED-04 ? 141 on Classical Conditioning. Classical Conditioning is a multistep procedure. Initially it involves presenting an unconditioned stimulus (UCS), which elicits an unconditional response (UCR). Pavlov placed a hungry dog in an apparatus and presented it with meat powders (UCS), which cause the dog to salivate (UCR). To condition the animal requires repeatedly presenting an initially neutral stimulus for a brief period before presenting the UCS. Pavlov often uses the bell as the neutral stimulus. In the early trials, the bell produced no salivation. Eventually, the salivated response is held to the bell prior to the presentation of meat powder. Gradually, the bell, a Conditioned Stimulus (CS) elicited a Conditioned Response (CR) similar to the original UCR. Repeated presentations of the CS without the UCS cause the CR to diminish in intensity and disappear, a phenomenon known as extinction. Classical Conditioning Procedure Phase Stimulus Response 1. UCS (Meat Powder) UCR (Salivation) 2. CS (Bell), then UCS (Meat Powder) UCR (Salivation) 3. CS (Bell) CR (Salivation) (a) Operant Conditioning: Operant Conditioning, a behavioural theory of learning was formulated by B.F. Skinner (1938) when he published a series of papers reporting results of laboratory studies with animals in which he identified the various components of operant conditioning. He was influenced by conditioned reflex of Pavlov and Watson's behaviourism. Conditioning refers to the strengthening of behavior which results from reinforcement. There are two types of conditioning – Type 'S' and Type 'R'. Type 'S' is Pavlovian conditioning, characterized by the pairing of the reinforcing US stimulus with another CS stimulus. The 'S' calls attention to the importance of the stimulus in eliciting a response from the organism. The response made to the eliciting stimulus is known as respondent behavior. Although type 'S' conditioning explains conditioned emotional reactions, most human behaviors are emitted in the presence of stimuli rather than automatically elicited by them. Responses are controlled by their consequences, not by antecedent stimuli. This type of behavior, which Skinner termed type 'R' to emphasize the response aspect, is operant behavior because it operates on the environment to produce an effect.

NSOU ? CC-ED-04 ? 142 Operant conditioning, sometimes referred to as instrumental conditioning, is a method of learning that employs rewards and punishments for behavior. Through operant conditioning, an association is made between a behavior and a consequence (whether negative or positive) for that behavior. Although operant and classical conditioning both involve behaviors controlled by environmental stimuli, they differ in nature. In operant conditioning, stimuli present when a behavior that is rewarded or punished controls that behavior. For example, a child may learn to open a box to get the sweets inside, or learn to avoid touching a hot stove; in operant terms, the box and the stove are "discriminative stimuli". Operant behavior is said to be "voluntary". The responses are under the control of the organism are operants. For example, the child may face a choice between opening the box and petting a puppy. In contrast, classical conditioning involves involuntary behavior based on the pairing of stimuli with biologically significant events. The responses are under the control of some stimulus because they are reflexes, automatically elicited by the appropriate stimuli. For example, sight of sweets may cause a child to salivate, or the sound of a door slam may signal an angry parent, causing a child to tremble. Salivation and trembling are not operants; they are not reinforced by their consequences, and they are not voluntarily "chosen". However, both kinds of learning can affect behavior. Classically conditioned stimuli—for example, a picture of sweets on a box—might enhance operant conditioning by encouraging a child to approach and open the box. Research has shown this to be a beneficial phenomenon in cases where operant behavior is error-prone. The study of animal learning in the 20th century was dominated by the analysis of these two sorts of learning, and they are still at the core of behavior analysis. They have also been applied to the study of social psychology, helping to clarify certain phenomena such as the false consensus. 6.5 Cognitive Theories of Learning (Insightful and Information Processing) and its Educational Implications The term, Cognitive Learning was by Coined by Piaget in 1936. He developed the Cognitive Learning Theory (CLT) to suggest that knowledge is something that

NSOU ? CC-ED-04 ? 143 is actively constructed by learners based on previously-learned knowledge. The cognitive learning process is based on individuals cognitively processing input to result in a behavior. The Cognitive Theories of Learning is about understanding how the human mind works while people learn. The theory focuses on how information is processed by the brain, and how learning occurs through that internal processing of information. As the name suggests, it focuses on thought. It's the theory that is all about understanding human thought and how the brain responds as people learn. The CLT is also concerned with how information is processed by the brain, and how learning occurs through that internal processing of information. The theories are briefly discussed in the following sections: I. Cognitive Theories of Learning: Development of the CLT is credited to Educational Psychologist, Jean Piaget, and is useful in the analysis of the relationship between mental processes and factors, both internal and external. Coined in 1936, Piaget developed the CLT to suggest that knowledge is something that is actively constructed by learners based on previously-learned knowledge. Contrary to behaviorist theory, the CLT pays attention to what the way of the learner's mind and how it dictates behavior, rather than relying strictly on outward behaviors (or responses). The cognitive learning process is based on individuals cognitively processing input to result in a behavior. It has been found that mental processes include a multitude of elements, viz., (i) Organizing, (ii) Interpreting, (iii) Categorizing, (iv) Attention, (v) Observing, and (vi) Forming generalizations. Cognitive learning theory explains how internal and external factors influence an individual's mental processes to supplement learning. Some common examples of cognitive learning strategies are discussed below: i. Implicit learning Learning is implicit if it does not involve an active intention to gain knowledge. It is a form of accidental and automatic learning as you are not aware of the process but find out later you've retained the information. Examples of this learning include talking, walking, eating and other things that you learn without conscious thoughts. ii. Explicit learning When you deliberately seek knowledge, you are learning explicitly. It involves attempting to become proficient at a new skill or process vital to your work, or going back to school for further studies. Unlike implicit learning that comes to you naturally, explicit learning requires deliberate action and sustained attention to

NSOU ? CC-ED-04 ? 144 acquiring new knowledge. Cognitive learning may help to learn more explicitly by giving an exceptional insight into the subject and how it relates to your work now and later. An example is when you enroll in a Computer course to improve your presentation skills. iii. Meaningful learning Meaningful learning occurs when a person relates new knowledge with past information and experiences. It encompasses emotional, motivational and cognitive aspects and helps to deepen knowledge and problem-solving skills. An example is when you go for an advanced management course to become a better team leader and have a deeper understanding of past leadership training. iv. Cooperative and Collaborative learning When you learn a new process as a group or team at work, you are doing cooperative learning. Learning cooperatively helps to deepen collaboration and bring out the best skills in each participant at the event. This cognitive learning comprises four elements, including: a. Simultaneous interaction b. Positive interdependence c. Individual responsibility d. Equal participation Similarly, collaborative learning is a cognitive strategy in which a resource person teaches a group how to develop their ideas on a specific skill or knowledge area. For instance, your company could train a colleague on a new production process so they can pass on the knowledge to team members. v. Discovery learning You learn through discovery when you actively seek new knowledge. If you enjoy researching new concepts and processes, think deeply about subjects that are not your primary area of specialization or adapt new information to your work, you are practicing discovery learning. For example, you may learn more information about a new workflow app professional in your institution. vi. Non-associative learning (Habituation and Sensitization) Non-associative learning is divided into two styles including - (a) Habituation and (b) Sensitization. Both focus on how you learn based on your reaction to a continuous stimulus. Habituation is the learning by habit. It involves a reduced

NSOU ? CC-ED-04 ? 145 reaction to a stimulus after prolonged exposure. For example, habituation prevents you from noticing the noise if you study in a busy road. Over time, the sound does not bother you anymore because you have learned to ignore the stimulus. The opposite of habituation learning is Sensitization because your reaction increases with repeated exposure to the stimulus. For instance, you might be more reactive to the sound of your home telephone ringing. Both types of learning are basic and can be adapted to a wide range of situations in life and work. vii. Emotional learning This cognitive strategy helps people learn emotional intelligence and other aspects of controlling their emotions and understanding those of others. Whether you are a leader or junior employee, emotional intelligence plays a crucial role in empathy, interpersonal relationship and effective communication. For example, emotional learning helps you maintain cordial relations with introverts and extrovert colleagues regardless of their position in the organization. Mastering this learning could improve your relationships at work and also in your private life. viii. Experiential learning People often learn best through experience. Experiential learning is a cognitive strategy that allows you to take valuable life-lessons from your interactions with other people. However, experiences are subjective and depend on your interpretations. For example, a medical intern can gain insights about patient care, diagnosis, empathy, and compassion by shadowing an experienced doctor. So, two people may have the same experience and draw different lessons from the event. The value of your experience depends on your level of introspection and reflection and how you can relate it to past events. ix. Receptive learning If you love learning at lectures where a person stands in front and talks about a subject while the audience listens or takes notes that is a form of receptive learning. This learning strategy is passive for the learner as it involves the active participation of the person who delivers the material. It limits your participation in taking notes and asking questions. An example is when your organization invites experts to train your team in a classroom or workshop setting. x. Observation learning This cognitive learning strategy involves imitation. Imitation is an effective learning tool, particularly among children. However, adults can also imitate others to learn the skills and traits they desire. You can learn leadership qualities by imitating

NSOU ? CC-ED-04 ? 146 leaders in your field, and you can also become a better team player by practicing the habits of great team players. For example, observing a manager who excels at long-term planning can help to improve your strategic thinking skills. xi. Mastery learning Cognitive learning is an excellent way to achieve mastery in your profession. It helps optimize the use of your brain, thoughts, emotions and experiences. Cognitive strategies condense your learning activities into a fully immersive event that builds on past information while applying it to future scenario. If you want to become an effective learner who enjoys seeking knowledge for a lifetime, practice the cognitive learning strategies to achieve excellence at work and in every sphere of life. II. Theories of CLT The CLT is divided into two further cognitive theories of learning: (i) the Cognitive Behavioral Theory (CBT) and (ii) the Social Cognitive Theory (SCT). i. Cognitive Behavioral Theory (CBT) of Learning: Cognition refers to the mental process of absorbing and retaining knowledge. Further, it encompasses the ability to understand through thought, experience and sense. Cognitive learning refers to active and long-lasting learning. This type of learning is generally very engaging, immersing learners in various processes, maximizing brain productivity, leading to learning new things. Cognitive Behavioral Theory (CBT) refers to the role of cognition in the behavioral pattern of individuals. By formulating self-concepts of the individual's own accord, their behavior is directly affected. The concepts can be based on extrinsic or intrinsic factors, both positive and negative. The Cognitive Triad is a major component of CBT, impact upon human thoughts and behavior – The Self, the World/ Environment and the Future. There are three main cognitive theories of CBT – (a) In the Dual Coding Theory, it is said that we learn through two cognitive systems: verbal and nonverbal. We receive verbal and non-verbal stimuli through our sensory-motor systems (visual, auditory, taste, smell, emotion) and associate these stimuli with words or memories. (b) The Cognitive Load Theory suggests that there is a set amount of information that can be remembered at a time and suggests ways to maximize the mind's productivity by minimizing distracting information. In the Cognitive Load Theory of Multimedia Learning, the overarching principle is that we learn more effectively from words and pictures than from words alone.

NSOU ? CC-ED-04 ? 147 (c) The main assumption of CBT is that thoughts are the primary determinants of emotions and behavior. The cognitive approach to learning believes that internal mental processes can be scientifically studied. It is centered on the mental processes by which the learner takes in, interprets, stores, and retrieves information. It compares the functioning of a human mind to that of a computer, in how it processes and reacts to information. Essentially, the CBT believes that in order to understand behavior, it is necessary to first understand what happens in the brain to cause such behavior. ii. Social Cognitive Theory of Learning: The Social Cognitive Theory (SCT) is primarily based on three factors, namely (a) Behavioral factors, (b) Environmental factors (extrinsic) and (c) Personal factors (intrinsic). The combination of all three factors results in an effective cognitive learning experience. It also includes various basic concepts which manifest in the learner: a. Observational Learning: This type of learning refers to the ability of individuals to gain knowledge through the observation of others' behaviour. EdApp's social learning features, like Discussions, enable users to learn from others. b. Reproduction: Increasing the repetition of a behavior increases the chance of greater knowledge retention. This is achieved by putting the learner in a comfortable environment with relevant and easily accessible materials to learn and practice. c. Self-Efficacy: This occurs when newly absorbed knowledge is put into practice. Emotional Coping: Effective coping mechanisms in stressful situations are useful for successful learning. d. Self-Regulatory Capability: This refers to the ability of individuals to control behavior in a potentially unfavorable environment. iii. Benefits of Cognitive learning Cognitive learning is an effective way of fostering a life-long love of learning and improvement in employees. Organizations can use cognitive learning strategies to impact the following benefits on their staff: a. Enhance comprehension In cognitive learning, students learn by doing. This hands-on approach makes learning immersive and promotes comprehension. Thus, you can develop a deeper understanding of the material and its application to your work and life.

NSOU ? CC-ED-04 ? 148 b. Improves problem-solving skills Problem-solving skills are critical at any level of leadership. The cognitive learning approach enhances your ability to develop this core skill and helps them to apply it to every aspect of their job. c. Boosts confidence Cognitive Learning can also improve confidence in your ability to handle challenges at work. This is because it promotes problem-solving skills and makes it easier to learn new things within a short period. d. Encourages continuous learning Cognitive skills promote long-term learning as it allows you to connect previous knowledge with new materials. It helps you merge old and new information and apply both effectively. Cognitive strategies promote a love of learning by making new knowledge exciting and fulfilling. This encourages you to develop a long-term appetite for knowledge acquisition in any environment. e. Information Processing Cognitive Learning strategies aim to improve a learner's ability to process information in a deeper way. The deeper the understanding, the learner can transfer more and apply information to new situations. Beyond surface learning, in which concepts are often limited to short-term memory only, cognitive learning strategies result in better-retained learning, meaning concepts are embedded into long-term memory. III. Insightful Learning: Insight, in learning theory, is immediate and clear learning or understanding that takes place without overt trial-and-error testing. Insight occurs as a cognitive learning when people recognize relationships (or make novel associations between objects or actions) that can help them solve new problems. It is a cognitive form of learning involving the mental rearrangement or restructuring of the elements in a problem to achieve a sudden understanding of the problem and arrive at a solution. a. Meaning of Insightful learning i. Insight leads to change in perception. ii. Insight is sudden. iii. With insight, the organism tends to perceive a pattern or organization.

NSOU ? CC-ED-04 ? 149 iv. Understanding plays important role in insight learning. v. Insight is related with higher order animals and not with inferior animals. vi. Experience of the learner influences insight learning. Insight learning is a type of learning or problem solving that happens all-of-a-sudden through understanding the relationships of various parts of a problem rather than through trial and error. Insightful learning is also known as Gestalt learning which means that learning is concerned with the whole individual and arises from the interaction of an individual with his situations or environment. Through this interaction emerge new forms of perception, imagination and ideas which altogether constitute insight.

b. Meaning of Gestalt Theory The Gestalt theorists were the first group of psychologists to systematically study perceptual organisation around the 1920's, in Germany. They were Wolfgang, Goethe, and particularly Ehrenfels, Wertheimer, Köhler, Koffka, and Lewin. According to the Gestalt psychologists, certain features in visual perception are universal. In semiotic terms, these universal features can be thought of as a perceptual code.

i. Gestalt is a sensual theory, what we see is a result of light and dark objects, edges and contours that we form into a whole image. Sensual theories are of a lower order of thinking than perceptual theories, such as semiotics, that are concerned with the meaning we attach to what we see.

ii. Dissatisfied with the behaviorist approach of learning, the Gestalt psychologists tried to see learning as a more deliberate and conscious effort of the individual rather than a mere product of habit formation or a machine-like stimulus-response connection. According to them, the learner does not merely respond to a stimulus, but mentally processes what he receives or perceives. Thus, learning is a purposive, explorative and creative activity instead of trial and error. Things cannot be understood by the study of its constituent parts only; actually it is understood only by perceiving it in a totality or whole.

iii. Gestalt theory focused on the mind's perceptive. The word 'Gestalt' has no direct translation in English, but refers to "a way a thing has been gestalt; i.e., placed, or put together"; common translations include 'form' and 'shape'. Gaetano Kanizsa refers to it as 'organized structure'. Gestalt theorists followed the basic principle that the whole is greater than the sum

NSOU ? CC-ED-04 ? 150 of its parts. In other words, the whole (a picture, a car) carried a different and altogether greater meaning than its individual components (paint, canvas, brush; or tire, paint, metal, respectively). In viewing the "whole," a cognitive process takes place – the mind makes a leap from understanding the parts to realizing the whole.

iv. Gestalt theory was introduced as a contrast to at the time dominant structuralism, which claimed that complex perceptions could be understood through breaking them into smaller elementary parts of experience, like splitting graphical forms into sets of dots or melody into sequence of sounds. The idea of Wertheimer was that the ability to perceive objects was an ability of the nervous system, which tends to group together objects that are nearby, similar, form smooth lines, form most of the shape we can recognize.

v. According to Gestalt psychology, the whole is different than the sum of its parts. Based upon this belief, Gestalt psychologists developed a set of principles to explain perceptual organization, or how smaller objects are grouped to form larger ones. These principles are often referred to as the 'laws of perceptual organization.'

c. Characteristics of Gestalt Learning:

i. Transition from pre-solution to solution is sudden and complete.

ii. When problem solution is found, performance is smooth and without errors.

iii. Insightful learning results in longer retention.

iv. The principle learned by insight can easily be applied to other problems.

v. Flash of understanding which comes to us all of a sudden.

vi. A type of learning that uses reason, especially to form conclusions, inferences, or judgments, to solve a problem.

d. Steps in Insightful Learning:

i. Identification of the problem: The learner identifies the presence of a block as intervening obstacles on his way to the goal.

ii. Analysis of the Problem situation: The learner observes the problematic situation, analyses of different components in the problematic situation and perceives the relation between the goal and the block.

iii. Establishing mental association in between similar previously acquired ideas: After analyzing the total situation he selects probable solutions in conclusions by means of hesitation, pause, concentrated attention etc.

NSOU ? CC-ED-04 ? 151 iv. Trail of Mode of Response: The learner makes initial efforts in the form of a simple trial and error mechanism. v. Sustained Attention: The learner maintains frequently recurrent attention to the goal and motivation. vi. Establishing cause-effect relationship: In a certain moment there is a sudden perception of the relationship in the total situation and the organism directly performs the required acts. This is Insight development. vii. Steady Repetition of Adaptive Behavior: After getting an insightful solution, the individual tries to implement it in another situation. e. Gestalt laws (law of pragnanz) : In perception, there are many organizing principles called gestalt laws. The most general version is called the law of pragnanz. Pragnanz is German means pregnant, but in the sense of pregnant with meaning, rather than pregnant with child. This law says that we are innately driven to experience things in as good a gestalt as possible. "Good" can mean many things here, such a regular, orderly, simplicity, symmetry, and so on, which then refer to specific gestalt laws. i. The Law of Similarity : As Gestalt principles go, the principle of similarity would seem to be one of the simplest to grasp. It states things that are similar are perceived to be more related than things that are dissimilar. Similarity occurs when objects look similar to one another. People often perceive them as a group or pattern. Similarity means there is a tendency to see groups which have the same characteristics. The principle of similarity states that things which share visual characteristics such as shape, size, color, texture, value or orientation will be seen as belonging together. ii. The law of contrast: The Law of Contrast states that when two items are presented one after another, "If the 2nd item is fairly different from the 1st, we tend to see it as more different than it actually is." The principle based on the assumption that individuals base their behavior on comparison of opposites not with sameness. The phenomenon that when two different but related stimuli are presented close together in space and/or time they are perceived as being more different than they really are. iii. Law of Proximity: Proximity occurs when elements are placed close together. They tend to be perceived as a group. The principle of proximity or contiguity states that things which are closer together will be seen as belonging together.

NSOU ? CC-ED-04 ? 152 Things that are close to one another are perceived to be more related than things that are spaced farther apart. As this principle does not rely on any extraneous structure, it is among the first principles to impact our perception and from which we derive understanding. All of us intuitively understand that the simplest way to indicate relatedness is to manipulate proximity. IV. Information Processing Theories of Learning: I. Meaning: The Information Processing (IP) theory is based on the idea that humans actively process the information they receive through their senses, like a computer does. Learning is what is happening when our brains receive information, record it, mould it and store it. The IP theory is based on the idea that humans actively process the information they receive through their senses, as a computer does. Learning is what is happening when our brains receive information, record it, mould it and store it. The theory is based on the idea that humans process the information they receive, rather than merely responding to stimuli. This perspective equates the mind to a computer, which is responsible for analyzing information from the environment. According to the standard information-processing model of mental development, the mind's machinery includes attention mechanisms for bringing information in, working memory for actively manipulating information, and long-term memory for passively holding information so that it can be used in the future. This theory addresses how as children grow their brains likewise mature, leading to advances in their ability to process and respond to the information they received through their senses. The theory emphasizes a continuous pattern of development, in contrast with cognitive developmental theorists such as Jean Piaget's theory of cognitive development that thought development occurs in stages at a time. Information processing theory is the approach to the study of cognitive development evolved out of the American experimental tradition. In physical development psychologists who adopt the information processing perspective account for mental development in terms of maturational changes in basic components of a child's mind. The theory is based on the idea that humans process the information they receive, rather than merely responding to stimuli. This perspective equates the mind to a computer, which is responsible for analyzing information from the environment. According to the standard information-processing model for mental development, the mind's machinery includes attention mechanisms for bringing information in, working memory for actively manipulating information, and long term

NSOU ? CC-ED-04 ? 153 memory for passively holding information so that it can be used in the future. This theory addresses how as children grow their brains likewise mature, leading to advances in their ability to process and respond to the information they received through their senses. The theory emphasizes a continuous pattern of development, in contrast with cognitive developmental theorists such as Jean Piaget's theory of cognitive development that thought that development occurs in stages at a time. II. Humans as Information Processing Systems: The information processing theory simplified is comparing the human brain to a computer or basic processor. It is theorized that the brain works in a set sequence, as does a computer. The sequence goes as follows, "receives input, processes the information, and delivers an output". This theory suggests that we as humans, will process information in a similar way. Like a computer receives input the mind will receive information through the senses. If the information is focused on, it will move to the short-term memory. While in the short-term memory or working memory, the mind is able to use the information to address its surroundings. The information is then encoded to the long-term memory, where the information is then stored. The information can be retrieved when necessary using the central executive. The central executive can be understood as the conscious mind. The central executive can pull information from the long-term memory back to the working memory for its use. As a computer processes information, it is thought our minds are processing information. The output that a computer would deliver can be likened to the mind's output of information through behavior or an action. III. Components of the Information Processing Theory Though information processing can be compared to a computer, there is much more that needs to be explained. Information Processing has several components. The major components are information stores, cognitive processes, and executive cognition. Information can be stored in the sensory memory of the mind. This information is stored just long enough for us to move the information to the short-term memory. The short-term memory can only hold a small amount of information at a time. George Miller, discovered that the short-term memory can only hold 7 (plus or minus two seconds) things at once. The information here is also stored for only 15– 20 seconds. The information stored in the short-term memory can be committed to the long-term memory store. There is no limit for the information stored in the long-term memory. The information stored here can stay for many years. The long-

NSOU ? CC-ED-04 ? 154 term memory can be divided among the semantic, episodic, and procedural memories. The semantic memory is made up of facts or information learned or obtained throughout the life. The episodic memory is made up of personal experiences or real events that have happened in a person's life. Last the procedural memory is made up of procedures or processes learned such as riding a bike. Each of these is the sub-categories of the long-term memory. i. Cognitive process is the way by which humans transfer information among the different memory stores. Some prominent process used in transferring information is coding, retrieval, and perception. Coding is the process of transferring information from the short to long-term memory by relating the information of the long-term memory to the item in the short-term memory. This can be done through memorization techniques. Retrieval is used to bring information from the long-term memory back to the short-term memory. This can be achieved through many different recall techniques. Perception is the use of the information processed to interpret the environment. Another useful technique advised by George Miller is recoding. Recoding is the process of regrouping or organizing the information the mind is working with. A successful method of recoding is chunking. Chunking is used to group together pieces of information. Each unit of information is considered a chunk; this could be one or several words. This is commonly used when trying to memorize a phone number. ii. Executive cognition is the idea that someone is aware of the way they process information. They know their strengths and weaknesses. This concept is similar to . The conscious mind has the control over the processes of the information processing theory. iii. Emergence is a model for human thinking, and learning is part of the resurgence of cognitive perspectives which asserts that complex mental states affect human learning and behavior that such mental states can be scientifically investigated. Computers, which process information, include internal states that affect processing. Computers, therefore, provided a model for possible human mental states that provided researchers with clues and direction for understanding human thinking and learning as information processing. Overall, information-processing models helped reestablish mental processes -- processes that cannot be directly observed -- as a legitimate area of scientific research.

NSOU ? CC-ED-04 ? 155 Source : John William Atkinson and Richard Shiffrin (1968) Where, Sensory Memory The sensory memory is responsible for holding onto information that the mind receives through the senses such as auditory and visual information. For example, if someone were to hear a bird chirp, they know that it is a bird because that information is held in the brief sensory memory. Short-Term Memory Short-term Memory lasts for about 30 seconds. Short term memory retains information that is needed for only a short period of time such as remembering a phone number that needs to be dialed. Long-Term Memory The long-term memory has an unlimited amount of space. In the long term memory, there can be memory stored in there from the beginning of our life time. The long term memory is tapped into when there is a need to recall an event that happened in an individual's previous experiences.

NSOU ? CC-ED-04 ? 156 Educational Implications of Cognitive Theories of Learning Cognitive Theories of Learning outlines a way of learning that can be used by teachers inside the classroom. Some examples of classroom implications of the Information Processing Theory include: ? Use mnemonics to aid students in retaining information for later use, as well as strengthening the students' remembering skills. ? When teaching a specific lesson, use many different teaching styles and tools. ? Pair students together to review the material covered. ? Break down lessons into smaller more manageable parts. ? Assess the extent of the prior knowledge students have about the upcoming material. ? Give students feedback on each assignment as reinforcement. ? Connect new lessons back to old lessons and real-life scenarios. ? Allow for over-learning. 6.6 Summary Theories of learning represent broad principles and techniques of learning, throwing light on the mechanism of how we learn. Most of these can broadly be classified as Stimulus-Response associationist type theories and Gestalt field of field cognition type theories. In the remaining ones, we can chiefly notice – information processing theories. Theory of trial and error learning or connectionism put up by Thordike emphasizes that in learning we make some attempts or trials. Classical conditioning is the best associated with the names of Russian Psychologists Ivan Pavlov. Through a series of experiments with dogs, Pavlov successfully demonstrated that an artificial stimulus (Like bell) in association with a natural stimulus (like food) become strong enough to produce salvation (natural response to food) even when not accompanied by food. Operant conditioning propagated by Skinner, does not believe in stimulus response trigger like behavior initiating mechanism. Skinner asserted that

100%

the presence of a stimulus for evoking a response is

not essential. In most of learning situations, our behavior is shaped and maintained by its consequences.

NSOU ? CC-ED-04 ? 157 Insightful learning as a theory of learning evolved out of the attempts of Gestalt psychologists. However, the main initiation in this direction was taken by Kohler. All above mentioned theories have been discussed in this unit. 6.7 Self-Assessment Questions 1. What is learning? 2. State any two characteristics of learning. 3. Mention any two factors of learning. 4. What is behaviorism? 5. What is conditioning? 6. What is the law of effect? 7. Mention primary factors of social cognitive theory. 8. What is reinforcement? 9. Write the name of two behaviorist psychologist. 6.8 References / Bibliography Chauhan, S.S. (1988): Advanced Educational Psychology, Vikas Publications, New Delhi. Kulshrestha, S.P. 	like an iceberg, with only a small amount of it being visible, that is our observable behavior, but it is the unconscious, submerged mind that has the most, underlying influence on our behavior. Freud used three main methods of accessing the unconscious mind: free association, dream analysis and slips of the tongue. He believed that the unconscious mind consisted of three components: the 'id', 'ego' and the 'super ego'. The 'id' contains two main instincts: 'Eros' is the life instinct, which involves self-preservation and sex which is fuelled by the 'libido' the energy force. 'Thanatos' is the death instinct, whose energies, because they are less powerful than those of 'Eros' are channeled away from ourselves and into aggression towards others. The 'id' and the 'superego' are constantly in conflict with each other and the 'ego' tries to resolve the discord. If this conflict is not resolved, we tend to use defense mechanisms to reduce our anxiety. Psychoanalysis attempts to help patients to resolve their inner conflicts. An aspect of psychoanalysis is Freud's theory of psychosexual development. It shows how early experiences affect adult personality. Stimulation of different areas of the body is important as the child progresses through the important developmental stages. The most important stage is the phallic stage where the focus of the libido is on the genitals. During this stage little boys experience the 'Oedipus complex' and little girls experience the 'Electra complex.' These complexes result in children identifying with their same-sex parent, which enables them to learn sex-appropriate behavior and a moral code of conduct. However, it has been criticized in the way that it over emphasizes the importance of sexuality and under emphasized the role of social relationships. The theory is not scientific, and can't be proved as it is circular. Nevertheless, psychoanalysis has been greatly contributory to psychology in that it has encouraged many modern theorists to modify it for the better, using its basic principles, but eliminating its major flaws. NSOU ? CC-ED-04 ? 43 iii. Humanistic Perspective: Humanistic psychology is a psychological perspective that emphasizes the study of the whole person (known as holism). Humanistic psychologists look at human behavior, not only through the eyes of the observer, but through the eyes of the person doing the behaving. W <https://www.simplypsychology.org/perspective.html>

on the view that each person is unique and individual, has the free will to change at any time in his or her life. The humanistic perspective suggests that we are responsible for our own happiness and well-being as humans. We have the innate (i.e., inborn) capacity for self-actualization, which is our unique desire to achieve our highest potential as human. Because of this focus on the person and his or her personal experiences and subjective perception of the world the humanists regarded scientific methods as inappropriate for studying human behavior. Two of the most influential and enduring theories in humanistic psychology that emerged in the 1950s and 1960s are those of Carl Rogers and Abraham Maslow. iv. Cognitive Perspective Psychology was institutionalized as a science in 1879 by Wilhem Wundt, who found the first psychological laboratory. His initiative was soon followed by other European and American Universities. These early laboratories, through experiments, explored areas such as memory and sensory perception, both of which Wundt believed to be closely related to physiological processes in the brain. The whole movement had evolved from the early philosophers, such as Aristotle and Plato. Today this approach is known as cognitive psychology. Cognitive Psychology revolves around the notion that if we want to know what makes people tick then the way to do it is to figure out what processes are actually going on in their minds. In other words, psychologists from this perspective study cognition which is 'the mental act or process by which knowledge is acquired.' The cognitive perspective is concerned with 'mental' functions such as memory, perception, attention, etc. It views people as being similar to computers in the way we process information (e.g., input-process-output). For example, both human brains and computers process information, store data and have input

on the view that each person is unique and individual, and has the free will to change at any time in his or her life. The humanistic perspective suggests that we are each responsible for our own happiness and well-being as humans. We have the innate (i.e., inborn) capacity for self-actualization, which is our unique desire to achieve our highest potential as people. Because of this focus on the person and his or her personal experiences and subjective perception of the world the humanists regarded scientific methods as inappropriate for studying behavior. gender psychology. The approach believes that most behavior is inherited and has an adaptive (or evolutionary) function. For example, in the weeks immediately after the birth of a child, levels of testosterone in fathers drop by more than 30 percent. This has an evolutionary function. Testosterone-deprived men are less likely to wander off in search of new mates to inseminate. They are also less aggressive, which is useful when there is a baby around. Biological psychologists explain behaviors in neurological terms, i.e., the physiology and structure of the brain and how this influences behavior. Many biological psychologists have concentrated on abnormal behavior and have tried to explain it. For example, biological psychologists believe that schizophrenia is affected by levels of dopamine (a neurotransmitter). These findings have helped psychiatry take off and help relieve the symptoms of mental illness through drugs. However, Freud and others argue that this just treats the symptoms and not the cause. This is where health psychologists take the finding that biological psychologists produce and look at the environmental factors that are involved to get a better picture. vi. Evolutionary

A central claim of evolutionary psychology is that the brain (and therefore the mind) evolved to solve problems encountered by our hunter-gatherer ancestors during the upper Pleistocene period over 10,000 years ago. The Evolutionary approach explains behavior in terms of the selective pressures that shape behavior. Most behaviors that we see/display are believed to have developed during our EEA (environment of evolutionary adaptation) to help us survive. NSOU ? CC-ED-04 ? 45 Observed behavior is likely to have developed because it is adaptive. It has been naturally selected, i.e., individuals who are best adapted to survive and reproduce. Behaviors may even be sexually selected, i.e., individuals who are most successful in gaining access to mates leave behind more offspring. The mind is therefore equipped with 'instincts' that enabled our ancestors to survive and reproduce. A strength of this approach is that it can explain behaviors that appear dysfunctional, such as anorexia, or behaviors that make little sense in a modern context, such as our biological stress response.

A person with the personal disposition of fear of certain phenomenon, as for example fear of speaking in public, may consider all persons who hesitate to speak in public as similar to himself and respond to them in the same way. But according to Allport it must be kept in mind that one person may be basically an introvert and may not want to talk in public, another may have no idea about the language and so may not want to talk in public and yet the third person may find the topic uninteresting and so may not want to talk in public. Hence the individual concerned will have to interact with them differently and not in the same manner as he would respond to a person like him who is afraid of talking in public. Thus the personal dispositions are concrete, can be easily recognized and they are invariably consistent. e. Allport

<p>s Trait Theory of Personality Gordon Allport's theory is considered to be one of the more scientific theories which has put forward the concept of traits in understanding personality. He takes the biological approach to an extent and mentions about how children are born with reflexes and as they use the reflexes continuously, how in course of time, these reflexes become a habit and how habits by indulging in them continuously turn into traits, which are relatively permanent entities in the individual and which are reflected in the individual's behaviors in different situations. Allport's theory puts forward the new idea of 'functional autonomy' in which he says a particular behavior indulged in initially for some specific purpose, becomes the constant behavior in the individual in course of time. For instance, a person who initially goes to a hill station because the doctor advised, later on goes to the hill station every year as it gives him a satisfaction and his urge gets fulfilled.</p> <p>SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)</p>

<p>both psychological and physical aspects, those interact between themselves. The interacting factors include at the physiological level on the endocrinal system. As for the interacting factors in the psychological aspects these include, traits, emotions, intellect, temperament, character and motives. All these interact with the physiological aspects and contribute to the personality development and behavior. b. Dynamic Organization - of different elements of psychological system is independent but functions in an interlocking manner with physiological and other systems amongst themselves and is subject to change. However, this change can take place in a gradual manner over a long period of time. c. Unique Adjustment to Environment - is characterized by a dynamic organization of psychological traits that makes his/her adjustment. The reason for this is that experiences of every person are unique and therefore, their reaction to the environment is also unique. It is well known that the identical twins though are from the same fertilized egg; do show considerable variations in their behavior because of such unique aspects within them.</p>

Personal Traits : 1. Allport was of the view that personal disposition is something unique to the individual and this disposition makes him/her behave consistently in the same way in a number of situations that are similar. 2. It is a generalized neuro-psychic structure that is unique to the individual concerned and this makes for the difference in the behaviors of many individuals even though they may face the same situation. For example, in a TV program when a sad scene is shown one person cries, another turns the other way from the TV not wanting to see the scene, and the third criticizes the scene as most unreasonable and unrealistic. These three different reactions are typically due to the personal disposition of the three different individuals. In his own words, 3. Allport defined (1938) this disposition as "a generalized neuro-psychic structure, unique to the individual, with the capacity to render many stimuli functionally equivalent, and to initiate and guide consistent or equivalent forms of adaptive and stylistic

<p>experience. The sense of body has boundaries, that is, we all feel the pain, touch and many other sensations including movement, etc. which all contribute to our becoming.</p> <p>SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)</p>				

ii. Self-identity : Another aspect that develops during the first two years is what Allport called as 'Self-identity'. In course of his experience, the child is able to become aware that pillow is not himself and mother is not himself. This kind of realisation through experience continues on and the person is able to develop a sense of his own self called as self-identity. This self- awareness leads to the recognition of oneself as having a past, present and a future. The person is able to see himself as a separate entity who is separated from the pillow, from the mother and various others in his environment. This differentiation of the self from the whole is an important aspect of the development of self-identity. Every individual has a name and a family and this identity is entirely the individual's own.

iii. Self-esteem (2 to 4 years of age) : This aspect develops in the individual around the age of two to four years. The child is able to move around now and is able to accomplish many things that he never used to in the past due to the non-maturation of many of the organ systems. As the child is growing and many of his organs are maturing he is able to make many movements both refined and non-refined and is able to reach his goals, as for instance NSOU ? CC-ED-04 ? 92 to fetch a toy from another corner of the room etc. As the child experiences many achievements and accomplishments he feels good about himself, becomes more confident and tries to do things like climbing the stairs and reaching the rooms on the first floor etc. He is able to control also many of his reflexes in terms of controlling his bowel and bladder. All these are appreciated by the caregivers and the child feels good about himself/ herself and thus develops a good concept about himself that he/she is capable. Thus, he develops self-esteem which is positive. On the other hand, if the experiences were in the negative direction the self-esteem would also have been negative.

iv. Self-extension (4 to 6 years) : The extension to one self- develops between four to six years of age. There are many things in the environment which are supplementary and complementary to the growth and development of the individual. The individual is able to understand that Mr. X and Ms. Y are his parents. They are his own. He lives in a place which again is his own, he has a room in which he studies and does a lot of things including listening to music etc. and these are all his own. Thus, there is an extension of self here into many things in the environment which all are identified with

Some people as they grow up may even identify themselves with being a sportsman, an athlete or a swimmer etc. Some belong to a group or a clan or a gang and identify themselves with the same. Some identify themselves with an occupation such as being a psychologist or a doctor or a lawyer. Thus, there is self extension into many aspects of the environment. v. Self-Image (4 to 6 years) : Self-image means, the self of the person as others see it. It is a mirroring of one's image by others. The impression that the individual makes on others by looks, clothes, behavior etc. In addition other aspects of self that are important include the social esteem or status one enjoys in the society and in the social circle. It also includes the person's sexual identity. Many times the ideal self and self-image may not be the same. While one may have an ideal image in mind as for example, one wants to be like Amitabha Bachhan in look and behavior, the actual image may not be anywhere near it. In some cases, others may consider the individual as resembling someone in looks and behavior, but the person concerned may consider his self-image as different. Thus, there could be a discrepancy in the self-image and what others think about the person. vi. Rational coping (6-12 years): As the individual grows up and his personality develops he is able to have higher cognitive functioning with increase in

his thinking abilities, decision making and memory capacities. These in turn help the individual to make decisions on many matters related to that age level. The person is able to now think rationally on many issues and is able to understand the pros and cons and takes relatively more appropriate decisions as compared to the earlier age levels. He puts in efforts to understand things and is able to accomplish far more tasks than before. This ability to cope with life related situations rationally is an important development that takes place during these years. vii. Proprium : Every individual has to finally take charge of his life. The individual has to be responsible for his thinking, actions and behaviors. After the varied experience in life the individual is able to look back on his goals, achievements and accomplishments, and then say now is the time he would try to spend on activities that gives him internal satisfaction and a sense of fulfillment. This is almost akin to that of self-actualisation as put forward by Maslow, though in a number of ways it is different. The propiate striving starts only after the age of 12 years and the individual is able to clearly identify his goals, what his future plans are and in which direction think he like to move and what is the purpose of his life etc. He is able to now say that he is the man in charge of his life and would like to do things as he wishes and desires. In all this, of course, the person acts rationally and logically.

<p>iii) Psychological Maturity. Allport described personality dynamics in terms of functional autonomy, conscious and unconscious motivation and psychological maturity. These dynamics are being explained below: (i) Functional Autonomy : Allport did not believe in looking too much into a person's past in order to understand his present. This belief is most strongly evident in the concept of functional autonomy: Your motives today are independent (autonomous) of their origins. In other words the means employed for the attainment of a goal are now themselves a Personality goal. For example, a person develops and inculcates discipline and hard work in his/</p> <p>SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)</p>

<p>life to become rich and famous. But even after becoming rich and famous he/she continues to live with discipline and hard work. Actually, discipline and hard work are no longer the means for being rich and famous but they have replaced the goal of being rich and famous in that discipline and hard work by themselves are goals. What is now is more important than what was in the past or what is going to be in the future. A person may have been persuaded by parents to become a lawyer, but as the individual practiced law, it was so interesting and so satisfying, that there was no need for the parents' persuasion any more, being a lawyer and practicing law by itself has become a goal for this individual.</p> <p>SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)</p>

<p>Merits : Allport developed his personality theory in academic settings instead of psychoanalytic settings. For this reason, this theory gained much importance and recognition among educational psychologists. According to Allport, present and future are more important in understating personality than past of an individual. Motivations NSOU ? CC-ED-04 ? 97 and behavior of an individual can be better understood by present and future. This characteristic of Allport's theory helps</p> <p>SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)</p>					

understand the structure of personality more scientifically. His idiographic approach to personality research is quite praiseworthy as it aids understanding and detailed analysis of personality. He made an important contribution to the field of psychology through his explanation of personality in terms of traits. b. Demerits: Feist criticized Allport's theory saying that it is grounded more in philosophical speculations and common sense than in scientific research. Psychoanalysts objected to Allport's concept of proprium which puts more emphasis of present and future and ignores his past. They say that such ignore of past hinders complete understanding of personality. Past events and experiences that went into the shaping of present personality can't be totally delinked from the present personality. Allport's theory describes the functionally autonomous motives of a psychologically healthy person but motive of children, psychotics and neurotics do not find any mention in his theory. Allport in his theory failed to explain their behavior. Allport in his theory does not mention how an original motive develops into a functionally autonomous motive. For example, discipline and hard work which originally acted as means to get rich and famous become functionally autonomous once the person is rich and famous. Thus, it is difficult to predict which motive of childhood develops into autonomous motive during adulthood. Critics also point to the idiographic approach taken to the personality taken by Allport. According to them nomothetic approach which requires study of several persons at the same time and subjecting the data so gathered to statistical analysis is the only right method for studying personality. Allport's theory is based only on the study of normal and psychologically healthy persons and does not take account of neurotics and others. This fact limits its applicability. Some of the concepts in Allport's theory do not lend themselves to empirical testing. For example, functional autonomy is a concept that can't be manipulated in experimental conditions. Psychologists also refute Allport's claim of discontinuity in the personality of children and adults and normal and abnormal. Furthermore, Allport did not make any sense about the impact of social factor on personality. 4.4.2

<p>Psychosis is not a separate diagnostic entity which is categorically separated from normality, (iii) This continuum is co-linear with the concept of Psychoticism embodied in the P scale of the EPQ. On this continuum, a person with high Extraversion is sociable, popular, optimistic, and rather unreliable, whereas a person with low Extraversion is quiet, introspective, reserved, and reliable. A person with high Neuroticism is anxious, worried, moody, and unstable, whereas a person with low Neuroticism is calm, even-tempered, carefree, and emotionally stable. A person with high Psychoticism is troublesome, uncooperative, hostile, and socially withdrawn, whereas a person with low Psychoticism is altruistic, socialized, empathic, and conventional (Eysenck & Eysenck, 1985). iv. Causal Aspects based on a three-dimensional description of personality: The PEN model further attempts to provide causal explanation of personality. The PEN model looks for Psycho-physiological, hormonal, and other biological mechanisms responsible for the personality dimensions, so that the theory can be tested by scientific experiments. Eysenck and Eysenck (1985) clearly contend that "no theory would be considered valid that did not make testable and verified</p> <p>SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)</p>

<p>predictions." Consequently, Eysenck (1990) proposes the arousal theory, by modifying his inhibition theory to explain the causal roots of the three dimensions of personality.</p> <p>SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)</p>					

basis for each of his three personality super traits or types. According to him, the super trait Introversion-extraversion is closely related to levels of cortical arousal as indicated by electroencephalographic recordings. Eysenck(1982) used the term arousal to denote a continuum of excitation, ranging from a lower extreme (e.g., sleep) to an upper extreme (e.g., state of panic). He was of the view that introverts are over aroused and thus are highly sensitive to incoming stimulation. For this reason, they avoid situations that are apt to overwhelm them. Extraverts are under aroused and thus are highly insensitive to incoming stimulation and thus they constantly seek out situations that are apt to excite them. Eysenck hypothesized those individual differences in stability vs neuroticism reflected the degree to which the autonomic nervous system reacts to stimuli. He linked this dimension with the limbic system, the brain's visceral or feeling system, which influences motivation and emotional behaviour. He pointed out that persons high on neuroticism tend to react more quickly to painful, novel, disturbing, or other stimuli than do more stable persons. Such persons also exhibit a more persistent reaction (even after the stimulus has disappeared) than do highly stable persons. Eysenck's

SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)

interpretation of the dimensions of personality is closely related to his theory of psychopathology. He was of the view that the symptoms or disorders that befall a person are related to the combined impact of personality traits and nervous system functioning. For instance, the person who is high on the dimensions of introversion and neuroticism is more prone to develop anxiety disorders such as phobias, obsessions, and, compulsions. On the other hand, the person who is high on the extraversion and neuroticism dimensions is at a risk for psychopathic (antisocial) disorders. Eysenck stated that psychological disorders do not automatically occur as a result of genetic predisposition. These genetic predispositions when interact with the environment or a certain situation produce psychological disorders.

v. Extraversion and Cortical Arousal According to the Arousal Principle: Eysenck (1990) provides a biological explanation of extraversion in terms of cortical arousal via the ascending reticular activating system (ARAS). Activity in the ARAS stimulates the cerebral cortex, which, in turn, leads to higher cortical arousal. Cortical arousal can be measured by skin conductance, brain waves, or sweating (Eysenck, 1990). Because of the different levels of ARAS activity, "Introverts are characterized by higher levels of activity than extraverts and so are NSOU ? CC-ED-04 ? 101 chronically more cortically aroused than extraverts" (Eysenck & Eysenck, 1985) emphasis added). Based on the Yerkes-Dodson law, which suggests that arousal and performance have an inverted-U relationship, the arousal theory of the PEN model assumes that "some intermediate level of arousal is optimal for performance" (Eysenck & Eysenck, 1985).

vi. Neuroticism and Visceral Brain Activation: Eysenck (1990) also explains neuroticism in terms of activation thresholds in the sympathetic nervous system or visceral brain. The visceral brain is also referred to as the limbic system, which consists of the hippocampus, amygdale, septum, and hypothalamus, and regulates such emotional states as sex, fear, and aggression. It is responsible for the fight-or-flight response in the face of danger. Heart rate, blood pressure, skin conductance, sweating, breathing rate, and muscular tension in the forehead can measure activation levels of the visceral brain. Neurotic individuals have greater activation levels and lower thresholds within the visceral brain. They become easily upset in the face of very minor stresses. However, emotionally stable people are calm under such stresses because they have lesser activation levels and higher thresholds.

vii. Psychoticism and Gonadal Hormones: Eysenck (1990) also provides a biological explanation of Psychoticism in terms of gonadal hormones such as testosterone and enzymes, monoamine oxidase (MAO). Eysenck (1992) reports that "low platelet monoamine oxydase (MAO) has been found in psychotic patients, and also in their relatives and

inpatients who have recovered, suggesting that low MAO activity may be

<p>more superficial reflections of the underlying type dimension, or are specific qualities that contribute to that dimension. According to Eysenck, traits are composed of numerous habitual responses, which, in turn, are derived from a multitude of specific responses. The trait of sociability correlates with such response dispositions as activity, liveliness, assertiveness etc. Taken together, these traits define a super trait or type Eysenck calls extraversion. In considering Eysenck's hierarchical model of personality structure, it should be noted that the word 'type' refers to dimensions of personality that he regards as normally distributed along a continuum. This is almost equivalent to traits. Thus, for example, the type concept of extraversion is a dimension with a low end and a high end along which people may fall at various points between the two extremes. It is not a dimension on which people can be classified as either low or high. Eysenck does not imply discontinuity when he uses the word 'type'. Personality Types Eysenck used a variety of methods for gathering information about people in order to delineate their personality. These methods included self-report, observer ratings, biographical information, assessments of physique and physiology, and objective physiological tests. These data are factor analyzed to determine the structure of personality. Initially Eysenck found two basic</p> <p>SA DPSY405_PERSONALITY THEORIES (1)(1).pdf (D98843051)</p>

<p>dimensions that he labeled as introversion-extraversion and neuroticism-stability (a factor sometimes called instability-stability). Eysenck (1976) added a third type dimension of personality, which he called psychoticism-superego strength. People high on this super-trait dimension tend to be egocentric, impulsive, sensitive to others, and opposed to social customs. They are often seen as – (i) troublesome, (ii) not fitting in well with others, and (iii) intentionally upsetting other people. Eysenck suggested that psychoticism is a genetic predisposition toward becoming either psychotic or psychopathic. He regarded psychoticism as a personality continuum along which all people can be located. He also added that this trait is found more commonly in men than in women. NSOU ? PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, generic, discipline specific elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern which finds efficacy in sync with credit system, credit transfer, comprehensive continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the university has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Material (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor

Objectives After reading this unit, you will be able to— ? describe the concept

of elementary education; ? describe the

concept of universalization of elementary education;

NSOU ? GE-ED-11 8 ? discuss about the constitutional provisions of elementary education; ? describe the provisions of

universalization of elementary education in RTE 2009; ? discuss the role DPEP in the universalization of elementary education; ?

discuss the role SSA in the universalization of elementary education; ? discuss the role SSM in the universalization of elementary

education. 1.2 Introduction India, after attaining independence on the 15 th of August in 1947, education system of the nation was a matter of priority of the first government as well as the successive governments of the nation. Though the first education commission in India was the University Education Commission led by Dr. Sarvapalli Radhakrishnan, elementary education occupied one of the most prioritized sector on the successive days in the hands of the successive governments. The law makers of our nation, especially the constitution-builders of our nation had made a provision

that free and compulsory elementary education would be provided to all children up to 14years of age

within a period of ten years from 1950. The logic behind such a provision was that to make all the citizens of the nation literate to nurture a better democracy by producing effective members of the society. Elementary education is generally provided to the children of the age group of 6-14 years. This is the most important and formative period in a child's life. Apart from imparting a child the basic skills of reading, writing and arithmetic, necessary care is taken to foster all round development of the personality through curricular and co-curricular activities. Elementary education can make a person self-reliant, sensible and productive citizen of the country. World Bank research says that even a one year primary schooling has appeared to be evident in increasing output sustainability of the labour force. The importance of elementary education is very crucial not only for the country but also for all the citizens of the country. It is true that the first aim of the constitution to bring all under the umbrella of elementary education within 1960 could not acquire successfully, the successive governments have prepared several provisions and policies for the universalization of elementary education in India.

NSOU ? GE-ED-11 9 The present Unit will have detail discussion about the concept of universalization of elementary education in India. 1.3 Universalization of Elementary Education in India 1.3.1 Concept of Universalization of Elementary Education Universalization of Elementary Education (UEE) means the expansion of elementary education in every nook and corner of our country. It can also be said that elementary education must be made available to every child in the age group of 6- 14 years irrespective of caste, colour, creed, sex, religion etc. The need for universalization of elementary education is so pressing that Article 45 of the Constitution of India highlights the concept in very beautiful words

as “

the state shall Endeavour to provide

within a period of ten years from the commencement of

the

constitution

for

free and compulsory

education for all children until they complete the age of 14 years.”

Universalization of education

means availability of education everywhere according to the specific need of the children and place. The school education of India can be broadly classified under following stages: Preschool : 3-6 years of age. Elementary : Primary (I-V): 6-11 years of age. : Upper Primary (VI-VIII) : 11-14 years of age. Secondary: (IX-X) : 15-16 years of age. Higher Secondary : (XI-XII): 17-18 years of age. Elementary education covers under its jurisdiction the primary (6-11 years) and upper primary (11-14 years) age group. In most of the Indian states, this refers to the successful completion of befitted educational requirements till Class VIII. The essence of the goal is for every 14-year old to have acquired foundation skills such as the ability to read and write with fluency, numeracy, comprehension, analysis, reasoning and social skills such as teamwork. Equally, elementary education should

NSOU ? GE-ED-11 10 input in children confidence, courage, curiosity, independence, resourcefulness, patience, resilience, and understanding. There is certain reason to believe that education till 14 years of age is the basic minimum requirement for the child to have effectively absorbed the aforementioned abilities. Apart from it being a Constitutional objective in India, child development studies support going beyond the primary age of 11 years. Piaget, for instance, opines that two important ingredients for thought to proceed in a cogent and scientific manner—hypothetico-deductive reasoning and propositional thought—appear in the average child only after the age of 11 years. Other important skills like elaboration, i.e. the memory strategy of creating a relation between two or more items that are not members of the same category, rarely appear before age 11 (Schneider and Pressley, 1989). Kail (1991) has shown that there is an age-related gain in basic information processing resources. As a result of this, and through several empirical studies, he has also shown that the rate of decrease in time taken to process basic cognitive tasks begins to taper off by age 14 years and no sooner. Essentially, the age-related gain in basic information processing resources permits the cognitive systems of older children to hold on to more information at once, as a result of which they can scan the information more quickly and generate better responses in a wide range of situations. The facility to do so does not develop until after the age of 11 years. 1.3.2 Aims and Objectives of Universalization of Elementary Education

Universalisation

of Elementary Education (UEE) has been accepted as a national goal

in India. Central and all the State governments are making strenuous efforts to achieve this goal.

The Article 45 in

the Directive Principles of State Policy in the Constitution of India mandated

100%

MATCHING BLOCK 4/58

SA chapter_4.pdf (D54365087)

the State to endeavour to provide free and compulsory education to

all children

up to age

fourteen

in a period of ten years. The primary objective of Universalization of Elementary Education is that elementary education must be made available to every child in the age group of 6- 14 years irrespective of caste, colour, creed, sex, religion etc. It should be made free and compulsory to all the children of the age group of 6-14 Years.

NSOU ? GE-ED-11 11 Universalisation of Elementary Education in India basically evolves three important things: ? Universalisation of provision ? Universalisation of enrolment and ? Universalisation of retention. 1.3.3 Importance of Universalization of Elementary Education The features that have characterized elementary education, since the country achieved its independence are still prevalent in the present existence. These continue to describe the elementary education and have been stated as follows: (Shiva Kumar, & Rustagi, 2010). Enrolment—Since the initiatives in 1990, India has witnessed a steady increase in the enrolment rate in elementary education. The policymakers introduced a number of schemes which have led to a positive increase in the enrolment ratio, these are, recruitment of local teachers, having an increase in the proximity of the schools, providing mid-day meals and incentives and scholarships for the students. One of the most important factors is, people have begun to recognize more and more the significance of education. They came to realize that with education, they will be able to flourish in their lives. If the parents still feel disinterested in sending their children to schools or if the children think of discontinuing their education, this is because, the teaching-learning processes are not up to the mark, there are not proper availability of creative activities, the management of the schools is not carried out in an appropriate manner and the environmental conditions of the schools are not suitable. Therefore, to lead to an increase in the enrolment rate, it is vital to make improvements in all these areas. Equity—The country has witnessed numerous improvements in education at all levels. In spite of these improvements, there is even an increase in the inequalities in basic education. Discrimination between the regions, genders, castes, class, ethnicities, religions and other marginalized sections of the population still continue to exist and caters to be the biggest challenge for the policy makers and the educationists. The levels of successful educational attainment vary across the regions. Though the average literacy rate for India was 65.4 percent in 2001, the proportion

NSOU ? GE-ED-11 12 of the population who could read and write varied from 48 percent in Bihar and 91 percent in Kerala. Such indicators were observed in the provision of school education as well. There has been an increase in the school drop-out rate amongst the deprived, marginalized and socio-economically backward sections of the society due to various reasons. In addition, there are differences on the basis of gender amongst the Scheduled Castes, and Scheduled Tribes, regarding the children who are in between six to fourteen years of age. Measures should be initiated to eliminate gender differences and equal opportunities should be made available to all the individuals. Quality—Quality of elementary education is considered to be an imperative aspect. The quality of the schools may be improved by making use of meaningful and worthy curriculum and instructional methods, materials and equipment, technology, physical environmental conditions, libraries and resources. Some of the elementary schools have limited materials and equipment available, insufficient to meet the needs and requirements of the students. Therefore, the vital measures to be undertaken to enhance the quality of elementary education are: i. making provision of proper teaching-learning methods; ii. effective communication between the teachers and the students; iii. availability of materials, books, articles, swings, playthings and other resources. These should contribute not only in the learning of the students, but will also generate awareness among them regarding different areas. Teachers should also focus upon making such concepts available to the students that would make them better citizens with values, norms, standards, principles, and etiquettes. Teachers are there to play the most crucial role in enhancing the quality of the schools, especially in rural areas, where they are the sole representatives of the education system. They are the main people who contribute an important part in the management of the school. Efficiency in the management process leads to an improvement in quality. Effectiveness—There are various systemic and structural deficiencies that characterise the functioning of the government or government-aided or sponsored schools. The effectiveness of the schools is characterized by proficiency and expertise in performing the managerial functions of planning, organizing, leading, directing, recruiting and controlling. These functions are applicable to both students and the

NSOU ? GE-ED-11 13 members of the staff. The teachers have to play an important role in maintaining effectiveness of the schools. They need to be supportive and encouraging towards the students. On the other hand, high rate of absenteeism amongst the teachers, ineffective teaching methods, engagement of the teachers on frequent basis in non-teaching work and use of intimidating and uninteresting methods of teaching are the ways that lead to an increase in the drop out of students. Teachers are expected to enrich the learning and understanding of the children. Within the classroom setting, there are various forms of biases and discriminations. In order to promote effectiveness within the elementary education, the primary factors are to treat all students equally, providing them equal opportunities, encouraging operative teaching-learning methods, and creative activities, having proper materials and equipment, and improving the physical environmental conditions of the schools, and effective communication processes. All the members of the schools and students should work in collaboration towards implementation of these factors. 1.3.4 Strategies for Achievement of Universalization on Primary Education In order to solve the problems of universalization of primary education the government both central and state level have undertaken some of the strategies which are as follows: i. The constitution (Eighty third Amendment) Bill, 1997 was introduced in the Rajya Sabha on 28" July, 1997 to make right to free and compulsory education for 6-14 years of age a Fundamental Right. Accordingly the Lok Sabha, on November 28, 2001, unanimously passed a constitution amendment making education for children in the age group of 6-14 years of fundamental right. In this regard the parliament passed

the 262 " Amendment Act, 2002 to make elementary -education a Fundamental Right for children in the age group of 6-14 years.

ii. In

order to create parental awareness and community involvement, a new scheme SarvaShikshaAbhiyan was evolved to pursue universal elementary education in a mission mode.

NSOU ? GE-ED-11 14 iii. It is essential to ensure appropriate economic incentives like free uniforms, free learning materials and compensation to the families of children to economically and socially backward sections of the society, scheduled castes and scheduled tribes. iv. The scheme of operation Blackboard was launched in 1987-88 with the aims of providing improved infrastructure in schools. v.

Project aim at universalization and qualitative improvement of primary education on remote and backward areas. 1.4

Constitutional Provisions of Universalization of Elementary Education Elementary education constitutes a very important part of entire structure of education system. Universalisation of elementary education has been one of the most important goals of educational development in India since independence.

Article 45 of the Indian constitution directed states

to

Endeavour

to provide

within a period of 10 years from the commencement of the constitution (1950)

free

NSOU ? GE-ED-11 15 and compulsory education

to all children up to the age of 14 years.

This

resolved to be fulfilled by 1960. In spite of concerted efforts by the centre as well as state governments in promoting elementary education, the target of Universalisation of elementary education has not been achieved till date. Article 45 reads: Provision for free and compulsory education for children-states

96%**MATCHING BLOCK 8/58****SA**

Project work-Balaram.docx (D141814926)

shall endeavour to provide, within a period of 10 years from the commencement of this Constitution, for free and compulsory education for children until they complete the age of 14 years. ?

Originally Part IV of Indian Constitution, Article 45 and Article 39 (f) of DPSP, had a provision for state funded as well as equitable and accessible education. ? The first official document on the Right to Education was Ramamurti Committee Report in 1990. ? In 1993, the Supreme Court's landmark judgment

61%**MATCHING BLOCK 7/58****W**

in the Unnikrishnan JP vs State of Andhra Pradesh & Others held that Education is a Fundamental right

flowing from Article 21. ? Tapas Majumdar Committee (1999) was set up, which encompassed insertion of Article 21A. ?

61%**MATCHING BLOCK 10/58****SA**

Balaram.docx (D141824621)

The 86 th amendment to the constitution of India in 2002, provided Right to Education as a fundamental right

in part-III of the Constitution.

The parliament has passed the

constitution 86 th amendment Act, 2002 to make elementary education

a Fundamental Right for children in the age group of 6-14 years. ?

The same amendment inserted Article 21A which made Right to Education a fundamental right for children between 6-14 years. ? The 86th amendment provided for a follow-up legislation for Right to Education Bill 2008 and finally Right to Education Act 2009. Another development is Supreme Court judgment which interpreting the constitutional provision declared basic education as a fundamental right of every citizen requiring the state to make necessary provisions as a basic obligation. This

NSOU ? GE-ED-11 16

was followed by a framework of partnership between the centre and the state governments on a massive scale through a number of centrally sponsored schemes such as District Primary Education Programme, LokJumbish Project, Mid Day Meal Scheme SarvaShikshaAbhiyan, Education Guarantee Scheme, Alternative and Innovative Education, ShikshaKarmi Project, Janshala Programme etc.

All these programmes

71%**MATCHING BLOCK 9/58****W**

aims at Universalisation and qualitative improvement of primary education in remote and socio-economically backward areas

by increasing enrolment, attendance and retention and also improving nutritional status of children in primary classes.

There are some problems of elementary education such as: ? out of school children ? working children, or child labourers ? parents ignorance ? family's poor financial conditions ? attitude of parents towards girl's education ? distance of the school from the place of residence ? lack of provision of basic infrastructure ? lack of women teachers in the school

To bring out of school children in the fold of elementary education child wise planning should be undertaken, child labour should be minimized, fund for primary education should be increased and part-time and alternate schools should be opened in large number. Nevertheless, unless efforts to attract the children to schools and to retain them in schools by making both parents and children feel that schools are worthwhile, the success of elementary education may remain a distant dream in country's developmental programmes. 1.4.1

SA CHAPTER 1_Edu Compendium UK.docx (D109559634)

Right of Children to Free and Compulsory Education (RTE) Act, 2009.

The

new law must be observed from the

NSOU ? GE-ED-11 17 viewpoint of children. It provides a justifiable legal background that permits all children between the ages of six to fourteen years to an education of rational worth, based on principles of justice and non-discrimination. It provides for children's right to free and compulsory admission, attendance and completion of elementary education. More essentially, it provides for the child's right to education that is free from anxiety, pressure and apprehension. There are several provisions in the Act, including, necessities segregating corporal punishment, detention and dismissal which need to be fore-fronted to ensure that one proceeds towards a system that, as the National Policy on Education states, makes provision of a sincere, hospitable and encouraging approach for children to get engaged in learning. The most important aspect, however, is to ensure that the teaching and the learning process is free from pressure and apprehension (Sec. 29), with apparent inferences for curricular reform. Testing and school grading systems need to be revised to stimulate children to expand and broaden their learning. The RTE Act also lays down the responsibilities of the teachers. Teacher accountability systems would need to ensure that children are learning and that their right to learning in an environment is free from stress and anxiety (Chapter I, n.d.). The RTE Act provides for: (Chapter I, n.d.). The right of children to free and compulsory education till they have completed their elementary education in the school that is located in the neighbourhood. It explains that compulsory education means responsibility of the suitable government to make provision of free elementary education and ensure compulsory admission, attendance and completion of elementary education to every child within the age group of six to fourteen years. '

95%

MATCHING BLOCK 13/58

SA CHAPTER 1_Edu Compendium UK.docx (D109559634)

Free' means that no child shall be responsible to pay any kind of fee or charges or expenses which may prevent him or her from pursuing and completing elementary education.

It makes provisions for a non-admitted child to get admitted within the school to a class that is appropriate to his age. This applies to children who have dropped out of school at an early age or who have never been enrolled in school before. It identifies

53%

MATCHING BLOCK 14/58

SA CHAPTER 1_Edu Compendium UK.docx (D109559634)

the duties and the responsibilities of suitable Governments, local authority and parents in providing free and compulsory education, and sharing of financial and other responsibilities between the Central and the State Governments. NSOU ? GE-ED-11 18 It lays down the norms and standards relating to, inter alia, Pupil Teacher Ratios (PTRs), buildings and infrastructure, school working days,

and working hours of the teachers. It makes provision for rational deployment of the

75%

MATCHING BLOCK 15/58

SA EDUCATION IN INDIA.docx (D30374012)

teachers by ensuring that the identified pupil teacher ratio is maintained for each school, rather than just as an average for the State or District or Block, thus ensuring that there is essentially no urban-rural disparity in teacher placements. It also

forbids the

100%**MATCHING BLOCK 16/58****SA** EDUCATION IN INDIA.docx (D30374012)

deployment of teachers for non-educational work, other than decennial census, elections to local authority, state legislatures and parliament, and disaster relief.

It makes provision for the appointment of teachers, who are appropriately trained. The teachers with the requisite training and academic qualifications are preferred. Teaching is considered to be a professional job and individuals are required to possess essential training and qualifications. The children who are within the age group of six to fourteen years, to them there are certain areas that need to be prohibited. These are, physical punishment and mental harassment, screening procedures relating to their admission, capitation fees, giving private tuitions by the teachers and functioning of schools without any kind of recognition. The penalties that have been implemented have been stated as, the charging of capitation fee, the fine up to ten times the capitation fee is charged. For resorting to screening process during admission, Rs 25,000 for first contravention, Rs 50,000 for each subsequent contravention, and for functioning of the school without acknowledgement. Fine up to Rs one lakh, and in case of continuing contravention, Rs. 10,000 for each day during which the contravention continues. It provides for the development of the curriculum in accordance to the standards and the principles that have been stated in the Constitution of India. The formulation of the curriculum should focus upon the all-round development of the child. It includes, enhancement of knowledge, proficiency, potentiality, skills and abilities and making the child feel relieved from any kind of pressure or anxiety. This can be done by creating a stress free, child centred and a child friendly learning environment. It provides for safety

88%**MATCHING BLOCK 17/58****SA** CHAPTER 1_Edu Compendium UK.docx (D109559634)

and observing of the child's right to free and compulsory education and redress of grievances by the National and State Commissions for Protection of Child Rights,

which shall have the powers of a civil court.
NSOU ? GE-ED-11 19 The Act comprises several provisions that are required to be put into place to make sure its appropriate implementation, including, inter alia systems for enrolment that is in accordance to the age, devices for school and habitation mapping, recruitment and re-deployment of teachers to ensure that the pupil teacher ratio is sustained in every school, enhancing the quality of the entire teacher workforce to a common national standard and training of 'untrained' teachers, revising the material and process of curriculum, undertaking ongoing and continuous evaluation, instituting school management committees and ensuring management, administration and supervision of the schools with support from the community. 1.4.1.2 Achievements of Right to Education Act, 2009: ? The RTE Act has successfully managed to increase enrolment in the upper primary level (Class 6-8); ? Stricter infrastructure norms resulted in improved school infrastructure, especially in rural areas; ? More than 3.3 million students secured admission under 25% quota norm under RTE; ? It made education inclusive and accessible nationwide; ? Removal of "no detention policy" has brought accountability in the elementary education system; ? The Government has also launched an integrated scheme, for school education named as Samagra Shiksha Abhiyan, which subsumes the three schemes of school education:

100%**MATCHING BLOCK 18/58****SA** 1703150003_S.docx (D136706675)

Sarva Shiksha Abhiyan (SSA) Rashtriya Madhyamik Shiksha Abhiyan (RMSA) Centrally Sponsored Scheme on Teacher Education (CSSTE). 1.4.1.3

Limitation of Right to Education Act, 2009: ? Age group for which Right to Education is available ranges from 6-14 years of age only, which can be made more inclusive and encompassing by expanding it to 0-18 years.
NSOU ? GE-ED-11 20 ? There is no focus on quality of learning, as shown by multiple ASER reports, thus RTE Act appears to be mostly input oriented. ? Five States namely Goa, Manipur, Mizoram, Sikkim and Telangana have not even issued notification regarding 25% seats for underprivileged children of society under the RTE. ? More focus is being given over statistics of RTE rather than quality of learning. ? Lack of teachers affect pupil-teacher ratio mandated by RTE which in turn affects the quality of teaching. 1.5 Role of DPEP, SSA and SSM 1.5.1 District Primary Education Programme (DPEP) The National Policy on Education, 1986 and the Programme of Action-1992 reaffirmed the national commitment that

78%**MATCHING BLOCK 20/58****SA** Project work-Balaram.docx (D141814926)

free and compulsory education of satisfactory quality should be provided to all children upto the age of 14 years before we enter 21st Century.

Since independence, the country has been striving to achieve the target of universalisation of elementary education (UEE). But this target still remains unachieved. One of the reasons for this is that the planning or the attainment of UEE has been mainly at the national and state levels. This has resulted in regional imbalances with regard to progress towards the attainment of UEE. This situation demands that the planning process should be decentralised and made participatory with a view to addressing the access for girls and disadvantaged groups. With this background in view, the District Primary Education Programme (DPEP), a centrally-sponsored programme, was launched in 1993 providing special thrust to achieve Universalisation of Primary Education (UPE). The overall goal of the programme is to reconstruct primary education as a whole in selected districts instead of piecemeal implementation of various schemes. For realising the goal, the DPEP envisages district specific projects, with specific activities, clearly defined responsibilities, definite time schedule and specific targets. Each district project framework is tailored to the specific needs of and possibilities in the district. The

NSOU ? GE-ED-11 21 goals of each project include reduction of existing disparities in educational access, provision of alternative systems of comparable standards for the disadvantaged groups, a substantial improvement in quality of schooling facilities, obtaining genuine community involvement in running of schools and building up local capacity. The DPEP is contextual and has a marked gender focus. The specific targets

77%

MATCHING BLOCK 19/58

W

of the programme are to provide access to primary education for all children, reducing drop-out rate to less than 10%, increasing learning achievement of primary school students by at least 25% and reducing the gap among different gender and social groups

to less than 5%. The programme had covered 163 districts in 15 states upto 1998. The objective of the programme is to gradually extend the coverage of all

100%

MATCHING BLOCK 21/58

SA chapter_4.pdf (D54365087)

educationally backward districts with female literacy below the national average; and

also the districts where Total Literacy Campaigns (TLCs) have been successful leading to enhanced demand for elementary education. District plans under DPEP are formulated with the active association of the community, NGOs, teachers and teacher educators. Appraisal of the plans is done with reference to the criteria of equity, participative processes, feasibility, sustainability and replicability. The objectives of the programme are: i) to provide access to all children to primary education through formal primary schools or its equivalent through alternatives; ii) to reduce overall dropouts at the primary level less than 10 percent; iii) to increase achievement levels by 25 percentage points over and above the measured baseline levels; iv) to reduce disparities of all types to less than 5 percent. The focus of each plan may vary depending upon the level of development of primary education in the selected district. In some districts, the priority may be more on access; in certain cases the focus may be on retention; and in still other cases the focus may be on achievement. Only a close scrutiny of the districts in a more disaggregated fashion can provide us a clue regarding the areas of emphasis. The criteria to identify districts under the programme are : i)

78%

MATCHING BLOCK 23/58

SA chapter_4.pdf (D54365087)

educationally ward districts with female literacy below the national average; and ii) districts where

TLCs have been successful leading to enhanced demand for primary education (Department of Education: 1993). It is quite possible that these two categories of districts can be NSOU ? GE-ED-11 22 from the same state. The priorities and planning concerns may be different in these two category of the districts. The problematic of multilevel planning in general and district planning in particular lies in the satellite imagery view i.e. looking at the people and their problems from above (Misra: 1991). The common practice of decentralized planning in India confirms to this pattern. The usual practice is preparing plans for the district at the state level. The district plans are generally seen as a process of regionalisation of national and state plans. And the effort invariably is to work out the implementation implications of the state plan. The DPEP is an attempt to initiate a process of planning from below. The framework of the programme envisages initiating and completing the process of planning first at the district level. The state level intervention strategies and plans are meant to facilitate the successful implementation of the district plans. It can be seen that looking at linkages between state and district plans in this framework changes the relative roles to be played by agencies at different levels. This process of planning ensures that state plans cannot be prepared unless and until the district plans are complete and the state level plans are nothing but efforts to achieve district level targets. Programs of District Primary Education Programme (DPEP) Some of the programs of activity under this plan are as below. 1. To develop the teaching aids and instruments for a child's education, 2. To provide special facilities for drinking water and sanitation for the girl students, 3. Also, to involve the community people in this plan of activity, 4. To make provision of education for children who were engaged in some other work, 5. To make provision for pre-primary school for children of the age group of 3 to 6 years for their all-round development, 6. Also, to make arrangements for child gathering, an exhibition of dolls, and a child's picture exhibition, 7. To establish co-ordination and co-operation between pre-primary and primary education.

NSOU ? GE-ED-11 23 Planning Process under DPEP: National Level District Primary Education Programme (DPEP) is conceptualised and concretised on the basis of varied experience and expertise the country has gained in the process of planning and implementing national programmes, state level programmes and externally funded programmes in education in India. The DPEP made a serious effort to translate the idea of decentralization into an operational practice through various steps: (i) the programme identified district as the unit for initiating decentralized educational planning. Selection of the unit for planning, namely, a district is in line with the understanding that India had arrived at as per the recommendations of various Committees. (ii) the programme attempted to alter the pattern of resource decisions from state level to local levels; (iii) the programme attempted to strengthen the planning process to make it more consultative, participatory and transparent; (iv) it tried to provide professional resource support to academic activities through new organisational arrangements like the BRCs and CRCs; (v) it attempted to provide support to schools through providing contingency grants of Rs.2000/- to each school and Rs.500/- to every teacher annually; (vi) the planning process tried to create local level capacity both at the district and sub-district levels. These efforts, in the initial stages, were supported through the existing administrative arrangements and professional bodies. The decentralized planning efforts were mostly initiated through providing professional support to the state and district levels by national institutions. The programme design and guidelines were initially formulated by the Government of India in February, 1993. A National Core Team was formed to guide and facilitate district level planning process and preparation of state level documents. The National Core Team consisted of 12 functional areas. These areas were: i) District Planning ii) Teacher Training iii) Curriculum Transaction iv) Early Childhood Education v) State Finances vi) Gender Issues vii) Tribal Education viii) Text Book Production and Distribution ix) School Effectiveness x) Baseline Assessment Studies x) Non-Formal Education and xi) Management Information System. Each of these functional areas was headed by a senior faculty from the National Institutions like NIEPA and NCERT and each of these functional areas constituted a group of specialists. There was a meeting of National Core Team Members in April, 1993 to orient the members of the National Core Team towards DPEP and its major NSOU ? GE-ED-11 24 concerns. After this orientation programme each of the groups of the functional areas developed an outline listing issues and concerns to be incorporated in the district plans. The district planning process made a serious effort to incorporate various issues related to class-room practices, school processes, gender issues, tribal issues, community participation etc. The overall co-ordination of district planning activities and activities of the National Core Team was carried out by the Department of Education, MHRD. One member of the National Core Team was requested to co-ordinate district planning activities in each of the states. From May, 1993 the National Core Team Members visited states and DPEP districts. These meetings were organised primarily to provide the necessary professional support to prepare district plans and to incorporate varying concerns identified by different functional areas. The effort was more to provide guidance than to incorporate any national level concern in a mechanical fashion in any district plan. These visits and meetings with the State and District level people were very helpful in broadening the basis of district planning and also in providing professional and technical support to prepare plans, draw schedules to prepare plans and also to identify activities which will ultimately lead to preparation of district plans. The draft district plans which were prepared were sent to the members of the National Core Team. Once the plans were received these plans were sent to the concerned heads of functional areas to closely examine whether the plan proposals cover aspects related to each functional area. The District Planning Group of the National Core Team had developed a check list to help examine and evaluate the district plans. The comments from each of the functional area was consolidated and sent to the respective states. Based on these comments the State Government and district authorities were requested to revise the draft plans which were further scrutinised by National Core Team Members and Members of the preparatory mission which came to India in July, 1993. Members of the National Core Team also visited the states and districts as part of the preparatory mission. Various state specific and district specific studies were initiated during this period to make district plans more realistic and local specific. In general studies

NSOU ? GE-ED-11 25 were initiated in the areas of Learner Achievement, Teacher Motivation, Gender Issues, Tribal Education, Text Books and State Finances. Findings of these studies were incorporated into the district plans when the plans were revised and finalised. The Mission made a closer scrutiny of the draft district plans and made suggestions for further improvement. After the wrap-up meeting of the preparatory mission, there was a meeting of the DPEP Bureau and members of the National Core Team. During this meeting it was felt that preparation of district plans requires more professional support. For this purpose NIEPA organised a workshop in September, 1993. Participants from the DPEP Districts came with their draft plans. During this workshop comments given on these plans by National Core Team and Mission Members were discussed and directions for further revision of the plans were clearly specified. The participants went back to their respective districts and revised the plans which were submitted to the pre-appraisal mission in October-November, 1993. During the pre-appraisal stage it was realised that while the medium term plan preparation reached a level of completion, the annual work plans were not clearly elaborated. The next effort was to finalise the medium term plans and to prepare annual work plan for the year 1994-95. To provide professional support at this stage, NIEPA organised another workshop in February, 1994 where participants from the districts and state level participated. Based on the deliberations in the workshop district plans were further revised and finalised and annual work plan proposals were developed. This revised document was submitted for appraisal. Parallel to this professional activities associated with preparation of plan documents, sanctions and approvals of the programme were sought at various levels. For example the DPEP guidelines formulated in February were revised in April, 1993. The union cabinet approved the programme in December, 1993 and planning commission approved it as a centrally sponsored programme in January, 1994. Expenditure and Finance Committee of India approved it in May, 1994 and the programme were formally launched in November, 1994 with the release of Rs.352.9 million to the state implementation societies of the seven states covered under the programme in its first phase. It needs to be noted that management structure to implement the programme was also created in all the states during this period.

NSOU ? GE-ED-11 26 1.5.2 Sarva Shiksha Abhiyan (SSA) The Sarva Shiksha Abhiyan is a historic stride towards achieving the long cherished goal of Universalisation of Elementary Education (UEE) through a time bound integrated approach, in partnership with State. SSA, which promises to change the face of the elementary education sector of

80%**MATCHING BLOCK 22/58****W**

the country, aims to provide useful and quality elementary education to all children in the 6 -14 age group by 2010.

The SSA is an effort to recognize the need for improving the performance of the school system and to

91%**MATCHING BLOCK 29/58****SA** 1703150003_S.docx (D136706675)

provide community owned quality elementary education in mission mode. It also envisages bridging of gender and social gaps.

SarvaShikshaAbhiyan (

100%**MATCHING BLOCK 24/58****W**

SSA) is a programme for Universal Elementary Education. This programme is also an attempt to provide an opportunity for improving human capabilities to all children through provision of community-owned quality education in a mission mode. It is a response to the demand for quality basic education all over the country.

Main feature of
SSA: ?

96%**MATCHING BLOCK 25/58****W**

Programme with a clear time frame for universal elementary education. ? A response to the demand for quality basic education all over the country. ? An opportunity for promoting social justice through basic. ? An expression of political will for universal elementary education across the country. ? A partnership between the central, state and the local government. ? An opportunity for states to develop their own vision of elementary education. ? An effort at effective involving the Panchayati Raj Institutions, school management Committees, village and urban slum level Education Committees, parent's Teachers' Associations, Mother-Teacher Associations, Tribal Autonomous councils and other grassroots level structures in the management of elementary schools.

Aims of

90%**MATCHING BLOCK 26/58****W**

SSA: ? To provide useful and elementary education for all children in the 6-14 age group by 2010;

NSOU ? GE-ED-11 27 ?

To bridge social, regional and gender gaps with the active participation of community in the management of schools; ?

To allow children to learn about and master their natural environment in order to develop their potential both spiritually and materially; ? To inculcate value-based learning this allows children an opportunity to work for each other's well-being rather than to permit mere selfish pursuits; ? To realize the importance of Early Childhood Care and education and looks at the 0-14 age as a continuum.

Objectives
of SSA: ?

All children

complete five years of primary schooling by 2007; ? All children complete eight years of schooling by 2010; ?

Focus on elementary education of satisfactory quality with emphasis on education for life; ?

Bridge all

gender and social category gaps at primary stage by 2007 and at elementary education level by 2010; ?

Universal retention by 2010.

Structure for Implementation: The Central and State governments will together implement the SA in partnership with the local governments and the community. To signify the national priority for elementary education, a National Sarva Shiksha Abhiyan Mission is being established with the Prime Minister as the Chairperson and the Union Minister of Human Resource Development as the Vice Chairperson. States have been requested to establish State level Implementation Society for DEE under the Chairmanship of Chief Minister Education Minister. This has already been done in many States. The Sarva Shiksha Abhiyan will not disturb existing structures in States and districts but would only try to bring convergence in all these efforts. Efforts will be made to ensure that there is functional decentralization down to the school level in order to improve community participation. Besides recognizing PRIs/Tribal Councils in Scheduled Areas/including the Gram Sabha, the States would be encouraged to enlarge the accountability framework by involving NGOs/teachers, activists/women's organizations etc.

NSOU ? GE-ED-11 28 Coverage and Period The SSA will cover the entire expanse of the country before March 2002 and the duration of the programme in every district will depend upon the District Elementary Education Plan (DEEP) prepared by it as per its specific needs. However, the upper limit for the programme period has been fixed as ten-years. Strategies Central to SSA programme ? Institutional reforms—As part of the SSA, institutional reforms in the States will be carried out. The states will leave to make an objective assessment of their prevalent education system including educational administration, achievement levels in schools, financial issues, decentralisation and community ownership, review of State Education Act, rationalization of teacher deployment and recruitment of teachers, monitoring and evaluation, education of girls, SC/ST and disadvantaged groups, policy regarding private schools and ECCE. Many States have already effected institutional reforms to improve the delivery system for elementary education. ? Community ownership—The programme calls for community ownership of school based interventions through effective decentralisation. This null be augmented by involvement of women's groups, VEC members and members of Panchayati Raj institutions. ? Improving mainstream educational administration—It calls for improvement of mainstream educational administration by institutional development, infusion of new approaches, and by adoption of cost effective and efficient methods. ? Community based monitoring full with full transparency— The Programme will have a community based monitoring system. The Educational Management Information System (EMIS) will correlate school level data with community based information from micro planning and surveys. Besides this, every school will have a notice board showing all the grants received by the school and other details. ? Accountability to community—SSA envisages cooperation between teachers, parents and PRIs, as well as accountability and transparency.

NSOU ? GE-ED-11 29 ? Education of girls—Education of girls, especially those belonging to the scheduled castes and scheduled tribes, will be one of the principal concerns in Sarva Shiksha Abhiyan. ? Focus on special groups—There will be a focus on the educational participation of children from SC/ST, religious and linguistic minorities disadvantaged groups and the disabled children. ? Pre Project phase—SSA will commence throughout the country with a well-planned pre project phase that provides for a large number of interventions for capacity development to improve the delivery and monitoring system. ? Thrust on quality—SSA lays a special thrust on making education at elementary level useful and relevant for children by improving the curriculum, child centred activities mid effective teaching methods. ? Role of teachers—SSA recognizes the critical role of teachers and advocates a focus on their development needs. Setting up of BRC/CRC, recruitment of qualified teachers, opportunities for teacher development through thorough participation in curriculum related material development, focus on classroom process designed to develop the human resource among teachers. Components of SSA The components of Sarva Shiksha Abhiyan includes appointment of teachers, teacher training, qualitative improvement of elementary education, provision of teaching learning materials, establishment of Block and Cluster Resource Centres for academic support, construction of Classrooms and school buildings, establishment of education guarantee centres, integrated education of the disabled and distance education. Requirement of Financial Resources for UEE According to broad assessments made by the Department of Elementary Education & Literacy, nearly Rs. 60,000 crores additional resources are required from the budget of the Central and the State level Departments over the next ten years. Since SSA is a programme for universalisation of elementary education, the actual requirement of funds can only be worked out after the District Elementary Education

NSOU ? GE-ED-11 30 Plans are finalized. Sarva Shiksha Abhiyan (SSA) has two

84%

MATCHING BLOCK 27/58

W

aspects-1) It provides a wide convergent framework for implementation of Elementary Education schemes;

II)

100%

MATCHING BLOCK 28/58

W

It is also a programme with budget provision for strengthening vital areas to achieve universalisation of elementary education.

While all investments in the elementary education sector from the State and the Central Plans will reflect as part of the SSA framework, they will all merge into the SSA programme within the next few years. As a programme, it reflects the additional resource provision for UEE. Financial Norms ? The assistance under the programme of Sarva Shiksha Abhiyan could be on a 85:15 sharing arrangement during the IX Plan, 75:25 sharing arrangement during the X Plan, and 50:50 thereafter between the Central government and State governments. Commitments regarding sharing of costs would be taken from State governments in writing. ? The support for teacher salary appointed under the SSA programme could be shared between the central government and the State government in a ratio 0/8 5:15 during the IX Plan. 75:25 during the X Plan and 50:50 thereafter. ? All legal agreements regarding externally assisted projects will continue to apply unless specific modifications have been agreed to in consultation with foreign funding agencies. ? District Education Plans would inter-alia, clearly show the funds/resource available for various components under schemes like JRY, PMRY, Sunishchit Rozgar Yojana, Local Area development fund of MPs/ MLAs. State Plan, foreign funding and resources generated in the NGO sector. ? All funds to be used for upgradation, maintenance, repair of schools and Teaching Learning Equipment and local management to be transferred to VECs/School Management Committees. ? Other incentive schemes like distribution of scholarships and uniforms will continue to be funded under the State Plan. They will not be funded under the SSA programme.

NSOU ? GE-ED-11 31 1.5.3 Sarva Sisksha Mission (SSM) Sarva Shiksha Mission (SSM) is one of the biggest robust educational programme after independence of India and initially the duration of the programme was for eight years from 2002 to 2010 with the financial involvement rising from Rupees 499.8 crore of 2001-02 to Rupees 13100 crore of 2008-09. After successful implementation of District Primary Education Programme (DPEP) though all districts were not covered by this programme, hence both the primary and upper primary classes were taken into account under SSM. 1.6 Summary The need for universalization of elementary education was felt long before the independence of India though, proper planning has been conducted after the independence. It was advocated that all the children of the age group of 6-14 years should be brought under the arena of education. They should be enlightened with the light of knowledge and thereby the nation may be enlightened by increasing the educated labour force of the nation. Several plans and programmes were also taken in the last 75 years to make the dream a true. It's true that we are still some paths away from the desired goal of putting 100 percent children into school for having elementary education; there are still gaps like drop out, child labour, enrolment, retention, etc. are existing but the policies have developed the situation a lot too. The most important plans among all the plans and policies taken by the government have been discussed above. DPEP or District Primary Education Programme has been very much effective in the concept of universalization of elementary education. The objectives and nature of their planning have been discussed in detail. SarvaSikshaAbhiyan and SarvaSiksha Mission have been proven to be most effective for universalizing elementary education. The success of SSA and SSM has led the government to introduce RMSA and RUSA for the development of MadhyamikSiksha and Higher Education respectively. In the first unit the detail of universalization of elementary education has been discussed alongwith the roles of DPEP, SSA and SSM. The constitutional provisions have also been discussed here which will enrich the students to be aware of the

NSOU ? GE-ED-11 32 concept of universalization of elementary education as well as the role of DPEP, SSA and SSM in this regard. 1.7 Self-Assessment Questions 1. What do you mean by universalization of elementary education? Also state the various steps for materializing the dream of UEE. 2. What are the aims and objectives of universalization of elementary education? 3. Discuss in detail the importance of universalization of elementary education in India. 4. What are the Constitutional provisions of universalization of elementary education in India? 5. What is Right of Children to Free and Compulsory Education Act, 2009? How does it contribute to the universalization of elementary education in India? 6. What are the achievements and limitations of Right to Education Act 2009? 7. What is DPEP? Discuss in detail the programmes and planning of DPEP? 8. How does DPEP contribute to the universalization of elementary education in India? 9. What is Sarva Siksha Abhiyan in India? Discuss the constitutional background of Sarva Siksha Abhiyan in detail? 10. How does Sarva Siksha Abhiyan work to universalize the elementary education in India? 11. What are the financial concerns of SarvaSikshaAbhiyan in reference to elementary education? 1.8 References Aggarwal, Y. (1998) Access and Retention under DPEP: A National Overview. To analyse

the issues and concerns in secondary education; ? To elaborate the Government of India (GOI) initiatives towards Universalization of Secondary Education; ?

To discuss the problems of secondary education in India; ? To suggest the way out of the problems of secondary education in India.

2.2 Introduction Secondary Education in India comprises of Class IX and X. it covers the age group of 14-16 years generally. After the completion of the elementary education up to age 14 years a child enters into the arena of secondary education. Secondary education may be considered to be a bridge between elementary education and higher education. The universalization of elementary education in India has brought with it the necessity to widen the arena of secondary education as well as higher education. On the other hand, to nurture the proper democratic nature of our country, the citizens should not only be limited in having universal elementary education. Moreover, the success of the SSA and SSM along with DPEP and the positive impact of RTE 2009, led the thinkers of India as well as the policy makers of the nation to have the idea of the universalization of secondary education in India. Different policies and programmes have come in their mind to implement the thought of universalization of secondary education. The success of SarvaSikshaAbhiyan and SarvaSiksha Mission led the thinkers to prepare such programmes for secondary education too. And the result is the introduction of RasthriyaMadhyamikSikshaAbhiyan or RMSA. RMSA was introduced with the aim of bringing all the children of the age group of 14-16 years under the umbrella of the secondary education. Policy was introduced, design was ready and the funds were also in the flow to bring the success of the mission of the universalization of secondary education. It is true that the post independent system of secondary education has been facing a number of issues and challenges in the way of the progress or bring the universalized quality education at secondary level in India. Different committees and NSOU ? GE-ED-11 37 commissions have cited several problems of quality secondary education. They have also cited possible solutions of those problems too. Problems have been found in the form of policy implementation, structure, curriculum, teaching method, teachers, text books, finance, etc. In this unit, we will discuss in detail the nature of the universalization of secondary education in India as well as the role of RMSA in universalizing secondary education. This unit will also focus on the issues and challenges of secondary education in India and some ways out to meet the challenges.

2.3 Universalization of Secondary Education

2.3.1 Secondary Education System in India

Education in India has always been a significant instrument for social and economic transformation. Educated and skilled population not only drives national and economic development but also ensures personal growth. The challenge to ensure education for all requires concerted efforts to strengthen education system at all levels—elementary, secondary and higher secondary, higher and professional education. Keeping in view the Education—Vision and Goals (MHRD, 2009-10), i.e. “to realize India’s human resource potential to its fullest in the education sector, with equity and inclusion”, the Ministry of Human Resource Development (MHRD), the Department of School Education and Literacy; and the Department of Higher Education have taken several new initiatives like Sarva Shiksha Abhiyan (SSA), Mid Day Meal Programme and National Literacy Mission (NLM). Implementation

of
the

Right of Children to Free and Compulsory Education (RTE) Act, 2009

is

also a direction in this regard. Secondary Education (classes IX and X)

is a crucial stage in the educational hierarchy as it prepares the students for higher
secondary

education and also for the world of work.

Harvey (1990) found that secondary education plays a critical role in addressing the emerging human development concerns in Countries, engaged in building knowledge societies, for staying connected to the globalization process. It is, therefore, absolutely essential to strengthen this stage by providing greater access and also by improving quality in a significant way.

Besides providing general

NSOU ? GE-ED-11 38 education up to secondary level, it is imperative to impart vocational education and other relevant skills to students at this level so as to compete in the job market.

Secondary education occupies a very strategic position in the educational pattern of the country. It

is the link between primary education and higher education. Primary education

is intended to provide minimum requirements for survival whereas secondary education enables an individual to become a full members of the complex society. After independence our country achieved a great remarkable changes in the field of secondary education. The Government of India, Soon after attainment of independence appointed a number of committees and commissions to review the system of secondary education. The various committees recommended certain suggestions for the improvement of secondary education both quantitatively and qualitatively. Tara Chand Committee in 1948 suggested the multipurpose type of secondary schools without discouraging the unipurpose schools. The university education commission 1948-49 which was appointed under the chairmanship of Dr. S. Radhakrishnan, remarked that “our secondary education remains the weakest link in our educational machinery and needs urgent reform.” The landmark in the reconstruction of India’s

50%

MATCHING BLOCK 30/58

SA Chapter 1 and 2 (Final Setting).pdf (D45945997)

secondary education is the secondary education commission report 1952-53. The commission was appointed by the Government of India, on September 23, 1952, under the chairmanship of Dr. A.

LakshmanswamiMudaliar to review the existing defects in the secondary education and made some suggestions regarding the improvement of secondary education. 2.3.2 Types of Secondary School Variety and multiplicity of the aims and purposes have naturally made secondary schools many and varied in their nature, structure, and functions. Therefore, a brief outline of them may be presented below. High and Higher Secondary School High schools and Higher Secondary schools give education to boys and girls for 10 years and 12 years’ time respectively. They cover the age group from 13-14 years

NSOU ? GE-ED-11 39 to 17-18 years of adolescence. The bulk of Secondary education in our country is largely constituted of these two types of schools. Their main objectives are to develop a range of knowledge, to diversify the course of study, to train in vocational efficiency, and also to prepare students for higher studies. This level of education is mainly responsible for training in middle-level manpower resources of the country. Multipurpose School In accordance with the recommendations of the Mudeliar Commission of 1952- 53 this type of secondary school has come into being. A Multipurpose school provides varied types of courses to students with diverse aims, interests, and abilities. It gives a suitable opportunity for individual pupils for the development of his innate aptitude for special courses of study. Also, this type of school aims at removing the sense of differentiation, distinction, and complexes from the mind of students towards the vocational subjects and promote the sense of democracy and harmony. Technical School According to Mudeliar Commission, the objective of this type of school is to give an all-round training in the use of tools, machines, and processes that are mainly responsible for turning the wheels of civilization. It is intended not to produce some artisans only. Normally students after completion of high school use to get admission here. But by making somewhat relaxation the students who have studied up to class VIII are also given to undertake the course of its study. Subjects of study include Applied Mathematics and Geometrical Drawing, Elements of Mechanical and Electrical Engineering, and Workshop Technology. This type of school at present has immense scope to serve the technological needs of modern society. Army School Secondary students who are physically and mentally fit and competent are given the opportunity of special education in this type of school. They may receive education in defense that includes army, navy, and air force training along with the general course of study. Army school education is effective in training the sense of national discipline and loyalty to secondary students. On completion of their study provisions are also made for their appointments. Besides, this type of school is residential in character.

NSOU ? GE-ED-11 40 Central School Central Board of Secondary Education under the Central Government has run this type of secondary school spread over the whole country. The Second Pay Commission has suggested for setting up of this type of secondary school specifically for those government officers and workers and the army who are subject to transfer of their services. The medium of education is English and Hindi. The curriculum and examination system is designed and conducted on all India bases. Although this type of school could not satisfy the local educational needs of people. Navodaya Vidyalaya The concept of NavodayaVidyalaya as a secondary school system is comparatively new. The National Education Policy of 1986 has formulated a pace-setting school for secondary education in the country. Its broad objectives are the maintenance of quality and excellence and the establishment of social justice and equity. Children with special talent and aptitude are provided the opportunity of good quality education irrespective of their capacity to pay for it. Therefore, this kind of NavodayaVidyalaya has been established in various districts of the country to promote equality of educational opportunity to all meritorious students. It can provide scope to them to live and learn together and develop full potential. It is a residential type of school free of charges. Public School As a deviation from the general system of education Public school system has been developed in our country. Ironically Public-school education is not easily available for the general public. The system and its tradition have been imported from England during the British rule. It maintains the high tradition of upper-class people in society and their sophisticated way of life. Also, public school is a boarding school of high standards meant for boys and girls up to 18 years of age. Therefore, this type of school is independent of state management and constitutes the education of a special class of its own. Its policies and principles are not in keeping with the democratic traditions of society. Further, the public school gives quality education of high standards and is capable of forming a strong personality in the students. School for Physically and Mentally challenged In view of maintaining equality and social justice through education attention has been given at present for the school of the physically and mentally handicapped

NSOU ? GE-ED-11 41 children. Owing to physical shortcomings and intellectual inability the handicapped children are unable to receive education given to normal children in school. Although physically handicapped are not necessarily low in their intelligence. They need separate educational environments for development. There are separate institutions growing up for them, the major objective of which is to help them attain economic self-sufficiency in life. 2.3.3 Aims and Objectives of Secondary Education Number of committees have recommended their valuable suggestions regarding the aim and objectives of secondary education after independence. They are as follows: Aims of secondary education according to secondary education commission (1952-53): 1. To bring all round development among the learners; 2. To train the youth of the country to be better citizens who will be competent to play their role effectively in the social and economic development of the country; 3. To promote social virtues, intellectual development and practical skills of students; 4. To train the character of students to make them enable to participate creatively as citizens in the emerging social order; 5. To improve practical and vocational efficiency of the students; 6. To develop a scientific attitude of mind to think objectively; 7. To inculcate the qualities necessary for living harmoniously and efficiently with one's fellowmen; 8. To develop artistic interests and cultural interests which are essential for self-expression and development of all round personality of pupils. Objectives of secondary education according to Indian Education Commission (1964-66): 1. The main objective is "national reconstruction by raising the standard of living of our people."

NSOU ? GE-ED-11 42 2. The education is to meet the needs of a modernizing democratic and socialistic society. 3. It would promote productivity. 4. It would strengthen social and national integration. 5. It would consolidate democracy to adopt as a way of life. 6. It would accelerate the pace of modernization. 7. It would enable students to participate in productive work in school, home, workshop, farm and factory etc. 8. It would develop social, moral and spiritual values among the students. As per the recommendations of Indian Education commission, education was reconstructed for the economic and cultural development of the country. Importance was given on qualitative development of secondary education by relating education with the real life situations of the students. The NPE, 1986 and the Revised NPE, 1992 have discussed about the aims and objectives of education in general out of which some are relevant to secondary education. They are as follows: 1. Secondary education is meant essentially for all round development, material and spiritual. 2. It develops manpower for different levels of the economy, ultimately promoting self-reliance. 3. It develops a sense of good citizenship among the learners. 4. It would inculcate democratic values, rights and duties in a democratic set up among the students. 5. It would strengthen the "whole world as one family" view and motivates, the younger generations for international co-operation and peaceful co-existence. 6. It should provide equality of educational opportunity for

all not only in access, but also in the conditions for success. 7.

It would inculcate in children scientific temper and independence of mind.

NSOU ? GE-ED-11 43 8. Minimum Levels of Learning (MLL) would be laid down and steps need to be taken for fostering among students an understanding of a diverse cultural and social systems of the people. 9. It enables to develop physical health through physical education among the students. Besides these, the secondary education should be based on a national curricular frame work which contains a common core along with other components that are flexible. The common core would include the history of India's Freedom Movement the constitutional obligations and the other content essential to nature and national identity. Promotion of vocational efficiency should form an integral part of secondary education. 2.3.4 RTE Act 2009

and Secondary Education

The

Right of Children to Free and Compulsory Education Act, (RTE

Act, 2009)

describes the

modalities

of the

importance of free and compulsory education

for children between 6

to 14 years in India under Article 21A of the Indian Constitution.

The

law came into

effect in the entire country except the state of Jammu and Kashmir from 1st April 2010.

RTE Act, 2009 recommended some major changes in the elementary system of education like making education free and compulsory, construction of curriculum as per constitutional values, ensuring quality of teachers, defining norms for schools, pushing for social reform, protection of child from academic fears and punishments, making admission and transfer procedures more simple, handing over the power and responsibility to hands of people, participation of non-officials and civil society people in the school management, removal of traditional system of examinations and implementation of continuous comprehensive evaluation. RTE Act lays emphasis on free and compulsory education, student-centred learning, fearless learning environment, progressive curriculum etc. The policies laid down at any stage of education like primary, secondary or higher has a direct or indirect impact on other stages of education because various stages of our education are inter linked and provide base for one another. Since

Free and Compulsory

NSOU ? GE-ED-11 44

Elementary Education has become a Constitutional Right of Children in India,

it is absolutely essential to push this vision forward to move towards Universalization of Secondary Education,

which has already been achieved in developed and developing countries

as

well. Secondary Education becomes the means of social transformation in education.

Secondary education needs to be reconstructed in the context of today and tomorrow (CABE Report, 2005).

A successful completion of Elementary Education is the precondition for taking the first step towards Secondary Education.

RTE Act provides strength to elementary education through its various provisions. It also supports secondary education to fulfil its various objectives indirectly. It

emphasizes on

hundred percent enrolment and retention of students at elementary level, which has spontaneously increased enrolment at secondary level. The RTE Act emphasizes curriculum as per constitutional values. This step helps the administrator to construct curriculum at secondary level according to the educational, social, psychological and physical requirements of the students. The RTE Act, also emphasizes on quality of teachers i.e. they should be well qualified and competent. If the teachers are well qualified and professionally trained they will help in developing students who can perform better at secondary level. Such qualified teachers also provide guidance and counselling to students while choosing their subjects and career for themselves after completion of secondary education. The RTE Act lays emphasis on the infrastructure facilities of educational institution

and the

learning environment facilitates students to achieve the objectives of education at elementary level. This helps the learners to continue secondary education in a smooth manner. This Act focuses on association of parents and community members for the development of school at elementary level of education.

Through this process, a positive attitude is developed towards schooling and elementary education among the learners, which creates a platform for them to express their ideas and thoughts in a better way at secondary level. The RTE Act stresses on a friendly environment between students and teachers through which students can reduce their doubts and problems, and as a result of this habit they can also perform better at the secondary level.

NSOU ? GE-ED-11 45 2.4 Role of RMSA in Universalization of Secondary Education 2.4.1 Concept of

95%

MATCHING BLOCK 31/58

W

Rashtriya Madhyamik Shiksha Abhiyan (RMSA) is a centrally sponsored scheme of the Ministry of Human Resource Development, Government of India, for the development of secondary education in public schools throughout India. It was launched in March 2009. The implementation of the scheme has started from 2009- 2010 to provide conditions for an efficient growth, development and equity for all. The scheme includes a multidimensional research, technical consulting, various implementations and funding support. The principal objectives are to enhance quality of secondary education and increase the total enrolment rate from 52% (as of 2005- 2006) to 75% in five years, i.e. from 2009-2014. It aims to provide universal education for all children between 15-16 years of age. The funding from the central ministry is provided through state governments, which establish separate implementing agencies.

RashtriyaMadhyamikShikshaAbhiyan or popularly known as RMSA is an initiative of the Government of India, in partnership with State governments, which seeks to universalize enrolment in grades 9 and 10 across the country. It supports the expansion of existing schools, the building of new schools to reach underserved areas, investments in quality improvement, and contributions to recurrent and capital costs. The goal is to universalize entry into secondary school by the end of 2017 and achieve universal completion of grade 10 by 2020. RMSA responds to the fact that no more than 60% of all Indian children complete secondary school and net enrolment rates are little more than 40%. Around half of those completing secondary school fail to acquire high level Board qualifications and demonstrate mastery of the national curriculum. In the Northern states, less than half of all children make the transition to secondary school. Those from Scheduled Tribes and Castes and other educationally marginalised groups are especially disadvantaged. Only 11% of children in the lowest quintile of household expenditure are likely to reach secondary school whilst almost all of those in the highest quintile complete grade 10.

NSOU ? GE-ED-11 46 2.4.2

Objectives of RMSA ?

100%

MATCHING BLOCK 32/58

The scheme is being implemented by the State government societies established for implementation of the scheme.

The central share is released to the implementing agency directly. The applicable State share is also released to the implementing agency by the respective State Governments. Revision of

Certain Norms of the Scheme

The Government of India has approved the following revised norms of RMSA, with effect from 01.04.2013: ?

To permit State/UT Governments to use State Schedule of Rates(SSOR) or CPWD Rate, (whichever is lower) for construction of civil works permissible under the RMSA. ?

To increase the Management, Monitoring Evaluation and Research (MMER) from 2.2 percent to 4 percent of the total outlay under the programme, with 0.5 percent of the 4 percent earmarked for national level and the rest of the 3.5 percent as part of the State allocation. In cases of States where even with this enhanced allocation of 3.5 percent MMER would not be adequate and would hamper the activities under the head, within the 3.5 percent of the overall MMER component; variations across State/UTs can be approved by the PAB, subject to a maximum of 5 percent of the outlay in any particular State/UT. 2.5

Problems of Secondary Education in India and its Remedies 2.5.1 Problems of Secondary Education Different scholars as well as different committee and commissions have found out several problems of secondary education in India. Their listing of the problems NSOU ? GE-ED-11 48 was almost a time specific listing of problems of secondary education in India. They have suggested some solutions to the cited problems in their recommendations. Some problems have been met and some were left aside. Some new problems came in the way as a result of the demand of time and technological development, the changed need of the generations. So there are several problems which may be cited here. Some are listed in the following to bring forth the contemporary problems of secondary education in India. Learning Gaps from Elementary Education Many of the students at the secondary level lag behind on elementary-level competencies. For example, the 2017 Annual Status of Education Report found that only 43 percent of the children surveyed at the secondary level were able to perform basic arithmetic operations such as division. This presents a huge learning gap that is only intensified when advanced curriculums are introduced in secondary school in preparation for the board exams. Students are left behind from day one, and don't have the opportunity for one-on-one instruction to catch up, and just fall further and further behind. High Stakes Associated with Board Examination Board examination results continue to be the metric of success in secondary education in India given that performance on these exams determines higher education and career choices for most students. However, the exams themselves are tailored towards rote-based learning and do not correlate with the competency-based learning of the elementary grades. As a welcome shift, India has recently announced its participation in Programme for International Student Assessment 2021. Measuring ourselves against global benchmarks is a great first step towards reforming our education systems. However, the testing approaches of these exams are very different from the board exams in India and tend to have a heavier emphasis on conceptual learning. While state and central government board examination systems themselves must undergo reform, they continue to remain the yardstick of success in the short term. Until that changes, teaching pedagogies will need to balance conceptual learning with board exam success.

NSOU ? GE-ED-11 49 School-Facing Challenges In addition, schools themselves are faced with several issues that affect the quality of the education they provide, such as 1) a shortage of skilled teachers, 2) lack of IT infrastructure, and 3) an absence of life skills training for students in this age range. Teacher Availability and Competency According to findings from the All India Survey of Higher Education (AISHE) released in July of 2019, substantial teacher posts remained vacant: 21.6 percent of sanctioned posts for grades IX and X and 26.5 percent of posts for grades XI and XII. Filling these teacher vacancies across the country has been particularly difficult due to the subject specialisations required at the secondary level. Further, improving quality and building expertise among 'in-service' teachers is also a major challenge in secondary schools. The institutional structures needed in schools to help teachers are sorely lacking and there is very little coordination across primary, secondary, and teacher education programmes. Poor IT Infrastructure Computer aided learning could be a useful teacher tool, given low teacher competency and availability. The secondary schools are not equipped with adequate IT infrastructure, namely adequate number of computers, projectors, power backups and internet connectivity. Available EduTech solutions are usually in English language and are not designed for students coming from low income backgrounds. Absence of Life Skills Training Adolescent kids need support with life skills in various areas. However, our school system does not provide any support for school teachers to fill these gaps. Teachers struggle with dealing with these issues in their classrooms, further leading to poor academic performance. Determination of Aims Secondary schools in India were established by the Britishers to prepare and train educated officials and clerks for conducting administrative work. Unfortunately the aim continued to remain more or less the same for a long time. Except preparing the students for entrance into the university, the secondary education had got no definite aim.

NSOU ? GE-ED-11 50 After the recommendations of S.E.C. secondary education is being treated as self-sufficient and independent unit in itself and not merely complementary to university education. For the first time this commission prescribed certain aims for secondary education keeping in view the needs of the independent and democratic India. It is expected that the secondary education should therefore, seek to fulfil all these various aims of education by inculcating in students the qualities of democratic citizenship and leadership, and developing their faculties as complete units so that they might make their own contribution to the prosperity and enrichment of national life in all possible respects. But it is most depressing that most of the present secondary schools are not fully conscious of their essential duties and fall short of the expectation in fulfilling these aims. Neither the students nor the teachers are very much serious in fulfilling these aims. Hence it is of primary importance that the teachers must realize the supreme and magnitude of those aims at the time of imparting instruction to the students, lest everything will be fruitless. Deterioration of the Standards of Education Since the introduction of the compulsory education the enrolment at the elementary level of education has increased to a considerable extent. As a result of this, the number of students reading in high schools has been enormously increasing. Thus the increase in the number of students is bound to affect the quality of education in general and secondary education in particular. Teachers, educational administrators, parents and politicians have been complaining that the standard of education at different stages of education has been going down in recent years and secondary education is no exception to it. The other factors responsible for the low standard of education are: low salary of teachers, growing discontentment among the teachers towards their profession, the lack of necessary requirements and equipment's in the school, inefficiency of the managing bodies and their interference in the internal affairs of the institutions, negligence of the education department, the wretched financial condition of the institutions, growing lack of the sense of responsibility among the teachers and their attitude of negligence towards their duties, indifference of the guardians and the general public towards the numerous educational problems.

NSOU ? GE-ED-11 51 To improve the present backward condition of education in the country the expansion of education is no doubt desirable but it should not be at the cost of 'quality' education. Each secondary school should be well-equipped with regard to teachers and instructional materials in order to maintain the standard and quality. The basis of admission should be on merit.

Therefore, in the expansion of secondary education proper correlation between enrolment and standard should be maintained.

Adequate scholarship facilities should exist for poor but meritorious students. The problem requires proper solution and immediate measures should be taken to produce such young person's as might prove ideal future citizens of the country in all respects.

Inappropriate Curriculum In order to meet the various problems of the secondary education, it is the responsibility of the educational planners to attack the problems from all the sides. They will have to modify the school curriculum in order to keep with the urgent educational needs of future development. The scientific knowledge is advancing so rapidly that the present curriculum may not be relevant to the present needs of the students. Many political, economic and technical changes are taking place in the country at different intervals, but the education in general and secondary education in particular is unable to keep pace with the changing times. Though steps have been taken at the later stage to introduce diversified curriculum at the secondary stage yet the difficulty lies in relating it to the real and practical life of the child and his environments. As much emphasis is given on the external examination, the students follow the curriculum mechanically without curiosity, understanding or appreciation, as the immediate aim is to get through the examination and be admitted to higher class. Various commissions pointed out the defects of the curriculum at different times but the problem has not been tackled radically. The recent trend is to give the curriculum vocational and scientific bias by introducing certain vocational and technical subjects, so that the students should be encouraged and trained to choose subjects according to their ability, interest and aptitude. Nearly 82% of the population of India lives in rural areas.

NSOU ? GE-ED-11 52 Hence, the curriculum should be so formulated as to be related to the main rural occupation, i.e. agriculture, dairy, animal husbandry, and other rural industries. Whatever is added or deleted in the curriculum, it must be individually meaningful and socially relevant. It must create a thirst for knowledge among the students. Methods of Teaching: The curriculum has intimate connection with the method of teaching. The method followed by most of the secondary teachers is stereotyped, obsolete and un-psychological. Modern activity-centred methods are not applied by the teachers. Many of them are not familiar with these methods and as such they fail to attract the attention of the students. As a result the lessons become unproductive and the effects are far from satisfactory. There are practical difficulties also in way of applying modern methods of teaching in our school situations. Many schools are not properly equipped with laboratory and library facilities, necessary teaching aids and appliances. Most of the secondary schools are over-crowded, ill-staffed and suffer from inadequate number of teachers and accommodation. The average teacher-pupil ratio is 1: 50. But for effective and creative teaching it should be 1: 30. There is little scope for tutorial work. No fruitful teaching is possible without personal contact between the teacher and the taught. Text Book Problem: Next comes the problem of text-books which is also intimately connected with the problem of curriculum and methodology of teaching. Many students suffer from want of text-books which are very costly. Text-books are often changed. This has added fuel to the fire. 45% of the population in our country lives below the subsistence level, and it is not possible for them to purchase text-books for their children and to supply necessary stationery needed for educational purposes. They cannot bear other educational expenses of their wards. It might have been better if text-books could be supplied free of cost. In many socialistic as well as capitalistic countries text books are supplied free of cost upto secondary level. But our educational system has not yet been nationalised and the budgetary provision for education is very less. Under the circumstances, the Govt. should give financial assistance to the private publishers so that the prices of text-books may be kept at

NSOU ? GE-ED-11 53 reasonable level. Due to competition the private publishers also will be forced to maintain the reasonable quality or standard. The Lacuna of Private Management and Administration At present secondary schools are controlled and managed by different types of bodies, i.e. Government, local board (District Council's Municipal Board) as well as private managing committees at places. There is no uniformity in management of the schools and it varies from state to state. So far as the private management is concerned this state of affairs is far from being satisfactory. Majority of the schools under private management suffer from financial crisis. They have neither good building nor other physical facilities. Keeping aside the low standards of education there are certain conspicuous defects prevalent in these institutions which are detrimental and pernicious for the growth of secondary education in the country. To some extent the weaknesses in the management of institutions are owing to the laxity and inefficiency of the officials of the education department and specially those belonging to the inspecting group. Their slackness amounts to inefficiency. At present school inspection has become a routine work and mainly confined to show and paper work with no impact what so ever. But it is expected that the supervision of school should be regular and effective and must result in improving the quality and standard of education. The entire system of education is vitiated by examination. The educational achievements of students are measured by the single measuring tool known as examination. The prevailing essay-type examination dominates the educational arena. But it has developed a large number of defects and as such it is no longer regarded as the only measuring tool for determining the academic achievements of students. The main charge against the essay-type examination is that it is vitiated by subjectivity. For this reason, along with essay-type examination which has its own intrinsic merits objective type tests and short-answer type tests have been introduced. But the latter two are not entirely free from defects. It is true that these have improved the examination process and made the system more scientific and reliable. We cannot reject the essay type examination altogether. But it should be reformed in the desired channels. Some reforms are needed after careful thinking and a good deal of research.

NSOU ? GE-ED-11 54 The Radhakrishnan Commission, the Hartog Committee, the Mudaliar Commission and the Kothari Commission all have made important recommendations and observations in respect to examination reform. Many of these have been put into operation and still many are under consideration. External examination alone should not be accepted as a tool for measuring the academic achievements of students. Internal evaluation throughout the year by the internal teachers should also be used for examining the students. Bi-weekly or monthly tests of the students should also be considered for assessing their academic achievements. Instead of percentile marks abilities of students should be measured in grades. For this purpose a five point scale (A, B, C, D, E) may be used. Along with essay type questions at least 30 percent of the total marks should be assigned to objective tests.

Meagre Finance Meagre Finance is the greatest hurdle for the expansion of secondary education in the country. Though education at this level is bit expensive even then it should not be confined within a selected few. Interest is evinced for secondary education and the establishment of new schools is essential for meeting the educational needs of the increasing student population. In every part of the country there is a tremendous hunger for education. For meeting the demand a large amount of money is required. But our economic condition is not likely to be in a position to provide the needed educational opportunity at this level. So it is a challenge to the educational planners, because they will have to work under the constraint of growing numbers and limited resources made available for education. To overcome the financial limitations partly and to solve the problems of mounting numbers the shift system may be tried out in the existing schools instead of spending large amount on new buildings. The society should bear a substantial part of additional burden for educating the increasing number of students. 2.5.2 Suggested Solutions to the Problems of Secondary Education Improvements in secondary education are critical. And while we have a rudimentary understanding of the issues that secondary students and schools face, we know we have a lot to learn. But what we know for sure is that without addressing

NSOU ? GE-ED-11 55 the issues that lie within the current system, we risk losing the advancements that have been made in elementary education. Given that, it's imperative that we begin the process of both understanding the challenges and identifying workable solutions. As with all of our work in elementary education, we know that this will require us to listen and learn to effectively arrive at a template that will work in different contexts. The success of our efforts and the ability to see genuine, sustainable improvements in the quality of secondary education will rely on solutions that are able to deliver system transformation at scale. 2.6 Summary After going through the whole unit, we now have the detail concept of the nature of secondary education in India. It has come clear that secondary education begins just after the completion of the elementary education at the age of 14. And secondary education generally covers the age group of 14-16 years. The necessity of the universalization of secondary education has also been discussed in detail. We have also come to know about the aims, objectives and importance of secondary education in India. The constitutional provisions and the introduction of new programmes and policies have also been brought under discussion. The concept of RTE 2009 has also been discussed in relation to universalization of secondary education in India.

RasthriyaMadhyamikSikshaAbhiyan or more popularly RMSA has also been discussed in detail with the aims, objectives, nature, plan of action, etc. and every point have been discussed in reference to the universalization of secondary education in India. It has also been mentioned that how the success of Sarva Siksha Abhiyan has put forward the concept of RMSA to bring universalization of secondary education. The last section of this unit has dealt with the issues and challenges of secondary education in India, which appears to be hindrances in the way of universalization of secondary education. The issues includes the structure, the curriculum, the social issues, the teaching method, the teachers, the finance of the secondary education and many more. We concluded the unit with a note that how we can reduce down the challenge for quality improvement in secondary education.

NSOU ? GE-ED-11 56 2.7 Self-Assessment Questions 1. What do you know regarding the system and structure of secondary education in India? 2. "Secondary Education is the bridge between elementary education and higher education in India."—Put your comment in reference to the theme of the statement. 3. What should be the contemporary objectives of secondary education in India? 4. Discuss about the importance of different types of schools in universalizing secondary education in India. 5. Do you think that universalization of secondary education is a continuation of the concept of universalization of elementary education? 6. What is RTE Act 2009? How does it initiate the idea of universalization of secondary education in India? 7. What is Rashtriya Madhyamik Shiksha Abhiyan (RMSA)? What are the specific objectives of Rashtriya Madhyamik Shiksha Abhiyan (RMSA)? 8. How does Rashtriya Madhyamik Shiksha Abhiyan (RMSA) work? Comment on the structure of Rashtriya Madhyamik Shiksha Abhiyan (RMSA). 9. How does Rashtriya Madhyamik Shiksha Abhiyan (RMSA) contribute to the universalization of secondary education in India? 10. What are the problems of secondary education identified for the present day education system? 11. Do you think that the political intervention in the autonomy of secondary education actually affects the desired quality of secondary education? 12. What are the probable solutions to the contemporary problems

of secondary education in India? 2.8 References Aggarwal, J.C. (2010). Development of Education System in India. New Delhi: Shipra Publications.

NSOU ? GE-ED-11 59 Unit 3 ? Rashtriya Uchchatar Siksha Abhiyan (RUSA) Structure 3.1 Objectives 3.2 Introduction 3.3 Role of Higher Education in India 3.3.1 Higher Education in India 3.3.2 Objective of Higher Education 3.3.3 Ministries and Agencies in Higher Education 3.4 Report of the Knowledge Commission and RUSA 3.4.1 Report of the National Knowledge Commission 3.4.2 Rashtriya Uchchatar Siksha Abhiyan or RUSA 3.5 Problems of Higher Education in India and Suggestions 3.5.1 Problems of Higher Education in India 3.5.2 Opportunities in Higher Education 3.5.3 Suggestions Improving the System of Higher Education 3.6 Summary 3.7 Self Assessment

Questions 3.8 References 3.1 Objectives After going through this unit the learners will be able to ? Know the system of higher education in India; ? Know about the different ministries related to higher education in India; ? Understand the objectives of higher education in India; ? Discuss about the report of the National Knowledge Commission; ? Discuss the objectives of RUSA;

NSOU ? GE-ED-11 60 ? Discuss the role of RUSA in expanding higher education in India; ? Point out the issues and challenges to higher education in India; ? Know about the suggestions of meeting up the issues of higher education. 3.2 Introduction In the earlier two units, you have come to know about the universalization of elementary education and the universalization of secondary education in India. It has also been mentioned that secondary education bridges the gap between the elementary education and higher education. In the present unit, we are going to have discussion regarding the higher education. Higher education comes after the school education. Higher education consists of Graduation course of three years and parallels and above. In the present unit, the learners will come familiar with the system and structure of higher education in India. The present Gross Enrolment Ratio (GER) also needs to be increased to develop the nation up to the level of international standard. The success of Sarva Siksha Abhiyan and Rashtriya Madhyamik Siksha Abhiyan in the field of school education to universalize the elementary education and secondary education in India, the educational thinkers along with the policy makers of the nation to introduce Rashtriya Uchchatar Siksha Abhiyan (RUSA) for the development of higher education. This unit will discuss in detail the aims, objectives, nature of work, funding procedure of RUSA

100%

MATCHING BLOCK 35/58

W

for the development of higher education in India. It is

true that even after almost seventy five years of independence, the higher education has not reached to the desired level. Even there is the compromise in the concept of quality of higher education too. There are so many issues and challenges in the way of higher education such as political interference, funding, enrolment, teaching and research, etc. The present unit will also discuss about the problems of higher education and some suggestive solutions. Thus, this unit will help you understand the different issues of higher education.

NSOU ? GE-ED-11 61 3.3 Role of Higher Education in India 3.3.1 Higher Education in India The Indian higher education system is viewed as a sun rising sector due to the growing population. Both central and state governments share a concurrent responsibility towards inclusive and sustainable development of higher education. The expectations can be achieved only when the knowledge workforce is accelerated towards global economy with interdisciplinary approach as shown in Figure 1 (‘The future of Indian Higher Education, 2012). The universities are broken into discipline themed schools, where in the ‘inter’ emphasizes the importance of relationships among academic and collaborative approach across nations. Higher education deals with the tertiary level of education. Under-graduate colleges, Post-graduate college. Universities and centres, of advanced studies are coming under scope of higher education. As on 27.07.2021, there were 1003 Universities including 54 central Universities, 435 state Universities, 126 deemed Universities and 388 private universities. The Indian higher education system is robust and complex with the presence of different types of universities and colleges. As per the annual All India survey of higher education (AISHE, 2018), there are totally 49964 institutions categorized as 903 universities, 10011 stand-alone institutions and 39050 colleges. The total Enrolment of higher education is 36.6 million students with Gross Enrolment Ratio (GER) of 25.8 %. The undergraduate programme (29.06 million) has high intake with distributed enrolment in each faculty of discipline as arts and humanities (36.4%), science (17.1%) followed by equal share in Engineering and Commerce (14.1%). The GER of higher secondary schools is 62.5 % with approximate enrolment of 13.5 million students per year. The country is expected to meet higher education GER as 30% by 2020, with the accounted growth of 7% in the last decade. Still there will be a huge qualified higher secondary school students, will find difficulty in higher education access (Sharma, 2018). The current tertiary education enrolment will get expanded five times in the coming years and expect the expansion of institutional capacity with three times (—India’s Education Policy, 2018).

NSOU ? GE-ED-11 62 The number of colleges and universities in rural area is 60.48 % and 47 % respectively. However, there is a large disparity in enrolment ratio between rural and urban population. The dropouts are high in rural population due to family circumstances and lack of support. Most of the rural institutions are also failed to impart quality higher education due to faculty shortage, poor infrastructure and limited funding. There is also a wide disparity in gender and community distribution of rural and urban. As per the human development index report (2018), the country moves upward towards education. However, the women empowerment to be highly concentrated as there is a sluggish improvement in gender development index. Also, there is a need of improving public expenditure on socioeconomic development including education sector. The reservation policies improve the community participation; still it requires additional attention to achieve inclusive growth. India’s higher education system is the world’s third largest in terms of students, next to China and the United States. In future, India will be one of the largest education hubs. India’s Higher Education sector has witnessed a tremendous increase in the number of Universities/University level Institutions & Colleges since independence. The ‘Right to Education Act’ which stipulates compulsory and free education to all children within the age groups of 6-14 years, has brought about a revolution in the education system of the country with statistics revealing a staggering enrolment in schools over the last four years. The involvement of private sector in higher education has seen drastic changes in the field. Today over 60% of higher education institutions in India are promoted by the private sector. This has accelerated establishment of institutes which have originated over the last decade making India home to the largest number of Higher Education institutions in the world, with student enrolments at the second highest (Shaguri, 2013). The number of Universities has increased 34 times from 20 in 1950 to 677 in 2014. Despite these numbers, international education rating agencies have not placed many of these institutions within the best of the world ranking. Also, India has failed to produce world class universities. Today, Knowledge is power. The more knowledge one has, the more empowered one is. However, India continues to face stern challenges. Despite growing investment in education, 25 per cent of its population is still illiterate; only 15 per cent of Indian students reach high school, and just 8.15 per cent graduate (Census 2011). The quality of education in India whether

NSOU ? GE-ED-11 63 at primary or higher education is significantly poor as compared to major developing nations of the world. As of 2018, India's post-secondary institutions offer only enough seats for 25 per cent of India's college-age population, 25 per cent of teaching positions nationwide are vacant. As of 2021, there are 3550 degree-granting engineering colleges in India with an annual student intake of 1400000 plus almost 2500 polytechnics with an annual intake of 1050000. Despite these challenges higher education system of India equally have lot of opportunities to overcome these challenges and have the capability to make its identity at international level. However, it needs greater transparency and accountability, the role of universities and colleges in the new millennium, and emerging scientific research on how people learn is of utmost important. India provides highly skilled people to other countries therefore; it is very easy for India to transfer our country from a developing nation to a developed nation.

3.3.2 Objective of Higher Education The University Education Commission 1948-49 have made a number of significant recommendations on various aspects of higher education.

1. **Wisdom and knowledge:** Since education is both a training of minds and training of souls, it should give both knowledge and wisdom. No amount of factual information would take ordinarily into educated men unless something is awakened in them. Therefore, there should be inculcation of wisdom and knowledge.
2. **Aims of the social order:** Our education system must find its guiding principle in the aims of the social order for which it prepares. Unless we preserve the value of democracy, justice, liberty, equality and fraternity, we cannot Preserves our freedom.
3. **Love for higher values of life:** The greatness of a country does not depend on the extent of its territory, the length of its communication or the amount of its wealth, but on the love for higher values of life. We must develop thought for the poor and sufferings, regards and respect for women, faith in brotherhood regardless of race, colour, religion etc.

NSOU ? GE-ED-11 64

4. Training for leadership: One of the important aims of higher education is the training for leadership in the profession and public life. It is the function of universities to train men and women for wise leadership. The Indian Education Commission (1964-66) has made the following recommendations:

1. To seek and cultivate new knowledge, to engage vigorously and fearlessly in the spirit of truth and to interpret old knowledge and beliefs in the light of new needs and discoveries.
2. To provide the right kind of leadership in all walks of life, to identify gifted youth and help them develop their potential to the full by cultivating physical fitness, right interests, attitudes and moral and intellectual values.
3. To provide society with competent men and women train in agriculture, arts, medicine, science and technology and various other professions, who will also be cultivated citizen individuals imbued with a sense of social justice.
4. To strive to promote equality and social justice and to reduce social and cultural differences through diffusion of knowledge.
5. To foster in the teachers and students and through them in society generally the attitudes and values needed for developing the good life.

The National Policy on Education—1986 viewed higher education as follows: "Higher education provides people with an opportunity to reflect on the critical, social, economic, cultural, moral and spiritual issues facing humanity. It contributes to national development through dissemination of specialized knowledge and skill. Being at the apex of the educational pyramid, it has also a key role in producing teachers for the education system." The National Education Policy 2020 viewed higher education as follows: "Higher education plays an extremely important role in promoting human as well as societal well-being and in developing India as envisioned in its Constitution—a democratic, just, socially-conscious, cultured, and humane nation upholding liberty, equality, fraternity, and justice for all. Higher education significantly contributes towards sustainable livelihoods and economic development of the nation. As India

NSOU ? GE-ED-11 65 moves towards becoming a knowledge economy and society, more and more young Indians are likely to aspire for higher education."

3.3.3 Ministries and Agencies in Higher Education It is worth mentioning that higher education in India is not the exclusive responsibility of the Ministry of Education. There are many other ministries and agencies directly involved in higher education.

- ? **Ministry of Human Resource Development:** The Department of Secondary and Higher Education of the Union Ministry of Human Resource Development (MHRD) is the major agency concerned with higher education. The Ministry operates normally through the UGC. The UGC is a quasi-independent body set up to discharge the responsibility of coordinating and maintaining standards in the fields of higher education.
- ? **Ministry of Agriculture:** The ministry of Agriculture has assumed responsibility of the agricultural education in India. All the Agricultural Universities function under this ministry. In agricultural education, the Ministry operates through the Indian Council of Agricultural Research (ICAR). The agricultural universities are established by the Ministry, in co-operation with the state governments.
- ? **Ministry of Health:** The Ministry of Health looks after medical education. The Medical Council of India (MCI) and the Indian Council of Medical Research (ICMR) assist the Ministry in the planning and development of medical education. The MCI determines the minimum standards of medical education necessary for granting medical degrees.
- ? **Ministry of Law:** The legal education is under the Ministry of Law. The Bar Council of India (BCI) is concerned with legal studies in India. Generally BCI is concerned with the first degree in law, while the post-graduate and research studies are under universities, and hence these come under the purview of the UGC.
- ? **Specialised agencies for promotion of research:** A number of bodies have been set up outside the framework of the university system to direct and support research. The Council of Scientific

NSOU ? GE-ED-11 66 and Industrial Research (CSIR), under the Department of Science and Technology, is a planning and coordinating body operating through a chain of national laboratories and institutions. The Council undertakes and supports pure and applied research, provides junior and senior fellowships, funds research projects and maintains a record of scientific and technical personnel. Similar functions are performed by Indian Council of Social Science Research (ICSSR) in the field of Social Science; Indian Council of Historical Research (ICHR) in the field of historical studies; Indian Space Research Organisation (ISRO) in the area of space research, etc. Among the above agencies, ICSSR has a few branches at the regional level also. 3.4 Report of the National Knowledge Commission and RUSA 3.4.1 Report of the National Knowledge Commission The report to the Nation 2006, produced by the National Knowledge Commission (NKC) deals with most of the concerns on Indian higher education system along with general prescriptions for dealing with them. A large number of such prescriptions have been advanced more elaborately during the past six decades, but with disappointing results. There are several new disturbing trends that are not considered in the report, but will have a significant bearing on the effectiveness of the recommendations. The range of issues in the higher education covered by the report may be broadly grouped under (i) expansion and structural configuration, (ii) curricular concerns, (iii) governance and (iv) finance. Expansion and Structural Configuration The report suggests an increase in the number of universities nationwide to around 1,500 by 2015 with a focus on new universities and also some formed by clustering of the existing affiliated colleges. The deleterious effect of the affiliation system on the Indian higher education system has been recognised since 1966, when the Kothari Commission [Gol 1966] dealt with this issue at considerable length. Some universities have as many as 600 affiliated colleges. Of the nearly 17,700 colleges 7,650 are under unaided private management and another 5,750 are under
