[1] PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific / generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes of all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this, we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success. Prof. (Dr.) Subha Sankar Sarkar Vice-Chancellor

Sociology and common sense 1.8 Sociology as science 1.9 Applied sociology 1.10 Summary 1.11 Questions 1.12 Suggested Readings 1.1. Objectives This unit focuses upon the following points: ? Sociological way of looking at reality of everyday life. ? It will give you an understanding of the classical ways of thinking about society ? Help us understand how these perspectives are being modified and challenged by arrival of new perspectives.

NSOU ? CC-SO-01 8 ? This chapter will discuss the wide ranging and developing theories to help us make sense of this world. ? To understand various sociological methods. 1.2 Introduction Sociology is best seen as multi-paradigmatic and suggests a range of perspectives. The key challenge for a sociology is to search for general ways of understanding and interpreting social life. Sociology helps to demonstrate the social forces that organize society in very, very different ways and demonstrate it in time and space. You are able to see the trajectory from the past societies to the present societies. "The first wisdom of sociology is this: things are not what they seem" —Peter Berger The sociological perspective reminds us of the varied differences in the world. Various theoretical perspectives guide sociologists as they construct theories. Newer developments in sociological theory have highlighted how all sociology must work from perspectives or different voices. It is thus multi-paradigmatic. The emergence of sociology as a distinct discipline dates back to eighteenth and nineteenth century Europe. The multiple phases and changes during that period helped shaped this subject culminating into newer ideas from time to time which has been described exhaustively in this chapter. 1.3 The classical traditional perspectives of sociology Broadly three perspectives dominated sociological thinking for a long while, which we will discuss in this segment. The three perspectives which will be briefly described are functionalism, conflict and action theory. (a) The functionalist perspective : Functionalism is a framework for building theory that sees society as a complex system whose parts work together and interconnect, often to promote solidarity and stability. This perspective implies that our lives are guided by social structure which means stable patterns of social behaviour. Secondly this perspective leads us to understand social structure in terms of its social functions, or consequences for the operation of society. Functionalism owes much to the ideas of August Comte, Herbert Spencer, etc. NSOU ? CC-SO-01 9 (b) The conflict perspective : The conflict perspective is a framework for building theory that sees society as an arena of differences and inequalities that generate conflict and change. This approach complements the functional perspective by highlighting not solidarity but division based on different interest and potential inequality. Karl Marx whose ideas underlie the conflict perspective. (c) The social action perspective : Action theory starts with the ways in which people (or actors) orient themselves to each other, and how they do so on the basis of meanings. This provides a micro-level orientation, meaning a focus on the emerging meanings of social interaction in specific situations. The major proponent of this approach is highly influential Max Weber (1864-1920), a German sociologist who emphasized the need to understand a setting from the point of view of the people in it. (d) Contemporary perspectives in sociology : Although functionalism, conflict theory and action sociology are important and common positions in sociology, there are multiple other perspectives for looking at social life that have emerged over the past decades. As society changes, so do different approaches are adopted within it. For instance, conversational analysis is an approach that focus on different aspects of action, such as language and conversation. 'There is no absolutely 'objective' scientific analysis of culture or ...of 'social phenomena' independent of social and 'one-sided' viewpoints according to which...they are selected, analyzed and organized.' – (Weber,1949:72) Different perspectives, different cultures, points of view or standpoints from which analysis proceeds has become more and more important for modern sociology. 1.4 The sociological imagination Sociological imagination is "the vivid awareness of the relationship between experience and the wider society" —C. Wright Mills The sociological imagination is the ability to see things socially and how they interact and influence each other. To have a sociological imagination, a person must be able to pull away from the situation and think from an alternative point of view. This ability is central to one's development of a sociological perspective on the world. As sociology is a discipline of broad scope: virtually no topic be it gender, race, religion, politics, education, health care, drug abuse, pornography, group behavior, conformity—is taboo for sociological examination and interpretation. Sociologists typically focus their studies on how people and society influence other people, because

NSOU ? CC-SO-01 10 external, or social, forces shape most personal experiences. These social forces exist in the form of interpersonal relationships among family and friends, as well as among the people encountered in academic, religious, political, economic, and other types of social institutions. In 1959, sociologist C. Wright Mills defined sociological imagination as the ability to see the impact of social forces on individuals' private and public lives. Sociological imagination, then, plays a central role in the sociological perspective. His book "The Sociological Imagination" covers the history of sociology as a field of study relating to society and people's lives in it. For now, Mills outlines three types of questions that sociologists tend to ask. First, what is the structure of society? This question wants to know how different groups in a society are related. Second, what is the place of society in history? This question wants to figure out how societies change across time and how our society today is related to societies of the past. Third, what kinds of people does society produce? This question seeks to describe how people's personalities and moods— their beliefs and values—are also shaped by the social world in which they live. Mills details the "promise" of this imagination: why he thinks it's important to ask these questions and what he thinks they help us understand. For a lay man person, a sociological imagination is able to shuttle between the personal and historical. In the case of the contemporary man who feels trapped and powerless, sociological study explains how these feelings are produced by something larger than an individual's life. Such study can show him how his personal life is also shaped by the society in which he lives and the historical period to which he belongs. Sociology connects the personal and the historical by recasting personal problems as historical ones and historical problems as personal ones. Personally, an individual feels trapped; sociology asks, what is going on in history that produces this feeling? Or, historically, the world is in a Cold War; sociology asks, how does this global situation get played out in how people feel and think in their private lives? Another aspect to the sociological imagination on which Mills laid the most emphasis was our possibilities for the future. He argued that sociology not only helps us to analyze current and existing patterns of social life, but it also helps us to see some of the possible future open to us. Through the sociological imagination, we can see not only what is real, but also what could become real that we should desire to make it that way. 1.5 Emergence of Sociology In this segment we

81%	MATCHING BLOCK 25/372	W
will trace the relationship between the emergence of NSOU ? CC-SO-01 11 sociology and the social and intellectual conditions of eighteenth and nineteenth century Europe.		

The reason we need to discuss this is because sociology as a subject or discipline that we study today, emerged first in Europe. Two very important

89%	MATCHING BLOCK 4/372	W
events of the period, the French Revolution and the Industrial Revolution which followed the Commercial Revolution and the Scientific Revolution in Europe leaving a lasting impact on the main themes of sociology. 1.5.1		

Background to the emergence of sociology

100%	MATCHING BLOCK 5/372	W
There is always a connection between the social conditions of a period and the ideas, which arise and are dominant in that period.		

During the British raj,

78%	MATCHING BLOCK 6/372	W
the Indian middle class emerged as a product of the economic policies of colonialism.		

Disturbed by the ongoing exploitation of colonialism, they started writing, campaigning, building movements for free India. Culture, theater, songs, literature etc was also later serialized in television which depicts changes of that time and how that ideas are normally rooted in their social context. Now we shall study the different phases and important factors which led to the emergence of sociology. 1.5.2 The Enlightenment Period

88%

MATCHING BLOCK 7/372

MATCHING BLOCK 12/372

W

Basic feature of French society The French society was divided into feudal 'estates'. Estates are defined as a system of stratification found in feudal European societies whereby one section or estate is distinguished from the other in terms of status, privileges and restrictions accorded to that estate. The First Estate consisted of the clergy, which was stratified into higher clergy

who

95%

MATCHING BLOCK 13/372

Emergence of social anthropology The subject matter of anthropology and its academic profession began as an intersection of natural science and humanities. Social anthropology being part of anthropology, its emergence has been historically linked with the development of other components of anthropology. The emergence of social anthropology has also been closely linked with other disciplines of the social sciences, such as sociology, philosophy, ethno-history, history, psychology (social psychology), political science, and economics. But the closest discipline of social anthropology is sociology.

Like sociology, the emergence and development of anthropology is said to be directly linked to the scientific development in the western world.

100%

MATCHING BLOCK 28/372

W

Anthropology is a word which the ancient Greeks had also used. To them Anthropologia occurs in 1595. Immanuel Kant published a book in 1798 entitled Anthropologie in

Pragmatischer Hinsicht" (Sarana 1983:3). 1.6.1

98%

MATCHING BLOCK 29/372

W

First phase of development By 18th century A.D. after the experience and influence of the renaissance in Europe, there were many eminent philosophers who have made immense contributions to the understanding of society, including Rousseau, Vico, Baron de Montesquieu and John Locke who dealt with the social phenomena of the time. These earlier works certainly laid the philosophical foundation for the development of the social sciences and the science of human society including sociology and anthropology. The contribution of the earlier philosophers and scholars have certainly contributed to the emergence and development of anthropology although they cannot be called anthropology per se.

97%

MATCHING BLOCK 30/372

W

On the nature of social anthropology, he states that "there is a broad division of opinion between those who regard social anthropology as a natural science and those, like myself [Evans-Pritchard], who regards it as one of the humanities. This division is perhaps at its sharpest when relations between anthropology and history are being discussed" (Evans-Pritchard, 1951:7). 1.6.2 Second Phase of development In the second phase (1840-1890) there was "transition in the natural sciences from a static equilibrium model to a dynamic model. Its culmination came with the introduction of thermodynamic and Darwinian evolutionary theory" (Voget, 1975:42).

95%**MATCHING BLOCK 31/372****W**

This period marks the emergence of anthropology into an academic discipline. It is through the inspiration of the "triumphs of the scientific method in the physical NSOU ? CC-SO-01 14 and organic domain, nineteenth century anthropologists believed that socio-cultural phenomena were discoverable lawful principles. This conviction joined their interests with the aspiration of a still earlier period, extending back before the social sciences had been named, to the epochal stirrings of the eighteenth-century Enlightenment and the vision of a universal history of mankind" (Harris 1979:1). However, it emerged as an academic discipline only in the nineteenth century. The significant factors for the emergence of the discipline is however attributed to the various intellectual and socio-political changes taking place in the 18th and 19th centuries in Europe. Some of the important influences include the French Revolution and the Industrial Revolution in Europe.

97%**MATCHING BLOCK 32/372****W**

Historic and evolutionary processes had been at work in the emergence of the anthropological scientific institution" (Voget 1975:89). Marvin Harris, a historian of anthropological development, also views that anthropology "began as the science of history" (1979:1). 1.6.3 Emergence of modern anthropology The emergence of modern social anthropology emerged mainly with the contribution of Bronislaw Malinowski and A.R. Radcliff-Brown. Marcel Mauss is also generally considered as the pioneer of modern social anthropology in France. Bronislaw Malinowski is one of the most well-known social anthropologists. In fact, he is generally regarded as the founder of modern social anthropology. His main contributions to modern social anthropology was the introduction of ethnographic method with participant method and/or technique, and founding of the theory of functionalism departing from the earlier approaches, particularly, evolutionary, and historical approaches. His significant works include Argonauts of the Western Pacific (1922), Crime and Custom in Savage Society (1926), A Scientific Theory of Culture and Other Essays (1944).

97%**MATCHING BLOCK 33/372****W**

Along these pioneers in social anthropology in varied areas, one can include Levi Strauss into the list for founding the theory of structuralism and structural anthropology. He is also regarded as one of the most influential thinkers of the 20th century about myth, culture, religion, and social organization. His significant works include The Elementary Structures of Kinship (1949), Tristes Tropiques (1955), and Structural Anthropology (1963). There are also many anthropologists who contributed to the development of modern social anthropology, but they come either later or of lower stature. The emergence of anthropology (social anthropology) as a discipline can also be reckoned through the formation of professional associations. The aborigines Protection Society formed in 1837 was the first anthropological association to be established (cf. Sarana 1983:4).

NSOU ? CC-SO-01 15

100%**MATCHING BLOCK 34/372****W**

In the Indian context, there is no consensus that the emergence of anthropology (including social anthropology) coincides with the formation of Asiatic Society. of Bengal as some would claim. Sarana is of the view that Indian anthropology did not emerge in the 18th century.

100%**MATCHING BLOCK 35/372****W**

The generally recognized anthropological works in India were written by the British administrators like Blunt, Crook, Dalton, Grierson, Ibbetson, Mills, Nesfield, O'Malley, Risley, Russel, Senart and Thurston. 1.7

Sociology and common sense Common sense knowledge refers to that knowledge which is routinely used in the conduct of everyday life. It is practical, experimental and critical but also fragmentary and incoherent in nature. Common sense views rely on perceptions formed without any reference to scientific methods of causality. On the other hand natural sciences and social sciences give more attention to the underlying causality rather than superficial resemblances or lack of resemblances. However according to Andre Beteille , sociology is distinct from common sense. Sociological knowledge aims to be general, if not universal, whereas common sense is particular and localized. An important contribution of sociology has been to show that common sense is highly variable, subject to constraints of time and place, as well as others, more specifically social constraints. Interpretative sociologists like Dilthey, Max Weber and Symbolic interactionists like G.H Mead and G.Cooley use common sense knowledge to some extent. The concept of common sense knowledge is central to Alfred Schutz's Phenomenological approach. Common sense knowledge also forms the basis of Peter Berger and Gluckman's general theory of society in the book, "Social construction of Reality". Ethnomethodologists like Harold Garfinkle, make use of common sense knowledge in their study of people's method in the construction of social reality. Anthony Giddens has also focused on common sense knowledge in his theory "theory of structuration". "Sociology is anti-utopian in its central preoccupation with the disjunction between ideal and reality , between what human beings consider right, proper and desirable, and their actual conditions of existence, not in this or that particular society, but in human societies as such. Sociology is also anti-fatalistic in its orientation. It does not accept the particular constraints taken for granted by common sense as eternal or immutable. It provides a clearer awareness than common sense of the range of alternative arrangements that have been or may be devised for the attainment of broadly the same ends". (Beteille: 1996)

the systematic and questioning approach of sociology is derived from a broader tradition of scientific investigation.

In this way sociology is more rigorous than common sense. Sociology has to be distinguished from common sense which is limited in its reach, and uses many unexamined assumptions for interpreting and explaining everyday phenomena. Sociology should not go against common sense but must go beyond it to reach a broader and deeper view of the operation of society. The subject matter of sociology is such that it is far more difficult to insulate it from the assumptions and judgments of common sense than, say, particle physics or molecular biology. Again, while current affairs may be grist to the sociologist's mill, the sociologist differs in his orientation to current affairs from the journalist. (vocation betellei) 1.8 Sociology as Science Sociology can be termed a science because it fulfills the basic requirements of objective and rational knowledge of social reality. Sociologists apply science to their study in the same way that natural scientists investigate the natural world. To analyze whether sociology is a science following points needs to be understood: ? Sociology can be considered as a science to the extent that it uses scientific methods to study from selecting a topic to choosing a research method and analyzing the results. ? Sociologists can make generalizations on the basis of micro studies and also these sociological studies are based on evidence, observations and explanations. Sociological theories are built upon one another, extending and refining the older ones and producing new ones. Comte concentrated his efforts to determine the nature of human society and the laws and principles underlying its growth and development. He also tried to establish the methods to be employed in studying social phenomena. Comte argued that social phenomena can be like physical phenomena copying the methods of natural sciences. He thought that it was time for inquiries into social problems and social phenomena to enter into this last stage. So, he recommended that the study of society be called the science of society, i. e. 'sociology'.

NSOU ? CC-SO-01 17 Positivist approach Positivists believe that sociology can and should use the same methods and approaches to study the social world that "natural" sciences such as biology and physics use to investigate the physical world. By adopting "scientific" techniques sociologists should be able, eventually, to uncover the laws that govern societies and social behaviour just as scientists have discovered the laws that govern the physical world. Positivists believe that good, scientific research should reveal objective truths about the causes of social action – science tells us that water boils at 100 degrees and this is true irrespective of what the researcher thinks – good social research should tell us similar things about social action. Because positivists want to uncover the general laws that shape human behaviour, they are interested in looking at society as a whole. They are interested in explaining patterns of human behaviour or general social trends. In other words, they are interested in getting to the 'bigger picture'. To do this, positivists use quantitative methods such as official statistics, structured questionnaires and social surveys. Statistical, numerical data is crucial to Positivist research. Positivists need to collect statistical information in order to make comparisons. And in order to uncover general social trends. It is much more difficult to make comparisons and uncover social trends with qualitative data. These methods also allow the researcher to remain relatively detached from the research process – this way, the values of the researcher should not interfere with the results of the research and knowledge should be objective While Durkheim rejected much of the details of Comte's philosophy "positivism", he retained and refined its method. Durkheim believed that sociology should be able to predict accurately the effect of particular changes in social organisation such as an increase in unemployment or a change in the education system. Durkheim believed the primary means of researching society should be the Comparative Method which involves comparing groups and looking for correlations or relationships between 2 or more variables. This method essentially seeks to establish the cause and effect relationships in society by comparing variables. Durkheim chose to study suicide because he thought that if he could prove that suicide, a very personal act, could be explained through social factors, then surely any action could be examined in such a way. The starting-point for Durkheim was a close analysis of the available official statistics, which showed that rates of suicide varied.

Robert

Bierstedt in his book The Social Order mentioned the following characteristics of the

nature of sociology: ? Sociology is a social science, not a natural science ? Sociology is a categorical or positive and not

89%

MATCHING BLOCK 39/372

W

a normative science. ? Sociology is a pure or theoretical science and not an applied science. ? Sociology is an abstract science and not a concrete one. ? Sociology is a generalizing science and not a particularizing science. ? Sociology is both a rational and an empirical science.

One of the key debates in the study of sociological theory is whether sociology could be considered to be a science or not. The founding fathers of sociology, Like Auguste Comte, and other sociologists like Emile Durkheim, certainly saw their subject as scientific. These positivists believed that sociology could use scientific method to establish social facts and prove universal laws, exactly like the natural sciences. However, interpretative sociologists argue that sociology is not a science and nor should it attempt to be, as humans have agency and will not simply conform to universal laws or predictable patterns and developments like natural phenomena. 1.9 Applied Sociology The term 'applied sociology' refers to a diverse group of practitioners all using sociology to 'understand, intervene, or enhance human social life'. Many different approaches to sociological application exist. We use the term 'sociological practice' or 'practitioner' to inclusively refer to applied, clinical, and public sociologists, as well as those who identify more with methods used across the social sciences: community-based researchers, participatory-action researchers, and translational researchers. With their work, all of these sociologists intend to impact groups of people in the present day. Applied sociology is using the sociological tools to "understand, intervene, or enhance human social life" (Steele and Price, 2004: p. 4). People apply sociology when they use sociological methods, theories, concepts, or perspectives (tools) to address a social problem or issue (Steele and Price, 2008). Lots of social scientists 'use' sociological tools in their teaching or in their research. But only a subset uses those tools to plan or engage in direct, concurrent social intervention or enhancement. We generally refer to those that do as applied sociologists. Many different approaches to sociological application exist. We use the term 'sociological practice' or

NSOU ? CC-SO-01 19 'practitioner' to inclusively refer to applied, clinical, and public sociologists, as well as those who identify more with methodology used across the social sciences: community-based researchers, participatory-action researchers, and translational researchers (Weinstein and Goldman Schuyler, 2008). 1.10 Summary As discussed in this chapter, it is now easy to decipher the vast broad discipline of sociology. Sociology is therefore multi-paradigmatic with wide range of perspectives , ideas and theories. The origin of sociology trace back to the early nineteenth century Western Europe. Revolutionary changes in preceeding three centuries paved the way for sociology that initiated the process of thinking about society and the consequences of revolutionary happenings. Sociology as a subject helps us look at varied issues from a different perspective, what Mills defined a sociological imagination, i.e, the ability to see things socially and how they interact and influence each other. Usage of various methods and techniques in the research area makes no less or different from natural sciences. It uses both qualitative and quantitative methods in the field.Sociology is also related to other social sciences which shall be discussed in the later chapters. 1.11 Questions 1. Answer the following questions briefly: (5 marks) (a) Discuss the Positivist approach in sociology? (b) What is Sociological imagination? Give examples. (c) Describe sociology as a science? (d) What is Applied sociology? (e) How is sociology and common sense related? 2. Answer in detail: (10 marks) (a) Discuss the emergence of Sociology as a distinct discipline. (b) Elucidate the classical traditional perspectives of sociology. (c) Discuss the emergence of social anthropology. (d) Elaborate modern social anthropology. (e) Can sociology be considered as a science? Discuss. NSOU ? CC-SO-01 20 (f) Sociology and common sense (g) Origin of Sociology (h) Perspectives of Sociology 1.12 Suggested Readings 1)

To learn about the historical sketch of sociology ? To learn about the phases of development of sociology ? To learn about the factors for emergence of sociology ? To learn about the challenges to development and growth of sociology 2.2 Introduction Presenting a history of sociological theory is an important task, according to S. Turner (1998). The theories and its related ideas treated in this discussion have a wide range of application, deal with centrally important social issues, and have stood the task of time. These criteria constitute our definition of sociological theory.

NSOU ? CC-SO-01 22 The focus is on the important theoretical works of sociologists, or the work done by those in other fields that has come to be defined as important in sociology. To put it succinctly, this is a book about the 'big ideas' in sociology that have stood in the task of time, idea systems that deal with major social issues and that are far-reaching in scope. One cannot establish the precise date and time when and where sociological theories began. People have been thinking about, and developing theories of, social life since early historical times of the Greek or Roman or even to the Middle Ages. But we will not go to the Seventeenth Century, although Olson (1993) has traced the sociological tradition to the mid-1600s and the work of James Harrington on the relationship between economy and polity. This is not because people in these epochs did not have sociologically relevant ideas, but the return on our investment in time would be small; we would spend a lot of time getting very ideas that are relevant to modern sociology. In any case, none of thinkers associated with those eras thought of themselves, and few are now thought of, as sociologists. It is only in the 1800s and we began to fight thinkers who can be clearly identified as sociologists. These are the classical sociological thinkers we shall be treated in and we began by examining the main social and intellectual forces that shaped their ideas. He became the toast of Europe in 1830. He announced that he would now engage in "cerebral hygiene" and no longer read the works of those whom he felt were his intellectual inferiors. He proclaimed himself to be "the Great Priest of Humanity" and the founder of the "Universal Religion". The final volume of his great multivolume work- the same work that had made him famous in Europe in 1830- did not received a single review in the French press in 1842. Who was this pathetic figure? He was none other than the titular founder of sociology, Auguste Comte. Perhaps it is somewhat embarrassing to have the founder of sociology be a person who clearly went a bit insane. Comte wanted to call this new discipline "social physics" because the term 'physics' in his time went to 'study the fundamental nature of phenomena'; and so the new discipline would study the fundamental nature of social phenomena. To Comte's dismay, the label 'social physics' had been previously used by a Belgian statistician, with the result that he constructed the Latin and Greek hybrid: 'Sociology'. He did not like this name, but he felt that he did not have a choice. Still, the first volume of his Course in Positive Philosophy (1830) - the volume that made him famous- was a brilliant analysis of how science had advanced to the point where the social universe could be systematically studied. Sociology could not emerge, Comte argued, until the other sciences had

NSOU ? CC-SO-01 23 advanced and until science in general had become widely accepted as a legitimate mode of enquiry. With the pervasiveness of science today, it is perhaps hard to recognize that science has to fight its way into the intellectual arena because it represented a challenge to the dominance of religion. Indeed, early in the growth of science in Europe, even Galileo had to renounce his views and suffer legal persecution for the insight that the earth was not the centre of the universe, nor was the earth the centre of our solar system. It is because the science itself was still not on a secure footing at the beginning of the Nineteenth Century; and as the controversy over Charles Darwin's theory of biotic evolution documented, science still had to fight for its place as the final arbiter of knowledge about the natural world. Thus, what Comte tried to accomplish in the first volume of Course of Positive Philosophy was monumental, and perhaps even risky. In giving the systematic study of social phenomena a name- albeit a second-choice name- and it legitimating a science of the social realm, Comte accomplished a great deal. Few read Comte today, but his arguments were hugely legitimating for a new discipline that had to fight its way into academia and science more generally. Long before Comte, of course, humans had thought about the universe around them, even the social universe built up from people activities of adapting to their environments. Indeed, people had always been "folk sociologists", just as most people are today when they make a pronouncement on the course of some social event, or when they assert what should be done to resolve some problematic social condition. So sociology has existed in one form or another for a long as we have been human, but Comte gave this activity a name and tried to make it a science like any other natural science. 2.3 Intellectual and Social Forces in the Development of Sociology

79%

MATCHING BLOCK 40/372

SA Module 1 - 5.docx (D21364761)

All intellectual fields are profoundly shaped by their social settings. This is particularly true of sociology, which is not only derived from

that setting but takes the social setting as its basic subject matter. We will focus briefly on a few of the most important social conditions of the nineteenth and early twentieth centuries, conditions that were of the utmost significance in the development of sociology. 2.3.1 The Intellectual Revolution: When the Roman Empire finally collapsed, there followed a period often termed the dark ages. Much of the learning of Romans and, more important, of Greeks, Arabs, Persians, and Egyptians was lost; only the faithful scribes of medieval monasteries kept the Eastern and Western intellectual traditions alive. The label, the Enlightenment, is

NSOU ? CC-SO-01 24 obviously mean to connote a lighting of the dark, but in fact, the Dark Ages were not stagnant; after the initial decline in Western civilization when the Roman Empire finally collapsed, living conditions for most people were miserable; and yet new inventions and new ideas were slowly accumulating, despite the oppressive poverty of the masses the constant warfare among the feudal lords; and the rigid dogma of religion. New forms and experiments in commerce, politics, economics, religion, arts, music, crafts, and thinking were slowly emerging. As these elements of 'the great awakening' were accumulating between the fifth and thirteenth centuries, a critical threshold was finally reached. Change came more rapidly as these innovations fed off each other. As social structure and culture changed, so did human thinking about the world. Much of what had been lost from the Greeks and Romans, as well as from the civilization of the Middle East, was found, rediscovered, and often improved on. Nowhere is this more evident than in how scholars viewed science as a way of understanding the universe. Francis Bacon (1561-1626) was the first to clearly articulate the new mode of enquiry: Conceptualizations of the nature of the universe should always be viewed with scepticism and tested against observable facts. Though this sound like scientific common sense today, but was a radical idea at the time. In the sixteenth- and-seventeenth-century astronomy, including Isaac Newton's famous laws of gravity were great achievements. Thinking about the universe was now becoming systematic, but equally important, it was becoming abstract and yet empirical. The goal was to articulate fundamental relationships in the universe that could explain the many varied ways that these relationships can be expressed in the empirical world. To explain events thus required systematic and abstract thinking- in a word, it required theory. And this way of thinking literally transformed the world. The Enlightenment was thus an intellectual revolution because it changed how we are to explain the universe, and increasingly, it held out the vision that knowledge about how the universe operates can also be used to better the human condition. In fact, progress was not only possible but inevitable once science and rational thinking dominate how to explain the world, including the social world of our own creation. 2.3.2 The Enlightenment: It is the view of many observers that the Enlightenment constitutes a critical development in terms of the later evolution of sociology.

The most prominent thinkers associated with the Enlightenment were the French Philosophers Charles Montesquieu (1689-1755) and Jean Jacques Rousseau (1712-1778).

The influence of the Enlightenment on the sociological theory, however, was more indirect and NSOU ? CC-SO-01 25 negative than it was direct and positive. As Irving Zeitlin puts it "Early sociology developed as a reaction to the Enlightenment" (1981:10). The seventeenth century philosophers such as Rene Descartes, Thomas Hobbes, and John Locke, emphasized was on producing grand, general, and very abstract system ideas that made rational sense. But the later thinkers though did not reject the ideas system of rational sense, but they did greater effort to drive their ideas from the real world and to test them there. In other words, they wanted to combine empirical research with reason. The model for this was science, especially Newtonian physics. At this point, we see the emergence of application of the scientific method to social issues. Substantially, the Enlightenment was characterised by the belief that people could comprehend and control the universe by means of reason and empirical research. The view was that because the physical world was dominated by natural laws, it was likely that the social world was too. Once they understand how the social world worked, the Enlightenment thinkers had a practical goal- the creation of a "better", more rational world. The world was no longer the province of the supernatural; it was the domain of the natural, and its complexity could now be understood by the combination of the reason and facts. And gradually, the social universe was included in domains that science should explain. This gradual inclusion was a radical break from the past where the social has been considered the domain of morals, ethnics, and religion. The goal was to emancipate social thought from any religious and traditional speculation. Their work was soon as a radical attack on established authority in both the state and the church. They found traditional beliefs, values, and institutions to be irrational and contrary to human nature and inhibitive of human growth and development. The Enlightenment was thus more than an intellectual revolution; its emergence was a response to changes in patterns of social organization generated by new political and economic formations. 2.3.3 Political Revolutions: New ideas of thought do not appear only from heavy intellectual debates; new ideas almost always reflect more fundamental transformations in the organization of polity and production. The Enlightenment was thus more than an intellectual revolution; its emergence was a response to changes in patterns of social organization generated by new political and economic formations.

The long series of political revolutions ushered in by the French Revolution in 1789 and carrying over through the nineteenth century was the most immediate factor in the rise of sociological theorizing. The impact of these revolutions on many societies was enormous, many positive changes resulted. However, what attracted the attention of many early theories were not the positive responses, but NSOU ? CC-SO-01 26 the negative effects of such changes. These writers were particularly distributed by the resulting chaos and disorder, especially in France.

They were united in a desire

91%

MATCHING BLOCK 43/372

to restore order to society. Some of the most extreme thinkers of this period literally wanted a return to the peaceful and relatively orderly days of the Middle Ages. The more sophisticated thinkers recognized that social change made such a return impossible. Thus, they sought instead to find new bases of order in societies that had been overturned by the political revolutions of the eighteenth and nineteenth centuries. 2.3.4

Industrial Revolution and the Rise of Capitalism: Industrial Revolution, as important as political revolution in the shaping the sociological theory, which swept through many Western societies, mainly

76%

in the nineteenth and early twentieth centuries. The industrial revolution was not a single event but many inter-related developments that culminated in the transformation of the Western world from a largely agricultural to an overwhelmingly industrial system. Large numbers of people left farms and agricultural work for the industrial

occupations. The factories themselves were transformed by a long series of technological improvements. In this economy, the ideal was a free marketplace where the many products of an industrial system could be exchanged.

100%

MATCHING BLOCK 45/372

Within this system, a few profited greatly while the majority worked long hours

for low wages. A reaction against the industrial system and against capitalism in general followed and led to the labour movement as well as to various radical movements aimed at overthrowing the capitalist system.

92%

MATCHING BLOCK 55/372

SA Module 1 - 5.docx (D21364761)

Four major figures in the early history of sociological theory- Karl Marx, Max Weber, Emile Durkheim, and George Simmel- were

preoccupied. They spent their lives studying these problems, and in many cases, they endeavoured to develop programs that would help to solve them. 2.3.5 The Rise of Socialism: One set of changes aimed at copying with the excesses of the industrial system and capitalism, can be combined under the heading "Socialism". Although some sociologists favoured socialism as a solution to industrial problems, most were personally and intellectually opposed to it. On the one side Karl Marx was an active supporter of the overthrow of capitalist system and its replacement by a socialist system. However, most of the early theorists, such as Weber, Durkheim, were opposed to socialism. They feared socialism more than they did capitalism. In fact, in many cases sociological theory developed in reaction against Marxism and, more generally, socialist theory.

NSOU ? CC-SO-01 27 2.3.6 Urbanization: Partly as outcome of the Industrial Revolution, large numbers of people in nineteenth and twentieth centuries were uprooted from their rural homes and move to urban settings. This massive migration was caused largely by the jobs that created by the industrial system in urban areas. But it represented many difficulties for those who had to adjust to urban life, such as overcrowding, pollution, noise, traffic and so forth. The nature of urban life and its problem attracted to the attention of many early sociologists like, Max Weber, Simmel. 2.3.7 Religious Changes: Social changes brought on by political revolutions, the industrial revolutions, and urbanization had a profound effect on religiosity. Many early sociologists came from religious backgrounds and were actively involved in religion. They brought to sociology the same objectives as they had in their religious lives. For some, thinkers, such as Comte, sociology was transformed into a religion. Durkheim wrote one of his major works on religion, a large portion of Weber's work devoted to the religions of the world, and Marx too had an imprint interest in religiosity for critical analysis. 2.3.8 Growth of Science: As sociological theory was being developed, there was as increasing emphasis on science, not only in academic interests but in society as a whole. The technological products of science were permeating every sector of life, and science was acquiring enormous prestige. Sociologists like Comte and Durkheim, from the beginning were preoccupied with science. However, a debate soon developed between those who wholeheartedly accepted the scientific model and those such as Weber, who thought that distinctive characteristics of social life made a wholesale adoption of a scientific model difficult and unwise. 2.4 Summary The emergence of sociology and, hence sociological theory was inevitable. If Comte had not been born, someone else would have articulated a name for the systematic and even scientific study of the social universe. Herbert Spencer's *The Study of Sociology* might have become the new manifesto for the discipline, but the only problem was that sociology's official arrival might have been delayed for decades. The emergence of sociology was the culmination of not only a very long history of human thinking about their creations- the social world- but of broader

NSOU ? CC-SO-01 28 social and intellectual movements that began to bring Europe out of the its "Dark Ages" after the collapse of the Roman Empire. This Renaissance also included new ways of thinking, which collectively are sometimes termed the Enlightenment. Once these new ways of thinking began to gain traction, it was inevitable that someone like Comte come along to give a name of new ways thinking about the social world. We should, therefore, briefly pause to see what the Enlightenment accomplished and why it set the stage for sociology to make its grand entrance before an often skeptical audience. 2.5 Questions 1. Answer the following questions briefly: (5 marks) (a) Elucidate briefly the key challenges to growth of sociology. (b) Briefly discuss about the influence of the Enlightenment on development of sociology. (c) Why sociology becomes inevitable to emerge? (d) Why intellectual revolution was crucial for the emergence of sociology. (e) What is sociology? (f) Who is the founding father of sociology? (g) Who are considered to be sociologists? (h) What is urbanization? 2. Answer in detail: (10 marks) (a) Discuss about the factors that are responsible for the emergence of sociology. (b) Explain in brief about the phases of development of sociology as a discipline. (c) Explain the challenges to development and growth of sociology as a subject. (d) Explain in brief about the historicity of sociology as a discipline.

Unit 3 Emergence of Social Anthropology Structure 3.1 Objectives 3.2 Introduction Objective and Purpose of the Unit 3.3 What is Social Anthropology? 3.4 Emergence of Anthropology 3.5 Birth and Growth of Social Anthropology 3.6 Growth of Social Anthropology in India 3.6.1 The Formative Phase (1774-1919) 3.6.2 The Constructive Phase (1920- 1949) 3.6.3 The Analytical Phase. 3.6.4 The Evaluative Phase (1990 -) 3.7 Summary 3.8 Questions 3.9 Suggested Readings 3.1 Objectives This unit focuses upon the following points: ? To understand the nature of Social anthropology ? To understand its emergence and scope ? To understand the various stages of its growth 3.2 Introduction Anthropology is the study of man. Though the discipline is not very old, originating only in the nineteenth century, the name of the discipline was coined by the great philosopher Aristotle who used the term 'Anthropologist' for the first time, though he used the word in somewhat different sense. The term 'Anthropology' is a combination of the two Greek words, 'anthropos' meaning humans and 'logos'

NSOU ? CC-SO-01 31 meaning science. Thus, anthropology becomes the science of man. Over the years, the term 'anthropology' has acquired a number of definitions ; for example, the Concise Oxford Dictionary defines it the study of mankind especially of the societies and customs. The study of structure and evolution of man. According to Kroeber. Anthropology is the science of groups of men and their behavior and production. Therefore, it studies everything about man including human evolution and culture from the prehistoric stage to the present days from the physical, cultural, and social points of view. The subject-matter of anthropology can be divided broadly into four major branches, namely, Biological, or physical anthropology, Archeological anthropology, Linguistic anthropology, and Social-cultural anthropology. Man's physical emergence, evolution and growth is studied by physical anthropology; his social evolution as a prehistoric person is studied by Pre-history and as a historic person is studied by cultural or social anthropology. However, there is a shift in interest in social anthropology in the last several decades and its dominant interest stands out to be the social and cultural life of simple, pre-literate, pre-urban people. To understand the relevance and significance of Social Anthropology we need to discuss the process of its emergence in detail. Objective and purpose of the unit: The objective of this unit is to trace the emergence and growth of social anthropology as an important branch of Anthropology, to examine the historical relevance of social anthropology and how does it differ from sociology. Social anthropology, today, occupies a place of importance in the study of human society and culture; it has undergone several stages of development to reach its current status. Many serious and never-to-be –resolved debates have come up regarding the nature and scope of the discipline. Therefore, the unit also has the objective to know the history of the debates. Another important objective is to examine and understand the discipline's relations with sociology; how the two differ and how do they share the same points of interests. By making students aware of such details, the unit attempts to give the students a wholesome knowledge about the emergence and nature of the twin discipline of sociology.

3.3 What is Social Anthropology? As the name suggests, social anthropology is all about the social life of man. So, its study includes social organizations and social institutions. Man is a social animal, but his social nature depends on the cultural environment within which he lives and in different societies social and cultural norms vary. For example, social-cultural norms differ in primitive, rural and urban societies. Social anthropology examines all these aspects of human existence with reference to cultural, political and socio-economic aspects, religion, language, art, knowledge of the group under NSOU ? CC-SO-01 32 the lenses. Firth has defined it broadly as the study of human social processes in a comparative manner. As a discipline, social anthropology means different things in different countries. In England and other European countries it refers to ethnology or sociology; whereas in the USA it has a much wider meaning to encourage the study of man as both social and cultural being. In the nineteenth century , during the heyday of the British colonialism social-cultural anthropology was known as 'ethnology'; it is a combination of two Greek words, 'ethos' and 'logia' meaning race and study respectively. Thus, ethnology means the study of races and their diverse behavior pattern. It also includes among other things, cultural diversity, cultural change, social relationships, family, kinship, age groups, law ,political organizations, economic activities, etc. Social anthropologists, too, study all these things. However, the name 'social anthropology' came into use about sixty years ago to distinguish the subject from ethnology. Noted British anthropologist A. R. Radcliffe-Brown had omitted historical studies from the scope of anthropology, while ethnology is historical in outlook. Respecting Radcliffe-Brown's views, The British school of social anthropology has made social anthropology non-historical. Majumdar and Madan observe that following the British School, social anthropology is known as the study of social structure and social organization of man. The British social anthropologist Edmond Leach once (1982) described it as comparative micro- sociology. However, in the USA anthropologists give more emphasis on cultural orientations and practices while studying social aspects of man. Social anthropology, over the years, has been defined in a number of ways. We need to look into these definitions to understand the scope of the discipline. According to Piddington, "Social anthropologists study cultures of contemporary primitive communities". This definition gives a narrow vision of the discipline because social anthropologists today study modern culture as well. In contrast, S.C. Dube has given a much more appropriate definition by saying, "Social anthropology is that part of cultural anthropology which devotes its primary attention to the study of social structure and religion rather than material aspects of culture." The definition given by M.N.Srinivas is quite comprehensive. He defines social anthropology as " ...a comparative study of human societies. Ideally it includes all societies , primitive, civilized and historic." The discipline applies the inductive method of natural sciences to the study of human society, its evolution and social institutions. Social anthropology has changed its nature and scope to a great extent since the late- nineteenth century when it was concerned more with speculation over origins of religion and of various practices like exogamy, totemism and the likes. Today social anthropology is more concerned with experimental studies, observation and analysis of social systems, systematic comparison of different types of social system , and many such things. It also studies social behavior , social forms and institutions, in a systematic comparative manner.

NSOU ? CC-SO-01 33 3.4 Emergence of Anthropology As the discipline of social anthropology has been recognized as an offshoot of Anthropology, we need to know about the origin of the mother discipline first. From a very ancient time, there was a concern about man and his surroundings; in fact, this concern has led to the birth of a number of distinct disciplines of knowledge. Since the fifth century B.C., classical Greek scholars like Herodotus, Socrates, Plato, Aristotle, Hippocrates, and many others had expressed their concern about man and his affairs in the society. Herodotus is known as the 'father of Anthropology' because he not only recorded everything he saw what he heard from people about the distant shores of the Mediterranean, he also raised questions and issues which today have turned out to be the subject matter of social anthropology. Over centuries, such concerns from scholarly minds have contributed to the establishment of a systematic body of knowledge about man and universe. Compared to various scientific disciplines, anthropology has a late entry in the world of knowledge. Its emergence could be traced in the seventeenth and eighteenth century, and most of its fields was formed by the late eighteenth century, though the real interests in the subject emerged in the nineteenth century only. It was not that the first anthropologists had to start from scratch, the pioneers could observe and record the traditions of social life with the help of various sources. Western political philosophers were eager to look out for evidence in support of their theory of 'state of nature', the social- political condition that prevailed before the formal emergence of state as a political agency. So these political thinkers and philosophers had studied primitive institutions with a political yet scholarly objective in mind. There were also chronicles of primitive social institutions and lifestyles of 'exotic' people in the writings of travelers and explorers, recorded out of curiosity in their untrained hands; therefore, these were not always fit as scientific materials. However, as a distinct discipline anthropology emerged in the nineteenth century only, though Sydney Slotkin has mentioned in his book *Readings in Early Anthropology* (1963) that some of its sub-divisions had started arrive in the seventeenth –eighteenth centuries. Though most of the subject –matter of the discipline was already there by the end of the eighteenth century, professional interested in the subject flourished only in the nineteenth century. Since the fifteenth century, naval exploration of unknown, distant shores became popular among the Europeans. The different culture practiced by the people of these unknown lands evoked huge interests among the explorers and In Paris, the union of naturalists and doctors established a society named as 'Observers of Man' in the year 1800 for the promotion of the study of natural history and to provide guidance to voyagers and explorers of distant shores. However due to Napoleonic wars and political turbulence the Society could not survive for long. In 1838, a society for the protection of aborigines was established in

NSOU ? CC-SO-01 34 London by eminent scholars; but the purpose of the society was primarily social and political and not scientific enough. As the need for scientific queries was being felt, the Ethnological Society came up in Berlin in 1839 under the leadership of the eminent naturalist, Milne-Edwards. Two years later, in 1841 The British Anthropological Society was established in London and in 1842 in New York the third Ethnological Society was born. The birth of three Ethnological Societies in quick succession heralded the emergence of anthropology. Thus, anthropology became the child of scientific inquisitiveness of men about the 'unusual people' of the unknown world. Charles Darwin's *Origin of Species* was published in 1859 to explain life's natural evolution through ages. His path-breaking explanation had boosted new researches in various scientific disciplines and encouraged socio-cultural studies of human species. Thinkers with scientific vision, like Herbert Spencer, Morgan and Tylor came to believe that evolution not only affected the physical appearance of mankind, but also the cultural life. Looking at these developments, the year 1859 can be counted as the year of birth of anthropology and it has been labeled as the 'child of Darwin' in 1912 by R.R.Marret. In the birth year of anthropology Paul Broca, an anatomist and human biologist, established an Anthropological Society in Paris. He believed that for securing a true understanding of man a discipline of general biology should be formed by combining all specialized studies together. Following Broca's recommendations anthropology made a significant progress in the US. By the beginning of the 1860s the British Anthropological Society had started to face serious problems over policies and in 1863 James Hunt and several other dissenting members left it to form the Anthropological Society in London for the service of 'a whole science of man' and to enquire into the origin and development of humanity. In 1868, Thomas Huxley, the noted scientist and a member of the Ethnological Society, was elected the President of the Society ; soon, the two societies merged together for all practical purposes, though the difference was maintained in names. One interesting fact is that, starting from 1840 till 1870, the debate over the name of the science of man continued, whether it should be ethnology or anthropology that was the moot point. By that time anthropology earned a huge popularity all over Europe, especially in France, Germany and Italy. In three successive years of 1866,1867 and 1868, International Congresses of Anthropology and Pre-historic Archeology were held in different parts of Europe. In 1871, the Anthropological Institute of Great Britain and Ireland was established, but in 1873, the Institute saw a split to form a new organization named London Anthropological Society for making international communication, research and publications. It also started to publish the journal 'Anthropologia'. By this time of late nineteenth century, the related terms like ethnology, ethnography, archeology, prehistory, philology and linguistics had received wide recognition side by side with 'anthropology'.

NSOU ? CC-SO-01 35 Paul Broca, the noted French physician, anatomist and anthropologist, had said in his address on 'The Progress of Anthropology in 1869 that anatomy and biology together formed the base of anthropology and the core ideas of general anthropology could be found only with the synthesis of these two. Soon, within a few years, anthropology's synthetic character earned wide recognition in both Europe and America. In Europe, till this day, the subject is known by multiple names like anthropology, ethnology, pre-history and linguistics as each of these compliment the others to cover all aspects of man as the discipline's subject-matter. But in America and in many parts of area the name 'Anthropology' is sufficient to include various aspects of the study of man. It is often said that while the Europeans provided the tradition of scholarship, books and theories in anthropology, the Americans, with their aborigines, provided a laboratory for the discipline. Lewis Henry Morgan (1818-1881), the noted American ethnologist and one of the founders of scientific anthropology, had combined field work in a native culture with comparative work and general theory to produce a global perspective that was quite different from the observations of others like Christian missionaries of his time, who too published many papers on the aborigine life and culture of America. Through his comparative analysis of family and kinship structure emerged the branch of social -cultural anthropology of the discipline. In the second half of the nineteenth century anthropologists had shown increasing interests in the study of racial stock and biological evolution of human species. As a consequence a good number of influences had enriched the subject; for example, France contributed largely in pre-history and physical anthropology whereas Germany's contribution was psychological and geographical traditions in cultural anthropology. Theodore Waitz initiated physical anthropology and Adolf Bastain, on the basis of his worldwide survey of people's culture, could infer about the basic psychological configuration in man . Friedrich Ratzel combined geography with anthropology to create a new branch of anthropogeography. But all these remained highly acclaimed book 'Primitive informal scholarly exercises until Sir Edward Burnett Tylor (1832-1917) ,the father of modern anthropology, established anthropology as an academic discipline in Europe. The two world wars brought in massive changes in the outlook of anthropology; Branislaw Malinowski (1884- 1942) broke the trend of arm-chair approach of the 19 th century anthropologists who used to depend on the unverified data collected by non-anthropologists and introduced field-study to stop speculation about the primitive people. Post the Second world war , the discipline was enriched by contributions from scholars like Claude Levi- Strauss who put emphasis on the formal aspect of culture. Meanwhile, through the works of British anthropologists social anthropology earned global recognition.

NSOU ? CC-SO-01 36 3.5 Birth and Growth of Social Anthropology As we have already noted, the discipline of anthropology has several branches and social anthropology is one of them. Social anthropology is intimately associated with man's inherent urge to know the unknown, to observe the life-style, habitats, dresses, food, language, cultural and religious rituals ,etc. of the unknown people from distant lands. The white people of Europe, having knowledge of their own Christian lifestyle and values set the standard of behavior and culture for others. So, the travelers of the yore maintained diaries, notes and other accounts of their travels to tell others about the 'strangeness' of those people. In the sixteenth century, the French author Montaigne became interested in the differences between the customs of his people and of others. In general, there were theoretical questions on the lineage and heritage of the colored people who wore no clothes at all. Rousseau described the Indians as "noble savage", while the Spanish missionaries of the eighteenth century described them as people without souls. Hobbes, too, in the seventeenth century came to believe that the American Indian aborigines were living in a lawless 'state of nature' where man's life was chaotic, insecure and full of uncertainties. In such an environment, the chronicles of explorers and missionaries were not only treated as awe-inspiring tales of 'strange' people from 'strange' land, but also as basic data for knowing these people. In 1724, a Jesuit missionary, Lefitau and several other writers together published a book on a comparative ethnographical analysis of American Indian customs and ancient Greek and Roman culture. During the same period, noted French writer Charles de Brosses made comparisons between ancient Egyptian religion and that of West Africa. In 1748, Montesquieu established himself as the first theorist of social anthropology when he published his famous book, Spirit of the Laws (Esprit des Lois) based on readings about different countries. Adam Smith and Adam Ferguson also based their theories of social and political evolution , following Darwin's theory of evolution of biological species. Before them, social philosophers and thinkers St. Simon, August Comte, and Herbert Spencer had discussed the concept of evolution from a philosophical point of view, without the support of any empirical evidence. Many historians argue that the origin of social anthropology can be traced back to the philosophy of David Hume and Immanuel Kant ; many others think Herodotus is the father of anthropology. At the same time, it is also believed that the systematic birth of social anthropology should be rightly counted from Henry Maine and Lewis Henry Morgan; and these two have formulated their deductions following the writings of travelers and missionaries. Darwin's ideas about the evolution of species had greatly influenced the thinkers of the nineteenth century and social anthropologists were no exceptions. Following the logic of Darwin, they

NSOU ? CC-SO-01 37 examined the origin of social institutions; for this reason, they became known as Social Darwinists. The foundation of social anthropology was laid by Henry Maine's *Ancient Law* (1861) and Lewis Henry Morgan's books like *Ancient Society* (1877). Maine was a senior imperial administrator posted in India. He made a distinction between status-based or traditional societies and contractual or modern, liberated societies like Britain. He observed that in traditional, status-based societies, one's status was to be determined by one's position within the kinship structure; whereas in a contract-based society the individual's personal achievements would determine his social positions. Morgan's contribution to early anthropology forms the background of evolutionary theory that suggests that human society has passed through the stages of savagery, barbarism and civilization, each stage characterized by certain type of economy. For example, savagery is supported by economy of subsistence based on livelihood through hunting and food gathering. The stage of barbarism is characterized by the economy of agriculture and animal husbandry; and the stage of civilization has higher level of literacy, technology, industry and political organization like state. This theory of Morgan has encouraged other scholars to build their theories. Finnish philosopher and anthropologist Edward Westermarck presented *The History of Human Marriage* (1891) and Robert Briffault an English surgeon, anthropologist and author established that women, in all animal species, determine the conditions of the animal family. Tylor produced the evolutionary theory of religion and other evolutionists like W.H.R. Rivers, Sir James Frazer, A.C. Haddon and Charles Seligman contributed immensely for the development of social anthropology as a science of social evolution. It was not that evolutionary theory was the only line of thought in the field of social anthropology; there were other opposite schools of thought like the structural-functional school of anthropology presented by the British anthropologist A.R. Radcliffe-Brown. There was also the Diffusionist School to reject the evolutionary ideas of unilinear progress and development of society because, society not only develops, but also degenerates. The diffusionists also believe that man is basically uninventive and so once an invention is made in any part of the world, it migrates to other parts through borrowing or initiation. The diffusionist ideas are shared by three distinct schools, the British, the German and the American ones, with supports from Smith, W.J. Perry, Rivers, Franz Boas, Clerk Wissler, Kroeber and others. Franz Boas and Bronislaw Malinowski, the leading modern anthropologists had great regard for field-studies. Boas collected empirical data and did extensive field-research in the US to study American Indians in the 1880s. He initiated the study of modern cultural anthropology in America and studied the mutual connection between culture and personality. Among his fellow cultural anthropologists we can name Ruth Benedict, Margaret Mead, Linton, Kardiner and Cora Du Bois.

NSOU ? CC-SO-01 38 The two branches of anthropology, one based on culture studies and another on the studies of society have developed side by side. Among the American anthropologists there is a trend of cultural analysis following Tylor, a British, on the other hand British anthropologists side with social anthropology of Morgan, an American. American anthropologists believe that there is not much difference between the two areas, only culture study has a much wider scope than the study of social life. In fact, they believe, social anthropology is contained within cultural anthropology. Yet, there are many who contest that view and claim that the two are completely different in concepts and methods. Radcliffe-Brown has commented that while doing fieldwork in any society, one apparently does not meet the culture, but experiences social relations. As all social relations are not equally important, they may be excluded from study. Only the relatively permanent and repetitive forms of social relations constitute social structure and by studying social structure the nature of social life and its continuity can be understood. Raymond Firth and Radcliffe-Brown have distinguished the concept of social organization from social structure. According to them, people make choices between alternatives within the broad framework of social structure. The social structure created by the choice-making persons is the social organization. With the help of these notions of social structure and social organizations, British social anthropologists have made comparative analysis of human behavior in institutionalized form. Claude Levi-Strauss predicted that the future of social anthropology would be in communication studies; that is, in the study of inter-communications between persons and groups through words and symbols; and from this there would appear several other sub-branches of social anthropology. In this way, many new ideas are entering in the field of social anthropology and its scope is increasing day by day in terms of theory and practice.

3.6 Growth of Social Anthropology in India

Anthropology in India has appeared much later compared to other countries of the world, it was only in the latter half of the nineteenth century when anthropological study via the ethnographic materials compiled by the colonial administrators. Andre Bettle (1996) has used the term 'Indian Anthropology' to mean the study of society and culture in India by anthropologists, irrespective of their race and nationality. D.N. Dhanagare has rightly observed that the development of social sciences, in general, is closely associated with the development of modern capitalism in the West. It was neither accidental nor coincidental that the growth of social sciences has remained linked to dynamics of power; the theories, researches and findings

NSOU ? CC-SO-01 39 have often been used to justify and sustain either to support the power- relations or to oppose them. Ideas, Concepts, ideas and theories of a given time are born and nurtured within the social environment of that period. This has happened to all areas of social science and more so in the field of sociology and social anthropology as academic disciplines and professions. In India both these two disciplines are children of British colonialism and both, in their initial years at least , reflected the colonial understanding of Indian social life. British colonial rule had affected the social, political and economic life in India drastically. For the colonial administrators too, India was a unique experience. After the devastating mutiny of 1857 the representatives of the Imperial authority had started to conduct ethnographic surveys to collect even the minutest details about each and every aspect of people's life. The main objective of these surveys was to ensure more control and power over the people of this land. The caste system, the rituals and beliefs of the religious sects, the tribal communities, hundreds of languages and their innumerable dialects, the land tenurial system and village social structure, all these intrigued the British. Their initial failure to understand the intricacies of India's social and economic life had led to a number of problems like agrarian disturbances and revolts. To prevent further problems in future and also to impose the iron grip over the land and its people, methods of sociology and social anthropology were utilized as tool of colonial domination. Joan Vincent (1990) has revealed that from its very beginning, British anthropology was used as a power- tool of the colonizers. The same is also true for early-American anthropology. Talal Asad (1973) has categorically stated that 'anthropology is rooted in an unequal power encounter between the West and the Third World'. The ethnographic and historic knowledge of the colonized country had helped colonial authority to know and control those lands better. European missionaries who came to preach Christianity also collected some data with a religious motive. Colonial administrators like Risley, Dalton, Thurston, O'malley, Russel, Crook, Mills and many others had compiled huge data on tribes and castes of the land. Around this time, some trained British anthropologists like Rivers, Seligman, Radcliffe-Brown, Hutton came to India to conduct field-studies. Most of those scholar-administrators focused more on the cultural diversity of India and floated a 'mosaic theory' to describe India's culture and society, more than the nature of its unity. They also created certain categories based on foreign idioms, principles and western understanding of the country. In the process , they started indiscriminate use of western ideas, concepts and theories to describe India's social life and culture. Unfortunately, such efforts proved to be counterproductive. Borrowing ideas, frameworks and methodology from western anthropologists to practice self-study or study of indigenous culture instead of studying 'other culture'. The path of growth for Indian anthropology has been

NSOU ? CC-SO-01 40 scrutinized regularly by both Indian and foreign scholars and following Vidyarthi's and Sinha's observations it can be divided into four distinct phases, namely, the Formative phase, the Constructive phase, the Analytical Phase and the Evaluative phase. We need to discuss those phases more elaborately. 3.6.1. The Formative Phase (1774-1919) Many believe that, anthropology as the scientific study of man began in 1774 with the establishment of Asiatic Society in Bengal. Its founder –President Sir William Jones had initiated a good number of anthropological studies. The Society's journal regularly published scholarly papers on the diversity of Indian life and customs. Information on rural life and tribal culture , collected by British administrators, missionaries, travelers and others. Following the footsteps of that journal, other scholarly journals like the Journal of Indian Antiquary(1872), Journal of Bihar and Orissa Research Society (1915) and Man in India(1921) saw the light of the day. But there are other who think that the study of anthropology did start in the latter half of the nineteenth century. The journey of anthropology here thus began with anthropological mapping. The Imperial administrators made extensive use of their official machinery to collect information about social and economic conditions, religious beliefs and practices of the native Indians divided into castes and tribes. In its formative phase the inspirations were drawn from the British anthropologists who came to India to do their researches; as for example ,W.H.R. Rivers studied the Todas of Nilgiri Hills, A. R. Radcliffe-Brown dealt with the Andaman Islanders, G.H. and B.H.Seligman collected information on the Veddas of Ceylon(present-day Srilanka). 3.6.2. The Constructive Phase (1920-1949) This phase can be described as the phase of institutionalization of anthropology as an academic discipline. In 1918, social anthropology started its formal academic journey as a subsidiary subject at the under graduate level, but it became part of the Post-Graduate curriculum of the University of Calcutta two years later in 1920. K.P.Chattopadhyay, trained at Cambridge University by the likes of W.H.R.Rivers and A.C.Haddon , was the first Professor in Anthropology at Calcutta University and R.P. Chanda was its first Lecturer. After independence, Universities of Delhi, Lucknow and Guwahati were established in 1947, 1950 and 1952 respectively. Within a short period, several other Universities like Saugarh, Madras, Puna, Ranchi, Dibrugarh, Utkal, Ravishankar (Raigarh, M.P/Chhatisgarh), Karnataka, North Bengal and North-East Hills started their departments of Anthropology.

NSOU ? CC-SO-01 41 3.6.3. The Analytical Phase (1950-1990) The end of Second World War and India's Independence happened in quick succession. Since then, contacts between Indian and American anthropologists started in an increasing manner. On the one hand, D. N. Majumdar, M.N. Srinibas and S, C. Dube made important contributions in village and community studies; on the other, American anthropologists like R. Redfield, M. Singer, M. Marriott and Bernard S Cohn studied different dimensions of Indian tradition. Redfield's ideas of 'Great traditions and Little traditions' and 'Folk-urban Continuum' were widely acclaimed; while K. Gough, E. Leach , N.K. Bose and A. Beteille dealt with the socio-economic basis of Indian society. The Anthropological Survey of India ,too, conducted a number of surveys. This period also witnessed a tendency among Indian researchers to be free from western theoretical biases and number of in-depth, bias-free analytical studies on various communities were thus conducted. This phase has been enriched by the contributions of eminent social anthropologists like B.K.Roy Burman, A.K.Das, by publication of new journals and bulletins , proliferation of research centers till the last decades of the 20 th century. 3.6.4. The Evaluative Phase : (1990—) It was quite clear by this time that western anthropological ideas could not explain the complexities of Indian society; therefore a new approach was needed to fit the Indian situation. Therefore, Indian anthropologists developed and depended on indigenous models firstly to overcome the barriers of intellectual colonialism and neo- colonialism; and secondly to acquire an active, humanistic and critical outlook. Presently anthropology in India employs new types of data, concepts, approaches, methods and theories. The relationship between social anthropology and sociology was quite close quite close before; now they have come further closer as both the disciplines deal with tribal, agrarian and industrial socio-cultural issues. Renowned anthropologists like Srinivas and Dube have undertaken sociological investigations and thus have brought the two disciplines closer. 3.7 Summary From our discussion above it can be concluded that In India social-cultural anthropology is a major sub-division of anthropology. Due to its subject-matter it also has close affiliation with sociology, the difference between the is only artificial as once it was believed that sociology should study the society and culture of 'civilized' section of population and social anthropology should examine those of the 'primitive' people. Both the branched of knowledge have come out of such narrow boundaries and expanded their scopes of analyses. Being nurtured in the cradle of the colonial ideology , for a prolonged period of time the subject –matter of social anthropology used to be affected by the colonial machinations of the west ;India was no exception. However, after the end of the colonial rule, social anthropology in India has not only come out of that kind of influence, but Post- globalization, also built up an approach of its own to help in the task of nation- building. Post- globalization, social anthropology in India is focusing on the new challenges that are rocking the society in many ways. 3.8 Questions 1. Answer in Short. 5 Marks. (a) What is Social Anthropology? (b) Why did anthropology in India emerge in the colonial period? (c) Which period is known as the formative phase of social anthropology in India and Why? (d) What is the constructive phase of social anthropology in India? (e) Write a short note on the analytical phase of social anthropology. (f) Write a short note on the evaluative phase of social anthropology in India? 2. Answer in Detail. 10 Marks. (a) Critically examine the birth and path of growth for sociology in India. (b) What is social anthropology? Describe the emergence and growth of social anthropology in India. (c) Discuss the different phases of growth for social anthropology in India. 3.9 Suggested Readings Bidney, D. 1953.Theoretical Anthropology. Columbia: Columbia University Press. Beattie, J. 1964. adopts and applies the scientific methods. The founding fathers of sociology, Auguste Comte, Emile Durkheim, and others subscribe to this view.

Others hold different views and opine that sociology is not a science. German sociologists like Max Weber do not accept sociology as a science. Others also assert that sociology is as much a science like Political Science, Economics, and Psychology are. But before any decision on whether sociology is a science or not, we must understand first what science does imply.

NSOU ? CC-SO-01 45 And if sociology is a science then how far or in what degree sociology does conform to the notion of science in our academic concern for it. 4.3 What is Science? Before we settle on the question whether sociology is a science or not, first we need to know what science is, otherwise the question does not make much sense. Science, to say it precisely, is nothing but the

84%

MATCHING BLOCK 53/372

W

body of systematic knowledge. It relies on reason and evidences. A science is a branch of knowledge or study dealing with a body of facts that are systematically arranged and showing the operation of general laws. Science collects facts and links them together in their causal sequence to draw valid inferences

which are verifiable. A researcher or scholar, to make science, must adopt scientific methods and acquire scientific knowledge through the very process of observation, experimentation, generalization etc. The basis of science is objective knowledge and cause and effect relationship among facts. Literally, current philosophical views on the nature of science are diverse, and largely liberalized from previous views. Firstly, they no longer accept strong criteria of falsification as a scientific method. There are several ways to formulate falsification. Secondly, new movements in philosophy attack the notion of universal laws.

Cartwright (1983) argued that seemingly universal philosophical laws are not really universal in nature, from logical point of view. This and other reasons led Cartwright (1983) and Hacking (1983) to present a new view of science in which piecemeal "models", instead of universal laws and theories, play the central role of scientific investigation. Here "models" means oversimplified mental pictures of structure. 4.4 Sociology as a Science With the analysis of science in the previous discussion, let us turn to sociology as a concept itself. According to James W. Woodard, the conception of sociology is basically 'the study of those uniformities which are group-situational emergents, that is, uniformities for which there is a necessity, or toward which there are tendencies, arising out of the nature of group situations, letting "group" represent here any social situation of more than one individual.' He states 'Out of the group-ness of this situation emerge vested interests; so also emerge of situational necessity group-wide uniformities of behaviour, and yet another tendency toward change. Sociology in the broad sense is the study of all these uniformities, uniformities which are the situational emergents (in the group situation) of the incidence upon

NSOU ? CC-SO-01 46 each other of men's nature (as it is made up), of the physical environment (as it is made up), and of the products (in culture cumulation) of the past incidence of these factors.' Early sociologists tried to establish sociology as a science and their arguments are mainly on the methodology of sociology. Comte claimed that sociology uses four different kinds of methodologies, namely observation, experiment, comparison and historical research as a special case of companion. These are the methodology used in several other scientific fields, especially in biology. But actually, he never did empirical research, so we cannot take him at the face value. But his argument influenced other sociologists, especially Durkheim. For him, sociology is a study of social facts. According to him, a social fact is "a thing that is external to, and coercive of, the actor." Because they are external, social facts cannot be investigated by introspection. We should use empirical research. Durkheim used statistics on suicide rate to establish his arguments that suicide is a social phenomenon. This is an admirable attempt of empirical research on society, but there are several problems, especially his rigid rejection of introspection as a sociological method. It was probably Weber's methodology that provides an answer to these concerning problems. His key word is 'verstehen', a German term for 'understanding' or 'interpretation'. According to him, we can 'understand' other people's motivation through introspection of our own intentions, and this kind of knowledge is necessary for sociology. This is exactly what Durkheim denied as a method of sociology. But, of course, the problem would lie in the fact if this method is permissible as a scientific method of investigation, strong falsification of a theory has to become almost impossible by such 'interpreted' facts. Before we proceed further, we will be urged to make a brief remark one would like to make a brief remark on the use of models in sociology as a discipline. One of the reason people may argue against sociology as a science is the lack of uniformities of the sociological theory. We have lots of theories in sociology such as Marxist theory, Durkheim's theory, Weberian theory and so on, but none of them are shared or taken as valid by all sociologists. This seems to make a strong contrast with other fields of science where scientists agree on the basic theories. 4.5 The balance View According to David V. McQueen, when writing about a subject of a social- philosophical matter, it is absolutely essential to notify the reader of one's underlying

NSOU ? CC-SO-01 47 biases so that he may come to the piece with the appropriate mind-set. Such a notion is probably the first point of awareness that 'social sciences are, after all, not altogether similar to the so-called "hard" sciences'. In reference to the question of whether sociology is a form of scientific pursuit or not, the conclusion is drawn that sociology barely meets any of the rigid criteria traditionally associated with the natural sciences. Social scientists look at problem much like engineers; they do not spend much time on theory. As Pitirim Sorokin (1931) mentioned that sociology studies a set of social phenomena either not studied systematically by any other social sciences or studied by sociology from a point of view different from that of the other social sciences. And secondly, that the class of phenomena studied and the standpoints from which they are studied are basically consistent and scientifically important. The first standpoint is individualizing, that concerned predominantly with a description of the unique- unrepeated- phenomena and relationships. The second is generalizing, that is with a description of uniformities and formulations of laws, that is, the set of relationships repeated either in time-series, or in space or in both. Franklin H. Giddings (1927), in so far, a science is a distinct part of science viewed as an indivisible whole it has become such by concentrating inquiry and perfecting a technical method. Because of the distinctiveness of facts, sociology can be more than an assembling and ordering of checked observations- but it cannot become like chemistry or astronomy a prediction of certainties. It can become a forecast and a measurement of possibilities, including contingencies of kind and correlations of size, in the field of those human relations which constitute normal society. Here normal society indicates that society is made up of the most frequently recurring combinations of societal components and attributes. The Debate between the objective and the subjective Sociologists, like all humans, have their own values, beliefs, and even pre- conceived notions of what they might do in their research. Even sociologists are not immune to the urge of making changes in the world, two approaches to sociological investigation have appeared. By far the most apparent is the objective approach advocated by Max Weber. Weber understood that social scientists have opinions, but vehemently argued against the expression of non-professional or non-scientific opinions in the analysis. Weber took this position for several reasons, but the major ones outlined in his discussion of Science as Vocation are many. He firmly believed it is wrong for a person in a position of authority (a professor) to compel his/her students to accept his/her opinions in order for them to qualify the exam. Weber argued that it was acceptable for social scientists to communicate wide ranging

NSOU ? CC-SO-01 48 opinions outside of the classroom. He advocated for social scientists to be involved in politics and other social activism. The objective approach to social science remains very popular in sociological research and academic journals because it refuses to pin down on social issues at the level of opinions only and instead focuses deeply on data and theories. The Objective Approach: The objective approach is contrasted with the critical approach, which has its origins in Karl Marx's work on economic structures. If you are familiar with Marxist theory, you will recognize that Marx went beyond describing society to advocating for change. Marx disliked capitalism and his analysis of that economic system included the initiation for change. This approach to sociology is often referred to today as critical sociology. Some sociological often focus on this branch of critical sociology and some sociological approaches are inherently critical for e.g., feminism, black feminist thought. Building on these early prognosis, the rise of Feminist methods and theories in the 1970's called for an ongoing debate concerning critical as against the objective realities. Drawing on early Feminist writings by several social advocates which included Elizabeth Cady Stanton, Alice Paul, Ida Wells Barnett, Betty Friedan, and sociological theorists such as Dorothy Smith, Joan Acker, and Patricia Yancey Martin, Feminist sociologists argued that "objective" traditions are often unrealistic and unscientific in practice. Specifically, they - along with other critical theorists like Michel Foucault, Bell hooks, and Patricia Hill Collins debated that since all science was conducted and all data was mediated by human beings and all human beings have beliefs, values, and biases that they are often unaware of and that shape their conception of reality objectivity only existed within their gamut of beliefs and values of the people that presented it. We can state it another way and claim that since human beings are responsible for scientific knowledge, this is despite the fact that human beings cannot be conscious of all the potential biases, beliefs, and values they use to do their science. That is to select their topics, construct measurements, and interpret data, "objective" or "value free" science are never possible. Rather, these theorists argued that the personal is often the political. This is because our personal decisions however small they are, are ultimately impacted by the political context of our lives and they will finally shape the personal and political realities of the. This happen irrespective of whether or not we are aware of these consequences. As a result, every scientist, regardless of their intentions or awareness - may often seek to follow Weber's recommendations concerning objective teaching and research. Though at the same

NSOU ? CC-SO-01 49 time he was aware that he will ultimately fail to achieve this ideal. Whether or not scientists explicitly express their personal opinions in their teaching and research, every decision scientists must make will ultimately relies upon - and to an extent demonstrate to varying degrees - their subjective realities. As a result, current debates that emerge, typically center around objective versus subjective interpretations of science. While scholars continue to debate the merits and limitations of subjective/ objective versus critical approaches, science go on taking its destined path. Some examples from the subjective basis of both "objective" and "critical" sociology may help illustrate this point. First, we may examine the research process for both objective and critical sociologists while paying our attention to the many decisions people must make to inculcate in any study from either of the perspectives. These decisions include: ? The selection of a research topic (this selection reveals something the author believes is important whether or not it is) ? The selection of data (this selection reveals data the author believes is reliable whether or not it is) ? If the researcher decides to collect their own data, then they must: ? Decide where to collect data ? Decide who to collect data from ? Decide what questions to ask (which ones they believe will answer the question) and how to ask these questions (which forms of talk they believe are best for getting the answers they want) ? Decide how much data to collect ? Decide how to analyze the data collected (if mathematically, which protocols will be used and which software program, and if qualitatively which themes will ze look for and / or what software program) ? Decide how to measure or categorize the data (if mathematically, what set of parameters counts as a good measure, and if qualitatively what must a category contain) ? Decide how to interpret the measurements or categories (if mathematically, what exactly do the numbers mean socially, and if qualitatively what do the categories say about society) ? Decide how to discuss the interpretation (which theories should be used and which ones should be ignored) ? If the researcher decides to use secondary data, this becomes even more

NSOU ? CC-SO-01 50 complicated. While they will have to do the final four items listed above, they must also: ? Trust that the data collection occurred properly ? Trust that the data was organized properly ? Trust that the questions were answered properly ? Trust that the sample is appropriate As you can understand, the research process itself is full of decisions that each researcher must make. As a result, while the researchers may try to conduct objective studies, attempting so may not be possible given the fact that doing research requires them to use their personal experiences and opinions. These may arise from personal life, the advice of the people that taught them to do research methods, or the books they must have read that were ultimately placed before the same subjective actions without trying to be fully objective throughout the process. As a result, researchers can attempt to be as objective as possible, but they can never actually reach the absolute level of objectivity. This same problem was seen in Weber's initial description of teaching. For someone to teach any course, for example, they must make a series of decisions including but not limited to: ? Deciding what subjects to cover within the overall course ? Deciding which readings to use to convey information ? Deciding what measures of learning will be used and what measures will be left out of the course ? Deciding what counts as an appropriate or inappropriate answer on any and all measures used in the course As a result, we can say that Weber's objectivity is an ideal that can't be fully realized. Whether or not the teacher (or researcher) explicitly takes a political, religious, or social stance, he or she will ultimately present their personal stances, beliefs, values, and biases implicitly throughout the course. Thus we recognize that all sciences are ultimately subjective to varying degrees, it is fairly well established at this point, the question of whether or not scientists should embrace this subjectivity remains an open question. Further, there are many scientists both in sociology and other sciences who propagate the idea that scholars should attempt to be as objective as possible, and often project this ideal in their teaching, research, and peer review activities. As a result, the argument within the field continues without any finality, and this will likely be an important part of scientific knowledge and scholarship for time to come 1 .

NSOU ? CC-SO-01 51 4.6 Summary Auguste Comte, the founding father of sociology, has presented the discipline as a science; other eminent thinkers like Durkheim also consider it a science because the discipline adopts and applies scientific methods in the study of its subject-matter. Even without the use of any laboratory, it adopts scientific methods like case-study, interview, sociometry scales for examining and understanding social phenomena. It also makes use of the technique of scientific observation. Like disciplines of natural sciences, it adopts objective analysis, examines the cause-effect relationship of social phenomena, attempts to make accurate prediction, tries to measure social relationships accurately, tries to frame laws for objective analysis of issues and also tries to make generalization of the matters it studies. On the basis of all these we can come to the conclusion that

63%

MATCHING BLOCK 54/372

W

sociology is science. However, there are several other sociologists like Max Weber who deny the status of science to

it. The main reasons for their objection are: lack of pure objectivity in its study; lack of experimentation, failure to make accurate prediction, lack of flawless measurement, failure to make proper generalisation, etc. Considering its limitations to emerge as a 'pure' or natural science discipline due to the difference of its subject-matter with that of natural sciences, we can definitely identify sociology as a social science. It has brought in multiple new ways of examining and observing the society and its various aspects in as much positivist way as possible. 4.7 Key Words Sociology. Science. Observation. Experimentation. Natural Science. 4.8 Questions 1. Answer the following questions briefly: (5 marks) (a) Demonstrate your opinion about the scientific justification of sociology as a discipline (b) Explain in brief about sociology as a subject. (c) Briefly explain the challenges to consider sociology as a science. (d) Explain in brief about the relationship between science and sociology. (e) Elucidate briefly the key challenges to sociology as a scientific discipline. (f) Briefly discuss about the influence of science on the emergence of sociology. (g) Discuss the nature of sociology. (h) Why sociology is a science?

NSOU ? CC-SO-01 52 2. Answer in detail: (10 marks) (a) What is sociology? (b) Who is science? (c) What are the subject matters of sociology? (d) What is social fact? 4.9 Suggested Readings Haralambos, M.(1998). Sociology: Themes and Perspectives,OUP. Jayaram, N.(1998). Introductory Sociology, Macmillan India. 5.1 Objectives After reading this unit learners will be able to learn about: ? To understand the concept of sociological imagination. ? To understand the difference between the public and the private ? To understand its scope in constituting the essence of sociology ? To understand its relevance in the present context.

5.2 Introduction The term "sociological imagination" was coined by the American sociologist C. Wright Mills in his 1959 book *The Sociological Imagination* to describe the type of insights and perspectives offered by the very discipline of sociology. The term is used in introductory textbooks in sociology to explain the nature of sociology and NSOU ? CC-SO-01 54 its relevance in daily life. The sociological imagination enables its possessor to understand the larger historical background in terms of its meaning. This affects the inner life and the extraneous career of a variety of individuals. It enables us to take into account how individuals, as they go through their daily experience, misinterpret their social positions. Within this maze, the order of modern society is organized and it is within this framework that the mental makeup of a variety of men and women is also sketched. In this way, the personal troubles of individuals are focused upon their external troubles and therefore the indifference of the public is translated into their involvement with public issues.

<https://www.slideshare.net/trisnaalient/c-wright-mills-the-sociological-imagination-3sn> Picture Credit: Sociological imagination ensures that the individual can understand his own experience and evaluate his own fate by locating himself within his period. It is only by placing him in that context can he know his own chances in life and become aware of those of other individuals like him in similar circumstances. C. Wright Mills made it clear that the crux of social understanding can only develop if we get to bridge the gap between our personal troubles and public problems. Mills remained a very prominent sociologist of the 1960s and his ideas helped shape the substance of sociological imagination which remained crucial to our understanding of the

NSOU ? CC-SO-01 55 sociological perspective in general and the public-private ridge in particular. Do you know who in real life, Mills was? Picture : C. Wright Mills <https://canadiandimension.com/articles/view/>

dissenting-big-time-e.p.-thompson- c.-wright-mills-and-making-the-first-new (

Picture Credit) C. Wright Mills was a formidable sociologist, social commentator, and critic. Both his writings and character aroused considerable debate. He had been described as an 'American Utopian' – committed to social change. He was quickly angered by the oppression he saw around him and immediately protested. He was very critical of what passed for contemporary sociology. He believed that knowledge when used properly, could bring about the desired society through social change. C. Wright Mills further argued that if the society that was desired was not yet here, it was primarily because of the fault of the intellectuals, i.e the people who possessed the knowledge. Therefore, the discipline, he felt, required a thorough make-over. Mills had spent his life in re-designing the discipline of sociology for he felt the subject would require a fine-tuning in the post-war years that must necessarily be accomplished. In the next section, we shall get a short biography of Mills to have a

NSOU ? CC-SO-01 56 clear idea of the sociological imagination and its under-currents. This will help us to better understand the concept of the sociological imagination and what propelled Mills to conceptualize such an idea. Probably a short peek into his biographical profile will better locate him and his vision of social science.

5.3 A Short Biographical Profile of C.Wright Mills C. Wright Mills was born in Waco, a city in Central Texas on August 28th, 1916. His father was an insurance agent hailing from Florida and his mother – Frances Wright Mills – was a lady born and bred in Texas. In the 1920s, the family shifted to Dallas, with Mills graduating from Dallas High School in 1934. He then went on to Texas Agricultural and Mechanical College but soon changed his stream. He went over to the University of Texas at Austin (in 1935) to major in sociology. At the prime of his life he met and married (in 1937) Dorothy Helen Smith. Dorothy at that time was studying post-graduation in literature. However, she left her studies mid-way on getting married and was soon engaged with some work at Women's Residence Hall to eke out a decent living for both of them.

<https://publishing.cdlib.org/ucpressebooks/view?docId=kt7f59q5ms; chunk.id=0;doc.view=print> (Picture and Text Credit) At the University of Austin Mills quickly showed his ability to stand out. He soon turned out to be a daredevil and outspoken. This robustness went against him in the sociology department as he struggled hard to earn a graduate assistantship. He pursued his MA in philosophy and this brought him close to the work of George H. Mead, John Dewey and Charles Sanders Pierce (Tilman 1984: 7). In 1939 Mills left Austin for Madison where he had gained a scholarship to enroll himself in a Ph.D. program in sociology at the University of Wisconsin. After some time, the NSOU ? CC-SO-01 57 relationship between Freya and C. Wright Mills became unsettled. They were finally divorced in 1940 and Mills remarried in 1941. In 1943 they had a baby girl – Pamela.

his thesis 'A Sociological Account of Pragmatism: An essay on the sociology of knowledge' (

which was published after his death in 1964). He gained a position in 1941 as an associate professor at the University of Maryland before moving very soon to Columbia University in 1945. Mill's very first academic association was to work as a research associate in the Bureau of Applied Social Research and then the following year he served as an assistant professor of sociology (Mills and Mills 2000: 344). Freya and C. Wright divorced again in 1947 with Charles moving to a separate apartment on the outskirts of Greenwich Village in New York City. This kind of life to which Mills was getting accustomed was both light and enjoyable and therefore, he tried relaxing as much as possible.

<https://publishing.cdlib.org/ucpressebooks/view?docId=kt7f59q5ms; chunk.id=0;doc.view=print> (Photo and Text Credit) Like his personal life, he did not gel well with his colleagues in the department. The members of the Department of Sociology at Columbia of US sociology during the 1950s and 1950s consisted of many luminaries like Daniel Bell, Paul Lazarsfeld, Seymour Martin Lipset, and Robert Merton. It would be wrong to say that they did not, on the whole, get along with Mills. To an extent, it might be personal but it mainly flowed from his methodological and ideological orientations. The feeling appears to have been somewhat mutual. However, there were others whom he looked up with respect including Robert Lynd and a few others who however were not from his department like Jacques Barzun and Meyer Schapiro (an art historian and radical who had a particular thrust upon style as a craft – Horowitz 1983: 88).

NSOU ? CC-SO-01 58 Do you know? Mills went to the University of Wisconsin in 1939. He was considered as extremely arrogant and overly ambitious. His professional relationships were intensely argumentative and unfavorable. At the oral defense of his dissertation, he declined to make the necessary revisions that his committee had clearly asked for. The defense was quietly accepted without ever being formally approved by the committee. In 1947 C. Wright Mills married Ruth Harper (who was a researcher on the project that later on became White Collar). Around four years later, their daughter Kathryn was born (1955). Ruth and C. Wright Mills were separated in 1957.

<https://publishing.cdlib.org/ucpressebooks/view?docId=kt7f59q5ms; chunk.id=0;doc.view=print> (Photo and Text Credit) In the mid-1950s Mills traveled extensively in Europe and he was, for a span of time, a Fulbright lecturer at the University of Copenhagen. He had begun to develop his interest in Marxism (which resulted in *The Marxist* published quite shortly after his death in 1962). He also developed acquaintance with a number of key UK figures on the left including Tom Bottomore (1920-92), Ralph Miliband (1924-94) and E. P. Thompson (1924-93). It was during these travels that he wrote much of *The Sociological Imagination* (1959). Irving Louis Horowitz (1983: 88) while commenting on this book said, "It helped to make possible the penetration of the field by a new generation of social scientists dedicated to problems of social change rather than system maintenance". This book was also a way of giving an answer to all the strife he had with his fellow faculties in the department. In 1959 C. Wright Mills married Yaroslava Surmach and moved into a new home in Rockland County with Kathryn. NSOU ? CC-SO-01 59

<https://publishing.cdlib.org/ucpressebooks/view?docId=kt7f59q5ms; chunk.id=0;doc.view=print> (Photo and Text Credit). Yaroslava and C. Wright Mills had a son Nikolas Charles in 1960 (Mills and Mills 2000: 346). In 1960 he had a major heart attack after which he was informed if he had another he would die (Mills and Mills 2000:321). On March 20, 1962, unfortunately, the nightmare came true and he died an untimely death at his home in West Nyack. He was only 46 years old when he was buried in Oak Hill Cemetery, Nyack, New York. Mills left behind his three children, Kate, Pam, and Nik, in New York to sustain his legacy. Along with him, we lost a sociological gem forever. Let us now have a look at one of his major works and how it influenced our discipline.

<https://publishing.cdlib.org/ucpressebooks/view?docId=kt7f59q5ms; chunk.id=0;doc.view=print> (Photo and Text Credit). 5.4 Sociological Imagination: The Promise it made Mills said that every individual, as they live from one generation to the next, in some society or the other; lives out a biography. He lives it out within some historical sequence. By the fact of his unique living, he contributes, however minutely, to the shaping of this society. He at the same time influences the course of its history, despite the fact that he is made by society and by its historical push and shoves. The sociological imagination enables us to grasp history and biography and the relations between the two within society. That is its task and its promise that we will be talking about. To recognize this task and this promise is a huge mark for any social researcher. This was not absolutely novel but the traces of this imagination that we had been talking about was even found in classical thinkers like Herbert Spencer, E. A. Ross, Auguste Comte and Emile Durkheim, Karl Mannheim, Karl Marx, Thorstein Veblen, Joseph Schumpetermany, W. E. H. Lecky and Max Weber. No social study could claim to have finished its intellectual journey unless it had addressed the problems of biography, of history and of their intersections and inter- minglings within a society. Mills was very clear that whatever might have been the typical problems of a social analyst, it should never stop to become as sociologically imaginative as possible. However limited or broad might be the features of social reality they have analyzed, those who have been imaginatively aware of the promise of their work must have consistently asked three sorts of questions, considered basic by Mills. 5.4.1 The Three Basic Questions of Mills Let's have a look at these questions, often posed by Mills. These questions are: ? What is the structure of this particular society as a whole? What are its essential components, and how are they related to one another? How does it differ from other varieties of social order? Within it, what is the meaning of any particular feature for its continuance and for its change? ? Where does this society stand in human history? What are the mechanics by which it is changing? What is its place within and it's meaning for the development of humanity as a whole? How does any particular feature we are examining effect, and how is it affected by, the historical period in which it moves? And this period—what are its essential features? How does it differ from other periods? What are its characteristic ways of history-making? ? What varieties of men and women now prevail in this society and in this period? And what varieties are coming to prevail? In what ways are they selected and formed, liberated and repressed, made sensitive and blunted? What kinds of human nature are revealed in the conduct and character we observe in this society in this period? And what is the meaning for human nature' of each and every feature of the society we are examining? Mills clarified that whether the point of interest is a great and powerful state or a minor literary mood, a family, a prison, a creed—these are the basic questions the best social analysts should always ask. They are the intellectual columns of classic studies of man in society—and they are also the questions inevitably raised by any being possessing the sociological imagination. We can easily understand that

imagination is the capacity to shift very rapidly from one perspective to another—

from the political to the psychological; from the examination of a single-family to NSOU ? CC-SO-01 61 comparative assessment of the national budgets of the world; from the theological school to the military establishment; from considerations of an oil industry to studies of contemporary poetry and whatnot. It is this versatile capacity to range from the most impersonal and remote transformations to the most intimate features of the human self that constitutes the core of sociological imagination. It examines the relations between the two and looks for its easy intersection and unification. Back of its mind, there is always the urge to know the social and historical meaning of the individual in the society and in the period in which he has his quality and his being. That, in brief, is why it is by means of the sociological imagination that men now hope to grasp what is going on in the world and to understand what is happening in themselves as minute points of the intersections of biography and history within the larger society. In large part, contemporary man's self-conscious view of himself as at least an outsider, if not a permanent stranger, rests upon an absorbed realization of social relativity and of the transformative power of history. The sociological imagination is the most fruitful form of this self-consciousness. Older decisions that once appeared sound now seem to them products of a mind unaccountably dense and unsettled. Their capacity for astonishment is made lively again. They acquire a new way of thinking, they experience another kind of interpretation of values. We can say, in a word, that by their reflection and by their sensibility, they can easily realize the cultural meaning of the social sciences. For this to happen, one must learn to distinguish between the public issues and the private problems that we already spoke about in our introductory section. Let's study it in detail in our next section.

5.4.2 The Distinction between 'Personal Troubles' and 'Public Issues' Perhaps the most fruitful distinction with which the sociological imagination works is between 'the personal troubles of milieu' and 'the public issues of the social structure. This distinction is an essential tool of the sociological imagination and a feature of all seminal works in social science. Troubles often occur within the character of the individual and within the range of his immediate interactions with others. They have to do with his own self and with those limited areas of social life about which he is aware. Therefore, the enlistment and the resolution of troubles properly lie within the individual as a biographical entity and within the scope of his immediate surroundings. That is to say, the social setting that is directly open to his personal experience and to some extent his voluntary activities. Troubles are more of a private matter, for values cherished by an individual are felt by him to be threatened. Issues have to do with matters that surpass these local environments of the individual and the range of his inner and selfish Me. They have to do with the institutions and the structures of a historical society as a whole. They must do with

NSOU ? CC-SO-01 62 the ways in which various milieux overlap and interpenetrate to constitute the larger structure of social and historical life. An issue, on the other hand, is a public matter. Some values cherished by the public are felt to be threatened.

5.4.3 Some Illustrations Let's try to understand private and public through proper illustrations. In these terms, consider unemployment. When, in a city of 100,000, only one man is Corona virus-infected, that is his personal trouble, and for its relief, we properly look to the profile of the man, his medical history, and his immediate exposures and travel history. Note currently the whole world is under the threat of Coronavirus, which has become a pandemic for the globe per se. Coronavirus disease (COVID-19) is an infectious disease caused by a new virus. The disease causes respiratory illness (like the flu) with symptoms such as a cough, fever, and in more severe cases, difficulty breathing. You can protect yourself by washing your hands frequently, avoiding touching your face, and avoiding close contact (1 meter or 3 feet) with people who are unwell. But when in a nation of millions, thousands get infected, that is an issue, and we may not hope to find its solution within the range of options open to any one individual. The very structure of global immunity is under threat. Both the correct proposal of the problem and the range of possible solutions require us to consider the social-economic and political institutions of the society. Not merely the personal situation and character of a scatter of individuals matter, but the entire globe and its global health had become impaired. The nation must propose ways to save the civilization from the tentacles of the deadly Coronavirus before it gobbles up the whole human race. The virus attacking one or a handful of individuals does remain a personal problem whose resolution must be sought within that individual or his current peers but when the virus had taken a pandemic shape, it had stopped becoming personal trouble anymore. We must realize the situation is dark and gloomy and beyond the scope of an individual. It requires social intervention now for the social structure is at stake now. Similarly, the personal problem of war, when it occurs, maybe how to survive it or how to die during a war with honor; how to make money out of it; how to climb into the higher safety of the military apparatus; or how to contribute to the war's possible termination. In short, according to one's values, we have to find a set of milieux and within it to survive the war or make one's death meaningful. But the structural issues of war have to do with its causes such as, what types of men it throws up into command; what are its effects upon economic and political, family and religious institutions, with the unorganized irresponsibility of a world of nation-states.

NSOU ? CC-SO-01 63 Again, let's consider marriage. Inside a marriage, a man and a woman may experience personal troubles, but when the divorce rate during the first four years of marriage is 350 out of every 1,000 attempts, this is an indication of a structural issue having to do with the institutions of marriage and the family and other institutions that have a bearing upon them. Thus, we find that there is a sharp line of divide between the public and the private. What we experience in various and specific milieux, is often caused by structural changes. Accordingly, to understand the changes of many personal milieux we are required to look beyond them and their local conditions. And the number and variety of such structural changes increase as the institutions within which we live become more structured. They keep embracing one another and become more intricately connected with one another. To be aware of the idea of social structure and to use it with enough sensibility is a great task at hand for a sociologist. To be capable of tracing such linkages among a great variety of milieux is possible for a man. To be able to do who possesses sociological imagination. 5.4.4 Formulating the Issues and Troubles To formulate issues and troubles, we must ask what values are cherished but threatened, and what values are cherished and encouraged, by the characteristic trends of our period. When people cherish some set of values and do not feel any threat or assault to them, they experience well-being. However, the opposite can also happen. When they cherish values but do feel them to be thwarted or threatened, they experience a crisis —either as a personal trouble or as a public issue. And if all their values seem involved, they may feel the total threat of panic or pandemic as is now the condition with Coronavirus. But suppose people are neither aware of any cherished values nor experience any harm to them? That is when we experience indifference, which, if it seems to involve all their cherished values, becomes a case of apathy. Suppose, finally, they are unaware of any cherished values, but still are very much aware of a threat? There is always a sense of danger looming over their minds, which is always haunting them, and what should you call that? That is the experience of uneasiness or of anxiety, which can create an absolutely deadly condition of morbidity. Ours is a time of uneasiness and indifference which often does not permit the work of reason and the play of sensibility. Instead of troubles— defined in terms of values and threats—there is often the misery of vague uneasiness, undefinable in words. Instead of explicit issues being spelled out, there is often the underlying feeling that all is somehow not right. Neither the values threatened nor whatever threatens them had been stated in clear terms. There is always an embedded sense of ambiguity and vagueness hanging

NSOU ? CC-SO-01 64 in the air as if all is not well. In short, they have not been carried out to the point of decision. Much less have they been formulated as problems of social science. In the 'thirties, the situations were not so stark. Some men came forward to understand their personal troubles in these terms. The values threatened were plain to see and cherished by all. The structural contradictions that threatened them also seemed plain and simple. There were not much complications wrapping us. But unfortunately, the values threatened in the era after World War Two are often neither widely acknowledged as values nor widely felt to be threatened. Much private uneasiness goes unformulated and unspoken. Much public malaise and many decisions of enormous structural relevance never become public issues. For those who accept such inherited values as reason and freedom, it is the uneasiness itself that is giving us the trouble. It is the indifference itself that is the issue. And it is this condition, of uneasiness and indifference, that is the signal feature of our period. All this is so striking that it is often interpreted by observers as a shift in the very kinds of problems that need now to be formulated. We are frequently told that the problems of our decade or even the crises of our period now have to do with the quality of individual life. In fact, with the question of whether there is soon going to be anything that can properly be called individual life. Not child labor but comic books, not poverty but mass leisure, are at the center of concern. Many great public issues, as well as many private troubles, are described in terms of 'the psychiatric'. Often, it seems, that it is a pathetic attempt to avoid the large issues and problems of modern society. It arbitrarily divorces the individual life from the larger institutions within which that life is enacted. Problems of leisure, for example, cannot even be stated without considering problems of work. Family troubles over comic books cannot be formulated as problems without considering the plight of the contemporary family in its new relations with the newer institutions of the social structure. Neither leisure nor its debilitating uses can be understood as problems without recognition of the extent to which malaise and indifference now form the social and personal climate of contemporary society. In this climate, no problems of 'the private life can be stated and solved without recognition of the crisis of ambition that is part of the very career of men at work in the incorporated economy. It is true, as psychoanalysts continually point out, that people do often have 'the increasing sense of being moved by obscure forces within themselves which they are unable to define. But it is not true, as Ernest Jones asserted, that 'man's chief enemy and danger is his own unruly nature and the dark forces pent up within him. On the contrary, 'Man's chief danger' today lies in the unruly forces of contemporary society itself and the reasons are many. With our alienating methods of production, enveloping techniques of political domination and its international anarchy, situations are unimaginably grave today. In a word, this has led us towards a pervasive transformation of the very 'nature' of

NSOU ? CC-SO-01 65 man and the conditions and aims of his life. It is now the social scientist's foremost political and intellectual to make clear the elements of contemporary uneasiness and indifference. It is the central demand made upon him by other cultural workmen— by physical scientists and artists, by the intellectual community in general. It is because of this task and these demands, Mills believed that the social sciences are becoming the common denominator of our cultural period, and the sociological imagination our most needed quality of mind. 5.5 The Task of the Social Scientists The sociological imagination is becoming, I believe, the major common denominator of our cultural life and its signal feature. This quality of mind is found in the social and psychological sciences, but it goes far beyond these studies as we now know them. Its acquisition by individuals and by the cultural community at large is slow and often fumbling. Many social scientists are themselves quite unaware of it. They do not seem to know that the use of this imagination is central to the best work that they might do. By failing to develop and use it they are failing to meet the cultural expectations that are coming to be demanded of them. The classic traditions of their several disciplines make available to them this imagination which they have discarded with utmost callousness. Yet in factual and moral concerns, in literary work and in political analysis, the qualities of this imagination are regularly demanded. In a great variety of expressions, they have become central features of intellectual endeavor and cultural sensibility. Popular categories of criticism—high, middle, and low-brow, for example—are now at least as much sociological as aesthetic. Novelists—whose serious work embodies the most widespread definitions of human reality— frequently possess this imagination and do much to meet the demand for it. Although fashion is often revealed by attempts to use it, the sociological imagination is not merely a fashion. It is a quality of mind that seems most dramatically to promise an understanding of the intimate realities of ourselves in connection with larger social realities. It is not merely one quality of mind among the contemporary range of cultural sensibilities. Perhaps, it is the quality whose wider and more skilled use offers the promise that all such sensibilities, especially the human reason will come to play a greater role in shaping human affairs. Among social scientists, there is widespread uneasiness, both intellectual and moral, about the direction their chosen studies seem to be driving them to. This uneasiness, as well as the unfortunate tendencies, are contributed by several factors, one of which is, part of a general malaise of contemporary intellectual life. Yet perhaps uneasiness is more acute among social scientists, if only because of the larger promise that had guided much earlier work in their fields. At the same time, NSOU ? CC-SO-01 66 the nature of the subjects with which they deal and the urgent need for significant work today exert pressure upon them. Not everyone shares this uneasiness, but the fact that many do not is itself a grave cause for further uneasiness among those who are alert to the promise. They are honest enough to admit the pretentious mediocrity of much current effort. Mills seriously hoped that one day there will be a decline in this uneasiness. This should be possible for one shall define some of its sources to help transform it into specific desperation to realize the promise of social science. Of late the conception of social science Mills held had not been powerful enough. His conception stands opposed to social science as a set of bureaucratic techniques that inhibit social inquiry by 'methodological' pretensions. They congest such work by obscurantist conceptions, that is they hide things from the public sphere. The trivialize major public issues by unnecessarily putting them under the carpet. Thus public problems unconnected with publicly relevant issues often lose significance and become challenged. These inhibitions, obscurities, and trivialities have created a crisis in social studies today without suggesting, in the least, a way out of that crisis. Some social scientists stress the need for 'research teams of technicians/ others for the primacy of the individual scholar. Some expend great energy upon refinements of methods and techniques of investigation. Others think the scholarly ways of the intellectual craftsmen are being abandoned and ought now to be rehabilitated. Some go about their work in accordance with a rigid set of mechanical procedures; others seek to develop, to invite, and to use the sociological imagination. There are different ways that scientist's study. Some scientists associate and disassociate concepts in what seems to others a curious manner while others narrowly study only small-scale milieux, in the hope of building up conceptions of larger structures. Others examine social structures in which they try 'to locate' many smaller milieux. Some, neglecting comparative studies altogether, study only one small community in one society at a time. Others can be seen in a fully comparative way work directly on the national social structures of the world. Some confine their exact research to very short-run sequences of human affairs while others are concerned with issues that are only apparent in long historical perspectives. Some specialize their work according to academic departments; others, drawing upon all departments, specialize according to topic or problem, regardless of where these lie academically. Some confront the variety of history, biography, society; others do not. But Mills also tried to state the cultural and political meanings of social science. He said only when the problem of social science as a public issue will be recognized, and fruitful discussion will become possible. Then there will be greater self-awareness all around—which is, of course, a pre-condition for objectivity in the enterprise of social science as a whole. Social imagination is just walking ahead to fructify all those dreams come true for a flowering and bright social science.

NSOU ? CC-SO-01 67 5.6 Conclusion When Mills wrote *Sociological Imagination*, and especially through the 1960s, administrative research was on the verge of growth. Mills accordingly singled it out for special attention in *The Sociological Imagination*. This makes it all the more remarkable that, at the turn of the millennium, most of *The Sociological Imagination* remains as valid, and necessary, as ever. Forty years ago, Mills identified the main directions of sociology in terms largely valid even today. Sociological imagination remains even today a strategy to encounter "a set of bureaucratic techniques which discourage social inquiry by methodological pretensions. Such techniques congest work by imprecise and half-true conceptions and distract our attention from publicly relevant issues. Mills noted that one of the high purposes of sociology had been to bring intellectual clarity to social life and this is where other disciplines like literature, art and criticism largely fail. The sense of political indifference can clearly be taken as resulting from the grave absence of sociological imagination in decision making processes. For Mills, the frequent absence of engaging legitimation and the prevalence of mass apathy are surely two of the central political facts that culminate our social problems even more. "Prosperity," however unequally distributed, should present itself as the all-purpose solution to all social questions.

5.7 Summary We saw sociological imagination was largely developed by Mills as a perspective or social lens for both social observations, inquiry and research as well for policymaking. The *Sociological Imagination* describes the type of insights and perspectives offered by the very discipline of sociology. The term is used in introductory textbooks in sociology to explain the nature of sociology and its relevance in daily life. The sociological imagination enables its possessor to understand the larger historical background in terms of its meaning. This affects the inner life and the extraneous career of a variety of individuals. It enables us to take into account how individuals, as they go through their daily experience, misinterpret their social positions. Within this maze, the order of modern society is organized and it is within this framework that the mental makeup of a variety of men and women is also sketched. In this way, the personal troubles of individuals are focused upon their external troubles and therefore the indifference of the public is translated into their involvement with public issues. The book helped Mills, as we saw in his biography, was an assortment of the tide of experiences he has had, especially at his workplace. The book made possible the penetration of the field by a new generation of social scientists dedicated to problems of social change rather than

NSOU ? CC-SO-01 68 system maintenance. This book was also a way of giving an answer to all the strife he had with his fellow faculties in the department. Mills said that every individual, as they live from one generation to the next, in some society or the other; lives out a biography. He lives it out within some historical sequence. By the fact of his unique living, he contributes, however minutely, to the shaping of this society. He at the same time influences the course of its history, despite the fact that he is made by society and by its historical push and shoves.

5.8 Questions 1. Answer the following questions briefly: (5 marks) (a) What is Sociological Imagination? Who proposed the term? (b) What is Biography? (c) When did Mills write the book, *Sociological Imagination*? 2. Answer in detail: (10 marks) (a) How will you distinguish between public and private? (b) What should be the task of a social scientist according to Mills? (c) Give illustrations to mark the sociologically imaginative insight.

5.10 Glossary 1. Biography—At first, biographical writings were regarded merely as a subsection of history with a focus on a particular individual of historical importance. The independent genre of biography as distinct from general history writing began to emerge in the 18th century and reached its contemporary form at the turn of the 20th century. However, here we are referring to the life experiences of a particular individual and the events he went through. 2. Milieux—The social environment, social context, sociocultural context or milieu refers to the immediate physical and social setting in which people live or in which something happens or develops. It includes the culture that the individual was educated or lives in and the people and institutions with whom they interact. 3. Public—The name "public" originates with the Latin *publicus* (also *poplicus*), from *populus*, to the English word 'populace', and in general, denotes some mass population ("the people") in association with some matter of common interest. So in political science and history, a public is a population of individuals in association with civic affairs or affairs of office or state. In social psychology, marketing, and public relations, a public has a more situational definition, John Dewey defined (Dewey 1927) public as a group of people who, in facing a similar problem, recognize it and organize themselves to address it. Dewey's definition of a public is thus situational: people organized about a situation. Built upon this situational definition of a public is the situational theory of publics by James E. Grunig (Grunig 1983), which talks of nonpublic (who have no problem), latent publics (who have a problem), aware publics (who recognize that they have a problem), and active publics (who do something about their problem).

6.1 Objectives To help students understand the following things: ? What is common sense? ? Distinguish 'generalized' knowledge from localized commonsensical knowledge. ? To understand the distinction between sociology and common sense. ? To understand the theoretical underpinnings of common sense.

NSOU ? CC-SO-01 71 6.2 Introduction Common sense is usually taken as a sound practical judgment revolving around everyday matters. It may also be taken as a basic ability to cognize, perceive, understand, and accordingly judge that is shared by nearly all people. The first type of common sense or good sense can be described as the tendency for seeing things as they are, and doing things as they are supposedly done. This second kind is sometimes described as folk wisdom or collective knowledge, which is characteristic of signifying unreflective knowledge not reliant on specialized training or deliberative thought or action. The two types go together, as the person who has common sense is always in touch with common-sense ideas, which again emerge from the lived experiences of those who are commonsensical enough to cognize them. However, Aristotle warns us that 'common sense' has nothing to do with our notion of 'plain and basic common sense'. Common sense, as we understand it, seems to be a primary ability of rational beings to follow their experience in interpreting some obvious things, making elementary connections between them, so as to avoid adjoining contradictions. Because this ability is so instinctual, it is usually shared by all rational beings around us. Therefore, it is called 'common'. On the other hand, it is called 'sense' because it is developed naturally without any fabrication. So, its operations are intuitive, rather being perceptual (Gregoric:2007). "Common sense" has at least two specifically philosophical meanings. Let us look at them. One is a capability of the animal soul as proposed by Aristotle. He described it as the ability of different individual senses to collectively perceive the characteristics of physical things such as movement and size, which all physical things have in different combinations. This allows people and other animals to distinguish and identify physical things. This common sense is somewhat different from basic sensory perception and from human rational thinking but combines both of them. The second special use of the term is Roman tinted and is used for the natural human sensitivity for other human beings and their community. Just like the first meaning, both of these refer to a type of basic awareness and power assigned to people to judge what most people are expected to share naturally, even if they cannot explain why. All these meanings of "common sense", that we discussed above including are interconnected in a complex history that has evolved during important political and philosophical debates in modern Western civilization. This again had a lot to do about science, politics, and economics. The interplay between the different meanings ascribed to the term has come to be particularly notable in English, as opposed to any other western European languages, such that the extensive use of the term has

NSOU ? CC-SO-01 72 Classic Print & Process • Final Proof (Last) • 28-10-21 made this coinage almost international. The concept of "common sense" has deep philosophical roots which we shall explore before moving towards its in-depth analysis especially in its relation to sociology. 6.3 The Philosophical Roots of Common Sense. The early roots of common-sense date back to Socrates who, it is believed, made a suggestive indication of the existence of "common sense" while being engaged in friendly interaction with one of his students. In this discussion, Socrates looks for a proper definition of knowledge with a talented young mathematician called Theaetetus. The first and longest part of the dialogue is devoted to Theaetetus' first reply that knowledge is nothing but a perception. In order to show that perception alone cannot amount to knowledge, Plato gives an account of the senses. The aim of his account is to translate perception to the passive reception of basic sensible qualities such as for instance, white, salty, hot; by means of our five senses. This, in turn, results in the initiation of the active process in which the so-called 'common features' are understood. These are the features that characterize our varied basic sensible qualities, and they may include 'being', 'difference', 'sameness', 'likeness', and 'unlikeness'. Plato too insists that the soul engages in this active process by means of its own resources, without being helped by the senses and the bodily parts in which the senses live. Since our knowledge requires a ready understanding of the common features, knowledge can only be found in this activity. This is the activity in which the soul engages independently. In the context of Aristotle's psychology, the expression 'common sense' refers to a distinct perceptual capacity in which the five senses are integrated. It is called 'common' because it is shared by the five senses, and it is called a 'sense' because it is indeed a perceptual ability properly speaking. And because it is a perceptual ability, rather than a rational ability, it is shared by all animals, non-rational and rational alike. Obviously, what Aristotle calls the 'common sense' is very different from what we call 'common sense'. Aristotle Photo Credit:

https://commons.wikimedia.org/wiki/File:Aristotle_-_Altemps_-_Inv8575.jpg

NSOU ? CC-SO-01 73 It is a strange linguistic coincidence that these two very different notions have the same name. The Aristotelian expression $\acute{\alpha}\lambda\theta\acute{\iota}\nu\acute{\alpha}\nu\sigma\iota\varsigma$ is translated, quite literally, as *sensus communis* in Latin and as 'common sense' in English. Here the Latin *sensus* and the English 'sense' are used in their primary sense of a perceptual ability strictly speaking. But in our recent use of the expression 'common sense', the English word 'sense' has a deeper connotation which travels far beyond the zone of the perceptual abilities. This wider connotation echoes in the Latin word *sensus*, and those other modern European languages which became dominant over the Latin word—such as English, French, or Italian. These languages soon began borrowing the wider implications from the term *sensus communis* in Latin along with them. For instance, the Greek word $\acute{\alpha}\lambda\theta\acute{\iota}\nu\acute{\alpha}\nu\sigma\iota\varsigma$ or *Koini logiki* by contrast, does not permit this wider meaning. It is for this reason, that this Greek expression never refers to the same thing to which our corresponding English expression refers now. However, we are not saying that what we call 'common sense' is a modern invention. This is because many of the Latin classical writers, such as Cicero, Horace, and Seneca, used the expression *sensus communis* in a way quite similar to our notion of common sense (Gregoric:2007) . So undoubtedly these Latin classical writers can pretty well be taken as the early fathers of the notion of 'common sense'. Do you know ? Do you have any idea about these classical Latin writers we just spoke of ? You must know them since they are usually taken as the early founders of the notion of common sense. Marcus Tullius Cicero was a Roman statesman, lawyer and a philosopher who wrote extensively on rhetoric, orations, philosophy, and politics. He was considered one of Rome's greatest orators. Quintus Horatius Flaccus, on the other hand was known in the English-speaking world as Horace. He was the leading Roman lyric poet during the time of Augustus. Seneca, more famously known as the Younger, fully Lucius Annaeus Seneca and also known simply as Seneca, was a Roman Stoic philosopher, statesman, dramatist of Latin literature. Seneca was born in Corduba in Hispania, and raised in Rome, where he was trained in rhetoric and philosophy.

6.4 Changing Meanings of the Common Sense

Since the Age of Enlightenment, the term "common sense" has frequently changed its course and come to take on different moods and meanings at different stages. It had sometimes been used in a demeaning or pejorative sense while at times it appealed to positively, as a sense of authority. It can be negatively identified

NSOU ? CC-SO-01 74 Classic Print & Process • Final Proof (Last) • 28-10-21 with vulgar prejudice and blind superstition, it is often positively contrasted to them as a standard or benchmark for good taste and as the source of the most basic principles needed for science and logic. It was at the beginning of the eighteenth century that this old philosophical term first acquired its first modern English meaning. Common sense began to mean plain, simple and self-evident truths or conventional wit or wisdom that one needed. It came without sophistication for grasping complex or knotty concepts with the basic (common sense) intellectual capacities was easy and tenable. This transition began with Descartes's criticism of common sense, and what came to be known as the dispute between "rationalism" and "empiricism". In the opening line of one of his most popular books, *Discourse on Method 1* , Descartes established the most common modern meaning of common sense. He stated that everyone has a similar and sufficient amount of common sense (*bon sens*), but it is rarely used adequately. He said that Good Sense or Reason, is by nature equal in all the men; and that the diversity of our opinions, consequently, does not emerge from some being endowed with a larger share of Reason than others. This diversity arises because we conduct our thoughts along different ways, and do not concentrate our attention on the same objects. But Descartes used two different terms in his work, not only the Latin term "*sensus communis*", but at the same time, the French term *bon sens*, with which he opens his *Discourse on Method*. And this second concept survived much better. This work was written in French, and does not directly discuss the Aristotelian technical theory of perception. *Bon sens* is the equivalent of modern English "common sense" or "good sense". As the Aristotelian meaning of the Latin term began to be forgotten after Descartes, his discussion of *bon sens* gave a new way of defining *sensus communis* in various European languages (including Latin, even though Descartes himself did not translate *bon sens* as *sensus communis*, but treated them as two separate things). In this context, Thomas Paine's polemical pamphlet *Common Sense* (1776) has been described as the most influential political pamphlet of the 18th century, influencing both the American and French revolutions. However, common sense was slowly undergoing a change in its meaning René Descartes [https://commons.wikimedia.org/wiki/ File:Frans_Hals_-_Portret_van_ Ren%C3%A9_Descartes.jpg](https://commons.wikimedia.org/wiki/File:Frans_Hals_-_Portret_van_Ren%C3%A9_Descartes.jpg)

NSOU ? CC-SO-01 75 especially after Descartes gave a new meaning to it. Gradually, modern philosophy came to use the term common sense like Descartes, abandoning Aristotle's theory. Modern philosophers like John Locke, David Hume, George Berkeley and Vico agreed that common sense is entirely built up from our shared experience and shared interactions. It comes out from our innate emotions, and therefore it is indeed imperfect as a basis for attempting to know the truth or to make the best possible decision. Therefore, common sense was slowly losing the moral legitimization and moving towards everyday routine knowledge. 6.5 Sociology and Common Sense Till now we were looking at common sense from the lens of the philosophers, now let's wait for a while and see what sociology has to do with it. Sociology in contemporary India is seen as a loosely structured field of intellectual activity 2 . There are widespread disagreements about its aims, its nature and scope, its approach, methods, concepts as well as its very subject matter. Sociology it seems, is almost, every one's cup of tea. Therefore, sometimes sociology appears to us a little cloudy and misty. Part of the vagueness and uncertainty which is characteristic of the subject arises from the very fact that it touches the everyday experience of the ordinary person at so many points. As a result sociology often appears so close to common sense that there is an inevitable tendency to use the one in place of the other (Beteille:1996:2361). Though there is a tendency to equate sociology with common sense, it was never accepted by the sociologists. Sociology has a well-defined body of concepts, methods and data, no matter how loosely held together. In contrast to it, common sense knowledge of even the most acute and well-informed kind cannot make a firm footing. Common sense can never be taken as a substitute for sociology, not from any angle. There can be an innumerable number of distinctions between sociology and common sense. The very first distinction is that, sociological knowledge aims to be general if not universal, whereas common sense on the other hand is particular and localised. Educated, middle-class Bengalis, like other educated or uneducated people anywhere on the earth , presume that their common sense is common sense as such or the common sense of mankind. To make this distinction more prominent, sociologists have tried hard to bring out the subtle characteristics of sociology. An important contribution of sociology, therefore, has been to show that common sense is in fact highly variable which is subjected to the constraints of time and place, more specifically speaking, social constraints. When we claim that sociology is distinct from common sense, we are not suggesting

NSOU ? CC-SO-01 76 Classic Print & Process • Final Proof (Last) • 28-10-21 that it should seek deliberately to be mysterious and impenetrable. It is only because it is so difficult to detach oneself from common sense in the analysis of the human circumstances, and particularly in the study of our own society, professional sociologists often take recourse to tempting conceptual and verbal trickery. This tendency, Beteille thinks is an occupational hazard that must be kept under constant check 3 . An anthropologist as well as a sociologist who detailed us on the connections between sociology and common sense was definitely Nirmal Kumar Bose. 6.5.1 Nirmal Kumar Bose on Common Sense and Sociology N K Bose used to say that there are two kinds of scientists, those who make difficult things simple and those who make our simple things more complex. Bose definitely preferred the former over the latter. We must surely avoid the unnecessary complication of the simple through the display of our technical expertise. Moreover, we must also accept the fact that applying common sense is not always successful unless we use it with in-depth sociological understanding, for it only ends up making simple things complex. There is no competition between sociology and common sense. Neither does sociology try bypassing common sense. Sociological writing often tends to be crowded with needless use of heavy academic terms. Thus, sociology often tries avoiding two things. One, it avoids being submerged in the common sense of the scholar's own surroundings for this commonsensical world often has a bearing over the scholar. Two, avoiding a temptation to absorb oneself in a narrow and self-satisfied technical mastery which is often unconnected with the core substance of social enquiry. Sociologists had therefore shown their concern for the inter-penetration of sociological knowledge and common sense. Of all those who showed such concern, special emphasis must be made of Nirmal Kmar Bose, about whom we have read before. N.K Bose's contribution to the domain of Indian sociology had been in making a stark distinction between sociology and common sense. He discussed at length the common practices and rituals followed by the men found everywhere but he was careful to dispel the wrong notions surrounding them. In a way Bose definitely took a strong position in debunking the myths shrouding the hypothetical beliefs and ideas. Bose researched a lot to grab the real roots of the social problem and did not limit himself by just reaching at its superficial depth. He wanted to go far and this probably drove him to the core of the problem. This in-depth analysis helped him to do away with the common sensual interpretations which often mislead us away from the true nature of the social facts.

NSOU ? CC-SO-01 77 Andre Beteille in his seminal book *Sociology: Essays on approach and methods*, writes a chapter on sociology and common sense. It was written to honor Nirmal Kumar Bose who was endowed with robust common sense as well as a passionate belief in the value of scientific enquiry. It tries to place sociology as a particular branch of knowledge in the widest context of general ideas and beliefs. The point is not so much that sociology should set itself against common sense as that it should try to reach beyond it. Only a handful of individual sociologists have succeeded in changing the common sense of their time, but that, rather than success in a political cause, should be the aim of sociology as a discipline (Beteille:2002:9-10). Bose had gone a long way in trying to reach beyond the common perceptions held by men. It is true that he respected the common men and observed their lives from very close quarters. He also vividly described their lifestyles and scientifically explained them as clearly as possible to remove any kind of mystifications enveloping it. In this way he showed how common wisdom contributed to the appropriate designing of the society where everything falls in place in spite of the absence of technological fortification. Thereby he showed the strength of common sense knowledge in encouraging and boosting the basis of sociological theories. Bose for example, while discussing the significance of rice as a cultural trait deliberates on the cultural features that have gathered round the principal foodstuff of the province. He explained succinctly how various activities are channelized centering on the nucleus of rice and which though seemed irrational from outside were brimming with common rationale. Thus while deliberating on the sociology of rice as a cultural trait he went beyond the scope of common sense to draw a bridge between the two (Choudhuri:2018:319). This is what is actually expected from sociology. Sociological knowledge bridges the gap between common wisdom and sound acumen carved out of a disciplined practice of a craft which often common sense alone cannot explain.

6.6 Durkheim's Social Fact and Common Sense

Let us now see how common sense was conceptualized by yet another sociologist, who was taken as one of the precursors of sociology in the world. David Émile Durkheim was a renowned French sociologist who formally established the academic discipline of sociology and along with W. E. B. Du Bois, Karl Marx and Max Weber are commonly taken as the leading architects of modern social science. As the builders of our modern sociology, Emile Durkheim, Max Weber and others, considered the whole of human society in its diverse and changing forms as their core subject of study, even though they were aware of the peculiar characteristics of their own society.

NSOU ? CC-SO-01 78 Classic Print & Process • Final Proof (Last) • 28-10-21 Durkheim believed that the rigorously disciplined application of the sociological method would necessarily contribute much to our understanding of our own society. This understanding could be further deepened and broadened by drawing analytical comparisons between their societies and those of others. Durkheim was convinced that common sense understanding was not adequate to reach the deeper insight he wanted to gain. The understanding he sought required him to fashion new tools of enquiry and interpretation. The sociologist who definitely played a big role in demystifying sociological understanding from the illusion of understanding created by common sense was definitely Emile Durkheim. He argued tirelessly that the systematic analysis of a subject was not possible unless the researcher freed himself from his presumptions of it. These preconceptions often moulded by his own narrow limited encounters shape the common sensical understanding of the society he inhabits. What is dangerous about such understanding is that not only are they often wrong, but they sometimes do play a deterrent role in exploring the appropriately relevant social facts. At the beginning of his career, Durkheim gave a brilliant demonstration of the excellence of his objective approach over that of common sense. This came out through his masterpiece work on suicide. He argued that suicide was a social fact whose forms and patterns could not be understood by our common ideas of human psychology. It is Durkheim who made us aware of the idea of 'social facts' which are taken as pivotal facts behind the incidence of social happenings. It is very interesting that what were presumed to have been instigated by commonsensical understandings, were never the actual cause. Durkheim pointed the finger at commonsensical knowledge and took us to an objective and scientific understanding of social happenings. He attributed all commonsensical notions behind social occurrences as wrongful explanation. He instead led us to a more systematic and precise understanding of social experiences Emile Durkheim Picture Credit:
[https://commons.wikimedia.org/wiki/File: Durkheim-vignette-png-9.png](https://commons.wikimedia.org/wiki/File:Durkheim-vignette-png-9.png)

NSOU ? CC-SO-01 79 which were backed up by sufficient evidence and corroborations (Giddens:2008). Now that we have behind us Durkheim's pioneering study and the many others to which it gave rise, this perhaps appears to be a generalized understanding now without much hitches. However, when it first appeared, it was obviously a remarkable admission that social causes were behind the social happenings and not private or individual acts as common sense might lead us to believe. For instance, Durkheim chose to study suicide where proved his claim. Suicide is generally considered to be one of the most private and personal acts, a notion which he debunked. Durkheim believed that sociology had a big role to play while explaining such a seemingly individualistic act such as suicide. Sociology contributed in breaking myths created by common sense. As a sociologist, Durkheim was not bothered with studying why any particular individual committed suicide, which he happily left to the psychologists. Instead, Durkheim was more interested in explaining differing rate of suicide across the social groups. He felt that no amount of psychological or biological facts could explain why one group had a higher rate of suicide than did another. Further, he noted that while suicide rates were on the whole quite stable, they were often subjected to fluctuations due to the operation of various social and economic causes which he could identify. One of his notable findings was that suicide rates not only go up significantly after an economic crash but also after an economic boom. Durkheim had an important insight that strongly contradicted common sense (Beteille:2002). He, therefore, decided to systematically gather a large body of data from different parts of the world. Do you know? According to Emile Durkheim, the aspects of social life that shape our actions as individuals. Durkheim believed that social facts could be studied scientifically. 6.7 Max Weber's idea of Common Sense Maximilian Karl Emil Weber or Max Weber as he is commonly known (21 April 1864 – 14 June 1920) was a German sociologist, philosopher and political economist, who is taken today as one of the most important precursors of theoretical development of modern Western society. 4 As his ideas would profoundly impacted social theory as well as social research and methods, 5 Weber is often regarded as among the three pioneers of sociology, alongside Émile Durkheim and Karl Marx. Weber was primarily focussed on the question of objectivity and subjectivity 6 . He went on to distinguish between social action from social behavior strictly noting that social action must be explained through how individuals subjectively relate to

NSOU ? CC-SO-01 80 Classic Print & Process • Final Proof (Last) • 28-10-21 one another 7 , 8 . The study of social action through interpretive understanding was the basis of his methodology. For him, any explanation of human conduct must be based upon understanding the subjective meaning and purpose that individuals attach to his actions. He maintained that consequences of human action are mostly the intentions of the actors, and that sometimes they may even be diametrically opposed to one another (Beteille :2002). The dominant view across the theoretical domain until Weber's time showed that whatever be its impact, religion had served as a vital source of social stability. stability was essential for social well-being. Weber's investigative and systematic study showed that deep seated changes had been brought about in economic life by the breakthrough in religion. Weber asserted that neither the commitment to a value system nor the demands of material existence, but it was the tug of war between the two that acted as the true agent of change in society. Weber's assertion went against the commonsensical idea about religion in the society held so far. Do you know what social action is? The concept of social action, assumes that humans vary their actions according to social contexts and how it will affect other people. Say, when a potential reaction is not desirable, the action is modified accordingly. Action can mean either a basic action (one that has a meaning) or an advanced social action, which not only has a meaning but is directed at other actors and causes action (or, perhaps, inaction). [Sociology is] ... the science whose object is

87%

MATCHING BLOCK 64/372

W

to interpret the meaning of social action and thereby give a causal explanation of the way in which the action proceeds and the effects

which it produces. By 'action' in this definition is meant the human behavior when and to the extent that the agent or agents see it as subjectively meaningful ... the meaning to which we refer may be either (a) the meaning actually intended either by an individual agent on a particular historical occasion or by a number of agents on an approximate average in a given set of cases, or (b) the meaning attributed to the agent or agents, as types, in a pure type constructed in the abstract. In neither case is the 'meaning' to be thought of as somehow objectively 'correct' or 'true' by some metaphysical criterion. This is the difference between the empirical sciences of action, such as sociology and history, and any kind of a priori discipline, such as jurisprudence, logic, ethics, or aesthetics whose aim is to extract from their subject-matter 'correct' or 'valid' meaning 9 . Max Weber Picture Credit: [https:// commons.wikimedia.org/ wiki/File:MaxWeber.jpg](https://commons.wikimedia.org/wiki/File:MaxWeber.jpg)

NSOU ? CC-SO-01 81 After Weber explained his theories, it is easy to see in retrospect how different regions of the world evolved different kinds of political and economic systems. These were, in turn, grounded on historic, religious and cultural factors (Bakker:1999). However, in order to arrive at his theory, Weber had to study rigorously and meticulously centuries upon centuries of social conditions and patterns. In other words, to arrive at this sociological understanding of which factors were pivotal in determining political and economic structures of modern societies, Weber had to work rigorously. He had to look way beyond 'common sense' explanations of status quo as is expressed in mainstream sources of theories. It would be appropriate to say that the sociological understanding of the social structures as explicated by the Weberian method of studying society is much more rich and profound than the simplistic, 'common sense' versions of the socio-political event available to mainstream channels of information. Therefore, any day, a sociological study of any situation, properly informed by historical facts and empirical evidence, is more likely to lead to a better understanding than what is attained through common sense 10 .

6.8 Peter Berger and Thomas Luckman's *Everyday Life and Common Sense* In their 1966 classic study, *The Social Construction of Reality*, sociologists Peter Berger and Thomas Luckmann examined common-sense knowledge. Peter L. Berger (1929–2017) and Thomas Luckmann (1927– 2016) were international sociologists who made significant contributions to the sociology of knowledge, especially by the composition of their highly acclaimed book *The Social Construction of Reality* (1966/1967). Peter Ludwig Berger 11 (1929–2017) was an Austrian- born American sociologist and Protestant theologian. Berger soon became well-known for his work in the sociology of knowledge and played a major role in the development of social constructionism. On the other hand, Thomas Luckmann was an American-Austrian sociologist of basically German and Slovene origin who taught mainly in Germany. His contributions were important to studies in sociology of communication, sociology of knowledge, sociology of religion, and the philosophy of science. Peter Berger Thomas Luckmann Photo credit:<https://www.timetoast.com/timelines/historia-de-la-psicologia-social-e7726993-e3fc-4298-ba59-750c7ed6086c>

NSOU ? CC-SO-01 82 Classic Print & Process • Final Proof (Last) • 28-10-21 Their "new" sociology of knowledge that they try constructing takes as its starting point, the experience and actions of human beings. They believed that human activity does not take place only in an already given ordered world, it also produces and reproduces a "world of things" 12 . These are the things that individuals often take for granted as real. They emphasized that these 'obvious' facts of social reality may seem to differ among people across cultures, and even among different people within a cultural system. The task becomes an analysis of the processes by which individuals learn to perceive what they think is 'real'. Social constructivists often apply the ideas of Berger and Luckmann to the investigation of social phenomena, to show the ways in which members of a society come to know and simultaneously build up what is real. sociology of knowledge must first of all concern itself with what people 'know' as 'reality' in their everyday, non- or pre-theoretical lives (Giddens:2008). In other words, common-sense 'knowledge' rather than 'ideas' should be taken as the central focus for the sociology of knowledge. It is precisely this 'knowledge' that forms the fabric of meanings without which no society could ground on its own. The sociology of knowledge, therefore, must be engaged with the social construction of reality. Berger and Luckman in his book, *Social Construction of Reality* (Picture at the bottom. Photo credit: <http://bonniesbooks.blogspot.com/2009/09/fifteen-books-11.html>) maintain that sociology of knowledge must first of all concern itself with what people 'know' as 'reality' in their everyday, non- or pre- theoretical lives. In other words, common-sense 'knowledge' rather than 'ideas' must be the central focus for the sociology of knowledge. It is precisely this 'knowledge' that constitutes the fabric of meanings without which no society could actually exist 13 . The sociology of knowledge, therefore, must concern itself with the social construction of reality. Berger and Luckman owed their fundamental insight into the necessity for this redefinition to Alfred Schutz (Berger & Luckman:1966). Throughout his work 14 , both as philosopher and as sociologist, Schutz concentrated on the structure of the common-sense world of everyday life. Although he himself did not illustrate a sociology of knowledge, he clearly saw what this discipline should focus on. He presumed that all typification of common-sense thinking are themselves integral elements of the concrete historical socio-cultural world. It is within this world that they take things as taken for granted and- as socially approved. Their structure determines among other things the social distribution and pattern of knowledge. It also determines the relativity and relevance of that knowledge to the

NSOU ? CC-SO-01 83 concrete social environment of a concrete group in a particular historical situation. This world of everyday life and the knowledge it generates is not only taken for granted as reality by the ordinary members of society in the subjectively meaningful conduct of their lives. Alongside, this is a world that originates in their thoughts and actions, and is manufactured and maintained as real by these. Do you know? Alfred Schutz (1899–1959) was an Austrian philosopher. Schutz is gradually being recognized as one of the twentieth century's leading philosophers of social science 15 . He was thoroughly influenced by Max Weber's legacy of philosophical foundations. One of his major work was Phenomenology of the Social World. 16 6.9 Interweaving Sociology and Common sense Now that we have studied the various theoretical vantage points, we must have learnt how they both theorize and do sociology by negotiating with common sense. It is time now we quickly go through the subtle interweaving that there is between sociology and common sense. We can conclude by drawing upon the Andre Beteille made some distinctions between sociology and common sense. Let us look into these distinctions. Common sense is not only localised and regionalised but at the same time constricted by time, place, class, community, gender, and so on. It is also less responsive and keeps meandering from one way to another such that it loses its focus. It is less objective and more ambiguous because it fails to question its own origins and basic suppositions. Even if it does, it does not do so methodologically and systematically. As a result, it often ends up being a little messy and cloudy. As an intellectual discipline, sociology cannot be an offshoot of common sense less because sociology is much more precise and Objective and above all it does not suffer from the pitfalls that afflict common sense. However, that does not mean that it should turn its back on common sense. We cannot deny that our sociology is to an extent tinted by common sense which is very much a part of our social environment. True it is that even common sense in its turn is also influenced by sociology. Sociology as an intellectual discipline does not separate itself from common sense rather acts back upon it to contribute towards its growth and fulfillment. Common sense is based on a small range of experience of particular persons or groups in given places and times. Where it comes to such mundane matters as family, marriage, kinship, work and worship, people develop a tendency to believe that their conduct is the most reasonable one. They acquire a confidence in their

NSOU ? CC-SO-01 84 Classic Print & Process • Final Proof (Last) • 28-10-21 ways of thinking and working. They start believing that whatever they believe or practise must be the standard benchmark across societies. Other ways of acting in these regards strike them as peculiar and uncommon. Whenever sociological reasoning acts upon common sense, it functions to level both the utopian and the fatalistic overtones found in it. A dangerous tendency often grows in the common sense, that is it easily constructs imaginary social patterns which bear no similarity with the ground realities. It tends to show that in which there is no inequality, oppression, conflict or tension much against the given current scenario. Here common sense can easily be contrasted against comparative sociology for the latter helps in acquiring and maintaining a sense of right proportion. 6.10 Conclusion It is the distinct characteristic of sociology to deal with the similarities as well as the lurking differences among societies with both comparison as well as contrast. It is true, even historians have studied cross-sections of beliefs and practices at different societies over time. They have been doing this even longer than the sociologists. But their characteristic tendency has been to study this diversity in parts and parcels and not as a whole. It is only a few historians who practise comparative history whereas one has to do both comparison and contrast while doing sociology. Sociology not only engages itself with facts from the entire range of human societies, it at the same time observes and analyses them. The educated layman may find it difficult to master all the facts with which the sociologists have to deal. Instead what he often does is, select the method of apt illustration without maintaining any consistent rule of procedure for the selection and corresponding organization of facts (Beteille:2002). On the other hand, sociological practice has its own style of argument that scrutinizes facts before readily accepting them blindly. But it is not that we always maintain objective precision while doing sociology and sometimes do get carried away by hearsays and even by our own biases. It is important that we learn to handle our values and judgements with care lest we will fall prey to unreflected thoughts and faulty notions. 6.11 Summary We started with introducing you to the idea of common sense and how its meanings changed over time. Starting from Aristotle to the social constructionists, you must now have a fairly good idea of the range of meanings that the concept went through. Next, we showed how various sociologists tooled their own concepts to combat the meandering nature of common sense. They did this with their own

NSOU ? CC-SO-01 85 objective concepts that they designed with aptness. After having studied the theoretical vantage points it became easier for us to look into the absorption of common sense into sociology as well as look for its peculiar distinctions between the two. 6.12 Questions 1. Answer the following questions briefly: (5 marks) (a) How will you define common sense? (b) Who was Peter Berger? Name a major book he penned? (c) What is social fact? 2. Answer in detail: (10 marks) (a) Bring out the essential differences between sociology and common sense. (b) What is Verstehen? Explain. (c) What is social action? What is its relation with common sense? 6.13 Glossary Rationalism : In philosophy, rationalism is the epistemological view that "regards reason as the chief source and test of knowledge" or "any view appealing to reason as a source of knowledge or justification". Empiricism : In philosophy, empiricism is a theory that states that knowledge comes only or primarily from sensory experience. It is one of several views of epistemology, along with rationalism and skepticism. Empiricism emphasises the role of empirical evidence in the formation of ideas, rather than innate ideas or traditions. Verstehen : Verstehen, in the context of German philosophy and social sciences in general, has been used since the late 19th century – in English as in German – with the particular sense of the "interpretive or participatory" examination of social phenomena. Social Construction : Social constructionism is a theory of knowledge in sociology and communication theory that examines the development of jointly- constructed understandings of the world that form the basis for shared assumptions about reality.

NSOU ? CC-SO-01 90 7.2 Introduction Applied Sociology is one form of Sociology. The discipline of sociology, in general, can be defined as the scientific study of society including critical analysis of all types of social connections and social structures. It also includes the study of social institutions like the media, economy, education, family, etc. that shape social action. Sociology helps us understand human behavior in a broader context, with reference to power relationship, social change, patterns of social construction, etc. According to Dr. Zuleyka Zevallos, sociology is often perceived as an academic profession, but outside academic premises it can be used extensively to enhance personal and professional development. In such spheres applied sociology comes in handy to bring in positive social changes through active intervention. In applied sociology we see the use of sociological theory, methods, skills and research to handle particular issues and problems in real-life settings; that means, it puts sociology in practice within a multidisciplinary setting. Objective and Purpose of the Unit: The Main objective of this unit is to trace the origin and growth of this newly emerged branch of sociology. So, it discusses the meaning and definition of applied sociology, its history and subject matter, its relationship with general or basic sociology and the recent trends in this area of application. Sociology, as a modern social science discipline, originated with focus on both acquiring of knowledge and on aspects of application. Applied sociology focuses primarily on decision-making and development. In the

61%

MATCHING BLOCK 67/372

W

continuum between pure research and pure practice, applied sociology occupies a middle position. The purpose of this

unit is to give the students some clear idea about the nature and scope of this specialized branch of sociology. 7.3 What is Applied Sociology? Applied sociology is sociology in use. It originated in the USA in the first decade of the twentieth century. The term applied sociology is used to describe practices of using sociological theories and methods outside of academic settings with the aim to bring in positive social changes through active intervention. It is policy-oriented, action-driven and it intends to train people and groups about the ways of attaining better or more viable social forms to adjust with the changing external and internal conditions. As it has been said earlier, applied sociology occupies a middle position in between pure research and pure practice because it uses theoretical explanations, develops causal models for predicting the likely impact of different policies and programs. To define applied sociology Lester F. Ward had mentioned in 1903 that it was the means and methods for the artificial improvement of social conditions by

NSOU ? CC-SO-01 91 man and society as conscious and intelligent agents. The oldest and most general name of those means and methods of social change is applied sociology. According to Harry Perlstad, applied sociology uses sociological knowledge and research skills to gain empirical knowledge to inform policymakers, clients and common people about various social problems, issues, processes, and conditions to help them make informed choices and to improve the quality of life. Broadly speaking, applied sociology involves evaluation research, needs assessment, market research, social indicators, and demographics. It also includes sociological research in specialized fields like medicine, mental health, complex organizations, work, education, military and the likes. Such research will produce descriptions, analyses, and findings that can be translated into ideas, lessons and programs to be used by action groups and government. Applied sociologists use sociological theory, methods and skills to collect and analyze data and to understand and resolve social problems. 7.4 Difference between Applied Sociology and Basic Sociology The discipline of sociology has several offshoots of its own; basic and applied are only two of them. Basic sociology or professional sociology is primarily concerned with research on social life, social change and human behavior. It puts emphasis on research for production of knowledge and considers empirical insight as an end in itself. Basic sociology is also referred to as 'academic' sociology as it advocates the pursuit of knowledge as a goal in and of itself without any concern to find any practical use of them in the larger world. On the other hand, applied sociology uses the findings of basic sociology to prepare and implement action-oriented plans for development. Due to its concern with using sociological knowledge and research skill to resolve social problems it is also known as pragmatic or practical sociology for the purpose of understanding and resolving social problems applied sociologists work with a variety of government and non-government organizations. Instead of production of pure knowledge, applied sociologists employ sociological tools and insights to help people, communities, groups, organizations and institutions or social structures in general, for their overall improvement. Applied Sociology has been greatly influenced by the Chicago School sociologists and their practical approach and as a practical form of sociology it requires theorists and researchers to combine their academic work with material realities and practical concerns beyond academic settings. Both basic or academic sociology and applied sociology remain research based and both follow the same research methods. But applied sociologists have developed a special set of techniques for observations and making useful recommendations to

NSOU ? CC-SO-01 92 their clients. Moreover, applied sociologists care less for publishing in academic journals; so, they prefer to present their work before specialized non-academic audience. Academics rely more on peer-evaluation, publish papers in academic journals; but, applied sociologists are judged by their sponsors on the basis of their clients' satisfaction. Freeman and Rossi argue that applied sociologists are constrained by time and demands of their work output; but academic sociologists have more freedom to choose their research topic. Then, academic sociologists, usually, have a longtime frame for developing their scholarship. But applied sociologists aspire for scholarship only for getting usable results. On many occasions, they may experience a swift turnover in their applied research. Applied sociologists remain concerned with the external validity of their conclusions in direct relations to their clients' necessities; on the other hand, academic sociologists are concerned with their contribution to the academic literature as well as by reviews from their fellow academicians. Finally, applied sociologists judge the success of their work on the basis of the extent of the adoption of their suggestions and solutions by their clients, and their ability to influence the process of their clients' decision-making. But the conclusions drawn by the academic sociologists do not always lead to any specific actions. All these clearly indicate that there are several points of difference between the two branches of sociology; but it is also true that these differences are not absolute.

7.5 Purpose of Applied Sociology

Applied sociology has a very wide scope as it includes many important issues within its domain to put sociology in practice. The main task of applied sociology is to use sociological theory, methods, skills and research for resolving particular issues in real-world settings.

- Therefore, a) It evaluates programs undertaken for bettering them in the interest of the clients or users.
- While working with a hospital or community health center it strives to improve access to health service for illiterate or semi-literate people.
- It designs surveys and collects data to measure public opinion; creates profiles for various populations like ethnic and other groups, measures changes in social indicators like fertility, cohabitation, poverty, educational achievements, racism, happiness etc.

NSOU ? CC-SO-01 93

- d) During or after any crisis applied sociologists study the social impact of emergency communications for the betterment of communication procedure in future.
- Applied sociologists work with community organizations to establish sound evidence-based program for backward youths.
- They also conduct participatory action research in association with a community to decide what kind of economic development would suit that community.
- Applied sociology tries to understand and resolve group and organizational issues within an institute.
- It also works to ensure equity by initiating creation of organizational and public policy. As applied sociology is interdisciplinary in nature, it attracts people from various related disciplines like urban planning, community development, communications, criminology, social work, women's studies, Gender studies, critical race studies, indigenous studies, religion, demography, anthropology and many others. Both independent researchers and formal organizations can join the field of applied sociological studies. At present, in the USA there are innumerable organizations of various sizes, funded by either public or private agencies, engaged in research to develop socio-engineering projects, management decision systems and practical recommendations with help from variously qualified researchers, including scientists. Applied sociology has earned so much popularity among sociologists that since the 1990s about 60% of them pursue academic sociology, while about 40% of them do applied sociology. Applied sociology training courses use field studies, independent studies, books, films, role games, computer, audiotapes, self-study, oral presentations, television demonstrations of courses, modules, programming, textbooks, examinations, etc. Knowledge accumulated from all these sources are used outside university settings to provide the clients with a deeper understanding of some specific areas of social life. The main clients of applied sociologists are private business organizations, government agencies and non-profit voluntary organizations.

7.6 Origin and growth of Applied Sociology (1850–1920)

Sociology originated as a discipline with an applied and public focus. Auguste Comte, the father of sociology had divided it into social statics and social dynamics, that is, the study of social order and the study of human progress and evolution respectively. Comte envisioned those sociologists would impart scientific knowledge

NSOU ? CC-SO-01 94 and social advice in every aspect of social life. Karl Marx, too, wanted to understand the social ills of his time for improving the conditions of the socially disadvantaged class. Applied and public sociology emerged and developed out of such advocacy for improving existing social conditions. When sociology reached the shores of America, its emphasis was on sociological practice for social improvement because America, then, was suffering from problems of rapidly urbanizing society. To handle the problems associated with urbanization, sociologists in America developed a scientific approach for studying and resolving the issues like race relations, poverty, immigration, and urban development. Lester F. Ward (1841-1913) was the first thinker who introduced the term applied sociology into the discipline with his work *Dynamic Sociology or Applied Social Science* was published in 1883. Ward refuted the arguments of Spencer and Sumner in support of Laissez-faire individualism and lent his support for assisted welfare of the people. Ward was a 'meliorist' who believed that by educating the government and the people much could be accomplished. Ward was the first President of American Sociological Association (1865) and used the term 'applied sociology' for the first time in 1896-97. By the early 1890s, he came to know that several European sociologists were using the term 'pure sociology'; and in 1897 he used the terms pure and applied sociology in the titles of two summer school courses in 1897. Then in 1903 he published *Pure Sociology* and in 1906 *Applied Sociology*. In the USA, there was an alliance between social reform and early sociology; out of that alliance emerged the social survey movement. At that time, several women reformers and activists like Jane Addams, Florence Kelley and several others were convinced that documentation of and publicizing the inhuman sufferings of the poor would surely bring in effective social reform processes. In 1892 and 1893, Kelley, on the initiative of a number of government agencies, had conducted surveys on Chicago garment industry and door to door survey in the Hull House district of Chicago to assess the extent of poverty and slums in the urban areas. Pauline Young has described the surveys and from her account we can see the range of topics had covered a very wide scope like wages, housing conditions, social relations in the family, etc. Kelley also prepared maps showing the nationality, wages and employment history of each resident. In 1912, a Department of Surveys and Information was established by the Russel Sage Foundation and by 1928, this department was able to review more than two thousand social surveys, some national level and others local level surveys. Since the beginning of the twentieth century, sociology was being applied in social welfare and social policy but also in industry. By the end of the World War I, several sociologists had appeared in the scenario, some with their experiences in social-survey movement and some with trainings in formal academic sociology.

NSOU ? CC-SO-01 95 7.6.1. The Second Phase (1920 – 1940) This phase is less well documented than the first one; but its beginning can be traced at the time of creation of Social Science Research Council (SSRC) in 1923 in New York. It established a committee on methods; the committee was created to identify the distinct characteristics of the social sciences so that they could be differentiated with and mutually related to each other. The history of applied sociology in this post—World War I period can be traced in Stuart Rice's book *Methods in Social Sciences* (1931). The book contain 52 contributions from as many writers to reveal the methods used by the social scientists. The central focus of the book was on methodology, temporal sequences, relations between measured and unmeasured factors, definition of objects, establishment of scales, etc. In 1932, the SSRC started a new wave of methodological concerns with Thomas and Znaniecki's *The Polish Peasant* and its review by Herbert Blumer. In this essay the study was based on the diaries and letters. Two other SSRC bulletins put their focus on the value of using personal documents or qualitative material like detailed open-ended interviews. Side by side of this qualitative procedures, a new type of quantitative study began to be popular. Previously most of the quantitative techniques were borrowed from England; for example, the sampling technique used in Booth's social survey. In the USA this techniques were used in market research, consumer surveys, opinion surveys on politics and public issues, techniques of measurements, etc. Tests, classifications, public opinion research, Gallup poll, etc. started to enter into social science researches. The technical sophistication of these research methods raised the academic status of the social scientists and separated their professional domain from those of the reformers. Throughout the 1920s the agencies of the US government had sought help from the sociologists and social researchers to look into the burning issues of the day. Sociologist Ogburn, as the President of the ASS in 1929 wanted to ensure applied research to be based on scientific methods and not at all on ethics, religion, journalism and propaganda. He encouraged sociologists to collect whatever data they could lay their hands on regarding all sorts of social issues and institutions. By 1932, sociometric system or sociometry was developed by J.L. Moreno. Ogburn made a distinction between sociologists as research scientists and social engineers, who are not scientists but apply reliable scientific procedures and more or less exact knowledge for reorganization and development of the existing social conditions. The term 'social engineering' means the applied research activities for using in planning and for dealing with the real world. However, during the socialist regime of Stalin in the former USSR, the term 'social engineering' earned notoriety and disrepute.

NSOU ? CC-SO-01 96 In the middle of the 1930s a debate over the relationship between academic sociology and applied sociology raged within the American Sociological Society; while stalwarts like Robert Maclver, Pitrim Sorokin, Maurice Parmelee and many others were of the view that sociologists should engage themselves with sociological research, writing and teaching, others held the view that sociology should be concerned with social reconstruction. In 1934, the ASA's Scope of Research Committee recommended a closer connection of sociologists with the US government's work in social planning and within two years, in 1936, the need for promotion of professional, not disciplinary, interests of sociologists was highlighted. But the ASA did not pay any heed to that recommendation, and academics preferred a narrow disciplinary approach and the reformers joined various administrative positions in new deal agencies created under the Roosevelt government.

7.6.2 The Third Phase: Federal Funding For Applied Sociology (1940–1980) World War II broke out in 1939; by then social research became overwhelmingly associated with governmental activities. Applied sociology received substantial support first from the Second World War and then from the War on Poverty. Research and observations collected in natural settings for applied purposes had generated new knowledge and contributed to sociological theories and concepts. To assess the spirit of that period, in 1980, Peter Rossi had commented in his ASA Presidential address that a good number of client-initiated applied – work would be considered as basic research in future in sociological literature. During the war time the US War Department, too, created a division of research and information. That division acted with assistance from more than one hundred sociologists and had conducted over 200 surveys with soldiers during the war time. They used all the available techniques of social science research such as content analysis, sampling surveys, detailed interviews, laboratory experiments, group dynamics, etc. Such applied research efforts had made an impact on sociological theory and methods. In the fall of 1941 the Office of War Information (OWI) At the initiative of that office Henry Field, Hadley Cantril, Paul Lazarsfeld and Samuel Stouffer together established the National Opinion Research Center (NORC) at the University of Denver to conduct civilian surveys as simple fact- finding measures; but it also conducted some path –breaking surveys on first national measurement of racial attitudes. The convergence of sociological research and pursuit of knowledge on the one hand, and problems of governmental and private organizations on the other became a permanent affair in the post-war America. This had already begun to happen in the pre-WW II period under the 'action research' initiative of Kurt Lewin, an eminent

NSOU ? CC-SO-01 97 German psychologist who migrated to the USA . He studied the role of the group in determining individual attitudes and decisions. Lewin used the term 'action research' and wanted to help in the solution of social problems with the results of his research. Thus he was instrumental in reducing the gap between social science knowledge and the use of that knowledge. The formal recognition of applied sociology came in 1948 at a conference held by the Social Science Research Council. According to Rossi, applied sociology has witnessed phenomenal popularity from 1960 to 1980. Dentler has estimated that from 1960 to 1975 about 2100 social research and development firms were established in America. Several specialized applied social research centers were also created. A number of American government departments had commissioned skilled researchers to prepare reports on the state of affairs in the society to enable the government to take appropriate decisions. Rossi, in 1980, has pointed out that applied research may be used in policy formation.

7.6.3. Modern Trends in Applied Sociology Professionalism and Training: 1980 – To present: The period between 1950 – 1980 has witnessed an increase in the number of people with Masters and doctoral degrees in sociology though vacancies in teaching positions were few and far between. So, a good number of new sociologists joined jobs in professional schools and research units in various government and non-government organizations. The first graduate program in applied sociology was started at Kent State University in the late 1960s and in 1978 the Society for Applied Sociology (SAS) was established. In 1980 and 1981 Peter Rossi and W. F. Whyte respectively became the presidents of the ASA, and academic and applied sociologies came closer. In 1989 ASA started a journal, The Sociological Practice Review to provide a common platform for applied, clinical and practical sociologists though it could not survive for long. In 1994, SAS prepared a code of ethics for Applied Sociologists. Applied research, is presently actively engaged with sociologists, psychologists, economists, and political scientists. Today in the USA there are innumerable big and small, public and private agencies are involved in research in socio-engineering projects, management-decision systems and practical recommendations. Since the 1990s the number of academic sociologists in America is decreasing while the number of applied sociologists is increasing. Courses in applied sociology are also becoming increasingly popular in American Universities.

7.7 Forms of Applied Sociology The keystone of Applied Sociology is research. Therefore, it not only shares the principles of scientific methods with the basic sociology, but also has developed

NSOU ? CC-SO-01 98 its own techniques for making observations and recommendations. These applied sociological techniques include program evaluation, needs assessment, cost-benefit Analysis and Social Indicator Development. Let us discuss these techniques one by one. 7.7.1 Program Evaluation Program evaluation is a very common technique practiced in applied sociology. Program evaluation refers to the application of sociological methods like surveys, observational techniques, statistical analysis of records, interviews, etc. to ascertain the status of a particular program evaluation, that is, to understand whether a social program or practice can meet its goals. Both business organizations and non-profit organizations develop programs to suit their needs and promote their services; therefore it is important to know whether such programs fulfill their purpose . It becomes the duty of the applied sociologists to assess whether certain program is appropriate for a given task, efficient enough to produce the targeted results, and / or is useful within a given context in relation to specific audiences. Program evaluation has two primary forms; one is summative and the other is formative. Summative evaluation seeks to understand whether or not a given program serves its purpose. This requires defining and measuring a specific outcome and to do all these sociologists need to (a)examine the probable outcome of the program (outcome variable) either before its initiation or when it is necessary; and (b) establish the outcome variable in the midst of the program operation. In both the cases sociologists apply quantitative or observational methods to measure changes in the outcome of interests over a given period of time. If the changes fulfill the expectations of the outcome, then the program is satisfactory. The next task of the sociologists, then, is to determine how well it worked and suggest ways to make it work better. If, on the contrary, there are no changes in the expected outcome or the outcomes do not match expectations, then the programs should be amended or abandoned altogether. The summative evaluation methods depend purely on the skill to assess whether organizational programs like procedures, activities, marketing campaign, interventions etc. work or not. If a program does not work according to expectations, then sociologists are given the task of doing formative program evaluations or analyses conducted for ascertaining new programs that would serve the purposes of the organization in a better way. Thus, the evaluation studies are used to 'form' new programs. While working with clients a sociologist may gauge the needs of the organization with the help of focus groups and surveys, the already existing programs in use by the organization, the budget sanctioned for development and implementation of the

NSOU ? CC-SO-01 99 program and the problems detected in the previous practices. By comparing and contrasting the existing elements in the organization, sociologists will be able to prepare most fitting programs and practices for the organization. Program evaluation is the most widely used technique in applied research. In the last fifty years many social programs and practices designed for eradication of several social problems have been evaluated for their effectiveness; such evaluation is specially needed for government –funded programs and practices for development. Thus, program evaluation has emerged as an important career option for sociologists. 7.7.2 Needs Assessment Needs assessment research is aimed at collection of data for determining how many people in a community need particular services, or products or facilities for a period of time. While providing facilities for the people of an area or for a period of time periodic assessment of need is essential for continuing the service and/ or for changing the nature of service. For example, a needs assessment research question may ask: How many BPL card holders are there in the locality? 7.7.3 Social Impact Assessment This refers to the estimation of the likely consequences of the proposed programs on the target groups, individuals, neighborhoods, communities, regions and other social entities. An example of Social Impact Assessment may include a question like – Does an increase in the number of BPL cardholders would create additional facilities for the people of a locality? 7.7.4 Social Indicator Development Social indicators are the scales or quantitative measures of important social phenomena like trafficking or drug addiction. Social indicator development aims at providing useful measures for such phenomena. For example, if there is a sudden rise in the rate of trafficking in a state, that is useful information. At the same time, it is also useful to know the ratio of the number of persons trafficked in relation to the total number of persons in a state. 7.7.5 Cost-Benefit Analysis Cost-Benefit analysis quantitatively compares the cost and benefit of a program or practice to assess whether the program should be altered or abandoned. For example, a cost –benefit analysis may investigate whether there is a less expensive way to combat the problem of human trafficking.

NSOU ? CC-SO-01 100 7.8 Variations of Applied Sociological Practices Joseph R. DeMartini suggests that applied sociology can be of two variations; one that uses basic empirical methods for collecting information to take informed decisions like social policy formation. In doing this, sociologists directly work either within government agencies or with private organizations. While working for government or private organizations applied sociologists employ theories and concepts along with application of sociological practices. In the other, applied sociologists use their sociological knowledge to help their clients understand an issue (any issue like demographic changes, causes of crime, shifts in social movements, etc.) in a much better way. To explain the two variations in a better way DeMartini has used the example of social policy. In the first case, where methods are given more importance, applied sociological research techniques are used for creating new social policies. But in the other case, where theories and concepts have greater relevance to the clients, applied sociological knowledge is employed to evaluate existing social policies. DeMartini has admitted that these two variations are not earmarked in two water-tight compartments, but they run along a continuum in between the two. Both theories and practices are used in tandem with one another, but some job may give more importance to one than the other. 7.9 Conclusion / Summary Sociology emerged in Europe as a theoretical tool for understanding the nuances of social life. But when it reached the American shore it became an instrument of social improvement. So parallel to academic sociology, in the writings of some American sociologists and scholars from other disciplines, emerged the urge to resolve the problems that were troubling the American social life. To satisfy that urge a number of academic and non-academic persons and organizations started to apply sociology in practice in the early years of the last century though its intellectual roots can be traced in 1883 in

the publication of Lester Ward's *Dynamic Sociology: or Applied Social Science*.

In due course of time applied sociology became the point of convergence for disciplines like sociology, urban planning, community development, communications, criminology, social work, women's studies, gender studies, critical race studies, religion, population studies or demography, anthropology and many others. Applied sociologists are usually based in various locations like the governments, the private sector, community organizations, international agencies, academic institutions, and many others. Independent researchers associated with any of these fields have also shown interests in applied sociology and it has blossomed in every area of sociological endeavor. In this area of sociology theory and methods

NSOU ? CC-SO-01 101 ,both, are driven by problems and when existing theories fail to explain problems, new assumptions are given shape. 7.10 Questions 1. Answer in Brief. 5 Marks (a) What is applied sociology? (b) What is meant by basic and applied sociology? (c) How did applied sociology emerge? (d) How do applied sociologists work? (e) What is Program Evaluation? (f) What is Needs Assessment? (g) Discuss, in brief, the modern trends in applied sociology. 2. Answer in Detail. 10 Marks (a) Discuss, in detail, the origin and growth of applied sociology from 1850 to 1940. (b) Examine the growth of applied sociology from the 1940s to the recent years. (c) Discuss the different forms of applied sociology. (d) Critically examine the differences between applied sociology and academic sociology. 7.11 Suggested Readings Rice, Stuart.:1931. *Methods in Social Science*. Chicago: Chicago University Press. Unit 8 Relationship between Sociology and Anthropology Structure 8.1 Objectives 8.2 Introduction 8.2.1 Anthropology : A Social Science Discipline 8.2.1 Social Anthropology : A Branch of Anthropology 8.3 Relationship between Sociology and Anthropology 8.3.1 Similarities between the two 8.3.2 Differences between the two 8.4 Sociology and Anthropology in India 8.5 Summary 8.6 Questions 8.7 Suggested Readings 8.1 Objectives To help students understand the following things: ? The unit will help the students: ? To learn about the distinct identities of the two disciplines; ? To understand their similarities; ? To understand their differences; ? To know how close they are to be known as 'twin disciplines'; ? How anthropology/social anthropology has nurtured sociology in India. 8.2 Introduction Sociology and anthropology both are important branches of social science. Though they have their own distinct identities, both have many things in common. As branches of social science these two are comparatively modern in origin, the subject-matter of both the disciplines cover similar areas of interest like aspects

NSOU ? CC-SO-01 104 of human society, but each of them analyse those areas from different perspectives. Due to the similarity in their subject matters sociology and anthropology are viewed as very close; so much so, that in many universities of the west sociology and social anthropology, a branch of anthropology, are taught under the same department. Anthropology studies 'anthropos' or man in general; but it focuses more on primitive man, his life, physical growth and changes, the culture of primitive communities including language, religion and rituals etc.; whereas sociology studies society, groups, associations, institutions, various social processes, language, culture and rituals of modern man. Even though the two academic disciplines appear so similar, they have their own independent and distinct paths of growth, different types of problem to sort out and different research methods to pursue. Therefore, it is quite interesting to compare these two disciplines and to examine their separate areas of study for a clear understanding of the relationship they share. For this, we need to start with a brief discussion of the scope and subject-matter of anthropology. 8.2.1 Anthropology : A Social Science Discipline Anthropology, as it has already been mentioned, is the study of man, his origin and bio-cultural evolution in different phases of civilisation and his society, evolution of beliefs, social-religious customs and rituals. The discipline has got its name 'anthropology' from a combination of two Greek terms – 'anthropos' meaning human and 'logos' meaning discourse or science. Thus anthropology stands for the science or discourse of human beings. Famous Greek scholar Aristotle first coined and used the term 'anthropologist' to mean 'the gossip who talks about himself'. (Majumdar & Madan.1956) a) Definitions Anthropology has been defined in various ways to identify its different aspects. For example, the Concise Oxford Dictionary defines it as 'the study of mankind especially of its societies and customs; study of structure and evolution of man as an animal'. The Merriam-Webster dictionary has given the definition of anthropology as the science of human beings. It further defines it as the study of human beings and their ancestors through time and space and in relation to physical character, environmental and social relations, and culture. According to anthropologist Kroeber, "Anthropology is the science of groups of men and their behavior and production." In the opinion of Herskovits, "Anthropology may be defined as the measurement

NSOU ? CC-SO-01 105 of human beings." Jacobs and Stern define it as the scientific study of the physical, social and cultural development and behavior of human beings since their appearance on earth. From these definitions it becomes quite clear that anthropology is not concerned with any single or particular individual, but with men in groups and races or ethnic communities and their activities. Anthropology has emerged much later than many other social sciences, it has progressed well and, therefore, has gone ahead of many of them. Sociology has been immensely enriched by anthropological studies and research methods; anthropology, too, has borrowed analytical methods from sociology. 8.2.2 b) Divisions of Anthropology: - Social Anthropology: A Branch of Anthropology As anthropology studies both the physical and cultural aspects of man, it has earmarked two distinct areas of study; one is Organic or Physical Anthropology and the other is Social or Cultural Anthropology. These two broad divisions have been further divided into several other areas of analysis. Anthropologists like Piddington believe that social anthropology is a sub-division of cultural anthropology. It studies the working of simpler, pre-literate and pre-urban cultures from a functionalist point of view. Ancient Greek and Roman thinkers like Socrates, Plato, Aristotle, Hippocrates, Herodotus and many other pioneer social thinkers expressed their humanistic interests in man's affairs. But their postulates were more in the line of philosophy than social scientific. As an independent discipline anthropology had originated only in the nineteenth century. Though there were traces of some early thoughts on several sub-disciplines of the subject, real professional interests started to emerge in the nineteenth century only when European explorers, seafarers and traders came into close contacts with unknown (to them) people and their cultures. Charles Darwin's landmark book Origin of Species had far reaching influences on the emergence of new disciplines like zoology, anatomy, physiology, palaeontology, archeology and geology. Scholars like Herbert Spencer, Morgan and Tylor had come to believe that evolution did not limit itself to the physical aspects of mankind only, but also extended to cultural life. Out of this belief the discipline of anthropology was born in the year 1859. Soon after its birth it earned huge popularity throughout Europe where it is still known by its multiple names like anthropology, ethnology, prehistory and linguistics to connote the discipline in its entirety. The discipline of anthropology or the science of man and his work has a very wide scope to include physical anthropology, prehistoric archeology, cultural anthropology, ethnology, linguistics, and symbology (study of symbols), genetics,

NSOU ? CC-SO-01 106 thought and art of primitive man, economic anthropology, social anthropology, etc. and mostly belong to the science faculty of universities, whereas sociology belongs to the arts faculty. Through its many branches anthropology gives us an understanding of man and his life in society, past and present and also to appreciate his limitless physical and cultural variety. With scientific study of humanity and human society it has emerged as a leading social science discipline; however, it also builds upon knowledge from natural sciences. Therefore, when we seek to find any similarity or close proximity between sociology and anthropology, we should select the part of social (cultural) anthropology only and exclude other areas from comparison.

8.3 Relationship between Sociology and Anthro- pology Both sociology and anthropology are comparatively young branches of modern social science; both cover wide number of subjects within their scopes . Most importantly, both of them are very close to each other because of the similarities in their subject matters. For this reason, it is quite difficult to differentiate between the scope, subject-matter and objectives of these two disciplines. T. B. Bottomore has opined that in spite of difference in origin, these two have become almost indistinguishable in character. The history of their relations prove that at the initial stage these two remained very close, then came a period of great divergence , and then again a state of convergence brought them together. To support his statement Bottomore has cited the writings of many famous scholars like Spencer, Tylor, and Westermarck. E. A. Hoebel argues in his book, *The Law of Primitive Man* (2006, Harvard Univ. Press), that in their broadest sense sociology and social anthropology are one and the same. Anthropologist Kroeber considers sociology and anthropology as twin sisters. We should discuss the relations between the two in this light. A very important task of sociology is to find out the link or continuity between the past and present forms of human society and to compare them for better understanding of the state of affairs. For this, sociologists collect information from other sources of knowledge like history and anthropology – both explain the march of civilization from the primitive age to the modern period. As sociologists often have to relate the contemporary society to its past forms they have to depend on the works of anthropologists to a large extent; this makes sociology indebted to anthropology and anthropologists in general. European and American sociologists ,in the recent years, are increasingly using anthropology's research methods and observations in their own areas of study. The focus of anthropology's analysis is undoubtedly Man; sociology's main area of interest is society created by men. Thus NSOU ? CC-SO-01 107 sociology and anthropology enjoy a close relationship and mutual support. According to Vidyabhushan and Sachdev, (2014.*An Introduction to Sociology*. Kitab Mahal) sociology greatly depends on the material supplied by anthropology and

100%

MATCHING BLOCK 70/372

W

the historical part of sociology is identical with cultural anthropology.

Thus anthropology has contributed substantially to the study of sociology. They have further stated that the research done by Malinowski has proved quite valuable to sociology. But this dependence is never one sided because anthropology is also indebted to sociology. Many of sociology's concepts and ideas have benefitted anthropologists and their research. For example, the functionalist approach proposed by Durkheim was adopted in anthropology by Radcliffe-Brown and Malinowski. Morgan and many others have built their ideas of primitive egalitarian system of society with help from the sociological analysis of property system in modern societies. As both the disciplines focus on the common subject of man and his group, anthropology has to depend on sociology in many ways.

8.3.1 Similarities between the two Anthropology, like sociology, is a general science; to many, it is the broadest of all the social sciences. Socio-cultural anthropology or more popularly known as social anthropology – a branch of the general science of anthropology- has come the closest to sociology. The disciplines share concepts like cultural area, cultural traits, cultural lag, family, kinship, marriage, religion and private property. Participant observation, a very popular and common research method adopted by anthropologists has also become valuable in sociological research. As a discipline the two are so closely related that they often become indistinguishable. In the past, these two disciplines used to maintain their well designated areas of study, like modern society for sociology and primitive or pre-literate, pre-industrialised society for anthropology. But, over the years the line of distinction has almost disappeared and at present sociologists do not feel shy to examine tribal society or anthropologists to look into various aspects of modern society. Both the disciplines are growing fast and in many universities sociology and anthropology are taught under the same department. While anthropology studies human behavior at the micro-level of an individual as a part of the larger culture, sociology, on the other hand, looks at the bigger picture of society taken as a whole. At present there does not exist any distinction of subject matter and the line between sociology and social –cultural anthropology is neither firm, nor fixed.

NSOU ? CC-SO-01 108 8.3.2 Differences between Sociology and Anthropology In spite of many similarities and close interactions between the two disciplines, we cannot deny that there exist a good number of differences between them. The reasons behind these differences are many. a) As Bottomore has observed, the initial intimacy of the two waned after the adoption of functional approach in anthropology and the primary reason behind the differences is related to the differences in their objects of study. Sociology studies the modern, advanced and complex societies ,while anthropology concerns itself with the simple, pre-industrial,primitive or pre- literate societies. b) Secondly, the scopes of the two disciplines are also different. Anthropologists engage themselves in the general analysis and observations on a specific society. In social anthropology, particular aspects of culture and civilizations are examined with reference to the community or country as a whole, for example, Melanesia, Meghalaya, or Nagaland. On the contrary, sociologists today are more interested in particular social institution like family, marriage ,etc. or processes like social change, social mobility or problems like divorce or crime trends in a certain society. c) Sociology and anthropology both have adopted different research methods. Anthropologists generally use methods of direct examination and participant observation; they may employ data from history, but do not use historical method in their research. Sociologists, on the other hand, depend on historical method, interview technique, questionnaire and statistical method for their research on a regular basis. d) Sociology and anthropology differ from each other in the scope of their research, too. Anthropologists usually do research on small but self-sufficient communities and groups like tribes with the help of direct participation in the group activities, ethnography, observation- both participant and non- participant types, etc. In sociological research the more favoured methods of data-collection are non-participant observation, case-study, interview, questionnaire etc. e) Anthropologists are more concerned with the past or primitive civilizations; on the other hand, sociologists are more concerned with the modern society. Vidyabhushan and Sachdev have observed that sociology concerns itself

75%

MATCHING BLOCK 72/372

W

with both social philosophy and social planning whereas anthropology remains more with social planning

only and, therefore, does not make any suggestion for future.

NSOU ? CC-SO-01 109 f) Sociologists and anthropologists may study the same topics and may follow similar research methods, anthropology in India is administratively classified as an extension of biological sciences with its conventional four-fold model of pre-history and archeology , linguistics and social and cultural anthropology. O these, the fourth fold often overlaps with sociology. 8.4 Sociology and Social Anthropology in India In India sociology has emerged as a child of anthropology during the colonial period. In their journey towards maturity as two independent social sciences, the two disciplines appear to be closely linked and overlapping. M.N. Srinivas and Panini have pointed out that sociology is a relatively young discipline; having centuries old roots, it finally appeared as an important social science to study all societies systematically in the nineteenth century in Europe and America. Here, in India, the origin of sociology can be traced back to the days when colonial administrators had undertaken ethnographical studies for gathering information on the life and society of the people in this country. Through such studies they had gathered minute details on religion, sect, caste, tribe, region, language and such other things and such ethnographical exercises by the British government officials had inspired the Indian nationalist scholars to delve into both anthropological and sociological analyses of the indigenous society. The growth of sociology and anthropology can be divided into three distinct phases: 1) covering the period between 1773-1900, 2) 1901-1950 and 3) the post-independence period. In 1769, Henry Verelst, the then Governor of undivided Bengal and Bihar encouraged revenue supervisors to collect information on the leading families and their customs. Since then, many British officials and missionaries had strived to collect data and record information on almost all aspects of life and culture of the Indian people. Sir Francis Buchanan undertook ethnographic survey as a part of nature. Abbe Dubois, a French missionary in Mysore wrote a very important book entitled Hindu Manners, Customs and Ceremonies in 1816 to narrate the life, customs and rituals he witnessed there. He was also one of the first to study caste and inter- caste relationships. Walter Hamilton's Gazetteer- A Geographical, Statistical and Historical Description of Hindostan and Adjacent Countries(1820)accurately located many places in India in terms of longitude and latitude, narrated the history of various towns and estimated the population of India to be 123 million. By the later part of the nineteenth century more systematic attempts to collect information on almost all aspects of indigenous life for enabling the Raj to control its subjects were made. The first all-India census was undertaken in 1871 and in 1901 Sir Herbert Risley established an ethnographic survey as part of the census for collecting and

NSOU ? CC-SO-01 110 recording important data before they could disappear due to larger social and cultural changes and also for the purposes of legislation, famine relief, sanitation, control of epidemics, judicial procedure and many such other administrative operations. However, on many occasions facts were misinterpreted either to serve colonial administrative purposes or due to lack of basic understanding of India's culture and social system. British scholars and officials were involved in Indological studies as well to become familiar with the life and culture of Indians. In 1776, a treatise on Hindu law was prepared with help from Indian pundits for the use of British judges. Help from Arabic scholars was also sought during the early period of British rule to decide cases involving Muslim laws and practices. The Asiatic Society of Bengal was established by the great Orientalist Sir William Jones in 1787; it published many articles on antiquarian and anthropological interests in its esteemed journal regularly. Indian scholars too benefitted much from these articles and from the new-found interest in Sanskrit texts aroused by Jones and Max Mueller. The discovery of India's past and the richness of its heritage through those Indological and Orientalist effort had gradually awakened the nationalist spirit among the educated sections of Indians and provided the necessary stimulus for both sociology and social anthropology in India. As the educated elites witnessed the criticism of Hinduism by European missionaries, and their bids to convert the poor and lowly Hindus to Christianity, they increasingly felt the need of social-religious reformation, a reinterpretation of the past and an examination of their contemporary society in India. They were inspired by the spirit of nationalism and their analyses of Indian society and the impact of foreign rule on it laid the foundation of sociology in India. By the beginning of the twentieth century, professional sociologists and social anthropologists shifted their focus on India. Sociology was more advanced and better established on the continent, i.e. in European countries like France and Germany than in England. In American universities, too, it had taken strong roots by then and till today it has maintained its stronghold. Alongside sociology, anthropology had also been developing in Indian Universities; the main difference between the two here remains in the use of methodology. At one point of time each had its own well defined areas like urban-industrial groups for sociology and tribes, caste, communities for social anthropology but over the years, the two have come so close that many suggest, the duo should be known as 'ethno – sociology'. Ethno-sociologists generally combine documentary and literary data with oral traditions and field data. Tribe, caste and religion have emerged as the common topics for discussion in both the disciplines. Both of them deal with aggregates of people in a number of locales like

NSOU ? CC-SO-01 111 village, town and city. In the colonial period, too, Sir Henry Maine and W.H. Baden- Powell wrote extensively on the village community in India. Besides, the many district gazetteers prepared by the colonial administrators provided ethnographic and economic data pertaining to Indian society. Sociologists like G.S. Ghurye have often drawn upon these documents prepared for helping the schemes of the Raj. Eminent Indian and foreign scholars like Brajendra Nath Seal, Patrick Geddes, W.H.R.Rivers, L.K. Ananthakrishna Iyer and Sharat Chandra Roy contributed generously to the fields of both sociology and social anthropology. B. N. Seal, a Professor of Philosophy at the University of Calcutta had taken the pioneering role to introduce sociology at the masters level. A nationalist to the core, Seal refuted Spencer's unilinear evolutionary theory to explain society's march from a simple to an increasingly complex form and also opposed the European conclusion of India's placement at the lower run of the evolution ladder. Uberoi, et al in the introduction to the book edited by them, *Anthropology in the East*, (2010) observe that most of the prominent Indian-born sociologists and anthropologists had taken pride in their role and responsibility of studying Indian society; and very few of the post – independence, India-based sociologists and social anthropologists have studied societies outside the Indian subcontinent. Most of India's eminent sociologists/anthropologists were English educated nationalists and contributed generously to the development of both sociology and social anthropology here in this country. As members of the educated middle class they remained engaged "in the production and dissemination of scientific and useful knowledge." (Uberoi et al. p.32). In India, sociology and social anthropologists both drew upon Indology and Sanskrit texts for understanding not only the past but also the contemporary phenomena like costume, architecture, sexuality, urbanism, family and kinship, Indian tribal cultures, human rights, citizenship, cultural survival, social reform and national integration. However, it is argued that sociology is a social or moral science and anthropology is, in the words of N.K.Bose, a field-science. 8.5 Summary Many Scholars, especially sociologists in India, believe that there is hardly any difference between the practices of the disciplines of sociology and anthropology. M.N. Srinivas was one of the first scholars to make such a claim in 1952 in an article in the very first issue of *Sociological Bulletin*. This claim of unity and inseparability of the two later swayed the opinions of other thinkers. In fact, since

NSOU ? CC-SO-01 112 the time sociology has received the official status of an academic discipline, the two have not been separated or segregated as different. Commentators like Andre Beteille (2006) and Uberoiet al. and Oommen after him argue that the division between the two disciplines is the brainchild of the West. From the above discussion we can definitely draw the conclusion that sociology and (social) anthropology have come and are increasingly coming closer. Bottomore believes that in the recent years these disciplines have renewed their intimacy afresh. As the world is going through rapid changes even long before globalization, the pre-literate, primitive communities are fast losing their culture, language, lifestyle , occupation and their abode. Under such circumstances, anthropology too is losing its own exclusive subjects to study and anthropologists are entering the domain of sociology in increasing number. It is, therefore, argued that social anthropology may soon become a part of sociology itself.

8.6 Questions 1. Answer in Brief : 5 Marks. (a) What is anthropology? (b) What is social anthropology? (c) What are the similarities between sociology and anthropology? (d) What are the differences between sociology and anthropology? (e) How did colonialism influence sociology and anthropology in India? (f) Which two disciplines are known as 'twin sisters'? Why are they known as such? 2. Answer in Detail : 10 Marks. (a) Do you agree that sociology and social anthropology grew together in India? Give reasons in favour of your answer. (b) Examine the relationship between sociology and anthropology in detail.

Unit 9 Sociology and Psychology Structure 9.1 Objectives 9.2 Introduction 9.3 Emergence of Psychology 9.4 Relation between Sociology and Psychology 9.4.1 Social Psychology 9.5 Differences between Sociology and Psychology 9.6 Similarities between Psychology and Sociology 9.7 The Two Disciplines in Brief 9.8 Summary 9.9 Questions 9.10 Suggested Readings 9.1 Objectives From this unit students will come to know about : ? The similarities between sociology and psychology. ? How the two disciplines examine man and his conducts from different angles. ? The differences between the two disciplines. ? In spite of differences how the two disciplines help and compliment each other. 9.2 Introduction Society is an expression of complex inter-personal relations and exchanges between men. Such relations and exchanges not only impact man's physical and social-cultural existence, but also influence his thoughts, attitudes, and behavior. So, to understand the relations between man and society, one needs to understand the patterns of human behavior. For this, an understanding of psychology or the NSOU ? CC-SO-01 115 science of human behavior becomes essential. Sociology, too, is concerned with man's activities in society and therefore it is closely related to psychology. Though both the disciplines primarily share the same subject-matter their approaches and methods to study human behavior are quite different; the focus of their interests is also different.

47%

MATCHING BLOCK 77/372

W

Psychology explores the mind of an individual or small group to understand different aspects of human behavior and man's social and emotional reactions. Sociology

does not limit itself to any single individual or his role but examines social groups and associations like family, neighbourhood, gender , race, ethnicity ,social class or religion. Bottomore has commented that the relation between sociology and psychology is rather "difficult and unsettled. There are two extreme views." (Sociology, 1962. p. 67).One view is held by John Stuart Mill and the other by Emile Durkheim. While Mill was of the opinion that sociology or a general social science could be firmly established only when it would be logically deducible from the laws of the mind. On the other hand, Durkheim was firmly in favour of keeping the two branches of social science separate. However, it has been found that sociology and psychology come the closest in the field of social psychology. 9.3 Emergence of Psychology Psychology is the science of behavior and mind. It includes the study of conscious and unconscious phenomenon as well as feeling and thought. It is an academic discipline of immense scope. Psychologists seek an understanding of the emergent properties of brains, and all the variety of phenomena linked to those emergent properties, joining this way the broader neuro scientific group of researches for understanding the whole range of human emotions that guide and govern man's behavior.. As a social science it aims to understand the finer details of the psyche of individual and groups by establishing general principles and researching specific cases. In this field, a professional practitioner or researcher is called a psychologist and can be classified as a social behaviouralist, or cognitive scientist. Psychologists attempt to understand the dynamic role of state of mind behind the social behavior of man and of group, while also exploring the hidden psychological and biological processes that influence those cognitive functions and behaviors. The word psychology is derived from Greek roots, firstly, to mean study of the psyche, or the soul. The second part of the word comes from another Greek word 'Logos' meaning discourse or science. Thus, psychology is recognized as the science of mind. Until the 1860s psychology was treated as a branch of philosophy, afterwards it began to develop as an independent science in Germany. The earliest known reference to the word psychology in English was by Steven Blankaart in

NSOU ? CC-SO-01 116 Classic Print & Process • Final Proof (Last) • 28-10-21 1694 in the physical Dictionary which makes a clear-cut distinction between anatomy as the study of the Body, and psychology as the study of Soul or Mind. In 1890 William James defined psychology as "the science of mental life, both of its phenomena and their conditions" This definition enjoyed widespread currency for decades. However, this meaning was contested, notably by radical behaviorists such as John B. Watson, who in his 1913 manifesto defined the discipline of psychology as the acquisitions of information useful to the control of behavior. Also since James defined it, the term more strongly connotes techniques of scientific experimentation. Folk psychology refers to the understanding of ordinary people, as contrasted with that of psychology professional. The ancient civilizations of Egypt, Greece, China, India, and Persia were engaged in the philosophical study of psychology .In ancient Egypt the Ebers Papyrus (book written on papyrus) mentioned depression and thought disorders much in the same way as physical disorder. Historians note that Greek philosophers, including Thales, Plato and Aristotle (especially in his De Anima treatise) addressed the workings of the mind. As early as the 4 th century B.C, Greek physician Hippocrates theorized that mental disorders had physical rather than supernatural causes. In India a central idea of the Upanishads is the distinction between a person's transient mundane self and their eternal unchanging soul. Divergent Hindu doctrines and Buddhist literature have challenged this hierarchy of selves, but have all emphasized the importance of reaching higher awareness. Psychology was quite popular in Philosophy during Enlightenment in Germany. Gottfried Wilhelm Leibniz (1646 - 1716) applied his principles of calculus to the mind. Christian Wolf identified psychology as its own science, writing Psychologia Empirica in 1732 and Psychologia Naturalize in 1734. This notion advanced further under Immanuel Kant, who established the idea of anthropology, with psychology as an important subdivision. However, Kant explicitly and notoriously rejected the idea of experimental psychology. Gustav Fechner began conducting research in psychophysics in Leipzig in the 1830s, articulating the principle (Weber- Fechner law) that human perception of stimulus varies logarithmically according to its intensity. Fechner's 1860 Elements of Psychophysics challenged Kant's stricture against qualitative study of the mind. Psychologists in Germany, Denmark, Austria, England, and the United States soon followed Wundt in setting up laboratories. G.Stanley Hall who studied with Wundt, formed a psychology lab at Johns Hopkins University in Maryland, which became internationally influential. Hall, in turn, trained Yujiro Motora, who brought experimental psychology, emphasizing psycholphysics, to the imperial University of Tokyo. Wundt's assistant, Hugo Munsterberg, taught psychology at Harvard to NSOU ? CC-SO-01 117 students such as Narendra Nath Sen Gupta- who in 1905 founded a psychology department and laboratory at the University of Calcutta. Edward Tifchener, created the psychology program at Cornell University and advanced a doctrine of "Structuralist" psychology. Structuralism sought to analyze and classify different aspects of the mind, primarily through the method of introspection. William James, John Dewey and Harvey Carr advanced a more expansive doctrine called functionalism, attuned more to human – environment actions. In 1890, James wrote an influential book. The principles of psychology, which expanded on the realism of structuralism, memorably described the human "stream of consciousness" and interested many American studies in the emerging discipline. Dewey integrated psychology with social issues, most notably by promoting the cause progressive education to assimilate immigrants and inculcate moral values in children. During the second world war and in the cold war period after that, the U.S. military and intelligence agencies established themselves as leading funders of psychology – through the armed forces and the new office of strategic services intelligence agency. University of Michigan psychologist Dorwin Cartwright reported that University research in 1939 - 1941, and in the last few months of the war had been used to determine the week-by week propaganda policy for the United states Government. Cartwright also concluded that psychologists had significant roles to play in managing the domestic economy. The Army had extensively used its new General Classification Test and engaged in massive studies of troop morale. In the 1950s the Rockefeller foundation and Ford Foundation collaborated with the Central Intelligence Agency (CIA) to find research on psychological warfare. In 1965, public controversy called attention to the Army's project" of social science an effort which enlisted psychologists and anthropologists to analyze foreign countries for strategic purpose. After the war, some new institutions were created, and some psychologists were discredited due to Nazi affiliation. Alexander Mitscherlich founded a prominent applied psychoanalysis journal called Psyche and with funding from the Rockefeller Foundation established the first clinical psychosomatic medicine division at Heidelberg University. In 1973 psychology was integrated into the required studies of medical students. Medical facilities increasingly employ psychologist to perform various roles. A prominent aspect of health psychology is the psycho education of patients: instructing them in how to follow a medical regimen. Health psychologists can also educate doctors and conduct research on patient compliance. Psychologists in the field of public health use a wide variety of interventions to influence human behavior. These range from public relations campaigns and outreach to governmental laws and

NSOU ? CC-SO-01 118 Classic Print & Process • Final Proof (Last) • 28-10-21 policies. Psychologists study the composite influence of all these different tools in an effort to influence whole populations of people. Positive psychology is the study of factors which contribute to human happiness and well-being, focusing more on people who are currently health. In 2010 clinical psychological Review published a special issue devoted to positive psychological interventions, such as gratitude journaling and the physical expressions of gratitude. Positive psychological interventions have been limited in scope, but their effects are thought to be superior to that of placebos, especially with regards to helping people with body image problems. 9.4 Relation between Sociology and Psychology Sociology, as we all know, discusses man as a social being. Psychology, on the other hand, deals with his mental and emotional world. As social beings' men are tied to each other with the ties of various social relationships; the love and respect, hatred and enmity, cooperation and distance, empathy, and antipathy – all these feelings, the social and cultural values they support – belong to their mental world. It is the task of psychology to discuss and analyse all the mental feelings and emotions that compel men to behave in a particular way within his social setting. Eminent sociologist, R.M. MacIver believes, all the activities of a living human being , all that are recorded in history and are etched in our experiences are nothing but psychological occurrences. By analyzing these occurrences psychology examines the status of man's mental strength. The primary emphasis of psychology is on the mind of man, and not on man as such, whereas sociology deals with the whole social existence of man. In this way, psychology becomes a part of sociology. The mind of man is dynamic and complex. It reflects itself through various social exchanges between men and groups. Since time immemorial, homo- sapiens have created and sustained society with the bonds of love and care, support and assistance to each other. All these are also parts of man's mental faculties. Psychology discusses, examines and analyses these faculties while the task of sociology is to look into their social context. Both the disciplines often share the same subject matter but deal with them differently. Durkheim has categorically mentioned that sociology should study 'social fact' and not psychological facts. Social fact, as Durkheim has mentioned, is external to the individual and exercises external constraint on him; whereas psychology's domain involves everything that is internal to individual and controls him internally. But other sociologists like Ginsberg believes that sociological explanations can be made more valuable if they are related to psychological explanations. According to Peter Worsley, the main area of interest

NSOU ? CC-SO-01 119 for a psychologist is in the way the individual's behaviour is organized to constitute his personality; but the sociologist examines the manner in which a person relates to others. Thus, in spite of their inherent differences both sociology and psychology enrich themselves with interdisciplinary exchanges of facts, ideas, theoretical approaches and mutually assisted investigations. Therefore, the sociologist must take into account the perceptions of individuals on various issues; but should leave the study of f that perception as such to the psychologist. Social psychology deals with the

86%

MATCHING BLOCK 73/372

W

mental processes of man as a social being. It studies particularly the influence of group life on the mental development of the individual; the effect to the individual mind on the group, and the development of the mental life of the groups within themselves and in their relations with one another.

R.W. Pickford observes that social psychology analyses the framework of social relationships firstly, to examine the interaction of individuals and groups, past and present, and secondly, to study the dynamics of these interactions to understand the personality patterns of individual members in the society. 9.4.1 Social Psychology Social psychology, as a branch of Psychology, studies inter-personal behaviour patterns and examines how such interactions affect people's thoughts, feelings, emotions and habits. For this, it has to depend on

91%

MATCHING BLOCK 74/372

81%

MATCHING BLOCK 76/372

W

a link between psychology and sociology. As a result of such close relationship between the two,

thinkers like Karl Pearson have not accepted the two as separate sciences. Moreover, if in the combination of sociological and psychological factors the stress is placed on the psychological then we have social psychology, but if the sociological factors or approach are stressed, we shall have what is called psycho- sociology. Social psychology, therefore, has to depend on both sociology and psychology to draw its data and concepts to analyse man's attitudes, aspirations and behavior in society and also to understand the interplay of individual character and social structure within a given period of time. This is essential for understanding how, through the process of socialization, man learns to respond to the social- psychological stimuli in various phases of life. To assess the role of an individual we need to understand his perception of other members of society, his ideas on

NSOU ? CC-SO-01 120 Classic Print & Process • Final Proof (Last) • 28-10-21 various social issues, his values, convictions, prejudices that may affect his decisions and behavioural pattern. Here social psychology comes in handy as a study of mental and behavior mechanism. In the opinion of Kimball Young, social psychology is rooted both in psychology and sociology. It studies the individual with reference to a group in particular and society, in general. 9.5 Differences between Sociology and Psychology The problem of the relation between psychology and sociology, and of the status of social psychology in relation to both, is difficult and unsettled. There are two extreme views. J.S. Mill believes that psychology is concerned with the laws of mental functioning of individuals and seeks to establish primacy of psychology over not only sociology, but all other social sciences. As both the disciplines are concerned with neighbouring areas of knowledge, but in different ways, the nature of their relationship still remains debatable and unsettled.

73%

Durkheim, on the other hand, makes a radical distinction between the phenomena studied by psychology and sociology. For him, sociology is to study social facts, defined as being external to individual minds and exercising certain constraints upon them; the explanation of social facts can only be in terms of other social facts, not in terms of psychological facts. Society is not

a simple aggregate of individuals, the

88%

MATCHING BLOCK 79/372

system formed by their association represents a specific reality possessing its own characteristics.

Consequently, whenever a social phenomenon is directly explained by a psychological phenomenon one can be sure the explanation is invalid. The opposite views of Mill and Durkheim still have their supporters today, but most sociologists seem to have adopted various intermediate positions. Some, like Ginsberg, would hold that

100%

MATCHING BLOCK 80/372

SA ESOC515 - U01 - A - Raw.docx (D99138867)

many sociological generalizations can be more firmly established by being related to general psychological laws.

Under Dilthey's influence, many German sociologists, including Max Weber, are of the view that even where strictly sociological explanation is possible, the sociologists gain an additional satisfaction or conviction in being able to understand the meaning of social actions that can be explained in causal terms.

broad sense and Weber was sympathetic to some of Freud's ideas.

Bottomore is of the opinion that psychology and sociology have their own distinct areas of study yet they may continue their enquiry together. Gerth and Mills suggest that the gap between the two disciplines are bridgeable.

NSOU ? CC-SO-01 121 The key differences between the two disciplines are these : 1. Psychology studies the mind of an individual in the context of the larger society or culture. But sociology looks beyond individuals to examine societies with reference to specific association and institution like gender, race, religion, family, marriage, social class, culture and so on. 2. Psychology usually studies one person or group at a time to understand the subject's thoughts , ideas, values, principles and perceptions about life. Sociology, on the other hand , raises questions about issues ,past and present. 3. Psychology focuses on emotional and social reactions , such as stress, memory, grief, anger, intelligence and aging. Sociology studies the social processes like cooperation, and conflict, accommodation and assimilation, mobility and change etc. and their repercussions on small and big groups in society. 4. Psychology , as a

41%

MATCHING BLOCK 83/372

W

social science, deals with the behavior and thinking of living beings and focuses primarily on individual behavior and not on group behavior. It also depends more on the

findings of the natural sciences. On the contrary, sociology studies human society and social behavior. 5. Psychology examines and analyses issues related to human emotions and behaviours associated with intelligence, stress, memory, grief, mental health, addiction and trauma. Sociology, on the other hand, deals with topics ranging from economics, consumerism, education, inequities and stratification, social problems and their redressal. Freud's psychology, although it emphasized the role of individual and biological factors in social life, nevertheless recognized that the innate impulses were transformed in various ways before they became manifest in social behavior. However, in the work of the post – Freudian school –especially in the writings of Karen Horney and Erich Fromm- the influence of society in shaping and reshaping individual behavior is given greater prominence. Fromm's concept of social character is intended precisely to relate individual psychological characteristic to the characteristics of a particular social group or social system. In spite of this wide recognition that sociological and psychological explanation may complement each other, the two disciplines are not, in practice, closely associated, and the place of social psychology, which ought to be specially close to sociology, is still disputed. It is easy to say that social psychology is that part of

NSOU ? CC-SO-01 122 Classic Print & Process • Final Proof (Last) • 28-10-21 general psychology which has a particular relevance to social phenomena, or which deals with the psychological aspects of social life. In fact, all psychology may be considered 'social' in some degree, since all psychic phenomena occur in a social context which affects them to some extent, and it becomes difficult to mark out even roughly the boundaries of social psychology. This means that social psychologists have usually felt a closer association with general psychology than with sociology, have been bound to a particular method and have often ignored the structural feature of the social milieu in which their investigations are conducted. This difference between sociology and social

86%

MATCHING BLOCK 84/372

SA

ESOC515 - U01 - A - Raw.docx (D99138867)

psychology can be illustrated from many angles. In the study of conflict and war there have been mutually exclusive sociological and psychological explanations. In studies of

social stratification, the psychological approach seems to have produced a particular account of class and status in subjective terms, which is contrasted with the sociological account in terms of objective factors, rather than systematic investigation of the psychological aspects of a significant element in the social structure. The 'psychology of politics hardly deserves to be mentioned so remote does much of the writing appear to be from the most obvious.

84%

MATCHING BLOCK 85/372

SA

ESOC515 - U01 - A - Raw.docx (D99138867)

In almost every field of enquiry it could be shown that psychology and sociology constitute for the most part two separate universes of

discourse. This is quite similar to Fromm's view which mentioned above and Garth and Mills, like Fromm, take up again the fundamental problem of the relation between the individual and society, which was earlier examined by Ginsberg in an illuminating study dealing with the respective influence to instinct and reason in social life, with theories of the 'group mind' and with problems of public opinion and organized group behavior. Later social psychology has for the most part abandoned this line of study in favor of statistical and experimental enquires which are for too much concerned with the individual or with simple aggregates of individuals; and it has therefore lost contact with sociology. Finally, we should reconsider one objection to the possibility of a close association between sociology and psychology Durkheim wished to exclude psychological explanation from sociology, though he often resorted to it implicitly. More recently, Radcliffe – Brown argued that sociology and psychology study two entirely different systems, one a social system, the other a mental system; and claimed that these two levels of explanation could not be combined. This seems an extreme view and one unlikely to be sound at a time when much of the fruitful research even in natural science is taking place on the frontiers of difficult sciences. Yet we should acknowledge the genuine difficulties.

Sociology and psychology do offer alternative account of

100%

MATCHING BLOCK 86/372

SA ESOC515 - U01 - A - Raw.docx (D99138867)

behavior, and if they are to be brought closer together it will

NSOU ? CC-SO-01 123 be necessary to work out more rigorously than has yet been done the conceptual and theoretical links between them. 9.6 Similarities between Psychology and Sociology Primarily, the subject-matter of both the disciplines are almost similar because both are concerned with human beings and determine the existence of humanity. The two disciplines are mutually dependent, interconnected and interrelated; and this dependence is necessary for their own deeper understanding. Since long, these two disciplines have remained dependent on each other. Renowned psychologists like Sigmund Freud, MacDougal and others have enriched sociology in multiple ways with the help of their novel ideas. They believe that the whole social life is reducible to psychological forces. Examining social phenomena and social problems and finding their solutions are important tasks of sociology. As each and every social issue has a psychological basis, to resolve the problems associated with them sociology often requires help from psychology. But it is no one way journey, because psychology, too, depends on sociology for its full comprehension. As human mind and personality is the product of its surrounding social environment, culture, customs and traditions, psychology, too, has to take help from sociology. The overlapping features of the two disciplines create their similarities. Both of them study patterns of recurring behavior characteristics. The study of these patterns better understanding of the subjects. Sociology studies individual as a being with choices, who has the capability to take decisions; now, this ability to take decisions is, no doubt, influenced by both social circumstances and human psychology. Social psychology studies attributes like prejudice, attitudes, aggression and other such elements that often determine the grouping and social acceptance of an individual.

NSOU ? CC-SO-01 124 Classic Print & Process • Final Proof (Last) • 28-10-21 9.7 The two Disciplines in Brief SOCIOLOGY 1. Sociology studies group behavior. 2. It studies social processes, social laws or values related to attitudes 3. Sociology discusses concrete form of society, its structure and functions. 4. It studies the interaction of the human being with the environment 5. It studies society from the community point of view 6. Sociology pertains to learning human behavior in the society 7. Sociology is an observation process 8. Sociology is considered a soft science due to its holistic nature and its attempt to look at the bigger picture 9. According to the American Sociological Association, sociology is the scientific study and evaluation of society. 10. Sociology majors participate in internships that are related to a broader community, such as international aid organization and community centers. PSYCHOLOGY 1. Psychology studies the behavior of an individual in society. 2. It studies the mental processes of the individual. 3. Psychology is the study of individual attitude towards cultural and social values and the laws related to these attitude 4. It analysis the framework of social relationship. 5. It studies behavior from the view- point of psychological factors 6. Psychology pertains to the study of human mind 7. Psychology can be termed as an experimental process 8. This is definitely considered a science as it has a scientific emphasis in that psychologists will infer cause and effect. 9. According to the American Psychological Association social psychology is the study of how people are shaped and affected by their social environments. 10. Psychology majors have more face-to face interaction with people during their internships in clinical settings.

NSOU ? CC-SO-01 125 9.8 Summary As branches of social science both sociology and psychology have enriched the spheres of our knowledge. They generally share much of the same subject- matter but apply different methods of analyses and understanding. Psychology focuses on behavior of individual influenced by both internal and external factors like nature and nurture; whereas sociology studies collectives like culture, groups and other social circles. Sociologists, thus, look beyond individuals and study society as a whole. Though different, they are always interdependent, interlinked and interrelated. Giddings observes that psychology studies the mind, mental faculties and emotions of man living within a social environment in a scientific manner, whereas sociology studies the social roles and interactions of man. Naturally, then, these two branches of social science become very closely related and interdependent. 9.9 Questions 1. Answer in brief: 5 Marks each. (a) Mention the similarities between sociology and psychology. (b) Discuss in brief the differences between sociology and psychology. (c) What is social psychology? How does it connect sociology and psychology? 2. Answer in detail: 10 Marks each. (a) Examine, in detail, the relationship between sociology and psychology. (b) Discuss the similarities and differences between sociology and social psychology. 9.10 Suggested Readings Bhattacharyya, D.C. Sociology. 1987. Vijaya Publishing House. Calcutta.

social life as a whole by taking help from other social sciences.

Sociology is not the only science which deals with man in organized society. There are also other disciplines which are also concerned with man and his activities in organized society.

90%

MATCHING BLOCK 95/372

SA Module 1 - 5.docx (D21364761)

But that does not mean that sociology only borrows from other social sciences and gives them nothing. The various social sciences are very much dependent on sociology

taking help from Sociology.

97%

MATCHING BLOCK 92/372

W

It is thus obvious that the different social sciences cannot have their existence independent of others. As they have a common subject- human social behaviour, it is but natural that they should be interrelated. As remarked by Prof. Simpson, "Social science is a unity, but it is not a fictitious unity, it is a dynamic unity of operating parts, and each part is indispensable to each and all of the others." Sociology and other social sciences have much in common

and yet they are distinct from each other. An attempt to

78%

MATCHING BLOCK 93/372

W

be made to explain the connection and distinction between sociology and some of the important social sciences. Now relationship between sociology and history

to be discussed. 10.3 The Meaning of Sociology Sociology is one of the important branches of social sciences. The term sociology was coined by the eminent French sociologist, Auguste Comte, in 1939. Sociology is the youngest discipline of the social sciences. Sociology is derived from

96%

MATCHING BLOCK 94/372

W

the Greek word 'logos' meaning 'study or science'. The etymological meaning of 'sociology' is

thus the 'science of society'. Prof. Ginsberg accordingly defines sociology as 'the study of society, that is, of the web or tissue of human interactions and interrelations.' It is the study of the development, structure, and function of human society. Sociology is concerned with the studies of man's behaviour in groups, social institutions, and social relationships. Sociology examines the dynamic of constituent parts of the society like community, population, gender, race, age group etc. Social stratification, social movements, social change, and social disorders like crime, deviance, and revolution are also studied under sociology. Historical sociology, Medical sociology, Comparative sociology are some sub-divisions of Sociology. Sociological history based on both the sciences. 10.4 The Meaning of the Term History The word History has originated from the Greek word 'Historia' meaning 'knowledge acquired by investigation'. The events that occurred before writing was invented are 'pre-historic'. History is studied from written records and focuses on the society and social affairs of the past. History is something that helps us make sense of the current society by relating to the past. History is the study of past NSOU ? CC-SO-01 128 events. It also includes a survey of conditions and

93%

MATCHING BLOCK 96/372

The historians need social background for writing and analyzing history and this provided by the sociologists. The study of history would be meaningless without the appreciation of sociological significance. History becomes meaningful in the social content 4 . 10.6 Similarities between Sociology with History

Both sociology and history are closely related to each other. There are some similarities between sociology and history. The following points may be discussed. i. The study of society is common in case of both sociology and history. Sociology is the study of society while history seeks to establish the sequence in which events. ii. Both are social science disciplines and are concerned with human activities and events. iii. Sociology and history- both are concerned with human activities and events. iv. History is concerned primarily with the record of the past. The historians want to describe as accurately as possible, what actually happened to man during a given time. The sociologists use to all intents and purposes the same record to the past. v. Apart from philosophy today the historian is considerably depending upon sociological concepts and narrations. We may say that modern historiography and modern sociology have been influenced by each other. vi. Both sociology and history are interested in contemporary events of the recent past.

NSOU ? CC-SO-01 130 vii. History is the branch of social sciences while historical sociology concerns studying the past's social phenomenon. The study of history would be insignificant without the appreciation of sociology are interdependent and interrelated with each other. viii. Both history and sociology seek information to study human and their world and interpret it correctly. 10.7 Sociology and History-Differences "

100%

MATCHING BLOCK 111/372

W

History without sociology has no fruit, sociology without history has no root".

Thus, both Sociology and History are closely related. In spite of their interrelationship and interdependence both the social sciences differ from each other from the following angles: i. Sociology is concerned with present and to some extent with future events. But history deals with the past events and society. Prof.

90%

MATCHING BLOCK 112/372

W

G. E. Howard rightly remarked, " History is the past sociology and sociology is the present history".

T.B. Battomore says, " Sociology and history may overlap in one area, but diverge widely in another". ii. Sociology is an analytical discipline whereas history is a descriptive discipline. Sociology generalized about society, history is a particularizing or individualizing discipline. iii. Sociology emphasizes on the regular and the recurrent whereas history investigate the unique and the individual. iv. Generally, history occupies itself with differences in similar events and sociology deals with the similarities in different events. v.

62%

MATCHING BLOCK 113/372

W

Sociology is a general science whereas history is a special science. Sociology can be defined as a general science of human society as it

83%

The scope of sociology is very wide while the scope of history is limited.

x.

100%

MATCHING BLOCK 116/372

W

Sociology is a modern or new subject whereas history is an older social science.

xi. A deeper distinction between these two sciences lies in the fact that history deals with human events in so far as they are correlated in time, while sociology studies them from the viewpoint of the social relationships involved. 10.8 Historical Sociology

90%

MATCHING BLOCK 118/372

W

As time has passed, history and sociology have formed into two different specific academic disciplines. Historical data was used and is used aplenty today in mainly these three ways. The first one is: Investigating a theory through a Parallel investigation. To negotiate with the natural-science conceptions of laws, and to look at, or apply various historical material where you

can collect

95%

MATCHING BLOCK 121/372

W

your resources in order to prove the theory that is applied. Or on the other hand, sociologists for the parallel investigation theory could aptly apply the theory to certain cases of investigation but

of course,

86%**MATCHING BLOCK 119/372****W**

in a different modalities of a more widely used process. The second theory that sociologists mainly use is applying and contrasting certain events or policies. Analysed by their specific characteristics, or what makes them unique, certain events may be used by the sociologist for comparative data can be contrasted and compared. For interpretive sociologists it is very common for them to use the 'Verstehen' tradition 1 .

Do you know what Verstehen mean? Verstehen means to understand, in the context of German philosophy and social sciences in general. It has been used since the late 19th century in English as in the German. It is used with the particular sense of the "interpretive or participatory" examination of social phenomena. The term is closely connected with the work of the German sociologist, Max Weber. These are rooted in the analysis of social action, a theory of human action mediated by contextual understanding. In anthropology, verstehen has come to mean a systematic and well-planned interpretive process in which an outside observer of another culture attempts to relate to it and understand others' actions 2 . Verstehen is now seen as a concept and a method central to a rejection of NSOU ? CC-SO-01 132 positivist social science. Verstehen refers to understanding the meaning of action from the actor's point of view. It is entering into the shoes of the other, and adopting this research stance requires treating the actor as a subject, rather than an object of your observations. It also implies that unlike objects in the natural world human actors are not simply the product of the pulls and pushes of external forces. Individuals are seen to create the world by organizing their own understanding of it and giving it meaning. To do research on actors without taking into account the meanings they attribute to their actions or environment is to treat them like objects.

100%**MATCHING BLOCK 120/372****W**

And lastly, the third way sociologists typically relate is by taking a look at the causalities from a macro point of view. This is Mill's method: " a) principle of difference: a case with effect and cause present is contrasted with a case with effect and cause absent; and b) principle of agreement: cases with same effects are compared in terms of their (ideally identical) causes. There is an important debate on the usefulness of Mill's method for sociological research, which relates to the fact that historical research is often based on only few cases and that many sociological theories are probabilistic, not deterministic. Today, historical sociology is

applied richly in social theories. Major theorists in this area include Randall Collins, Emile Durkheim, Norbert Elias, Michel Foucault, Karl Marx, Karl Polanyi, Immanuel Wallerstein and most importantly Max Weber. The theories bank upon comparative historical research as one of their strategies too. This brings us to the question of comparative historical research 1 . 10.9 Comparative historical research It is a method of social science that examines historical events in order to create such explanations that remain valid beyond a particular time and place. This may be either by direct comparison to other historical events, theory building, or reference to the present day. [1] Generally, it involves relative comparisons of social processes across times and places. It overlaps with historical sociology. While the disciplines of history and sociology have always been associated, they have connected in different ways at different times. This form of research may be used in any of several theoretical orientations. It is usually distinguished by the types of questions it asks, not by the theoretical framework it employs 3 . 10.10 Conclusion Sociology and history are the two important branches of social sciences. Both disciplines are very much interrelated. Sociology is concerned with the study of the NSOU ? CC-SO-01 133 science of society. History is the study of past events and humans who lived in the past and their societies, culture, and art which helps us realize human developments.

100%**MATCHING BLOCK 122/372****SA** ESOC111-U03-SLM.docx (D103358968)

Both sociology and political science are branches of social sciences that deal with the study of overall human

society. The two terms understand human behaviour and the fundamental aspect of human life in a community. It is called that sociology is the science of society i.e., social relations. It deals with the origin, evolution, NSOU ? CC-SO-01 136 organization, purpose, ends, and nature of the society. Society is the oldest organization of human beings, "

83%

MATCHING BLOCK 135/372

W

Sociology is also the science of society or of social phenomena.", says

Prof. Ward. Since political and social behaviour of man cannot be separated, there is a close relation between sociology and political science. "Political science and Sociology", remarks Prof. Catlin, "are inseparable and in fact these are two sides of the same picture." Sociology as a science and particularly as a separate discipline did not come into existence until about the middle of the nineteenth century. Sociology is the youngest of the social sciences. Regarding the emergence of sociology there is a great contribution by the eminent thinkers. More than thousands of thinkers' names are enlisted in Prof. P.A. Sorokin's book 'Contemporary Sociological Theories', 1928. Besides, 'Social Thought, from Lore to Science', 1952 by Howard Becker and Harry Elmer Barnes wrote in favour of the emergence of sociology. However, the eminent thinkers are A. Comte and Emile Durkheim of France, Herbert Spencer from England, Max Weber and George Simmel from Germany, and Lester F. Ward from America. During the 19 th Century and part of the 20 th Century were controlled by them. And that mentioned period was the epoch of emergence and creation of sociology. They were the representatives of their countries- France, Germany, UK, USA, etc. They played vital role for the emergence of sociology and in its evolutionary process.

86%**MATCHING BLOCK 137/372****SA** Module 1 - 5.docx (D21364761)

In the words of Morris Ginsberg, "Historically sociology has its main roots in politics and philosophy of history." Sociology greatly benefitted by the books written by political scientists like Plato, Aristotle, and Koutilya such as Republic, The Politics, and Arthashastra respectively. 11.3

Contribution of Political Science to Sociology On the other hand, political science made its roots into the Macedonian Empire where the great philosopher Aristotle had first coined the term about 2400 years ago and that is why he is known as the 'Father of Political Science'. The focus of political science is understanding the function of political systems (i.e., Government) in society. Political science is concerned with the Government, power, and politics from domestic to international perspectives. In the words of Paul Janet, "Political science is that part

74%**MATCHING BLOCK 136/372****W**

of social science which treats the foundation of the state and principles of government." Political Science deals with the social groups organized under the sovereign of the state. Without the sociological background the study of political science will be incomplete. The forms of government, the nature of governmental organs, the laws and the sphere of the state activity are determined by NSOU ? CC-SO-01 137 the social processes. Prof. Barnes rightly said, "The most significant thing about Sociology and modern political theory is that most of the changes which have taken place in the political theory in the last thirty years have been along the line of development suggested and marked out by sociology.

Contribution of Political Science to Sociology a) Political science supply - materials about the state Man is not only a social animal, but he is also a political one, and state is his supreme political institution. State influences the social life and sociology gets knowledge about state from political science. b) State always tries to eradicate social evils State always tries to finish all the social evils through its laws and this way clears the social life. In this way, sociology depends upon political science. The state and the government make laws for the welfare of the society. The government removes social evils l poverty, unemployment, dowry, and so on from the society. The undesirable customs are uprooted from the society by the government. c) State regulates social organizations All the social organizations in the state are regulated by the laws of the state. All famous sociologists like Morris Ginsberg, A. Comte, Ward, and others consider the study of state as a part of the study of sociology. They always take a keen interest in the activities of the state. d) Each and every social problem has a political cause

90%**MATCHING BLOCK 138/372****SA** Module 1 - 5.docx (D21364761)

To understand different political events sociology takes help from Political Science. Any change in the political system or nature of power structure brings changes in society. Hence, sociology takes the help of political science to understand the changes in society.

So, sociology to draw its conclusion depends on political science. Moreover, Political Science examines government power and politics from domestic to international perspectives. Political Science entails studying the policies, laws, diplomacy, and processes of a government institutions as well as the behaviour of political parties and the people groups. A Political Science course might cover the causes and prevention of war or impacts of race and ethnicity on policy debates. Like sociology, political science relies on a variety of qualitative and quantitative measures to inform its research and analysis. NSOU ? CC-SO-01 138 11.4 Contribution of Sociology to Political Science Political science also depends on Sociology. Political Science is like a part of sociology, it is regarded.

98%**MATCHING BLOCK 139/372****SA** Module 1 - 5.docx (D21364761)

To understand the part, it is necessary to understand the whole. Almost all political problems have a social cause and for the solution of these political problems Political Science takes the help of sociology. State frames its rules and

regulations, laws on the basis of social customs, traditions, and social

81%**MATCHING BLOCK 143/372****SA** Module 1 - 5.docx (D21364761)

values. Without sociological background the study of political science will be incomplete. Political science is largely benefitted by the researchers and research methods of the sociologists. Some thinkers consider political science as a branch of sociology. State is considered as a social group, there is a subject of sociology.

A politician is basically a sociologist and uses sociological concepts. Society acts as a mirror of the political life of the country. The contribution of Sociology to Political Science can be discussed under the following points: a) The highest political organisation originated in society We live in society which is the oldest organization. State has grown out of it. In order to know the origin, development and nature of the state, Political Science has to seek the help of sociology, the science of society. b) Social conditions influence political organizations Social conditions of a particular time influence the nature and working of political institutions of that time. In under-developed countries/societies political institutions are also under-developed and in developed societies, political institutions are also developed. This shows the deterministic influence of sociology on political science. c) Social customs influence the laws of the state Social traditions, customs, and conventions are the important sources of the laws of the state. The laws which are formed by the government are based on the social customs, traditions, mores, norms etc. of the society.

65%**MATCHING BLOCK 140/372****W**

Most of the changes which have been taken place in the political theory during the past times have been

possible due to Sociology. For understanding the political problems, some knowledge about sociology is very essential because all political problems are mainly corrected with a social aspect. NSOU ? CC-SO-01 139 d) Sociology provides materials to political science The study of the state - its origin, development, nature, functions - constitutes the central focus in political science. State is the highest political institution and at the same time the state influences the social life and sociology gets knowledge about state from political science. Social relations are the determinants of all political relation. All political institutions are conditioned by social relations. All political activity is the result of the social nature of man. Sociology contributes to political science the knowledge of society. Political science depends upon sociology and sociology provides materials to political science that is the political life of the people. e) Political science relies heavily upon sociology for its basic theories and methods. For example, in mid-20 th century, Michigan social psychologists and Parsonians at Harward significantly shaped political science agendas in political behaviour and political development, respectively. f) Central specialties in both the discipline borrowed from similar third-party disciplines such as economics, history, anthropology, and psychology. g) A large number of scholars such as Marx, Weber, Gramsci, Pareto, Parsons and Mosca etc. equally have contributed to the growth and development of both the disciplines. In the same way Harold Lasswell's treatise, "Politics: Who Gets What, When, and How." (1936) was an important work from which both sociologist and political scientist get inspired and take lead to work in an inter-disciplinary framework (Lipset, 1964). It may be pointed out that given for changing societal need and aspirations in contemporary globalized world an interdisciplinary approach is needed to understand the existing social problems and find solutions to the problems of modern society. 11.5 Common Issues We have discussed the contribution of sociology to political science and contribution of political science to sociology in details and separately.

81%**MATCHING BLOCK 141/372****W**

Besides, there are some common issues which are being studied by both the disciplines. These topics

are war, propaganda, authority, lockdown, vaccination, communal riots, law etc.

100%**MATCHING BLOCK 142/372****W**

With the help of both political science and sociology, a new subject comes into

NSOU ? CC-SO-01 140 existence which is known as Political Sociology.

96%**MATCHING BLOCK 144/372****W**

Political Sociology is the study of power and relationship between societies, states, and political conflict. It

is the combination of political science and sociology. Political sociology deals with the relationship between state and society on the basis of mutual interaction and with power as the ultimate aim of all

92%

MATCHING BLOCK 147/372

W

political processes. Political sociology is a discipline which is mainly concerned with the analysis of the interaction between politics and society.

Despite the contributions of Pareto, Hobhouse, it is Max Weber who is known as the father of political sociology because of his special contributions in this field. Sociology studies groups of people based on identity factors such as ethnicity, race, age, gender, education, and social clans. Intro level coursework will cover the basics of human behaviours and theories on social development before launching into a more refined study of specific people groups and how they interact within society as a whole. Sociology can study reform issues including poverty, crime, and economic inequality as well as large scale demographics like population and migration. Sociology relies primarily on quantitative research like surveys, polls, and census data for its analysis and research conclusions but also utilizes qualitative methods like case studies and ethnography. 11.6 Differences between Sociology and Political Science Although both Sociology and

72%

MATCHING BLOCK 145/372

W

Political Science contribute to each other, but in spite of their inter-relationship and interdependence both the subjects differ from each other on the following

grounds: a) Sociology is one of the vital branches of social sciences. It is the scientific study of human society. It

Module 1 - 5.docx (D21364761)

The main difference between sociology and political science is that sociology is the scientific study of human society while political science is

the study of politics and their impact on society as a whole. Hence, unlike sociology political science emphasizes the use of political power in the national and international level. I) The approach of sociology is sociological. It follows its own methods in addition to the scientific methods in its investigation. On the other hand, the approach of political science is political. It has its own methods of study like the historical, philosophical, comparative etc.

NSOU ? CC-SO-01 142 11.7 New Concept- Political Sociology, Political Culture, Political Socialization, and Comparative Political Studies Political Sociology which is basically an outcome of intersection between sociology and political science is relatively a newer branch of sociology studies various political institutions, associations, organizations, interest groups, and multitude of power dynamics in society. Political sociology also studies interest groups, political parties, administrative and bureaucratic behaviour, social legislations, state policies, reforms, and political ideologies as its areas of the study. Political sociology often sees as a new, growing, and burgeoning sub-field within the discipline of sociology. It is considered as a connecting bridge between sociology and political science. Sociologists see two-way relationships between the two (Rathore, 1986). Both have a give and take relationship. Various other scholars see political sociology as a marriage between sociology and political science.

88%

MATCHING BLOCK 161/372

SA ESOC111-U03-SLM.docx (D103358968)

Like political sociology, sociology of politics is a sub-field of sociology. Sociology of politics also throws light on sociological appraisals of political processes and institutional mechanisms.

Political culture, political socialization are the most used and frequently mentioned concepts in political sociology. Within political science we have a branch called 'comparative political studies' which deals with comparing different political system to judge in which method do people function better, and uphold the values of equality, freedom, and justice. 11.8 Conclusion From the above discussion it is clear that sociology and political science are mutually contributory. A politician basically is a sociologist and uses sociological concepts.

100%

MATCHING BLOCK 160/372

it influences and is influenced by the social life of

man. Sociology primarily studies about society, social relationships. Economics welfare is only a Part of human welfare .The relation between these two sciences is very intimate.

NSOU ? CC-SO-01 145 12.3 Definition

of Sociology Sociology is the youngest branch of social sciences.

71%

MATCHING BLOCK 166/372

W

The term 'sociology' is derived from the Latin word 'societus' meaning society and the Greek word 'logos' meaning 'study or science'. The etymological meaning of 'sociology' is the 'science of society'.

Sociology is

usually defined as the science of society. This definition has two terms to be pointed out clearly: a)Science and b) Society. Most of the scholars described science as a body of knowledge. This type of knowledge is acquired by systematic observation, experience and study of the facts which have been coordinated and classified. In this way science adds to our knowledge by describing actual reality. Hence scientific knowledge is enduring. Sociology is also a body of knowledge about society which has been empirically tested and found to be valid. Society may be defined as the complicated network and ever changing pattern of social relationships. These relationships are varied and complex. They may be

84%

MATCHING BLOCK 169/372

SA

ESOC515-U01-Raw.docx (D102256794)

economic, political, or religious but they are at the same time 'social'. Sociology

is the study of social relationships. In order to be a distinct and separate science, sociology must confine itself to the study of social relationships for no other science that takes that subject for its central concern. The only field of study which remains for sociology is the field of social relationships. Sociology can be truly a separate science when its focus is not identical with those of other sciences. That is why sociology is concerned with the study of social relationships. Since all parts of social life are intimately related and interwoven, society should be studied as a whole and the nature of the interactions between its various elements should be understood. 12.4 Definition of Economics Economics is one of the most important branches of social sciences. It can be defined as the branch of knowledge that deals with a human life's economic aspects. Wealth related activities of man are the main subject matter of economics. So, economics is called

100%

MATCHING BLOCK 168/372

W

the science of wealth in its three phases of production, distribution, and consumption.

In general, wealth means money, property, expensive goods etc. But in economics, wealth means that kind of goods which fulfil our demand directly or indirectly and its supply is limited (not sufficient). To collect wealth, to create wealth, wealth distribution and utilization of wealth, to determinate the policy for total development of the society and to research for the proper implementation of the policies- these are the subject matter of economics.

NSOU ? CC-SO-01 146 Moreover, economics is a social science that deals with wants and their satisfaction. Classical economics assumes that people have unlimited wants and to satisfy these wants there are limited resources. At that time people always had to engage in work to secure the things they needed for the satisfaction of their wants. Almost all types of individuals are working to earn money/income with which they satisfy their wants. To fulfil the basic needs i.e., food, cloth, shelter, and other needs such as better education, better drinking water, better health facilities etc are very urgent. According to one perspective, it is assumed that there is no limit for human wants. When one wants to get satisfied, another new want automatically takes place and so on in an endless succession. Hence, we say that it is impossible to fulfil one's wants. Sociologist Seligman says the starting point of all economic activity is the existence of human wants. Wants give rise to efforts and efforts secure satisfaction. The things which directly satisfy human wants are called consumption goods. A few consumption goods like air, sunshine etc are abundant. They are available free of cost. But most goods are scarce. They are available only by paying a price. And therefore, they are called economic goods. They do not exist in sufficient quantity to satisfy all wants. 12.5 Main Characteristics of Sociology Sociology is an important discipline. It deals with the social aspect of man. It studies the different parts of Society as a whole. In Sociology, all the concepts and principles concerning human beings as societies are covered. Sociology studies all the rules and regulations concerning and dividing people all over the world. All activities fall under this branch, hence Sociology drastically growing and expanding for creativity and learning infinite knowledge. Sociology deals with the diverse patterns of relationships and interactions between people across the globe. One can say that primarily it tries to answer three basic questions- (1) How and why do societies emerge? (2) How and why do societies persist? And, (3) How and why do societies change? Most of the sociologists are in favour of the following: (a) Sociology is an independent discipline. It is no longer treated as a branch of any other social sciences like political science, history, philosophy, anthropology, psychology etc. It is considered to be the newest of all social sciences. (b)

63%

MATCHING BLOCK 170/372

W

Sociology is a social science and not a physical science. Sociology belongs NSOU ? CC-SO-01 147 to the network of social sciences and not to the physical sciences

like physics, chemistry, or biology. (c) As

40%

MATCHING BLOCK 174/372

SA Module 1 - 5.docx (D21364761)

a science of society, sociology is highly concerned with the institutions and associations of human beings. Sociology is the scientific studies of human interactions and interrelations, their conditions and consequences. (

d) The main focus of sociology is to give attention to the study of primary social institutions like family and maintenance of social order. (e) Sociology focuses on evolution, transformation and functioning of social life. (f) Sociology deals with social processes like cooperation and competition, accommodation and assimilation, social conflict, communication in society, social differentiation, and social stratification. (g) Sociology has its own methodology and is based on empirical data collection and inductive reasoning but also has deductive aspects at the level of generalisations. (h) The study of sociology is done by quantitative and qualitative measures and the means employed for gathering data are different. 12.6 Main Characteristics of Economics Economics can be

55%

MATCHING BLOCK 171/372

W

defined as the branch of knowledge that deals with human's life's economic aspects. It deals with how goods and services are provided, produced, and manufactured.

Economics deals with economic relations concerning individuals. Factors like supply, demand, price, goods and services, and the elasticity of various products and these factors contributing to the fluctuation of products and services of the market are basic knowledge needed for knowledge. The vital characteristics of economics are the following: (i) Economics is basically a science of wealth, choice and economic activities of man living in society. (ii)

94%

MATCHING BLOCK 172/372

W

According to Professor Robbins, "Economics is a social science which studies human behaviour in relation to his unlimited ends and scarce means which have alternative uses." (

iii) Economics largely focuses on

77%

MATCHING BLOCK 173/372

W

the activities of man such as production, consumption, distribution, exchange, and resource management. It also studies the structure and functions of different economic organisations like banks, markets etc.

From this, it is obvious that economics

100%

MATCHING BLOCK 192/372

SA

ESOC111-U03-SLM.docx (D103358968)

is concerned with the material needs of humans as well as their material welfare.

NSOU ? CC-SO-01 148 (iv) Economics is divided into two: (a) Micro-economics and (b) Macro- economics. The term 'micro' seems to have derived from Greek word 'mikros' meaning small. Micro-economics- study of small economic unit such as individuals, firms, industries, competitive market, labour market, personal decision making, price of a commodity, out of individual firm and so on. Macro-economics deals with the study of the Nation's economy as a whole. The scope of macro-economics is wide. It is concerned with the study of aggregates. It is concerned with the concept such as Aggregate demand, Aggregate supply, Total output, General price level, National income, National economic growth, Government spending, Inflation, Unemployment etc. (v) Positive and Normative Economics: Positive economics is the branch of economics that concerns the description, quantification, and explanation of economic phenomena. It focuses on facts and cause and effect behavioural relationships and notes that economic theories must be consistent with existing observations. Normative economics/statements- The beliefs of individuals expressed in the form of value judgements based on moral and ethical considerations are termed as normative statements. These statements that describe what ought to be on the basis of ethical considerations are the subject matter of normative economics. According to Prof Samuelson and Prof Nordhaus, "Economics is the study of how societies use scarce resources to produce valuable commodities and distribute them among many different people." To explain the statement two vital thinking come into existence: (1) Scarcity of the commodity and (2) Skilful distribution of the valuable commodity in society. In fact, in these circumstances, economics played a vital role in the implementation of the inadequacy of commodities. If the desired commodities are easily available and every demand is fulfilled, then man is unworried. The Government is not in a position to collect tax. Only economics as a science of society can take decision with the insufficient commodity and unlimited demands. Economics is divided into two categories: (a) Micro-economics and (b) Macro-economics. Eminent British economist Adam Smith is called the father of Micro-economics. Micro-economics is the study of small economic units such as individuals, firms, industries etc. Macro-economics deals with the study of nations economy as a whole. The scope of macro-economics is wide. National income, National economic growth, Inflation, Unemployment etc.

NSOU ? CC-SO-01 149 12.7 Relationship between Sociology and Economics Now we proceed to show the inter-relationship between these two (sociology and economics) important branches of social sciences. Both are interdependent and interrelated. Because of this interrelationship, Prof

92%

MATCHING BLOCK 175/372

W

Thomas opines that economics is, in fact, but one branch of Sociology. Similarly, Silverman opines that economics is regarded as

an

100%

MATCHING BLOCK 176/372

W

offshoot of sociology which studies the general principles of all social relations.

57%

MATCHING BLOCK 177/372

W

Economic welfare is a part of social welfare. When there are economic problems in society such as inflation, poverty, unemployment

etc economists usually take help of sociology. For getting common welfare, economics receives help from all social sciences and preferably sociology. Economics depends on sociology. Economics can not

95%

MATCHING BLOCK 178/372

W

go far ahead without the help of sociology and other sciences.

It is very difficult to understand economics completely. As a result, economics is regarded as a part of sociology. Classical sociologists like Max Weber, Vilfredo Pareto etc have done extensive and rigorous research on economy and society which was later great beneficial for economic.

100%

MATCHING BLOCK 179/372

W

Some economists also consider economic change as an aspect of social change.

On the other hand, sociology also is influenced and enriched by the economic factors in many ways. Social problems like suicide, dowry, etc will be analysed and minimized with the help of economic procedure because the root of these problems is deep rooted in the economic factors. So, we may come to the point that such kind of problems will be solved with the help of economic contribution to the field of sociological knowledge and research. The famous social scientist Karl Marx suggested that economic relations constitute the foundation of society. So, economic factors greatly influence every aspect of our social life. So, sociologists like Spencer, Max Weber, E. Durkheim, and others have given importance on economics in their analysis and research of social relationships.

100%

MATCHING BLOCK 180/372

W

According to A.C. Pigou, "Economics studies that part of social welfare which can be brought directly or indirectly into relationship with the measuring rod of money." Here

he suggests that social relations are formed due to the pressure of wealth which is

86%

MATCHING BLOCK 181/372

W

the domain of economics. According to Alfred Marshall, who was a neoclassical economist, "Economics is the study of mankind in the ordinary business of life, it examines that part of individual and social action which is most closely connected with the use and attainment of material requisites of well-being." This shows that economics is concerned with their activities in the social setup.

It is clear from the aforesaid discussion that the relation between sociology and economics is widening. Economists are more and more making use of the

NSOU ? CC-SO-01 150 sociological concepts in the study of economic problems. They work with sociologists in their study of the problems of economic development in underdeveloped countries. Combined efforts of both the experts may be of great practical help in meeting the challenges. 12.8 Differences between Sociology and Economics Despite the interdependence

87%

MATCHING BLOCK 182/372

W

of these two sciences, they are quite distinct from each other. The

main differences between them are given below: a) Sociology as an important branch of social sciences is concerned with society and social relationships whereas economics deals with wealth and its production, distribution, consumption, and exchange, and choice. Economics is concerned with the

96%

MATCHING BLOCK 183/372

W

material welfare of the human beings. Economic welfare is only a part of human welfare.

b) Sociology emerged as a science of society and it is the youngest branch of social sciences. On the other hand,

80%

MATCHING BLOCK 184/372

W

economics is comparatively older science. c) Sociology is regarded as an abstract science whereas economics is considered as a concrete science in the region of social

science. Economic variables can be measured and quantified more easily and accurately. Social variables are very distinct to measure and quantify. d) Sociology is generally concerned with all aspects of social science whereas economics studies the specific aspects of social science. e) The scope of sociology is wider and has comprehensive viewpoints. The scope of economics is extremely limited and narrow. f) Sociology deals with the social activities of individuals, on the other hand, economics is concerned with their economic activities. It is also called the science of bread and butter. g)

86%

MATCHING BLOCK 185/372

W

Both sociology and economics differ from each other regarding the methods and techniques they use for their study.

h) In sociology, society is the main theme as a unit whereas in economics individual is the central theme as a unit. i) Sociology is a general part of social science, but economics is the special branch of social sciences. j) In sociology, man is studied as a social animal. In economics, man is studied as an economic being.

NSOU ? CC-SO-01 151 12.9 Common Issues Concerning both Sociology and Economics Both sociology and economics are the vital branch of social sciences which deal with the study of overall human development. Both of them

65%

MATCHING BLOCK 186/372

W

use scientific methods for studying their respective areas of interest. They are closely related and dependent on each other for their study

yet there are some common problems which stay in the border line. The problems of population growth, environmental pollution, slum, unemployment, poverty, illiteracy, child labour, inequality etc have both social and economic implication. Economic Sociology as a Sub-discipline of Sociology Economic sociology emerged as a systematic academic subdivision of sociology in less than a century ago. It has made a remarkable contribution in analysing society from an economic perspective.

71%

MATCHING BLOCK 187/372

W

The birth of economic sociology was found in the writings of Karl Marx. N.J. Smelser and R. Swedberg point out that the first use of the term 'economic sociology' seems to have been in 1879.

76%**MATCHING BLOCK 188/372****W**

In recent times, especially after 1980's economic sociology experienced remarkable revival. Some sociologists were doing rigorous research on the relationship between the market and society.

In contemporary economic sociology, markets are considered as networks of producers watching each other and trying to carve out niches. Hence, we can say that such networks are the core area of concern in contemporary economic sociology.

94%**MATCHING BLOCK 189/372****W**

Karl Polanyi, a renowned contributor to economic sociology, argued that the birth of the free market was an institutional transformation necessarily promoted by the state. This got a general acceptance in the domain of economic sociology.

91%**MATCHING BLOCK 190/372****W**

Economic sociology is the application of sociological methods to understand the production, distribution, exchange and consumption of goods and services. Economic sociology is particularly attentive to the relationships between economic activity, the rest of

the

100%**MATCHING BLOCK 191/372****W**

society, and changes in the institutions that contextualize and condition economic activity. 12.10

Summary In this unit, we have tried to understand the relationships of sociology with economics. Sociology is the youngest branch of social sciences whereas economics is older than sociology. Sociology is the science of society. The relation of sociology with economics has been extensively proved in this unit by showing how society is greatly influenced by economic factors and how economic processes are determined NSOU ? CC-SO-01 152 by the social environment. Classical sociologists have done extensive research on the economy. Karl Marx suggested that economic factors influence every aspect of our social life. It is the economic factor which influences the individual's lifestyle and needs. The economic needs of society are generally met through social institutions. Thus, the two subjects are complementary to each other and it is difficult, rather impossible to study one subject by leaving the other. Despite the dependence, these two social sciences are quite distinct from each other. Besides, there are some common issues like unemployment, over-population, poverty, pollution, child labour etc. Keywords : Sociology, economics, macro-economics, micro-economics, society, economy, positive economics, normative economics. 12.11 Questions 1. Answer the following questions briefly: (5 marks) (a) Analyse common issues concerning both sociology and economics. (b) Point out the reciprocal relationship between sociology and economics. (c) Point out Economic Sociology as a sub-Discipline of sociology. (d) Define economics. (e) Define sociology. (f) Point out the differences between Micro-economics and Macro-economics. (g) Define the concepts of Supply and Demand. (h) What do you mean by positive economics and normative economics. 2. Answer in detail: (10 marks) (a) Write a note on the relationship of sociology with economics. (b) What are the main characteristics of sociology? (c) Show differences between Sociology and Economics. 12.12 Suggested Readings 1. Wikipedia.org 2. Ahuja, Ram (1992)- Social Problems in India, Rawat Publication 3. Appadurai, A. Political science 13.8 Sociology and

Economics 13.9 Cultural studies 13.10 Summary 13.11 Questions 13.12 Suggested Readings 13.1 Objectives In this unit we will focus upon the following points: ? The interrelationship between Sociology and other social sciences such as social anthropology, psychology, history, political science and economics. ? We will try to understand the similarities and dissimilarities of these above different disciplines with sociology in terms of approaches and methods used. ? To have a brief idea about Cultural Studies. 13.2 Introduction Sociology is the study of human social life. Because of the expanded human social life, sociology has many sub-sections of study, ranging from the analysis of conversations to the development of theories, which help us to understand how the NSOU ? CC-SO-01 155 entire world works. Sociology being a vast dynamic field, it thus becomes difficult to limit its definition to a few words would be an injustice to it. It is one of the several social sciences which deal with man and his activities in society; while the other sciences being history, geography, philosophy, political science, economics or even anthropology. In other words, it won't be wrong to say that sociology is the basic social science which encompasses all other sciences in it. Man's life is multifaceted. It has the economic aspect, political aspect, religious aspect and so on and so forth. This chapter will introduce you to the vastness of the discipline sociology and explain the related other disciplines which play an equally important role in understanding and examining societal realities. 13.3 Sociology and other social sciences Social sciences concern people's relationships and interactions with one another. Sociology, with its emphasis on social life, falls into this category. A multidisciplinary field, sociology draws from a variety of other social sciences, including anthropology, political science, psychology, and economics. It is necessary to understand other social sciences to study society and the others should also study sociology. To understand social life in a particular aspect one must know society. Therefore sociology and other social sciences are interdependent. Sociology not only borrows from other social sciences but also has given a lot to them by paving a new path and dimension to other social sciences. As mentioned in the beginning Sociology makes it possible to talk and inculcate various characteristics while studying about it, unlike other social sciences which aim at one particular aspect. However, sociology could be distinguished from other social sciences related to its contents and the emphasis is given on them. There are many parallels amongst almost all fields of sciences. In order to study these parallels, one must know to what extent and on what terms do they differ.

100%**MATCHING BLOCK 205/372****SA**

Unit 03 - Template.docx (D103100617)

The social sciences comprise the application of scientific methods to the study of the human aspects of the world. Psychology studies the human mind and micro- level (or individual) behavior; sociology examines human society; political science studies the governing of groups and countries; communication studies the flow of discourse via various media; economics concerns itself with the production and allocation of wealth in society; and social work is the application of social scientific knowledge in society. Social sciences diverge from the humanities in that many in the social sciences emphasize the scientific method or other rigorous standards of evidence in the study of humanity.

NSOU ? CC-SO-01 156 In the upcoming sections we will study these interrelationships of sociology with other social sciences and an exhaustive manner. 13.4 Sociology and

There are many eminent anthropologists who have opined the close relationship between Sociology and anthropology, particularly socio-cultural anthropology. For instance, Frazer is, perhaps, the first anthropologist who defined "social anthropology as that branch of sociology that deals with primitive societies" (Radcliffe-Brown, 1952:2; cf. Voget, 1975:143). According to Frazer, sociology "should be viewed as the most general science of society. Social anthropology would be a part of sociology, restricted to the "origin, or rather the rudimentary phases, the infancy and childhood of human society" By limiting social anthropology to a study of savage life, Frazer echoed the ideas of Waitz and of Tylor in placing the anthropological emphasis on the early history and institutions of mankind" (Voget, 1975:143). According to Radcliffe-Brown (1983) social anthropology is a 'comparative sociology'. By the term 'comparative sociology', he would mean "a science that applies the generalizing method of the natural sciences to the phenomena of the social life of man and to everything that we include under the term culture or civilisation" (p.55). Thus, he is of a considered view that social anthropology should look for 'nomothetic' approach (search for general laws of

100%

MATCHING BLOCK 218/372

SA

ESOC111-U03-SLM.docx (D103358968)

society) rather than the idiographic approach (search for particular scientific facts and processes, as distinct from general laws). It is a method to demonstrate "a particular phenomenon or event" to establish a "general law" (ibid.). There are also many other anthropologists who concur to his view. For instance, Evans-Pritchard, another well-known anthropologist considers social anthropology as "a branch of sociological studies, that branch which chiefly devotes itself to primitive societies" (1951:11). He opines that "when people speak of sociology they generally have in mind studies of particular problems in civilized societies. If we give this sense to the word, then the difference between social anthropology and sociology is a difference of field (

ibid.).

100%

MATCHING BLOCK 206/372

W

While anthropology was formulated as a holistic study of mankind and related aspects, Auguste Comte also considered that sociology would be the overarching study of human society, and therefore, sociology should be the "queen of all sciences".

Even when the discipline of sociology and socio-cultural anthropology were established their relationship still existed. The relationship is mainly because of the similarity in the subject matter and methodology.

Although

100%

MATCHING BLOCK 207/372

W

the subject matter, interests, theories and methodology overlap between sociology and Anthropology, there are also certain differences. The first and foremost difference lies in the definition of the scope of the subjects itself. Sociology is the study (or science) of society, whereas anthropology (integrated anthropology) is the study of man and everything that concerns man, including the physical and socio- cultural aspects.

100%

MATCHING BLOCK 208/372

W

While the emergence of sociology can be mainly attributed to the attempt to bring about social order in the society (in the European social context) after the great social transformation brought about by industrial revolution and French revolution, its influence on the emergence of anthropology was not as direct as with sociology or other social sciences; rather it was an indirect influence through the opening up of intellectual and geographical spaces to enable the European scholars to go outside the European society and study the pre-literate societies (the 'other' non-European societies) (cfr. Eriksen et al 2001; Sarana 1983).

100%

MATCHING BLOCK 209/372

W

Sociology began with the focal interest with the study of society-as a generalizing social science, particularly with a focus on a larger societal context to explain social phenomena.

Sociologists largely employ quantitative methods like questionnaires to collect data and subsequent analysis of the data with the help of statistical techniques. Anthropology began as a field-based science. Anthropologists largely use qualitative methods, particularly 'participant observation' along with other methods and techniques. Anthropologists go out to the field and live with the people for several months or even for years and learn their culture as one of the insiders. However, over a period of time, the differences in the use of research methods and NSOU ? CC-SO-01 158 techniques have changed as sociologists began to extensively employ qualitative methods, while anthropologists also began to profusely use quantitative methods along with qualitative methods. 13.5 Sociology and

100%**MATCHING BLOCK 211/372****W**

Psychology The term psychology is derived from two Greek words; Psyche means "soul or breath" and Logos means "knowledge or study" (study or investigation of something). Psychology developed as an independent academic discipline in 1879, when a German Professor named Wilhelm Wundt established the first laboratory for psychology at the University of Leipzig in Germany. Initially, psychology was defined as 'science of consciousness'. In the simple words, we can define psychology as the systematic study of human behavior and experience.

100%**MATCHING BLOCK 212/372****W**

Sociology and psychology together form the core of the social sciences. Right from their inception as separate academic disciplines, sociology and psychology have studied different aspects of human life. Most of the other species, work on instincts in the physical environment for their survival. While the survival of humans depends upon the learned behaviour patterns. An instinct involves a genetically programmed directive which informs behaviour in a particular way. It also involves specific instruction to perform a particular action (Haralambos and Holborn, 2008).

It is

98%**MATCHING BLOCK 213/372****W**

through socialization that humans learn specific behaviour patterns to suit them best in the physical environment. Humans process the information provided by the social context to make sense of their living conditions. Sociology's basic unit of analysis is the social system such as family, social groups, cultures etc. The main subject matter of psychology is to study human mind to analyse attitude, behaviour emotions, perceptions and values which lead to the formation of individual personality living in the social environment. While sociology deals with the study of the social environment, social collectives which include family, communities and other social institutions psychology deals with the individual. For instance, while studying group dynamism, sociologist and psychologist initially share common interests in various types of groups, and their structures which are affected by the degree of cooperation, cohesion, conflict, information flow, the power of decision making and status hierarchies. This initial similarity of interest, takes on different focus, both the disciplines use different theoretical positions to explain the group phenomena The quest to study human behaviour on scientific principles started with the emergence and establishment of natural sciences during the nineteenth century. Comte thought that society could be studied using the scientific methods of natural sciences. Comte argued careful observation of the entities that are known

NSOU ? CC-SO-01 159

97%**MATCHING BLOCK 214/372****W**

directly to experience could be used to explain the relationship between the observed phenomena. By understanding the causal relationship between various events it is possible to predict future events. He also held the belief that once the rules governing the social life are identified, the social scientist can work towards the betterment of the society. This quest to produce knowledge about the society and place of the individual within it, on the basis evidence and observation is central to the origin of Social psychology. The ideas of early and later sociologist helped to shape the sociological social psychology. Mead studied the effect of social conditions on our sense of self. Other influence contributors in the development of sociological social psychology include Georg Simmel (1858-1918), Charles Horton Cooley (1864-1929), and Ervin Goffman. The emergence of modern social psychology could be traced from the nineteenth century onwards.

100%**MATCHING BLOCK 215/372****W**

Social psychology could be defined as the study of the "interface between these two sets of phenomena, the nature and cause of human social behaviour" (Michener & Delamater, 1999 cf. Delamater, 2006:11). G.W Allport (1954:5) defines social psychology with its emphasis on "the thought, feeling, and behaviour of individual as shaped by actual, imagined, or implied the presence of others".

100%

MATCHING BLOCK 216/372

W

To sum up we can say that social psychology is the systematic study of people's thoughts, feelings, and behaviour in the social context. 13.6

Sociology and History Sociology and history are interrelated to each other. Sociology study society and focuses on current issues by looking their historical background. Both present and past come closer in such analysis. Sociologists often refer to history to explain social changes, developments and changing face of society over period of time. Similarly history also needs social aspects (sociological concepts) to explain past. The boundaries between the two disciplines get blurred and entangled which do entails a context to explain complex webs of social reality.

100%

MATCHING BLOCK 219/372

W

Both sociology and history thus depends on each other to take complete stoke of reality. Sociology depends on history to understand past events, movements and social institutions. Needless to say that sociology is also concerned with the study of historical developments of society. Sociologist studies ancients or old traditions, culture, growth of civilisations, groups and institutions through historical analysis and interpretations.

100%

MATCHING BLOCK 220/372

W

Auguste Comte's conception of sociology includes history in his analyses of growth of sociology and society. He dwells into causes and reasons of developments of humanity through various historical stages. Furthermore, as Tilly (2001) notes, Karl Marx's Capital, Max Weber's Economy and Society or Ferdinand Tonnies'

NSOU ? CC-SO-01 160

100%

MATCHING BLOCK 221/372

W

Gemeinschaft and Gesellschaft have elaborately used historical dimension to enrich their sociological analysis. Such analysis demonstrate that sociology takes help of history (for instance Weber's elaboration of ideal type is an example of how sociologist have drawn to develop their sociological interpretations) to locate an issue and examine its significance. Furthermore, history has many things to offer to sociology

Even though both sociology and history are two different intellectual disciplines in the domain of social sciences, both the disciplines differ in their methods, approaches and purposes. Historians emphasise their findings as time– space localised whereas sociologists believe their understanding transcends space- time dimension. Thus, the major difference between sociology and history is with regard to the nature of data or evidences put for analysis. Sociologist much concerns with the past and primary data whereas historians are concerns with the past and look for secondary data in achieves or past events. For a richer sociological analysis, it is often argued that the sociologists should be historically aware- they should be aware of historical setting and limits which should inform their analysis of social issues. It is said that history interprets whereas natural science explains. Historians collect the concrete and interpret it as unique phenomenon whereas sociologists work on hypotheses, classify and arrange data in relevant and different categories to explore and formulate the typical propositions. It is a fact that sociology and history do not speak same language. The two professions diverge on many counts. notably, one need not to see only just two different professions but structures with distinct languages, style of thinking and values shaped by differences in education and training. It is said that sociologists have crave for numbers, historian for dates and words; sociologists recognise rules and ignore variations whereas historians stress on the individuals and specific. Furthermore, sociology differ from history in the sense that the sociologists seek generalized uniformities and processes to form typology of concepts which differ from the exact data sets proposed in a particular case by the historians. Many scholars called history as concrete and descriptive science of society. History attempts to construct a picture of social past. On the other side, sociology said to be abstract and theoretical science of society. Scope of sociology in this respect considered broader than the history. Sociology is not only concerned with the social present, but with the social past too. Sociology thus covers a wider range of issues; often go with broad purpose and transcend time and space limits to produce generalisation grounded in theoretical propositions. Sociology and history are two different disciplines in the domain of social sciences differ in their methods, approaches and purposes. Sociologists have crave for numbers, historian for dates and words. Sociologists recognise rules and ignore

NSOU ? CC-SO-01 161 variations whereas historians stress on the individuals and specific. Sociologists seek generalised uniformities and processes to form typology of concepts which differ from the exact data sets proposed in a particular case by the historians. History is seen as concrete and descriptive science of society. History attempts to construct a picture of social past. On the other side, sociology said to be abstract and theoretical science of society. Scope of sociology in this respect considered broader than the history. 13.7 Political Science and Sociology Sociology being the study of society and social life touches various political aspects of human life. Both the disciplines together intersecting with each other helps us to understand various issues and concerns of everyday life and policy matters, also issues concerning the functioning of various political institutions and its functions in maintaining the order of the society. Issues such as governance, civil society, voting behaviour, power relations among groups, etc are some of the examples that are of vital importance. Thus these issues brings disciplines of sociology and political science closer. Both sociology and political science share common interests, but at the same time the approaches of both the discipline also differs. In this segment we will try to understand the interrelationship of sociology and political science and how both the disciplines share and differ when comes to understanding the social realities. Political science is generally defined as a scientific study of state, government and politics. Here, probably, the most frequently used concepts are politics, state, power, political socialisation, leadership, governance, decision taking, policy making and its impacts. The concept of politics is central to political science Sociology and political science are closely related to each other in various respects. It has been stated that both the disciplines are closely interwoven when it comes to the analysis of power, authority structures, administration and governace (Lipset 1964). The similarities between the two can be seen in many factors. Political science relies heavily upon sociology for its basic theories and methods. The focal specialities in both the discipline are borrowed from other social science disciplines such as economics, history, anthropology and psychology. The major proponents like LKarl Mae\rx, Max Weber, Talcott Parsons, etc have equally contributed in the growth and development of both the disciplines. Sociology is often defined as scientific study of society. We may also note that society is nothing but a complex network of various groups, institutions, communities,

NSOU ? CC-SO-01 162 associations, people and their everyday life activities. Politics and power dynamics forms integral to all of these conceptions of human lives. Notably, polity or political formations has always been the essential components of any human society. In modern times, no society can be imagined without polity, political institutions or, so to say, any form of political life. State and governance are basic to any society both in terms of its function, development and meeting essential needs of social life such as law and order, security and development. Sociology too essentially reflect on status of social world with a focus on social issues and on the condition of human society, the network of social relationships in an increasingly globalised interconnected world, the growing variety of political traditions, caste and politics, ethnicity, cultural background, economic conditions and linguistic affiliations. Sociology examines various aspects of political behaviour with special focus on their social implications. This in fact indicates deeper intersection between sociology and political science. However both the disciplines differ in their approach. Political scientists investigate into rise, fall and changes of governments and their leaders whereas sociologists see governments as social institutions, political behaviour as outcome of social dynamics and leadership as social phenomena having multifarious implications for social developments. Both sociology and political science intersect at multitude of points and provide a broader analysis of the social reality. Thus, the similarities, between the two, are well appreciated by scholars. However, both the disciplines have differences too which also need to be critically assessed. Sociologist most importantly talk of interaction system, be it within groups, institutions or organisations, whereas political science talk about control mechanism within such groups or organisations. Hence, the frame of reference or perspectives of sociology and political science differ. The former primarily concerned about interactionist views, whereas later focuses on power structure, order and control mechanisms. Scholars argued that when sociological perspective of interaction system is applied to the analysis of political phenomena it tends to become political sociology. Political sociology often sees as a new, growing and burgeoning sub-field within the discipline of sociology. It is considered as a connecting bridge between sociology and political science. Sociologists see two way relationships between the two (Rathore 1986). Both have a give and take relationship. Various other scholars see political sociology as a marriage between sociology and political science which studies and brings critically important and newer areas as mentioned earlier which touches both sociology and political science, but could not be adequately studied by either one.

NSOU ? CC-SO-01 163 13.8 Sociology and Economics Economics is a social science that deals with human wants and their satisfaction. Classical economics assumes that people have unlimited wants and the resources to satisfy these wants are limited. They are always engaged in work to secure the things they need for the satisfaction of their wants. The farmer in the field, the worker in the factory, the clerk in the office, and the teacher in the school are all at work. The basic question that arises here is: Why different people undertake these activities? The answer is that they are working to earn income with which they satisfy their wants

100%

MATCHING BLOCK 222/372

sociology. For its own comprehension, economics takes help of sociology and depends on it. Economics is a part of sociology hence without the help from sociology;

it

is very difficult to understand economics completely.

91%

MATCHING BLOCK 226/372

W

Similarly, Sociology too takes help from economics. Economics greatly enriches sociological knowledge. Economic factors greatly influence each and every aspects of social life.

Some of the important social problems like dowry, suicide etc. cannot be sociologically analyzed without the help of economics because these social problems are mainly of economic crisis. Hence, we can say that

100%

MATCHING BLOCK 238/372

SA

ESOC111-U03-SLM.docx (D103358968)

economics is a part of sociology and without the help of economics;

sociologists will not be able to find solutions for many social problems. Economics greatly contribute to the field of sociological knowledge and research. The well-known social scientist Karl Marx said that

72%

MATCHING BLOCK 227/372

W

economic relations constitute the foundation of society. Economic factors plays vital role in every aspect of our social life and so, Sociologists are concerned with economic institutions. For this reason, Sociologists like Spencer, Weber, Durkheim and others have relied on economics in their analysis of social relationships.

Economists are more and more making use of the sociological concepts in the study of economic problems. Economists work with sociologists in their study of the problems of economic development in underdeveloped countries. Combined efforts of both the experts may be of great practical help in meeting the challenges Despite the above discussed interrelationship between sociology and economics, both
NSOU ? CC-SO-01 164 the sciences have certain differences as well.

100%

MATCHING BLOCK 228/372

W

Sociology primarily studies about society and social relationships whereas economics studies about wealth and choice. Sociology emerged as a science of society very recently whereas economics is comparatively an older science. Sociology is considered as an abstract science whereas economics is considered as a concrete science in the domain of social sciences. Sociology generally deals with all aspects of social science whereas economics deals specific aspects of social science. Sociology has a very wide scope whereas economics scope is very limited. Sociology is concerned with the social activities of individuals whereas economics is concerned with their economic activities. Society is studied as a unit of study in Sociology whereas individual is taken as a unit of study in economics. Both Sociology and economics differ from each other in respect of the methods and techniques they use for their study. 13.9

Cultural studies Cultural studies is an interdisciplinary field concerned with the role of social institutions in the shaping of culture. Cultural studies emerged in Britain in the late 1950s and subsequently spread internationally, notably to the United States and Australia. Originally identified with the Center for Contemporary Cultural Studies at the University of Birmingham (founded 1964) and with such scholars as Richard Hoggart, Stuart Hall, and Raymond Williams, cultural studies later became a well- established field in many academic institutions, and it has since had broad influence in sociology, anthropology, historiography, literary criticism, philosophy, and art criticism. Among its central concerns are the place of race or ethnicity, class, and gender in the production of cultural knowledge which are studied in the discipline of sociology too. Nearly half a century ago, Raymond Williams (1961: 10) wrote that there was no academic subject which allowed him to ask the questions in which he was interested: questions of how culture and society, democracy and the individual voice, interrelate. The early tradition of cultural studies emerged into this gap, drawing in part on the resources of sociology. Looking back, the historical parallel between Williams and the critical sociology of C. Wright Mills was not accidental, since that too privileged the role of power in culture and cultural analysis (1959: 33, quoted Hall, Neitz and Battani 2003: 2). From the beginning, then, the robustness of cultural studies' relationship with sociology was crucial to cultural studies' possibilities of success. The first substantive strand of cultural studies that we might identify for this purpose focused on to the forms and dynamics of contemporary popular culture.

NSOU ? CC-SO-01 165 There are sociological problems with isolating the 'popular' as the focus of cultural studies in this way. For one thing, this excludes many important areas of taste and cultural consumption, for example the cultural experience of the old (Tulloch 1991; Riggs 1998), 'middlebrow' culture (Frith 1986), the cultural experience of elites (Lamont 1991), indeed any cultural experience that is not 'spectacular' or 'resistant' (Couldry 2000; 58-62). Finally, an exclusive emphasis on 'the popular' ignores the need to deconstruct the relation between what is designated 'popular' and everyday 'experience' (Hall 1981). The second strand within early cultural studies that we might identify as a potential contact point with sociology is the strand that prioritised ways of reading culture, especially those derived from semiotics and versions of post-structuralism. This is the strand most frequently emphasised in histories of cultural studies (Turner 1990; Barker 2003; Tudor 1999). But here too there are difficulties. On the one hand it becomes, in some versions, an attempt to read all culture as, indeed only as, text, an approach which is resolutely non-sociological and so inadequate to understand the multilayered but structured complexity of culture (Hannerz 1992). On the other hand, the use of semiotics and post-structuralist approaches to reading culture has largely been absorbed across all cultural sociology and humanities work (Hall, Heizert and Bettani 2003), so no longer comprises a distinct strand of its own. The third strand within early cultural studies that tried to focus cultural analysis on the particular question, and problem, is of democratic culture. It is this strand that develops furthest the concern for hidden power relations within culture, both inclusions and exclusions, that marked off cultural studies from the start. The early work of Raymond Williams did so by identifying a culturally-embedded democratic deficit at the heart of societies such as late 1950s Britain (Williams 1958, 1961).

13.10 Summary From the above discussion it can be inferred that sociology as a discipline can be studied in relation to other social sciences such as social anthropology, psychology, history, political science and economics. Together they help us to examine the social realities of our society through the culmination of various approaches and methods used by the respective disciplines.

Objectives After reading this unit, you will be able to: ? Understand the meaning of

the concept of individual, ? Identify the concept of society, ? To get the actual position of the relationship between individual and society, ? To understand how a man is a social animal, ? To know how individual and society affect each other. NSOU ? CC-SO-01 169 14.2 Introduction The most distinctive feature of human life is its social character. All human beings have to interact with other human beings in order to survive. Aristotle, the great Greek philosopher, remarked that 'Man is a social animal'. Both nature and necessity impel man to live in society. Man's behaviour in society is determined mainly by two forces- physical and social which he has been trying to understand and control from time immemorial. 14.3 Concept of Society Man is a social animal. Sociology is generally defined as 'the science of society'. So, what is society? Society is the most vital term in sociology. The "society" means relationships social beings, men, express their nature by creating and re-creating an organization which guides and controls their behaviour in myriad ways. Society liberates and limits the activities of men and it is a necessary condition of every human being and need to fulfilment of life.

87%

MATCHING BLOCK 240/372

SA Module 1 - 5.docx (D21364761)

Society is a system of usages and procedures of authorities and mutual aid of many groupings and divisions of controls of human behaviour and

of liberties.

This ever-changing, complex system, we call society, and it is the "web of social relationships". And it is always changing. Society exists only where social beings "behave" toward one another in ways determined by their recognition of one another. There are two types of definitions of society: (i) the functional definition and (ii) the structural definition. From the functional point of view, society is defined as a complex of groups in reciprocal relationships, interacting upon one another, enabling human organisations to carry on their life-activities and helping each person to fulfil his wishes and accomplish his interests in association with his fellows. From the structural point of view, society is the total social heritage of folkways, mores and institutions of habits, sentiments, and ideas. Ginsberg, Giddings, Cole and Cuber take a structural view of society which Mclver, Persons, Lapiere, Cooley and Leacok have given functional definition of society. The latter include in its different activities of the individuals and their relations with one another. Society not confined limited to human beings. There are many degrees of animal societies, likely the ants, bees, the hornet are known to most school children. It has been contended that where-ever there is life there is society because life means heredity and so far as we know, can arise only out of and in the presume of other life. A higher animal at least has a very definite society, arising us of the requirement their nature and the conditions involved in the persuasion of their special in society each member seeks something and gives something.

NSOU ? CC-SO-01 170 Society is an abstract term that connotes the complex of inter-relations that exist between and among the members of the group. Society exists whenever there is good or bad, proper, or improper relationships between human beings. These social relationships are not evident, they do not have any concrete form and hence society is abstract. Society is not a group of people, it means

90%

MATCHING BLOCK 239/372

W

in essence a state or condition, a relationship and therefore necessarily

and abstraction. Society is organization of relationship. It is the total complex of human relationship. Social relationships invariably possess a physical element, which takes the form of awareness of another's presence, common objective or common interest. Thus, reciprocal awareness, likeness, interdependence, difference and co-operations are the essential elements to constitute society. The relation between individual and society is very close. Essentially, "society" is the regularities customs and ground rules of antihuman behaviour. These practices are tremendously important to know how humans act interact with each other. Society does not exist independently without individual. The individuals lives and acts within society, but society is nothing in spite of the combination of individuals for cooperative effort. On the other hand, society exists to serve individual not the other way around.

90%

MATCHING BLOCK 241/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

Human life and society almost go together. Man is biologically and psychologically equipped to live in groups, in society. Society has become an essential condition for human life to arise and to continue. The relationship between individual and society is ultimately one of the profounds of all the problems of social philosophy. It is more philosophical rather than sociological because it involves the question of values.

Man depends on society.

a societal force. It is in the society again that he has to conform to the norms, occupy statuses and become members of groups. The question of the relationship between the individual and the

society in the starting point of many discussions. It

95%

MATCHING BLOCK 245/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

is closely connected with question of the relationship of man and society.

The relation between the two depends upon one fact that the individual and the society are mutually dependent, one grows with the help of the other. Man is a social animal. Before we explain the relationship between man and society, it may be worth while to explain the origin of society. Various thinkers and philosophers have been put forward to explain the origin of society. According to Divine origin theory God created all the animate and inanimate objects of this world, so He created the society as well. In course of time Divine origin theory took the form of Divine Right Theory. According to this theory, all men are born free. The Force Theory makes society the result of superior physical force. According to this theory, the

100%

MATCHING BLOCK 244/372

society originated in the subjugation of the weaker by the stronger.

NSOU ? CC-SO-01 171 In addition to these theories the contract

91%

MATCHING BLOCK 246/372

SA

Nilamani Dutta_Philosophy.pdf (D15264414)

theory views society as a contrivance deliberately set up by men for certain

ends. The aim of this paper is to show the questions: how a man is a social animal and how individual and society affect each other? In what sense is man a social animal? In what sense do we belong to society? These questions are aspects of one fundamental question, the relation of the unit, the individual, to the group and to the social system. This question is the starting point and the focus of all sociological investigation. What is the relation of the individual to society? Traditionally, there are two opposed approaches to the solution of the problem, which have been particularly influential in the history of western social thought—the social contract theory and the organic theory. In addition to these theories there exists evolutionary theory. 1. The Social Contract Theory A number of thinkers and philosophers have viewed that society has deliberately created by formal contract or convention. This theory of social contract reached its fullest expression in the social and political thought of Europe in the Seventeenth and Eighteenth centuries. Thomas Hobbes, Locke and Rousseau had been the three great exponents of the theory in these centuries. According to the theory, Society has been created by men for security and safeguard their liberties and properties. All men were born free and equal. Individual precedes society i.e. men lived in a pre-social state. Individuals who originally lived in a pro-social state made a mutual agreement and created society. Society is made by men, he is more real than his creation.

MATCHING BLOCK 247/372

SA

Nilamani Dutta_Philosophy.pdf (D15264414)

According to Hobbes man in the state of nature was in perpetual conflict with his

neighbours on account of his essentially selfish nature. In his own words, the life of man was "solitary, poor, nasty, brutish and short. Every man was an enemy to every man. To protect himself against the evil consequences man organized himself in society in order to live in peace with all". Locke, another social contract thinker, believed that the

82%

MATCHING BLOCK 248/372

SA

Nilamani Dutta_Philosophy.pdf (D15264414)

state of nature was not a state of war. It was a state of peace. Man in the state of nature was enjoying an ideal liberty

free from any social restraints; but in order to ensure the exercise of his liberty he

93%

MATCHING BLOCK 249/372

SA

Nilamani Dutta_Philosophy.pdf (D15264414)

entered into a contract by which the individuals conferred power, not to the government, as Hobbes thought, but to the community. This contract

is not absolute, because to

75%

MATCHING BLOCK 250/372

SA

Nilamani Dutta_Philosophy.pdf (D15264414)

the natural rights of life, liberty and property remain in hands of the individual.

NSOU ? CC-SO-01 172 J.J. Rousseau in his Contract Social (1762) held that men in the state of nature were equal, self-sufficient and contented. They lived life of idyllic happiness and primitive simplicity. But

56%

MATCHING BLOCK 251/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

growth in numbers of men and the quarrels arising among them compelled man to make a contact with his fellow men in virtue of which everyone, while uniting himself to all remain, as free as before. Out of this contract

a general will emerges which is really

83%

MATCHING BLOCK 252/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

sovereign and includes by a tacit agreement the individual wills of all. 2.

The organic theory of society This theory is as old as Plato and Aristotle. Plato compared society or state to a magnified human being. The organic theories may be grouped under two types: Organic theories strictly so called, and Idealistic or group-mind theories. The organic theory views society as a living organism possessing organs which performs functions analogous to those of a plant or animal. This view of society was put forward by the biological school of social and political theorists in the 19 th century-Bluntschli, Spengler, Novicow and Herbert Spencer. All of them notably Spencer, pointed to the similarity between the growth of living beings towards higher life and the development of society. Both the animal and social bodies, Spencer affirmed, begin simple forms, grow, and develop. In the process the parts become more complex, and the function varied. But in each case the parts remain interdependent. Just as the different parts of the body- like the ears, the hands, the legs and the head-are mutually dependent and form one unit even though they have distinct functions of their own. Likewise, society, composed of individuals having distinct function of their own, is one integrated whole. Pursuing the analogy further, Spencer said that corresponding to the sustaining system, the distributary system and the regulatory system of a human body society has its own system of industries, of transportations and of government and military. According to some thinkers, society passes through the organic processes of birth, youth, maturity, old age and death. The group-mind or idealist theory is closely related to the organic theory. It has been propounded by a number of thinkers including Plato, Hegel, Bosanquet, Otto Gierke, McDougal Emerson and Wagner and Wundt.

87%

MATCHING BLOCK 253/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

Plato called society a "mind writ large" Divided it into three classes

of philosophers. Warriors and Artisans (workers) based respectively on wisdom, courage and desire. However, this comparison of society with the human mind did not go beyond a metaphor in Plato. 3. Evolutionary Theory To explain the origin of society evolutionary theory played a vital role.

NSOU ? CC-SO-01 173 According to evolutionary theory society is not a make but a growth. It is the result of a gradual evolution. It is a continuous development from unorganized to organized, from less perfect to more perfect. Various factors helped in its development from time to time. Kinship and family were the earliest bonds uniting man with man. "Kinship creates society", says McIver. Religion was another factor to held in the creation of social consciousness. As a matter of fact, as Gettell observes, "kinship and religion were simply two aspects of the same thing". They were closely inter- twined. Man gave up his wandering habits, settled in villages and cities, and took to the pastoral and agricultural life. The population began to multiply. Wealth was advanced. All this necessitated changes in the forms of social relations and man arrived at such advanced forms of social organisations as the nation state. The above-mentioned theories fail to explain adequately the relationship between the individual and society.

90%

MATCHING BLOCK 254/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

The social contract theory puts under emphasis upon the individual minimizing thereby the value of society which is said to be

a

100%

MATCHING BLOCK 255/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

mere instrument devised for the satisfaction of certain human needs. The

social contract theory seems to assume that man as individual is prior to society, but this assumption is erroneous because of the fact that sociality is inborn in man. The organic theory views society as a living organism-The theory of "Social Organism" or "Social mind" is correct in so far as it stresses the dependence of man on society. But the theory denies the individuality to the individual.

100%

MATCHING BLOCK 256/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

The organic and group-mind theories almost entirely discount the role of individual in social life.

Hence it indicates a one-sided relationship between man and society. But

90%

MATCHING BLOCK 258/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

the relationship between individual and society is not one-sided as these theories seem to indicate.

Before we try to understand the true relationship between individual and society, we may just follow in what sense man can be called a social animal. Man can be called a social animal on the basis of the following reasons: 14.4 Man is social by nature Man is

91%

MATCHING BLOCK 257/372

W

a social animal by nature. Man is a social animal because his nature makes him so. Sociality or sociability is his natural instinct. He can

not but live in

100%

MATCHING BLOCK 260/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

society. No human being is known to have normally developed in isolation.

Man's nature is such that he cannot afford to live alone. Eminent sociologist Mclver has

95%

MATCHING BLOCK 259/372

W

cited a number of case studies to justify the theory of development of man's social nature. In these cases human infants were isolated from all social relationships to make experiments

about man's social nature. The first

61%

MATCHING BLOCK 269/372

SA Nilamani Dutta_Philosophy.pdf (D15264414)

case was of Kaspar Hauser who from his childhood until his seventeenth year was brought up in the woods of Nuremberg

in Germany. In his NSOU ? CC-SO-01 174 case it was found that at the age of seventeen (in 1925)

95%

MATCHING BLOCK 261/372

W

he could hardly walk, had the mind of an infant and could mutter only a few meaningless words. In spite of

his subsequent education and training he could never make himself a normal man.

84%

MATCHING BLOCK 262/372

W

Lack of social life could not make him a social being. The second case was of two Hindu children namely Amala and Kamala

who in 1920 were discovered in a wolf den. One of the children died soon after discovery. The other could walk only on all four, possessed no language except wolf like growls. She was shy of human being and afraid of them. It was only after careful and sympathetic training that

70%

MATCHING BLOCK 263/372

W

she could learn some social habits. It shows how human nature develops within her. The

third case was of

96%

MATCHING BLOCK 264/372

W

Anna, an illegitimate American child who had been placed in a room at

the age of six months and discovered five years later in 1938. On

85%

MATCHING BLOCK 265/372

W

discovery it was found that she could not walk or speak and was indifferent to people around her. But After careful and sympathetic training it was found that she quickly learns human qualities. But after few years she died. It is another feral case study experimented by sociologists. Issabella was an illegitimate child who was locked in a room with her deaf and mute mother by her kinsmen to hide her existence. But when she was discovered she knew no words and made only animal like sounds and her mind was undeveloped. But after some special and careful education and training she became able to learn human behaviour and learn language. She was enrolled in a school. She became successful in making adjustments with her classmates. Her case further strengthens the fact that man became a social animal only when he lives

in society. All the above case studies prove that human being is social by nature. Human nature develops in man only when he lives in society, only when he shares with his fellow beings' common life. Even the sadhus who have retired from worldly life live in the company of their fellows in the forest. All this tends to show that society is something which fulfills a vital need in man's constitutions, it is not something accidentally added to or super-imposed on human nature. He knows himself and his fellow beings within the framework of society. Indeed, man is social by nature. The

70%

MATCHING BLOCK 266/372

W

social nature is not super imposed on hum or adde4d to hum rather it is inborn. 14.5 Necessity Makes man a social animal

Man lives in a society. He

89%

MATCHING BLOCK 267/372

W

is a social animal not only by nature but also by necessity. It is said that needs and necessities make man social. Man has many needs and necessities. Out of these different needs-social, mental, and physical-are NSOU ? CC-SO-01 175 very important and needs fulfillment. He cannot fulfill these needs without living in society. All his needs and necessities compel him to live in society. Many of his needs and necessities will remain unfulfilled without the cooperation of his fellow beings. His psychological needs only fulfilled within the course of living in society. He is totally dependent for his survival upon the existence of society. Human baby is brought up under the care of his parents and family members. He would not survive even a day without the support of society. All his basic needs like food, clothing, shelter, health and education are fulfilled only within the framework of society. He also needs society for his social and mental developments.

To fulfill his security concern at the old age individual lives

86%

MATCHING BLOCK 268/372

W

in society. Similarly, helplessness at the time of birth compels him to live in society.

A nutrition, shelter, warmth and affection need compel him to live in society. Thus,

64%

MATCHING BLOCK 270/372

W

for the satisfaction of human wants man lives in society. Hence it is also true that not only for nature but also for the fulfillment of his needs and necessities man lives in society. 14.6 Man lives in society for his mental and intellectual development Society not only fulfils his physical needs and determines his social nature but also determines his personality and guides the course of development of human mind. Society moulds our attitudes, beliefs, moral ideas and thereby moulds individual

personalities.

86%

MATCHING BLOCK 271/372

W

From birth to death individual acquires different social qualities by social interaction with his fellow beings. Individual mind without society remains undeveloped at infant stage. The cultural heritage determines man's personality by moulding his attitudes, beliefs, morals and ideals. With the help of social heritage

determines man's in born potentialities are unfolded.

100%

MATCHING BLOCK 272/372

W

He acquires personality within society. There exists a very close relationship between individual and society like that of cells and body.

100%

MATCHING BLOCK 273/372

W

Thus, from the above discussion we conclude that man is a social animal. His nature and necessities makes him a social being. He also depends on society to be a human being. 14.7

Relation between individual and society Man cannot survive without society and societies cannot exist without members. Still there may be conflicts between the individual and society. One can imagine that social systems function better when they have considerable control over their NSOU ? CC-SO-01 176 individual members, but that this is a mixed blessing for the system's members. Likewise, can competition with other societies strengthen the social system, while wearing out its constituent members? This idea was voiced by Rousseau (1764) who believed that we lived better in the original state of nature than under civilization and who was for that reason less positive about classic Greek civilization than his contemporaries. The relation between individual and society has been an interesting and a complex problem at the same time. It can be stated more or less that it has defined all solutions so far. No sociologist has been able to give a solution of the relation between the two that will be fully satisfactory and convincing by reducing the conflict between the two to the minimum and by showing a way in which both tend to bring about a healthy growth of each other. Aristotle has treated of the individual only from the point of view of the state and he wants to the individual to fit in the mechanism of the state and the society. It is very clear that relation between individual and society are very close. So, we will discuss here Rawls three models of the relation between the individual and society. 14.7.1 Utilitarianism The first model in Rawls's presentation of the position of classical utilitarianism. His argument against the utilitarian position is that it conflates the system of desires of all individuals and arrives at the good for a society by treating it as one large individual choice. It is a summing up over the field of individual desires. Utilitarianism has often been described as individualities, but Rawls argues convincingly that the classical utilitarian position does not take seriously the plurality and distinctness of individuals. It applies to society the principle of choice for one man. Rawls also observes that the notion of the ideal observer or the impartial sympathetic spectator is closely bound up with this classical utilitarian position. It is only from the perspective of some such hypothetical sympathetic ideal person that the various individual interests can be summed over an entire society. The paradigm presented here and rejected by Rawls is one in which the interests of society are considered as the interests of one person. Plurality is ignored and the desires of individuals are conflated. The tension between individual and society is resolved in subordinating the individual to the social sum. The social order is conceived as a unity. The principles of individual choice derived from the experience of the self as a unity are applied to society as a whole. Rawls rightly rejects this position as being unable to recount for justice except perhaps by some administrative decision that it is desirable for whole to give individuals some minimum level of liberty and happiness. But individual person does not enter into the theoretical position. They are merely sources or directions from which desires are drawn.

NSOU ? CC-SO-01 177 We will discuss here Rawls three models of the relation between the individual and society. (i) Utilitarianism. (ii) Justice as Fairness. (iii) The idea of a social union. 14.7.2 Justice as Fairness The second paradigm is that which characterises the original position. It has already been suggested that this is a picture of an aggregate of individuals, mutually disinterested, and conceived primarily as will, while not necessarily egoistic, their own life plans. They coexist on the same geographical territory and they have roughly similar needs and interests so that mutually advantageous cooperation among them is possible. I shall emphasize this aspect of the circumstances of justice by assuming that the parties take the interest in one another's interest. Thus, one can say, in brief, that the circumstances of justice obtain whenever mutually disinterested persons put forward conflicting claims to the division of social advantages under conditions of moderate scarcity. Here the tension between individual and society is resolved in favour of plurality, of an aggregate of mutually disinterested individuals occupying the same space at the same time. It is resolved in favour of the plural, while giving up any social units which might obtain. The classical utilitarian model and the original position as sketched by Rawls provide paradigms for two polar ways in which the tension between the plurality of individuals and the unity of social structure might be resolved one resolutions favours unity and the other favours plurality. 14.7.3 The idea of a social union The third paradigm is included under Rawls' discussion of the congruence of justice and goodness and of the problem of stability. It is described as a good, as an end in itself which is a shared end. This paradigm is distinct both from the conflated application to the entire society of the principles of choice for one person and from the conception of society as an aggregate of mutually disinterested individuals. The idea of a social union is described in contrast to the idea of a private society. A private society is essentially the second model as realised in the actual world. It seems from a consideration of the conditions of the original position as descriptive of a social order. Over against this notion of private society. Rawls proposes his idea of a social union. It is one in which final ends are shared and communal institutes are valued.

NSOU ? CC-SO-01 178 14.8 The view of Marx and Engels on the relationship between individuals and society on the discussion about the relationship between individuals and society Marx and Engels divided into three categories: (i) general statements concerning the dialectical relations between the two and the historicity of human nature; (ii) concrete descriptions – often angry, sometimes satirical - of the impact on people of their particular relations to the production process and the examination, as a major concern, of "estrangement" or "alienation"; and (iii) analysis of consciousness with particular attention to the pervasive power of commodity fetishism in class society. Besides the relationship between individual and society can be viewed from another three angels: (a) Functionalist, (b) Inter-actionist, and (c) Culture and personality. 14.8.1 Functionalist view How society affects the individual? Functionalists regard the individual as formed by society through the influence of such institutions as the family, school, workplace etc. Early sociologist such as Herbert Spencer, Emile Durkheim society is reality, it first in origin and importance to the individual. Durkheim's keen discussion of the collective consciousness showed the ways in which social interactions and relationships and ultimately society influence the individual's attitudes, ideas and sentiments. He utilized his theory of "collective representation" in explaining the phenomena of religion, suicide, and the concept of social solidarity. In contrast to Auguste Comte who regarded the individual as a mere abstraction, a some what more substantial position by Durkheim held that the individual was the recipient of group influence and social heritage. In sociological circle, this was the "burning question" (individual vs society) of the day. How society is important in the formation of individual's personality in clearly reflected in the cases of isolated and feral children. The studies of feral children, referred to earlier, have clearly demonstrated the importance of social interaction and human association in the development of personality. 14.8.2 Inter-actionist view How is society constructed? An important question is raised how an individual helps in building society? To inter-actionists society is formed through the interaction of the people. The pro-founders of this approach was Max Weber (social action theorist) who pointed that society is build up out of the interpretations of individuals.

NSOU ? CC-SO-01 179 The structuralists (functionalists) tend to approach the relationship of self (individual) and society from the point of the influence of society on the individual. Inter-actionist, on the other hand, tend to work from self (individual) "outwards" stressing that the people create society. A prominent theorists of the last century Talcott Parsons developed a general theory for the study of society called action theory, based on the methodological principle of voluntarism and the epistemological principle of analytical realism. The theory attempted to establish a balance between two major methodological traditions: the utilitarian-positivist and hermeneutic idealistic traditions. For Parsons, voluntarism established a third alternative between these two. More than a theory of society Parsons presented a theory of social evolution and concrete interpretation of the "drives" and directions of world history. He added that the structure of society which determines roles and norms, and the cultural system which determines the ultimate values of ends. His theory was severely criticised by George Homans. In his presidential address "bringing man back in" Homans re-established the need to study individual social interactions the building blocks of society. A recent well-known theorist Anthony Giddens has not accepted the idea of some sociologists that society has an existence over and above individuals. He argues, "Human actions and their reactions are the only reality, and we cannot regard societies or systems as having an existence over and above individuals".

14.8.3 Culture and personality view How individual and society affect each other? Or Individual and Society interacts? Both the above views are incomplete. In reality, it is not society or individual, but it is society and individual which helps in understanding the total reality. The extreme view of individual or society has long been abandoned sociologists from Cooley to the present have recognised that neither society nor the individual can exist without each other. This view was laid down mainly by Margaret Mead, Kardiner and others who maintained that society's culture affects personality (individual) and, in turn, personality helps in the formation of society's culture. These anthropologists have studied hoe society shapes or controls individuals and how, in turn, individuals create and change society. Thus, to conclude, it can be stated that the relationship between society and individual

100%

MATCHING BLOCK 274/372

SA

Nilamani Dutta_Philosophy.pdf (D15264414)

is not one-sided. Both are essential for the comprehension of either.

Both go hand in hand, each is essentially dependent of the other. Both are interdependent on each other. The individual should be subordinated to society and the individuals should

NSOU ? CC-SO-01 180 sacrifice their welfare at the cost of society. Both these views are extreme which see

89%

MATCHING BLOCK 275/372

SA

Nilamani Dutta_Philosophy.pdf (D15264414)

the relationship between individuals and society from merely the one or the other side.

But surely all is not harmonious between individual and society. The individual and society interact on one another and depend on one another. Social integration is never complete and harmonious. 14.9 Conclusion The well-being of nations can occur at the cost of the well-being of their citizens, and this seems to have happened in the past. Yet in present day conditions, there is no such conflict. Society and individual are made mutually dependent and responsible and mutually complementary. As a result, society progresses well with the minimum possible restrictions on the individual. Society demands greater sacrifices from its greater individuals while the fruits of the works of all are meant equally for all. A sincere attempt is made by the sociologists to bring to the minimum the clash between the individual and the society, so that there will be few psychological problems for the individual and the society both. The inherent capacities, energies and weakness of the individual are properly taken into account and the evolution of the relation between the two is made as natural as possible. Human values and idealism being given due respect, the development of the relation between the two is more or less philosophical. 14.10 Summary Sociology is generally defined as 'the science of society'. Man is a social animal. Both nature and necessity impel man to live in society. He lives in social groups in community and in community and in society. He cannot live without

93%

MATCHING BLOCK 279/372

SA

Nilamani Dutta_Philosophy.pdf (D15264414)

society. Society has become an essential condition for human life to arise and to continue.

So, society is the most important term in sociology. Society is the 'web of social relationship.' Society may be defined in ways: (i) functionally defined and (ii) defined structurally. Society is always changing. Society is always changing. Society is an abstract term. The relation between society and individual is very close. The question of relationship between the individual and the society is the starting point of many discussions. The aim of this unit is to show the questions: 1. How a man is a social animal? 2. How individual and society affect each other? Traditionally there are two opposed approaches to the solution of the problem. 1. The Social Contract Theory and 2. The Organic Theory. Besides in addition to these theories there exists evolutionary theory. A number of sociologists have viewed that society has been created by formal contract. Thomas Hobbes, Locke and Rousseau had been the

NSOU ? CC-SO-01 181 three great exponents of the theory. According to the theory society has been created by men for security and to safeguard their liberties and property. The others are the organic theory of society and evolutionary theory. The above-mentioned theories fail to explain the relationship between the individual and the society. Maclver has

100%

MATCHING BLOCK 276/372

W

cited a number of case studies to justify the theory of development of man's social nature.

All the above four case studies prove that human being is social by nature. Human nature develops in man only when he lives in society, only when he shares with his fellow beings' common life. Necessity makes man a social animal. Man lives in society for his mental and intellectual development. A number of thinkers viewed that man cannot survive without society and society cannot exist without individuals. Yet you can have individuals without society, but society is nothing more than a group of individuals. Therefore, the individual is more important, as society is not a thing, just an interacting set of individuals, each properly seeking their own interests. Keywords : Society, Individual, Personality, Culture. 14.11 Questions 1. Answer the following questions briefly: (5 marks) (a) What do you mean by society? (b) How is society related to culture? (c) "Society is the web of social relationship"- Discuss. (d) "Man is a social animal"-Describe the relation between man and society. (e) Why individual becomes a social animal by nature? (f) How does individual affects society? (g) How does society affect the individual? (h) Why is society and culture interdependent? 2. Answer in detail: (10 marks) (a) What is the relationship between individual and society? (b) What is the role and responsibilities of the individual in society? (c) How individual and society affect each other? (d) In reference to the four case studies show how human beings became social animal? (e) How can individual contribute to bring changes in society?

NSOU ? CC-SO-01 184 15.2 Introduction Man is a social animal. He rarely, if ever, exists alone. As human beings we are part of several social groups, because human beings have lived in various types of groups. Under different circumstances from the primitive hunting and gathering societies to modern electronic age. Now we are trying to know about social group. Man forms as well as interact with numerous groups which vary according to size, structure and the quality of interaction among social members in every society. His daily life is largely of participating in groups. Groups are created and maintained because they enable individual members to attain certain goals or interests which they hold in common. Our social behaviour and personalities are shaped by the groups to which we belong. Through out his life, individual is a member of various groups – some are chosen by him, others are assigned to him at birth. Group's constitute the complex pattern of the "Social structure". Groups are a part of society. Parsons defined sociology as the study of structural and functions of human groups. Social group is the basic factor in all social functions, social structures, social institutions, system and organization. All sociological studies are based upon the study of social group. 15.3 Definition In this unit, we shall devote our attention to the study of social groups as the very basic organ in society. Everyone knows what a group is in general. When two persons or more come together and interact at one place it may be called a group. The group may be defined in various ways. Some important definitions regarding group are given below. 1. According to R. M. WILLIAMS (1951), "A social group is a given aggregate of

100%

MATCHING BLOCK 277/372

W

people playing inter-related roles and recognized by themselves or

other as a unit of interaction". Here it can be said group is an aggregate of some people. The roles of the group members are inter-related. The group is considered as unit. 2. To R. M. Maclver (1953), "By group we mean any collection of social beings who enter into distinctive social relationships with one another. It is clear that there must be social relationships between the individual members of a group. 3. According to David (1968), "A social psychological group is an organized system of two or more individuals who are inter-related so that the system performs some functions, has a standard set of the role relationship among

NSOU ? CC-SO-01 185 its members and has a set of norms that regulate the function of the group and each of its members".

4. Kretch, Crutchfield and Ballachy (1962) defined psychological group "as two or more persons who meet the following conditions: (i) the relations among the members are independent, each member's behaviour influences the behaviour of each of the other, (ii) the members "share on ideology" a set of beliefs values and norms which regulate their mutual conduct". 5. According to Paulus (1989), "A group consists of two or more interacting persons who share common goals, have a stable relationship are somehow interdependent and perceive that they are in fact part of a group". Here we can say that individuals interact with each other, either directly or indirectly. Besides this, the group members are independent in some manner i.e. what happens to one must affect what happens to others. Not only this, their relationship must be relatively stable. The members of the group involve to attain the goals and their interaction will be in a structured form so that, each group member performs the same or more or less similar functions each time they meet. Finally, it can be said that the individuals involved in a group must recognise that they are part of a group. Members of a social group need not have close physical or social contact, but the awareness of common membership is absolutely necessary for a group to exist. To know the meaning of the group more clearly we think about all the groups to which we belong, viz, local friends, college friends, music, dance groups and so many. Generally people join in groups due to various needs and these include- i. Satisfaction of important psychological and social needs viz receiving affection and attention, for attaining belongingness. ii. Achievement of goal in a smooth and easy way. By working with others, the person performs the task well than doing it alone. iii. Getting knowledge and information on various issues which are not available at one place. iv. Getting safety and security. In psychology we define group as the study of organisations and their behaviour. Psychology studies groups and explores the control of the individual within the group setting. Social organisational and group psychology are all powerful areas of study that look at many factors that drives group behaviour and the decisions that a group makes. Depending on the groups influence the group members individuality is often relinquished for the greater good of the group. It is the role of social psychology to uncover why this release occurs in groups and what effects it has on society.

NSOU ? CC-SO-01 186 15.3.1 Important features of group The important features of group are : i. One or more individuals come together and influence each other. ii. There are social interactions and relationships amongst the individual members of a group. iii. There exists some common motives, drives, interests, emotions etc amongst group members. iv. There is communication among group members, both verbal or non-verbal. v. The group members have some common object of attention and group members stimulate each other. vi. They have common loyalty and participate in similar activities. vii. There exists feeling of unity in the group. Group members treat each other with respect and regard and has a sense of camaraderie that develops among them. viii. The action of the members in controlled by group. ix. There are some customs, norms and procedures which are acceptable to everyone but if exception happens, then the particular member will be ostracised from the group. 15.3.2 Characteristics of Social groups From the definitions of social group given above the following characteristics may be pointed out : i. A strong sense of we-feeling : The members of a group help each other and defend their interests collectively. There is a feeling of belongingness among the members of the group. They work collectively against the harmful powers. ii. Reciprocal relation : Reciprocal relation exists among its members. The members of a group are interrelated to each other. Social relations are the fundamentals of group life. iii. Common interest : Each and every member of the group has a common interest. There is similarity among the members in regard to their interest which promotes unity. iv. A sense of unity : The members of a group are united by a sense of unity and a feeling of sympathy. Unity is essential for every group. Each and every member of the group treats each other as their own and there develops a sense of camaraderie amongst the members of group.

NSOU ? CC-SO-01 187 v. Affected by group characteristics : Every group has some social characteristics which separate it from similar and dissimilar groups. These characteristics affect the members of the group. vi. Common values : There are certain values which are common among members and are traditionally respected and communicated to the succeeding generation. They are manifested in the mutual behaviours of the members. Members of the social group are bound together in terms of these common values. vii. Control of group : In each group there are some customs, norms and procedures which are acceptable to everyone. In fact without some norms the existence of group life is impossible. It may be stated that the reasons behind the similarity of behaviour in a group life is that the actions of the members are controlled by the group. viii. Obligation : In a group situation, all members have complementary obligations to each other. Also the relationships between the members of a group get strengthen through their mutual obligation and common social values. ix. Expectations : Not only mutual obligation, the members of the group also expects love, compassion, sympathy, so-operation etc. from all other members of the group. If mutual expectation is fulfilled, the group members are maintained in fact. A group can maintain its existence only if the constituent members fulfil their responsibility by satisfying the desires among themselves. x. Awareness : Awareness about its membership to differentiate them from other groups. The members of a group are aware of the existence of other members. Each member recognises that he is a part of the group. Greater importance is given to the group life in comparison with individual life. 15.3.3 Group and Aggregate As a social being man lives in group and continuously creates with his fellows new groups such as the family, the friendly group, the social class, a party or a football club, a village, a nation, a trade union is a social group. A social group is a collection of people who interact with each other and share similar characteristics and collectively have a sense of unity. Aggregate : An aggregate is a gathering of persons in physical proximity who have come together temporarily and lack any organisation or meaningful social interaction. An audience, a crowd, passengers on the same bus and a gathering of

NSOU ? CC-SO-01 188 people watching a fireworks display or a football match are all aggregates. Most people in the crowd do not know one another and therefore, there is no possibility of meaningful interaction among them. Members of the aggregate do not share common characteristics and hence do not share a sense of belonging to the group. It is as a physically compact aggregation of human beings brought into direct, temporary and unorganised contact with one another. It is quickly created and quickly dissolved. There are, of course, myriads of casual meetings of friends, acquaintances or strangers taking place at all times in every society. On the street, on the house porch, on the train, in the office, in the market place and so forth. 15.3.4 Category / Potential group/ quasi A social category is a collection of people who do not interact but who share similar characteristics of group. A social category is not an aggregate in the sense that they are a collection of individuals. A category may exist, even if, its components are not physically concentrated together. It is a class of persons who are distinguished from the rest on the society by a certain status that is ascribed to them. Artist, student, teenagers/ youths, peasant, toto drivers, auto drivers, doctors, film stars and all bachelor persons form in each division, a social category. Members of a category may not be related with each other on the basis of a social group. One film actor may have no relation whatsoever with another, and these may be no desire in them to work together for a common purpose, yet they shall form a social category and absence of a relationship or a goal will prevent them from becoming a group. But as soon as these two actors form an association for securing their rights in the film industry, they become members of a social group. They may, as a social category, attend in a party, not as a social aggregate. But they can without the mark of their status, become a part of the social aggregate when they crowd together with others to watch an event. Cine goers as a class form a social category distinct from those in society who abjure films as a means of entertainment; but the audience at a particular show are an aggregate. From the above discussion it is clear that each person belongs to a family and, in this sense, a member of a category or an aggregate automatically forms part of one group or other. 15.4 Relation between society and social group In sociology, the term ‘

89%

MATCHING BLOCK 278/372

W

Society’ refers not to a group of people but to the complex pattern of the norms of interaction that arise among them. People

are valuable only as agencies of social relationships. There are two types of definitions of Society – (i) the functional definition, and (ii) the structural definition. From the

NSOU ? CC-SO-01 189 functional point of view, society is defined as a complex at groups in reciprocal relationships, interacting upon one another, enabling human organisations to carry on their like-activities and helping each person to fulfil this wishes and accomplish his interests in association with his fellows. From the structural point of view society is the total social heritage of folkways mores and institutions, of habits sentiments and ideals. Society, to quote

65%

MATCHING BLOCK 282/372

SA Module 1 - 5.docx (D21364761)

Maclver and Page is an ever changing complex system. “of usages and procedures, of authority and mutual aid, of many grouping and divisions, of control of

men.” Whether this be direct and indirect, organised or unorganised, conscious or unconscious, co-operative or antagonistic.” 15.4.1 Difference between society and groups Difference between society and groups may be pointed out : 1) Group is a collection of human beings i.e. is an aggregation of individuals who enter into certain distinct social relationships with one another for a specific purpose or a set of purposes. On the other hand, society may be defined as a web of reciprocal relationships and interactions among men and groups within a cultural framework. 2) Group is an artificial creation, society is natural growth. 3) Membership of Group is voluntary, membership of society is compulsory. 4) Group is always organised, society is unorganised. 5) Group is formed for specific purpose, on the other hand society acts for general purpose. 6) Group is marked by co-operation and the society is marked by co-operation and conflict. 7) Group may be temporary and society is permanent. 15.4.2 Group formation and related theories Group formation is connected with the following theories : i. The manner in which the groups form. ii. The structures and processes of the group. iii. The functions of the group in different situations. There are mainly five stages of group development, viz. a) Forming b) Storming c) Norming

NSOU ? CC-SO-01 190 d) Performing, and e) Adjourning a) Forming is a stage which is characterised by some confusion and uncertainty. Forming is actually an orientation period when members get to know one another and share expectations about the group. This is the initial stage when the group comes together and members begin to develop their relationship with one another and learn what is expected of them. b) Storming is the stage when one can see the height level of disagreement and conflict. Members mainly voice their concern and criticism occurs at this stage. Actually in this stage interpersonal conflicts arise and differences of opinion about the group goals also emerge. It is important to work through the conflicts at this time and to establish clear goals. c) Norming is characterised by the recognition of individual differences and shared expectations. Responsibilities are divided among members and the group decides how it will evaluate the progress. If the group resolves its conflicts, it can establish patterns of how to get its work done. Expectations of one another are clearly articulated and accepted by members of the groups. d) Performing occurs when the group has matured and attains a feeling of cohesiveness. In this stage members of the group make decision through a rational process that is focused on relevant goals rather than emotional issues. Issues related to roles, expectations and norms are no longer of major importance. The group is focused on its tasks, working effectively to accomplish its goals. e) Adjourning indicates that members of the group often experience feelings of closer and sadness as they prepare to leave. It is the final stage when the group, after achieving the objectives for which it was created, starts to gradually dissolve itself. Theories of group formation Theories are establishing hypothesis which explain a particular phenomenon. Many theories may explain one phenomenon, as for instances "delinquency". There are psychological, biological themes which explain delinquency. On the same lines as above there are many theories which explain how groups are formed and how they develop and progress. There are several theories regarding group formation and development. The theories put forward here include classic theory social exchange and social identity theory. i. Classic Theory : A classic theory developed by George Homans suggests

NSOU ? CC-SO-01 191 that group develop on the basis of activities, interactions and sentiments mainly. Basically this theory indicates that when individuals share common activities they will have more interactions and will develop attitudes (either positive or negative) toward each other. This main element in the interaction of the individuals involved. ii. Social Exchange Theory : Besides this, another important theory is the social exchange theory which offers an alternative explanation for group development. According to this theory individuals form the relationship on the basis of implicit expectation of mutually beneficial exchanges based on trust and felt obligation. It can further be said that a perception that exchange relationships will be positive if persons are to be attracted to and affiliate with a group. iii. Social Identity Theory : Another important theory is social identity theory which offers explanation for group formation. This theory suggests that individuals get a sense of identity and self-esteem based on their membership in salient groups. The group is demographically culturally and organisationally based. 15.5 Types of social groups Social groups may be classified from a variety of view points : The size of the group,

59%

MATCHING BLOCK 280/372

W

the nature of their interacts, the degree of organisation, the nature of group interaction, kind of contact among the members, the

duration of the group and the like. Following Tonnies and Cooley, sociologists have attempted to classify groups on the basis of other criteria. French sociologist G. Gurvitch has proposed fifteen criteria of classification. However, on the basis of the accumulated work of sociologists we may classify the following ten dichotomous groups and groupings from as many angles as possible: 1) Primary group

48%

MATCHING BLOCK 281/372

W

and Secondary group 2) In-group and out-group 3) Community and Association 4) Permanent group and transitory group 5) Vertical group and Horizontal group 6) Formal group and Informal group 7) Contractual group and non-contractual

group 8) Voluntary group and in-voluntary group 9) Homogeneous group and heterogeneous group

NSOU ? CC-SO-01 192 10) Institutional group and non-institutional group Each pair of this classification implies more or less mutually exclusive categories. But, we must bear in mind, the ten basis of classification are not necessarily mutually exclusive. The family, for example, is a primary group, but it may also be viewed as an in-group, as a vertical group, as a permanent group, as an institutional group and so on. 1) Primary and Secondary group Charles H. Cooley has classified groups into primary and secondary. His concept of primary group is similar to Sumner's concept of the in-group. The primary group is the simplest and most universal of all forms of social organisations. It is a small group in which a small number of persons come into direct contact with one another. A small number of men meet face-to-face for companionship, mutual aid, the discussion of some common questions. The family, the play group, the neighbourhood group, congeniality group, intimate friendship group and so on. Cooley lays emphasis on face-to-face association and the relationship of "sympathy and mutual identification" i.e. "We feeling". Fundamentally, these groups are harmonious and affectionate. On the other hand, secondary group may be defined as a kind of association which is characterised by impersonal or secondary relations. They do not depend on face-to-face contact. Here human contacts become superficial and undefined. In a secondary group the co-operation with the fellow members is indirect, formal, impersonal and of "touch-and-go" type. The trade union, the business corporation, the political party, the church organisation, the state, Red cross society are examples of secondary groups. 2) In group and Out group Sociologist Sumner classified groups into two – (i) in-groups and (ii) out- groups. The distinction between in-groups and out-groups is sociologically significant. In-groups are those groups to which we belong and towards which we feel pride and have a strong loyalty. Out-groups are those groups to which we do not belong and towards which we may feel contempt and even hostility. In-groups are "we" groups the group of insiders where as out-groups are "they" groups or a group of outsiders. In the in-groups we express our deepest sentiments of love and sympathy and we have a sense of solidarity, loyalty, friendliness, and co-operation. These group are not necessarily small, they can be as large as a nation or even bigger. Castes groups, religious groups, political parties, linguistic groups, football teams- are all in-groups, to people who belong to them. Whenever there is a communal or inter-caste conflict, members on each side become far more united and sensitive. During the Kargil crisis, people of India displayed a great sense of pride and

NSOU ? CC-SO-01 193 patriotism. During election members of political parties or caste groups often forger individual differences and support candidates from their own in-groups. 3) Community and Association One of the most important divisions of social groups is that which is based on community and association. A community is a group of people who live together in a particular locality and share the basic conditions of a common life. A community must be such a group in which an individual may live his life in full, Maclver defines it as "an area of common life, village or town or district or country or even wider area. To deserve the name of community the area must be somewhat distinguished from further areas, the common life may have some characteristics of its own such that the frontiers of the area have some meaning. The mark of a community is that it is the total organisation of social life in the area; "one's life may be lived wholly within it". A tribe may be a community while a church is not, the latter gives a glimpse of life only sectionally. Primitive communities tried to live in a more or less self-contained fashion, while modern communities are all interdependent on each other. A community is characterised by the following factors : 1. Definite Locality : Community is a group of people living together in a particular locality. Society has no definite boundary. 2. Community sentiments : Not only locality, the presence of common sentiment among the members of the community is necessary. 3. Community is a species of society. It exists within society and possesses its distinguishable structure which distinguishes it from other communities. 4. Community is a concrete concept. It is a group of people living in a particular locality and having a feeling of oneness. 5. A group of people. 6. Permanency : Community essentially includes a permanent life in a definite place. 7. Naturality : Communities are not natural, not created. AN individual is born in a community. 8. Wider ends. 9. Likeness 10. A particular name.

NSOU ? CC-SO-01 194

75%

MATCHING BLOCK 283/372

SA ESOC515-U04-Raw.docx (D103728757)

Association : An association is a group of people organised for a particular purpose or a limited number of purposes. According to Maclver an association

is "

90%

MATCHING BLOCK 286/372

SA ESOC515-U04-Raw.docx (D103728757)

an organisation deliberately formed for the collective pursuit of some interest or set of interests, which its members share". According to Ginsberg, an association is "a group of social beings related to one another by the fact that they possess or have instituted in common an organisation with a view to securing a specific end or specific ends".

The

following elements may be mentioned: 1. A group of people. 2. These people must be organised. 3. They must have a common purpose. The following are the differences between community and association: 1. An association is partial while a community is a (whole)/ integral. 2. Association exists within community i.e. association is not a community but is an organisation within the community. 3. Community is not created but it grows. It is spontaneous. An association is deliberately created by some individuals for realizing a specific purpose. 4. Membership of an association is limited and voluntary while the membership of community is of wider significance and compulsory. 5. Community sentiment (we feeling) is an essential feature of community, but not of association. 6. A community works through customs and traditions while an association works through written laws and rules. On the basis of norms and rules, groups can be categorised into the following types: 1. Formal Group: It is generally formed on the basis of specific norms, rules and values. The group of students in a classroom – an example of this type. 2. Informal Group: The nature of the group is not formed at all. The rule usually flexible. Play groups, peer groups and social club – are example of informal groups. Besides the above two, group can also be classified into various categories as given below: 3. Original Group: The groups which are formed for specific purpose and are carefully planned is called organised group. Family, school, club etc.

NSOU ? CC-SO-01 195 4. Spontaneous Groups: These groups are formed without any careful planning. Audience may be considered as spontaneous group. 5. Command Group: Command groups are identified by the organisational chart. It consists of a supervisor and the subordinates that report to the supervisor. 6. Task Group: A group of people work together to achieve a common task. In many situations there is a specified time period. This can be referred to as task forces. 7. Functional Group: Functional group is generally created by the organisation to accomplish specific goals within an unspecified time frame. Functional group generally exist, after achievement of current goals and objects. 8. Interest Group: It usually continues overtime and may last longer than general informal group. It is seen that the interest of the members may not be part of the same organisational department, but they are bound by some common interest. 9. Friendship Group: These groups are formed by the members who enjoy similar social activities, political beliefs, religious values and other common bonds. 10. Reference Group: This group has been developed recently. Hyman used it in 1942 in his book "Psychology of status". Man, a social belong to many groups and wants to belong to some other groups for which he tries to follow the rules and norms of that particular group, so that he too may be identified as a member of that group – this group is reference group. R.K. Murton, New Comb, Turner, Johnson, Sherieff and Sherieff also used the term "Reference Group". 11. Temporary Group: Studies indicate that temporary groups come together for a certain purpose and disburse after the task is over. These groups have their own unique sequences of actions. 15.5.1 Some other Groups There are other types of groups, a few of which are pointed out below: a. Clique : An informal tight knit group usually in a High school/ college setting that shares common interests. There is an established yet shifty power structure in most cliques. The effects of cliques are varied. b. Club : A club is a group, which usually requires one to apply to become a member. Such club may be dedicated to particular activities, such as sports clubs. NSOU ? CC-SO-01 196 c. Franchise : This an organisation which runs several instances of a business in many locations. d. Gang : A gang is usually an urban group that gathers in a particular area. It is a group of people that often hang around each other. They can be like some clubs, but much less formal. e. Mob : A mob is usually a group of people that has taken the law into their own hands. Mobs are usually a group which gathers temporarily for a particular reason. f. Posse : A posse was initially an American term for a group of citizens that had banded together to enforce the law. However, it can also refer to a street group. g. Squad : This is usually a small of around 3-8 people, that would work as a team to accomplish a certain goal. h. Team : This is similar to a squad, though a team may contain many more members. A team works in a similar way as a squad. 15.6

Summary Parsons defined sociology as the study of structure and function of human groups. It means sociology is the systematic study of human groups. The study of society is called Sociology. From the above, we can conclude that social group is the basic factor in all social functions, social structure, social institution, systems, and organisation. All sociological studies are based upon the study of social group. It means that social group is important in human life. The importance of social groups becomes clearer when we observe that human personality develops in social groups. The whole process of socialization pass through social groups. Man leans his culture among the groups in which he lives. 15.7

Keywords Group Behaviour, Group Conflict, In-group, Out-group, Society, Potential Group, Aggregate. 15.8 Questions 1. Answer the following questions briefly: (5 marks) (a) Describe briefly the various kinds of social groups. (b) Write a note on reference groups.

NSOU ? CC-SO-01 197 (c) What is the importance of social groups? (d) What are the relations between society and social groups? (e) What is the importance of primary groups? (f) Differentiate between in-groups and out-groups. (g) How many stages of group development? (h) Show the relation between society and social groups. 2. Answer in detail: (10 marks) (a) Write a note on social groups. (b) What are the main characteristics of secondary group? (c) Point out the main characteristics of social groups. (d) Distinguish between primary group and secondary group. (e) Describe with illustrations the characteristics of primary and secondary groups. 15.9

Unit 16 Association Structure 16.1 Objectives 16.2 Introduction 16.3 Definition 16.4 Characteristics 16.5 Differences between association and Society 16.6 Differences between association and community 16.7 Differences between association and institution 16.8 Summary 16.9 Questions 16.10 Suggested Readings 16.1 Objectives In this unit, we shall come to know about- ? The concept of association ? Meaning and definition of association ? Utility of association ? Differences between society, community and institution 16.2 Introduction Man is a social animal. He cannot live in isolation. Always he tries to keep contact with his fellow beings for his survival. Men have diverse needs, desires and interests which demand satisfaction. There are three ways of fulfilling these needs. Firstly, they may act independently each in his own way without caring for others. This is unsocial with limitations. Secondly, men may seek their needs through conflicts with one another. But this method is precarious and wasteful and, in opposed to the very existence of society. Finally, men may try to fulfill their ends through co-operation and mutual assistance. When this element of co-operation is introduced, an association comes into existence. NSOU ? CC-SO-01 199 16.3 Definition of Association Now the question is, what is an Association? Every group of persons cannot be described as an association. When a group or collection of individuals organize themselves expressly for the purpose of pursuing certain of its interests together on a pursuit an association is said to be born. Every group of persons cannot be described as association. If groups of persons together watch any public event no association is created between them since they have not been brought together by a common interest which creates a relation between them but as soon as these persons cooperate with each other to remove from a scene of accident the injured and the hurt, they can create an association for themselves. An association, therefore, is based on a definite function, whether it be political, economic, scientific, educational, literary, or religious. In other words, when at least two or more persons with one interest ore more are organised an association comes into existence. Membership of an association is, therefore, related to a specific 'interest'. An individual may at the same time have various 'interests' and as such he may be a member of several associations at the same time. He may be a member of several clubs; he can have his membership in a business group, and he may belong to a particular church or a particular religious association. Thus, the family, church, trade union, Football club, university, hospital- all are the example of association. Association may be formed on several basis, for example, on the basis of duration i.e., temporary or permanent like Flood Relief Association which is temporary and State which is permanent; or

80%

MATCHING BLOCK 284/372

MATCHING BLOCK 295/372

SA ESOC515-U04-Raw.docx (D103728757)

an organization deliberately formed for the collective pursuit of some interest or set of interests, which its members share." To Ginsberg, an association is "a group of social beings related to one another by the fact that they possess or have instituted in common an organization with a view to securing a specific end or specific ends."

G.D.H. Cole says, "By an association I mean any group of persons pursuing a common purpose by a course of cooperative action extending beyond a single act and for this purpose agreeing together upon certain methods of procedure, and laying down in however rudimentary a form, rule for common action." P. Gisbert states that an association is a group of persons who unite on a definite, common, and limited purpose.

NSOU ? CC-SO-01 200 16.4 An association has the following characteristics 1.

100%

MATCHING BLOCK 288/372

W

A group of people: An association is basically a group of people who form it for the attainment of

92%

MATCHING BLOCK 289/372

W

common goals. Without a group of people, no association can be formed. Hence a group of people is important. 2. Organization: Association does not refer to any ordinary group of people rather it refers to an organized group of people.

It is a concrete group which can be seen while at work. An association rests on an organization which is operated by responsible agents and it acquires a legal entity or recognition. 3. Common aims and objectives: No association can maintain its identity without any distinct aim and objective. An association is formed for the attainment of some common objectives. Members who do not endorse these objectives do not become members of the association. 4. Some rules and regulations: Association cannot exist without formal rules and regulations. Every association floats on the ground of certain rules and regulations. Rules and regulations are formed to run it on the basis of these rules and regulations. It also contains code of conduct for the members. 5.

71%

MATCHING BLOCK 290/372

W

Co-operative spirit: Association is the result of co-operative spirit of some organized individuals. People work together with a cooperative spirit to fulfill some common purposes. This cooperative spirit helps them realize their objectives. When this spirit is cracking there is no cooperation and no association. 6. Membership

is voluntary: Associations are products of modern societies. People voluntarily join in an association to fulfil their desired aims and

57%

objectives. Members can also withdraw their membership when they feel so. Similarly, no one can compel them to be a member of any association. But they have to obey the rules and regulations of the association. 7. Degree of permanency: Some associations may be temporary whereas some are permanent. There exist some long-lived

associations

95%

MATCHING BLOCK 292/372

W

like family or state. Similarly, there exists some temporary associations like flood relief association. 8. Legal Status: Association is an organized social group which has responsible members. This shows that association has legal status. It can sue

or

nature: Association is an artificial creation, not natural. It is manmade in nature. Some individuals deliberately form association to fulfil their common objectives. There exists no natural bond between the members of association. Rather there exists a bond of self-interest. 11. Limited significance: An association is a temporary group organized for the fulfilment of particular interests of its members. It has significance for its members so for it serves their purpose. It

may lose its significance when it will fail to serve its members purpose. 12. Variety of functions: Association performs a variety of functions for its members as well as for society. Every association has to perform various functions for its members. 16.5 Differences between society and association There are various differences between society and association. The following are the points of difference between society and association. 1. Society is a system of social relationship; association is a group of people: The widest and most inclusive term is society. It is an 'everchanging complex', a 'web of social relationship' that is constantly changing. In sociology, the term '

76%

MATCHING BLOCK 297/372

W

society' refers not to a group of people but to the complex pattern of the norms of interactions that arise among them. Society is a system of social

relationship which are invisible intangible. It is the result of natural evolution. On the other hand, association is a group of people organized for the fulfilment of particular interests for its members. 2. Society is older than association: Society is older than association and is in existence since man appeared on the earth while association arose at a later stage when man learnt to organize himself for the pursuit of some particular purpose. 3. Membership of society is compulsory: Man cannot live without society. Society will exist as long as man exists. The membership of society is compulsory, on the other hand, man may live without being a member of any association at all. The membership of an association is voluntary, association may be only transitory. 4. The aim of society is general: The aim of society is general while that of association in particular. Society comes into existence for the general wellbeing of the individuals. Hence, the aim of society is general. It is marked by both co-operation and conflict. 5. Society may be organized or unorganized; on the other hand, association must be organized. Association is formal for fulfilling the interests of its members. 6. Society is natural, association is artificial. 7. Society is marked by both co-operation and conflict on the other hand association is based on co-operation alone. 16.6 Differences between association and community The following points may be mentioned to differentiate between association and community. 1. Community is a natural growth, where as association is an artificial creation. An association is deliberately created by some individuals for realizing a specific purpose. Community is not created but it grows out of community sentiment. It has no beginning, no hour of birth. It is spontaneous. 2. An association is partial while the community is a whole. An association is formed for the achievement of some specific purpose which does not include the whole purposes of life. On the other hand, a community includes the whole circle of common life. A community is more than any specific organizations that rise within it. "It does not exist for the pursuit of special interests. It is not deliberately created. It has no beginning, no hour of birth. It is simply the whole circle of common life, more comprehensive, more spontaneous than any association." 3. Associations exist within community. An association is formed by the individuals for realizing a specific purpose. On the other hand, community is not created but it grows out of community sentiment. Association is not a community but is an organization within the community. 4. Membership in an association has a limited significance while the membership of community is of wider significance. It is true that an association may be wider than or different from those officially professed. But we belong to associations only by virtue of some specific interest that we process. Consequently, there can be a multitude of association within the same community. And the individual, of course, may belong to many.

NSOU ? CC-SO-01 203 The president Butler of Columbia University reported membership in twenty clubs in addition to dozens of other associations. 5. The membership of association is voluntary, but the membership of community is compulsory. We are born in communities, but we choose our associations. 6. Community sentiment is an essential feature of community but not of association. There can be no community without 'we feeling'. 7. To fulfil the purposes of the association office bearers are must. So an association has got its office bearers who manage its affairs while an office is not necessary to constitute a community. 8. A community works through customs and traditions while an association works mostly through written laws and rules. The constitution of an association is generally written. It has also a legal status. 9. Associations may become community, at least temporarily. There are the examples of seventeenth century trading company outposts which became communities in every respect, or of military units compelled to create their own communities when isolated for a period of time. 10. There are borderline cases between community and association, such as the monasteries, convents and prisons. The family and the state- the two major social oiorganization may seem to lie on the borderline between associations and communities. The family in some of its forms, especially in some primitive and extremely rural societies, as many of the attributes of a community. In these cases, people toil, play and even worship almost wholly within the orbit of the family. It circumscribes largely or even wholly the lives of its members. Maclver says, "In modern society, in all complex civilizations, the family becomes definitely an association, so far as its adult members are concerned. The functions of the family are more and more limited and defined as the social division of labour increases. But even in the most complex society, the family, for the new lives that arise within it, is more than an association. To the child, the family is a preliminary community which prepares him for the greater family." Maclver also observes that though the state began in the olden times as a community, in the modern world it is gaining characteristics of an association. The state can be regarded as an association in some sense or the other with its governmental apparatus. Whether or not such apparatus is totalitarian in nature, the operates today as an association that controls the community. The distinctions between community and associations were very much clear in NSOU ? CC-SO-01 204 primitive societies. But due to the rapid urbanization, development of transportation and communication, it becomes very difficult to distinguish between them. Though an association has been described as a group of persons, it is distinct from a group because while anybody of persons can become a group by being reciprocally involved in it, an association is a group that must be expressly organized for the fulfilment of a common purpose, even a crowd or a class of person may be described as a group but since it is without any organization, it can not become an association. 16.7 Difference between association and institution Associations and institutions are different conceptually. Sometimes confusion arises between institutions and associations because the term in a different context, may mean either one of the other. But there is a much more distinction to be made between institutions and association. The following differences between association and institution may be pointed out: i. Institutions are the rules of procedure, on the other hand association is a group of individuals organized for the pursuit of a specific purpose. Family is an association which is organized for the preparation of mankind while marriage is its main institution. Likewise, political party system is an institution, state is an association. The church is an association, while baptism is an institution. An association represents human aspect, while an institution is a social condition of conduct and behaviour. ii. An association is considered as "an organized group". It has form and it is concrete. On the other hand, an institution is considered as a "form of procedure". It has no form and is abstract. iii. Associations are formed deliberately while institutions grow. iv. Association denotes membership, while institution indicates a mode or means of service (procedure of work). Institutions give life and activity to associations, communities, or any other types of societies. To Sprott, "Associations are things, institutions are modes and ways. We are born and live-in association". v. Every association bears a particular name, while every institution is based on cultural symbol. vi. An association is an organized group while an institution is an organized procedure. NSOU ? CC-SO-01 205 vii.

MATCHING BLOCK 298/372

SA Module 1 - 5.docx (D21364761)

Association is a group of people organized for the pursuit of

some specific purposes. On the other hand, institutions fulfil all the primary and basic need of people. In spite of the differences between the two, it may be noted that no institution can function without an association. Institutions are impossible without associations. It may also be noted that while association and institution are different concepts, no institution can function without an association. Again, institutions give life and activity to associations, communities or any other types of societies. They are related to each other as every organisation has an institutional framework, which allows it to survive. An association has a location, on the other hand, an institution does not have a location. 16.8 Summary In this unit we have studied the meaning, characteristics, various types of association, and differences between association and other entities.

100%

MATCHING BLOCK 299/372

SA ESOC515-U04-Raw.docx (D103728757)

An association is a group of people organized for a particular purpose or a limited number of purposes.

The life of an association is up to the achievement of the aim for which it has been created. The existence of association after his achievement of the aim becomes, immaterial and irrelevant. It becomes nominal and lifeless body of formalities only. The aim is the soul of the association.

100%

SA BSOS 12.doc (D129312302)

After reading this, you will be able to ? Understand the concept of

institution. ? Describe the different ways in which individuals relate to each other. ? Relation between institutions and association and society. 17.2 Introduction As a social animal, man always works so that these activities may fulfil our needs. For this reason, we often try to search practical means or methods. From this research we came to know the concepts like institution, values, Folkways and Mores, the complex relation between the individuals living in the society are controlled by the concepts. How these concepts influence social life of the individuals.

NSOU ? CC-SO-01 208 17.3 Meaning of Institution In everyday language people use 'institution' to mean organizations. For example, college is called educational institute. But in Sociology, the concept 'institution' has a specific meaning. According to Ellwood, Institutions are "habitual ways of living together which have been sanctioned, systemized and established by the authority of communities." Woodward and Maxwell say, an institution is a "set or web of interrelated folkways, mores and laws which enter in some function or functions." According to Green, "An institution is the organization of several folkways and mores into a unit which serves a number of social functions". According to Horton and Hunt, "an institution is a system of norms to achieve some goal or activity that people feel is important, or more formally an organized cluster of folkways and mores centered around a major human activity." Gillin and Gillin says, "A social institution is a functional configuration of culture pattern (including actions, ideas, attitudes and cultural equipment) which possesses a certain permanence, and which is intended to satisfy felt social needs." M.T. Majumder defines institution "as collective mode of response or behaviour which has outlasted a generation, which prescribes a well-defined way of doing things and which binds the members of the group together into an association by means of rituals, symbols, procedures and officers possessed of regulatory power or Danda." According to Bogardus, "A social institution is a structure of society that is organized to meet the needs of people chiefly through well established procedures."

98%

MATCHING BLOCK 302/372

SA ESOC515-U04-Raw.docx (D103728757)

According to Ginsberg, "Institutions are definite and sanctioned forms or modes of relationship between social beings in respect to one another or to some external object.

These may be described as recognized and established usages governing the relations between individuals or groups." According to Maclver, "an institution is a set of formal, regular and established procedures, characteristic of a group or number of groups that perform a similar function within a society. In short, an institution is an organized way of doing something." Barnes defines social institution as "the social structure and machinery through which human society organizes, directs and executes the multifarious activities required to satisfy human needs." Sumner said, "

96%

MATCHING BLOCK 303/372

SA ESOC515-U04-Raw.docx (D103728757)

An institution consists of a concept (idea, notion, doctrine, interest) and a structure."

Then he points out that "institutions begin in folkways, become customs and develop into mores by having attached to them a philosophy of welfare." Chapin has given a definition of an institution in terms of the cultural concept. "A social institution is a functional configuration of culture patterns (including actions, ideas, attitudes and cultural equipment) which possesses a certain permanence, and which is intended to satisfy felt social needs." According to Horton, "An institution is an organized system of social relationships which embodies certain common values and procedures and NSOU ? CC-SO-01 209 meet certain basic needs of society. To Landis, "Social institutions are formal cultural structures devised to meet basic social needs." Maclver propounds the view of institutions with the help of H.E. Barnes's idea of the connotations of the term. Every institution has a definite interest and such it may well be confused with an association. In fact, an institution is a concept that is not totally divorced from an association, but it is not the association itself. Whatever be the common idea of the 'institution' as an organization, the sociological interpretation of the term lies in its equation with forms of procedure. By the term institution, Barnes understands certain mechanisms with the help of which society functions. Maclver explains the connection between an association and an institution by correlating the two by a dominant interest. According to the interest of the association. The institution will find its growth. Thus, with the interests of sex, home and parentage the family comes into existence as an association, and with it is related to the institution of marriage or inheritance. Similarly, interests of learning bring into being the college as an association and institutions of examinations and graduation. The church as an association is linked with institutions of forms of worship though interests of religious faith. This marriage, education, property and religion are the main institutions. The relation between associations, institutions and interests is exemplified in the following chart:

Association	Characteristic	Institute	Special Interests
1. Family	Marriage, the home, inheritance	Sex, home, parentage	2. College
Lecture and examination system, graduation	Learning, vocational preparation	3. Business	Bookkeeping system, incorporation, share capital
Profit	4. Trade Union	Collective bargaining, strike, picketing	Job security, wage rate, conditions of work
5. Church	Creed, communion, forms of worship	Religious faith	6. Political Party
Primaries, party "machine", political platform, Office, power, government policy	7. State	Constitution, legal code, forms of government	General regulation of the social order

NSOU ? CC-SO-01 210 17.4 Its Characteristics From the above definitions we can understand the concept of social institution more precisely through its characteristics which are pointed out below :

- Institutions emerge out of social interactions within a group. Sumner points out that institutions are of two types - (i) Crescive institution and (ii) Enacted institutions. Crescive institutions are those norms that emerge unconsciously in society. Its origin is unclear and can not be dated. On the other hand, enacted institutions are consciously created for specific purposes. In modern days' laws which are rationally formulated, are an example of enacted institutions.
- Institution are the means of controlling individuals. Every member of a society expected to follow the rules, regulations and usages for the interest of the society. These can be informal or formal. If it is formal then it is codified and in most cases will have an organization responsible to see that individuals follow these rules. For example, in Indian society if a person wants to get married she can do so only under one of the Marriage Act's formulated by the Government. The male and female agree to perform the duties of husband and wife respectively. In cases of conflict between there are police and courts to deal with them.
- All institutions have roles and status. Every institution have a particular role and status to the individuals involved in it. Role is a set of behaviour expected of an individual in particular social context. Status is the position of the individual in society. In an educational institution, for example, there are students who come to learn from the society and are given the status of students, and the teachers who teach are given the status of "teachers". Both the teachers and students maintain discipline. As a student he/she has to attend class, obey the teachers. As a teacher he/she has to take classes, evaluate students' notebook. Control the students. Thus institutions operate through the means of roles. Relationship between an organization and institution Institutions and organisations are different conceptually. Institutions are recognized way of thinking while organizations are formal groups created to achieve specific objectives. At the same time they are related to each other as every organization has an institutional framework, which allows it to survive.

NSOU ? CC-SO-01 211 Cluster of social usage Institutions are composed of customs, mores, rules organized into a functioning unit. An institution is an organisation of rules, and behaviour and in manifested through social activity and its material products. In short the institution functions as a unit in the cultural system viewed as a whole. I. Institutions have a degree of permanence. Our beliefs and actions are not institutionalized until they are accepted by others over a period of time. Once these beliefs and behaviour get recognition they become the yardstick for evaluation of the beliefs and actions of others. It does not, however, mean that they do not change. Institutions function in accordance with cultural norms, however, in comparison with associations they have the greater degree of permanence. II. Well-defined objectives : Institutions have fairly well defined objectives which are in conformity with the cultural norms. The institution of marriage has the objective of regulative the network of social relationships and the members of the society would consciously work for the attainment of the dis-objective. For example, marriage in the same caste or class objective has to be differentiated from different functions to which the members may be unaware of e.g. the function of marriage or gratification of sex urge and to have children. III. Symbols are a characteristic feature of institution : A symbol may be defined as anything which depicts something else. Symbols may be either material or non-material in form. The institutions can have permanency identity and solidarity if they have some symbols. The members of that institution feels quite closer to each other by sharing the common symbols. IV. Institution has definite traditions. Each institution has a fairly definite tradition – oral or written. Such tradition refers to the purpose, attitude and the behaviour of the members. The tradition attempts to bring together individuals into functioning whole through established behaviour, common symbols and objectives. The traditions when become rigid, take the shape of the ritual. V. Institutions are transmitters of the social heritage. Social institutions are the great conservers and transmitters of the social heritage. It is in the institutions that individual learns basic values of the life. The child initially plays a role of general receptivity in the basic and multifunctional institution of the family and in this way receives the largest share of the social heritage. In this initial helpless state, culture is indoctrinated to him by his family.

NSOU ? CC-SO-01 212 VI. Institutions are resistant to social change. As patterned forms of behaviour, social institutions are more resistant to social change than behaviour where such uniformity and regularity do not apply. Social institutions are thus, by their very nature, conservative elements in the social structure. 17.5 Types of institutions There are several types of social institutions may be found. Sumner, Ballard, Chapin, Ross classify institutions in several ways. Sumner has classified institutions into two main types : 1. Crescive and 2. Enacted institutions. 1. Crescive Institution Crescive institutions such as property, marriage and religion which originate from mores. These unconscious in origin. 2. Enacted Institution Enacted institutions such as credit institutions, business institutions which are consciously organized for definite purposes. To Ballard there are two main types of institutions : 1. Basic institutions and 2. Subsidiary institutions. 1. Basic Institution The Basic institutions are those which are regarded as being necessary for the maintenance of social order in a given society i.e. the family, the economic institutions, the religious institutions, the educational institutions and the political institutions are regarded as basic institutions. 2. Subsidiary Institutions The subsidiary institutions are complexes of the type which are not regarded as quite so necessary for the maintenance of social order. For example, recreational ideals and activities belong to this class. Chapin classified institutions with respect to their generality or restrictions in the society in which they are found. The cultural elements involved in general institutions are usually "universal". While those involved in restricted institutions are usually "specialties". Religion as such is a general institution, Hinduism is a restricted institution.

NSOU ? CC-SO-01 213 Ross mentioned two types of institutions : 1. Operative Institutions and 2. Regulative Institutions. 1. Operative Institutions Operative institutions are those of which the main function is the organisation of patterns whose practice is actively necessary for the attainment of the objective e.g. the institution of Industrialism. 2. Regulative Institution Relative institutions are organized for the control of customs and other types of behaviour which are not themselves part of the regulative institution itself; the legal institution is an example. 17.6 Functions of Institutions Institutions have various important functions. Functions may be classified into two types : 1. Manifest functions and 2. Latent functions. Institutions have manifest functions which are easy to recognise as part of the professed objectives of the institution. And latent functions which are unintended and may be unrecognized or if recognized, regarded as by products, says Merton. The primary institutions function in manifest manner. The working is direct and clear. These, however, give rise to the secondary institutions. They function in latent manner. There are various important functions of the institutions. The following functions are to be mentioned. : 1) Institutions simplify action for the institutions. An institution organizes many aspects of behaviour into a unified pattern. One of the most highly integrated institutions in modern society is Military establishment. The soldiers learn to pass in orderly fashion from one type of behaviour to another without hesitation towards the objective of eliminating enemy. 2) Institutions provide a means of social control. Institutions play a central part in the process of social control. All major institutions – the family, the school, the religious institution, the state inculcate basic values and definitions to the young one. 3) Institutions provide order to the society. Besides helping individuals to satisfy

NSOU ? CC-SO-01 214 their basic needs, institutions provide unity to the society. The law of the jungle would prevail if there were no institutions that maintained order. 4) Institutions act as stimulant. The institutions may stimulate certain individuals to react against it and formulate new patterns of behaviour, Sometimes individual feels the disharmony between the various institutions. He seeks some way out of the impasse. He must devise some way whereby his urges may be more fully satisfied. Hence, the institution functions in such cases to stimulate the individual to "break new roads to freedom". 5) Institutions acts as harmonizing agencies in the total cultural configuration. The institutions are not independent, but are related to each other in a cultural system or configuration. Most of the institutions in the system tend to support one another and the configuration as a whole. Thus courtship supports marriage which in return supports the family, all three institution being mutually interdependent. 17.7 Difference between society and institution The following points of various difference between institution and society may be pointed out : i. Society is a system of social relationship while institution is the organisation of rules, traditions and usages. ii. Institutions are the forms of procedures which are recognized and accepted by society. iii. Institutions exist for the society and govern the relations between the members of the society. iv. Society represents human aspect while an institution is a social condition of conduct and behaviour. 17.8 Difference between community and institutions The following differences between community and institution are to be pointed out : i. Community is a group of people while institution is an organization of rules, traditions and usages. ii. Community is a group of individual living in a particular locality and possessing community sentiment. On the other hand, institution is a structure of society to fulfil some specific needs. iii. Community is concrete while institution is abstract.

NSOU ? CC-SO-01 215 iv. Individuals are the members of community, and not of the institution. v. Community is concerned with the social life as a whole. While every institution is concerned with one particular aspect of life. vi. Community is based on mutual relationship. While institution is based upon the collective activities of human beings. vii. A community grows itself while institutions are born in a community. 17.9 Difference between association and institution Associations and institutions are different conceptually. Sometimes confusion arises between institutions and associations because the term in a different context, may mean either one of the other. But there is a much more distinction to be made between institutions and association. The following differences between association and institution may be pointed out: i. Institutions are the rules of procedure, on the other hand association is a group of individuals organized for the pursuit of a specific purpose. Family is an association which is organized for the preparation of mankind while marriage is its main institution. Likewise, political party system is an institution, state is an association. The church is an association, while baptism is an institution. An association represents human aspect, while an institution is a social condition of conduct and behaviour. ii. An association is considered as "an organized group". It has form and it is concrete. On the other hand, an institution is considered as a "form of procedure". It has no form and is abstract. iii. Associations are formed deliberately while institutions grow. iv. Association denotes membership, while institution indicates a made or means of service (procedure of work). Institutions give life and activity to associations, communities, or any other types of societies. To Sprott, "Associations are things, institutions are modes and ways. We are born and live-in association". v. Every association bears a particular name, while every institution is based on cultural symbol. vi. An association is an organized group while an institution is an organized procedure. vii.

100%

MATCHING BLOCK 306/372

SA Module 1 - 5.docx (D21364761)

Association is a group of people organized for the pursuit of

some specific purposes. On the other hand, institutions fulfil all the primary and basic need of people.

NSOU ? CC-SO-01 216 In spite of the differences between the two, it may be noted that no institution can function without an association. Institutions are impossible without associations. It may also be noted that while association and institution are different concepts, no institution can function without an association. Again, institutions give life and activity to associations, communities or any other types of societies. They are related to each other as every organisation has an institutional framework, which allows it to survive. An association has a location, on the other hand, an institution does not have a location. 17.10 Summary The term "institution" is used in a broad sense and in a narrow sense as well. But in sociology a precise definition is required. Institutions are forms of procedure. Every organisation is dependent upon certain recognised and established set of rules, traditions and usages. These usages and rules may be called institutions. They are recognised and accepted by society and govern the relations between individual and groups. Thus marriage, education, property and religion are the main institutions. Institutions are the means of social control. Institutions are formed to satisfy the primary needs of individuals. They have social recognition behind them. There are differences between institution and society, institution and community, and institution and association. 17.11 Keywords Community, Association, Society. 17.12 Questions 1. Answer the following questions briefly: (5 marks) (a) Define a social institution. (b) Point out five examples of institutions including association. (c) What are the types of Institution? (d) Mention the relation between association and institution. (e) Describe the functions of institution. (f) How does institution differ from society? (g) What are the differences between institution and community? (h) What are the general features of institution?

NSOU ? CC-SO-01 217 2. Answer in detail: (10 marks) (a) Write a note on Institution. (b) "Institutions are the machinery through which human society organizes, directs and executes the multifarious activities required to satisfy human needs." (Barnes). Elucidate. (c) What are the characteristics of institution? (d) Institutions are "the machinery through which society carries on its activities" (H.E. Barnes) Explain. 17.13 Suggested Readings 1. Objectives After reading this unit, you will be able to: ? understand the concepts of

culture ? describe some major characteristics of culture ? explain the relationship that exists between culture, society and individual behaviours 18.2 Introduction Culture is one of the most important concepts within sociology because Sociologists recognise that it plays a crucial role in our social lives. Though the term Culture is used today as a scientific concept by most of the social sciences, its

NSOU ? CC-SO-01 219 mostly comprehensive definition has been provided in anthropology. Humans are social beings. That is why we live together in societies. Day-to-day, we interact with each other and develop social relationships. Every society has a culture, no matter how simple that culture may be. Without culture there would be no humans. No society could exist without culture, but equally, no culture could exist without societies. Without culture, we would not be 'human' at all. The member of every society shares a common culture which they must learn. Culture is shared. Culture is not inherited; it is transmitted from one generation to the other through the vehicle of language. Like society, cultures differ all over the world. The two concepts of society and culture are closely related and sometimes can be used interchangeably. This unit discusses the meaning and definition of culture in anthropological perspective. The unit also discusses some of the characteristics and elements of culture. 18.3 The Concept of Culture Normally, one can presume culture to be equivalent to higher things of the mind such as fine art, literature, classical music and painting. However, in the perspective of Sociology it goes beyond such activities. Culture refers to the ways of life of the members of society or of groups within a society. It includes how they dress, the marriage customs, language and family life, their patterns of work, religious ceremonies, and leisure pursuits. Without culture there would be no humans. Culture is made up of traditions, beliefs, way of life from the most spiritual to the most material. Human beings are creators of culture, and at the same time Culture is what makes us human. But anthropologists define and use the term 'Culture' in quite a different way. It is used in a much broader sense by anthropologists, as culture includes much more than just the "finer things in life". There is no differentiation between 'cultured' people and 'uncultured' people since all people have culture from the anthropological point of view. Regarding human behaviour, the debate between anthropology vs sociology is a matter of perspectives. The primary goal of anthropology is to understand human diversity and cultural differences. Anthropology examines culture more at the micro-level of the individual which the anthropologists generally take as an example of the larger culture. In addition, anthropology homes in on the cultural specificities of a given group or community. Sociology, on the other, bends to look at the bigger picture, after studying institutions (educational, political, religious etc) organisations, political movement, and the power relations of different groups with each other. 18.3.1 Meaning and Definition of Culture The word 'culture' derives from a French term which in turn derives from the

NSOU ? CC-SO-01 220 Latin 'colere' which means to tend to the earth and grow, or cultivation and nurture. In an anthropological perspective, every society has a culture. It is universal, though in some societies it may be simple which complex in others. Likewise, every human being is cultured and culture is an attribute of the genes Homo. Culture is a design for living. It is the basis of human life. It rests on biology but is not biological. What has been acquired as a design for living is not biological. Culture is a product of social learning rather than biological heredity i.e. culture is non-genetic. It cannot be inherited by offspring from parents, but it can be transmitted socially from parents to children. Like animals humans cannot inherit behaviour. Animal behaviour is inborn. Animals inherit behaviour or at most pro to culture, but humans acquire culture. It in a totality of mental, rational and material, technological processes and products. This totality is what anthropologists call Culture. People often call an educated man a cultured man and regard that man as uncultured who is lacking education. Sometimes, an individual is described as a 'highly cultured person' meaning thereby that the person has certain features such as his speech, manner and taste in literature, music or painting which distinguish him from others. Culture in this sense, refers to certain personal characteristics of an individual. But in this sense, the word 'culture' is not used and understood in social sciences. Sometimes 'culture' is used to refer to a celebration or a programmer of entertainment as a 'cultural show'. In this sense, culture is identified with aesthetics or the fine arts such as dance, music or drama. This is also different from the technical meaning of the word 'culture'. Culture is used in a special sense in anthropology and sociology. It refers to the sum of human beings' life ways, their behaviour, beliefs, feelings, thoughts, it connects everything that is acquired by them as social beings. Culture has been defined in number of ways. There is no consensus among sociologists and anthropologists regarding the definition of culture. Culture is the basic concept of anthropology and is central of all the sub- branches of anthropology. Anthropologists have been discussing and debating definitions of culture since the origin of the discipline in the 19 th century. The classic definition of culture is given by a British anthropologist E. B. Taylor in his book Primitive Culture in 1871. He stated "culture or civilization is

73%

MATCHING BLOCK 305/372

W

that complex whole which includes knowledge, belief, art, morals, law, customs and any capabilities and habits acquired by man as a member of society."

This is a very broad definition of culture encompassing almost everything about a person's overall way of life, from knowledge to habit. Herein emphasis in on the fact that culture is something

NSOU ? CC-SO-01 221 individuals acquire as 'a member of the society', meaning that people obtain their culture from growing up with and living among a particular group. The phrase 'acquired by man as member of society' in this definition is very important. Taylor was able to establish the differences between biologically determined characteristics and those attributes which are socially learned. It is not a habit or capability of man as a biological being but man as a member of a social group. The acquisition of culture is not through biological heredity but through socialisation which is called enculturation.

Enculturation is specifically defined as the process by which an individual learns the rules and values of one's culture which begins at the family level right from the moment a child is born. Culture has been defined in number of ways. There is no consensus among sociologists and anthropologists regarding the definition of culture. From the beginning of the discipline about hundreds of definitions have been proposed and their number continues to grow steadily. Today, there are more than two hundred definitions of culture. Different definitions of culture reflect different theoretical bases for understanding or criteria for evaluating human activities. A few definitions of culture are given below- Malinowski defined culture as a "instrumental reality and apparatus for the satisfaction of the biological and derived need." It is the integral whole consisting of implements in consumers' goods, of constitutional characters for the various social groupings, human ideas and crafts, beliefs and customs.' According to Kluckhohn and Kelly, "Culture in general as a descriptive concept means the accumulated treasury of human creation books, paintings, buildings and the like, the knowledge of ways of adjusting to our surroundings, both human and physical, language, customs and systems of etiquette, ethics, religion and morals that have been built up through the ages." To Herskovits, "Culture refers to that part of the total setting (of human existence) which includes the material objects of human manufacture, techniques, social orientations, points of view, and sanctioned ends that are the immediate conditioning factors underlying behaviour". In simple terms, he says, culture is the "man-made part of the environment." According to Harris, "A culture is the total socially acquired life-ways or lifestyle of a group of people. It consists of the patterned respective ways of thinking, feeling and acting that are characteristics of the members of a particular society or segment of a society."

NSOU ? CC-SO-01 222 According to Gary Ferraro, "The concept of culture as everything that people have, think, do as members of a society. This definition can be instructive because the three verbs correspond to the three major components of culture. That is everything that people have refers to those things they carry around in their heads such as ideas, values, attitudes and everything that people refer to behaviour patterns. Thus, all cultures comprise of (a) material object, (b) ideas, values and attitudes, and (c) patterned ways of behaving." To Maclver, "culture is the expression of our nature in our modes of living and our thinking. Intercourse in our literature, in religion, in recreation and enjoyment."

97%

MATCHING BLOCK 307/372

Culture is the total content of the physio-social, bio-social and psycho-social universe man has produced and the socially created mechanisms through which these social products operate."

According to H.T. Hoebel, "Culture is the sum total of integrated learned behaviour patterns which are the characteristics of the members of a society and which are therefore not the result of biological inheritances."

90%

MATCHING BLOCK 309/372

W

According to H.T. Mazumder, "culture is the sum total of human achievements, material as well as non-material, capable of transmission, sociologically i.e. by tradition and communication, vertically as well as horizontally."

Irrespective of the various definitions, conceptions and approaches to the understanding of the concept of culture, it is however agreed that culture is a way of life and morality is a part of culture. Practically all modern definitions share key features. Culture is a system of learned behaviour shared by a transmitted among the members of the group. Culture therefore is mortal; intellectual and spiritual discipline for advancement in accordance with the norms and values based on accumulated heritage. From the aforesaid definitions of culture, we may mention the following characteristics- 18.3.2 Characteristics of Culture 1. Culture is learned : Culture is not inherited biologically but it is learnt socially by individuals in a society. Much of learning culture is unconscious and we learn culture from families, peers, institutions and media and others e.g., drinking, eating, dressing, walking, behaving readily etc are all learnt by man. Human beings learn

76%

MATCHING BLOCK 310/372

W

or acquire culture by living in groups. He learns it from society through

enculturation. The process of learning culture is called enculturation. The learned behaviour is communicated in the group NSOU ? CC-SO-01 223 through forms of socialisation such as observation, instruction, reward, punishment an experience. 2. Culture is social : Culture is not an individual phenomenon, but it is the products of society. It develops in the society through social interaction. It is shared in the members of the society. No man can acquire it without the associations of others.

96%

MATCHING BLOCK 311/372

W

Culture is not individual but social in nature. As a social product culture develops through social interaction which is shared by all. Without social interaction or social relations, it is exceedingly difficult and almost impossible to be cultured.

90%

MATCHING BLOCK 312/372

W

It is created or originated in society. Hence it is social. 3. Culture is shared : Culture is

shared by the members of society. Culture is not something that an individual alone can possess but shared by common people of a territory. For example, customs, traditions, values, beliefs etc are all shared by the people in a social situation. These beliefs and practices are adopted by all equally. Because we share culture with other members of our group. We are able to act in socially appropriate ways as well as predict how others will act. Despite the shared nature of culture, that does not mean that culture is homogenous (the same below) the multiple culture worlds that exists in any society are discussed in detail. 4. Culture is transmitted : Culture is capable of getting transmitted from one generation to the next. It passes from parents to children and so on. It is not transmitted through genes but through language. Language is means to communication which passes cultural traits

87%

MATCHING BLOCK 313/372

W

from one generation to another. This transmission is a continuous and spontaneous process. It never remains constant. Man inherits or learns culture from his ancestors and passes it to his successors. In this way culture constantly accumulates. 5. Culture

is continually changing and cumulative : It is a continuous process. It is a stream which is flowing from one generation to another through centuries. "Culture is the memory of human race." It is one of the fundamental and inescapable attributes of culture. Some societies sometimes change slowly, and hence in comparison to other societies seem not to be changing at all. But they are changing. People frequently have a deep-seated distrust and fear of change. It is usually easier not to change. Man does not meet each recurring situation in exactly the same way each time. He makes modifications, large and small. He tries new ways, or he accidentally tries the new ways. These new ways are transmitted to others and already the culture is changed. 6. Culture is Symbolic : A symbol is something that is used to represent NSOU ? CC-SO-01 224 something else. These may be physical objects like flags, crosses, or may be signs at the crossings or acts like shaking hands, kisses or something else such as words, numbers or sequence of sounds etc. All symbols have some or the other meaning bestowed upon them by those who use them. All human behaviour originated in the use of symbols. Thus, all civilizations have been generated and perpetuated only by the use of symbols. 7. Culture is consistent and integrated : All the cultural aspects are inter-connected with each other. The development of culture is the integration of its various parts. For example, value system is interlinked with morality, customs, beliefs and religion. Culture possesses an order and system. Its various parts are integrated with each other and any new element which is introduced is also integrated. Culture is an integrated whole that is the parts of culture are integrated to one another. 8. Culture is Variable. Culture is variable and changeable. Culture varies from society to society, group to group. Hence, we say Culture of India or England. Further culture varies from group to group within the same

100%

MATCHING BLOCK 314/372

W

society. Each and every society has its own culture. It also varies within a society from time to time. Ways of living of people of a particular society varies from time to time.

However, the ways of eating, drinking, speaking, greeting, dressing etc are different from one social situation to another at the same

89%

MATCHING BLOCK 315/372

W

time. 9. Culture is organised : Culture has an order or system. As Tylor says, Culture is a "complex whole". It means different parts of culture are well organised into a cohesive whole. Different parts of culture is organised in such a way that any change

in

100%

MATCHING BLOCK 316/372

W

one part brings corresponding changes in other parts. 10. Culture is

adaptive and maladaptive : Using culture, people adapt themselves to the environment. The ability to adapt themselves to practically any ecological condition, unlike other animals, makes humans unique. This ability is attributed to human's capacity for creating and using culture. Culture has also maladaptive dimensions. This is the very cultural creations and achievements of people may turn out to threaten their survival. When we see the contemporary problems of the environments, the side effects of rapid growth and in science and technology etc we see that culture is also maladaptive. 11. Culture is all-encompassing : Culture encompasses all aspects which affect people in their everyday lives. Culture comprises countless material and non-material aspects of human lives this it includes manmade objects, ideas, NSOU ? CC-SO-01 225 activities whether those of traditional of the past or those created lately. Culture is the sum total of human creation, intellectual, technical, artistic, physical and moral. 12. Culture is gratifying : Culture always necessarily provides all the basic biological and social needs of human beings. Cultural elements continue so long as they satisfy the needs of humans. If they fail to fulfil the wants of humans, they may be changed or replaced by new ones to secure the satisfaction of human wants. Gratification of needs reinforces, strengthens and perpetuates cultural elements. Our basic needs are food, shelter, clothing and desires are status, fame, money, physical needs etc are the examples which are fulfilled according to the cultural ways. In fact, it is defined as the process through which human beings satisfy their needs. 13.

94%

MATCHING BLOCK 317/372

W

Culture is Idealistic : Culture is idealistic in nature. Because it embodies the ideals, values and norms of the group. It sets ideal goals before individuals which

is worth attaining. Culture consists of the intellectual, artistic and social ideals and institutions which the members of the society profess, and to which they strive to confirm.

92%

MATCHING BLOCK 318/372

W

In other words, Culture is the sum total of ideals and values of individuals in society. 14. Culture is abstract : Culture

exists in the minds of or habits of the member of the society. Culture is the shared ways of doing and thinking. There the degrees of visibility of cultural behaviour, ranging from the regularised activities of persons to their internal reasons for doing so. In afterwards, we cannot see culture as such we can only see human behaviour. This behaviour occurs in regular, patterned fashion and it is called culture. 15. Culture is Structured : Culture has a definite and proper structure. This implies that there is definite arrangement of its component and units. The structural components of culture are called traits and complexes. A given culture has many traits and these traits form into complexes and each one acts as a unit. These traits and complexes are arranged in a systematic manner. This arrangement is the plan or structure of a culture. 16. Culture is region : Socio-cultural anthropologists talk about culture region which is the geographical territory in which a particular culture prevails. It is marked by all the characteristics of a culture, including modes building styles, forms and field and other material manifestation. That is there are sub-cultures, regional cultures, national cultures and international cultures. 17. Cultural Universals specialities and alternatives : Cultural universals are features that are found in every culture. It is those that distinguish Homo NSOU ? CC-SO-01 226 Sapiens from other species. Anthropology assumes that all human beings are fundamentally alike, and they share the same basic biological, psychological, social and other characteristics. People all over the world have certain common obligations towards one another. All people are members of a single community, they all have the same root and destiny. This belief is either explicit or implicit in most of the great world religions. Certain biological, psychological, social and cultural features of human beings are universal, others are moral, generalities, common to several but not to all human groups. Still other cultural features are particularities unique to certain cultural traditions (for details, Hammoud, 1971) 18. Culture is a human product : Culture is not a free, operating by itself and independent of the human actors. There is an unconscious tendency of defying culture to embow it with life and treat it as a thing. Culture is a creation of society in interaction and depends for its existence upon the continuance of the society. Culture does not 'do' anything on its own. It does not cause the individual to act in a particular way. Culture, in short, is a human product. It is not independently endowed with life. 19. Culture is a way of life (Concept of explicit and implicit) : Culture means simply "the way of life" of people or their "design for living". Kluckholm and Kelly define it in this sense: "A culture is a historically derived system of explicit and implicit designs for living which tends to be shared by all or specially designed members of a group." Explicit culture refers to similarities in word and action which can be directly observed. For example, the adolescent cultural behaviour can be generalised from regularities in dress, mannerism and conversation. Implicit culture exists in abstract forms of which are not quite obvious. 20. Culture is pervasive : It touches every aspect of life. The pervasiveness of culture is manifest in two ways: 1) First, culture provides an unquestioned context within which individual action and response take place. Not only emotional action but relational actions are governed by cultural norms. 2) Culture pervades social activities and institutes. 21. Language is the chief vehicle of culture : Man lives not only in the present but also in the past and future. He is able to do this because he possesses language which transmits to him what was learnt in the past and enables him to transmit the accumulated wisdom to the next generation. Culture is transmitted in a variety of ways; language is one of the most important vehicles for perpetuating cultural patterns. Besides the aforesaid characteristics we are discussing the following concepts regarding culture

NSOU ? CC-SO-01 227 18.3.3 Some important concepts regarding culture i. Overtness and covertness : Overtness and covertness refer to the qualities of culture as detected by an observer. The observer may be an anthropologist or a member of a society who is unfamiliar with certain parts of the culture. Overt means easily detectable qualities of a culture. These include artifacts, actions, utterances which can be perceived directly. Artifacts include houses, clothes, books, tools etc; actions imply postures in various situations, curing practices, sports, externally manifest signs of respect etc; utterances include speech, songs, proverbs etc. An observer can easily detect these qualities because one has plenty of opportunities to see them, experience them and record them. On the other hand, covert implies those qualities of culture which are not easily detected by an outsider. Sentiments, beliefs, fears and values are some of the cultural items which cannot be easily detected i.e., they are Covert. They are not amendable to direct observations and moreover people cannot always explain what they feel. It is generally difficult to express these abstract ideas. ii. Explicit and implicit : According to Kluckhohn explicit means the people's awareness of existence of the cultural items. Implicit implies the people's dim awareness or unawareness of certain cultural items. Explicitness and implicitness concern the experience of people possessing the culture, while overtness and covertness refer to the view of the observer. Explicit cultural refers to similarities in word and action which can be directly observed. For example, the adolescent cultural behaviour can be generalised from regularities in dress, mannerism and conversation. But there are certain items of culture about which people are only dimly aware or unaware of. Hence, they cannot give any clear account on such cultural items. These are implicit items of the culture. Implicit culture exists in abstract forms which are not quite obvious. iii. Ideality and reality : Ideality of culture refers to how people say they should behave, or the way would like to live. Reality is the actual way people behave. There is generally a discrepancy between ideality and reality. iv. Ethos and Eidos : Kroeber has drawn attention to these two aspects of culture. Ethos refers to effective or emotional quality of a culture expressed in series of beliefs, thoughts and behaviour. It acts as a central force, interest theme or patterned colours every item of culture. AS it determines what people should have do, think, and feel, prepares all the people in a culture to express the same emotional tone in all acts, thoughts and feelings. Whereas Eidos in the formal appearance of a culture derived from its NSOU ? CC-SO-01 228 constituents. Eidos is the totality of items of culture. On the contrary ethos is the emotional quality colouring this totality. Ethos is affective but eidos is cognitive. v. Organic and super-organic : Culture is organic in the sense that it is ultimately rooted in the biological nature of human organism. Without humans to act, to think, to feel, or to make and use things. There would be no culture. Thus, Culture is organic. Culture is super organic, while it is organic. Once created, culture acquires a super-organic quality or the quality by virtue of which culture exists on a level above that of the Individuals who create and carry it. According to Kroeber, culture becomes a phenomenon in its own right, with its own laws and processed apart from the human carriers who sustain it. Culture is super-organic to the extent that is outlines the particular generations of people who carry it and so persists from one generation to another. This does not mean that its origin is other than biological. Culture is created by humans and it is dependent on human choice for its continuity. Culture can be altered through the decisions of human beings. But this does not mean it is easy to change culture. The super-organic may be injurious to the organic. Some cultural traits for instance, are definitely harmful to the organic life of the humans. The superorganic is an order of phenomenon different from the organic and goes its way with certain amount of independence from the organic. vi. Universal and Unique : Cultural universals are features that are found in every culture, those that distinguish Homo Sapiens from other species. Anthropology assumes that all human beings are fundamentally alike, and they share the same basic biological, psychological, social and other characteristics. People all over the world have certain common obligations towards one another. All people are members of a single community, they all have the same root and destiny. Certain biological, psychological, social and cultural features of human beings are universal. Others are merely generalities; common to several. But not to all human groups. Still other cultural features are particularities unique to certain cultural traditions. Culture is universal in the sense that every man experiences it and uniqueness of culture implies its regional variations. Some cultural traits are necessary to all members of the society these cultural traits are called cultural universe like for e.g., incest taboo. vii. Ethnocentrism and cultural relativism : The two concepts – ethnocentrism and cultural relativism occupy key positions in socio-cultural anthropology. They are the most sensitive and controversial issues in Sociology and socio- cultural anthropology. In his book" Folkways" sociologist William Graham

NSOU ? CC-SO-01 229 Sumner coined the terms "ethnocentrism" to refer to the tendency to assume that one's culture and way of life are superior to all others. The ethnocentric person sees his/her own group as the centre or defining point of culture and views all other cultures as deviations from what is "normal". Cultural Relativism/ determinism approach was first formulated by Franz Boas in North America in 19th century. He says no culture should be judged by the standards of another. Cultural relationism views people's behaviour from the perspective of their own culture. 18.4 Culture and Civilization Culture is used in a specific sense in Sociology. Culture is a system of learned behaviours shared by and transmitted among the members of the society. It is a heritage into which a child is born. Man begins to learn it since his birth. By picking up the culture and by tapping the heritage of his past, man becomes distinctively human. Singing, talking, dancing and eating belong to the category of Culture. They have been transmitted to him by someone, be it his schoolteacher, his parents or friends. Man has, therefore, been called the culture-bearing animal. The term 'civilization' has been used almost synonymously with culture. This is because civilization and culture are different aspects of a single entity. Civilization can be viewed as external manifestation and culture as the internal character of a society. Thus, civilization is expressed in physical attributes, such as tool making agriculture, buildings, technology, urban planning, social structure, social institutions and so forth. Some sociologists divide culture into two parts- 1) the material and 2) non-material. By material is meant concrete objects like dwellings, pens, radio, articles of clothing, utensils, tools, books, paintings etc. By non-material is meant the abstract creations of man such as language, literature, science, art, law, religion. Maclver uses the term 'civilization' to denote utilitarian things- the whole mechanism and social organism, techniques and material instruments- which have been designed by man in his endeavour to control the conditions of his life. These things operate as means to ends. 18.4.1 The following differences regarding culture and civilization may be pointed out 1. Civilization has a precise standard of measurement, but not culture. Civilization is susceptible of being quantitatively measured on the grounds of efficiency. When comparing the products of civilization we can prove which is superior and which is inferior. Their efficiency can be estimated

NSOU ? CC-SO-01 230 and in fact be measured. A lorry runs faster than a bullock cart, an aeroplane runs faster than a lorry. On the contrary, there is no measuring rod by which we can assess the cultural objects. 2. Civilization is always advancing, but not culture. Civilization shows a persistent upward trend. It is unilinear and cumulative and tends to advance indefinitely. Since man invented automobile, it has continuously improved. Similar is the case with other means of transportation like railway, ship, which are constantly growing more swift, more efficient and better designed. Culture, on the other hand, advances slowly and it is often subject to retrogression. 3. Civilization is passed on without effort but not culture. Culture is transmitted on a different principle from that of civilization. The former can only be assimilated by the like-minded. It can be had only by those who are worthy of it. No one without the quality of the artist can appreciate art, nor classical music can be judged by those who do not have an ear for it. On the other hand, civilization in general makes no such demand. 4. The works of civilization can be improved by anybody but that is not possible in the case of culture. Lesser minds can improve the work of the great inventors, but lesser artists instead of improving may rather spoil the poems of Milton or Tagore. Again, the product of the artist is more revelatory of his personality than is that of the technician. Culture, being the immediate expression of the human spirit, can advance only if that spirit is capable of finer efforts, has itself something more to express. 5. Civilization is external and mechanical while culture is internal and organic. Civilization is inclusive of external things, culture is related to internal thoughts, feelings, ideas, values etc. Maclver remarks, "Civilization is what we have, culture is what we are." 6. Civilization is borrowed without change or less but not culture. The transference of civilization from one generation to another is quick and easy. Given adequate means of communication things of civilization can quickly spread to the whole world radio, television, x-ray, automobiles are no longer the monopoly of any one country. The new techniques of constructing buildings and building roads have everywhere been adopted. Culture on the other hand, has an intrinsic quality and can only be imbibed. In India, we have borrowed much Western civilization, but not western culture. Civilization proceeds more rapidly, more simply, less selectively, always spreading outward from the foci of technological advance.

NSOU ? CC-SO-01 231 Culture and civilization are independent. Culture and civilization, different as they are, will hardly exist apart from each other. The two are not only interdependent but also interactive. The articles of civilization called "artifacts" are influenced by culture called "mentifacts" and culture is influenced by articles of civilization. Both culture and civilization have been developed by the same human processes. Both are complementary to each other. Culture needs a civilization for further growth. Civilization needs culture even for its vital forced survival. The two are therefore interdependent. Civilization cannot survive without strong stimulus and motive, however high may be its achievements in science. In short, civilization is the driving force of society, culture is its steering wheel.

18.5 Culture and Society Culture is the sum total of learned, shared and socially transmitted behaviour that includes ideas, values, and customs of groups of people. Society is defined as a complex of groups in reciprocal relationships, interacting upon one another, enabling human organism to carry on their life-activities and helping each person to fulfil his wishes and accomplish his interests in association with his fellows.

18.5.1 Difference between Society and Culture

1. Society includes social relationships, social groups and social institutions that exist in abstract form and hence are intangible. Culture has two major constituent parts- materials and behavioural (non-material) while the behavioural aspects of culture are intangible because of their abstract existence. Due to material elements culture is tangible.
2. Both society and culture are subject to change over time. Change in social life takes place slowly whereas in some aspects of culture such as technology, food habit, dress pattern and ornaments, change occur rapidly.
3. According to Nadel, society means the totality of social facts projected in the dimension of relationships and groupings and culture is the same totality in the dimension of action. Firth has stated, "if society is taken to be an aggregate of social relations, then culture is the content of those relations." According to Foster, "society refers to organised groups of people who have learned to live and work together interacting in the pursuit of common ends and cultural ends and culture is the common, learned way of life shared by the members of society. In this way, he has pointed out that society means people and culture means the behaviour of people. Keesing has given distinction between society and culture. To him, culture puts the

NSOU ? CC-SO-01 232 focus on the customs of people and society puts it on the people who are practicing the customs. As society is essential for survival and inheritance of culture so also culture is essential for the existence of society. One of the fundamental needs for the existence of society is occurrence of interactions among people occupying different statuses. Cultural aspects like values, ethics, manners, usages and etiquette guide persons to interact with others in a socially prescribed manner. People disobeying usages are often socially cautioned and sometimes punished. In fact, some social relationships are identified and maintained through usages that are prescribed for such relationships. For instance, father-in-law and daughter-in-law relation is identified by avoidance usage and the relationship between a man with his wife's younger sister and brother is characterised by joking usage. Society can exist so long as orderly social life is maintained. Culture contributes to maintain orderly social life by providing a set of norms and laws for proper social interaction among people. It also compels people to maintain peaceful orderly social life through its mechanism of social control. Integration and interaction among social groups are also essential for survival of society. Culture in the shape of celebration of festivals and rituals games and sports etc. provide scope for such interaction and unity. When a village festival is organised all households of the village are united. Similarly, in the occasions of marriage ceremony or death rituals kins are found to act as a single unit through mutual cooperation. The events like national games, sports, cultural festivals and trade fairs develop and strengthen the sense of integration among people of different states in a country. Despite fundamental differences between society and culture, anthropologists believe that the two terms are closely related and are complementary to each other. Focusing on the linkage between the two terms, Kroeber has pointed out that there can be no culture without a society and no society without culture. The complementary relation between social and culture is further exemplified by the fact that the existence of one is a pre-requisite for survival of the other. Tylor, Hunter, Whitten have emphasized upon the importance of society for an individual to learn culture. They have stated, culture is the patterned behaviour that individuals learn, are taught and practised within the context of the groups to which they belong. Culture and society correspond to two different dimensions of human life, they are complementary to each other.

NSOU ? CC-SO-01 233 18.6 Summary In this unit we have studied the anthropological meaning of culture though the term culture is used today as a scientific concept by most of the social sciences. Culture is one of the basic concepts of anthropology. Man is social being, that is why we live together in society. Every society has a culture (which is learned and shared). It is not inherited; it is transmitted from one generation to the other through the vehicle of language. Like societies cultures differ all over the world. To review, we may say that culture is – learned, as each person must learn how to "be" a member of that culture. Shared, as it offers all people ideas about behaviour. Symbolic, as it is based on the manipulation of symbols, and systematic and integrated, as the part of culture work together in an integrated whole.

18.7 Keywords Society, Civilisation, Ethnocentrism, Explicit, Implicit, Overt, Covert, Social.

18.8 Questions

1. Answer the following questions briefly: (5 marks) (a) Define culture. (b) What is sub-culture? (c) How does culture become civilization? (d) What causes the rise of civilization? (e) Why is civilization important to humankind? (f) What is the importance of the study of ancient civilisation? (g) In what ways have we learnt about the early civilisation? (h) What is the basis of civilisation?
2. Answer in detail: (10 marks) (a) Write a note on the nature of culture. (b) Write a note on the relation between culture and civilization. (c) What is the role of culture and civilisation in society? (d) How has civilisation benefitted us?

MATCHING BLOCK 323/372

W

Samaj. At some other time, society refers to an association like Customer's society, co-operative society or cultural society. Society is also used in the sense of a group such as rural society or urban society.

Everyone often defines society as an aggregation or collection of individuals. But in sociology and anthropology, the term is used in a different sense. The term '

68%

MATCHING BLOCK 324/372

W

society' refers not just to a group of people but to a complex pattern of norms of interaction that exist among them.

In terms of common sense, society is understood as a tangible object, whereas in sociology and anthropology it refers to an intangible entity. It is a mental construct which we realize in everyday life but cannot see it. The important aspect of society is the system of relationships, the pattern of the norms of interaction by which the members of the society maintain themselves. Some anthropologists say that society exists only when the members know each other and possess common interests or objects.

94%

MATCHING BLOCK 325/372

Unit 1.docx (D109896188)

Society has become an essential condition for human life to continue.

Herein, we will discuss some of the views of the social thinkers who had on society and how they have perceived the same. Some popular definitions by famous sociologists August Comte viewed society as a social organism possessing a harmony of structure and function. Emile Durkheim regarded society as a reality in its own right. To Talcott Parsons society is a

81%

MATCHING BLOCK 330/372

W

total complex of human relationships in so far as they grow out of the action in terms of means- end relationship intrinsic or symbolic.

G.H. Mead conceived Society as an exchange of gestures which involves the use of symbols. M. Ginsberg defines

79%

MATCHING BLOCK 331/372

W

society as a collection of individuals united by certain relations or mode of behaviour which work them off from others who do not enter into these relations or who

are different from them in behaviour.

78%

MATCHING BLOCK 332/372

W

To G.D.H. Cole, "Society as the complex of organized associations and institutions within the community." According to Maclver and Page, "Society is a system of usages and procedures, authority and mutual aid, of many groupings and divisions of controls of human behaviours and liberties, "

a web of social relationship."

86%

MATCHING BLOCK 333/372

W

According to Cooley, "Society is a complex of forms and processes each of which is living and growing by interaction with the others, the whole being so unified that what take place in one part affects all the rests." According to

F. H. Giddings, "Society is the union itself, the organization the sum of formal relations in which associating individuals are bound together."

97%

MATCHING BLOCK 334/372

W

According to Cuber. "A society may be defined as a group of people who have lived long enough to become organized and to consider themselves and be considered as a unit more or less distinct from other human units."

100%

MATCHING BLOCK 335/372

W

According to Leacock, "Society includes not only the political relations by which men are bound

to get her

95%

MATCHING BLOCK 337/372

W

but the whole range of human relations and collective activities." From the

aforesaid definitions of the society, we can sum up into two types: (i) the functional definition and (ii) the structural definition. From the functional point of view society is defined as a complex of groups in reciprocal relationships interacting upon one another, enabling human organisms to carry on their life-activities and helping each person to fulfill his wishes and accomplish his interests in association with his fellows. From the structural point of view, society is the total social heritage of folkways, mores and institutions, of habits, sentiments and ideals. Ginsberg, Giddings, Cole and Cuber take a structural view of society. While Macalver, Parsons, Lapiere, Cooley and Leacock have given functional definition of society. The latter include in it different activities of the individuals and their relations with one another.

NSOU ? CC-SO-01 238 Thus, society is to be interpreted in a wider sense. It is both a structural and functional organization. It consists in the mutual interactions and mutual inter-relations of the individuals, but it is also a structure formed by these relations. It is a pattern, a system and not the people. Those who define it as a group of people interpret it in terms of "A society" as distinguished from "Society".

95%

MATCHING BLOCK 338/372

W

Thus, from the above analysis, we conclude that from a wider-angle society is considered as both a structural as well as functional unit. It is an organization, a system and a pattern. It is a system of rules and regulations which changes in course of time. Society is a larger group of which individuals is a member. But society is not a group of people only rather it is a system of relationships which exists among individuals or groups. That is why Maclver remarked that society is "a web of social relationship". This relationship may be of different types. But no social relationship could be possible without awareness and without social relationships, there could be no society. 19.5 Characteristics of society

From the above definitions we can point out the following characteristics of society: 1)

100%

MATCHING BLOCK 339/372

W

Population: Without a group of people no society could be formed.

A society must have population.

93%

MATCHING BLOCK 340/372

W

Of course society refers to a group of people but to a system of social relationships. But for the establishment of social relationships a group of people is necessary. 2)

90%

MATCHING BLOCK 341/372

W

Likeness is the most important characteristics of society. According to Maclver, "Society means likeness." Without a sense of likeness, there could be no mutual recognition of "belonging together" and therefore no society. This sense of likeness was found in early society on Kinship. And in modern societies the conditions of social likeness have broadened out into the principles of nationality

of one world.

87%

MATCHING BLOCK 342/372

W

Society consists of like bodied and likeminded individuals. Friendship intimacy and association of any kind would be impossible without likeness. It also helps in the understandings of one by the other. That is why F. H. Giddings opines that society rests on the "Conscious of kind". 3) Difference: Along with likeness differences is another important characteristic of society. Society also implies difference, and it depends on

the latter

84%

MATCHING BLOCK 343/372

W

as much as on likeness. That is why Maclver points out that primary likeness and secondary differences create the greatest of institutions- the division of labour. Because differences are complementary to social

NSOU ? CC-SO-01 239 relationship, it has been argued that likeness is necessarily prior to the differentiations of social organization.

69%

MATCHING BLOCK 344/372

W

Family as the first society based on biological differences and differences in aptitude, interest and capacity. Though difference does not create society. Hence, differences are subordinate to likeness. 4) Interdependence: Interdependence is another essential characteristic of society. This fact of interdependence is visible in almost all modern societies. Aristotle remarked that man is a social animal. As a social animal he is dependent on others.

So

88%

MATCHING BLOCK 345/372

W

individual is self-sufficient. He has to depend on others for food, shelter and security and for the fulfillment of many of his needs and necessities.

84%

MATCHING BLOCK 346/372

W

Family being the first society based on the biological interdependence of the sexes. Not only individuals are interdependent but also the groups, communities and society. 5) Co-operation: Both co-operation and conflict are two another important characteristic of society. Maclver remarked that society is co-operation crossed by conflict. Co-operation is an essential component for the formulation of society. Without co-operation, there can be no society. People cannot maintain a happy life without co-operation. Family being the first society rests on co-operation. Co-operation avoids mutual destructiveness and results in economy in expenditure. 6) Conflict: Conflict is also necessary for society. It acts as a cementing factor for strengthening social relationships. In a healthy and well-developed society both co-operation and conflict co-exist. Because with the help of these two universal processes societies is formed. Conflict makes co-operation meaningful. Conflict may be direct and indirect. However, both are necessary for society. 7) Society is a network of web of social relationship. Social relationship is the foundation of society. Maclver remarked that society is a network of social relationship. Hence it is difficult to clarify social relationships. But this social relationship is based on mutual awareness or recognition to which Cooley call wefeeling, Giddings call consciousness of kind and Thomas as common propensity. Without these social relationships no society could be formed. As social relationships are abstract in nature so also the society is abstract in nature. Different kinds of social processes like co-operation, conflict constantly takes place in society. 8)

Permanent nature: Permanency is another important characteristic of society. Society is a coherent organization. Society continues to exist even after the death of individual members.

NSOU ? CC-SO-01 240 9) Society is abstract: Society is an abstract entity. As Maclver opines, society is a web of social relationships. We cannot see this relationship, but we can feel it. Hence it is an abstract concept. Wright has aptly remarked that "society in essence means a state or condition, a relationship and is, therefore, necessarily an abstraction." Besides society consists of customs, traditions, folkways, mores and cultures which are also abstract. Hence, society is abstract in nature. 10) Society is Dynamic: No society is static. Every society is always in a state of continuous change. Old customs, traditions, folkways, mores, values and institutions got changed and new customs and values takes place. Society changes from its traditional nature to modern nature. Hence, one of the most important characteristics and nature of society is dynamic and changeable. 11)

91%

MATCHING BLOCK 347/372

W

Comprehensive culture: Culture is another important characteristic of society. Each and every society has its own culture which distinguishes it from others. Culture is the way of life of the member of a society and includes their values, beliefs, art, morals etc.

Hence

83%

MATCHING BLOCK 348/372

W

culture is comprehensive because it fulfils the necessities of social life. Moreover, each and every society transmits its cultural pattern to the succeeding generations. 12)

68%

MATCHING BLOCK 349/372

W

Accommodation and assimilation: These two associative social processes are also important for the smooth functioning and continuity of society. Apart from the above characteristics, famous sociologists Maclver and Page in their definition mentions some of the elements of society which are

pointed out below: (a)

78%

MATCHING BLOCK 350/372

W

Usages: Every society has some usages regarding marriage, religion, education, food, speech etc. These usages differ from society to society. (b) Procedures: In every society there are some procedures like modes of action which helps to maintain its

entity and organization. (c)

95%

MATCHING BLOCK 351/372

W

Authority: Every society has some sort of authority. Every member of society has to obey this authority. Some sort of authority is necessary for the maintenance of order in society. (

d)

100%

MATCHING BLOCK 352/372

W

Mutual aid: In every society there exists a feeling of mutual aid among its members. Everyone needs

help from others. (e)

100%

MATCHING BLOCK 353/372

W

Groupings and divisions: In every society there exists several groupings and divisions like family, village, city etc. which constitute a society. (

f) Liberty and Control exists together in a society. Without liberty man cannot NSOU ? CC-SO-01 241 develop his personality. Every society exercises some sort of control over its members. Control upon an individual's behaviour is not meant to destroy his liberty, but to promote and protect it. 19.6 Difference between society, association, community, and institution 19.6.1 Difference between society and association There are differences between society and association. The following are the points of difference between society and association. 1. Society is a system of social relationship; association is a group of people: The widest and most inclusive term is society. It is an 'everchanging complex', a 'web of social relationship' that is constantly changing. In sociology, the term '

76%

MATCHING BLOCK 354/372

W

society' refers not to a group of people but to the complex pattern of the norms of interactions that arise among them. Society is a system of social

relationship which are invisible intangible. It is the result of natural evolution. On the other hand, association is a group of people organized for the fulfilment of particular interests for its members. 2. Society is older than association: Society is older than association and is in existence since man appeared on the earth while association arose at a later stage when man learnt to organize himself for the pursuit of some particular purpose. 3. Membership of society is compulsory: Man cannot live without society. Society will exist as long as man exists. The membership of society is compulsory, on the other hand, man may live without being a member of any association at all. The membership of an association is voluntary, association may be only transitory. 4. The aim of society is general: The aim of society is general while that of association in particular. Society comes into existence for the general wellbeing of the individuals. Hence, the aim of society is general. It is marked by both co-operation and conflict. 5. Society may be organized or unorganized; on the other hand, association must be organized. Association is formal for fulfilling the interests of its members. 6. Society is natural, association is artificial. 7. Society is marked by both co-operation and conflict on the other hand association is based on co-operation alone. NSOU ? CC-SO-01 242 19.6.2 Difference between Society and Institution The following points of various difference between institution as society may be pointed out: 1. Society is a system of social relationship while institution is the organization of rules, traditions, and usages. 2. Institutions are the forms of procedures which are recognized and accepted by society. 3. Institutions exist for the society and govern the relations between the members of the society. 4. Society represents human aspect while an institution is a social condition of conduct and behaviour. 19.6.3 Difference between Society and Community The following are the differences between society and community: 1. Community sentiment: A community is a group of people who live together in a particular locality and share the basic conditions of a common life.

100%

MATCHING BLOCK 355/372

W

To constitute a community the presence of sentiment among the members is necessary.

On the other hand, there is an element of likeness in society, but it is not necessary that likeness should include the people in oneness, the enemies can also be included in society. Society includes every relation which is established among the people. It is the name of the structure of all social relationships, direct or indirect, organized or unorganized, conscious or unconscious, co-operative or antagonistic. When we think of society, we think more particularly of organization, but where we think of community, we think of the life hence organization springs. 2. Definite Locality: Society has no definite boundary or assignable limits. It is universal and pervasive. Society is the name of our social relationships. Community, on the other hand, is group of people living together in a particular locality. 3. Community- a species of society: Community is the species of society. It exists within society and possesses its distinguishable structure which distinguishes it from other communities. Some communities are all inclusive and independent of others. Small communities exist within greater communities, the village within a town, the town within a region, the region within a nation.

NSOU ? CC-SO-01 243 4. Community is concrete, society is abstract: Society is a network of social relationships which cannot be seen or touched. It is an abstract concept. On the other hand, community is a concrete concept. It is a group of people living in a particular locality and having a feeling of oneness. We can see this group and locate its existence. Zimmerman and Frampton describe the distinction between community and society as follows: "In the community the group has a life of its own, superior to that of its temporary members. The group is an end in itself. In the society the group is merely a means to an end. In the Gemeinschaft (community) we have faith, customs, natural solidarity, common ownership of properties, and a common will. In the Gemeinschaft (society) we have doctrine, public opinion, fashion, contractual solidarity, private property, and individual will." 19.7 Summary In this unit we have studied the anthropological meaning of the concept society.

100%

MATCHING BLOCK 356/372

SA Unit 1.docx (D109896188)

It is derived from the Latin word Socius which means companionship or friendship.

We have come to know that a society comprises of a group of people who share a common culture, live in a particular area and feel themselves to constitute a unified and distinct entity. Society or human society is a group of people related to each other through persistent relations such as kinship, marriage, social status, role and social networks. By extension, society denotes the people of a region or country, sometimes even the world, taken as a whole. 19.8 Keywords Community, Institution, Association, Abstract, Likeness, Difference, Inter- difference. 19.9 Questions 1. Answer the following questions briefly: (5 marks) (a) What is society? Indicate the basic features of society. (b) "Society is the web of social relationship"-discuss. (c) Differentiate between human society and animal society.

NSOU ? CC-SO-01 244 (d) "Society is a biological organism" – what is meant by this statement? Give your opinion on it. (e) In "Man is social by nature" – substantiate the statement. (f) Bring out the role of language in human society. (g) Differentiate between society and community. (h) What are the differences between society and institution? 2. Answer in detail: (10 marks) (a) Mention the distinctive characteristics of human society. (b) Write a note on the concept of society in details. (c) Discuss the relationship between society and culture. (d) "Man is a social animal" – describe the relation between man and society. 19.10 Suggested Readings 1. Vidya Bhushan and D.R. Society is a system of social relationships. But these relationships are never permanent, they are subject to

incessant changes. Change is the law of nature. So, nature is always changeable. Human society also follows the natural law.

What is

NSOU ? CC-SO-01 246

100%**MATCHING BLOCK 357/372****W**

today shall be different from what it would be tomorrow.

This becomes evident from the fact that each modern society is today different from its past form. Due to changeability, human society reached at modern industrial civilization acrossing primitive, cave-based, and hunting stage of life, and going on towards the future. Society is the web of social relationships. And it is always changing. According to K. Davis, to observe the nature of social change time-dimension must be considered seriously. Because short term change may be regarded as social change. To know social change properly, we should understand the nature and significance

75%**MATCHING BLOCK 358/372****W**

of social change. Social change occurs in all societies. No society remains completely static.

This is true of all societies, primitive as well as civilized. However, society is subject to change, and the social structure changes in the sense that it acquires growth, maturity and even decay for the purpose of acquiring a 'new birth' in the Shelleyan sense of the term. Variations of conditions and modifications of norms, values and standards affect the social structure which responds to the changes much in the same way as change in nature and natural conditions affect any living organism. Social change can be witnessed in conditions under which man lives and the stride from the jungle to the metropolis is very much a part of this process. Changes take place in beliefs and views of men, and while man consciously notices how technological innovations have changed his culture and personality, he unwillingly takes part in the changing process of geographical and biological conditions. The interesting feature about any type of social change is that while the process is in operation, changes are not felt as clearly as when it is viewed upon as a past event. When the bastions of feudalism collapsed before the advancing might of science, few realized that the 'good old days' had gone forever. Even today, society is in its changing process. As Maclver and Page point out, social change is better understood when it is looked upon as a changing process. Continually, when it is in action and not merely as one isolated phenomenon of change compartmentally measuring the difference between one structure and another finally and completely. In this regard, the same authors said that this very process of change establishes society as a "time sequence". To them, society is "a process, not a product." A social process is a continuity, and whatever product it generates, that co-exists with the very process itself as soon as the process is stopped the product disappears. The laws of inheritance are a product the social processes connected with ideas relating to succession. If thoughts about the distribution of a man's properties after his death are no longer entertained, both he concepts of succession as the process and the laws of inheritance as the product will disappear.

NSOU ? CC-SO-01 247 20.3 Definition of Social Change According to Dictionary of Sociology and Related Sciences (Fairchild 1968: 277), social change refers to

71%**MATCHING BLOCK 360/372****SA** Module 1 - 5.docx (D21364761)

variations or modifications in any aspect of social process, patter or form...social change may be

progressive or regressive, permanent or temporary, planned or unplanned, unidirectional or multidirectional, beneficial or harmful." Social change may be swift and radical as in the case of the French or Russian revolutions, or it may be slow and gradual as in the case of secularization and modernization. All societies evolve over a period of time, and social change is a part of the process of growth. As Robert Lauer (1991: 4) points out, "social change is normal and continual." Some of the sociologists would emphasize the change in the very structure of society itself while others take into consideration 'partial' and 'total' changes in a given social system. In case of women's education change in any society, there takes place a partial change in its systems, and when feudal conditions are demolished in favour of arising class, the change in the social system is total. Again, some other writers seek to differentiate between changes that are 'basic' and others that are 'incidental'. Some writers observe that social changes occur at a pace that is faster than that of geographical changes. These changes are particularly noticeable in a society after the ravages of war or civil disturbances on a large scale, or often natural calamities China after the Revolution is a society that is markedly different from the one that existed before Mao-Tse-Tung took over, and the world as a whole has changed in radical terms after the second World War. To understand the nature and significance of social change it is better to know first about the definition of social change.

52%**MATCHING BLOCK 362/372****SA** Module 1 - 5.docx (D21364761)

Social changes may be simply defined as the process by which alteration occurs in the structure and function of a social system.

According to Morris Ginsberg, "By social change I understand a change in the

100%

MATCHING BLOCK 361/372

W

social structure e.g., the size of a society, the composition or balance of its parts or the type of its organization...

The term social change

must also include changes in attitudes or beliefs in so far as they sustain institutions and change with them." So, to him, social changes are mainly of two types- 1. Change in structure and functions, and 2. Change of values, ideas, social norms. It is not proper to analyze them separately because one influence another. In change occurs in the mind of the people, then change to be noticed in the structure. In the end of the 19 th century, the size of the family of West-European countries was becoming nuclear. M. Ginsberg thinks that there is a general agreement that this has been brought about in the main by voluntary restriction of births. In this case, attitude influenced social structure. Again, change in the social structure may NSOU ? CC-SO-01 248 change the thoughts (attitudes) of people. M. Ginsberg writes in his 'Studies in Sociology' that the structure of a society changes in as much as its size and patterns get rearranged and rebalanced when social changes affect it at any given stage of its development. Individual attitudes, according to Ginsberg, towards institutions and associations change from time to time, and in fact, this view tallies with Kingsley Davis's idea that changing society would mean changing man. K. Davis in his 'Human Society' writes, "

92%

MATCHING BLOCK 363/372

SA

Module 1 - 5.docx (D21364761)

by social change is meant only such alterations as occur in social organization- that is, the structure and functions of society.

Social change thus forms only a part of what is essentially a broader category called 'cultural change'. The latter embraces all changes occurring in any branch of culture, including art, science, technology, philosophy etc. as well as changes in the forms and rules of social organization. Again, he writes, "Since men are social creatures, social change means human change. To change society is to change man." However, sociologists Stewart and Glynn, in their 'Introduction to Sociology' minds, "Social change refers to large-scale alterations in the organizations and institutions of a population. Change in the individual's lifestyle or the realignment of a family because of divorce may be significant to the people involved, but, neither example is indicative of social change."

Maclver and Page describes, "...our direct concern as sociologists is with social relationships. It is the change in these relationships which alone we shall regard as

91%

MATCHING BLOCK 364/372

SA

Module 1 - 5.docx (D21364761)

social change." According to Jones, "Social change is a term used to describe variations in, as modifications of any aspect of social processes, social patterns, social interaction or social organization."

To

80%

MATCHING BLOCK 365/372

SA

Module 1 - 5.docx (D21364761)

Anderson and Parker, "social change involves alteration in the structure or functioning of social forms or processes themselves."

Moore observes that social change is "the significant alteration of social structure (that is of patterns of social action and interaction), including consequences and manifestations of such structures embodied in norms (rules of conduct), values and cultural products and symbols." Thus, social change implies any alterations in structures, functions, patterns of interaction, values and attitudes of people, and in their environment in a society. On the basis of these definitions, it may be concluded that

100%

MATCHING BLOCK 366/372

SA

Module 1 - 5.docx (D21364761)

social change refers to the modifications which take place in

the life patterns of people. It does not refer to all the changes going on in the society. Social relationships are social processes, social patterns and social interactions or social organization. It is a change in the institutions and normative structure of society.

NSOU ? CC-SO-01 249 20.4 Characteristics of Social Change From the above definitions, we may describe the following characteristics: 1. Social change is universal: It characterizes every society. No society remains completely static. This is true of all societies, primitive as well as civilized. Under the impact of several internal and external factors. Each society experiences changes in its structure, function, institutions and processes. 2. Social change is not uniform: Social change differs from society to society. Change is the law of nature. Change is the spice of life. However, it can be progressive or regressive, positive or negative, permanent or temporary, planned or unplanned, unidirectional or multidirectional, beneficial or harmful. 3. Social change involves community change: Social change does not mean the change in the life of an individual or several individuals or some group of individual. It is a change involving the life of the entire community. It characterizes and influences the life of the whole community change and not an individual change. 4. Nature and speed of social change in various societies is different: In all societies the nature and speed of social change varies. Each society has its own history and culture. The speed of change in some societies is slow while in others it is fast and rapid. In societies with low levels of literacy and development, the speed of social change is slow e.g., at the villages. In a developed and highly literate society the social change speedily comes e.g., in urban areas. 5. Social change is again relative to time: Social change characterizes each society. Its speed, however, always differs from time to time and is not essentially uniform. It keeps on changing from time to time. Before 1947, when our country was living under British imperialism, the speed of change remained slow. After independence, the speed of change in Indian society became extremely fast. Rapid industrialization, development of agriculture and the process of planned socio-economic development increased the speed of social change. Under the impact of information and communication revolution of contemporary times, the speed of change has become very fast. Thus, the speed of change in each society continues to vary from time to time. 6. Social change shows a chain reaction sequence: Since social change always comes under the impact of several social, economic, technological and situational factors, it very often shows a chain reaction sequence i.e.,

NSOU ? CC-SO-01 250 change is one part/factor leads to changes in the other parts/factors. Industrialization and urbanization lead to changes in family life and village life. Increased need for labour to run the factories encourages the women to join the work force. Need for skilled labours encourages both men and women to go in for technical education and training. This again leads to change in all parts of social relations. Thus, social change is characterized by a chain-reaction sequence. 7. Several interdependent and interacting factors of social change comes under the influence of several social, economic, cultural, political and science technological factors. 8. Social change is unpredictable in general: No one can predict social change. It is indeed difficult to predict the nature of social change that might come in a society so sociologists can really predict it. The process of social change is overly complex and dynamic. Revolution is a process of social change. What speed and in what form the change takes place is not easily predictable. 9. Social change is continuous: Society is undergoing endless changes. These changes cannot be stopped.

100%

MATCHING BLOCK 367/372

SA Module 1 - 5.docx (D21364761)

Society cannot be preserved in a museum to save it from the ravages of time.

From the dawn of history, dawn to this day, society has been in continuous flux. 10. Social change is temporal: Change happens through time. Social change is temporal in the sense it denotes the time sequence. In fact, society exists only as a time sequence. As Maclver says, "it is a becoming, not a being, a process, not a product". Innovation of new things, modification and revolution of the existing behaviour and the discarding of the old behaviour patterns take time. But the mere passage of time does not cause change as in the biological process of ageing. 11. Social change is environment: Social change must take place within a geographical or physical and cultural context. Both these contexts have impact on human behaviour and in turn man changes them. Social changes never take place in vacuum. 12. Social change is Human change: The composition of society is not constant but changing. Social change involves the human aspects. 13. Social change results from interaction of several factors: A single factor may trigger a particular change, but it is always associated with other factors. The physical, biological, technological, cultural and other factors may together bring about social change. This due to the mutual interdependence of social phenomenon.

NSOU ? CC-SO-01 251 14. Social change is an objective term: To the sociologists, social change as a phenomenon is neither moral nor immoral, it is amoral. It means

88%

MATCHING BLOCK 369/372

SA Module 1 - 5.docx (D21364761)

the study of social change involves no value judgement. It is ethnically neutral.

One can study change even within the value systems without being for against the change. 20.5 Sources of Social change Change comes from two sources: one source is random or unique factors such as climate, weather, or the presence of specific groups of people. Another source is systematic factors, for example, successful development has the same general requirement, such as a stable and flexible government, enough free available resources and a diverse social organization of society. On the whole, social change is usually a combination of systematic factors along with some random or unique factors. 20.6 Factors of Social Change In every society, there are conditions which facilitate social change. In recent decades, attempts have been made to analyze social change based on studies in various fields. Several factors operate together in bringing about social change.

78%

MATCHING BLOCK 368/372

W

Social change has occurred in all societies and in all periods of time. But

the rate of social change differs from society to society. In one society, the rate is rapid while in another it is necessarily slow. There are various factors which determine the role and direction of social change. The physical or environmental or geographical and population, the biological, the technological, the cultural and the psychological factors are mentioned below- Attempts to frame an integrated and full-fledged theory of social change have been proceeding on for a long time. But still now most of the theories regarding social change have been criticized as deterministic. Deterministic, theoretical approach is that one by which an integrated full-fledged explanation is required. For example, economic determinism, technological determinism, geographical determinism may be mentioned. According to geographical determinism theory, natural and geographical environment and location society may be changed. Due to mountains, hills, seas, rivers, plain land, forest, desert, flood, drought etc. - These natural and geographical factors motivate social change. According to sociologist P. Sorokin, social change is not created only by a single factor. Social change is the combination of many factors. As a result, it is not easy to identify which cause is direct or indirect.

NSOU ? CC-SO-01 252 a) Population and the Physical/Geographical/Environmental Factors The population of every country is always changing both in numbers and in composition. The variables that are important are birth rate, mortality rate and migration so far as the study of population is concerned. The growth of population and the increasing migration to urban areas are the major trends in most of the states. The size of human population is, in fact, an important variable in the making of social change. Population size and density have operated as intervening variables. Population changes that have altered modern society include a decrease in the death rate, which has caused population explosion and increased the number of older people, a decrease in the birth rate which has decreased the number of people and migration, which has brought different cultures into contact with one another, spreading the ideas of one culture to another. Internal population changes, such as, fluctuation in birth and death rates are also likely to produce social cultural change. b) The Physical Factor Man's environment is not merely the geographical one, it comprehends the economic, the political and the cultural surroundings of man so that all human beings live in that may be described as a total environment. However, the geographical surroundings have a special significance for him, since physical conditions directly affect his life and the changes that are affected in it climatic conditions and geological attributes of land certainly influence human habitation, and along with these factors other natural conditions shape man's life, the materials that he uses for his buildings, the matter that becomes his food, means of transportation, methods of cultivation and the use of animals and animal power for domestic and agricultural purposes. In the process of cultural development of any society, all these physical factors have their importance in as much as people living in any geographical area become ecologically habituated to the local physical conditions. These conditions do not change radically in order to annihilate the local culture but at the same time they do not remain the same. Man has always tried to change the physical surroundings in which he lives, with the help of his cultural attainments. He covered himself and P to the predatory forces of nature in the initial stages of his development, in the later stages, he has learnt to change courses of rivers, soil qualities, the very topography of land and other physical conditions whenever they perplex him with adverse conditions. Forests are cleared for human habitation while at the same time deserts and areas with inclement attributes are made habitable and productive. Some writers point out that whatever is natural in geographic conditions has been modified by the cultural features of human civilization, and the natural landscape has given way to

NSOU ? CC-SO-01 253 the cultural landscape not only in urban concentrations but in rural areas too. Thus the cultural landscape manifests itself in canals, manmade lakes, irrigation devices, highways and railroads. Several hundreds of years are taken in the change of a natural landscape while the cultural landscape changes speedily particularly in developing countries like our own where the desire for progress brooks no delay. Differences in conditions of development in different regions may not be caused by geographical factors alone, but the physical surroundings have their share of importance. Countries in Europe are developed not because they are located in the temperate zone of this earth of ours but because they felt the importance of industrial revolution before other countries. Excessive heat or cold will not help the concentration of habitation in any locality, nor will human beings tend to settle down in places that are devoid of the minimum of natural resource. People living in colder countries can be more hardworking than those of warmer climates, and man necessarily learns to correlate his efforts of the minimum magnitude and those who live under hard conditions of incommunicable mountains or rough deserts will apply their skill and experiences to the possibilities of improving their living conditions under such difficult habitat. The different localities will therefore, generate cultural differences in the respective ways of life that can hardly be missed by the student of sociology. Interaction in the relation of production, according to Marx and Engels, brings about changes in society. Kingsley Davis, However, does not consider this analysis of social relations to be very perfect. According to him, it would be an oversimplification to state that the economic structure alone brings about changes in a society; there are other factors too that account for such change. No single factor can afford to bring changes in a society through each of them has its own share of contribution in the process that has been described as social change. Geography can impede or facilitate change by isolating or permitting ready contact between groups. The changes in the environment have profound repercussions on culture. An earthquake, a volcanic eruption and other natural disasters obviously have immense adverse consequences for social life. Similarly, pollution, drought, soil erosion and the like can produce far-reaching economic and social consequences. The changes in the natural environment producing social changes arise from the interaction of man with his environment. c) The Biological Factor Of the several factors that account for social change the biological arguments are of considerable importance. The biological conditions can change faster than the slow natural changes. By biological factors we mean the factors that determine the

NSOU ? CC-SO-01 254 numbers, the composition, the selection and the hereditary quality of the successive generations. The human element in society is always changing. The changes in population, both in numbers and composition have a far-reaching effect on society. The composition of population in any society changes according to social conditions and this fact is true not only with developed countries of Western Europe, but also with some of our countries in the orient. With the onset of the industrial revolution in the nineteenth century, population rose in the western countries and then became stabilised in the last fifty years with the result that today birth rates as well as death rates tend to remain on the lower side. Some demographers found that in India a trend towards balancing population is being officially encouraged. The variables that are important are birth rate, mortality rate and migration so far as the study of population is concerned. The growth of population and the increasing migration to urban areas are the major trends in most of the states. The size of the human population is in fact an important variable in the making of social change, population size and density have operated intervening variables. Population changes that have altered modern society include a decrease in the death rate, which has caused population explosion and increased the number of older people, a decrease in the birth rate, which has decreased the number of people and migration, which has brought different cultures into contact with one another, spreading the ideas of one culture to another. The influx of a large group bearing a divergent culture influences those whose ranks they join. Internal population changes such as fluctuation in birth and death rates are also likely to produce social and cultural change. Increasing population produces profound defects in a society, including an increase in impersonal relations, the expansion of secondary groups and greater institutional differences. d) Technology In our daily life technology affects society greatly. It is impossible to separate technology from our daily life- dress, various food habits, attitudes, beliefs, required communication system etc. Technology is a great invention of social change. All technological invention provides new opportunities with less effort or at less cost and establish new condition of life. Invention of agricultural technology in our country, for example has led to an increase in the quantity and quality of agricultural production. Regarding industry the technical condition of the modern factory tend to weaken the caste system and strengthen industrial unionism. Industrialism has destroyed the domestic system of production, brought women from the home to the factory and the office, and changed their earnings. And it has shaken the joint family system to its root. The textile plant has brought about organisation of labour and a complicated system of production and distribution.

NSOU ? CC-SO-01 255 With the invention of new agricultural tools and chemical manures, agricultural production has increased there by rising the standard of living of the rural people. Changes in the agricultural techniques have affected the rural community. Fewer people are now needed for agriculture. As a result, many agricultural labourers have shifted to town to find employment. Communication is an important factor determining our social life. The basic functions of all communication devices is the conquest of time and space. Its technique definitely limits the kinds of organized life that a people can have. The primary techniques of communication are speech and gesture since these techniques provide the base upon which all other modes of communication are built. Radio communication is the transportation of speech through space. The invention of the printing press has influenced entertainment education, politics and trade. The printed records have become a store house of wisdom upon which the would-be inventor can draw at will. The printed word also makes for a wide and rapid diffusion of inventions and discoveries within the members of a society and between societies. Similarly, the invention of radio, telegraph, telephone and computer has influenced the business recreation, public opinion and furthered the development of new modes of organisation. From the above discussion we may say that technology is changing the entire society in many ways. The following effects of technology may be mentioned: Modern technology has changed the family structure and the form of husband-wife relationship. It brought women from home to factory and the office. Love marriage, inter caste marriage, late marriage are the other effects of technology. It has increased the number of divorces. The invention of birth control devices has reduced the size of the family. Technology has lessened the importance of family as an agency of social control. It has caused economic depression, unemployment, industrial disputes, accidents and diseases. Trade-union movement is the product of technology. It has created a middle class of white-collar employees. It has led to the decline of community life; it has grown the sense of individualism. Recreation has become commercialized. Caste-system has been weakened by technology. Man has become a machine; social contacts have become secondary. The worth of man is judged by what a man has than by what he is. A large number of functions have been transferred from the family to the state. The scope of state activity has been enlarged. Technology made the state secular. It has increased the size and power of bureaucracy. With the growth of scientific knowledge, the role superstitions have decreased. The followers of different religions have shed off their orthodoxy and mix with each other. Religion has now become more secular and scientific. But now through out India religions environment is in danger.

NSOU ? CC-SO-01 256 20.7 Concepts of Social Change, Social Evolution, Social, Progress, Social Development and Social Revolution Social change, social evolution, social development, and social progress are used in the discussion of the initial stage of sociology. These concepts are almost synonymous in most ways. They are treated as logically related terms though there were differences among them. Later there raised a question regarding their validity. Again, there was a doubt about the relationship of the concepts treated as logically related terms. Now we are trying to indicate the changes of these terms and their characteristics. In the eighteenth and nineteenth centuries sociology came into existence from philosophical approach to the philosophy of history. In the historical background of the writings of A. Comte, K. Marx, H. Spencer, Max weber an attempt was followed to explain the evolution of the society. Though E. Durkheim was not in favour of this approach, yet he actually failed to ignore totally the evolutionary approach. In the discussion of his Division of labour Durkheim followed the evolutionary approach from primitive to modern society. He tried to point out the evolution of the society. After words evolutionary approach was introduced in the discussion of E. Durkheim, Hob House, Edwards Westermarck and Moris Ginsberg. Evolution is a continuous process of differentiation cum integration. Evolution describes a series of related changes in a system of some kind. it is a process in which hidden or latent characters of a thing reveal themselves. It is an order of change which unfolds the variety of aspects belonging to the nature of the changing object. The concept of evolution was first developed by the German sociologist Von Baer and subsequently by Darwin, Spencer and many others. This concept, evolution, is different from that of progress, from the Latin progredial, to step forward and coincides with the Sanskrit pra-gat. The fundamental meaning of progress, therefore, is the march or advance towards a desirable end, so that there may be as many types of progress as there are desirable ends. When we speak of

100%

MATCHING BLOCK 372/372

SA Module 1 - 5.docx (D21364761)

progress, we imply not merely direction, but direction towards some final goal, some destination determined ideally.

83%

MATCHING BLOCK 370/372

W

Progress means change for the better, and hence implies a value judgement.

It is for possible tv speak of progress without reference to standards.

NSOU ? CC-SO-01 257 20.8 Characteristics of Progress In short, the following characteristics may be pointed out: i. Progress is change in some direction. ii. Change can be called progress only when it fulfills the desired aim. iii. Progress is communal. iv. Progress is volitional. It requires desire and volition. v. The concept of progress is variable. What is considered today the symbol of progress may tomorrow be regarded as sign of regress. vi. There are no limits to human progress. 20.9 Relationship between Social Change and Social Progress Social Change and Social Progress: Social change should also be distinguished from social progress. Social change is a generic term, an objective term describing one of the fundamental progresses. There is no value judgement attached to it. It is true that some changes are beneficial to mankind, and some are harmful. But social change as a phenomenon is neither moral nor immoral. The study of social change involves no value judgment. The concept of social progress, on the other hand, involves and implies value judgments social progress means improvement, betterment, moving to a higher level from a lower level. 20.10 Concept of Social Revolution (Marxist Revolution) From the above discussion we may say that there is no appropriate theory about social change. As a result there arises a question what brings social change and what retards it? In sociological literature there are two types of explanation of social change: a) first type theory is deterministic theories and b) social change results from the interaction of a number of factors. Again deterministic theories are of two kinds: a) normal types and b) a social factor Prof. K. Davies prefers geographical determinism as an example of the first kind of theory, and Marx's theory as the example of the second type. The geographical environment can not be regarded as a separate and sufficient cause. This environment,

NSOU ? CC-SO-01 258 unaffected by men, changes very slowly and hence can not explain most social changes. The deterministic theory of social change is a widely accepted theory of social change among contemporary sociologists. According to this theory there are certain forces, social or natural or both ,which bring about social change.It is not reason or intellect but the presence of certain forces and circumstances which determines the the course of social change .Prof Sumner and Keller insisted that social change is automatically determined by economic factors. According to Marx, material conditions of life are the determining factors of social change. His theory is known as the theory of economic determinism or "the materialist interpretation Of history 'Marx held that human society passes through various stages, each with its own well-defined organisational system. Each successive stage comes into existence as a result of conflict with the one preceding it. Change from one stage to another is due to changes in economic factors, namely, the methods of production and distribution. The Productive Forces and the Relations of Production together constitute the Mode of Production. The two are inseparably linked. If there is a discrepancy between the two, society goes through a period of crisis struggle. The material Productive Forces of society, in course of their development come into conflict with the existing relations of production which are directly reflected in political life and legal norms of the society. The conflict between the Relations of Production and Productive Forces leads to a sharpening of the conflict between the classes between the ruling (exploiting) classes, whose interest is to maintain and preserve the existing production relations, and the exploited, whose interest is to replace it by a new one. Sooner or later this conflict is by the revolutionary abolition of the old production relations and old classes, and their replacement by new ones. Marx showed that in the capitalist society it inevitably leads to the abolition of classes and the establishment of a classless society, socialism. This theory has been criticised by Prof K. Davies and Maclver ,and many other social thinkers as deterministic and hence unscientific and wrong; for Marx,in their opinion ,regarded the economic factor as the only determinant of all social phenomena including social change. 20.11 Summary Change is the law of nature. So, nature is always changeable. Human society also follow the natural law. Due to changeability human society reached at modern industrial civilization acrossing primitive, cave-based and hunting stage of life and going on towards the future.

NSOU ? CC-SO-01 259 Social change is a concept in sociology which talks about a change in the established patterns of social relations or change in social values or change in structure. Sociologists define social change as changes in human interactions and relationships that transform cultural and social institutions. These changes occur over time and often have profound and long-term consequences for society.

W

According to Morris Ginsberg, "By social change I understand a change in social structure e.g., the size of a society, the composition or balance of its parts or the type of its

organizations.... The term social change must also include changes in attitudes or beliefs, in so far as they sustain institutions and change with them". Social changes have some characteristics: social change is universal, social change is not uniform, social change is continuous, it is temporal. Social change is the combination of many factors: (i) Population and the physical/geographical/environmental (ii) Biological factors, technology etc. Social changes are of various types and can be explained by different terms such as process, growth, progress, evolution, revolution, adaptation and accommodation etc. Evolution is a process of differentiation and integration. Some thinkers opine that men have all what they need in material goods and that there is no need for further invention. However, it would be unwise to assert that further inventions be stopped because mankind has all the material goods it needs. Man's wants are limitless. Changes will continue in future also. 20.12 Questions 1. Answer the following questions briefly: (5 marks) (a) Define social change. (b) Point out four types of social change. (c) What do you mean by evolution? (d) What is progress? (e) Difference between evolution and progress. (f) Relation between social change and evolution. (g) Point out the geographical factors. (h) Define civilization.

NSOU ? CC-SO-01 260 2. Answer in detail: (10 marks) (a) Write a note on the concept of social change. (b) Point out the main characteristics of social change. (c) Mention the factors of social change. (d) Describe the main causes of social change. 20.13 Suggested Readings 1. Vidya Bhushan and D.R. First phase of development By 18th century A.D. after the experience and influence of the renaissance in Europe, there were many eminent philosophers who have made immense contributions to the understanding of society, including Rousseau, Vico, Baron de Montesquieu and John Locke who dealt with the social phenomena of the time. These earlier works certainly laid the philosophical foundation for the development of the social sciences and the science of human society including sociology and anthropology. The contribution of the earlier philosophers and scholars have certainly contributed to the emergence and development of anthropology although they cannot be called anthropology per se.

On the nature of social anthropology, he states that "there is a broad division of opinion between those who regard social anthropology as a natural science and those, like myself [Evans-Pritchard], who regards it as one of the humanities. This division is perhaps at its sharpest when relations between anthropology and history are being discussed" (Evans-Pritchard, 1951:7). 1.6.2 Second Phase of development In the second phase (1840-1890) there was "transition in the natural sciences from a static equilibrium model to a dynamic model. Its culmination came with the introduction of thermodynamic and Darwinian evolutionary theory" (Voget, 1975:42).

This period marks the emergence of anthropology into an academic discipline. It is through the inspiration of the "triumphs of the scientific method in the physical NSOU ? CC-SO-01 14 and organic domain, nineteenth century anthropologists believed that socio-cultural phenomena were discoverable lawful principles. This conviction joined their interests with the aspiration of a still earlier period, extending back before the social sciences had been named, to the epochal stirrings of the eighteenth-century Enlightenment and the vision of a universal history of mankind" (Harris 1979:1). However, it emerged as an academic discipline only in the nineteenth century. The significant factors for the emergence of the discipline is however attributed to the various intellectual and socio-political changes taking place in the 18th and 19th centuries in Europe. Some of the important influences include the French Revolution and the Industrial Revolution in Europe.

Historic and evolutionary processes had been at work in the emergence of the anthropological scientific institution" (Voget 1975:89). Marvin Harris, a historian of anthropological development, also views that anthropology "began as the science of history" (1979:1). 1.6.3 Emergence of modern anthropology The emergence of modern social anthropology emerged mainly with the contribution of Bronislaw Malinowski and A.R. Radcliff-Brown. Marcel Mauss is also generally considered as the pioneer of modern social anthropology in France. Bronislaw Malinowski is one of the most well-known social anthropologists. In fact, he is generally regarded as the founder of modern social anthropology. His main contributions to modern social anthropology was the introduction of ethnographic method with participant method and/or technique, and founding of the theory of functionalism departing from the earlier approaches, particularly, evolutionary, and historical approaches. His significant works include Argonauts of the Western Pacific (1922), Crime and Custom in Savage Society (1926), A Scientific Theory of Culture and Other Essays (1944).

Along these pioneers in social anthropology in varied areas, one can include Levi Strauss into the list for founding the theory of structuralism and structural anthropology. He is also regarded as one of the most influential thinkers of the 20th century about myth, culture, religion, and social organization. His significant works include The Elementary Structures of Kinship (1949), Tristes Tropiques (1955), and Structural Anthropology (1963). There are also many anthropologists who contributed to the development of modern social anthropology, but they come either later or of lower stature. The emergence of anthropology (social anthropology) as a discipline can also be reckoned through the formation of professional associations. The aborigines Protection Society formed in 1837 was the first anthropological association to be established (cf. Sarana 1983:4).

The social sciences comprise the application of scientific methods to the study of the human aspects of the world. Psychology studies the human mind and micro- level (or individual) behavior; sociology examines human society; political science studies the governing of groups and countries; communication studies the flow of discourse via various media; economics concerns itself with the production and allocation of wealth in society; and social work is the application of social scientific knowledge in society. Social sciences diverge from the humanities in that many in the social sciences emphasize the scientific method or other rigorous standards of evidence in the study of humanity.

through socialization that humans learn specific behaviour patterns to suit them best in the physical environment. Humans process the information provided by the social context to make sense of their living conditions. Sociology's basic unit of analysis is the social system such as family, social groups, cultures etc. The main subject matter of psychology is to study human mind to analyse attitude, behaviour emotions, perceptions and values which lead to the formation of individual personality living in the social environment. While sociology deals with the study of the social environment, social collectives which include family, communities and other social institutions psychology deals with the individual. For instance, while studying group dynamism, sociologist and psychologist initially share common interests in various types of groups, and their structures which are affected by the degree of cooperation, cohesion, conflict, information flow, the power of decision making and status hierarchies. This initial similarity of interest, takes on different focus, both the disciplines use different theoretical positions to explain the group phenomena. The quest to study human behaviour on scientific principles started with the emergence and establishment of natural sciences during the nineteenth century. Comte thought that society could be studied using the scientific methods of natural sciences. Comte argued careful observation of the entities that are known

through socialization that humans learn specific behaviour patterns to suit them best in the physical environment. Humans process the information provided by the social context to make sense of their living conditions. Sociology's basic unit of analysis is the social system such as family, social groups, cultures etc. The main subject matter of psychology is to study human mind to analyses attitude, behaviour emotions, perceptions and values which lead to the formation of individual personality living in the social environment. While sociology deals with the study of the social environment, social collectives which include family, communities and other social institutions psychology deals with the individual. For instance, while studying group dynamism, sociologist and psychologist initially share common interests in various types of groups, and their structures which are affected by the degree of cooperation, cohesion, conflict, information flow, the power of decision making and status hierarchies. This initial similarity of interest, takes on different focus, both the disciplines use different theoretical positions to explain the group phenomena. 3.4 SOCIAL PSYCHOLOGY: HISTORICAL DEVELOPMENT The quest to study human behaviour on scientific principles started with the emergence and establishment of natural sciences during the nineteenth century. Comte thought that society could be studied using the scientific methods of natural sciences. Comte argued careful observation of the entities that are known

<p>society) rather than the idiographic approach (search for particular scientific facts and processes, as distinct from general laws). It is a method to demonstrate "a particular phenomenon or event" to establish a "general law" (ibid.). There are also many other anthropologists who concur to his view. For instance, Evans-Pritchard, another well-known anthropologist considers social anthropology as "a branch of sociological studies, that branch which chiefly devotes itself to primitive societies" (1951:11). He opines that "when people speak of sociology they generally have in mind studies of particular problems in civilized societies. If we give this sense to the word, then the difference between social anthropology and sociology is a difference of field (</p>

is a social animal not only by nature but also by necessity. It is said that needs and necessities make man social. Man has many needs and necessities. Out of these different needs- social, mental, and physical-are NSOU ? CC-SO-01 175 very important and needs fulfillment. He cannot fulfill these needs without living in society. All his needs and necessities compel him to live in society. Many of his needs and necessities will remain unfulfilled without the cooperation of his fellow beings. His psychological needs only fulfilled within the course of living in society. He is totally dependent for his survival upon the existence of society. Human baby is brought up under the care of his parents and family members. He would not survive even a day without the support of society. All his basic needs like food, clothing, shelter, health and education are fulfilled only within the framework of society. He also needs society for his social and mental developments.

is a social animal not only by nature but also by necessity. It is said that needs and necessities makes man social. Man has many needs and necessities. Out of these different needs social, mental and physical needs are very important and needs fulfillment. He can't fulfill these needs without living in society. All his needs and necessities compels him to live in society. Many of his needs and necessities will remain unfulfilled without the co-operation of his fellow beings. His psychological safety, social recognition, lover and self-actualization needs only fulfilled only within the course of living in society. He is totally dependent for his survival upon the existence of society. Human baby is brought up under the care of his parents and family members. He would not survive even a day without the support of society. All his basic needs like food, clothing, shelter, health and education are fulfilled only within the framework of society. He also needs society for his social and mental developments.

<p>for the satisfaction of human wants man lives in society. Hence it is also true that not only for nature but also for the fulfillment of his needs and necessities man lives in society. 14.6 Man lives in society for his mental and intellectual development Society not only fulfils his physical needs and determines his social nature but also determines his personality and guides the course of development of human mind. Society moulds our attitudes, beliefs, moral ideas and thereby moulds individual</p>		<p>For the satisfaction of human wants man lives in society. Hence, it is also true that not only for nature but also for the fulfillment of his needs and necessities man lives in society. (C) For the Development of Mind and Personality man lives in Society : This is yet another reason for which man is a social animal. Society not only fulfills his physical needs and determine his social nature but also determines his personality and guides the course of development of human mind. Development of human mind and self is possible only living in society. Society moulds out attitudes, beliefs, morals, ideals and thereby moulds individual</p>

Family being the first society based on the biological interdependence of the sexes. Not only individuals are interdependent but also the groups, communities and society. 5) Co-operation: Both co-operation and conflict are two another important characteristic of society. Maclver remarked that society is co-operation crossed by conflict. Co-operation is an essential component for the formulation of society. Without co-operation, there can be no society. People cannot maintain a happy life without co-operation. Family being the first society rests on co-operation. Co-operation avoids mutual destructiveness and results in economy in expenditure. 6) Conflict: Conflict is also necessary for society. It acts as a cementing factor for strengthening social relationships. In a healthy and well-developed society both co-operation and conflict co-exist. Because with the help of these two universal processes societies is formed. Conflict makes co-operation meaningful. Conflict may be direct and indirect. However, both are necessary for society. 7) Society is a network of web of social relationship. Social relationship is the foundation of society. Maclver remarked that society is a network of social relationship. Hence it is difficult to clarify social relationships. But this social relationship is based on mutual awareness or recognition to which Cooley call wefeeling, Giddings call consciousness of kind and Thomas as common propensity. Without these social relationships no society could be formed. As social relationships are abstract in nature so also the society is abstract in nature. Different kinds of social processes like co-operation, conflict constantly takes place in society. 8)

Family being the first society, is based on the biological interdependence of the sexes. Not only individuals are interdependent but also the groups, communities and societies. (5) Co-operation and Conflict : Both co-operation and conflict are two another important characteristics of society. Because famous sociologist Maclver once remarked that "Society is Co-operation crossed by conflict". Co-operation is essentially essential for the formation of society. Without co-operation there can be no society. People can't maintain a happy life without co-operation Family being the first society rests on co- operation. Co-operation avoids mutual destructiveness and results in economy in expenditure. Like co-operation conflict is also necessary for society. Conflict acts as a cementing factor for strengthening social relations. In a healthy and well developed society both co- operation and conflict co-exist. Because, with the help of these two universal process society is formed. Conflict makes co-operation meaningful. Conflict may be direct and indirect. However both are necessary for society. (6) Society is a network or web of social relationship : Social relationships is the foundation of society. That is why famous sociologist Maclver remarked that society is a network of social relationship. Hence it is difficult to classify social relationships. But this social relationship is based on mutual awareness or recognition to which Cooley call we- feeling, Giddings call consciousness of kind and Thomas as common propensity. Without these social relationships no society could be formed. As social relationships are abstract in nature so also the society is abstract in nature. Different kinds of social processes like co-operation, conflict constantly takes place in society.

PREFACE In a bid to standardise higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses: core, generic discipline specific elective, and ability/ skill enhancement for graduate students of all programmes at Elective/ Honours level. This brings in the semester pattern, which finds efficacy in tandem with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC Open and Distance Learning (ODL) Regulations, 2017 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English. Eventually, these will be translated into Bengali too, for the benefit of learners. As always, we have requisitioned the services of the best academics in each domain for the preparation of new SLMs, and I am sure they will be of commendable academic support. We look forward to proactive feedback from all stake-holders who will participate in the teaching-learning of these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success. Diversity of the opinions of the colonial people about the society in India. The ways history is constructed and imposed on the people of a less advantageous country from above. 9

NSOU CC-SO-02 10 1.1 Introduction The Colonial Discourse means the assortment of opinions found in the writings, pronouncements and declarations made by the British colonial officials and administrators. To understand the true spirit of this discourse it is essential to understand the history of colonial rule in the country. The British imperialistic control over the subcontinent was first introduced in the 18th century, designed by the systematized policy of oppression and plundering of resources of a country rich in natural resources for the benefit of the British empire. The British colonial authority wanted to usurp all the natural and human resources to enrich itself and monopolize its control over the vast territory of undivided India and they spared no effort to fulfill their desire. However, they wanted to hide their real intention under the cover of their lofty arguments and ideological camouflage. The Discourse acted as a mechanism of control over the vast Indian subcontinent for a long period of time. It also ushered modernization in the western sense of the term through clever planning, and an encounter between the modern west and the traditional east. In fact, social anthropology and its twin sister sociology emerged in the subcontinent out of the contributions of the colonial administrators and their ethnological endeavours. Risley, Ibbetson, Hutton and many other had played important roles in introducing and strengthening the colonial approach towards the land and people of India. The main objective of the imperial government was to impose greater control of the colonized territory of India and her people. So, to justify the aggressive control over the land and its people the colonial administrators wanted to project it (India) as a degenerating society that was badly in need of the rescuing touch of the Imperial authority. The main problem was their total unfamiliarity with the social and cultural systems of the land. The village community and its land revenue system, the religious practices and rituals, innumerable languages and their dialects, the structure and functions of the tribal society - everything was unfamiliar to them. This unfamiliarity had misled them to adopt wrongful interpretations of traditional Indian institutions. The views of the British-Indian officials were primarily based on the principle of utilitarianism of Jeremy Bentham and philosophy of John Stuart Mill who rigidly believed that the colonial rule had contributed in an extremely positive way for the modernization and development of the traditional Indian society. Before the establishment of colonial rule India was basically a rural, agricultural, self-sufficient

NSOU CC-SO-02 11 society. In the absence of a properly developed market system, the village society used to produce crops and utility goods for its own members only. A very limited amount of the total village produce of crops and artisan goods used to be sold in the local market. The regular exchange of goods used to be conducted on the basis of jajmani system, generating a close family-based relationship among different castes and their clientele. In the town areas there were excellent handicrafts products like fine cotton and silk, textiles, ivory and stone carvings, brass and copper-work, boat and ship-making industry, leather-craft, sword, shield and knife-making industry, etc. with traditional techniques. The vast land of the subcontinent was rich with precious natural and human resources. The colonial efforts at industrialization and modernization had multiple impacts; both positive and negative. But the colonial writers have highlighted the positive aspects only, while ignoring the negative impacts totally as they wanted to justify the interventionist policy of the authority. The utilitarian thinker like James Mill was in charge of the East India Company in London and under his direction utilitarian principles towards India were being applied. James Mill and other Utilitarians rejected all attempts at recognition of any good feature of India. Mill considered India as a 'dark continent' and recommended application of British laws, British-type education, and abolition of inhuman practices like sati and child marriage to bring in changes. 1.2 The Central Issues of the Colonial Discourse The colonial administrators could feel that the absence of proper understanding of the Indian villages and their people would ultimately create a serious problem for the Raj and frequent occurrences of tribal and peasant revolts were giving such indications to the colonial administration. To nip the buds of such problems the colonial administrators had used ethnology to collect information about India's land and people in great details. They could understand that efficient control of the country would only be possible with garnering of sufficient material about every details of people's life. Thus, from the very beginning sociology and social anthropology became important tools in the hands of the colonial administrators. Colonial officials with anthropological bent of mind used to formulate policies for the rural and tribal people and helped the government with their distorted interpretation of the culture of the land. The ethnographic writings of British administrators, missionaries and anthropologists created long-lasting images of India and her people for the world to see. As ethnologists, most of them were amateurs and indulged in the task of

NSOU CC-SO-02 12 unearthing information for the benefit of colonial administration; they had classified the complex social organization of an unfamiliar country on the basis of race, level of evolution, civilization etc. From these anthropological-ethnological ventures sociology in India had emerged gradually. 1.3 The Colonial Administrators The colonialists were responsible for the development of sociology in India, no doubt; but the discipline had entered the subcontinent by following the footsteps of anthropology. British administrators had painstakingly collected detailed information on India's social, cultural and economic systems. It is necessary to discuss their contributions for proper understanding of the implication of the colonial approach in Indian sociology. The leading role was adopted by senior officials like Francis Buchanan, B.H. Baden-Powell, Risley, Nesfield, Crook. Hutton and many others. Dr. Francis Buchanan, also known as Hamilton-Buchanan was a botanist, surveyor and a surgeon serving the East India Company. He had worked as an assistant surgeon of the Company from 1794 to 1815. This stay of over two decades in Bengal had given him sufficient opportunity to know the country and its flora and fauna from close quarters. In 1798, he was appointed by the Company government to make survey of Chittagong and its surrounding areas to find if those areas could be used for cultivation of crops for export purposes. He did many such surveys after that. For example, he made a survey of Bengal in the period between 1807-1814, recording every details of the land. As he travelled through the different parts of the country ranging from the Andaman Islands, Burma (Myanmar), Chittagong, Nepal, North Bengal and Bihar, he collected detailed information and prepared reports on them. Being a keen observer of the natural life he collected drawings of plants and animals by local artists from wherever he traveled. He had made important comments on the plant and animals of India. In the period between 1807- 1814 the then government of Bengal entrusted him with the task of conducting surveys on topography, history, relics, conditions of the local people, religion, natural resources and products, local agriculture and agricultural practices including tools, manures, domestic animals, fences, landed property, fine arts artisans' crafts, transportation of goods, exports and imports, weights and measures and many more of the region. These records and observations prepared by Buchanan are one of the important first-hand accounts of the traditional Indian ways of life. Not only in Bengal, he collected detailed information, statistics and oral histories on a wide

NSOU CC-SO-02 13 range of topics from the everyday existence of common people from other parts of India too. He presented all his findings with first person narratives accompanied by maps, table and diagrams. His works represented the pioneering survey explorations in different parts of India. B.H. Baden-Powell, an eminent English civil servant had served in Bengal and Punjab and wrote on the traditional system of India's land tenure, forest conservation and law. His writings on Indian land system, in fact, acted as a handbook and guide for the colonial India's revenue officers. His famous book *The Land-Systems of British India* has three volumes and contains discussions on India's land-tenure and revenue systems, myriad local systems of village settlements including Rayotwari and other allied systems. The second volume of the book contains detailed discussions on land tenure and revenue systems in Bengal. His book also contains details of different types of villages found among the tribal and non-tribal populations. Sir Herbert Hope Risley was one of the most well-known British administrators and ethnographer who made extensive studies on the castes and tribes of the Bengal Presidency region. He was also the leading anthropologist of British India. In the 1900 census of Indian population he classified the people of India into several types, i.e. seven main physical types residing in different parts of India starting from the western frontier region and ending at the southern-most region. His observant eyes and an urge for precision to analyse things had recorded the physical features of the inhabitants in great details. He had also defined castes and was the first author to notice the conversion of tribes into castes. His *Tribes and Castes of Bengal* (1891) had once been acknowledged as a classic, but his theory on caste has also been severely criticized later as one of the most racist accounts. Risley argued that castes represented a hierarchical distinction of the higher, fair-skinned Aryan origin people and the lower dark skinned people of Dravidian origin. He supported his conclusion with the help of 'nasal index' or the shape of the nose and its correlation with social status. In fact, Risley being one of the 'official anthropologists' did introduce 'scientific racism' in his extensive ethnographic studies on the castes and tribes of Bengal Presidency and used his survey findings to justify racial discrimination of the so called racially inferior people in the hands of perpetually superior white western rulers. Of course, being accused of blatant racism he had written many disclaimers but ultimately concluded that the whites belonged to the 'conquering race'.

NSOU CC-SO-02 14 Ethnology and anthropology in India by the late Victorian period were developed also by several other colonial administrators like Crooke, Ibbetson, Baines, Nesfield, Hutton, Dalton. William Crooke and Sir Denzil Ibbetson. Crooke had far less exposure to the Indian society as he remained posted during the whole of his career to the North-western provinces of then undivided India, and comprehensively wrote on the native inhabitants, their religions, beliefs, customs, and mentalities. Ibbetson, as the superintendent of the Punjab region made an ethnographic survey of Punjab's castes and tribes and classified them on the basis of occupation and proclaimed that caste system was nothing but the product of the age old traditions of division of labour. Other colonial administrators like Athelstane Baines and John Nesfield also spoke in favour of the occupational origin of caste. Following the instruction of the census commission in 1881 several provincial governments had undertaken surveys on castes and tribes and published handbooks on the basis of the findings. Ethnological studies on castes continued till 1911, but hill and forest tribes of central India and Assam remained the topics of ethnographical analysis till the end of the colonial rule. J.H. Hutton, as an anthropologist and administrator under the colonial government, was posted in Assam where he studied the tribal culture of that region. For his interests in anthropology, he made extensive studies on the tribes of the region and earned the reputation of 'the greatest authority on the Naga Hills in general' for his knowledge. His studies helped the British government to bring the Nagas under its control. He had noticed during his posting in Assam that each tribal villages had some occupational specialization and thus the neighbouring villages used to create some network of interdependence. He had assumed that that practice was being continued since the pre-Aryan period in the country. Hutton's views on caste, tribal life and villages in Bengal had inspired many such studies later. Another remarkable ethnological work was made by Edward T. Dalton, a mid-level military officer posted in Bengal Presidency who collected enough ethnological material on remote tribes residing in Upper Assam, North-Eastern Frontier and in Chhotanagpura areas of then Bengal. His book, *A Descriptive Ethnology of Bengal* (1872), published by the government of Bengal was one of the first ethnological works on the indigenous people. He viewed the British control of India from a liberal perspective and was praised by the authority for doing commendable job in managing, or, controlling the tribes in the name of development. Dalton also was in favour of converting tribes to Christianity by the Christian missionaries. Other colonial ideologues and administrative historians had started to write on as a part NSOU CC-SO-02 15 of their official duty and extensively used the official documents for their writings. Among them there were other British-Indian officials like Sir Henry Maine, B. Malleson, James Todd, M.E. Grant Duff, to name a few. As the Governor of Madras Grant Duff had commented in 1887 that British capital investment was essential for a "half-civilized" country like India. John Ruskin, the noted Victorian writer and art critic of his time had an open contempt for all types of Indian art. Some others like George Birdwood would believe that painting and fine art did not exist in the pre-British period. Thus, the western thinkers, in general, had portrayed India as a country frozen in history, devoid of any civilizational progress for centuries. James Mill, who wrote three volumes of *History of British India*, William Jones and Henry Maine had nurtured this vision of India devoid of any social, intellectual and technological mobility and innovation and it had received wide publicity among western thinkers.

1.4 The Evangelical Writers

The colonialist viewpoint towards India did not remain limited among the British-Indian officials and historiographers only. The Evangelical writers, too, believed in the superiority of the whites and inherent inferiority of the native Indians. The School of Evangelical writers used to be comprising of missionaries who came to India with the objective of preaching and converting the Indians and thus spreading the message of Christianity among the people of the subcontinent. However, at the initial stages of the Company rule the primary belief of the East India Company was that, neither business nor controlling the docile people of India would be too much of a problem; therefore preaching and conversion were not among their primary objectives. But its stand was changed in 1813 under pressure from Evangelical movement back home and the Company had to open the doors for the missionaries. The Christian missionaries and several missionary societies had taken pioneering role in the spread of English education in the country. By the last decade of the 18th century three Christian missionary societies were established in the country, namely, the Baptist Missionary Society (1792), the London Missionary Society (1795) and the Church Missionary Society (1799). Of all the missionaries William Carey was the first to introduce English education in Bengal. In association with two other fellow missionaries, Joshua Marshman and William Ward, he had established one school for English education and one printing press for supplying reading materials in both English and Bengali. Later in 1818 they established the Serampore

NSOU CC-SO-02 16 College — the first college in India to offer modern higher education to all. Carey and his companions had established 126 schools to educate about 10,000 Indian students in modern western ideals and values. By that time, Robert May, another Christian missionary of the London Missionary Society had established one school in Chinsurah first, and then 36 more schools in different parts of Bengal. The Christian missionaries did not establish schools and colleges purely as a humanitarian effort, their sometimes open, sometimes hidden, agenda was to spread Christian spiritual and religious messages, to eradicate the Hindu practices of idol worship, polytheism, polygamy, human sacrifice and other superstitious customs which they (the missionaries) considered barbaric. They wanted to sensitize the native population and prove profanity and falsehood of their religions. However, they could not fulfill their goal of religious sensitization as in job-starved India English-education became the essential criterion for securing government employment; and gradually the focus of the education system became success in examinations. The missionaries initially had a slow start because the East India Company was reluctant to interfere with the faith and beliefs of the native people and opposed the entry of the preachers and missionaries. But, several Evangelists like Wilber Force, Macaulay and others had started a serious movement to oppose government ban against the missionaries and finally in 1813 the ban was lifted. Evangelism means preaching of the gospel or message of the Bible to the non-believers. So the Charter of 1813 had opened the floodgate for the missionaries to come to India and to preach and spread of education based on Christian principles and values. Alexander Duff was an eminent missionary who had established the Scottish Mission in Bengal. Like Carey, he, too, had established several schools here to teach English. Of them the most important was the General Assemblies Institution (present-day Scottish Church College). His endeavor for spreading English education and Christian religion among the locals was so successful that the period between 1830-1857 came to be known as the Age of Duff. Both Duff and Macaulay were also known as Anglicists because they were in favour of education in English medium only, to create a new class of Indians who would think and speak in English habitually, who would be proud of their loyalty to the colonial masters and would be totally immersed in the lessons taught by the western scholars, philosophers and ideologues. Christian missionaries like Carey could anticipate that British educators should learn Sanskrit and interpret Sanskrit texts in a manner compatible with the colonial aims. They had little respect for Indian people and their traditions. The colonialists not only opened schools, they

NSOU CC-SO-02 17 also supplied text books written by English authors who were either highly prejudiced or openly racist in their attitude towards everything Indian. For example, William Carey had no respect for Indian traditions, culture and music. In a similar vein, Charles Grant, too, had despised everything associated with Indian society and religion. Most of them would consider Indians as dishonest, immoral, and untruthful. Christian missionaries were also convinced that India was the worst place to live in. William Wilberforce once commented that it was disgraceful for Britain to allow Indians (meaning Hindus) to follow the grossest and the darkest as well as the most degrading system of idolatrous superstition on earth. Out of this hatred towards the land and its people, the Christian missionaries built up the belief that it was their duty to wean the natives from their 'disgusting and bestial rites.' Like the colonial officials, they too, took upon themselves the task of civilizing the inferior, ignorant people of India. They had even debated over whether the natives needed to be civilized first or to be Christianized. Many of them like James Montgomery genuinely felt that Christianizing was an important tool to civilize the people of India. With preaching and spreading the messages of the Bible the twin task of conversion and civilizing would easily be possible. It is not difficult to conclude that such notions were based on the blind belief in the inferiority of the native Indians and superiority of the whites in general. However, this type of opinion and attitude to their subjects were common among all the European races. The British had borrowed it from the French who had used this to legitimize their colonial control over non-European 'coloured' races. In the nineteenth century the British evangelists had spread their control over the north-eastern part of the country, the area inhabited by hill-tribes. In direct collaboration with the missionaries the British government destroyed their culture and traditional religious practices in the name of civilizing them; and in the process was able to maintain a tight control over these people.

1.5 The Orientalist School Among the European scholars of the colonial era another school of thought had emerged; it was known as the Orientalist School. The advocates of the School had contributed in many ways for the welfare of the society here in India, even though they were supportive of the exploitative exercises undertaken by the government. The School is known by the name because it was rooted in the principle of 'Orientalism'. Orient means East, the opposite of the West or the Occident. Therefore, Orientalism stands for the study of the eastern societies by the western scholars. The Orientalists

NSOU CC-SO-02 18 who came to India, had supported the preservation of Indian languages, laws, customs, traditional and ancient institutions and culture of the country. According to Prof. Edward Said, Orientalism is the tradition of looking at the societies of the east (Asia) from the point of European or western experiences. Modern Europe's interest in the Orient and Orientalism could be explained with reference to the fact that several European states including Britain had their richest and oldest colonies in those parts of the world. The most famous of the orientalist during the regime of the East India Company were Sir William Jones, James Prinsep, Sir Charles Wilkins and Dr. Horace Hayman Wilson. Rev. James Long was also a much respected man in the field of orientalism. All of them were brilliant academicians and contributed positively and extensively in different areas of knowledge like linguistics, literature, science and also wanted to make the world aware of India's hidden intellectual treasure. Orientalism also refers to the administrative policy of the East India Company in favour of preserving Indian languages, laws, customs and age-old traditions of the country. The period of Orientalism lasted for over five decades, starting in 1773, when Warren Hastings was appointed the Governor-General of the Company and continued up to 1832, when under the growing influence of the liberal and Evangelical ideas the Company government had to abandon its policy of preservation and made English education compulsory in India. That was the end of the Orientalist phase. The East India Company had pursued its 'Orientalist' policy not for philanthropic purposes alone; it could realize that for better and more effective control of the colonies a thorough knowledge and clear understanding of the culture and language of the native people was essential. But liberal economists like James Stuart Mill used to consider the colonies as corrupt and stagnant. Even Karl Marx, had identified the Asiatic Mode of Production as unchanging. Christian missionaries, too, used to despise the non-Christian religious traditions as barbaric and evil. In spite of so many criticisms and oppositions from powerful quarters Orientalism had emerged as a distinct academic discipline under the protection and encouragement of western scholars like Max Muller and Eugene Burnoff. Many accuse Orientalism of romanticizing India in an attempt to legitimize the colonial rule, there were several Orientalists who had truly appreciated Indian culture and civilisation. We should discuss their contributions in brief.

1.5.1 Sir William Jones (1746-1794) was the principal founder of the Asiatic

NSOU CC-SO-02 19 Society of Bengal and he wanted to know and understand India better than anyone else in England. He was proficient in at least 28 languages, and initiated the study of comparative philology or linguistics. He was also a prolific translator and translated in English many Sanskrit texts like Manu Smriti and Abhigyan Shakuntala. Jones studied Hindu astronomy, botany and literature; worked as a Judge for ten years, and supported the rights of Indian citizens to trial by jury under Indian jurisprudence.

1.5.2 James Prinsep (1799-1840) :

Prinsep was another remarkable orientalist who had contributed in many ways to restore and preserve the heritage of India. He had worked at the Benaras and Calcutta Mints for 20 years; and developed the study of the largest Indian coins collection of that time. He was the founder — editor of the Journal of the Asiatic Society of Bengal. As an orientalist he worked on deciphering the Kharosthi and Brahmi Scripts; and he was the first European scholar to decipher the edicts of the Emperor Ashoka.

1.5.3 Sir Charles Wilkins (1749-1836) :

A prominent orientalist of his time, was one of the founding - members of the Asiatic Society, the first translator of Bhagavad Gita into English and one of the creators of the first Bengali typeface beside Panchanan Karmakar. Wilkins also designed typeface for publication of books in Persian. He had studied Sanskrit in Benaras under a Brahmin pandit. With strong support from Warren Hastings he had started to translate the Mahabharata but could not complete it. He had interpreted the Gita in a new way by declaring that the Gita's main objective was to promote monotheist Unitarianism against the polytheism supported in the Vedas. He also translated the Heetopadesha and wrote on the Sikh religion. Being deeply interested in religion Wilkins had visited many religious shrines of different faiths.

1.5.4 Horace Hayman Wilson (1786 - 1860) :

Horace by profession a doctor, came to India as Assistant-Surgeon of the East India Company. He was a renowned orientalist and was the first person to translate the Rigveda. He also translated The Vishnu Purana in multiple volumes, the Meghaduta by Kalidasa and wrote books on the religions of the Hindus, on Hindu and Mohammedan Law, on Puranas and on many other topics like the history of British India. Though the British Orientalism has been criticised by the followers of Said line for portraying the India as a stagnant, superstitious, corrupt and magico-religious country, the Orientalists mentioned above have given tremendous service for

NSOU CC-SO-02 20 understanding the true spirit of India and also to make the whole world aware of that.

1.6 Impact of Colonial Discourse on Sociology in India

Sociology in India has progressed with anthropology and the two disciplines share an intimate relationship. During the colonial period the British administrators and scholars had undertaken several ethnographic surveys to collect intimate knowledge about the land and its people for the benefit of strengthening the colonial control. Another important reason behind such surveys was prevention of rebellion and revolts against the colonial regime. Herbert Risley, a prominent member of the civil services in India had collected monumental data on castes and tribes of Bengal. His book on the findings of his survey, Caste and Tribes of Bengal (1891) has provided ample data for the rulers to understand the system of caste. In this book he has presented an analysis of caste from the point of Brahmanical sociology and the divineness of caste. He has also examined how caste was compatible with politics. Risley was of the belief that caste should be discouraged to get a proper control over the people in India. Following Risley many other ethnographical studies of caste, religion, culture and rituals of the people of India had been undertaken. Such studies not only helped the colonial rulers to gain tight control over the subcontinent and its people, but also prepared the ground for sociology here in India. Ethnographical researches encouraged western scholars, British administrators and Christian Missionaries to take interest in every details of local culture like local language, literature, folklore, rituals and many other things. Out of their interests a good number of surveys on tribes, caste, village and religious communities, language, etc. had taken place. Oriental scholars and Indologists like William Jones, Max Mueller, Prinsep and others had translated sacred Indian texts like the Gita in English, established research organizations like the Asiatic Society and Anthropological Survey of India. Sir Henry Maine, though was not very favourable to India, had taken interests in the Hindu legal system and village communities. Some of the western sociologists like Max Weber had taken interest in the understanding of the essence of Hindu religion and based his theory of emergence of capitalism on that understanding. Thus, the Indian society and culture had attracted the interests of western scholars and officials of the colonial government with their unique features of land tenure, revenue system, poverty, social and economic structure of the poor but self-sufficient village communities; and out of such diverse interests coming

NSOU CC-SO-02 21 from academic, missionary, administrative and political quarters, the seeds for the emergence and development of the formal discipline of sociology were sown. The colonial founding fathers of anthropology and sociology in India had collected sufficient ethnological materials needed for both efficient administration and scholarly pursuit. Joan Vincent has observed that British anthropology, from the outset, has helped colonial rulers; and in India anthropology had to depend on data gathered by 'administrators, missionaries, travellers,' (Uberoi, Sundar, Deshpande, 2007:12). This was also true for American anthropology that had a close association with power and control of indigenous people in many parts of the world. Talal Asad has shown that the disciplines like anthropology and history not only enable the western colonisers to know and control their captured territories better but also to reinforce the inequality between the coloniser and the colonised. Edward Said and Bernard Cohn separately have shown that the orientalist scholars and anthropologists, on the basis of their keen observation, have identified several sociological categories like caste, ritual, custom, law and political institutions as the hallmarks of the colonized society. With a very clever intention, the British administration had introduced British type of education in India to colonise the minds of the people of India so that their cultural priorities could be altered. For Indians the introduction of western education was a blessing but it actually helped in the colonization of mind and culture that an eminent philosopher like K.C. Bhattacharya had lamented that Indians could not contribute anything worthwhile independently in the field of culture and modern ideology. However, not all western scholars were driven by the colonialist spirit; for example, Patrick Geddes, as the architect of sociology department in the University of Bombay, did not bow down to the wishes of the imperial government and had thought of modernization of India following some alternative path. Some of the early anthropologists like S.C.Roy and Verrier Elwin had felt deep empathy and admiration towards the tribes they studied. But some others like L.K. Anantha Krishna Iyer, the revered pioneer anthropologist and M.N. Srinivas would conduct their researches on tribes and villages from the elevated position of their upper- caste, western educated, urbanized self. Yet they never failed to see the 'others' like the tribals, peasants and workers from backward classes as their own and equal members of the society. This shows that the imperial goal of colonization of mind was not fulfilled and a very large section of educated Indians with modern outlook opted for a nationalist approach in their academic and research activities.

NSOU CC-SO-02 22 1.7 Summary The colonialist discourse reveals the different shades of views and aspirations in the minds of the colonial scholars, administrators and missionaries who came in this sub-continent with a view to exploit and dominate the 'others' or the people of different ethnic origin, language, culture and religion with disdain. To impose more control more efficiently, they had initiated in ethnographic surveys and explored different aspects of their culture. Out of those efforts, first the birth of anthropology happened in our country and then sociology followed suit. As both the disciplines share many common areas and their institutional difference was of western origin only, in colonial India these two disciplines have enriched each other in many ways. So, we cannot omit the growth and development of anthropology out of any discussion of evolution of sociology in India. 1.8 Model Questions 1. Answer in brief. 5 Marks. a) What is Discourse? Distinguish it from Critique. b) What are the central issues of colonial discourse? 2. Answer in Detail. 10 Marks. a) Examine the different dimensions of colonial discourse that emerged in British India. b) Make a critical assessment of colonial discourse in India. c) What is colonialist discourse? Examine its objectives and purposes. d) Examine the impact of colonial discourse on sociology in India. e) Write a shortnote on the Orientalist School of colonialist discourse. f) Discuss, in brief, the Evangelical ideas in colonialist discourse g) Write a short note on the need for ethnographic studies in the colonial period.

NSOU CC-SO-02 25 2.1 Introduction Nationalism is an ideology based on love and respect for one's own country of birth or of choice. On a wider note, it is an amalgamation of countrymen's attitudes, claims, expectations, obligations and patriotic feelings towards the state based on a number of political, moral and cultural values. This feeling urges people to identify with their own country and support and ultimately fight for its own interests. It is both an ideology and a movement for the protection and promotion of the interests of one's own country, establishing its sovereignty and abolition of foreign control over the land and its people. Out of this feeling of nationalism the nationalistic discourse in sociology was born. The Nationalistic discourse, has given birth to a number of ideas, opinions and narratives regarding the emergence of national identity among the people of a colonized territory. This discourse had emerged in the country under the impulse of anti-colonial sentiments in general and nationalist social and political movements in particular since the late 19th century-early 20th century period; it was instrumental in the creation of a consciousness to develop a new social, political, economic and educational system free from colonial domination. Movements like Swadeshi and Boycott did play important roles in creating an urge for everything made in and controlled by India. Mahatma Gandhi believed that the partition of Bengal in 1905 was a great turning point in the awakening of awareness regarding nationalism. The nationalistic discourse, in general, involves the writings and opinions of Mahatma Gandhi, Rabindranath Tagore, Bal Gangadhar Tilak, Dadabhai Naoroji, Swami Vivekananda, Gopal Krishna Gokhale and many others. In the field of sociology the discourse has left its lasting impression in the writings of Benoy Kumar Sarkar, Radhakamal Mukhopadhyay, D. P. Mukherjee, D. N. Majumdar and others who were energized with the thoughts of nation-building. They wanted to counter the prejudiced arguments of the colonialists and believed that ancient India had many things to offer to the world. While Radhakamal had made in-depth analysis of India's economic problems under colonial regime, rural poverty and inequality; Dhurjati Prasad, a self-proclaimed Marxologist, was concerned with issues of colonialism like a true blue nationalist. G.S.Ghurye's sociology reflects an understanding of India's civilization and culture based on Hindu/Brahmanical nationalist ideology of cultural unity and nation-building. In this way nationalist discourse in sociology contains multiple views and it deals with multiple issues related to nation-building, creating and strengthening of new national identity.

NSOU CC-SO-02 26 2.2 Meaning and Definition of Nationalism and Nationalistic Discourse The Nationalistic discourse has given birth to a number of ideas, opinions and narratives regarding the emergence of national identity among the people of a colonized territory. Here, in India, the nationalist sentiments and the urge for a nation of the peoples' own did emerge under the influence of colonial rule. But nationalism should not necessarily be linked with colonial rule or be considered as a negative anti-colonial concept. It should also be considered from a positive standpoint as it also means creation of a new type of social and political identity in accordance with local mores and environments. Therefore, as a negative concept nationalism means opposition to outside rule and rejection of foreign control and dominance; whereas, in a positive sense it indicates a positive signal towards nation-building. Nationalistic discourse contains all the ideas, beliefs and narratives that emerged during the Raj to glorify India's past and to oppose the colonial regime. 2.3 Nationalism in India In the context of India, nationalism is a modern phenomenon to envision India as a free country. The idea was introduced during the colonial period by the western educated leaders of India. Dissolution of foreign control became its primary goal and to establish India's identity as a nation-state appeared to be its secondary {but no less important} goal. Inspired by those two goals, a number of nationalist movements had taken place in the country starting from the sepoy mutiny of 1857, to the resistance struggle of the native princes against the British imperial power and then to the moderate and extremist movements by different factions of the Congress and other local radical political outfits. Not only did educated middle class participate in the freedom movement, even the illiterate peasantry and tribal populations from different regions, too, took part in the nationalist movement on their own terms. The nationalistic movement and the principle of nationalism in India is often accused for its elitist nature and its failure to integrate the class interests of the peasants. 2.4 Nationalist Discourse in Indian Sociology The British colonial rule in India not only imposed a foreign government had

NSOU CC-SO-02 27 brought in major changes in the matters of governance, introduced new policies and implemented new laws in the name of development and modernization of a traditional society. All these had taken place in the selfish interests of the Raj. With the introduction of modern western education, educated Indians became aware of the modern ideas and latest developments in the fields of natural and social sciences in the west and they started to initiate a number of public debates and discussions on issues related to governance, customs and practices. Modern men like Ram Mohan Roy, Akshay Kumar Dutta, Iswar Chandra Vidyasagar, Pyari Charan Mitra, Kaliprasanna Sinha, Bhudeb Mukherje, Ramendra Sundar Tribedi and several others had made significant contributions in examining and questioning the then existing social practices. Neither of them was professional sociologist, yet their thought-provoking essays and books had laid the foundation of sociology in India. Many of the modern men the late-nineteenth-early-twentieth period were nationalists in spirit and even actively participated in nationalist movements. They were genuinely interested in the development of India and her people. In their sociological thoughts, therefore, there was a strong undercurrent of nationalism and glorification of India. Benoy Kumar Sarkar, one of the pioneers of sociology in the country, had once commented that extra-university sociological discussions and analyses had always preceded and supplemented academic sociology in India. These extra-university sources or the voluntary organisations and their members were immensely influenced by the ideas and concepts of western scholars like Comte, Herbert Spencer, Toennies, Von Wiese and many others. At the same time, acquaintance with liberal ideas of the modern west made Indian intellectuals aware of the absence of freedom and equality in their own society. While the stereotypes, categories and identities created by foreign political regime in the mid-eighteenth century, it also brought in an era of social reform. Calcutta was the capital of British India in the initial days of the Raj and had experienced a lot of developmental activities. The colonial bureaucrats received general acceptance within the society, a section of the educated Indians had started to look at the society and people around them with a positivist bend of mind. They came from different disciplines of knowledge yet all of them were keen to explore and examine various aspects of Indian society in a positivist way. Though all of them were not professional sociologists their efforts had prepared the ground for sociology to emerge in India. By the mid-nineteenth century social reformers and thinkers with modern education had established a number of learned society and started serious discussions on social issues from a nationalist point of view.

NSOU CC-SO-02 28 The founding-fathers of sociology in India were intellectual giants like Benoy Kumar Sarkar, Radhakamal Mukherjee, Dhurjati Prasad Mukerji, Patrick Geddes and G.S.Ghurye. They had original visions and ideas about society and sociology with which many of them could overcome the impact of the "colonisation of mind". Geddes was not an Indian, but he was not the mouthpiece of the Imperial government here. At the core of their heart, early sociologists in India were nationalists who took immense pride in their motherland and aspired for fitting respect for the country from all quarters. With their creative nationalist spirit they presented an image of India that was different from, but not inferior to the west. To comprehend the nationalist discourse as opposed to the colonialist discourse in sociology we need to examine the roles played by the founding-fathers of sociology in India.

2.4.1 Nationalist Ideas of Benoy Kumar Sarkar (1887-1949) : Benoy Kumar Sarkar was a great scholar, an original thinker and an excellent teacher devoted to his profession. Since a very young age till to his last he was inspired by the spirit of nationalism and patriotism ; and these two principles had influenced all his thoughts and visions of the world. He was also very much fond of the power of creative idealism for nation-building and believed in man's creative energy for building a new India. For this very reason, his sociology remained forever dedicated to the search for an independent identity of India's culture and civilization beyond the image projected by the western scholars. Much before the formal introduction of academic sociology in the country Sarkar was busy with reinterpretation of India's traditions by challenging the arguments offered by stalwarts from the west like Max Mueller, the Indologist, and Max Weber, the sociologist. As a renowned scholar he visited many academic institutes in different parts of the world, and exchanged ideas with scholars from across the globe. Many of his books were published in countries like Japan, Germany, the United Kingdom and the United States of America. Yet his mission in life was "to project the image of resurgent India and emerging Asia." (Bhattacharya,1990. B.U.: 17) Sarkar was very optimistic of the future of India and Asia as he had high hopes for his motherland and mother-continent. At the same time, he was deeply pained to see the naked dominance of the west over Asia in general, and India, in particular. Therefore, as a nineteen years old teenager in 1906, Sarkar through his first article in English, titled National Education and the Bengali Nation, published in the Amrita Bazar Patrika, a nationalist daily, had expressed his concerns for his beloved homeland. (Bandyopadhyay, Levant,: 193) Six years later, in 1912, Sadhana, a collection of NSOU CC-SO-02 29 essay in Bengali by Sarkar depicted how each and every nationality and society would evolve in its own distinct way. Thus, he concluded, the model for development never could be the same for all the nations. All these show that Sarkar was a patriot, a nationalist, a Swadeshi from a very young age. His close association with Satish Chandra Mukhopadhyay inspired him to take an active part in the Swadeshi and boycott movements. He was also deeply influenced by what he termed as "the Ramakrishna Movement" and strongly believed that Vivekananda had set a goal for India to conquer the whole world. Guided by the motto of the Swadeshi movement, he became one of the most active participants of the national education movement. To make the movement a success he published numerous books, articles, pamphlets and delivered lectures in support of the movement.

2.4.2 Sociology of Benoy Kumar Sarkar : Sarkar was an ardent admirer of positivism and believed that the Hindu way of life was full of it. Following the trends of his time he compared the spirituality of the orient with the materialism of the occident and unlike many others he strongly felt that materialism could not safeguard the basic liberty and equality of all. Therefore, the western civilization was inferior to the Indian civilization. He was well acquainted with the positivism of Comte when he wrote his treatise The Positive Background of Hindu Sociology (1914, 1921, 1926, 1937) In fact Comte's positivism, religion of humanity, social service ideas had made an impact on the Bengali intellect in as early as 1860s. When he (Sarkar) accidentally came across an ancient Sanskrit text named Sukraniti, or the sacred text of Shukracharyya, he translated it into English and named it The Positive Background of Hindu Sociology. The book was so named because it contained secular, worldly and 'positive elements of Hindu social economy'. (Bhattacharya). Moreover, he had often used the terms 'Hindu' and 'Indian' alternatively and found the history of Hindu aka Indian civilization far more glorious than that of the western civilization. Sukraniti was Nitisastra, Arthasastra, and Dharmasastra all rolled into one with discussions on Dharma or morals, Artha or interests, and Kama or desires. The image of ancient India that was revealed to him through the text of Shukraniti was that of a very pragmatic state that was conversant with the art of warfare, state administration, power, aggression and all other aspects of everyday life. (Bandyopadhyay, :196). Thus, Shukraniti's subject matters were not at all "other worldly" but non-transcendental and non-spiritual in nature. With this observation Sarkar has challenged the carefully-crafted western

NSOU CC-SO-02 30 image of India. Weber and others like Hegel, Gobineau, Buckle, Senart, Max Weber and Max Mueller had convinced the world that Indian, that is, Hindu civilization was ultra-ascetic, non-industrial and non-political in spirit. Sarkar, with the help of the Positive Background, has counter-argued that the Hindu way of life is nothing but a synthesis of both the worldly and the other-worldly, and of the positive and the transcendental elements in life. He has further narrated in his Chinese Religion through Hindu Eyes (1916) about the characteristics of Asian Positivism. He has earnestly believed that every religion is positivistic and every human being is a positivist, if we relate positivism with humanitarian principles or social duties. He has also spoken of 'Asiatic Positivism' and finds all old and ancient Asian religions like Confucianism, Hinduism and Buddhism positivistic. He has clearly mentioned that the secular principles of good citizenship, social service and humanitarianism have always remained parts of Hindu religion and culture; one cannot ignore all these because of the single word 'Nirvana'. The wrongful image that was popularized by the western scholars became parts of the machinations of the colonial and imperialist conspirators. The propagated otherworldly image of the civilization was unscientific, baseless and prejudiced as there was no real difference between the two civilizations. To counter such prejudice Sarkar used the tool of sociology. As both a nationalist and a sociologist he was eager to identify the problems of modern India from a sociological point of view and also opted for curving out India's path to modernity with the help of sociological understanding. Sarkar was a professor of Economics in the University of Calcutta; but he wrote on many subjects including sociology. His works include books like The Science of History and the Hope of Mankind (1912), The Positive Background of Hindu Sociology (1914), Introduction to Hindu Positivism (1937), The Folk Element in Hindu Culture (1917), The Sociology of Races, Cultures and Human Progress (1937), The Sociology of Population (1936), Villages and Towns as Social Patterns (1941) and many others. Sarkar has observed that in any discussion on sociology, the meaning of the word 'positivism' is to be understood in Comtean terms. Comte has used the word 'positivism' with reference to specialization, generality and scientific experience. According to Comte's three-staged theory of evolution of human intellect and social organization the third stage is the positivist stage where scientific experience reigns supreme. Sarkar himself has admitted that he has not applied Comte's ideas of positivism in full; but for scholarly analyses, experiments, specialization, generalization, scientific enquiries only. He has found positivism in the Vedas

NSOU CC-SO-02 31 though these are conditioned as religious texts because the Vedic literature considers all practical elements of day to day living like annihilation of enemies, the control of enemy property, the distribution of booty, expansion of one's territory, attainment of the highest position in the society of men, and real-life feelings and emotions like jealousy, ambition, hatred, war, political rivalry etc. He has also urged Indians to pay homage to the cunning of Chanakya, the Kautilya who is known for his creative intelligence, sharp mind and political acumen. With such arguments he has always defended India's past contributions towards social sciences. From his arguments in favour of scientific outlook and logical reasoning in India's ancient texts, it can be assumed that Sarkar's sociological vision was influenced by his association with the Dawn Society, Satish Chandra and Brajendranath Seal. From Seal he came to learn the importance of comparative sociological analysis in understanding India's social institutions. In 1926 Sarkar joined the Economics Department at the University of Calcutta and he used to teach sociology optional paper within that department. As a teacher he prescribed several topics for the two optional Sociology papers with an aim to make the students aware of the latest trends of social science research in the west. But as a hardcore nationalist in spirit and mind, he always wanted to represent the views of 'young India' during his visits abroad and to learn from the advances in Europe and America. In 1937, Sarkar founded the Bengal Social Science Conference for sociological researches in Bengali language and to bridge the gap between the sociological discourses of the orient and the occident. As a nationalist sociologist, he was concerned with the civilization of both India and Bengal and was always concerned with the socio-economic development of Bengal. Bengal's folk-culture in the form of folk songs and music and folk-dance was dear to his heart. He examined how the Bengali culture and literature embraced both the folk and classical elements of life; imbibed elements from other cultures and how they represented the creativity, humanism and imagination of the quintessentially Bengali mind. Thus Sarkar's sociology was shaped up by his nationalist feelings it ultimately became the sociology of national development for India, in general and of Bengal's development in particular.

2.4.3. Radha kamal Mukherjee (1889-1968) : Professor Radhakamal Mukerjee is well known for his pioneering role in the enrichment of sociology in India. He was a brilliant student and was exposed to the works of all modern European sociologists and political scientists like Comte,

NSOU CC-SO-02 32 Herbert Spencer, Bagehot, Lester Ward, Hobhouse, Giddings and many others. Like Sarkar, he, too, became associated with the Swadeshi movement during his student days in 1905 - 06. As a young patriot he came to appreciate the value of education for the poor, backward people of the country; so he worked among the slum-dwellers of Calcutta with the motto of spreading education among the poor, adult but illiterate people residing in slums. Like young people of his generation, he was motivated by the spirit of nationalism and philanthropy; and the British government's decision of Bengal partition further ignited the flame of nationalism in him. In 1906, Mukerjee had started an evening class for adult education and wrote simple texts to serve that purpose. His career as a teacher in economics started in 1910, but five years later, in 1915, he was arrested by the police on charges of terrorism and sedition. All his schools had to face closure because of that serious allegation but such adverse experiences could not dim his spirit of nationalism. Though he had chosen the career of college and university teacher, he always remained driven by the spirit of nationalism. He had taught in a number of reputed academic centers, but is most remembered for his association with the Lucknow University that he joined as the

80%

MATCHING BLOCK 2/104

W

Professor and Head of the Department of Economics and Sociology in 1921, on the very day the university started

to function, and continued teaching there for the next three decades. Mukerjee's vision of sociology remained rooted in India's tradition, yet it was universalistic. He believed that a general theory of sociology could be founded; in the context of Indian society that theory could be developed with the help of Indian philosophy and cultural tradition. T.N. Madan has observed that Mukerjee, as an economist, an ecologist and a sociologist, was concerned with the prospect of social reconstruction in connection with renewal of the past rather than any break with it. He has even made attempts 'to locate West's modernity within the endogeneous stream of Hindu culture itself....' (Hegde, 2011 : 50) He (Mukerjee) has further found Indian tradition spiritually modern and self-governing whereas western civilization seemed ailing and uprooting to him. Yet, he dreamt of a synthetic integrated model to retain the Eastern tradition by surpassing the West's modernity. Mukerjee and his colleagues at the Lucknow University, Dhurjati Prasad Mukerji and D.N.Majumdar had founded the Lucknow School of Indian sociology; the School had immense contribution in almost every area of knowledge like sociology, economics, culture, aesthetics, history, development including the area of nation building. One of the major task of the School was to seek remedial measures against the trauma of NSOU CC-SO-02 33 partition and jolts from independence the young state had experienced. The School, at the initiative of its founders, strived to present an integrated and comprehensive sociology of values and Indian culture and it had developed its own ideas and analytical ways to examine India's social reality. T. N. Madan has observed that Mukerjee strongly favoured the idea of renewal of India's past and so did not support any break with the past for the benefit of modernization of the society. In matters of social reconstruction in the Asian states, he always insisted on the principle of renewal and adaptation of old habits and impulses to satisfy the complex and larger needs of the modern period. He started thinking of an alternative, non-western socio-economic model of development to suit India's conditions and values in a better way. In fact, Mukerjee always wanted to present sociology in a manner most fitting to Indian society because he was a true nationalist in his mind, soul and work. Like Sarkar, Mukerjee was also inspired by the works of Brajendra Nath Seal who encouraged investigations of the reality of Indian society; so he, too, developed a fondness for field -investigations. He started his research-career with empirical field-work and encouraged his students to undertake field-researches on life and society in India. The love and respect for his own country and its people had motivated Mukerjee to explore the society through investigative field-research. Later, though his sociology turned more towards value-research, the spirit of nationalism never left him.

2.4.4 Dhurjati Prasad Mukherji : Dhurjati Prasad Mukherji or D.P. (as he is more popularly known) was one of the founders of the Lucknow School at the University of Lucknow. He was born in 1894, and grew up in an environment marked by several important events and influences that shaped the Bengali intellect of that time. The late -nineteenth century- early-twentieth period was marked by several important influences that had taken place in Bengal in particular, like emergence of a new phase of Bengal Renaissance, of several social and religious reform movements (Brahmo Samaj, Arya Samaj, Ramkrishna-Vivekananda influence, etc), Hindu revivalism, rediscovery of Sanskrit literary tradition, and an overwhelming influence of Rabindranath Tagore. A few years later, in 1905 Curzon's decision of Bengal Partition had shaken Bengal and then there occurred the Swadeshi Movement. The upgradation of Calcutta University for imparting post-graduate education to Indian students also happened in this period. Most of the Bengali pioneers of sociology like Sarkar, Mukerjee, K.P.Chattopadhyay and D. P. were the products of that turbulent period. NSOU CC-SO-02 34 D.P. has often been described as a conservative, Hindu intellectual with superficial ideas of modernity. He of course, never denied his Hindu Brahmin identity and was passionate about classical Hindu views about life, though he rejected the Brahminical religious belief and rituals quiet early in life. D.P. was respectful of the dynamism of Indian classical thoughts like the motto of 'Charaiveti, Charaiveti' or 'forward, forward' from the ancient text of Aitareya Brahmana. He always acknowledged the contributions of the Hindus behind the growth of medieval and modern Indian culture and believed that it has amalgamated well with other cultural influences in the country. Like Sarkar he, too, rejected the western belief about Indian minds being totally occupied with religion because he was truly fascinated by the Charvaka line of thought based on hedonism and on states of consciousness as being purely physical. He lamented that Indian sociologists were not interested in history, philosophy, dynamism and meaningfulness of social life. In the year 1955, as the President of the first Indian Sociological Conference he had addressed the issue with the observation that too much emphasis on empirical social research, particularly in India, seemed meaningless to him as that failed to impart any life-meaning. He was also not, at all, satisfied with the western sociological theory and especially Talcott Parsons' theory of social action, because of their excessive emphasis on the 'individual' D.P. has dealt with the ideas of progress, equality, social forces and social control in his book Basic Concepts in Sociology and has revealed his concern with 'progress'. To him, progress was not synonymous with growth, it was a movement of freedom, the growth of inner personality of man. For that regular contemplation and retirement from the hectic schedules of life after an age was needed. He found supports in favour such system of contemplation and retirement in the Hindu philosophy. He understands 'progress' as a problem of balancing of values, or the hierarchy of values to determine the fundamental values. To find out a suitable answer to his quest he turned to the values of the Upanishada, that is, the values of shantam or harmony, shivam or welfare and advaitam or unity. By doing this, D.P. has synthesized the principles of Vedanta with the western concept of progress. He was also concerned with the problems Indian society was experiencing like partition and communal violence and suggested that a positive reorientation of Indian culture would work as an essential condition for real progress. If we go through the works of D.P. we find that he never forgot his cultural heritage and tradition and believed in the happy marriage of Indian culture and values with modern western education.

NSOU CC-SO-02 35 2.3.5. G.S. Ghurey (1893 -1983) : Like other first generation sociologists in India G. S. Ghurey, too, was the product of his social and cultural environment. He is the founder of the Bombay School of Sociology and for long had tremendous influence in the growth and development of sociological research. As a student of Bombay's Elphinstone College he came into contact with European professors from Oxford and Cambridge from whom he learned about history and literature of Europe. Elphinstone had a reputation for producing western India's modern English educated intellectuals and professionals of that time. Nationalist political leaders like M.G. Ranade, Dadabhai Naoroji and Bal Gangadhar Tilak, too, were the products of the college. It was able to create an intellectual environment of independent thought and rational critique of colonial rule. As students came to learn about Europe's social and political history, they became interested in examining similar institutions and ideas in their own country. When in 1862 the first professor of Sanskrit was appointed, students' interest in their ancient past and Hindu philosophy was ignited. When Ghurey took admission in Elphinstone College in 1913, the wave of western intellectual ferment had subsided considerably with an increase in nationalism. Ghurey's nationalism was ingrained in his academic training as a Sanskritist and also within his chosen field of Indology. He was greatly influenced by the traditions of British and German Orientalism that encouraged the study of Sanskrit texts and respect the Brahminical values and perspectives embodied in them. Just as Swadeshi and Bengal partition issue in 1905 had aroused nationalist feelings among the Bengalees, in the western part of the country social reform movements of the nineteenth century evoked concerns about Indian society. The targets of those social reform movements in Maharashtra were values and institutions of a tradition-bound society, eg., Brahminical and patriarchal norms, kinship structures, etc. Western values introduced new norms of behavior and ideas concerning widow remarriage, age of consent, etc. In 1932 his first major book *Caste and Race in India* was published and it revealed his deep commitment to Indological approach. He was of the opinion that continuity and change in Indian society should be examined only with reference to ancient Indian texts. Due to this preference for Indological approach, Ghurey accepted and glorified the Vedic culture, values, traditions and civilisations of ancient period and their continuation in modern times without any question. Like his contemporaries he also acknowledged and valued the contributions of the Renaissance men like Raja Rammohan Roy, Keshab Chandra Sen, Ishwar Chandra Vidyasagar, M.G. Ranade and R.G. Bhandarkar. As a Maharastrian, he used to support

NSOU CC-SO-02 36 one particular type of regional nationalism for his state, and was proud of Maharashtra's cultural heritage, and its distinctive identity. So much so that he was happy when Shiv Sena was formed in the 1960s in Maharashtra. As a sociologist Ghurey primarily focused on cultural nationalism and reconstruction of Indian society and history to examine and understand the origin and emergence of existing institutions. He studied caste in the context of Indian civilization for projecting the unity and characteristics of India's ancient heritage, which, he believed, contained nothing but Hindu society dominated by Brahminical values. In several of his books, Ghurey has revealed the influence of nationalism on him by severely criticizing the tribal policies of the colonial government. Like other nationalists he, too, believed that the British policy of exclusion of the tribal people in the name of protection was actually another form of the strategy of divide and rule. Again, he was of the opinion that the natural process of assimilation and diffusion of various groups and culture was jeopardised because of forceful imposition of colonial rule. He was in favour of slow integration of marginalized elements into the mainstream of social life. Ghurey and his colleagues were influenced by the conservative nationalism and initiated a particular brand of sociology with a combination of Indology and anthropology. Ghurey has viewed Indian society as a product of Brahminical Hinduism being bound together by its unique cultural traditions and social institutions. He, as a sociologist, has worked hard to create an Indological and nationalist image of traditional Indian society based on caste and joint family system, culture and civilization nurtured in the tradition of the Vedic past and connected with the spirit of Brahminical Hinduism. To substantiate that image he has introduced the techniques of anthropological field research and scientific methodology in sociological investigation and research. He never adhered to foreign intellectual standards, nor did he submit himself to foreign research agendas because of his strong nationalist convictions. Like other first generation Indian sociologists Ghurey, too, wanted to exhibit the organic unity of Indian society; hence the legacy of sociology's over-emphasis on caste, kinship, family, religion by side-lining economic and political aspects had started with him. Carol Upadhyay has rightly observed that Ghurey's sociology has combined nationalism, Orientalism, and social reformist ideas to function within the diffusionist and empiricist structure of anthropology of his time. It is important to note that his sociological vision was nurtured by his experiences with colonialism, his respect for India's past glory, and his nationalist aspiration for India's freedom in future.

NSOU CC-SO-02 37 2.4.6 Partha Chatterjee : Partha Chatterjee, a Political Scientist by training and a multi-disciplinarian by choice is one of the leading scholars of the contemporary world and a founding- member of the Subaltern Studies group. He has contributed generously in the understanding of India's nationalism. Though his discussions often refer to the perspectives of thinkers and litterateurs of the colonial period he is primarily interested in nationalism and nation-building in India. He has lights on how the newly liberated states welcome the principles of western capitalism by shifting their own age-old values and traditions aside during their strife for building a strong and powerful nation. Chatterjee has examined the roles of modern Indian intellectuals like Bankimchandra, Mahtma Gandhi, Nehru and their likes. These three icons of modern India came from three distinct regions of the country.

Bankimchandra, a nineteenth century writer admired the west's advances in science and economics, but was critical of its failure to fully grasp the rich cultural heritage of India. Mahatma Gandhi, a political leader much younger than Bankimchandra, felt that more than any western ideology, the principles of the Bhagabad Gita should be the foundation of the modern Indian nation. He recommended non-violence to be the only weapon to bring the colonial rule to an end and forwarded the idea of making villages and village-based cottage-industries the life-line of a modern Indian nation. Nehru, a leader much younger than Gandhi, had accepted many of Gandhi's beliefs but summarily rejected his ideas of nation-building as inept. He aspired to create a sovereign, democratic nation-state, governed by revolutionary elites to keep the dissenting groups in control and to use science and technology for all round development including surging economy and social justice for all. Chatterjee's book, *Nationalist Thought and the Colonial World: A Derivative Discourse* (1986) has urged the readers to adopt a fresher approach towards nationalism by linking it to the post-Enlightenment liberal-rationalist conceptions of knowledge which was responsible for imposing colonial control over more than half of the world. He has compared the three distinct Indian versions of nationalism that emerged in three different corners of the country, namely, the east, the west and the north. His exploration of nationalism is a critique of Benedict Anderson's theory of imagined nationalism. Anderson believes that nation has only an imagined existence as a political community which is both limited and sovereign in nature. The imagination of nation stays in the minds of the people because even without knowing each other NSOU CC-SO-02 38 personally as fellow countrymen they imagine themselves as belonging to the same nation. The nation has a limited existence because it is always territorially bounded. Chatterjee observes that in spite of its existence in the minds of the people , nationalism's formation and development are aided by several sociological conditions. These are, printing press and publication of books in native language, spread of secondary education family and women's position within it. Thus, Chatterjee's stand on nationalism has posed a challenge to Anderson's 'modular' form of nation that supposedly travelled from the West to the colonies. Under this kind of nationalism colonies were left with no freedom to dwell on their own imagination of nation and makes the imagination of nation colonized. However, Chatterjee finds the spiritual domain missing in the Andersonian concept of 'modular' nationalism; whereas in India's nationalism the spiritual domain remained hidden within the privacy of family. The family was the epicenter of cultural elements needed for imagination of nationalism. Chatterjee has chosen examples, carefully, from culture, drama, school education system, family, women, etc. from the Bengali society to prove his points. A short discussion of these examples will be helpful. Since the end of the 18th century, under the initiative of the East India Company and European missionaries the first books, mostly translations of the Bible, in Bengali began to get published for administrative purposes. By the early years of the nineteenth century prose compositions began to be printed. As the dominance of the Company became stronger, Persian was replaced by English as the language for administrative work. The newly emerging elites of colonial Bengal were educated in modern schools and colleges and were bilingual. They also played important roles in standardizing the written form of the native language outside the purview of the colonial domain. They wrote and published original works in different formats of literature and in the process made language and literature important sources of nationalism. The other domains of national culture and nationalism in colonial Bengal were secondary schools and family. The elites of the nineteenth century Bengal had turned the modern educational institutions into citadels of nationalism through the curriculum, faculty, funding-everything. Another beholder of nationalistic values and national culture was family. As per western assessments, the Indian culture needed thorough changes, but the middle class, the educated elites of the country, took the task of social reformation upon themselves because they were not ready to allow the colonial state to initiate reform of practices of the 'traditional society'. During the first half of the twentieth century, the position of Indian women also NSOU CC-SO-02 39 underwent manifold changes as the nationalistic values spread throughout the social body. They embraced modern ideals, acquired education and occupation as well; but they did not leave their traditions altogether. Such combinations of tradition and modernity helped in the national imagination, Chatterjee believes. Thus, his observations present a new model of Indian nationalism.

2.5 Summary From our discussion above we can say that most of the founding-fathers of sociology in India were nationalists in spirit and wanted to project India as one united entity. They were also respectful of India's rich cultural heritage and wanted to proclaim India's cultural equality with the western world by challenging the western perception of the 'other-worldly' or non-materialistic nature of Indian society. While some of India's early sociologists like Benoy Kumar Sarkar and Radhakamal Mukerjee had actively participated in nationalist political movements themselves, others were deeply influenced by the nationalist political and cultural environment of the time. Much of the growth and development of sociology in India depended on the nationalist discourse about Indian society and Indian sociologists were dedicated to the nationalist causes of nation-creating and nation-building, with inspirations from the images of ancient India beheld in the ancient texts. They also wanted to reconstitute the society by combining the traditional elements with modernity; this unique combination became the mainstay of the nationalist discourse in Indian sociology.

2.6 Model Questions 1. Answer in Brief: 5 Marks. a) What is meant by Nationalist Discourse? b) What is the significance of nationalist discourse in sociology? c) What was the impact of colonial rule on nationalist discourse in sociology 2. Answer in detail : 10 Marks. d) Define nationalist discourse . Examine the contributions of nationalist discourse in Indian sociology. e) Examine the nationalist ideas of Benoy Kumar Sarkar. f) Make an assessment of Radhakamal Mukerjee in the study of sociology in India. NSOU CC-SO-02 40 g) Do you think Dhurjati Prasad Mukerji was a nationalist sociologist? Give reasons in favor of your arguments. h) Examine the nationalist perspective in G.S.Ghurye's sociology.

NSOU CC-SO-02 42 3.1 Introduction The term 'Subaltern' conveys a sense of subordination,that is, the position or status that remains perpetually under the control and domination of someone else. The term was first used by the noted Italian Marxist thinker Antonio Gramsci in his famous 'Prison Notebook' to mean, firstly, the proletariats or the working class; and secondly, to mean the marginalized, powerless people who are always dominated and subordinated by the far more powerful, dominating section of the society. The subalterns in a society remain powerless as the class-in-control enjoys exclusive power and authority over them. Gramsci did not confine the 'subalterns' within any specific time-frame like the post-industrial society as this class has remained present in every other phases of history. In the context of Indian societythe term 'Subaltern' is used to mean Dalits, tribal and other ethnic communities, poor peasants and all other impoverished, marginalized sections of population during the colonial period. They were excluded from social institutions and were denied a voice of their own. The Subaltern Perspective in sociology, along with the discipline of History focuses on the neglected 'underbelly' of the society to get an insight into the roles played by them... So it (Subaltern Studies) is referred as 'history told from the below.' This perspective has emerged and evolved as a critique of the other two long-established schools of thought that view the history of colonial India as the history of power, domination and achievements of a tiny elite group like either the colonial rulers and administrators or the nationalist elites of Indian origin. The perspective originated in England in the late 1970s in the hands of group of Indian historians but it earned popular notice in 1982 only when the mouthpiece The Subaltern Studies, Volume 1 saw the light of the day. The people associated with that movement wanted to alter the common perception of both academics and ordinary people about subalterns as the 'subjects of history. Both the Colonialist and the Nationalist perspectives have totally overlooked the roles played by the subalterns who remain subordinated; yet retain an element of independence of consciousness. They focus their attention on the one-sidedness of elite politics and prefer to highlight the roles of revolts and rebellions of the subalterns; it also looks into the potentials of such classes to attain coherent and self-conscious conception of resistance and insurrections against upper class of rich peasantry, urban traders and colonial revenue administrators. Ranajit Guha has observed in his book Elementary Aspects of Peasant Insurgency In Colonial India (1983: Duke University Press)

NSOU CC-SO-02 43 that peasant insurgencies cannot be explained simply on the basis of certain economic conditions. Though such incidents may appear to be spontaneous and guided by absurd principles, actually all insurgent acts are guided by proper planning, preparation, organization and certain patterns of political activism. All these remain rooted deep within the independent consciousness of the peasantry. Guha has observed that the study of social movements needs a fresh approach because neither the colonialist approach nor the nationalist approach leaves any room for ethnic politics. This shortcoming was mainly responsible for the birth of the subaltern perspective. The subaltern perspective has rejected several 'myths' regarding the role of the underclass in the colonial period. Myth no. one is that the dalits, tribal people and the other marginalized sections had joined the freedom movement at the behest of the nationalist elites. Myth no. 2 suggests that the subalterns in India were drawn to freedom-struggle as they came into contact with the nationalist leaders and their ideologies. Facts have claimed both the myths wrong. Sometimes they were drawn to nationalist movements led by Indian political elites, no doubt; but on many other occasions they either did not respond to the elite leadership or retracted even after joining them. All these happened because the political objectives, goals and strategies were distinctly different from those of the elite politics because the nationalistic ideas and aspiration of the two groups were completely different. We must remember here that basic character of the subaltern nationalism remains rooted in everyday experiences of subordination and marginalization. Often those experiences have irrupted into peasant insurgencies. For this very reason Subaltern perspective has extensively studied the history of peasant revolts during the colonial period. It has put the focus on the non-elites as active agents of social and political change. By the 1980s the Subaltern studies methodology and its use of oral history, mythology, folk tales, folk arts, field studies, etc. became integral parts of South Asian historiography. They have also used official reports and records of tribal revolts and peasant insurgencies, but have discovered totally different narratives from these materials. Presently the term 'Subaltern' has a much wider connotation and refers to any person or group of inferior rank or station— who remain subordinated or subjugated because of their race, class, gender, sexual orientation, ethnicity or religion. The main task of the Subaltern Studies is to present a critique of the mainstream historiography. It is not that this perspective has a smooth sailing all along; many of its basic proposition has been questioned. Yet in the 1970s-'80s period Subaltern Studies or NSOU CC-SO-02 44 'History from the below' became popular in Europe. British Marxist historians like Christofer Hill, Edward Thomson, Erik Hobsoborn and many others had started to explore the tragic history of many forgotten communities and their stories of oppression and failed resistance. However the subaltern scholars in India never limited their exploration of the history of the underclass within any fixed pattern. 3.2 Ranajit Guha Ranajit Guha is one of the most influential scholars of history to pioneer a new genre of research to understand the social position and contributions of the subordinated people. He was born in Buckergunge of Barishal in 1923 in undivided Bengal. In the year 1959 he had migrated to Britain from India for higher studies and research . He was a Reader in History at the University of Sussex when he led a group of scholars to pursue the Subaltern approach. His groundbreaking book, Peasant Insurgency in Colonial India, to chronicle peasant movements in 19th century India, is considered a classic and the founding-stone of the new approach. The Subaltern historiography still remains based on his famous observation that the 'subaltern' is all about "the demographic difference between the total Indian population and all those whom we have described as the 'elite'. Guha and his group of scholars have published a good number of academic essays in several volumes of Subaltern Studies mto define and determine the scope of the subaltern perspective. Apart from his thought-provoking essays in those volumes Guha has also published several books on the subject like –

97%

MATCHING BLOCK 5/104

W

A Rule of Property for Bengal : An Essay on the Idea of Permanent Settlement(1963); Elementary Aspects of Insurgency in Colonial India(1983),

etc. Guha has pointed out that the study of history in India has been cleverly regularized to serve political and economic interests of the colonial government. The colonial administrators had collected and recorded all the details of the archaic practices of indigenous agriculture. Later, those data and information, as maintained from the standpoint of the imperialist government, have acted as authentic sources of historical research. Those records represent the elitist approach of the British colonialists; and the Indian aristocrats also were considered as part of the elite circle. As we have already come to know that the Subaltern Perspective never has never accepted the elitist version of history as the only narrative of modern India In his endeavour to establish a more befitting approach, Guha was concerned with several basic things like establishing a well-rounded definition of the (subaltern)

NSOU CC-SO-02 45 perspective; the ways and means of earning recognition for the (then) emergent perspective, its central idea and its focus on the incidents of peasant revolts. With a sharp eye to unearth the hidden truth of a semi feudal, colonized society and a keen analytical mind, Guha has pioneered a new genre of history told from the point of the the subalterns. Guha and the other scholars have tried hard to unearth the nature of domination during the colonial period, the roles of the subjugators and of the subjugated, the process to make domination possible etc. Guha was one of the most prolific contributors of the school and published 16 papers out of the 76 papers published in the first 10 volumes of the journal *Subaltern Studies*. Other contributors were Partha Chatterjee, David Arnold, David Hardiman, Gyanendra Pandey, Dipesh Chakrabarty, Goutam Bhadra, Gayatri Chakravorty Spivak, Shahid Amin, Sumit Sarkar and many others. Within a short period, the journal and its perspective both received appreciation from discerning scholars of different areas of social science from across the globe. Guha could realize that the age-old investigation methodology used in the study of Indian history has lost its relevance and so, a fresher approach was badly needed. It was time to look at history from the point of the subjugated subalterns, whose life, culture and role in society have remained, so far, unobserved and neglected. In his clarion call to the fellow historians (*Subaltern studies*, vol 1, chapter 1) Guha has made them aware of the elite bias in the the-existing narratives of history. The peasants, the artisans, and/or the mill-workers never before that period found any mention worth to remember, in the pages of history, For this very reason, Guha felt the need for the all-new subaltern perspective.

3.2.1 Guha's Observations on Peasant Insurgency : Both the British colonialists and the Indian Nationalist elites used to view peasant insurgency or up-rise as acts of crime or pathology. Guha has sought to see it from a totally different perspective in his path -breaking work, *Elementary Aspects of Peasant Insurgency in Colonial India*(1983). With the help of extensive research on the nature and characteristics of peasant revolts and awareness of the peasants' motives, Guha, like a true Marxist feels the need for an altered point of view and a change in consciousness for fresher and better understanding of the situation. He strongly believes that the peasant and tribal insurgents are not mere products of history, they are "the makers of their own history." (Dhanagare, p. 133). He is critical of the manners by which the British administrative machinery has taken anti-insurgency measures to prevent any such occurrence in future. NSOU CC-SO-02 46 However, Guha's analytical mind has also understood the failure of the orthodox Marxist historiography to give the peasant and tribal movements their due. He has noticed that social historians, while studying these movements usually focus on the organization, leadership and ideology behind those movements as the key-elements in consciousness building because they are guided by the belief that the insurgent activities in the colonial period were 'pre-political phenomena'. In Guha's opinion this is a serious error of judgment about the merit of those movements. In fact, as he assumes, one should not question whether these movements are pre-political or not, one should better understand such movements with reference to the role of the colonial state in promoting parasitic landlordism and protecting its evil machinations. These practices strengthened oppression of the small farmers or landless peasants and tribal tenants on the one hand, and encouraged them to rebel, on the other. He has observed that the tribal and non-tribal often rebelled against the land-lords, money-lenders and the lower-level government officials. All the protest movements of the 19th century like the Bhumij uprisings, the Kol insurrections, the Santhal revolt(1885), the Indigo Protests(1859-1862) and the Deccan riots (1875) show how the subalterns on their own wanted to break, destroy and alter the then- existing structure of power, authority and control. Guha believes that this is proof enough to consider these movements as much political in nature as the latter-day reformist struggles of the Congress and the class-struggles led by the Leftists in the country. No doubt, these two sets of movements are qualitatively apart; the leadership, aims, programs and ideologies of the uprisings are no match for the maturity and sophistication of the far better organized movements of the 20th century. Yet, as Guha opines, the so-called 'pre-political' movements of the subalterns were no-less significant in leading the long-deprived communities to voice their anger, desperation and protests against the local centers of power., even though those movements remained rather localized and sectarian in nature. Guha has identified six common forms and general ideas in the consciousness of subaltern insurgents. These are : Negation or formation of negative identity; ambiguity, modality, solidarity, transmission and territoriality. These forms should be examined in detail. i. Negation or Formation of Negative Identity : By the term 'negation' Guha means that under the oppressive domination of both the colonial government and the local centers of power, the subordinated, marginalized peasants and tribals had formed a consciousness based on the negation of the properties or characteristics

NSOU CC-SO-02 47 of their superiors. Following Gramsci, Guha believes that this negative identification of the opposition is nothing but the initial arousal of a class consciousness that enabled the subalterns to apply violent measures and techniques against their perceived enemies. With the strength of that consciousness the subalterns could reject the traditional order, the conventional forms of respect, dress-codes, language style, etc as the commonly accepted norms were nothing but the symbols of the feudal nobility and elites who used to maintain social and cultural distance from the subalterns. By rejecting the values and symbols of the elites the subalterns could have a negative assertion of their identity and consciousness. ii. Ambiguity: Ambiguity, according to Guha, makes insurgency different from a criminal act. Crime is secretive, conspiratorial act committed by either one individual or by a comparatively small group; whereas, insurgent or revolutionary activities may involve violence; get manifested in public and are backed by certain ideologies or value-laden ideas. The ambiguity lies in the open act of violence based on ideology in insurgency and makes it different from crime. iii. Modality : It represents the rebels' search for an alternative authority. To validate and sanctify the violence used in insurgent activities, the tribal rebels would often use the practice of paying nazranas to their leaders. They would also resort to plundering of goods and looting of cash for economic gains, would use destruction, wrecking or burning of resources as modalities of rebellion. But killing and bloodshed were of very rare use in tribal insurgency. iv. Solidarity or formation of the insurgents' own identity is an important part of tribal insurgency. The subalterns would identify themselves on the basis of class and other elements of solidarity like ethnic identity, religious, caste or filial bonds. These elements would overlap often. Guha believes, such over-lappings constitute the duplex character of insurgency. Sometimes class and religion, sometimes class and ethnicity got fused. For example, in the Kol and the Birsa rebellions, class was the prime factor, whereas in the Santhal revolt ethnic identity was more important than class-identity. v. Transmission as an aspect of subaltern insurgency, indicates the pattern how insurgency used to be spread. Insurgents used to spread the message of insurgency among other subaltern sections with the use of various symbolic signs and rumours. Prayer-meetings, drum-beatings, blowing of flutes or horns, distribution of 'sal' branches and leaves, passage of a blazing torch, distribution of chapattis, oil or

NSOU CC-SO-02 48 sindur were the means used by the Kols, the Santhals, the Birsaites and the Moplas to spread the messages of their uprising among their fellow ethnic group members. vi. Territoriality, in the context of subaltern approach means bonds built on the basis of blood-ties and locality; or on consanguinity and contiguity. In other words, a sense of we-feeling or belongingness is created with the help of a common heritage and shared habitat. Guha earned popularity and respect for his perspective, but that has not spared him from criticism. The 'autonomy' of the subaltern consciousness has been questioned on the ground that this can be studied independently, without connecting them with other political processes. Another serious weakness of the perspective is lack of comprehension regarding its meaning and scope. In a broader sense, subalternity may encompass a huge section including the lowest strata of rural population on the one end and the rich and upper- middle class of peasantry on the other.

3.3 David Hardiman David Hardiman, one of the important founding members of the Subaltern Studies Group, was born in Rawalpindi (Pakistan) in October, 1947 and was brought up in England. As a renowned scholar of History he has taught in different universities in the UK, including the University of Oxford and at the Centre for Studies in Social Sciences, Calcutta. He has built up a rich resource of subaltern studies like

Peasant Nationalists of Gujarat : Kheda District, 1917-1934 (1981); The Coming of Devi : Adivasi Assertion in Western India (1987) ; Peasant Resistance in India : 1858-1914 (1992) ; Subaltern Studies 8 : Essays in Honour of Ranajit Guha (1994);

History for the Subordinated (2006), etc. The main focus of his work is on the colonial history of the subcontinent and the effect of colonization on the rural areas of the country, power-play between factors, popular basis of Indian nationalism, environmental and medical history, etc. His study on the Devi movement among the tribals of Gujarat may not match the definition of subaltern studies, but it is known as a very important addition to the rich tapestry of subaltern studies.

3.3.1 The Devi movement in South Gujarat : This peaceful mass movement by the native people of that region—has revealed how the local tribals have tried to bring in social reform for the group in the British period. Though this movement was really important for the self-assertion of the local tribal people, nobody-right

NSOU CC-SO-02 49 from the British government and its administrators, journalists, the Congress nationalists, not even the socialist politicians—had taken any interests in this important event of tribal life. This movement was undertaken by the tribal people of south Gujarat to transform their traditional habits and alter their life-style. The Devi movement was not one of its kind because such movements did take place among almost all adivasis from all corners of the country, but the mainstream or non-subaltern sections of population did not take notice of the events of the movements. So there was no documentation, nor any full-length monograph was ever prepared on such important events of tribal life. Even when the nationalist workers had taken a rare notice, they would immediately see the influence of Gandhiji and his principles behind it. The socialist activists and ideologues, too, in a similar fashion, failed to give the tribal people their dues. Hardiman, in course of his analyses of the movement, notices that tribals and other subaltern groups have always been denied credits for either any of their independent initiative or for their ability to decide what was good or bad for them. In *The Coming of Devi* Hardiman has shown that the adivasis of Gujarat were able to assert themselves evil machinations of the moneylenders on the strength of this movement. The (Devi) movement was started in 1921 by the fisher folks of Palghar taluk, gradually it spread to other parts of Gujarat. Through this movement the tribal people of that part of the country had attempted to reform themselves socially and culturally. For example, they wanted to get rid of their drinking habit, to resist the highhandedness of big landlords and Parsi liquor-vendors who compelled them into debt-bondage. The Devi movement was based on the belief that the Devi or the goddess would manifest herself through a medium, usually a girl. The medium would pronounce the commands of Devi in front of a crowd. The six-fold commands would run like this : 1) Drinking of liquor and toddy was to be stopped. 2) Consumption of meat and fish needed to be stopped. 3) Life should be simple and honest. 4) Personal cleanliness was of great importance and men should take bath twice a day. 5) Women should bathe three times a day. 6) All contacts with the Parsis were to be severed.

NSOU CC-SO-02 50 The commands sometimes would also ask for abandonment of witch-craft; and sometimes to follow the principles of Gandhi. Once the girl dressed as Devi would finish the commands, she would be offered coins and/ or gifts. The group would then seat for the common feast or bhandara. The movement not only changed their ways of life, but also led to the awakening of their political consciousness and made them politically mobilized. But ultimately such movements could not make them free from all oppressions, because the control of the Parsis over them was replaced by the domination of elite sections of the adivasis over other members of the clan. Still, it cannot be denied that from various other aspects the Devi movement was immensely beneficial for them. Hardiman has also studied the strange relations between the subaltern classes and the local money-lenders in rural India in his second book *Feeding the Baniya*. The relationship was based not only on economic dependence of the poor villagers on the usurers but also on political and cultural undercurrents. The local money lenders, who were basically banias or merchantshad the remarkable quality of bouncing back even after strong oppositions and rebellions by the local villagers. Even in areas where there were branches of government controlled banks to provide financial assistance to the villagers at cheaper rates, the villagers would prefer the more exploitative terms and conditions of the local moneylenders. Hardiman's study reveals that due to cultural reasons, the moneylender could continue to maintain his position of domination as a member of the locally dominant sections. For the purpose of his subaltern enquiries, Hardiman has made field-studies, met with numerous people, has recorded popular stories and folk-songs. His Subaltern Thesis stand on a combination of anthropology and history as he believes that the relationship between the elites and the subalterns is the product of a historical process. His investigation has proved that 'The concept of Devi and her commands had brought in radical changes in the consciousness of the tribes of Palghar region. They gradually became politically mobilized and came out of the clutches of the money-lenders and liquor-vendors ;their standard of living also did improve. True, That movement could not protect them from all kinds of oppression and exploitation; but, it definitely helped them become assertive. At the same time, they learned to be self-reliant and active for their own welfare. Hardiman has looked deep into the relationship between the villagers and the money-lenders to examine the nature of exploitation they (tribal-

NSOU CC-SO-02 51 villagers) used to experience regularly. He has also noticed that the Baniyas could consolidate their control over the villagers with the help of certain sets of traditional practices and beliefs. Even though the baniyas and the money-lenders used to exploit the rural poor with their never-ending demands and threats, they (the poor) would seek help from their Abusers rather than from the banks or other such organizations that would offer them better terms and conditions like softer interests for loan. Sometimes as the dominating force, sometime as a clandestine agent for other dominating forces the money-lenders would offer the poor peasants an avenue to connect with the more powerful, ever-growing capitalist world outside their villae. True, Hardiman's thesis has not offered any solution to the age-old problems of poverty, inequality, exclusion and marginalization of the underclass in India, it has helped us to look at these problems from a new angle. As a sociologically- sensitive historian he has focused on the impact of colonial rule on rural society of India, power relationship at various levels, India's freedom movement and its popular bases, and several other areas of social life. He has minutely examined the participation of peasants in the national movement in Gujarat; and has found that it was quite different from the Gandhian movements in aims and objectives. To do that he has studied how adivasis of Gujarat were uniting against the liquor dealers who, with their monopoly right of supply were exploiting the local tribals. As a subaltern thinker Hardiman was not only influenced by the path-breaking ideas of Guha, but was also inspired by the thoughts of Marx, Gramsci, Michel Foucault, Pierre Bourdieu. D.D.Kosambi and several western Marxist historians like E.P. Thompson, Eugene Genovese and Elizabeth Fox- Genovese. 3.4 Babasaheb Bhimrao Ambedkar : As it has been said earlier, Ambedkar was an admirer of the principle of equality in every sphere of life; like equality of respect, of status, of consideration and equality of dignity; therefore he wanted abolition of the Brahminical arrangement of society that had fragmented the social order into multiple groups. In the early years of civilization, the powerful well-heeled people had engaged the impoverished, powerless people as their servants, watchmen and menial staff. They had their living quarters on the outskirts of the village and eventually became known as the 'antyajas' and 'avarnas' or as people who remained outside the periphery of

NSOU CC-SO-02 52 the varna system. In this way a huge section of people were excluded and marginalized by the powerful. Ambedkar could realize that Brahminical values and caste practices reinforced each other and started untouchability by utilizing the preachings of ancient texts. Ambedkar has used the term 'Dalit', instead of terms like the 'Depressed Class' or the 'Harijan' to mean the oppressed and exploited sections of the society. Dhyanjoy Keer, the biographer of Ambedkar has rightly pointed out that 'Ambedkar was aspiring them (Dalit)

100%

MATCHING BLOCK 7/104

W

to do battle for their human rights. He was driving them to action by acting himself.....Ambedkar was displaying energy by his own action; arousing their faith by showing faith.'

For the promotion of the status of the dalits Ambedkar has advocated five principles:

100%

MATCHING BLOCK 8/104

SA

chapter three-origin and development of caste ... (D40662830)

self- improvement, self- progress, self- dependence, self- respect, and self- confidence.

He was also in favour of dalit- activism and movement. This is the essence of Ambedkar's subaltern approach. With the help of this approach he has presented an alternative narrative, that is, anti -Hindu and anti- Brahminical, of nationalism. This version has been reified through the formation of Dalit- Bahujan Samaj and establishment of a critique of the Brahminical social structure. With the help of his subaltern approach, Ambedkar has upheld the aspirations of the Dalits, their vision of nationalism as opposed to the nationalistic ideas of eminent spokesperson and leaders like

73%

MATCHING BLOCK 9/104

Raja Rammohan Roy, B.G.Tilak, Mahatma Gandhi, Nehru and Shyamaprasad Mukhopadhyay on the one hand, and

the secular -socialist ideology of the leftist leaders like M.N. Roy, Rajani Palme Datta, E.M.S.Namoodripad, on the other. He has traced the origin and problems of Dalits, origin of caste and untouchability, and has also suggested measures for the eradication of untouchability. We need to discuss all these aspects of to understand his subaltern views. 3.4.1 Origin of Caste : Ambedkar has traced the origin of the Dalits in the history of ancient India. He believes that in the past the present dalits were known as the 'broken persons'. On the basis of his understanding of history of ancient India he concludes that the primitive society had nomadic tribes who had cattle as their property. As cattle- tenders these tribes had to move from one place to another on a regular basis. With the passage of time people learned cultivation and came to depend more on agriculture for a stable and secured life and gave up their nomadic habits to settle down at one place. Acquisition of land replaced cattle as property. When people started to settle down, there occurred frequent fights with those two groups of people, the settled

NSOU CC-SO-02 53 and the nomadic tribes. As the nomads often had to face defeats in those fights, they had to break into smaller groups and scattered into different areas to escape captivity. With time those defeated, scattered people came to be known as the Broken Men. They started to work as the watchmen and security guards for the well-settled people in exchange of food and shelter. The Broken Men were considered as outsiders by the settled people as they used to be members of two different communities and had to live outside the boundaries of the village. As they lived on the outskirts of the village, they came to be known as the 'antyaja's. Ambedkar believes that today's dalits are the descendants of the 'broken men' of the past. They are the natives or original inhabitants of the country. Ambedkar's subaltern ideas have been narrated in several of his books like The Untouchables, Who are They? [1948], Who were the Shudras? [1945] Mr Gandhi and the Emancipation of the Untouchables. [1936], Annihilation of caste, etc. He strongly felt that mere legal equality of status could not be sufficient, and wanted to establish equality of consideration as well as equality of dignity as the foundation of an equal society. He had opposed the Brahminical arrangement of society as it had brought fragmentation within the social structure by creating severe divisions and discriminations among the people. The impoverished people were forced to do all sorts of menial jobs, were compelled to stay at the outskirts of the villages and were labeled as 'antyajas' and 'avarnas' or people who were out of the periphery of varna system. This had led to the exclusion and marginalization of the poor, hard working people. Ambedkar came to realize that the Brahminical values and caste practices reinforced each other and had started untouchability with the help of ancient texts like shastras and samhitas. Ambedkar has used the term 'Dalit' to mean the so called 'untouchables' in the Indian society. Gandhiji had called them 'Harijans. Ambedkar has inspired the dalits to fight for their human rights. As an activist he has led them to action by acting himself. For the promotion of the status of the Dalits, Ambedkar has advocated five principles, namely,

100%

MATCHING BLOCK 14/104

SA

chapter three-origin and development of caste ... (D40662830)

self-improvement, self-progress, self-dependence, self-respect and self-confidence.

In addition to these he advocates in favour of dalit-activism and movement. This was the essence of Ambedkar's subaltern approach. With this he has presented an alternative narration i.e an anti-Hindu, anti-Brahminical version of nationalism. t, E.M.S. Namboodiripad, on the other. Ambedkar has strongly hoped that his version of nationalism would bring forth an egalitarian, casteless, classless society

NSOU CC-SO-02 54 possible. With Ambedkar's vision of a robust caste-less society an awareness about a discrimination-free world has started to emerge. It also marked the beginning of anti-caste movements across India, especially in the western part of the country.

3.5 Summary The unit on subaltern critique has discussed the definition, meaning and significance of the perspective that has examined the role of the down trodden in the traditional society. Though there are several celebrated authors of the perspective, it has focused on the three of them because of the importance of their thoughts and approaches to create a balance between the roles of the masses and of the elites in social and political arena of life. The perspective, influenced by Marxism had emerged in the field of historiography to understand and rewrite history from the below; but it also has earned an equally important presence in sociology by questioning the popular social concepts that marginalize and ignore communities as archaic, primitive and backward. Thus, the perspective compels people to rethink about the alternative sociabilities and their political roles in self-assertion. The critique does not represent any single intellectual image, but a number of important academic development in social history. In the opinion of Christopher Lee, this perspective presents constant critique towards the accumulated knowledge in different areas of social science. No doubt, it also has faced many questions and debated from different quarters. Critics have pointed out that the term 'subaltern' has not been defined well. It has also been pointed out by some that "subaltern" is a relative concept in the sense that it should be understood with reference to something else. If subalterns belong to somewhere below, then the question obviously is, "Below what"? A subaltern may not always remain a person without power, as Hardiman has observed during his study on the Devi movement that with a little alteration in life style, a tribal leader can assume the role of an exploiter rather than remaining as an exploited person.

3.6 Model Questions 1 Answer in Brief : 5 Marks. a) What is Subaltern Critique? b) How does Subaltern Critique differ from the other established perspectives?

NSOU CC-SO-02 55 c) Who are the subalterns? d) What is Ambedkar's view on origin of caste? 2. Discuss in detail : 10 Marks. e) Define subaltern critique. Examine its role in introducing a new perspective sociology in India. f) Examine, in detail, the views of the chief founding father of subaltern critique. g) Make an assessment of David Hardiman's views on the Devi movement in relation to subaltern perspective in sociology. h) Do you think Ambedkar is a subaltern thinker? Give your arguments in the light of his views.

Caste in Independent Period 4.5 Merits of the Caste System 4.6 Critiques of the Caste System 4.7 Summary 4.8 Model Questions 4.9 References and Suggested Readings 4.0 Objectives Focuses on the age-old system of caste in India. Points to the various critiques or criticisms against caste. Offers deeper understanding of the caste system. 4.1 Introduction The Indian social structure has a unique social institution-the caste system. It is an ancient system among the Hindus to denote the concept of social stratification. Origin of the caste system is still unknown to mankind. It dates back to time immemorial. This system of stratification is considered to be unique to India as its features are nowhere similar to any other forms of stratification that exists elsewhere. 59

NSOU CC-SO-02 60 The word 'caste' is believed to have originated from the Spanish word 'casta', which means 'lineage'. In traditional India, this system of social stratification was not named as the caste system. It was after the British colonization in India, that the phrase 'caste system' got popularized. In traditional India, it was originally the Varna system or the Varnashram. The Rigveda highlights the Chaturvarna system, which means there is the presence of four main varnas in the Indian society- " The Brahmins who are destined to be priests " The Kshatriya who were the warriors " The Vaishyas as the traders and finally, " The Shudras who were meant to be the servant of the society. Thus, the colonizers changed the concept of Varna and Jati system to 'the caste system' in order to suit their way of understanding. Several seminal scholars have tried to define the caste system in their own way. A few of them are: Firstly, S.V Ketkar mentioned that "

a

93%

MATCHING BLOCK 15/104

W

caste is a group having two characteristics; (i) membership is confined to those who are born of members and includes all persons so born, (ii) the members are forbidden by an inexorable social law to marry outside the group".

Secondly,
Sir Herbert
Risley defined

90%

MATCHING BLOCK 17/104

W

caste as "a collection of families, bearing a common name, claiming a common descent, from a mythical ancestor, human or divine, professing to follow the same hereditary calling and regarded by those who are competent to give an opinion as forming a single homogenous community".

Thirdly, MacIver and Page opined, "

100%

MATCHING BLOCK 18/104

W

when status is wholly predetermined, so that men are born to their lot without any hope of changing it, then class takes the extreme form of caste."

Different factors have been the reason behind the continued existence of the caste system in the Indian society. A few such factors are as follows: Geographical Location-India was isolated from the other countries for a long period of time. This helped the Indian tradition, customs, mores and beliefs to grow and become deep seated among the people. Rural belt-Before the advent of the British in India, it was mostly covered

NSOU CC-SO-02 61 under the rural social structure category. This static social order and structure helped the caste system to grow in India. Religious influence-The origin of Hinduism as a religion is unknown to the people. Hinduism is thus referred to as the Sanatana Dharma. It believes in the theory of Karma and reincarnation, which might have helped the caste system to grow in India. Education-People were mostly religious in nature. They feared to oppose the dictums of religion. Lack of education was one such factor, which made them ignorant to the dogmatic, superstitious beliefs. They went on believing and maintaining the rules and regulations of the caste order, which thereby facilitated the growth of the caste system in India. Thus, the caste system is an inherent system of social stratification even in the modern century. It had its own changes with the passage of time, but the core factor still remains. It mainly prevailed due to ancestor worship, following the rituals, maintaining colour or racial prejudice and so on. 4.2 Characteristics of the Caste System The caste system is one of the oldest and most complex forms of social stratification. Govind Sadashiv Ghurye provided

62%

MATCHING BLOCK 19/104

SA babi.docx (D109428965)

six main features of the caste system in his noted work "Caste and Race in India" (1969). The following are the prime features of the caste system- i. Segmental Division:

The caste system is a non-homogenous segmental division of the society. There's a well-maintained social boundary. The members of a caste is given the ascribed status that is the status which is determined by one's birth and is not based on one's achievements in life. No amount of other social accomplishments can change the caste to which one is born into. It is an unattainable and nontransferable position. The caste rank to which one was placed became a way of life for them. Each caste rank came with its own set of rules and regulations. It was the duty of the caste panchayat to take care whether the members of one's caste were obliging to the rules of the caste order or not.

ii. Hierarchical Division: In India, the system of caste has divided the Hindu order into castes and sub-castes. There was a gradational system by which members of the higher castes were deemed to be superior to members from the lower caste rank. The lower caste that is the Shudras were tagged to be the untouchables. They NSOU CC-SO-02 62 were considered to be members from the outcaste group. According to the hierarchical division, the Brahmins were the superior most who were followed by the Kshatriyas, Vaishyas and Shudras in line.

iii. Restrictions on food and social intercourse: Each member of a specific caste system has their own set of rules and regulations related to food and social relations. Restrictions based on food vary from one caste group to another. For example, the Brahmins can accept kachcha food (uncooked food) from the members of lower caste group but they cannot accept pakka food (cooked food) from the lower caste groups. The foods that are prepared by the Brahmins are acceptable to all caste members. On many occasions, when a Brahmins eats from a plate, the lower caste members believes that if they will food from that particular unwashed plate, then they can attain blessings from God. Consumption of beef is strictly not allowed. Many Brahmins restrain themselves from consuming onion, garlic and so on in order to maintain the caste rules. Similarly, the concept of purity and pollution is also associated with the restrictions related to social intercourse. It is followed in such a strict way that even the touch or shadow of a lower caste can pollute the Brahmins. This is the reason, which has propelled the concept of untouchability in India. This practice has segregated the four caste groups from each other.

iv. Civil and Religious Disabilities: Following the caste rules and regulations, there are several lower sub-caste groups who are compelled to live on the outskirts of one's city or village in order to maintain the purity of the area. Certain lower caste groups follows that they cannot come out of their house before 12 noon. The reason behind this is that before 12 noon, the shadow of a human being falls at his back, which if by mistake falls on an upper caste member's body, then that might pollute him. Many Dalits (the lower caste group) are not allowed to draw water from public well, or visit temple, school, colleges, hotels and so on. The lower caste groups were debarred from getting their basic educational or legal right, or even political representation. The Brahmins are believed to be born pure. They are deemed to be superior. Chanting Vedic mantras were allowed only by the Brahmins and no other lower caste groups.

v. Occupational Choice: The caste system is linked with the occupational gradation too. Each caste group is designated with a specific set of occupation. The members of a caste group cannot change their field of occupation, as it is an ascribed status. For example, the Brahmins were expected to be priests or teachers, the Kshatriyas were meant to be warriors, the Vaishyas are entitled to be the NSOU CC-SO-02 63 warriors and the Shudras were meant to do all the menial jobs of the society.

vi. Restrictions on marriage: The Hindu caste system has rigid rules on marriage. Castes are endogamous group, according to which an individual can marry within his or her own caste group. Inter-caste marriage was not allowed by the caste groups. For example, a Brahmin can only marry another Brahmin; a Brahmin cannot marry anyone from the lower caste group. The caste groups follow the concept of Anuloma (Hypergamy) and Pratiloma (Hypogamy). Anuloma means that when a lower caste girl marries a boy from the upper caste group, they she moves up the caste ladder. On the other hand, Pratiloma means when an upper caste girl marries someone from the lower caste group then she suffers from a demotion in the caste ladder. Pratiloma is looked down upon by the society. On several occasions, honor killing is infamously famous in many parts of India. Inter-caste marriage is one such factor, which triggers honor killing. Therefore, G. S Ghurye made an effort to list out the prime features, which dominates the Indian caste system. These features prove the point that the system of caste promoted inequality among the masses. It completely stood against the concepts of individualization, industrialization, globalization, modernization, westernization and so on.

4.3 Theories on the Origin of the Caste System

There are numerous theories and opinions placed by various scholars related to the origin of the caste system in India. A few such theories which try to bring out the theory behind the origin of the caste system are as follows:

a) Traditional Theory: According to ancient texts, it was believed that the caste system originated due to divine ordinance. The Purushashukta of Rig Veda mentions the existence of the four Varnas. These four Varnas originate from Prajapathi Brahma or the Supreme Being. In accordance to this theory,

the
Brahmins originated

87%

MATCHING BLOCK 21/104

W

from the mouth of the Supreme Being, the Kshatriyas from the arms, the Vaishyas from the thighs, and the Shudras from the feet.

Due to this reason, each caste group qualifies with a special feature. Mouth is considered to be the source of knowledge or speech. Thus, the Brahmins are vested with the task of preaching and teaching. The arms are a symbol of strength, thereby linking the Kshatriyas to the field of being a warrior who can protect the society from external threat. The thing with the other repository organs is closer to the stomach; therefore the Vaishyas

NSOU CC-SO-02 64 are vested with the duty to take care of the economic wellbeing of its members. The Vaishyas are thus often associated with trading activities. Finally, The Shudras originated from the feet of the Brahman, thus their prime task is to serve the other parts of the body and to do the menial tasks of the society. Their purpose is to clean the society. Though this theory is associated with its own set of criticisms, but it is one of the most popular beliefs on the origin of the caste system in India. b) Racial Theory: Scholars such as G. S Ghurye, Sir Herbert Risley and Dr. D.N Majumdar were the prime movers of this theory. The pioneers of this theory were of the belief that the concept of castes came into existence due to the long- standing racial differences among the Indian masses. They propounded that it was after the Aryan invasion in India that they started to segregate people on the basis of racial differences. They were fair complexioned, for which they tried to dominate over other groups of people who had different racial features. c) Occupational Theory: Nesfield proposed the occupational theory behind the origin of the caste system. According to this theory, if a specific group of people follows the same hereditary calling for a specific course of time then there emerges a caste group based on that hereditary calling. In his opinion, the idea of purity and pollution got developed based on the kind of occupation one is associated with in his/her group. Besides these three propositions on the development of the caste system, there are other theories such as the political theory, which claims that the Brahmins wanted to maintain their supremacy over the other groups of people for which they developed the traditional theory on

71%

MATCHING BLOCK 20/104

W

the origin of the caste system. They associated the development of the caste system

with religion, so that people complies without questioning. On the other hand, Sharatchandra Roy provided a notion that the caste system emerged due to the integration and assimilation of different cultures. 4.4 Evolution of the Caste System There are two main stages, which show the evolution of the caste system in India. They are: a) Caste in Pre-British Age b) Caste in Pre-Independence Period c) Caste in Independent Period (1947 onwards)

NSOU CC-SO-02 65 4.4.1 Caste in Pre-British Age : The Pre-British age is largely divided into two main categories that is, firstly, the system of caste in ancient age where the role of the Puranic and Vedic age comes to play. The period upto 1100 A.D comes under the ancient age. Secondly, the system of caste in the medieval period which witnesses the Mughal rule in India. This period entails from 1100 A.D to 1757 A.D. 4.4.2 Caste in Pre-Independence Period: The East India Company of the British took over the Indian administrative system from the hands of the Mughal emperors and started to rule India as a colony for more than 200 years. After the intrusion of the British way of governing India, a few changes were incorporated within the Hindu caste system. A few of them are as follows: Decline of the Caste Panchayat-The British incorporated a uniform legal system in India. The powers that were previously enjoyed by the caste councils were now transferred to the civil and criminal courts. Influence of Social Legislations-The British legal system incorporated a few legal rulings, which inevitably brought a change in the caste system of India. Acts such as The Caste Disabilities Removal Act of 1850 tried to remove the practice of untouchability from the Indian social system. Other Acts such as

75%

MATCHING BLOCK 22/104

SA chapter three-origin and development of caste ... (D40662830)

The Special Marriage Act of 1872 legalized inter-caste and inter-religious marriages. Therefore, the

long-standing endogamous principle broke down after the executing this legal Act. Social Reform Movements-Several social reform movements sprang up during the British rule in India. These reform movements tried to challenge the age- old inequalities in the Indian traditional social structure. Few reform movements were The Brahma Samaj which was founded by Raja Ram Mohan Roy in 1820 which attacked idol worshipping, caste divisions and so on; The Prarthana Samaj which was initiated by Justice Ranade who spoke strongly in support of inter-caste marriages, widow remarriage and so on; The Arya Samaj which was launched by Swami Dayanand Saraswati in 1875 who protested against caste inequalities and tried to make the Shudras study the Vedas. Influence of Western Ideas-The British brought with themselves western education in India. Open values such as "liberty, equality and fraternity", democracy, liberalism, secularism and so on were spread through western education among the Indian masses. Due to the spread of this education,

NSOU CC-SO-02 66 the deprived masses dreamt of a new world without inequality. It led to the rationalization of the Indian thinking process. Influence of Census System-The concept of a systematic demographic study of the Indian population was initiated by the British rule in India. It sharpened the feeling of caste consciousness among the masses. The grading points of the caste groups created a sense of competition to uphold one's caste spirit in the social ladder. Influence of Industrialization and Urbanization-The Industrial Revolution in England also had an effect in the Indian socio-economic system. Several industries with modern machineries started to have its mushroom growth in India. Introduction of railways, printing press, and construction of roads helped to improve not only the communication facility among the Indian masses but also the development of new employment opportunities. This resulted into the mingling of all caste members as crowded trains, buses, trams could not make the people follow the norms of purity and pollution. Due to the growth of the cities, people started migrating from rural to urban areas in search of better life opportunities; this in turn led to the development of equal minded individuals which in turn acted as an impetus to eradicate caste based inequalities. 4.4.3 Caste in Independent Period : After India's independence in 1947, there was a shift in the socio-political structure. The traditional caste structure also witnessed a makeshift. Secularism was becoming the call of the day, thereby attacking the religious notion behind the caste structure. Imposition of several caste based rules and regulations like restriction on food habit, got relaxed. The concept of caste controlling one's hereditary calling, also saw a setback. People were free to choose their own field of occupation rather than following one's caste based occupation. Though the notion of endogamy still prevails but the Brahmin supremacy over the lower caste groups has been curbed down by strict legal intervention. People now give importance to the class system instead of the caste system. Other factors like sanskritization and westernization too helped in changing the traditional notion of caste. Thus, the rigidity of the caste structure has undergone a sweeping change. 4.5 Merits of the Caste System The Indian caste system has no recorded history of origin. Due to several historical events, the caste system evolved with the passage of time. It is an all-

NSOU CC-SO-02 67 pervasive system in India, which no Indians can ignore. It has its own influence upon the people. Swami Vivekananda was of the view that the caste system in India brought with itself its own set of advantages. To him, a person's caste was determined by the 'gunas' or the qualities he possesses. To him, as per the original system of caste which was spread by Parashuram and Bhishma, it was quite flexible in nature. People could choose their own field of interest as per their skills and aptitude. He postulated that caste was a system of social order and not a part of any specific religion. Due to gradual evolution of mankind and the introduction of several external cultures in the Indian sub-continent, the caste system started to take a new shape among the masses. A few of its merits are as follows- The caste system represents a harmonious division of society. It was based on the principle of division of labor and one's hereditary calling. Occupational skills were passed down from one generation to the other. The caste system provided its member with its own social security and protection. Traditionally, it tried to promote an equalitarian society, which was gradually transformed due to external intrusion in the Indian social system. The caste system promotes the concept of we feeling. Rich or poor weak or strong it tried to help each caste members to get united in the name of caste. During the monarchical rule in India, the caste system peacefully co- existed with the other groups. The caste system acts as the rulebook of the Hindu community. It contains the dos and don'ts that a member must abide by. It tries to promote social order and solidarity. The caste system acts as an agent of socialization too. As it is based on the ascribed status of an individual, thus, the family members pass down the caste rules to the younger members so that they, too, can be accepted members of the society. Caste is a way of life for many. It also acts as a moral restraint within the followers. It contains its own rules and regulations, which helps a member to be in accordance with the social whole. The system of caste helps to maintain social stability. It encourages the qualities of a member and promotes sympathy and mutual respect for each other. The system of caste has promoted India's political culture. Due to the

NSOU CC-SO-02 68 presence of the caste panchayats, the caste system has acted as one of the major units of law. In case of asking for justice, the members of the caste panchayats established their own form of sanction to bring about peaceful existence among the members. Besides the merits that entails with the caste system, several critiques have criticized the presence of caste system in India. 4.6 Critiques of the Caste System Besides the merits, the caste system has its own set of demerits. Several critiques have pointed out various perspectives to speak against the system of division that the Indian caste system breeds in the society. One such prominent figure is Dr. B.R Ambedkar. He is regarded as the 'Father of Indian Constitution'. He made an effort to fight in favour of the 'depressed class' of the society and enlighten them to stand against discrimination. His socio-political thought to bring about a social reform in the Indian social system was indeed a noble one. He made the people speak up against caste based discrimination and made ways so that the 'dalits' can represent themselves on an equal ground, both politically and socially. Thus, a few such critiques of the caste system are as follows- Firstly, the caste system created segregation in the society. It was not just a system promoting division of labour but a system, which created division of labourers. The hierarchical feature of the caste system was a key to start grading the people on the basis of their ascribed status and thereby discriminate them on moral and social grounds. Secondly, an individual's ascribed status cannot be the sole determining factor to judge his social life or dictate his life-based choices. Many scholars deem this system as unnatural as it is not based on individual choice and it creates a system of favouritism in the society. Thirdly, it destroys the solidarity of the Indian social structure. The caste members are united within their group but they do not encourage the mingling of inter-caste members. This creates feelings of division, aloofness as well as hatred towards one another. It leads to the creation of untouchability. The reason behind this hatefulness of one caste against the other is because of the existence of stringent caste based rules. Fourthly, the caste system hampers the freedom of speech of an individual.

NSOU CC-SO-02 69 If a lower caste member wants to voice his opinion against the upper caste member, then he is looked down upon and on many occasion, he/she is subjected to negative sanction by the caste panchayats. It destroys both public spirit and public opinion. Fifthly, caste is not in favour of economic prosperity of the members. Caste based rules makes one stick to the occupational group that his caste members are entitled to. Therefore, for example, if the son of a Brahmin wants to work in a leather industry, then his social group will look him down upon, because any job associated with leather is clubbed with the lower caste members. Sixthly, the caste system in India degrades the position of the women in the society. Several caste-based rules are directed towards the women group, which leads to their low social status. It does not encourage women's education, does not make them equal participants in religious ceremonies, a female cannot be a priest who can mediate between God and the followers. They are even discouraged from joining the political activities. Strict endogamous rules are imposed upon them and if anyone debar from following the rules of the caste group, honour killing is the prime sanction imposed upon them by the caste groups. Seventhly, caste rules discourage the proper growth of a human being as a social being. Caste-based rules and regulations create widespread distinction among the social groups. It creates division and feelings of hatred among the inter-caste groups. It not only affects one's social life but also their personal life too. Several scholars are of the opinion that such stringent rule leads to self-denial, low self-esteem and imbalanced personality among the caste members. Finally, several eminent individuals stood against the injustice of the caste system in the society. Renowned people like Jyotirao Phule pointed out that if the caste system was the brainchild of Brahma, then it should have been imposed upon the animal kingdom too; Mohandas Karamchand Gandhi stood against the perilous system of caste where the lower caste groups are treated as untouchables and are marginalized from the social whole. He stood up for them and declared the Shudras as "Harijans" or the children of God, so that they too can be a part of the society without any discrimination.

NSOU CC-SO-02 70 4.7 Summary Therefore, as evident from the above discussion that the caste system was indeed a complex social system which the Hindus followed since time unknown. The system was only unique to India. Social mobility is practically impossible within the members of the caste system as it is a system based on divine origin. The caste system is a conservative and a complex system whose rules are being transmitted down the generation. Though, the system of caste has changed down the years and people now mostly focus on the class system rather than the caste system; achieved status rather than ascribed status; secular status rather than divine status and so on. Due to the introduction of several policies in independent India, there has been flexibility in the rigid caste system. People are now voicing for equality of the people in the society. It is indeed a challenging question to answer that whether the caste system will survive in the near future or not but it can be claimed that with changing times, the caste system too is making its own set of compromise to include the people as one single community. Did you know? 1. The caste system was justified in Manu (considered as the father of Hindu Dharma) in his most famous work, Manusmriti. He mentioned that the caste system justifies order and regularity in the social order. 2. Khap panchayats are caste-based panchayats, which are found in the rural areas Northern India. It acts as quasi-judicial bodies, which pronounces harsh crimes on its victims. The verdicts given by Khap panchayats are mainly against the women. They even promote honour killing to secure their caste rules. 3. According to the Human Rights Education Movement of India, every hour three Dalit women are raped, two Dalits are assaulted and two Dalit houses are burned down. 4.8 Model Questions A. Answer briefly. 5 i) Give any four changes that happened in the caste system in India during the British rule. ii) Point out any 4 merits of the caste system in India.

NSOU CC-SO-02 71 iii) What points did Gandhiji and Jyotirao Phule make on the system of caste in India? iv) Who were known as the Harijans? v) What is the function of a caste panchayat? vi) What do you mean by honour killing in the name of caste? B. Answer in detail. 10 i) Define caste. Point out the main characteristics of the Indian Caste System. ii) Discuss the theories behind the origin of the caste system in India. iii) What criticisms are leveled against the system of caste in India? 4.9 References and Suggested Readings Ahuja, R 1993. W

caste is a group having two characteristics; (i) membership is confined to those who are born of members and includes all persons so born; (ii) the members are forbidden by an inexorable social law to marry outside the group." The

caste system can be found to have unique features such as it creates a segmental division of the Hindu society; it creates a hierarchical division of the society; it imposes restrictions on feeding and social intercourse; the caste members are bound by a few civil and religious disabilities and barred from certain privileges from the other sections of the society; it creates a restriction on the occupational choice of the caste members and lastly, it follows the endogamous restriction on marriage. After the British colonized India, the caste system underwent several changes, whose effect can be felt even today. But before that, one must be aware about the Indian concept of Varna and Jati from where the caste system emerged. 5.2 Varna The etymological meaning of the word 'varna' means colour. It is a Sanskrit term. The root word is 'vr' which means to cover or envelop. The origin of the word can be traced to Rigveda, which means the colour or outward appearance of an individual. The Rigveda highlights the Chaturvarna system, which means there is the presence of four main varnas in the Indian society- The Brahmins who were destined to be priests The Kshatriyas who were the warriors The Vaishyas as the traders and finally, The Shudras who were meant to be the servants of the society. Any community which belonged to one of the four varnas, were known as 'savarna' and on the other hand people who did not belong to any specific caste rank (such as the Dalits or Scheduled Tribes) they were known as the 'avarnas'. Thus, the varna system was a purely gradational system in the Hindu society. The history of the emergence of the Varna system can be traced down to the Aryans' invasion in India. The Rigveda refers to the fact that the Aryans were the light complexioned individuals of the then Indian society. These light complexioned

NSOU CC-SO-02 74 groups of people were contrasted with the dark complexioned non-Aryans (who were referred as the 'dasa' Varna). In addition to the Varna system of creating a gradation in the society, the Vedic literature also spotlights various other groups who lay outside the Varna system such as Ayogava, Chandala, Nishada and Paulkasa. They too were meant to perform the menial tasks of the society and were not given any respect for the tasks they were assigned to perform by birth. In addition to people, the Varna system also extended itself to the soil composition of Mother Earth. In that fashion, soils can be divided into four main varnas- The white coloured soil is the Brahman soil which smells like pure butter; red colour soils indicate the Kshatriyas who represents blood and tastes bitter; the yellow colour soil (Vichy soil) indicates the Vaishyas which tastes sour and finally the black colour soil which represents the Shudras and tastes like wine. Therefore, the Rigveda mentions about the existence of the varna system in the society. It is in the tenth mandal of Rigveda under the Purusha Sukta verse. Different scholars give varied opinions about the origin of the Varna system. One such explanation points out that the Varna system originated because of the three basic elements or qualities that the universe is made up of, i.e. the Gunas. The three qualities or gunas are- 1. Satva Guna or Neutral nature 2. Rajo Guna or Passionate nature 3. Tamo Guna or hopeless nature. Hence, the origin of the Varna system, where Satva Guna indicates white, Rajas indicates Red and Tamas indicate black. The believers of this theory points out that- people with greater intellectual quality (Satt Guna) took the pledge to protect the society and preserve its knowledge. They were known as the Brahmins. Similarly, people with fighting skills (Rajo Guna) took the pledge to defend the nation against all harm-they came to be known as the Kshatriyas. In the same way, people with qualities of both trading and merchanting (Rajo as well as Tamo Guna) were referred to as the Vaishya and finally, people with selfless virtues within their heart and soul, who dedicated their lives to maintain the purity of the society (Tamo Guna) were referred to as the Shudras. Several Hindus started relating the Varna system with the theory of Karma. Karma indicates action of an individual. Each action bears with it, its own consequence, therefore, a positive action of an individual will bear positive Karma and negative action of an individual (which can bring harm

NSOU CC-SO-02 75 to the society) will bring forth negative Karma to the perpetrator. It is a cause and effect relationship, which many people believed in and maintained that Varna is not related with the ascriptive status of an individual rather it coincides with the type of action he/she is involved with, which finally leads to the allotment of that individual into the Varna hierarchy. The Varna Dharma promotes two kinds of duties among the people (as mentioned in the Vedas)- a) Sa ma nya Dharma: The universal dharma, irrespective of one's varna includes universal moral codes such as restraining oneself from violence, maintaining honesty, considering cleanliness is next to godliness and so on. b) Via esa Dharma: The special duties assigned to members of each specific Varna, such as the Brahmins can only accept kachcha food (raw food) where as the other Kshatriyas, Vaishyas and Shudras can accept pakka food (cooked food) from each other. Therefore, the reality of the Varna system cannot be neglected as several scholars have been going on discussing about the same since time unknown. 5.3 Varna : A Theoretical Overview Several scholars have tried to present their own viewpoint into explaining the Varna System. A few such theoretical explanations are pointed below: 5.3.1 The Western Theory : The originators of this theory uphold the view that the Varna system originated with the Aryans coming into India. It was maintained that the original inhabitants of India were the Dashuds, who were defeated by the Aryans. After conquering, the Dashuds (who were dark complexioned) were enslaved and suppressed by the Aryans. Thus, in order to maintain their hold upon the people in India, they started the Varna system where the Dashuds were tagged as the Shudras (due to their dark complexion). The Shudras were also tagged as outcasts and were subjected to perform the menial tasks of the society. Many other scholars reject this theory, as it is not backed by proper evidence. 5.3.2 The Brahminical Theory : This theory supports the divine origin of the varna system. It refers to the late Rigvedic Purusha Shukta. The Purush or the cosmic being is considered as the Lord of Immortality. All the other existences on this planet are equivalent to nothing when it comes to him. Gods once tried to perform a sacrifice with Purusha as the NSOU CC-SO-02 76 peace offering, spring as the butter, summer as the fuel and autumn as the other associated offerings. But, the Purusha along with the other saints was immolated on the sacrificial grass. It was during this offering that from the mouth of the Purusha emerged the Brahmins, from his arms emerged the Kshatriyas, from his thighs emerged the Vaishyas and from his feet emerged the Shudras. The Bhagvad Gita (the holy book of the Hindus) mentions that the Varna system was not based on hereditary principles rather was based on the law of Karma. It is similar to the concept of retributive punishment where the sin of an individual is determined by the negative actions of his previous life. Many theorists, such as Max Mueller, rejected this theory of the origin of the Varna. 5.3.3 The Marxist Theory : am Sharan Sharma proposed the Marxists theory on Varna. According to this theory, the early Rigvedic society was based on the lines of primitive communism where society was largely egalitarian in nature. The later Vedic period witnessed the rise of agricultural society where surplus production of crops was used to reward the priests. This pattern led to the development of a social hierarchy. Gradually, with the creation of the surplus produce there came the development of the use of iron plough. This moderate development of the society saw the rise of the Brahminical ideology due to which the society was divided into four main classes (each in accordance to one's own occupation). Though this theory seems to be logical in portraying the Marxist concept of class and class struggle through the lines of Varna, but it is not supported with relevant proofs. 5.3.4 B.R Ambedkar's Theory on the Varna System : Bhimrao Ramji Ambedkar rejected the divine theory of the varna system. He referred to the Varna System as the one which created uncanny division in the society. He argues that only Lord Buddha questioned this hierarchy in the society in the name of Varna gradation. He opined that the Chaturvarna system promoted nothing but division and ill feelings among the people in the society. It preaches class composed society as an ideal one; it gives a legal stamp to all the misdeeds that people used to carry out in the name of religion; it considers this gradation as sacred in nature.

NSOU CC-SO-02 77 5.4 Varna System—A Basis for Division of Labour The Varna system also implies vocational division among the people based on one's Varna. The choice of one's occupation is solely based on one's birth into one's own specific Varna. Therefore, division of labour in the society is based on one's rank in the Varna ladder. It is also highlighted from this viewpoint that in order to avoid chaos and confusion in the society, the Varna system created a pre-ordered vocational guidance into which men fall since their birth. Thus, there is no brawl over the selection of one's favourite occupation. It strived to create a smooth functioning society. This hereditary calling of the people expects the Brahmans to take up the job of being a priest in the society; a Kshatriya to be a warrior; a Vaishya to be a trader and a Shudra to be a selfless server of the society who are designated to do all those activities for maintaining the purity of the society. The Varna Dharma does not call for gradation in the kinds of work one is involved with but it solely ensures that whether the society functions properly or not. If people follow the Varna Dharma and maintain their vocations in that order, it is assumed that the we-feeling of the Hindu community will be maintained properly. 5.5 Jati The term "Jati" is derived from the Sanskrit root word, which means to be born. It points out to the social birthright of an individual as well as the lineage to which that individual belongs. A Jati is an endogamous group, which indicates that inter-group marriages are not encouraged within a Jati. The members of a Jati group has an ascribed status that is, they are member of a Jati group by virtue of their birth. It is due to this reason that the members of a Jati from a specific village consider themselves as potential kins. It is a hereditary social group where each group has their own name and its related attributes. Each member of a Jati group is expected to follow and abide by the specific Jati attributes. In many places in India, a member's Jati acts as his/her social identity. This notion of social identity as per one's jati maintains a sense of cohesion among the group members. It leads to the creation of a separate social unit. Members of a village community depend on the other village members to maintain his Jati's style of life. Relations with other Jati members are flexible and not bound with specific Jati rules. The members of a Jati are not bound with their traditional occupational roles. For example, if a Jati's traditional calling is to act as

NSOU CC-SO-02 78 a priest, it is not necessary that he will restrict himself within that occupational calling. He may involve himself with either farming or being a carpenter. It is on the basis of marital relations that members of Jati are demarcated from each other. Villagers used to interchange ideas from members of other Jatis, and this categorization of members from one Jati with another was known as Jati-Cluster. 5.5.1 Jati Cluster: Jati cluster was a social category by which members used to distinguish one Jati member from the other. A group of separate Jatis used to class together under one name, which made it easier for them to deal with people in a complex social structure. Through the jati-cluster category finer distinction between Jati members was made possible. Jati-cluster was done keeping in mind that they had similar traditional occupation, jati related practices and relatively similar rank. For example, in Gujarat two main Jati clusters are the Barias and the Patidars who ranked as cultivators as per their traditional calling. The Patidars were ranked higher than the Barias. Both these Jati clusters differ in their ritual practices and it is easier for the people to categorize and relate to one another in that way. It is ascribed in nature, as one cannot change the Jati roles to which one is born into. Therefore, Jati is a concept that is closely related to the ideas of kinship and lineage. An individual associates oneself with a jati group because his social world is engulfed within it and his identity and existence is a part of the jati's idea of what kind of individual he is. It is both inevitable and considered to be morally proper for an individual to be related to one's Jati. 5.6 Varna and Jati (Caste)—The Difference Varna and Jati represents two different forms of social stratification in India. Most of the people in the society, mistakenly admit both to be two overlapping concepts, but the distinction between the two notes their stark difference. A few points of differences are as follows: a) Numerical : The Varna System is four in number where as jatis are innumerable. The Chaturvarna doctrine promotes the concept of people being divided into four main divisions-Brahmins, Kshatriyas, Vaishyas and Shudras. It represents the four- fold division of the society. Each of the four Varnas has its own set of rules and regulations. On the other hand, jatis are large in number. There are more than two thousand and eight hundred castes and sub-castes in India.

NSOU CC-SO-02 79 b) Status: The Varna system is based on occupation where as the concept of Jati is based on the ascribed status of an individual. For people who are born in which Jati is determined by his birth. For example, a Shudra is a born Shudra. Membership within a Jati is fixed. One cannot change it by any means of wealth, power or prestige. On the other hand, the Varna system was based on the basis of one's occupation or division of labour. It is the Karma of an individual, which determines the Varna he will be entitled to. In Bhagwad Gita Chapter 4, Verse 13, Lord Krishna mentioned that He is the creator of the four categories of occupations based on one's quality and activity. c) Mobility: The Jati system is closed in nature where as the varna system is much more open or flexible in nature. In this context, in the Varna system, a human being has the chance to change his Varna order. If a man is born Brahmin, he can change it to the Kshatriya Varna if he finds himself to be a good, able bodied warrior. Even the Shudras (who were looked down upon by other caste members) can also be a Brahmin. For example, Dronacharya, Kripacharya, Ashwathama originally belonged to the Brahmin Varna but eventually they pursued the Kshatriya career. On the other hand, the Jati system follows closed social mobility because caste members cannot change their caste later in their life. They have to stick to their own given caste ascribed to them since their birth. Thus, Jati membership is unchangeable in nature. d) Equality: The Jati system is based on the principle of inequality where as the Varna system is based on the principle of equality among its members. During the Vedic period, members of all the Varna were given equal socio-economic status as well as education and political opportunities. Mobility of all kinds and forms were allowed to the Varna members. On the other hand, the members of a jati had restricted social mobility and an inbound status differentiation. Opportunities were completely non-existent. The upper caste members used to look down upon the members of the lower caste members. e) Rigidity: Caste system is more rigid than the Varna system. The Varna system was not restricted with several forms of restrictions such as restriction in one's food habit, dressing habit, activities such as educational, political and religious and so on. People had their own freedom to lead a normal social life. In contrast to this, the caste system is more rigid as it places restrictions on each and every social factor. On many occasions, the upper caste members also curb the morals and manners of the lower caste members.

NSOU CC-SO-02 80 f) Sanction: Hinduism is the sanction of the Varna system where as the caste system does not have any sanction of its own. The origin of the Varna system explains the fact that it was divinely ordained (as the members believe that the four Varnas emerged from Prajapatya Brahma). On the contrary, the caste system is exempted from such divine sanctions. The degenerated version of the ancient Varna system was considered to be the origin of the caste system. 5.7 Summary Thus, the existence of the Varna model is present in theoretical terms but not in practical existence. Varna as a form of social stratification is now present in the pages of history. It is the Jati system (in the name of caste system), which is in existence in the modern society. Jati helped in the identification of one's own Varna. It is due to this reason that people tend to overlap the two concepts of Varna and Jati in the current period. Jati is the subdivision of the communities, which was broadly divided into the four Varnas-Brahmins, Kshatriyas, Vaishyas and Shudras. It was after the British colonization of India, that the concept of Jati got degraded into the concept of the caste system. To conclude, both the Varna and the Jati system are unique to the Indian Hindu society and is an inherent part of the Indian culture since time immemorial. Did you know? 1. The Caste System was originally known as the varnashram. 2. The confusion of castes through intermarriage is known as varnasamkara. It is looked down upon by the members of the society. A girl can marry an upper caste member but not to a lower caste member because that will lead to the degradation of her caste rank. 3. Varnas are largely considered as supercastes. 4. The Scheduled Castes or the Dalits are a part of the fifth Varna which has got no mention in the Vedas. This fifth Varna is kept out from the Chatur Varna system.

NSOU CC-SO-02 81 5.8 Model Questions A. Answer briefly. 5 i) What is a jati cluster? ii) Why are Jatis considered to be an endogamous group? iii) How can you relate the Varna system along with division of labour in the society? iv) What do you mean by sanction? v) Give an example of Jati cluster. vi) How did B.R Ambedkar refer to the Varna system as? B. Answer in detail. 10 i) Write a note on the Varna system in the Indian society. ii) Give a theoretical overview of the Varna system. iii) What do you mean by a Jati? How can you differentiate Jati from Varna? 5.9 References and Suggested Readings Ahuja, R 1993. Indian Social System. Rawat Publications, New Delhi. Ketkar, S. V. 2018. History of Caste in India. To understand it as a hierarchical system of division of labour. To understand its relevance in society. To understand the system as a socio-economic relationship between the service -providers and the service- receivers. 6.1 Introduction Jajmani system is an age-old system of occupational obligation. It is related with the concept of caste system in India. Caste is an ancient system among the Hindus to denote the concept of social stratification. In the traditional period, people were economically interdependent on each other. Each individual was specialized in their field of occupation as per the caste they were born into. The caste system 82

NSOU CC-SO-02 83 followed the ascribed status by which an individual is born into a caste; he cannot change his caste on the basis of his achieved status. This specialization of occupation led to the inculcation of an exchange of service in the village. Two groups formed due to this exchange of services-the servicing group i.e. who provided services to the other group and the serviced group i.e. who received the services of the servicing group. This system of exchange was purely based on the principle of caste. It was mainly followed in the village society. It had a durable relation among the members of the two groups. This system of exchange of services in the lines of caste was known as the Jajmani System. The etymological meaning of the word 'jajman' is rooted in the Sanskrit word "Yajman" which means an individual who performs a yajna. Yajna is a ritual among the Hindus performed by a group of sages (Brahmin) as a symbol of devotion and worship of the Almighty. In order to perform a yajna, it is the Brahmin of the village who is called for. This tradition of asking the Brahmin to come and offer his service, later on turned into the Jajmani system. Prof. Yogendra Singh defines the

90%**MATCHING BLOCK 27/104****W**

Jajmani System as "a system governed by relationships based on reciprocity in inter-caste relations in

village". According to

N.S Reddy, "The service relations which are governed by a hereditary tenure are called Jajman-Praja relations". In the words of Oscar Lewis, "Under

100%**MATCHING BLOCK 29/104****W**

this system each caste group within a village is expected to give certain standardised services to the families of other castes.

Each one works for certain family or group of families with whom he is hereditary linked." Harold Gould mentioned that the jajmani system is based on the principle of super ordination and subordination of one group upon the other. It was generally the high caste groups who used to be the service receiver from the lower caste groups such as the barbers (Nai), washermen (Dhobis), carpenters (Khathi) and so on. The service provider was known as the kamin and the service receiver were known as the jajman. The high caste groups were land-owning families, who used to pay the kamins either in cash or kind (i.e. by providing them with pieces of land or clothes or domesticated animals). The term jajman also refers to that relationship where a Brahmin provides service to members of the caste i.e. by conducting a yajna or puja for the members of the other castes. In this case too, the Brahmin was referred as the kamin and

NSOU CC-SO-02 84 the service receiver was known as the jajman. Thus, the jajmani system has multiple roles in the society-social, economical as well as moral. 6.2 Features of the Jajmani System The jajmani system is unique in India. It has several features, which can be listed one after another— i) The jajmani system is traditional in nature. The origin of the concept of jajmani system is unknown to the people. It is unique to the Hindu group and is closely associated with the caste-based divisions of the Hindu society. ii) The system of jajmani has an occupational obligation between the caste groups. The long-standing relationship between the kamin and the jajman denotes interdependence and mutual obligation towards one another. The kamins are dependent on the jajmans to fulfill their economic needs and the jajmans are dependent on the kamins to meet their required services. iii) The system is closely linked with the families. Families of one caste group with the other are tied with on jajmani lines. It creates a close familiarity between the members of two caste groups. iv) The jajmani system is exclusive in nature. Firstly, it is unique to the Hindu caste system and secondly, if a kamin provides his service to his jajman, then the jajman will seek services from the same service provider. For example, if a barber is providing his service to a particular family, then the service receiving family members will not replace that barber with someone else. v) The relationship within a jajmani system is durable. Both the caste groups are interdependent on each other. If a priest performs the daily worship of a specific family, then he will continue to give his services till his last breath and the jajmans will make sure that the kamin is not replaced by anyone else. vi) The jajmani relationship is hereditary in nature. The kamins will go on providing service on a hereditary basis. If a Brahmin gives his service to a specific family member then on the basis of hereditary calling, the future generation of the Brahmin will go on providing services to the future members of that specific family.

NSOU CC-SO-02 85 vii) The jajmani relationship promotes solidarity. Interdependence among the members intensifies the feelings of solidarity. It promotes vertical solidarity. Different caste groups come closer and develop a deeper bond due to the jajmani system. They continue to stay obligated towards each other. viii) The jajmani relationship has multiple roles. The jajmani system is not entirely an economic system, it is social and moral too. It reduces caste rifts and brings members of other caste groups closer to one another. People find their own mutual benefit within a caste system. Therefore, the jajmani system is a long and well-established relationship in the Hindu community. Several scholars have studied the jajmani system in India, only to find that it has its own set of merits and demerits. The system got introduced so that exchange of relationship continues to take place. Though it appears to be a relationship between the caste groups, but in reality it depicts the interdependence of the families till an indefinite period of time. 6.3 Spotlighting the Jajmani Relationship The jajmani system is also referred to as the traditional form of Indian barter system. The rights of the people involved within the jajmani system are permanent in nature. A kamin can in no way be removed from service by his jajman. This shows the process of mutual dependence upon each other forging social solidarity. The exchange of service that is present within this system is not exclusively economical in nature. Relationships are maintained with the exchange of either cash or kind. In case of any problem confronted by the kamin, the jajman tries his level best to give him a solution. The relationship is not equivalent to that of an employer and his servant but rather one family member helping his other kin in need. But the relationship with two or more castes with each other on the basis of exchanging a few things cannot be regarded as a jajmani relation. A Jajmani relationship is hereditary in nature. A Jajmani relationship is strengthened on the basis of the rituals and the social support. For example, it is the duty of the servicing class to perform rituals and ceremonies such as birth rites, marriage rituals, funerals, daily worship of one's Kula Devta and so on for his jajman. The servicing class receives help from one's jajman in the form of gifts, food, money, clothes, and plots of land and so on. By this the strength of the relationship is maintained for life.

NSOU CC-SO-02 86 It is not only the higher castes performing rituals and is acting as the servicing class; the lower castes also perform those tasks which are considered to pollute the higher caste members. For example, a lower caste member can wash the dirty clothes of his jajman. Thereby, professions such as Dhobi (washer man), Nai (barber), Nain or Dai Ma (midwife) and so on are included within the jajmani relations. The Jajmani relationship denotes the ties between families rather than one's caste. For example, a higher caste family receives services from one particular washer man and not from all the castes who are washer men by profession. Similarly, it is that particular washer man's family who will receive goods and services from his specific jajman and not from any other high caste members. In case of death of a family member, the next generation carries forward the same duties of maintaining Jajmani relationship. In the works of Orenstein, it was found that specific professions (such as being a watchman), enables the servicing class to maintain relationship with the entire village. The watchmen receive goods and services from all the land owning families in the village. Therefore, the Hindu jajmani system is such a social institution which helps to build up network relations within the members of a specific geographical location. This networked relationship has its own set of legalized norms and regulations, which creates a holistic bond among the masses. It helps in the reduction of antagonistic feelings among the members of the other group. The Jajmani relationship comes with its own set of power and authority but it ultimately unites the society as one social whole. 6.4 Jajmani System-Norms and Regulations The jajmani system is one of the oldest patterns of relationship that exists within the Indian Hindu community. Several norms and values are associated with the jajmani system. In India, it was mostly during the harvest time when the landowning families used to pay back to their respective kamins. The jajmans used to give them food grains which were considered to be the traditional mode of payment. However, this is not the only method by which the kamins stay dependent on the jajman. For several other factors such as building a house, choosing a plot to build a house, places for animal grazing and so on, the servicing class is dependent on his jajman. On many occasions, the jajman were also entitled to offer loans of money in case of the kamin's emergency.

NSOU CC-SO-02 87 Harold Gould mentioned in his findings that the magnitude of economic relationship between the jajman and the kamin is huge. For example, if a priest acts as the servicing class in his village, then all the single nuclear units establish separate economic transactions with the kamin. Thereby, a strong chain of power and wealth flow within the jajmani system. Gould in his study (conducted from 1954-1955) found that a barber (Nai) received about 312kgs of grain per year from 15 joint families. The transaction involved between the jajman and the kamin also depends upon the kind of service that is relegated to the jajmans. For example, if a washer man tears a cloth of the jajman, then the jajman can withhold him from giving his kamin sufficient amount goods in exchange. On the other hand, if the kamins see that his jajman does not pay him much with goods or services, then he renders minimum amount of service towards his jajman. No matter how much flexibility is maintained within the Jajmani relationship, the concept of purity and pollution stays intact as one of the basic feature of the Indian caste system. If the jajman comes from a lower caste group and the kamin from the upper caste group, the rules of ritual purity and pollution are strictly followed. The jajmans from a higher caste group will act as the subordinate member to his kamin who is from the higher caste group. However, the norms of maintaining a healthy relationship between the kamin and the jajman are not overlooked by any means. A jajman is bound to be paternalistic when it comes to looking after his kamin. The kamin too must act as an obedient service provider to his jajman. Though inequality is evident within the caste system, the Jajmani relationship tries to build a bridge to lessen the widening gaps between the castes. The jajman-kamin relationship is culturally obligated towards one another. The caste panchayats can punish either the kamin or the jajman if they find either of them to be at fault. In the form of punishments, the caste panchayat has the right to withdraw a jajman from receiving services from a specific kamin and vice versa. Therefore, the jajmani system comes with its own set of merits and demerits. However, the jajmani relationship is still not eradicated from the society. Even in this current century, the jajmani system is widely prominent in India.

NSOU CC-SO-02 88 6.5 Changes in the Jajmani System The jajmani system is facing new challenges of the modern society due to which its traditional structure is undergoing both structural and functional changes. Post independence from foreign rule, India's rural structure underwent several socio- economic changes. Several attempts have been taken to improve the condition of the lower caste members and give them their basic right. They are now given the right to vote which is equivalent to the status of the jajmans. Coupled with socio- economic changes, several scientific and technological developments have led to sweeping change in the role of the jajmani system. A few such trending changes are noted below: 1. People in the rural areas no longer depend on their caste system to take up their occupation. The drive of education for all has empowered the rural population, due to which they are focusing more on their achieved status than their ascribed status to choose their field of occupation. This has certainly led to a change in the traditional jajmani system. 2. The importance of cash over kind is making the Jajmani System to fall apart. Traditionally, the jajmans used to lend various things to the kamins for their welfare. But in the recent years the jajmans prefer to give cash in exchange to the services of the kamins. The cash does not always suffice the need of the kamins. Commodity exchange alongside cash used to help the kamins in numerous ways, but the situation has changed with the growing years. 3. Importance of the class system over the caste system has led to the decline of the jajmani system. The status of an individual is judged on the basis of one's class position than one's caste rank. Specially, after the introduction of the British rule in India, the traditional caste rank of an individual to demarcate one's social status has been eroded. Thereby this led to the dissolution of the jajmani relations in the Indian society. 4. Growing industrialization was another important factor to bring about changes in the jajmani relation in India. The British brought the sweeping force of industrialization in India, which made the people to give importance to the class system than the caste system. The growth of English education made the people to realize the evils of the caste system and how it affects the

NSOU CC-SO-02 89 social order. Jobs in the industrial sector were meted out to those who were qualified for the post. One's caste did not affect the kind of job he/ she used to get. Achieved status was given more priority than ascribed status, which led to a change in the traditional jajmani relationship. 5. The rapid growth of urbanization. Urbanization was the movement of the rural people to the urban areas in search of better livelihood. The urban sector had jobs and was freed from the clutches of the evils of the caste system. The lower caste people found educational opportunities and a way to prove their worth and not to stay dependent on the upper castes members throughout their lives. They found jobs, respect and a respectable social status, which ultimately led to the decline of the jajmani relationship in the rural area. Thus, it can be said that the above mentioned reasons led to the development of a new trend in the Indian society. The implementation of English education, developed communication facilities, growth of the print media and increasing acculturation among the people led to the decline of the traditional jajmani relationship. It led to the formation of a new order in the Indian society. Though the Jajmani System is still present in many parts of India but its impact has now declined. 6.6 Merits of the Jajmani System The Jajmani System has its own set of advantages and disadvantages. Several scholars are of the opinion that this traditional system of exchange of services that is unique to the Indian caste system has both its own pros and cons. A few such advantages of the jajmani relationship found in India are as follows- 1. Economic security of the kamins is maintained. The jajmani system provides economic security to its members. The servicing class is assured of their economic security by their jajmans. Not only in terms of economy, have the jajmans provided all sorts of necessary help to their kamins in times of crisis. 2. The jajmani system ensures one's security of occupation. As the system of jajmani relation is hereditary in nature, therefore, the kamins are guaranteed of their profession. For example, if a blacksmith (Lohar) provides metal tools to one specific family, then this chain of relationship will continue down the generation from both the service providing and the service receiving class.

NSOU CC-SO-02 90 3. The jajmani system maintains close and intimate relationship among the members. As it is mentioned earlier, that the relationship between the jajman and the kamin is purely economical in nature, rather it is bound with feelings and a sense of fraternity. The members have a spirit of fellow feeling for which they stand beside each other in terms of crisis. As the relationship is hereditary in nature, the jajmani relation ensures peaceful co- existence with one another. 4. There is a peaceful co-existence among the members within a jajmani relation. The jajmani system is based on the principles of exchange; therefore, the atmosphere of peaceful living is maintained by the members. In case, a servicing class does not provide proper service or the service receiver does not payback properly to the kamins then, the caste panchayats can take decision to ensure the prevalence of peace. 5. The jajmani system regulates division of labour in the society. The demarcation between the servicing class and the service receiver class is wide and clear. Thus, each individual knows what his duty towards one another is. It also helps them to act as a self sufficient community. Each village has their own kamin and a set of jajmans, thus the members do not have to depend on members from the other village to meet their task. Therefore, the jajmani system is functional in the society. Due to its follow-up advantages, it still prevails in the current century. Due to the passage of time, the structure and roles must have changed but the relationship per se remains even till today in rural and urban India. 6.7 Demerits of the Jajmani System Several scholars are of the opinion that the jajmani system in India is an exploitative one. Several reasons have been pointed out in support of this statement. A few such reasons are as follows:- 6. Feelings of social inequality are involved within the jajmani system. The jajmani relationship revolves around the feelings of inferiority and superiority. The servicing class is given a low social stature where as the service receiving class is given a high social stature. For example, though the barber is the kamin to his jajman, still he is looked down upon by the

NSOU CC-SO-02 91 members of other caste, including his jajman. The barber is not given the same social respect which the jajman receives from his community. Due to the feature of hereditary calling within the jajmani system, the future generation of the low caste kamins cannot change their occupation to gain a respectable social status. They do not have any other means to improve their economic condition. On several noted cases, it was found that the jajmans have even humiliated their kamins due to their low caste status. 7. The jajmani system is a source of exploitation. The caste system creates a division in the society. The higher caste member suppresses, dominates, humiliates and even exploits the lower caste members of the society. Though there involves a give and take relationship within the jajmani system, the lower caste members are still subjected to discrimination by the upper caste members. 8. The jajmani system hinders occupational mobility. The kamins and jajmans have a long lasting relationship. The servicing class is bound to provide service to their jajmans for generations after generation. Therefore, it depends upon one's hereditary calling. This system becomes a hindrance for someone's personal development in life. The son of a blacksmith is bound to carry on with that hereditary calling. He cannot choose a separate occupation for himself and make a mark in the society. It is through economic weakness of the lower caste members that the system of dominance is still prominent in the Hindu Caste System. 9. The jajmani system supports the caste system. As mentioned earlier, the hierarchical division inherent in the caste system leads to harassment and trouble between the jajman and kamin relationship. Therefore, the jajmani system has two sides of the same coin. It has its own set of pros and cons. Though the jajmani system tries to promote interdependence in the social system, it also leads to the projection of power-play of one caste over the other. 6.8 Summary Therefore, the prime question that can be asked is that-is the Jajmani System an exploitative system? Is the jajmani system nothing more than a power-play relationship of the jajman over his kamin? Several scholars, such as Beidleman

NSOU CC-SO-02 92 (1959) said that the jajman can be equated as the exploiter and the kamins can be equated as the exploited. People generally conclude that the jajmani relationship is nothing more than a chief instrument of power-play of the jajmans over the kamins. It is a system of coercion and control of the upper caste members over the lower caste. This concept can be equated with that of Karl Marx's class and class struggle, where the haves (i.e. the jajmans) exploits the have nots (i.e. the kamins). Besides this above understanding, many scholars are of the opinion that the jajmani system is a way by the society maintains its solidarity among the members. It is a way by which people can understand the importance of one another and stay interdependent. Firstly, the kamins are not forced to keep a relationship with their jajmans. They are allowed to sell their goods in case they get better profit margin from another group who may not be his jajman. Secondly, in case of any injustice, the kamins can move the caste panchayat and seek for justice. Similarly, if the jajmans see that the kamin is not maintaining a stable relationship with them, they can easily choose another set of kamins from whom they can receive the service. Therefore, the Jajmani System promotes collective action among the people. Each system that exists in the society has its own set of pros and cons. If the caste system creates a division in the society, the Jajmani System is the thread which makes the members of different castes to stay connected and be dependent on each other. Though, the dominance of the Jajmani System has declined over the years, but its influence is still vibrant in the 21st century. Did you know? 1. William Henricks Wiser was the first sociologist who used the word jajmani system academically. The name of his book was "The Hindu Jajmani System: A Socio-Economic System Interrelating Members of a Hindu Village Community in Service". 2. Initially, the jajmani system used to indicate the relation between a jajman and the priest ("purohith") but in later years, other services were added onto the list.

NSOU CC-SO-02 93 6.9 Model Questions A. Answer briefly. 5 i) Define jajmani system. ii) Point out a few norms and regulations in relation to the jajmani system in India. iii) Is the jajmani system exploitative in nature? Discuss. iv) Who are referred to as the jajman and kamin? v) Give an example to explain the jajmani system. vi) Is the jajmani system still prevalent in India? Give example. B. Answer in detail. 10 i) Write a note on the origin and features of the Jajmani System. ii) Discuss the trends which led to the changes in the jajmani system in India. iii) What are the merits and demerits of the jajmani system? 6.10 References and Suggested Readings Ahuja, R 1993. To provide an insight into the workings of traditional and contemporary rural India. 7.1 Introduction Caste is an ancient system among the Hindus to denote the concept of social stratification. The origin of the caste system dates back to time immemorial. The word 'caste' is believed to have originated from the Spanish word 'casta', which means 'lineage'. The Rigveda highlights the Chaturvarna system, which means there is the presence of four main varnas in the Indian society- The Brahmins who are destined to be priests The Kshatriya who were the warriors The Vaishyas as the traders and finally, 94

NSOU CC-SO-02 95 The Shudras who were meant to be the servant of the society. Maclver and Page have observed, "

100%**MATCHING BLOCK 30/104****W**

when status is wholly predetermined, so that men are born to their lot without any hope of changing it, then class takes the extreme form of caste."

Thus, the caste system is an inherent system of social stratification even in the modern century. It had its own changes with the passage of time, but the core factor still remains. Along with the concept of caste, another noted concept was also attached with it in many parts of India-that is the idea of Dominant Caste. The idea of dominant caste was propounded by an eminent sociologist in India named Mysore Narasimhachar Srinivas. This concept was first mentioned by him in

68%**MATCHING BLOCK 32/104****SA** babi.docx (D109428965)

his essay named "The Social System of a Mysore Village". This essay was written after his

vivid study of the Rampura village. It was in 1948 that Srinivas worked in Rampura and after a few years came up with his work on the dominant caste. A caste is believed to be dominant when it has three prime powers in the society- a) Economic Power b) Political Power c) Numeric Power These powers enable a group to occupy the most powerful authoritative position in the society. Castes with higher ritual ranking were not considered to be the powerful one in the society if they did not possess these three powers. Srinivas made it clear that the concept of dominant caste is not exclusive to the people of Rampura village, but this concept is popular in other states of the country too. For example, Lingayats and Okkaligas were from Mysore villages, Reddys and Kammas were from the villages of Andhra Pradesh, Gounders, Padayachis and Mudaliars are from Tamil Nadu, Patidars are from Gujarat and so on. Thus, M.N Srinivas defined dominant caste as "

96%**MATCHING BLOCK 33/104****SA** babi.docx (D109428965)

A caste may be said to be dominant when it preponderates numerically over other

castes

89%**MATCHING BLOCK 34/104****SA** babi.docx (D109428965)

and when it also wields preponderant economic and political power. A large and powerful caste group can be more easily dominant if its position in the local caste hierarchy is not too low."

Srinivas further added that "

100%**MATCHING BLOCK 35/104****W**

A caste to be dominant, it should own a sizable amount of the arable land locally available, have strength of numbers and occupy a high place in the local hierarchy. When a caste has all the attributes of dominance, it may be said to enjoy a decisive dominance."

NSOU CC-SO-02 96 Srinivas pointed out that the Okkaligas (a middle caste peasant group) were numerically the majority in the village out of the 19 jati groups that were present in the village. They were the biggest landowners and exercised their domination over the other caste groups both politically and economically. Despite them being from the lower caste group in the ritual ranking, they acted as the dominant caste in the village. Thus, a dominant caste can exercise their domination over a set of villages which are closely related and not just on one village. On most occasions, a single clan can dominate and control a number of villages at the same time. One branch of the clan resides in each of the villages and thereby by following the superiority of a clan head, domination is exercised in all the villages. Srinivas also noted that those castes, which had the elements of numerical, economical and political strength, higher ritual status or western education along with better occupational status than the other in the village, could have a decisive dominance over others. 7.2 Dominant Caste: Features M. N Srinivas noted three prime powers that the dominant castes wield to exercise their dominance over others in the village. These powers are (as mentioned earlier) political, economic and numeric power. Along with these powers, one other prime criterion is for those who occupy the topmost rank in the ritual ranking, for example, the Brahmin, Kshatriyas and the Vaishyas. On the basis of these factors, four prime characteristics can be drawn out in detail- a) Political and economic power-The power of a caste is largely determined by the amount of land he owns. It is in that way that he can earn more than the rest through his agricultural income. The more land that a specific caste owns, the more will he be able to provide jobs to the landless farmers in the village. This automatically gives rise to the situation of super-ordination and subordination. Yogendra Singh in his study has noticed that most dominant castes have higher authority over the others in the village, in terms of the land they possess. He finds that jati groups such as Okkaligas have control over Wangala, Rajputs controlled Senapur and the Vaghela Rajputs have control over Cassandra village in Gujarat. These big land owning castes give high regards to education. Thus, the more educated they are, the better jobs they have, which thereby leads to them getting better administrative or urban jobs. A better job comes with better pay scales, which thereby lead

NSOU CC-SO-02 97 to better economic position in the rural areas. This leads to the making of a dominant caste due to economic and political power. b) High ritual ranking-According to the traditional ritual ranking, the Brahmins and the Rajputs have been the dominant caste since time unknown. They enjoy the topmost rank in the caste hierarchy. The Rajputs were the feudal lords of most villages. They were the owners of large property of land. Thus, the traditional ritual purity of the group gave them a certain form of right to exercise their control over others. c) Greater numeric strength-The numeric strength of a group implies that the number of followers have given their votes to select them as the leader of their village. Those caste groups who wield the larger number of votes is selected as the winning candidate. A dominant caste doesn't exercise his power in just one single village, rather they rule in more than one village. The dominant caste members are spread across these clusters of villages so that they can exercise their authority over the members of those villages. By this way, people from the other villages will be aware of their existence. This will lead to the building up of networks and will thereby lead to regional dominance of that area. d) Specific amount of arable lands-In India, landowners occupy bigger portion of lands. In this way, the caste group who will have the larger portion of land will have the authority to exercise their dominance over the others in the village. Power and prestige are not just the two things that they enjoy, they also enjoys people looking up to them as a dominant figure. This is one of the prime reason why in the modern society, people tend to invest in land based properties in order to achieve upward mobility in his group. Thus, with these powers in hand, the dominant castes can not only exercise their authority over the others in the village, but they can also settle disputes belonging to their own group or from people of other jati groups. The existence of the dominant caste in the village discourages the village members to seek for justice from the government or other official sectors. They generally have their full faith on the decisions taken by the members of the dominant caste. The dominant caste members also acts as the village representative in legal matters related to the village. Thus, the people tend to rely on the existence of the dominant caste in the society, which led to the growth of their power in the local level.

NSOU CC-SO-02 98 7.3 Sociological Studies in Relation to Dominant Caste M. N Srinivas was mainly the first sociologist who brought into the light the concept of dominant caste in the academic world. Following him, there were other scholars who conducted studies in rural India and came up with the prevalence of dominant caste in those areas. S.C Dube examined the prime elements of caste dominance by studying four villages in Madhya Pradesh. He opined that a caste group can act as dominant when the power is diffused in the group and is exercised due to the interest of the village at large. The members of the dominant castes were segregated from other villagers in terms of their wielding authority over wealth, power and prestige. In most cases, it was also found that this inequality among the members led them to exploit the non-dominant members of their own group or people from the village. Kathleen Gough studied a village in Tamil Nadu to report on the existence of Brahmin domination over the other village members. Srinivas noted that the exertion of dominance of the caste groups over the non-dominant village members to preserve the ideals of the village and maintain its virtue and harmony. India received its independence from the British rule in 1947. Elected self-governing local councils (or the popularly known panchayats) were set up to look after the administration of rural India. While electing the Panchayat members, most of them were from the dominant caste. As the dominant castes, kept exercising their authorities for all these years and they have greater hold (both economically and politically) in the society, they formed the members of the Panchayat. Louis Dumont opined that he sole factor behind members acting as the dominant caste in a village is due to one's economic power and not their numeric strength. He claimed that this economic power flows from their large land holdings Several scholars noticed that on the basis of one's power, property, wealth and prestige, the dominant castes were internally divided into various rival factions. Control over the land by one individual led to the establishment of one single powerful headman to whom the members of the villagers felt subordinated. On the contrary, if the control over land was dispersed among members of a large dominant jati then there was the creation of a vertical flow of power between the segments of the dominant jatis. It can thus be seen that each village had their own set of dominant caste based on the structure of the village and the kind of power the dominant castes wield.

NSOU CC-SO-02 99 7.4 Functions of The Dominant Castes There are several functions in relation to the dominant caste that can be found in rural area. A few such functions are noted below:— a) The dominant castes acted as the reference group for the other lower caste members in the village. This made them to imitate the practices of the dominant caste members-this led to the development of cultural transmission among the members of the villagers. b) The dominant caste of a village acts as the safeguard of pluralistic culture. They set a normative pattern for the members of the village. For those who violate the norms of the village were given exemplary punishments so that others never repeat it in future. They are the decision-makers of the village, who decides what rewards or punishments to assign for the villagers. c) The dominant castes act as the power holders of the society. They are the representatives of the village who exercise their political or economic influence so that the interest of the village is maintained. Their actions influence the political process of the village. d) They act as the pillars of socio-economic development of their village. They sought out ways to better the position of their village in comparison to others. In many cases, they act as the agent of rehabilitation programmes so that the interests of the members of their village are safeguarded. e) The dominant caste acts as the bridge to the outer world. They are educated, for which they can socialize the members of the village and direct them to better their lives. On most occasions, the members of the dominant caste teach the villagers how to improve their agricultural skills, the importance of using modern technologies to help them in their agricultural activities and so on. They act as the agents of modernization in rural India.

7.5 Dominant Caste: Criticisms The rule of the dominant castes in the Indian subcontinent has been continuing since time unknown. The existence of the dominant caste has led to the rise of other concepts such as

79%

MATCHING BLOCK 36/104

SA Sampat Kale sir Assignment.pdf (D30263465)

Sanskritization. According to M. N Srinivas, "Sanskritization is a process by which a lower caste or tribe or any other group changes its customs,

rituals, ideology and way of life in the direction of a higher or more often twice-born caste".

Several criticisms have been leveled against the concept of dominant caste. A few such criticisms are as follows- i) Louis Dumont pointed out that there should be a division between powers related to ritual ranking and secular ranking. ii) The dominant caste favours the rule of the few over the majority. Power and prestige in the hands of the few are making them act as the dominant caste. This contributes to the growth of social inequality and social antagonism of the subordinated group against the superordinated group. iii) According to Gardener, dominant castes can have four basic levels or divisions-a) The ruler; b) the regional dominant caste; c) the local dominant caste; and d) dominant caste on the basis of amount of land acquisition. Thus, to him, dominance should not be restricted within the domain of caste only. The concept of dominant caste should be wide ranging. iv) Dominant castes bring modern forces into the rural social structure by which the traditional structure of rural India is having a structural shift. It leads to the process of a wide cultural change. v) D. N Majumdar has noted that it is not on the basis of numeric strength that a group is assigned to be the dominant caste of the village; rather it is largely the Brahmins and the Kshatriyas who act as the dominant caste despite being numerically weak. Out of several scholars who raised questions against the concept of dominant caste in India, we can name T.K Oommen. He has questioned the validity of the concept and has pointed out that Srinivas has not mentioned anything about alternate situations when a numerically weak caste owns most of the village's land, thereby gaining better economic status than the rest in the village; or the other way round that a person or group is numerically strong but economically deprived and falls below the ritually lower caste groups. He has commented that in such situations, the caste members will share the community power. This will lead to the growth of the we-feeling among the community members. He questions the context of dominance as well as the resources available to the members for dominate others. He notices the prevalence of a "multiple power structure" in a multi-caste village.

NSOU CC-SO-02 101 Srinivas did not point out anything related to this situation. But besides the criticisms leveled against the concept propounded by Srinivas, the basic existence of the dominant forces of caste is still felt in modern India. 7.6 Dominant Caste in Modern India After India's independence from foreign rule, several socio-economic changes have altered the social structure of India to some extent. The traditional structural pattern and its associated rules and regulations have undergone changes. But the concept of dominant caste still prevails in India. Its nature might have undergone changes currently, but the concept as a whole still exists. The traditional pattern of ranking someone higher in the social structure on the basis of one's ritual purity has undergone changes. New systems like universal adult franchise, electoral politics, and the panchayati raj system have changed the rural social structure in India. In the modern political system of India, caste based politics have become a common factor. The politicians use caste as a shield to gain the votes of the people. People from the ritually low ranking castes are now coming up to be represented in the face of India's politics. Many are joining the political parties to stop being the marginalized community and work for the uplift of the lower caste groups. These dominant castes are still acting as the representatives of their villages and are bringing up the local issues in front of the national eyes. Few political parties which have come up in the modern Indian politics are- "The Bahujan Samaj Party of Uttar Pradesh banked on Dalit votes. The Bharatiya Samaj Party emerged with the support of the Pasis and Rajbhars. The Apna Dal became the party of the Kurmis; the Mahan Dal emerged as a party for the Kushwaha caste. In Bihar, the Lok Janshakti Party, the Rashtriya Lok Samata Dal and the Hindustan Awaam Morcha are similar examples." Therefore, new patterns of development are bringing about new sweeping changes in the Indian social structure. Reservations are now given to the lower or backward caste members so that they can educate themselves and stand neck to neck with the other caste groups in the society. Reservation policies were intended to bring about social equality among the people. But the concept of dominant caste didn't get eroded away from the society at large even till today.

NSOU CC-SO-02 102 7.7 Summary Therefore, it can be concluded that the dominancy among the dominant castes was based on dependency and there are several associated factors which help make a caste dominant. The impact of dominant caste can be noticed in all walks of life- in the social, economic as well as the political field. With the growing change in the social structure of India post independence numeric strength has become stronger due to the implication of the adult suffrage in the society. The traditional authority that the dominant castes had over the villagers are now fading away. Despite the decrease in the functioning of the dominant castes over the people, reservation policies coming up for the rights of the lower caste groups, the decentralization of power in the Indian society and the introduction of the Panchayati Raj, the prevalence of the concept of dominant caste can be still felt in the rural structures of India. Did you know? 1. Though there are numerous laws to protect the lower caste members from any crime or inequality still according to reports, one crime is committed against a Dalit every 18 minutes. 2. 70% of Dalit women are still illiterate in India. 3. In the Hindu law book by Manu (Manusmriti), it is mentioned that "If a shudra mentions the name and class of a twice-born contumely [i.e. without proper respect], an iron nail, ten fingers long, shall be thrust into his mouth". 7.8 Model Questions A. Answer briefly. 5 i) Briefly mention about two sociological studies on dominant caste in India. ii) Name a few dominant castes found in modern India. iii) Give any two examples of dominant caste as mentioned by M.N Srinivas. iv) Define dominant caste. v) Define caste. vi) Name the book where Srinivas first mentioned the concept of dominant caste.

NSOU CC-SO-02 103 vii) How did T. K Oommen criticize Srinivas's concept of dominant caste? B. Answer in detail. 10 i) Write a note on the development of the concept of dominant caste in the academic field. ii) List the features of Dominant Caste found in India. iii) What are the merits and demerits of dominant caste in India? 7.9 References and Suggested Readings Ahuja, R 1993. The Critique of Sanskritization 8.8 Summary 8.9 Model Questions 8.10 References and Suggested Readings. 8.0 Objectives Examination of the process of caste mobility in India. To understand how castes can better their social status. To know it as a matter of positional change and not structural change. 8.1 Introduction The caste system is one of the most unique gradational systems found only in India. It is a system of social stratification found among the followers of Hinduism. Several scholars are of the opinion that the caste system has its own set of advantages and disadvantages. Membership within a caste system is based on the system of ascribed status. A member is born into a caste. For example, if a man is born as a Shudra, the person cannot change his caste in this lifetime. Several rules and regulations are imposed within the caste system-such as, rules of endogamy, on 104

NSOU CC-SO-02 105 commensality, on social intercourse and so on. The higher caste members of a caste system, tends to look down upon the lower caste members. Thus, the caste system was rigid in nature, and mobility within the caste system was largely not possible. Social mobility means the movement of one individual from one status to another. Mobility is mainly of two types- 1. Upward social mobility 2. Downward social mobility When an individual moves from one social status to another social status and with that there is the increase of respect and improvement of one's economic position in the society, it is said to be an example of upward social mobility. For example, when a bank peon is promoted as the bank manager it signifies upward mobility. In the same way, downward social mobility implies the demotion of an individual in the society; for example, if a millionaire gets bankrupt and is left with nothing, then this situation implies downward social mobility. But mobility within the caste groups was thought to be impossible as the caste status is ascribed in nature. It is due to the nature of social and cultural change that M. N Srinivas found examples of caste mobility in India. This process of caste mobility was explained by Srinivas as-Sanskritization. Sanskritization denotes such a change where the lower caste members try to change their caste status by imitating the practices followed by the upper caste members over a period of time. The lower caste members made the practices of the upper caste members as a way of life. They mainly used to imitate the practices of the dwija born caste or the twice born caste. This paved the way for social mobility among the lower caste members as there used to be a positional change of status in the society. The concept of Sanskritization was highlighted by Srinivas in

87%**MATCHING BLOCK 39/104****W**

his book named- "Religion and Society among the Coorgs of South India".

He found in his study in Mysore that the lower caste members tried to uplift their caste position by following the practices of the upper caste members over a period of time. This brought about a cultural change among the lower caste members thereby raising their status in the caste hierarchy. As they followed the ideals of the Brahmins to bring about a change in their caste status, Srinivas initially termed this behaviour as-Brahminization. Scholars criticized this use of the term Brahminization, due to which Srinivas

NSOU CC-SO-02 106 changed it to Sanskritization. The term Brahminization was criticized due to several reason- i) Brahminization was a narrower term than Sanskritization. There are divisions even within the category of Brahmin; therefore, the use of the Brahminization would have confused that which Brahmin groups were being referred to. ii) Many lower caste members followed the ideals of their immediate upper caste members (who may not be Brahmins) in order to change their social status. For example, few low caste members in Mysore followed the Lingayat's way of life. The Lingayats were not Brahmins. Thus, due to these reasons, Srinivas dropped the Brahminization and instead used the term Sanskritization to denote this pattern of cultural mobility within the caste groups. Therefore,

M. N

Srinivas

defined Sanskritization

87%**MATCHING BLOCK 40/104****W**

as-"a process by which a lower caste or tribe or any other group changes its customs, rituals, ideology and way of life in the direction of a

higher or more often twice-born caste". 8.2

Features of Sanskritization The process of Sanskritization has the following set of characteristics:- i) Sanskritization is the process of imitating the upper castes so that they can bring about a change in their cultural and social status. The lower caste members used to suffer from various kinds of religious and social disabilities. They were marginalized from the other members of the society. It is due to this reason that they started to practice Sanskritization. ii) Sanskritization goes hand in hand with the economic and political domination of the local dominant castes. Dominant castes were those groups who had economic, political and numeric power to dominate the other members of the society. If a lower caste has these powers, then despite them being members of the lower caste, they used to dominate the other higher caste members of the society. So, on most occasions, the lower caste members followed the practices of the dominant caste in order to uplift their social status. iii) Sanskritization also occurred among those groups who were economically and politically well off but lacked the ritual ranking in the society. Thus, NSOU CC-SO-02 107 in order to claim their high position, they used to imitate the practices of the upper caste members. This usually led them to have a higher acquisition of social power. iv) Sanskritization denotes a change in the social position of a lower caste group in the society. It does not denote a change in the hierarchical or structural position of a caste group. The lower caste group, that imitates the practices of the higher caste group, remains to be a member of the lower caste group. It is a positional change and not a structural change in the caste ladder. v) Economic development is not an essential precondition for Sanskritization to take place. Though on most occasions, development in the spheres of politics, economy, education, leadership leads to Sanskritization among the lower caste groups. But economic development in itself does not lead to Sanskritization of a group in the society. vi) Sanskritization is not only found among the Hindu lower caste groups, but it is also prevalent among the tribes in India. vii) Sanskritization implies the mobility of a group and not one specific individual or family. It is the entire group who witnesses the mobility. viii) The British rule in India has changed the picture behind Sanskritization. Previously, people used to strive for caste based mobility, but after the British rule, people started to focus on vertical mobility based on the class system instead of the caste system. ix) Achieving Sanskritization takes a few generations. Gaining the status of a higher caste group does not happen overnight. It generally takes two or three generations to take place. Sanskritization is a claim that the lower caste members make in the society. On most occasions, it wasn't accepted by the society. Therefore, Sanskritization was an essential factor among the lower caste members to change their social status. They used to follow all the regulations of the higher caste members in order to attain that positional change in the society. They adopted all kinds of sanskritic beliefs, duties and values so that their claim for mobility was accepted by the society.

NSOU CC-SO-02 108 8.3 Models of Sanskritization Sanskritization is an age old practice in India. It is followed by the lower caste members by imitating the practices of the upper caste members. Harold Gould referred to this practice of Sanskritization and claimed that it is basically a challenge that the lower caste groups have taken up to show that they are nothing less than the higher caste groups. It is the result of an age old domination and subjugation that the upper castes used to do upon the lower castes. Sanskritization used to transmit in the society with the help of a few mediums. These were known as the models of Sanskritization:- x) Cultural Model-The ranking of a caste as high or low depends on the cultural features of a caste. Practices such as wearing the sacred thread after the upanayana ceremony, abstaining from alcohol consumption, following endogamy, rejecting widow remarriage, observing all caste based restrictions, worshipping as per the code of law in Hinduism, giving reverence to Hindu mythology are a few parts of a Hindu upper caste culture. It follows several standards of purity and pollution, in order to maintain the sanctity of the Hindu cultural tradition. If any low caste group follows these do's and don'ts then they are believed to be walking on the path of Sanskritization. xi) Varna Model-The caste system follows the Chaturvarna model. There are four main varnas in Hinduism-Brahmins at the apex, followed by Kshatriya, Vaishyas and the Shudras. The lower caste groups were denied from the basic privileges of the society. They were debarred from numerous social and religious intercourses. The Varna system is thus based on the principle of honour and respect. It is due to this reason that each caste group has their own rank in the caste ladder. The wish to achieve this superior status, that the lower caste members follow the principle of Sanskritization. Thus, the varna model implies how the upper caste groups enjoy the elitist position in the society and how by following the sanskritic beliefs and values, one can achieve a positional change in the society, despite being a member of the lower varna. xii) Local Model-In the Indian society the concept of dominant caste is largely prevalent. A person can be referred to be a member of the dominant caste if he or she possesses economic power, political power and numeric power within his group. The lower caste members followed the lifestyle pattern of

NSOU CC-SO-02 109 the local dominant caste so that they can get an uplifted status in the society. They tried to improve their status by following the ideals and behaviours of the dominant caste groups. It can be said that, Sanskritization is a generation old process. It is the only way by which the lower caste members can achieve caste based mobility in the society. 8.4 Factors Promoting Sanskritization The process of Sanskritization was made popular in India due to the fact that it acted as a kind of social mobility by which the status of the lower caste members got uplifted once they were completely sanskritized. This process of Sanskritization did not occur overnight. Several factors have promoted the concept of Sanskritization in India. A few such factors are noted below- Firstly, developed means of communication led to the spread of Sanskritization. People in the remotest part of the country got to know about this process of social mobility. They thereby applied this process in their day to day lives in order to be sanskritized in the process. Secondly, spread of literacy. As people started to become educated, they understood the process of Sanskritization and the benefits attached with it. They started to imitate the lifestyles of the upper caste members in such a way that after two or three generations, they were referred to be as the members from the high caste groups. In case of following the Brahmin way of life, education helped the lower caste people to read the Shastras and follow them in accordance with the Brahmins. Though the lower caste members were debarred from chanting the Mantras from the Veda but they were allowed to follow the social practices of the upper caste groups. Though, the factors promoting Sanskritization are not mentioned in the Hindu law books but the changes in the social structure and the attitude of the people towards it have led to the growing awareness about this concept. It is one gateway for the people to raise their social status so that the long lived discrimination and marginalization comes to a halt for a specific period of time. 8.5 Factors Affecting Sanskritization Sanskritization denotes caste mobility since time unknown. There are several social factors which affect the process of Sanskritization. A few such factors are

NSOU CC-SO-02 110 as follows- i) Industrialization-this has promoted class based division in the society. People started to favor the achieved status more than the ascribed status of caste. The members of the dominant caste too started getting involved with the forces of industrialization. Thus, people started to fight over class division than one's caste division. This led to the formation of the concept of occupational mobility than caste based mobility. ii) Improved means of communication-Increasing interaction among the people led to the wide exchange of ideas which thereby made the people to focus on class based mobility than caste based mobility. Fight for gaining a better ritual ranking was taken over by vertical mobility on economic level. iii) Spread of education-Education opened the inner eye of the people. They realized that fight to gain a better status in the caste hierarchy is futile, rather better class position can give them an international standard. The new generations realized that caste mobility was not the call of the day. iv) Urbanization-Along with industrialization, urbanization is one such factor which affected the spread of Sanskritization in the modern society. Urbanization implied the movement of the people from rural areas to upper areas in search of better livelihood opportunities. In the urban society, people get influenced by western ideals and values, which thereby leads them to forget about caste based hierarchy. Urbanization influences people to strive for class based mobility rather than caste based mobility in the social system. v) Influence of Westernization-After the advent of the British rule in India, Indians were influenced by the pattern of Westernization. Srinivas defined westernization as "

100%

MATCHING BLOCK 41/104

W

the changes in technology, institutions, ideology and values of a non-western society as a result of cultural contact with the western society for a long period".

This contact with the western thought pattern, affected the rigidity of the Indian caste system. People realized the importance of class based social ranking more than caste based social rankings. Therefore, all these aforementioned factors affected the functioning of Sanskritization in India. As the caste system is unique to India, thereby, majority of the Hindu groups in rural and urban areas claimed to go with the flow and start adopting western principles to change their life. The westerners have become the new reference group NSOU CC-SO-02 111 of the Indians. It is no longer the Brahmins or the dominant caste that people largely want to imitate to gain a higher social status. Though, the percentage is much smaller in number but change towards that path has already begun. 8.6 Merits of Sanskritization Several scholars have put forward their own opinion on the merits and demerits of Sanskritization in the society. Eminent figures like Swami Vivekananda propagated the merits of the caste system, similarly there are a few merits in relation to the concept of Sanskritization in India. They are: i) The idea of Sanskritization is not restricted to the Brahmins only. It can include any higher caste groups. ii) There is no harm attached to the concept of Sanskritization. It is a way of life. It is a way by which the lower caste groups imitate the daily life practices of the upper caste groups, which involves no harm to anybody. iii) The only agenda behind following the concept of Sanskritization is to achieve a higher social status. It assimilates the people as one large social group. iv) The idea of Sanskritization is one way of protesting against the traditional caste based division in the society. Traditionally, the higher and lower caste groups were segregated from one another. The higher castes used to dominate the lower caste members in various ways. Sanskritization makes the lower caste members to imitate the practices of the upper caste members by which this traditional segregation comes to a halt. v) M.N Srinivas pointed out that Sanskritization reduces the widening gap between the secular and ritual ranking. Due to the rising concept of the dominant caste secular ranking took over the concept of ritual ranking. For example, if a lower caste member becomes the dominant caste of the area in terms of gaining political, economical and numerical power, then the ritual ranking ceases to exist in that area and secular ranking takes it over. Therefore, for every concept that exists in the society, there also exist its hidden reasons to spread among the people. Without certain merits of a system, the concept would not have existed at the first place.

NSOU CC-SO-02 112 8.7 The Critique of Sanskritization M. N Srinivas introduced the concept of Sanskritization in the academic world, which was regarded as one of the most significant contribution in this field. He wanted to point out how mobility within the caste system is creating a social change in the rural areas. Apart from the merits of the concept, there are several demerits that have been pointed out by various scholars. A few such criticisms are noted below: i) J. F. Stall claimed that there is confusion with the term 'Sanskritization', as its relation with Sanskrit is not quite clear. ii) Yogendra Singh pointed out that Sanskritization has failed to be an umbrella concept that is, it did not take into account the aspects related to cultural change both in the past and in the present. He also opined that this concept neglects the non-sanskritic traditions. iii) Sanskritization was not a universal concept in India. Not all caste groups followed the concept of Sanskritization. In few parts of India, people imitated members from other religions who used to hold power and authority in the society. This was not mentioned by Srinivas in his theory. iv) In most of the cases, people followed the concept of Sanskritization as a way of protesting against the socio-economic deprivations by the upper caste members. Sanskritization was equivalent to a challenge to fight against the oppression of the lower caste members against the upper caste members. This basically leads to inter-caste hostility in the society. v) Sanskritization highlights hierarchy in the society. As if, the lower caste groups must imitate the upper caste groups to create a mark in the society. It looks upon the cultural practices of the lower caste groups in a negative light. Therefore, there were a few fallacies in Srinivas' concept of Sanskritization. He failed to point out whether it is the Sanskritized families who face caste mobility or the entire lower caste group attains the mobility. Besides all the criticism leveled against the concept, it can be rightly said that no one else before Srinivas, highlighted the concept of caste-based mobility among the people. The Indian caste system is thought to be a rigid one where no sign of mobility was noticed whatsoever. NSOU CC-SO-02 113 Srinivas made an effort to bring out this concept and discuss it within the sociological parlance. 8.8 Summary It can be concluded by mentioning that M. N Srinivas tried to explain the concept of cultural change in the caste lines. He wanted to point out that how this concept of caste based mobility is bringing a change in the Indian social structure. New forces of westernization, modernization are also affecting the Indian cultural pattern due to the advent of the British rule in India. But these new forces of social change did not change the overall traditional concept of the caste system. The rigidity of the system must have lessened due to ongoing social changes, but the system per se still continues to exist in the society. Did you know? a) Caste has an impact on the economic mobility of India. It is due to the reason that occupational and spatial mobility has largely been the result of the Indian caste system. b) In most parts of northern India, especially in places like Punjab, Islamic traditions were considered to be the basis for cultural imitation. People did not follow the upper caste members to Sanskritize. c) D N Majumdar notes in his study of the Mohan village in Uttar Pradesh that if a lower caste member such as a cobbler wears a tilak or bibhuti on his forehead and wears a dhoti, then he is not regarded as a member from the higher caste in this village. Thus, Sanskritization is not universal in India. 8.9 Model Questions A. Answer briefly. (5 Marks) i) How do you differentiate between Sanskritization and Brahminization? ii) Give two examples of Sanskritization in the Indian Village System. iii) Give a critical review of the caste system in India? iv) Define Sanskritization. NSOU CC-SO-02 114 v) What is Westernization? vi) List down a few factors which led to the promotion of Sanskritization in the Indian society. B. Answer in detail. (10 Marks) i) Write a note on the concept of Sanskritization with relevant examples. ii) Point out the features of Sanskritization. iii) List the advantages and disadvantages of the concept of Sanskritization, with proper examples. 8.10 References and Suggested Readings Ahuja, R 1993. NSOU CC-SO-02 118 The nature and purpose of land reform in India. Impact of globalization on agriculture. 9.1 Introduction India is one of the most complex countries socially. It has a continuity of history and culture which extends back to millennium. India next to China is the world's most populous country. According to the 1951 Census, it has a population of 35,68,29,485 humans. (Desai,2000.pp.106). Majority of the Indian population lives in rural areas. Out of 35.7 crores of people living in India, 29.5 crores or 82.7% lives in Indian villages. Agriculture is the main occupation of these people. There studying the Agrarian class structure become significant from Sociological point of view. Without understanding their structure, culture and lifestyle the total overview of the country will remain unclear. The rural class structure reveals that how the agrarian India has founded on a balanced self sufficient village economy on the basis of equilibrium and artisan industry. These functions with the help of the village panchayat, caste councils and joint family till the advent of the British rule. The British rule has brought about many qualitative changes and transformations in the rural setting. A.R.Desai points out that the available land per capita is only 9 acres. This highlights an enormous pressure of population on land. New class of creditors and traders were in a rise in the underdeveloped village economy which was changing from the production of subsistence to that of market. However after the British rule structure underwent enormous changes. A.R. Desai gives a picture of the rural class structure after the withdrawal of the British rule from the country. The structure is as follows - Agricultural Landowners - 22.2% Agricultural Tenants - 27.2% Agricultural Labourers - 30.4% Non-Agriculturist - 20.2% (Desai, 2000.)

9.2 Indian Agrarian Structure India is a land of soils. Majority of the people are associated with it. Daniel Thorner aimed to describe and analyse the network of relationship among the various groups of persons who draw their livelihood from the soil. The consequences of such patterns of relationships are important for the analysis of the economy of the country as a whole. Thorner has attempted to reduce the social arrangements on land in different parts of India, into well-defined, precise categories on the basis of three following criterions. 1. Type of income obtained from soil - a)

39%

MATCHING BLOCK 43/104

W

Rent b) Fruits of own income c) Wages. 2. Nature of Rights - a) Proprietary or Ownership b) Tenancy c) No right at all. 3. The extent of field work actually performed

a) Absentee, who does not

work at all. b) Those who perform partial work. c) Total work done

by actual cultivators with family labourers. d) Where work is done entirely for others to earn wages. (Thorner, 1956.) Dhangare has put forward Thorner's model of the Agrarian class structure in India, as follows- I. Malik -

83%

MATCHING BLOCK 46/104

W

whose income is derived primarily from property rights in the soil and those common interests is to keep the level of rent up while keeping the wage level

low. The rent is collected from the tenants, subtenants and the share croppers. Introduction: India is one of the most complex countries socially. It has a continuity of history and culture which extends back to millennium. India next to China is the world's most populous country. According to the 1951 Census, it has a population of 35,68,29,485 humans. (Desai,2000.pp.106). Majority of the Indian population lives in rural areas. Out of 35.7 crores of people living in India, 29.5 crores or 82.7 % lives in Indian villages. Agriculture is the main occupation of these people. There studying the Agrarian class structure become significant from Sociological point of view. Without understanding their structure, culture and lifestyle the total overview of the country will remain unclear. The rural class structure reveals that how the agrarian India has founded on a balanced self sufficient village economy on the basis of equilibrium and artisan industry. These functions with the help of the village panchayat, caste councils and joint family till the advent of the British rule. The British rule has brought about many qualitative changes and transformations in the rural setting. A.R.Desai points out that the available land per capita is only 9 acres. This highlights an enormous pressure of population on land. New class of creditors and traders were in a rise in the underdeveloped village economy which was changing from the production of subsistence to that of market. However after the British rule structure underwent enormous changes. A.R. Desai gives a picture of the rural class structure after the withdrawal of the British rule from the country. The structure is as follows - Agricultural Landowners - 22.2% Agricultural Tenants - 27.2% Agricultural Labourers - 30.4% a) Big Landlords - holds large tracts of land extending over several villages. They are generally absentee owners or renters with absolutely no interest to

83%

MATCHING BLOCK 47/104

W

land management or improvement. b) Rich Landlords - proprietors with considerable holdings but usually in same

villages. They don't perform any field work but engage in supervising cultivation and takes personal interest in the improvement or management of land when and if necessary. II. Kisans - working peasants, having property interest in the land but no actual rights as those of their maliks.

100%

MATCHING BLOCK 48/104

W

a) Small Landowners - having holdings sufficient to support a family,

who cultivate land with family labour and who do not either employ outside labour (except in harvest) or receive rent.

NSOU CC-SO-02 121 b) Substantial Tenants - tenants holding leases under either Ia or Ib tenure rights fairly secure, usually above sufficient level. The rest is IIa. III. Mazdurs - this group generally belongs to those whose earnings are primarily from working on others' land or others' plots. a) Poor Tenants - having tenancy rights but less secure, holdings too small to suffice for a family maintenance and income derived from land often less than that earned by wage labourers. b) Share Croppers - either tenant at will leases without security, cultivating land for others on share cropping basis and having least agricultural implements. c) Landless Labourers - those without land. (Edi.Gupta.2012.PP 271-272). 9.3 Nature of the Agrarian Classes in India Roughly there are three principal groups who are termed as proprietors, working peasants and labourers or popularly the malik, kisan and mazdur. Daniel Thorner has discussed the nature of each of these classes and their sub groups. Malik - Malik or proprietors are those groups of people whose agricultural income are derived primarily from property rights from the soil. The family members may have other form of income but the main source of income would be share of produce from agriculture. Typically this share is generated from rent. Usually the rent is in the form of money but it may also be in the form of kind if the tenants are on crop sharing basis. The proprietor always does not rent his land he may also sometimes hire labourers to work for him. He may also sometimes hire a manager to look at the labourers or do by himself. However he will enjoy the status of being a malik if the rent collected from land is more than that of what he himself produce. The malik generally enjoys a high property right in the soil however this may always not be the case. He may hold directly under the government or may be a superior tenant. Within this group there are two sub groups - (i) Large Absentee Landlords - who typically have holdings in more than one village. (ii) Smaller Proprietor - who resides personally in the village, in which they hold land. Socially, the resident maliks and money lenders form a small and quite distinctive

NSOU CC-SO-02 122 group, within the village. They typically belong to the upper class structure, mainly Brahmins and Thakurs. They live in big houses, wear fine clothes and eat better than the entire villagers. They use all luxuries which are beyond the compass of the debt ridden Kisans. 9.4. Land Reform in India As the Indian Agrarian Structure is based on land, it is important to have a look at the major land reforms, brought in by the British rule as it has an enormous impact on the present Agrarian structure of the country. Land reforms are often connected with re-distribution of agricultural land and hence it is related with agrarian reforms too. In India, there was a practice of land holdings from historic times and it was distributed in a highly unequal manner and have always been used as a source of social power. To get secure access to land for the poor and landless, policies of land reform were implemented to benefit poorer section of society since independence. After that a number of land reforms have been done by the government such as abolition of 'Zamindari' or middlemen as revenue collectors, imposing ceiling on landholdings and awarding of the surplus land's rights to landless, and tenancy reforms (Mearns, 1998). Land reform is described as redistribution of land from the rich to the poor. More broadly, it comprises of regulation of ownership, operation, leasing, sales, and inheritance of land (indeed, the redistribution of land itself requires legal changes). In an agricultural economy such as India with great dearth, and an unequal distribution, of land, coupled with a large mass of the rural population below the poverty line, there are enthralling financial and political opinions for land reform. Purpose of land reforms is efficient use of scarce land resource, redistributing agricultural land in favour of the less privileged class in general & cultivating class in particular. 9.4.1. Historical Review of Land Reforms in India: Land program in post- Independence India has evolved through different phases. During the Mughal period, before the arrival of the British there were numerous changes in the system of land taxation or revenue. Peasants continued to enjoy customary rights over land they occupied and generally could not be evicted unless they failed to pay the required land revenue (land tax) to the state. The task of collecting land revenue was assigned to a class of agents called zamindars (Bhaumik, 1993).

NSOU CC-SO-02 123 When the East India Company (EIC) established in the Seventeenth Century, the agricultural structure underwent fundamental change. The EIC first purchased the right to receive the collected land revenue and later, under the Permanent Settlement introduced in 1793, declared the Zamindars to be proprietors of land in exchange for the payment of land revenue fixed in perpetuity. Zamindars, or those to whom they sold their proprietary rights, typically delegated revenue collection to a series of middlemen. The increasing layers of intermediaries meant that there was considerable increase in rent extracted from the tillers and failure to pay this increased amount resulted in large-scale evictions, widespread disturbance, and declining agricultural production (Bhaumik, 1993). The British sought to stabilize the situation through legislated tenancy reform. The Bengal Rent Act of 1859 placed restrictions on the power of landlords' to increase rent or evict tenants. However, the Act only protected fixed-rent tenants and did not protect bargadars or agricultural labourers. But it only protected those fixed-rent tenants who could prove they had cultivated the land for 12 consecutive years. Constant cultivation was difficult to prove due to poor records and the Act resulted in an increase in evictions by Zamindars to prevent tenants from possessing land for the required time period (Bhaumik, 1993). The 1885 Bengal Tenancy Act also sought to protect long-standing tenants, and was similarly ineffective. During this period, another form of landholder emerged in Bengal. The Jotedars were a rich class of peasants who reclaimed and gained control of large quantities of uncultivated forests and wetlands outside the territory governed by the Permanent Settlement (Bhaumik, 1993). The Jotedars refined some of this land through the direct supervision of hired labour or servants. Nevertheless, the bulk of the Jotedars' land, like much of the land in Bengal, was cultivated by Bargadars. Rural tensions over the dilemma of Bargadars were common in the decades prior to and after Independence. In the 1940s, the Tebhaga movement called for a smaller crop share payment and also created the slogan, "He who tills the land, owns the land." The movement is given credit for shaping post-Independence land reform legislation in West Bengal (Datta, 1988). At the time of Independence, this matter was of great significance. In the decades following independence India passed a significant body of land reform legislation. The 1949 Constitution left the adoption and implementation of land and tenancy reforms to state governments. This led to a lot of dissimilarity in the implementation of these reforms across

NSOU CC-SO-02 124 states and over time. After India's independence, the government took major step to eradicate the systems of zamindaris and Jagirdari, to remove intermediaries between state and peasant. This was the first legislature taken by almost all the states called as Abolition of Jamindari / Jagirdari systems Act. 9.4.2 The Main Objectives of the Land Reforms: These are as follows - 1. To make redistribution of Land to make a socialistic pattern of society. Such an effort will reduce the inequalities in ownership of land. 2. To ensure land ceiling and take away the surplus land to be distributed among the small and marginal farmers. 3. To legitimize tenancy with the ceiling limit. 4. To register all the tenancy with the village Panchayats. 5. To establish relation between tenancy and ceiling. 6. To remove rural poverty. 7. Proliferating socialist development to lessen social inequality 8. Empowerment of women in the traditionally male driven society. 9. To increase productivity of agriculture. 10. To see that everyone can have a right on a piece of land. 11. Protection of tribal by not allowing outsiders to take their land. Land reform legislation in India is categorized in to four main sections that include abolition of intermediaries who were rent collectors under the pre-Independence land revenue system, tenancy regulation that attempts to improve the contractual terms faced by tenants, including crop shares and security of tenure, a ceiling on landholdings with a view to redistributing surplus land to the landless and lastly, attempts to consolidate disparate landholdings. Abolition of intermediaries is generally established to be effective land reforms that has been relatively successful. The record in terms of the other components is mixed and varies across states and over time. Landowners naturally resisted the implementation of these reforms by directly using their political influence and also

NSOU CC-SO-02 125 by using various methods of evasion and coercion, which included registering their own land under names of different relatives to bypass the ceiling, and shuffling tenants around different plots of land, so that they would not acquire incumbency rights as stipulated in the tenancy law. The success of land reform was driven by the political will of particular state administrations, the prominent achievers being the left-wing administrations in Kerala and West Bengal. a) Tenancy Systems of Land: At the time of independence, there existed many types of proprietary land tenures in the country. 1. Ryotwari: It was started in Madras since 1772 and was later extended to other states. Under this system, the responsibility of paying land revenue to the Government was of the cultivator himself and there was no intermediary between him and the state. The Ryot had full right regarding sale, transfer and leasing of land and could not be evicted from the land as long as he pays the land revenue. But the settlement of land revenue under Ryotwari system was done on temporary basis and was periodic after 20, 30 or 40 years. It was extended to Bombay Presidency. 2. Mahalwari: This system was initiated by William Bentinck in Agra and Oudh and was later extended to Madhya Pradesh and Punjab. Under this system, the village communities held the village lands commonly and it was joint responsibility of these communities to make payments of the land revenue. The land ownership is held as joint ownership with the village body. The land can be cultivated by tenants who can pay cash / kind / share. 3. Zamindari: Lord Cornwallis gave birth to Zamindari system in India. He introduced this system for the first time in 1793 in West Bengal and was later adopted in other states as well. Under this system, the land was held by a person who was responsible for the payment of land revenue. They could obtain the land mostly free of charge from the government during the British rule and it is called estate. Landlords never cultivated the land they owned and rented them out to the cultivators. The amount of land revenue may either be fixed once one for all when it was called permanent settlement or settlement with regard to land revenue may only be temporary and

NSOU CC-SO-02 126 may, therefore, be revised after every 30-40 years, as the practice may be. The Zamindari system is known as absentee landlordism. Under this system the whole village was under one landlord. The persons interested can work in the zamindar's land as tenant / labourer based on the agreement with the zamindar. The zamindari system was known to be more exploitive, as the zamindar used to fix / hike the prices of land according to his desire. 4. Jagirdari: It is similar to zamindari system. The jagirdar is powered to control the unproductive masses of village by engaging them in agricultural activities. Because land is controlled by state in India and the relationship between production and land tenure varies from state to state, the national policy recommendations resulted in differing tenancy reform laws in each state. Tenancy is completely banned in some states but completely free in others. Punjab and Haryana have not forbidden tenancy whereas Karnataka has a near complete ban on tenancy. Some states have discussed ownership rights on tenant cultivators except for sharecroppers, whereas West Bengal chose to provide owner- like rights only to the sharecroppers. Tenancy reforms may have indirect effects in the form of reduced tenancy shares if poorly implemented. Most tenancy reform laws also contained provisions concerning the ability of tenants to surrender the land back to the landlord voluntarily. These provisions were used by landlords to wane the impact of the laws. In most states the surrender of land falls under the jurisdiction of the revenue authorities. 9.4.3 Impact of Land Reform in India: Following are the outcomes of Land Reforms in India. 1. Abolition of Zamindars and Jagirdars: The powerful Zamindars and Jagirdars have become nonexistent. The abolition of intermediaries has stopped exploitation. Transfer of land to peasants from intermediaries has reduced disparities. The new proprietorship has given scope for innovation in Land Reforms. The ex-jagirdars and ex-zamindars have engaged themselves actively in other work thus contributing for National Growth.

NSOU CC-SO-02 127 The abolishment of these systems has increased to the new land owners thus adding revenue to the state governments. 2. Land Ceiling: Land is a source of Income in rural India and it provides employment opportunities. Therefore it is important for the marginal farmers, agricultural labourers, and small farmers. The concept 'ceiling on land holdings' denotes to the legally stipulated maximum size beyond which no individual farmer or farm household can hold any land. The objective of such ceiling is to promote economic growth with social justice. Land Ceiling should be imposed on all kinds of lands such as Fallow, Uncultivable, irrigated and Cultivable land. All the mentioned are inclusive of ceiling Act. The ceiling act varies from state to state on ceiling on two crops a year land. However in most of the places the ceiling is 18 Acres. 3. Land possession and social power: It is observed that the land is not only the source of production but also for generating power in the community. In the Indian system, the land is often transferred from one generation to another generation. However all this lack the documentation of possession of land. In this framework, the government had made it mandatory to register all tenancy arrangements. To summarize, Land reform is the major step of government to assist people living under adverse conditions. It is basically redistribution of land from those who have excess of land to those who do not possess with the objective of increasing the income and bargaining power of the rural poor. The purpose of land reform is to help weaker section of society and do justice in land distribution. Government land policies are implemented to make more rational use of the scarce land resources by affecting conditions of holdings, imposing ceilings and grounds on holdings so that cultivation can be done in the most economical manner. 9.5 Globalisation and Crisis in Indian Agriculture The structural adjustment programme and WTO trade regime in the decade of the 90s, have brought about a new crisis of rural livelihoods. The new economic regime, in a way, has taken us back to the colonial era, where the process of surplus accumulation and utilisation is once again to be mediated by metropolitan capital. a) Withdrawal of State : The state withdrew from its earlier declared role of intervening in the market processes to protect economic space of domestic producers

NSOU CC-SO-02 128 and among them that of small producers and weaker sections. The elaborate structure of controls on domestic and international trade and on investment has been dismantled rapidly. The Essential Commodity Act, Agricultural Produce Marketing Act and Small Scale Industry Reservation Act, restricting movement, storage, marketing and processing of agricultural produce have been modified. The multinationals and big domestic units are now allowed to enter into these activities. Exim policy in the post-liberalisation period has removed import controls on agricultural commodities rapidly - sometimes much ahead of WTO stipulated phase out period. Trade liberalisation has taken place in the background of extremely unfavourable global market conditions for primary commodities. The prices of all primary commodities (including wheat and rice) have fallen dramatically since mid 90s. Falling prices of primary products in US dollars (USD per ton.) Commodity 1988 1995 1997 1999 2001 Wheat (US HW) 167.0 216.0 142.0 - 133.0 Rice (US) 265.7 - 439.0 - 291.0 Cotton (US cents per lb) 63.5 98.2 77.5 - 49.1 Groundnut Oil 590.0 991.0 1010.0 788.0 - Palm Oil 437.0 626.0 93.5 74.7 - Soya bean Oil 464.0 479.0 625.0 71.4 - Soya bean Seeds 297.0 273.0 262.0 - 178.0 Source: Utna Patnaik Agrarian Crisis and Global Deflationism Social Scientist Jan.-Feb. 2002 The infrastructure facilities provided by the government are on the decline. A number of minor and medium size irrigation network projects are left incomplete, not because they are controversial but because of paucity of funds. The last decade saw the privatisation of power sector and the agenda for the coming decade is to privatise water. The ramifications for Indian agriculture will be wide spread. It may shatter the viability of even medium level farmers. The changed priority of the banking sector has slashed down the direct advances to agriculture made by commercial as well as cooperative banks. Schemes to facilitate

NSOU CC-SO-02 129 the credit needs of small and marginal farmers are completely eroded. This has led to an aggressive growth of informal credit markets. Apart from traditional moneylenders, traders of new technology, inputs and equipments have entered these markets. Fertilizer subsidies have been cut down in annual budget exercises and the government has handed over the task of providing seeds to the multinationals and private companies. Finally, in the current parlance the term 'land reform' is being used for advocating removal of land ceiling and tenancy regulations. This would allow the corporate sector to enter into direct farm operations. The big farmers would be able to negotiate profitable deals with the corporate sector and MNCs. Some states like Maharashtra and Karnataka have made significant moves in this direction. b) Entrenchment of Corporate Sector (MNCs) into Indian Agriculture The most fundamental shift in the structure of international political economy of food has been the emergence of transnational agro-food corporations, attempting to organise the production and consumption in national economics geared to their investment and marketing goals. In India, the corporate sector has been prevented from entering direct farm production because of the land ceiling laws. The low ceiling limits do not allow scale intensive farming in which companies are interested. Only the plantation sector has been exempted from the land ceiling regulations. Capitalist farms controlled by foreign companies have existed in this sector since before independence. The average size of large farms in Assam is 88.80 hectares and in Kerala 59.33 hectares. Under the new definition of 'land reform' there is an increasing pressure to allow companies to undertake direct farm production especially in the areas of horticulture, floriculture and agro-forestry. The demand is to substantially extend the land ceiling limit or to remove it altogether. As already mentioned many state governments are prepared to concede this demand. Maharashtra government has already taken the initiative to grant exemption in landholding act to trusts, companies and cooperatives for horticulture purposes, Fallow, waste or khar lands can be purchased by such entities and land under cultivation can be taken on lease. The farm size can be large as 1000 acres. In the meanwhile companies have been acquiring vast tracts of land in Orissa and Southern states for aquaculture. A large number of small and marginal farmers

NSOU CC-SO-02 130 have been uprooted in this process. Several companies are entering agro forestry (teak-planting) circumventing the land ceiling regulations. They buy the land and allot it to individuals on payment of substantial sums and in turn promise them attractive returns. However, the design of agribusiness to control the surplus of the farm sector is far more ambitious than what can be achieved through direct farm cultivation. Agribusiness is fast acquiring control on the input and output flows of the farm sector with the acquiescence of Indian state. The design is to alter the land use pattern geared to their profit interests. The agrarian transition under the state led industrialisation of Indian economy reached an impasse. Concentration of resources both in agriculture and industry led to an industrial growth where space for labour was scarce. Agriculture obliged by containing the unskilled and marginalised mass of workforce within itself. In the 21st century the neo-liberal global regime has brought about inexorable changes world over. The global circuits of production, exchange and finance have qualitatively changed the functioning of national economies. The agrarian question in India is now being resolved in its own ruthless manner by the globalisation process. The increasing control of agribusiness over input and output flows of agriculture will necessarily result in a massive debouching workforce from this sector. Such a trend is already discernable. The workforce, debouched from agriculture, just does not have space outside. Manufacturing and service sector together are quite incapable of accommodating it. The situation admits no other solution but a radical restructuring of the entire production base. For those of us, who owe allegiance to an equitable society ensuring dignified human existence, the 'agrarian question' can then be looked at only in its first layer of meaning - namely to seek the support of uprooted peasantry for overthrowing the existing regime. The trend of agrarian unrest in India can be traced to the period of British rule when the nationalist mass movements took place on a fairly large scale in 1920- 22 and 1930-34. The movement in the 1930s was the result of the economic depression caused by World Weir II which worsened the conditions of the peasants in India. The

NSOU CC-SO-02 131 peasants and workers were actively involved in the struggle for independence during the Civil Disobedience Movement and also due to the emergence of the Left. The first All-India Kisan Sabha was set up in 1936 under the leadership of Swami Sahajanand Saraswati. The period between 1945-47 saw a steep increase in agrarian movements mainly due to the expectations from independence and the dreams of changes in agrarian relations. During the post-independence period, agrarian unrest of various types have taken place, ranging from the legendary Telengana movement and the PEPSU tenant movement to the Naxalite movement. Other lesser known struggles are the Kharwar tribal movement in Madhya Pradesh and Bihar during 1957-58, the Bhil movement in Dhulia (Maharashtra) during 1967-75, the Warlis movement under the leadership of Kashtakad Sangathana headed by Marxist Jesuit Pradeep Prabhu since 1978. The Communist Party of India set up the Bharatiya Khet Mazdoor Union in 1968. 9.6 Important Peasant Movements in India Some of the well-known peasant movements in post-independent India are discussed below. 9.6.1 Telengana Movement: The Telengana peasant movement was strongly associated with the emergence of Communists in Andhra Pradesh in 1942 after the ruling British government lifted the ban on the Communist Party of India because of its pro-war stand. The cause of unrest was rooted in the feudal oppression which the peasants had to suffer at the hands of jagirdars and deshmukhs. The Communists organised the farmers against the British policy of forced grain levy collection. Gradually, the movement started spreading all over Telengana. The Communists achieved greater success when the Nizam of Hyderabad endorsed the decision to stay out of the Indian Union; the Communists organised the anti- Nizam and pro-integration movement in the Warangal, Nalgonda and Khammam districts. It was in this period that the lands taken over by landlords in lieu of debt repayments, during the economic depression of the thirties, were redistributed among farmers.

NSOU CC-SO-02 132 The uncultivated land and forests owned by the government were also distributed to the landless. Minimum wages were increased, and measures were taken against social ills like wife-beating. Even after the success of the armed intervention by the Nehru government against the Nizam, the Communists did not give up their anti- government stance. A bitter confrontation took place between the peasants led by the Communists and the government in which the peasants were subjugated. However, the government responded to the issues raised by the movement. The Jagirdari Abolition Regulation was abandoned in 1949 and the Hyderabad Tenancy and Agricultural Lands Act was passed in 1950. More than 6,00,000 tenants occupying over one-quarter of the agricultural land were declared 'protected' tenants with the right to purchase land on easy conditions. As a consequence of the movement, land reforms were well implemented in the Telengana region.

9.6.2 Patiala Muzara Movement: The Muzara movement had its origin in the late 19th century, when the princely state of Patiala suffered oppression by the Maharaja of Patiala. The biswedars (local landlords) enjoyed proprietary rights on land but the tenants felt these landlords had no legitimate right to the land. The grievance of the tenant found an outlet in the movements such as the Akali and Praja Mandal movements during the 1920s. During the 1930s, a somewhat liberal atmosphere enabled the Congress party to gain hold in many provinces. By then, the Communists were actively involved with the movement from British-ruled Punjab and soon they became the nerve centre of the Muzara movement. By the end of 1948, small armed groups, each comprising 30 to 40 people, used to protect muzaras against the onslaught of the landlords. With the formation of the Congress ministry in 1951, there was a fresh wave of political resurgence. The Agrarian Reforms Enquiry Committee was set up to recommend measures to tackle the issue. The PEPSU Tenancy (Temporary Provision) Act was formulated in 1952 which sought to protect tenants against eviction. After the fall of Rarewala's Congress ministry, President's Rule was imposed. The President issued the PEPSU Occupancy Tenants (Vesting of Proprietary Rights) Act in 1953. The Act enabled the peasants to become owners provided they paid compensation twelve times the land revenue. The Communists condemned the legislation since the lands owned by biswedars were not confiscated without compensation. The Communists, however, gradually lost their complete hold over the peasants.

9.6.3 Naxalbari Movement of West Bengal: After the formation of the first non-Congress United Front government in West Bengal in 1967, the government decided to distribute surplus land among the landless peasants. The initiative raised enthusiasm among the poor whereas the middle and small land owners were not happy that their land would be distributed among sharecroppers. But soon the ruling coalition faced some legal constraints in the grant of pattas, verification of claims, etc. The Communists belonging to Darjeeling district in North Bengal had been organising sharecroppers and tea estate labourers-mostly Santhals, Oraons and Rajbanshi tribals-since the early 1950s. They now argued that land reform was not possible through legal means, so they believed in seizing land through violent means. All the villages of Naxalbari came under their umbrella in 1967, and about 20,000 peasants became full time activists under the leadership of Charu Majumdar. Most of the leaders of the movement belonged to dissident groups differing from the ruling Communists. The differences between Communists and Naxalites (as they came to be known) grew at an alarming pace. Clashes took place between the Naxalite elements and the police. The Communist Party Marxist (CPM) left the ruling coalition and pursued a mediator's role by endorsing the Naxalites and persuading the UF government for an amicable settlement. However, continued police repression led to the end of the Naxalbari movement; all the leaders were either shot down in encounters or jailed.

9.6.4 New Farmers' Movement: A fresh farmers' movement started in 1980 with road-rail roko in Nasik (Maharashtra) under the leadership of the Shetkari Sangathan led by Sharad Joshi. The immediate demand of the farmers was higher prices for sugarcane and onions. Then came Mahinder Singh Tikait, a Jat leader, who organised lakhs of villagers and compelled the then chief minister of Uttar Pradesh to accept their demand for reducing electricity charges to the previous level. The movements which have been able to mobilise rural peasants were Vivasayigal

NSOU CC-SO-02 134 Sangam in Tamil Nadu, the Rajya Ryothu Sangha in Karnataka, Kisan Sangh and Khedut Samaj in Gujarat, and the Bharatiya Kisan Union in Uttar Pradesh and Punjab. Most of these peasant movements occurred due to the government policy of paying low agricultural prices for controlling the price of food and raw- materials. As a result the farmers felt victimised in the cause of serving urban interests. The new farmers' movements have attracted media attention on some glaring issues such as remunerative prices for agricultural goods, reduction or elimination of government dues such as electricity charges, canal water charges, interest rate, etc. Indeed, after the Green Revolution, the farmers' movements have become political weapons for securing more power and money. Although these peasant movements are branded as 'new' non-class or supra- class social movements, in reality, these new peasant movements are least interested in societal issues like educational, environmental, or gender-related problems. Most of these 'new' peasant movements have narrow caste-based mobilisation for getting political mileage.

9.7 Summary India is known as an agricultural country since about 70% of its population is involved in different types of farming or related activities. The agrarian class structure is comprised of several classes like landowners, tenants, labourers and non-agriculturists. Of the labourers, a considerable section consisted of bonded labourers and marginal farmers. The Government of India has taken measures to free people from debt-bondage. Land reform has also been undertaken by some state governments. The government of West Bengal had adopted a number of measures to improve the lot of thika tenants and marginal farmers. Post -1990s, globalization has also thrown several challenges at the agrarian system in India.

9.8 Model Questions Write Short Notes on the Following. (5 Marks Each)

1. New farmer's movement.
2. Characteristics and composition of the Malik Kisan and Mazdoor.
3. Globalization and agriculture.
4. Naxalbari movements.
5. Main objectives of land reforms in India.
6. How are peasant movements different from that of the agrarian movements.

Long Questions: (10 Marks Each)

1. Explain the nature of Agrarian class structure of India.
2. Explain the various Indian Agrarian Movements.
3. Explain the nature of land reforms in India and point out its impact on the agrarian class structure of India.
4. Explain Telengana movement as an Agrarian unrest.
5. Explain the impact of globalization on the agrarian class structure of India.

The nature of traditional cities. Trends of urbanization in India and challenges of city life. The issues of rural-urban continuum. 136

NSOU CC-SO-02 137 10.1 Introduction A city is a place which satisfies the needs of the citizens in the best possible way through social and residential arrangements like housing, governing, protecting the society, and division of labor which helps in reaching its goals. Paul Bairoch in his book: *Cities and Economic Development* said that a place can be quantified as a city, in its true sense only when it supports trade systems and opportunities. As a human invention, cities are scarcely 10,000 years old, but as centuries have passed they have become both much larger and far more numerous. (Macionis and Parrillo, 2015). *The Rise of the Cities* : Although scattered cities such as Jericho and Catal Huyuk thrived in the period between 7000 and 4000 B.C.E, it was not until about 3500 B.C.E that urban development accelerated to a point where large numbers of cities flourished. To the east of Mesopotamia, along with Indus River of present day India and Pakistan, was a favourable area where early cities emerged. Trade routes linked the Indus cities with Mesopotamian cities through other outposts, such as Tepe Yahya, midway between the two areas. It is also likely that trading in such products as jade linked this area with Central Asia to the east. (Magee 2005). Excavations have shown the remains of two highly developed cities that were centers of a regional civilization beginning about 2500 B.C.E. Both were prominent in Urban history until about 1500 B.C.E. Mohenjo-Daro was situated on the Indus River about 175 miles from the Arabian Sea, Harappa was about 350 miles further north, on one of Indus River tributaries. Each had a population as high as 40,000 and represented an urban civilisation district in many ways. Unlike other Mesopotamia or Egypt for example Mohenjo Daro does not show evidence of a single, all powerful leader or a pre-occupation with temples and god monuments but it does show evidence of existence "good living". Mohenjo Daro would have seemed familiar to a modern visitor with the same grid run pattern common to most western cities today. Its remarkable structure of mud baked bricks and burnt wood framing were up to two- storied high and included an elaborate, well built bath area with a layer of natural tar to keep it from leaking. Remarkably it even had a building with an underground furnace, like the Roman hypocausts for heating bathing. Other city- features were a central market place, a large common well, and a settle or administrative centre that may have included a granary for storage of food surplus.

NSOU CC-SO-02 138 Until the mid 20th century it was commonly thought that Mesopotamia, Egypt and the Indus Valley contain the cities from which all later ones took their pattern. Archaeological research since then however showed otherwise. Apparently cities emerged in many places around the world independent of one another in other regions where this occurred where China and America. 10.3 Indian Towns and Cities While there has been no obvious cultural link between the Indus cities and the contemporary ones, there is some continuity between the Indo-Aryan cities and the present day cities. In the *Vastu Shastra*, The signs of town planning differentiation is made between several kinds of towns according to their main functions such as trade, commerce, manufacturing, administration and military marches (DUTT, 1924, pp.272-85). A Nagara was an ordinary fortified town where inland trade was an important activity, whereas at Pattana was a large commercial port situated on the bank of a river or sea. It was a city of trading castes, the Vaishyas, and was replete with jewels, wealth, silk, perfume and other articles. Drona Mukhi was also a market town lying on the delta of a river or sea shore, frequented by traders. It was also a small marketing centre in the midst of 400 villages. Kheta was a small walled town situated on the plain, near a river or a forest, lying in the midst of villages and having facilities of communication. If a Kheta was combined with local industries such as mining, it was known as Sakhanagara. Kharvata was similar Kheta but was an inland town lying in the midst of above 200 villages. Nee Gama was also a market town but mainly consisting of artisans. It was also a resting place for traders and caravans. Thus it is seen that the different kinds of towns were organised around both inland and marine trade and commerce. The Royal capital Rajdhani was another distinct type of town which was elaborately planned. It had a belt of walls and ramparts circumscribed by ditches and military outposts. Within the Metropolis, separate places were assigned to the palace, Royal officers, the Army, citizens quarters and shops. It had tanks, Wells, Gardens, temples, taverns, and brothels. Durga was a fortified town equipped with an Arsenal and well stored it with food stuff. It was both a seat of chiefs and Kings and a military town. Several military encampments were also distinguished. Thus Sivira was the encampment of a king's army out on a conquest. Senamukha was a military base which was also a serve urban town, a little away from the main city and guarding it. Shaniya was a local fortified town which was the seat of the king with garrison and police. It was not however a permanent capital.

NSOU CC-SO-02 139 Another type of town was organised around education, the university town, called Marthanda or Vihara, consisting of students and teachers. The town was defended from external attacks and the food supplies were insured. A classic example of a university town was Nalanda which was developed, During Harsha's rule, as the centre of Buddhist learning and educational activities (Puri, 1966, PP. 52-56). The Monks numbered several thousands. The city had symmetrical rows of Monasteries. It had a large campus with lecture halls and residential quarters. Taxila was also a centre of academic traditions, although it combined various other political and commercial interest. Temple towns formed another category with their own characteristic features. They had several successive rings of circumambulatory paths to go around the central lots where the temples were situated. A number of minor shrines were also set up in these towns temple. A temple town, such as Srirangam, Tirupati, Kashi Or Puri, was the centre of diverse cultural activities. Besides temple towns, There was sacred cities which attracted pilgrims. While somewhere all India pilgrim centers others were regional ones. The former includes Haridwar, Gaya, Nasik, Ujjain, Pushkar and Mathura. All these cities formed part of the sacred Geography of the Hindus, and derived their sacred character from the epics and mythologies. 10.4 Old Capital Cities Of all the different type of cities, the capital is where most vulnerable to extraneous forces. The rise and fall of the cities were closely connected with the political and cultural history of India. Pataliputra, according to Megasthenes, was the greatest city in India at the time of Mayuras. The area of the city was 20 square miles. The fortification had 570 towers and 460 gates. It remained the capital and Metropole is under successive dynasties for about a century and, under the Buddhist influence, it also remained a seat of learning. Ghurye estimates that its population at the time of Chandragupta was a little more than 1 million. His army alone was six lakh strong. The Hindu Gupta Dynasty had, for most of the time, its capital in Ayodhya which hardly came up to the standard of Pataliputra. The Sakas ruled from Ujjain, which was considered a religious centre by the Hindus, the Buddhists and the Jains. In South India, Kanchipuram was the capital of Pallavas and the Cholas. It was the home of many different faiths - the Vaishnavites, Saivites, Jains and Buddhists. It

NSOU CC-SO-02 140 was also a set of literary and artistic development. Madura was the capital of the Pandyas. The Metropolis of Vijayanagara rose to prominence in the early years of the 15th century. Portuguese and Italian travellers have given a detailed account of this fortified city. They considered it the best provided city in the world with ample storage, gardens and orchids. 10.4.1. Cities in Islamic Civilization : To the civilisational complex, which was reflected in the urban centers, was added the Islamic civilization. This meant, among other things, the introduction of a new and different style of urbanism. The Muslims emerged as imperial rulers, and by the end of the 13th century Delhi began to develop as their administrative centers. However, Lahore surpassed Delhi in population. Delhi remained the capital for rulers of many Muslim dynasties in the 17th century it had a population of above half 1 million. During the Muslim period cities of Delhi had been built. While Qutub-UD-DIN built Lalkot, Allauddin Khilji established the city of Siri. The Tughlaqs built cities like Jahan- pana and Firozabad. The Sayyids and Lodis built their capital in Agra. But with the Moguls, Delhi once again became the seat of imperial power. The imperial city of Shahjahanabad had a population of about 1 1/2 lakhs. The city grew up to the west of Red Fort. Three main roads radiated from it. Trade and commerce flourished in the city and margins came from distant places. The fair was held on every important festival, where fine muslin, rich brocades and other goods were sold. The city was also the centre of literary and cultural activities. The Urdu language developed in the courts of Delhi. During the Muslim rule many more provincial cities came into prominence, principal among them were Ahmedabad, Lucknow and Hyderabad. The city was the centre of trade in food grains coming from the first fertile district of Kiara. It also traded in drugs and Indigo. 10.5 Cities and Civilizations The concept of civilisation is particularly helpful in the context of analysing the features of traditional urbanism and urbanization. Ghurye (1949) elaborated the Geddesian proposition that a city is the concrete image of a civilisation in his Marathi book Samaja Shastra. Redfield and Singer (1954) worked out in detail the process of

NSOU CC-SO-02 141 primary and secondary urbanization, which was also known as little tradition and great tradition. Little tradition developed into the great tradition with its special intellectual class, administrative officers and rules closely derived from the moral and religious life of the local culture and advanced economic institutions. Milton Singer (1964) elaborated Redfields idea of social organization of tradition with reference to Indian civilisation. He emphasises the conception of Indian civilisation as a coherent structure of rural networks and urban centers which also acts as a medium for mutual communication of great and little traditions and of other cultural differences between and among tribes and castes, linguistic regions, towns and countries B.S.Cohn and McKim. Marriot (1977) understanding of the cultural role of cities is significant. He argues that cities exist in societies which are organized into states whether they are literate or non-literate. He then considered two coordinate axes of economy and state power to differentiate the cultural roles of the primary urban types. While the variation on the axis of urban economy was from dependent to autonomous, those of State power used to vary from segmentary to bureaucratic to differentiate the cultural roles of the primary urban types. While the variation on the axis of urban economy was from dependent to autonomous, those of state power are from segmentary to bureaucratic. The primary urban types depending on those two axes are: 1. Regal-ritual city is characterised by dependent urban economy and segment to re-state power for forming an ideological role. 2. Sunshine city state had autonomous urban economy and segment to the state power performing more central role 3. Administrative and colonial cities which are characterized by dependent urban economy and bureaucratic state power having administrative role, and 4. Industrial cities with features of autonomous urban economy and bureaucratic state power for forming an industrial roll. 10.6 Nature of Traditional Cities More or less every traditional city shares some basic commonalities in its functioning and elements no matter which ever civilisation belong to. When observed keenly, it is seen that power was mainly vested in the hands of the rulers, the kings and the monarchical governments who asserted their power through laws and rules but primarily through defence. The center of a city generally included a centre place like a pulpit

NSOU CC-SO-02 142 or a market or a building of importance and surrounded by a second wall to depict the idea of that place being a special area to the onlooker. Main buildings and structures usually were made for religious purposes like places of worship or for political purposes like courts and places. Social interactions were not very common. Living arrangements for the ruling class were elaborate and luxurious in comparison to the common people who dwelt in small houses and shanties. Traditional cities were seen to be divided by class differentiations. Divisions were also based in ethnicity and religious groups but not imposed on living conditions as such. Perhaps, at the most, residential areas were allocated differently for different groups. The concepts like work culture was very different from what exists today. Work gave pleasure to the workers. Kin relations and family had much more importance than what one witnesses today. People were well knitted in to the kin web and bonds were much stronger than what is observed today.. The development of education was limited only among the knowledgeable in terms of arts and science. Writing and symbolic art forms were in full growth at the time. However, its impact over the rural areas were very less. Only a few among the lot were the reapers of the benefits. The majority remained illiterate throughout their life unlike the people in modern cities where education has become a necessity for good. Intra-city communication or travelling across cities for work purposes was limited only between cities sharing friendly relations. Urbanism was not growing at the rate which was witnessed after industrialization or during it. Industrialization introduced a whole new concept of urbanism that led to the dilapidation of entire traditional structure as such, giving rise to new ethos which were alien to traditional man. 10.6.1. Modern Ethos : Modernization took birth at the wake of industrialization. Countries facing industrialization like the UK came across modernization right at its beginning leaving behind traditional practices and concepts, industrialization impacted the cities with shades of modernity. Modernization is the process of transformation of the traditional society to a whole new method of technology, industry, economic, political, social and secularist tenets. Modernity introduced a liberal though process among thinkers and freeing the mind from traditional beliefs and arm- chair philosophies. Urban life has increasingly raised the number of city dwellers in industrial countries

NSOU CC-SO-02 143 and developing countries as well. For example, in 1975 around 40% of the world population lived in urban areas, it is guessed that around 15 to 20 years from now this will rise to a considerable extent. India's approximate urban dwellers were studied to be 10.6% in 1921 which increased to 18% in 1951. (Kar.2013). industrialization being a prime force in population mobility from rural to urban areas, had also led to population increase in cities of Britain, Unites States and most other European countries. Modernity and Urbanization has become a major influence in the social and cultural life in every country. 10.7 Nature of City Life Right from the beginning of industrialization, city and its development in the social, cultural as well as economic aspects have been a major topic of discussion among urban and social researchers. The city is in a way bigger settlement than a village or a town and therefore, it forms a bigger web of personal, impersonal, formal or informal relationships all together. Large populations started migrating industrialization from the Rural areas to the cities for better jobs and livelihood options. City life made people sever their ties from the countryside lives and fall for the flashy, city life. However that does not imply that cities were not present in the pre industrialization period. Cities generally flourish due to trading purposes, growing around harbors or near riverbanks to ease trading practices. Development of modern cities has gone through both encouragement and partial condemnation post industrial revolution. While Conservatives like Burke and Corbett despised industrial life for threat of crime, loss of community ties, alienation and mental isolation, radical social thinkers like Marx were weary of the blessings of capitalism and technological advancement to an extent which was barely visible before. 10.8 Urbanization in India Urbanisation is one of the common characteristics of economic development. With the gradual growth of the economy, the process of urbanisation depends on the shift of surplus population from rural to urban areas along-with the growth of some industrialised urban centers. Due to social and economic pressures, people from backward villages started to move towards urbanised centres in search of job, where newly established industries and ancillary activities continuously offered job opportunities to those people migrating to cities.

NSOU CC-SO-02 144 The pace of urbanisation is fast if the industrial growth is fast. The pace of urbanisation gradually declines only when the proportion of urban population to total population of the country becomes too high. 10.8.1 Trends of Urbanisation in India : In India, an increasing trend towards urbanisation has been recorded from the very beginning of this present century. The census data on the rural-urban composition reveal a continuous rise in the rate of urbanisation in India and more particularly during the second half of the present 21st century. The proportion of urban population to total population which was only 11 per cent in 1911 slowly increased to 11.3 per cent in 1921 and then gradually rose to 14 per cent in 1941. With a liberal definition of urban area adopted in 1951, the proportion of urban population suddenly rose to 17.6 per cent. But with a slightly strict definition, the proportion of urban population recorded a small increase to 18.3 per cent in 1961. In the 1971 census, a new definition of an urban unit was adopted and that definition was continued in 1981 census. This definition was as follows: (a) All places with a municipality, corporation, cantonment board or notified town area committee etc. (b) All other places which satisfy the following criteria: (i) Minimum population of 5,000; (ii) At least 75

100%

MATCHING BLOCK 50/104

W

per cent of male working population engaged in non-agricultural

pursuits; and (iii) A density of population of at least 400 persons per sq km (1,000 persons per sq mile). The definition of an urban unit in 1961 census was also similar to the above mentioned definition. Thus the data on rural-urban distribution during the last three censuses are comparable. The proportion of urban population to total population of India as per this new definition was estimated at 20.2 per cent in 1971 census and then marginally rose to 23.7 per cent in 1981. Again in 2001, the total size of urban population in India increased to 285 million as compared to that of 217 million in 1991. This shows that the proportion of urban

NSOU CC-SO-02 145 population to total population of India has increased from 25.8 per cent in 1991 to 27.8 per cent in 2001. The provisional figure of total urban population of India in 2011 is estimated at 377 million which is estimated at 31.16 per cent of the total population of the country. Moreover, the total number of towns in India which was only 1627, gradually rose to 3060 in 1951, 3126 in 1971, 4029 in 1981 and then to 5166 in 2001. In India, towns are classified into six different classes. From the census data, it has been observed that in Class I town (having a population of over 1 lakh) the proportion of urban population concentration has increased from 25.7 per cent in 1901 to 60.4 per cent in 1981. Thus there is an increasing trend towards huge concentration of population in the bigger towns. In Class II and Class III towns together, the proportion of urban population remained almost constant at the level of 26 to 28 per cent during the period 1901- 81. But in the remaining Class IV, Class V and Class VI towns together, the relative proportion of urban population concentration declined sharply from 47.2 per cent in 1901 to only 13.6 per cent in 1981. Besides continuation of urbanisation process, a number of Class II towns have been transformed into a Class I town and the number of Class I towns has thus increased from 74 in 1951 to 216 in 1981. Accordingly, the total population of Class I towns also increased from 273 lakhs in 1951 to 943 lakh in 1981 showing an increase of nearly 245 per cent. During the same period, the number of Class II towns has increased from 95 to 270 and that of Class III towns increased from 330 to 739 in 1981. Total population of Class II and Class III towns increased from 330 to 739 in 1981. Total population of Class II and Class III towns increased by 130 per cent, i.e., from 97 lakh in 1951 to 224 lakh in 1981. While the number of class IV towns has increased from 85 lakh to 149 lakh, the number of Class V and class VI towns and their total population declined sharply during the same period. Again the number of big cities with million plus population has increased from 12 in 1981 to 27 in 2001 and their total population also increased from 42.1 million in 1981 to 73.0 million in 2001. As per 2001 census the size of population of four-cities of India are 11.9 million for Mumbai, 4.58 million for Kolkata, 9.8 million for Delhi and 4.2 million in Chennai.

NSOU CC-SO-02 146 Causes of Rapid Urbanisation in India: Rapid urbanisation is taking place in different parts of the country in and around some big cities and towns of the country. The growing trend of urbanisation as reflected in growing concentration of major proportion of urban population in some big cities. The factors which are largely responsible for such rapid urbanisation are mentioned below: (i) Natural Increase in Population: Rapid urbanisation is taking place as a result of high rate of natural increase in population. Natural increase is taking place when the birth rate in urban areas exceeds the death rate. The natural growth rate of urban population is higher than that of rural due to higher net survival rate arising out of better health and medical facilities. Improvement in health and medical facilities, drinking water supply and sanitation facilities have reduced the incidence of water-borne diseases, communicable diseases etc. Accordingly, the birth rate in urban areas in 1971 was estimated at 30.1 per thousand as compared to the death rate of 9.7 per thousand which subsequently reduced to 24.3 and 7.1 per thousand in 1991. Thus the natural growth rate is stated too high because of large difference between birth and death rates. The death rate in urban areas declined considerably due to better availability of medical and health service, safe drinking water supply and improved sanitation facilities. This natural increase in population is largely responsible for phenomenal growth of population in urban areas i.e. 46 per cent in 1971-81 and 36 per cent in 1980-91 decade as compared to that of 19 per cent and 20 per cent growth rate attained in rural areas of India during these two decades. (ii) Migrations: Rural-urban migration is considered another important factor responsible for rapid urbanisation in India. The rural to urban migrations have been resulted due to many factors during the post independence period. Creation of many activities of manufacturing and trading as a result of industrial development has resulted migration of rural people to urban areas for seeking jobs and higher incomes as well. After the partition of the country in 1947 rural uprooted people started to settle down in urban areas. Poor living conditions and negligible arrangement in respect of education and health have also attracted large number of rural people to migrate and settle in urban areas in search of good education, health facilities, better living conditions and securities of life.

NSOU CC-SO-02 147 As a result of heavy public investments in industry and mining, huge industrial development and sustained agricultural development urbanisation takes place. These "pull factors", compel large number of rural people to migrate to urban areas. However there are certain "push factors" where due to worse economic conditions a number of rural people are pushed out of villages due to economic compulsions. Thus in the current phase of urbanisation both the "pull factors" and "push factors" are very much operational. (iii) Expansion of Industry and Trade: In recent years, urbanisation takes place with the growing expansion of industry and trade in a particular state of region. Growth of an industry with its ancillaries along with localisation of industry would always create a favourable situation for the growth of an urban set up. Similarly, growth of business and trade along with establishment of an active market always provides adequate support toward growing urbanisation in those places related to the development of industry and trade. (iv) Boundary Changes of Towns: With the extension of the boundaries of cities and towns, more and more rural areas are gradually being included in rural areas. Although life in these newly extended areas remains rural initially but the inclusion of these areas into these towns and cities necessarily increases the number of urban population. Consequences of Rapid Urbanisation: The rapid urbanisation is subjected to both healthy and unhealthy consequences and aspects. (i) Healthy Aspects: Rapid industrialisation results the development and setting up of many industrial cities. Along with manufacturing units, ancillaries and service sector started to grow in those urban areas. Secondly, new and additional employment opportunities are created in the urban areas in its newly expanding manufacturing and service sector units. This would result rural-urban migration and "industrialisation-urbanisation process" to set in. Thirdly, growth of cities can give rise to external economies so as to reap the benefit of economies of scale for various services and activities. Finally, urbanisation results changes in attitudes and mind set of the urban people resulting modernisation in behaviour and proper motivation which indirectly helps the country to attain faster economic development.

NSOU CC-SO-02 148 (ii) Unhealthy Aspects: Although development of the economy are very much associated with urbanisation but it has resulted some serious problems. Firstly, growing urbanisation is largely responsible for increasing congestion in the urban areas. Too much congestion has resulted problems like traffic jams, too much concentration of population, the management of which is gradually becoming very difficult and costly. Secondly, too much of population is another unhealthy aspect of urbanisation which creates urban chaos related to housing, education, medical facilities, growth of slums, unemployment, violence, overcrowding etc. All these would result in deterioration in the quality of human life. Finally, as a result of urbanisation, large scale migration takes place from rural to urban areas. Such large scale migration of active population from rural areas would result loss of productivity in rural areas, leading to poor conditions in village economy. Thus urbanisation, beyond a certain point, would result in unhealthy consequences. (iii) Urban Policy Measures: Considering unhealthy consequences of rapid urbanisation, it is quite important to formulate an urban policy which can provide urban development with minimum undesirable effects. The measures which can be largely followed include: (i) Integrating urbanisation process with the development plans of the country for developing non-agricultural activities like manufacturing services and infrastructure leading to attainment of external economies, (ii) Making arrangement for selective urban development so as to minimise the disadvantages of these large sized towns, (iii) To develop rural districts, by developing towns in highly rural districts, (iv) To develop satellite townships in and around large cities; and (v) Relieving pressure on large urban centres by developing urban amenities in adequate quantities so as to make urban living peaceful.

10.9 Concept of Rural-Urban Continuum a. Conceptual Framework: Rural Urban Continuum is a concept of sociology and settlement geography. The concept that, the size of continuum varies according to the size of town or city. This concept suggests that the population size, depends on the population density and the

NSOU CC-SO-02 149 number of settlement. The continuum at the rural end of the continuum is envisaged as being close knit, highly stable, integrating and homogenous in composition. At the urban end it is supposed to be loose in association, unstable, characterized by great social mobility and has a tendency for inter-individual contacts. The continuum is seen as marking a process of social change. Here social change can occur without any growth of settlement or increase in population, i.e. through the replacement of an original rural population simply by commuters or new settler. It is also possible to find rural societies in urban settings, and urban societies in rural settings. The association between these two setting is not entirely perfect, although the continuum concept still has some validity. b. Definition: Tonnies' (1887) has given the idea of *Gemeinschaft* (rural) and *Gesellschaft* (urban) and discussed the difference between tradition and modernity. According to Durkheim, David Emile (1893), "Rural community is based on mechanical solidarity whereas urban community is characterized by organic solidarity". According to Maclver, (1917) "Between the two, there is no sharp demarcation to tell where the city ends and country begins". According to Gist and Halbert, (1945) "The familiar dichotomy between rural and urban is more of a theoretical concept than division based upon the facts of community life". Kingsley (1945) has said "the city effects are wider than the city itself". According to Queen and Carpenter (1953) "there is a continuous gradation from rural to urban rather than a simple rural-urban dichotomy". Mukherjee, (1963) prefers the continuum model by taking the degree of urbanization as an useful conceptual tool for understanding rural-urban relations. Frankenberg, (1966) differentiates rural from urban by means of the concepts of rate and network. According to him, in urban areas, there is much greater differentiation of roles and the network of social relationships is less dense. Rao, (1970) points out in the Indian context that although both village and town formed part of the same civilization characterized by institution of

NSOU CC-SO-02 150 kinship and caste system in pre-British India, there were certain specific institutional forms and organizational ways distinguishing social and cultural life in towns form that in village. c. Dynamic Characteristics of Continuum: The dynamic characteristics of rural urban continuum are directly made on the following relations: 1. Agricultural Relations; 2. Business and Financial Relations; 3. Educational and Health Relations; 4. Transport and Communication Relations; 5. Administrative and Political Relations; 6. Social and Cultural Relations; 7. Industrial Relations.

1. Agricultural relations: Near the urban centers the intensity of agricultural activities is generally high, and this tendency is decreased with the increasing distance towards peripheral areas.
2. Trade and financial relation: Retail trade, wholesale trade and other trade related services located in urban centers develop relation between the urban and rural areas.
3. Educational and health relations: The urban centres generally have educational centres in the form of schools, college, technical schools and sometimes post graduate level educations. People from rural areas come to urban areas and make a relationship. Relationship also develops for providing health facility to the surrounding villages.
4. Transport and communication relations: Urban centres act as a convergence point for different modes of transport routes. Urban centres are connected with transport and communication with the neighbouring villages. Urban centres also act as nerve centres, of transportation lines. Roads radiate like spokes of a wheel in different directions from the city centres. So, a relationship is developed between urban and rural areas.
5. Administrative and political relations: Urban centres may act as a place of state capital, district headquarter, subdivisional headquarters. These centres, pull people every day from surrounding areas and create relation between rural and urban areas. Urban centres are the centres of political party offices. People also come to urban areas for political reasons.
6. Social and Cultural Relations: Cultural functions, religions festivals, sports and games fall under social and cultural items of entertainment which are mostly

NSOU CC-SO-02 151 undertaken in urban areas. People both from urban and rural areas take part and establish social and cultural relations. 7. Industrial relations: Industries are mostly located in urban areas or at the periphery of urban areas. But they receive raw materials from rural areas and labourers from both urban areas and surrounding areas. Thus people commute from rural to urban areas or vice-versa. Daily movement establishes a mutual relationship between rural and urban areas. The zone or belt, where commuters move is known as commuter belt. 10.10 Challenges of City Life Living in a city can be very complex to be honest. Here are some of the challenges you can face when living in a city. 1. If you are not very good at conversing with people, living in a city will be hard. You have to constantly deal with various types of people. If not, city life is really hard. 2. Air Pollution: Air Pollution too is becoming a big challenge. Living in city means living between cars and their smoke. If you are not used to a life where you have to constantly deal with smoke and dust, Living in a city is challenging. 3. Joblessness: High levels of unemployment and underemployment Urban labour markets are incapable of absorbing the expanding number of job seekers The result of urban poverty and social exclusion Creates an informal sector Housing Problems: In mega cities of the developing world, population growth is always ahead of housing supply. This create slums or squatter settlements. For example, 50% of Mexico City's population live in slums or squatter settlements. Strategies for meeting housing needs include upgrading projects and core housing projects.

NSOU CC-SO-02 152 Water and Sewerage Problems: Sewerage facilities are often ancient and inadequate. For example, only 11% of Manila's population are connected to the sewerage system. Providing the infrastructure for the collection and treatment of solid and liquid waste is often beyond the resources of many mega cities. Health and Nutrition Problems: Increased poverty leads to a decline in living standards and leads to infectious and parasitic diseases, deficiencies in the physical environment. 10.11 Summary India is an ancient civilization and towns and bigger urban centers were in existence since time immemorial. Cities have come up as centers of commercial activities, political capitals and pilgrimage centers. However, modern cities had come up in the colonial period when modern business and commercial activities began and modern modes of transport became available. The rate of urbanization then accelerated first after independence, and again, in the 1990s, under the impact of globalization. Rapid economic development, better infrastructural facilities, growth of private sector and employment opportunities in cities facilitate urbanization everywhere and India is no exception. There are thus many push and pull factors to drive people out of rural areas and to bring them to the cities. Rapid and unplanned urbanization often have negative impacts on the environment and rural-urban migration poses big challenges to city life.

10.12 Model Questions A. Write Short Notes on the Following.: (5 Marks Each) 1. Challenges of city life 2. Rural urban continuum 3. Nature of traditional cities 4. Characteristics of a city. B. Long Questions: (10 Marks Each) 1. Explain the challenges of city life in India. NSOU CC-SO-02 153 2. Examine the history of the rise of the urban industrial cities. 3. What is urbanization. What are its impact. 4. Explain the nature of urbanization in India. 5. Explain the nature of rural-urban continuum in the context of India. 10.13 References and Suggested Readings Ahuja Ram.2017.Society in India.Rawat Publication. New Delhi India. Ahuja Ram.2013. NSOU CC-SO-02 154 Unit 11 Industry and Labour Structure 11.0 Objectives 11.1 Introduction 11.2 Nature of Industrial Society 11.3 History of Labour Movement and Industrialization 11.4 History of Working Class Movements in India 11.5 Summary 11.6 Model Questions 11.7 References and Suggested Readings 11.0 Objectives This unit examines the characteristics of industrialization in India. It also looks into the emergence of working class and its movements in India. It also discusses the history of working class movements in the colonial period in a nut shell. 11.1 Introduction Society refers to a group of people who live in a definable community and share the same culture. On a boarder scale, society consists of people and institutions around us, our shared beliefs and our cultural ideas. Typically, more-advanced societies also share a political authority. The term society has been derived from the Latin word 'socius' which means a companion, association or fellowship. Sociologist Gerhard Lenski (1924-) defined societies in terms of their technological sophistication. So, societies with rudimentary technology depends on fluctuations of their environments, while industrialized societies have more control over the impact 154

NSOU CC-SO-02 155 of their surroundings and thus develop different cultural features. This distinction is so important that sociologist generally classify societies along a spectrum of their level of industrialization from preindustrial to industrial to postindustrial. Under pre industrialized societies are hunting and gathering societies, pastoral societies began around 12,000 years ago; under developing societies we can see horticultural societies emerged between 10,000 and 12,000 years ago, agricultural societies. Then comes industrial societies emerged in 1700, also known as modern societies. 11.2 Nature of Industrial Society One of the major characteristics of our modern era is that we witness a qualitative change in our economic and industrial life. There have some massive development in communication and the electronic reproduction of sound, image and text. Television is central to this rapid change over. All this has not come overnight. It was some time during 18th century that there came industrial revolution in Europe. It was steam power and steam engine which gave emergence to modern society. (Doshi) Before coming up of modernity in the west, there was renaissance followed by enlightenment. Both these movements stood for social justice. For an ordinary person, modernity means industrialization. It means technology, invention, mass production and innovations. One of the feature of traditional civilization, was that most people were engaged in working on land. By contrast, an important feature of industrial societies today is that a large majority of employed population work in factories, offices or shop rather than in agriculture. (Giddens) Traditions gradually got weakened at the hands of modernity. Religion and religious practices received the first blow, follows by the death of monarchy and feudalism. It is for the first time in traditional societies that the importance of cities increased. There were cities in these societies bit they were the centre of administration and pilgrimage. The new cities which emerged from industrialization and urbanization.(Doshi) Large scale organisation, such as business corporation or government agencies come to influence the lives of virtually everyone. Most jobs are to be found new job opportunities are created Major changes were brought in political systems rather than developing new political systems which are more advanced and intensive or differed substantially from the traditional form of political systems, which have been developed due to modernization. In traditional societies, political authorities were the monarchs and

NSOU CC-SO-02 156 emperors had little direct influence on the customs and habits of most of their subjects, who lived in fairly self contained local villages. Industrialization also facilitated transportation and communication making a more integrated 'national' community. The industrial societies were the first nation states to come into existence. Nation states are political communities, divided from each other by clearly delimited border rather than the vague frontier areas that used to separate traditional states.(Giddens) The application of industrial technology has by no means been limited to peaceful processes of economic development. From the earliest phases of industrialization, modern production process have been put to military use, and this has radically altered ways of waging war, creating weaponry and modes of military organisation much more advanced than those of non- industrial cultures. Together, superior economic strength, political cohesion and military superiority account for the seemingly irresistible spread of western ways of life across the world over the past two centuries.(Giddens) Another perspective of modernity besides urban, industrial and democratically created nation states, transport and communication is of development and progress. The founding theorists of sociology are the production of industrialization and modernization. Emile Durkheim (1858), Max Weber (1864) and Karl Marx (1841) belonged to the same European generation. They all witnessed the consequences of modernity. Durkheim in his argument says that in the long run modernity would create differentiation would help the mechanical society to transform into organic society. Social density and social contract, in the long run, would hold society together. Weber has a different interpretation for industrialization and modernity. To him, the industrial society would be a bureaucratic rational society. Marx was of the view that ultimate progress lies in the attainment of socialism.(Doshi) Some of the important processes which led to the development of modernity are (Doshi) Enlightenment (the age of reason): according to social scientists society can be explained scientifically. Hegemony of profiteering: industrialization had come with the ideology of capitalism. Profiteering intensified the desire for building capital empires.

NSOU CC-SO-02 157 Political revolutions: there was decline of monarchy and feudalism due to French and industrial revolution. Intersection of national and international conditions and processes. Birth of counter culture of socialism to capitalism The triumph of liberalism Thus, the idea of modernity is intimately tied to the development of Europe. In its initial stage it developed in art. It was Weber who separated it from religion and metaphysics.(Doshi) 11.3 History of Labour Movement and Industrialization Industrialization in India had began during 1850s when the English East India Company operated few workshops .But the insurrection of 1857 had posed a major challenge to colonial rule. The railway introduced during this time was considered as the harbinger of modern industry in India. In 1862, the British Govt. had formulated "stores purchase policy" for purchasing limited and selected goods from local industries. But the most difficulty at this time was the availability of labour force. During the latter half of 19th century, the labour policy of the govt. had found several ways to compel workers to provide labour for a fixed period of time. Worksmen Breach of Contract Act (1859) was the first labour law in India. It made the breach of contract of employment an offence. Employees and Workmen (Dispute) Act (1860) rendered workers liable to punishment under the Indian Penal Code for breaching contract of employment. The Transport of Native Labourers Act (1863) of Bengal allowed the private contractors to recruit and transport labourers for plantation works. a) 1881 to 1900 : During this period, textile industries had developed in India. In 1854, there was only one textile mill but in 1881, there were 47 mills and by 1900 there were 193 textile mills. During this time, the British Parliament passed the Factories Act. Under the Indian Factories Act (1881) the working hours of children were regulated, provisions were extended to women and basic safety measures were also introduced. But during this time, there were no trade unions. Organizations such as the Servants of India Society had absorbed the Indian labour force into anti-British movement?

NSOU CC-SO-02 158 b) 1900 to 1913 : The most important aspect of this phase was the establishment of mining industries. The enactment of Mines Act (1901) and Inland Emigration Act (1901) ensured the safety, welfare and security of labourers. c) 1914 to 1938 : During this time the industries had spread out in many centers of India and expanded in terms of productivity, technology and international markets. The wartime requirement of Britain had disrupted the communication between Britain and India which had consolidated Indian industries to greater self confidence among the capitalists and rapid growth of Indian working class. Labour welfare was introduced by Works'men Compensation Act (1923). In 1936 Payment of Wages Act was passed which was only confined to manufacturing industries. d) 1939 to 1945 : The needs of the war resulted in the development of industries in India. The state regulation of industries through licenses was established, which was known as "License Quota Permit Raj". The Bombay Plan of 1944 was the blueprint of Indian industrial development which underlined the importance of govt. policies directed towards not only safeguarding industries by licensing also to protect labour by ensuring fair wages and reasonable working conditions. The Defense of Indian Rules contained the provisions for reconciling industrial disputes, prevention of strikes and lockouts and reference of disputes to arbitration and to set up regular machinery for adjusting disputes. e) First Five Years Plan : Industrial adjudication came during this period. Principles of fixed wage and job classification were established. The first Pay Commission was appointed to recommend fixed wages for civil servants. During this time, many Industrial Training Institutes were established. f) Second Five Years Plan : This period envisaged large investment in public sector in order to lay foundation of industrial infrastructure and mobilization of resources. Employees Provident Fund Act (1952) was passed in this period which required both the employer and employee to contribute 8.33% of wages as statutory fund. The Second Five Years Plan undertook numerous schemes to stabilize labour market like Employment Market Information Programme, National Classification of Occupation and Vocational Guidance programme etc. Finally, the Employment Exchange Act was enacted under provision of which notifications of all vacancies were made compulsory.

NSOU CC-SO-02 159 11.4 History of Working Class Movement in India. Post-War colonized India, the advent of Industrialization led to the emergence and growth of manufacturing and Industries with western technology. Started with building of Railways linking Calcutta, Bombay, Baroda and Raniganj (coal mining center) spread to first textile mill in Bombay, Jute factory in Calcutta, Iron and Steel plant in Jamshedpur and large scale tea plantations. Economists, Sociologists and Planners have classified non-agricultural workers into organized and unorganized or formal or informal workers, where unorganized could not be sufficiently explained by them. Earlier workers were determined by their condition and capital but now their conditions are being determined by wages, security and other laws provided by the firm. Meanwhile, workers in organized sector can be divided into white and blue collared workers. Strikes by industrial sector workers started in the nineteenth century, Bombay strike marked the beginning followed by strikes by jute, textile, plantation, railway workers on Calcutta, Ahmedabad, Bombay and Madras. Some works by researchers who sought to study working class movements of colonial period are discussed. Panchanan Saha analyse the cause and effect of strikes; how parties help organising workers to lead the strike and how the government dissolves them. Colonial Bombay saw the rise of working class movements made way beside the bourgeoisie nationalist movement. The main concern was, "To what extent did the workers, particularly in Bombay Presidency constitute a working class, which at a political level was at a position to operate independently from the upper classes?" (Georges Lieten, 1983). Eaman Murphy studies the strikes in southern part of India focusing on how worker's origin and recruitment pattern. Rajni Bakshi's study saw role of different leaders and political parties in the strike. His works were also used for further studies. Mukhopadhyay, Joshi, Ghosh and Datta covered various industrial movements and classified them onto 3 categories: (1) descriptive and statistical accounts (2) analysis from the management's perspective and (3) analysis from socio-economic and political perspective. Ramaswamy typified strikes based on issues involved, into six categories; (1) caused by the dispute over rules; (2) the wildcat strike, which is without the sanction of the union; (3) the rite-of-passage strike which is for demanding recognition of the union; (4) the inter union dispute; (5) the tedium-relieving strike; (5) the political strike; and (6) the bread-and-butter strike.

NSOU CC-SO-02 160 Strikes in India's factories began to take place initially in an unorganized way since the 1870s. In 1870, one of the first strikes occurred in 1877 at a Nagpur mill (Empress Mills) over wages. Then a series of strikes (25 strikes) took place in quick succession between 1882-1890. On many occasions the main reason of such strikes was not solely the workers' professional interest, but for nationalist causes as well. For example, in 1908 workers did participate in the six day political mass strike in Bombay in protest of Tilak's imprisonment. The workers' awakening of their oppression and rights opened the door for modern labour movement in India in 1918 the entire textile mills sector was swept by the demands and movements of the workers. R.P. Dutt has reported (India Today, p. 406) that in the first six months of 1920 there were 120 strikes involving about 150 million workers. Starting from the year 1921 and upto 1945 thousands of strikes and lock-outs took place involving crores of workers altogether. Wage issue indicates more pay against wage cuts, non-payment on Sundays and gazetted holidays, dearness allowance etc. Bonus being another important reason along with more holidays and better infrastructure facilities. Women industrial workers have their own additional issues related to discrimination like victimisation, 'manhandling' by workers, ill-treatment along with the other set of issues which all workers face. Inter-union and intra-union rivalry triggers agitation turning into strikes. Inferring from a new field of study, Industrial sociology, workers are merely reduced to objects catering to material needs, having no power over any means of production.

11.5 Summary Under the colonial rule the Indian labour class movement steadfastly organized itself to be free of both bourgeois oppression and colonial control. Thus it became the symbol of national emancipation and freedom from capitalistic control. The Indian working class had emerged in the second half of the nineteenth century due to the emergence of various modern industries and modern means of transport. The early nationalists had combined the working class agenda with their nationalist programmes; but trade unions started to be formed since the second decade of the last century. In 1926, the British Government had passed the trade union act for recognizing trade unions as legal organizations. Within a short period after that the control of the trade unions was taken over by the newly established Communist Party of India. The labour unions worked relentlessly for increase of wages, improvement of work environment and basic amenities, prevention of child labour, equal wage for equal pay benefits, etc.

NSOU CC-SO-02 161 11.6 Model Questions A. Write short notes on the following. (5 marks) 1. Five years plan 2. Industrial society. 3. Post Industrial Society. 4. Industrialization. 5. Impact of industrialization. B. Long questions. (10 marks). 1. Explain the nature of Industrial society. 2. Analyse the history of the working class movement in India. 3. Explain the nature of working class movement in India.

Objectives After you have read this unit you should be able to describe

The Definition of Tribe. Name of different Tribes in India Distinctive features of Tribal community 162

NSOU CC-SO-02 163 Geographical distribution of Indian Tribes Problems of Tribal community Solution to the Tribal problems 12.1 Introduction The Indian society comprises of individuals belonging to different castes, creeds, races, ethnicities, religious groups and socio-economic backgrounds. Individuals practice their own traditions, cultures and norms. The distribution of the Indian society is on the basis of urban, rural and tribal areas. India is a country where people have come to obtain numerous characteristics, based on region, language, religion and so forth. There are many aspects within the Indian society that create a linkage between individuals belonging to diverse backgrounds. The main purpose of this module is to understand Indian society, with regards to, rural and tribal characteristics, factors contributing to the unity within the Indian society and structure of the Indian society. Primarily the research paper focuses upon the traditional aspects of the Indian society, but in the present existence, there have been changes with the advent of technology and use of modern and innovative techniques and methods. The tribals are the autochthonous people of the land who are believed to be the earliest settlers in Indian Peninsula. They are generally called the adivasis, implying original inhabitants. A tribe is a homogeneous and self contained unit without any hierarchical discrimination. Each tribe enjoyed equal status. Each tribe had its own system of administration. There was decentralization of authority among the tribes. In this unit, an outline of the Indian tribes, particularly their geographical classification, linguistic classification, racial, economic and cultural divisions is given. Tribal people form a major segment of the world population. They are found all over the world. They are called by different names such as 'primitive', 'tribal', 'indigenous,' 'aboriginal,' 'native,' and so on. India has a large number of tribal people. According to the census of 2001, India is the home to the largest tribal population in the world, a total 104281034 tribal people live in India. In India indigenous people are known as "Tribal people" or "Tribals", they are at the lowest rung of the social hierarchy; they are the poorest and the most marginalized, oppressed and deprived people in the country (Nathan and Kekar, 2004; Rath, 2006). Tribes of this land are heterogeneous and diversified in respect of size of the population, life style, culture and language. National Tribal Policy (Govt. Of India) 2006, identifies 698 tribal communities in

NSOU CC-SO-02 164 India. Scheduled Tribe communities in India are found in different parts of the country. They occupy nearly 15% of the total land of the country and basically they live in the forest and hilly areas, though some of them also live in the plains. On the basis of ecological, social, economical, administrative and ethnic factors they are divided into five regional categories (Tribal Community Report 2014) such as 1. Himalayan Region. 2. Middle Region. 3. Southern Region. 4. Western Region. 5. Island Region. According to the census of 2011, 5.79% of the total population of West Bengal is Scheduled Tribes and 40 different types of tribal community reside in West Bengal. Most of them are found in the Southern, Western and Northern part of the state. 12.2 Who are the Tribes? According to The Oxford English Dictionary the word 'tribe' is derived from the Latin term 'tribus' which was applied to the three divisions of the early people of Rome. The term however has gone through a lot of changes. It meant a political unit consisting of a number of clans. A tribe occupied a definite geographical area. Permanent settlement gave a geographical identity to a tribe. For that reason, tribes were often named after the area. Our country is named after a tribe called 'Bharata.' Even today states like Mizoram, Nagaland and Tripura are named after the Mizo, Naga and Tripuri tribes respectively. Some western anthropologists and sociologists argued that the tribes of India belonged to three stocks-the Negritos, the Mongoloids and the Mediterranean. The Negritos are believed to be the earliest inhabitants of the Indian Peninsula, but they have almost disappeared. Some believe that they are still found among the tribes of Andaman and Nicobar Islands, known as the Onges, Great Andamanese, the Sentinelese and the Peniyans. The Mongoloid race is represented by the tribal people in the sub- Himalayan region. They may be divided into two categories, namely the Palaeo Mongoloids and the Tibeto Mongoloids. The Palaeo Mongoloids are represented by the tribes living in Assam, Meghalaya, Mizoram, Nagaland and Manipur. The Tibeto Mongoloids are represented by the tribes living in Sikkim and Arunachal Pradesh. They are believed to have migrated from Tibet. The Mediterranean people form a bulk of the tribal population and are generally known as the Dravidians. Verma says: "Dravidians are again divided into two parts [groups]-Kolarians who speak a dialect called Mundari, and the Dravidians proper". It is believed that with the advent of the Aryans, there was a protracted struggle between the Aryans and the Dravidians, then referred to as the 'Dasyus.' The conquered Dravidians were reduced to a servile status

NSOU CC-SO-02 165 and regarded as 'Sudras.' A section of the Dravidians who escaped defeat and did not surrender to the Aryans continued to maintain their independent existence in the remote hills and forests. They are believed to be "the forerunners of the various tribes in India" The term 'tribe' has also been variously understood as 'nation', 'society', 'race' etc. A tribe is ideally characterized as a socially homogeneous, non-hierarchical and non- differentiated, un-stratified unit; having its own dialect, political and cultural institutions. So we have described the tribe as a society with a political, linguistic and somewhat vaguely defined cultural boundary; further as a society based upon kinship where social stratification is absent. But in contemporary India, the 'tribe' of an anthropologist's ideal type can be rarely found, and so some scholars have preferred to consider it as a thing of the past and instead drawn our attention to tribes in transition (Bose, 1981: 191). Beteille for example observes that, like so many definitions of social categories, tribe is also the definition of an ideal type. In India hardly any of the tribes exist as a separate society. They

100%

MATCHING BLOCK 52/104

W

have been absorbed, in varying degrees, into the wider society

of India (1977: 13). 12.3 Popular Names of Indian Tribes The tribes of India live in the forest hills and naturally isolated regions and are known as a rule by different names, meaning either the people of forest and hill or the original inhabitants, and so on. The popular names are: Vanyajati (castes of forest), Vanvasi (inhabitants of forest), Pahari (hill-dwellers), Adimjati (original communities), Adivasi (first settlers), Janjati (folk people), Anusuchit janjati (scheduled tribe) and so on. Among all these tribes the term Adivasi is the most popular term. In India, tribes are generally called adivasis, implying original inhabitants. The ancient and medieval Indian literature mention a large number of tribes living in India. Before the introduction of the caste system during the Brahminic Age, people were divided into various tribes. Government of India has specified 427 communities and has included them in the schedule of tribes. These tribes are known as scheduled tribes. They are entitled to special protection and privileges under the constitution of India. Numerically, the three most important tribes are the Gonds, the Bhils and the Santhals, each having a population of more than 30 lakh. Next to them are the Minas, the Mundas, the Oraons each having a population of more than 5 lakh. Then there are 42 tribes each having a population between one and five lakh. The tribal people of India, who come under the category of Scheduled Tribes (ST's) in terms of the provisions of the constitution

NSOU CC-SO-02 166 of India, constitutes 8.2 percent of the population of the country according to 2001 census. 12.4 Distinctive Features of Tribal Community The characteristics of the tribal society have been stated as follows: Tribal people generally live in forests and hilly areas. They usually have a geographically well demarcated territory. They earn their living by being dependent upon the natural resources on a large scale. They live by hunting and gathering of fruits, tubers and edible roots. The only traces left by the tribal people of the Palaeolithic Age are the stones that they made use of on the surface of many parts of the Deccan (Von Furer-Haimendorf, Christoph, 1982). These individuals were dependent upon the forests on a large scale for meeting their needs and requirements. The tribal people do not possess much assets, their belongings consists primarily of tools, instruments and some clothing. Amongst the tribal communities, there is no existence of financial economy. They usually practice the barter system. Economically they are self-sufficient and are able to sustain their needs. Their economy is based on the subsistence level, where there is no surplus. They make use of primitive technical methods and do not possess awareness regarding the usage of modern technology and innovative methods. The barter system is when goods are exchanged for goods, for instance, when they give one product, they obtain the other one. Through this system, the tribal communities are able to sustain their living by trading commodities for commodities. Tribal communities have their own language and not any kind of script. The communication amongst the tribal communities takes place on the basis of their own language. The tribal people enjoy a strong sense of freedom and personal independence. They are free to migrate and transfer from one place to another. They are not bound by any rules and regulations and have their own customs, traditions and cultures. The differences between them are characterised by material and intellectual development (Von Furer-Haimendorf, Christoph, 1982). They may differ from each other on the basis of cultures, norms, values and practices. The tribal communities have their own political system. There are two kinds of political systems that are found within the tribal communities. These are both stateless and state. In the earlier period, there was prevalence of the stateless system, it is when there is not any tribal chief. In the stateless system, the law and order within the

NSOU CC-SO-02 167 community was managed through family and kinship ties. The head of the family was responsible and authority was bestowed upon him. Later on, came the state system, when the tribals nominated and elected their own chiefs. In the present existence, this autonomy is not available and they have become part of the local administration. The tribal communities have their own religion. Religious beliefs are considered to be imperative amongst them and they worship their own deities. Their forms of religions are known as animism, which means worshipping of the souls or the ancestors, animatism, which worshipping of any non-living object, such as a stone or wood, totemism, which means worshipping of the tree or any animal, as they possess the belief that their ancestor has assumed the form of a tree, and naturism, in this, they worship objects of nature, such as, river, stream, sun, moon, forest, lake, water bodies, natural resources and so forth. These individuals possess this belief that worshipping of the natural resources will make their living productive. The basic unit of the tribal communities is the nuclear family. The families consist of husband, wife and their children. For carrying out day to day operations of the households and other concerns, husband and wife are equal partners with equal rights. This equality of status means, that family may live with either the husband's or the wife's tribal group. The men usually consult women in case of making of any kinds of decisions, they usually involve women to express their ideas and give suggestions (Von Furer-Haimendorf, Christoph, 1982). The tribal individuals possess a strong sense of belonging to their family and community, they possess this viewpoint that they are the sons of the soil and possess a strong ethnic identity. The tribal individuals are dependent upon the forests and the natural resources to meet their nutrition and health care requirements. In case of illnesses and diseases, they usually obtain medicinal roots and plants from the forests and provide cure to their illnesses and health problems. Proper medical and health care facilities are lacking amongst the tribal communities. Their abilities to get involved in indigenous medicine and magical practices have been productive in the past. But in the present existence, the prevention and cure of illnesses and diseases require specialized medical treatment and consultation with professionals. The tribal communities are gradually possessing awareness regarding advanced and innovative medical and health care facilities. There has been prevalence of agriculture amongst the tribal communities. The kind of agriculture that is prevalent amongst them is known as primitive agriculture. It is known mainly as shifting or slash and burn cultivation. In the present existence,

NSOU CC-SO-02 168 these individuals are leaving these types of agricultural practices. The tribal communities of south India, depended to a great extent upon slash and burn cultivation. The cultivation of products such as, various types of millets, maize, pulses and vegetables were common amongst them. The dwellings of the tribal communities consisted of thatched huts during rains and cold weather and in hot weather conditions, they lived in camps in the open, under overhanging rocks or in temporary leaf shelters (Von Furer-Haimendorf, Christoph, 1982).

12.5 Geographical Distribution of the Tribes

The tribes of India, on the basis of geography of India and tribal demography can be classified regionally. Guha (1951, 1955) demarcated three tribal zones. They are (i) northern and northeastern area, (ii) the Central belt and (iii) the Peninsular India. Majumdar and Madan (1956) also refer to these zones and present a somewhat similar distribution. They have called them Northern and North-Eastern Zone, the Central or Middle Zone, and the Southern Zone. Dube (1960) has classified the geographical regions of the tribals into four zones, the North and North-Eastern Zone, the Middle Zone, the South Zone and the West Zone. Again Roy Burman (1971) divided the tribal communities living in different regions into five territorial groups. Taking into consideration the geographical, ecological, social, economic, administrative, ethnic, and racial factors, Vidyarthi and Rai (1976) proposed a four- fold geographical region along with one distinct sub-region of the islands. These are:

- North Zone :** This zone covers Himachal Pradesh, Punjab, sub-Himalayan Uttar Pradesh, Bihar. The prominent tribes here are Khasa, Tharu, Bhoksa, Bhotias, Gujjars and the Jaunsaris. Khasas are a polyandrous tribe. Bhotias make carpets and are involved in the Indo-china border trade. The Gujjars are a pastoral tribe. The major problems of the tribes of this zone are inaccessibility, lack of communication, poverty, illiteracy and land alienation.
- North-Eastern Zone :** This zone includes seven north-eastern states, and the major tribal groups here are Nagas, Khasi, Garo, Mishing, Miri, Karbi and the Apatais. Ecological degradation because of shifting cultivation and inaccessibility due to lack of communication facilities are two major problems of these tribes. Because of a high degree of isolation, the tribes of this sector have not really shared history with the mainstream Indians and have instead shared history with the neighbouring communities. This explains why there is an element of hostility of these tribes with the mainstream.
- Central Zone :** This zone has maximum concentration of tribal population. It stretches from southern MadhyaPradesh to South Bihar across northern Orissa. The major tribes lying in this zone are the Santhals, HO, Baiga, Abhujanaria, Muria, Munda and Birhor. The major problems faced by the tribes of this region are land alienation, indebtedness. Among the tribes of this region, the Santhals have discovered a script of their own, called ole chiki. Baigas are a prominent shifting cultivation tribe. Birhors are a very backward tribe of this region and because of extreme backwardness and no secure means of livelihood, they are threatened with extinction.
- Southern Zone :** This zone comprises the Nilgiris together with the adjoining hilly regions in Andhra Pradesh and Karnataka. It is the smallest, the most backward and the most isolated tribal communities on the mainland. Tribes of this region are Toda, Koya, Chenchu and Allars. Todas are a pastoral people who practise buffalo herding. Allars are cave dwellers, who also live on tree tops. Chencus are a very backward tribe who survive mainly on hunting- gathering. The major problem of these tribes are shifting cultivation, economic backwardness, isolation, lack of communication and threat of extinction of langauges.
- Eastern Zone :** This zone includes West Bengal, Bihar and Orissa with tribes such as Paraja, Kondhas, Bondas, Bhuniya, Gadabas, Bhuinyas and Saoras. The major problems of the tribes of this zone are economic backwardness, exploitation by forest officials and contractors, land alienation, prevalence of disease and displacement due to industrial projects.
- Western Zone :** Rajasthan and Gujarat are included in this zone. Tribes which are found here are Bhils, Garasiya and Meenas. Among them, Meenas are a very advanced and well educated tribe.
- Island Region :** Andaman and Nicobar islands, lakshadweep and Daman and Diu included in this zone. Great Andamanese, Santinelese, Jarwas, Onges, Nicobaris and Shampen are tribes of this region. Some of these tribes are extremely backward and are struggling to come out of the stone age mode of livelihood. Most of these tribes are classified as minor tribes which face the threat of extinction. Apart from the problem of survival, prevalence of disease and malnutrition are some other problems of the tribes of this region. The basic strategy of the government for the tribal region is aimed at providing protection to the tribals and bringing about their economic development. The tribal strategy initiated during the Fifth five year plan is a comprehensive, well-knit and NSOU CC-SO-02 170 integrated programme. Its objective is elimination of exploitation of tribes, protection of their socio-economic development, bridging the gap in development vis-a-vis other areas, improvement of quality of life etc.

12.6 Problems in Tribal Society

Over the last 20 - 25 years, the tribal community has been incessantly trying to draw the attention of the world's leading power blocks to save them from perennial miseries. The World Health organisation (WHO) has emphasised that indigenous people have higher rates of infant mortality, lower life expectancy and more cases of chronic illness than the non indigenous populations in their home countries. It is argued that the indigenous people are among the poorest of the poor. They suffer from extreme discrimination and lead a life of misery and destitution. The development discourse, therefore, needs to concentrate on finding an effective strategy to mitigate these crises. Some of the major problems which present day tribal people face can be categorised as problems of poverty, health problems and social problems like lack of education. However, it is more pertinent to look at each categories in greater details by carefully taking into account the nuances of a problem. It is observed that certain types of tribals emerged with their contact with the outsider. Before the Muslim rule, tribals lived fairly in isolation, but during the muslim rule process of revenue collection started. However, the Muslim rulers did not interfere with the tribal customs and traditions. Exploitative contact started during the British rule. This was found mainly because of three reasons: (a) The colonizers wanted to rule over the tribal land (b) they wanted to syphon off resources from tribal areas, which were rich in minerals resources (c) they wanted to preach Christianity under the pretext of rationality. In the post British rule, the non tribals started exploiting the indigenous people in various ways. The basic problems faced by the tribal community in the 21st century are as follows :

12.6.1. Land Alienation:

Land as a prime resource has been a source of problem in tribal life because of two related reasons, first, dependency, i.e. tribal dependency on land and second, improper planning from government agencies. Tribal people in India can be classified on the basis of their economic pursuits in the following ways: Foragers, Pastoral, Handicraft makers, Agriculturists, Shifting hill cultivators, Labourers and Business pursuers. All of these occupations involve direct or indirect dependency on land. Land

NSOU CC-SO-02 171 rights and changes in rules go unnoticed. Tribal people are unaware or are made unaware about the rules which govern India's land rights. They do not have access to land records, not even the Record of Rights. This lends them to a higher probability of getting exploited, by the non-tribals and in some cases by the local officials. Wherever lands are given yet the pattas are not given, or pattas handed over yet the land is not shown. There is a discrepancy in demarcation of Scheduled Areas. In some places it is village wise and in some places it is area wise. There should be a clear village-wise demarcation of the Scheduled Area to avoid ambiguities and exploitation of tribal lands. Some of the tribal villages surrounding the Scheduled Areas are administratively called the Tribal Sub-Plan Areas, where land alienation is high and has numerous pending cases. Land alienation within tribes is a serious problem. A special protection should be provided for the local tribes by a process of categorization of tribes both for the purpose of preventing land alienation from lesser-developed tribes, and for a more equal distribution of reservations and other constitutional provisions. As commoners are difficult to manage, tribal people have frequently been denied from their rights over land. Their compulsion led to a situation where tribal people purchased seeds and other components from local money lenders against loan which ultimately caused chronic indebtedness and displacement from land. The unsatisfactory state of land records contributed a lot to the problem of land alienation. The tribal people were never legally recognized as owners of the lands which they cultivated. The second form of land alienation is reported to have taken place due to 'benami' transfers. Another form of land alienation is related to the leasing or mortgaging of the land. To raise loans for various needs they have to give their land as mortgage to the local moneylenders or to the rich farmers. Encroachment is another form of dispossessing them of their lands and this is done by the new entrants in all the places where there were no proper land records. Bribing the local Patwari for manipulating the date of settlement of land disputes, ante-dating etc., are resorted to claim the tribal lands. However, being the natural owners of forests and its adjoining lands the tribal people are being deprived of their rights to own them. They have been relegated from their earlier 'self-reliant' status to a 'dependent' one. Coupled with the exploitation by the non-tribes, the State legislations also proved detrimental to their interests. Therefore, to understand the root causes behind the land alienation process of the tribal communities, its relationship with the changes in the socio-economic structures have to be understood properly.

NSOU CC-SO-02 172 12.6.2 Bonded Labour : Slavery convention (1926) and International Labour Organisation (ILO) (1930) argue that forced labour, bonded labour, etc. are to be defined on the basis of labour and services extracted from a person as a penalty where the person was not involved voluntarily. United Nations Organization sees bonded labour as a special kind of forced labour (1956). However in India bonded labour is characteristically more complex. Major reasons behind bonded labour are link between caste, social structure and bondage, traditional feudal social relations and bonded labour. Small scale and localised quarrying and mining invite labourers from nomadic tribes and rural poor. They are irregularly paid and they remain bonded without proper work place protection. Instances are reported from Haryana, U.P, M.P, Rajasthan, Karnataka and Tamil Nadu. India has a strong and substantial Bonded Labour System Abolition act of 1976. It recognises: a) overlap between forced and bonded labour, b) contract labour and interstate migration issues, c) embeddedness within social customs. However, since states showed reluctance, it is challenging to identify bonded labours and accordingly, the Supreme Court has tasked National Human Rights Commission for monitoring the implementation of the act.

12.6.3 Issues Related to Health : Malnutrition, as expected, is the most common health problem among tribal people. In addition, communicable diseases such as tuberculosis, malaria, and STDs are major public health problems. Some tribal groups are also at high risk for sickle cell anemia. Generally tribal diets are seen to be deficient in protein, iron, iodine, and vitamins. According to the NFHS-3 survey 47% of tribal women are having chronic energy deficiency (CED) compared to 35% among the general population. The most common diseases seen among them are respiratory tract infections and diarrheal disorders. 21% of children suffer at least two bouts of diarrhea every year and 22% suffer from at least two attacks of respiratory infections. Tribal population accounts for 25% of all malaria cases occurring in India and 15% of all falciparum cases like intestinal helminthiasis or worm infection is widely prevalent among tribal children (up to 50% in Orissa and 75% in MP). Skin infections such as tinea and scabies are seen among tribal people due to poor personal hygiene. Sexually transmitted diseases are relatively more common (7.2% prevalence of syphilis among Kolli hills tribals of Tamil Nadu). The prevalence of tuberculosis is high, especially in Orissa. Sickle cell trait prevalence varies from 0.5% to 45%, disease prevalence is around 10%. It is

NSOU CC-SO-02 173 mostly seen among the tribes of central and southern India, not reported in North- East; the prevalence of tobacco use is 44.9% among tribal men and 24% among tribal women. Those who live in remote places and are shy of mixing with the larger community are often the worst sufferers of health hazards. The per capita health expenditure among tribal is higher than regular population. The available health infrastructure, i.e. the number of health care centres, professionals, and the distance is considered to be the determinants of the quality of health care facilities available. However, many recent studies have shown that sometimes even if health care facilities are available, tribal people tend to depend on their traditional system. The World Health Report (2000) has put stress on the importance of healthy delivery and in healthy outcomes, also stressing on the awareness of the generation about hygiene and available health infrastructure. The role of indirect intervention was removal of chronic poverty and a culture change, which was thought to be the prime factor for improvement in health and hygiene. At the time of independence the government system of health care was wholly urban centred. The rural areas depended on traditional faith-healers and voluntary agencies run by the missionaries. The importance lies in making health service facilities available at micro level with more emphasis on this section. As a result the health issues are dealt by clubbing them together with nutrition, sanitation, family planning, health education, awareness generation etc. The village community health workers chosen by village people now follow a decentralized agenda.

12.6.4 Education : Traditionally tribal communities have undergone drastic changes due to large scale migration, encroachment by outsiders and increasing vulnerability of the resources on which they have traditionally depended. Though many measures like scheduling of tribal areas, increasing land transfer and recognition of the rights over resources is encouraged by the Government of India. Yet, these people are facing problems like land alienation, displacement, indebtedness and bonded labour. Many of the problems are rooted in their increasing attachment with dominant culture and lack of basic competence in education. Nehru advocated for adopting a non-isolation strategy for the tribes, but failed to build capacity for them to cope with challenges put forth by modern culture. The capacity building initiatives quite clearly must involve a high emphasis on the education sector, i.e. education for tribal population to gain the NSOU CC-SO-02 174 power and self reliance and to cope with and transform their material reality. The universalization of primary education in India since 1950 is emphasised but remains underperformed. In recent decades a number of incentives are provided, e.g. Sarva Siksha Mission in 2003 - providing elementary education to all children in the age group of 6 - 14 by the year 2010. Mid-day meal scheme of 2001, provides mid-day meal to school going children and has dramatically increased the enrollment rate. However, in the 9th plan special provisions including pre and post matric scholarship and hostel facilities are initiated exclusively for tribal students..

12.7 Solutions to the Problems of Tribal Community Various solutions have been presented for dealing effectively with the tribal problems. The tribal problems have been approached from three viewpoints. They are as follows: a) Assimilation: Assimilation is one of the ways of dealing with the tribal problems. According to this approach, we cannot deal with tribal problems on the basis of tribal culture and life but should change them to fit the frame of new community. According to this solution advocated by the social reformers and voluntary organizations, assisting and encouraging the tribes to assimilate them with the mainstream of national life, can alone permanently solve the tribal problems. The Christian missionaries on the one hand, and the Hindu social reformers like Thakkar Bapa on the other, have been trying to assimilate them into Christian and Hindu community respectively. This approach has its own limitations as complete assimilation by giving up all of their traditional tribal beliefs, practices and ideas is a difficult task. Any attempt to impose the external cultural practices on them, creates in them guilt feelings, confusions and mental conflicts. This solution may even create economic, religious and moral degradation among them. b) Isolation: Elwin have suggested that they must be kept at a distance from the rest of the society. Keeping them in isolation in some "National Parks" or "reserved areas" would solve two problems: (a) the tribals would be in a position to maintain their independent identity; (b) they would be free from the exploitation of outsiders. The champions of this approach are of the view that sufficient time must be given to the tribal groups to assimilate themselves with the rest of the community. The limitation of this approach is that once they are kept in isolation they are likely to develop vested interests and keep themselves permanently away from others.

NSOU CC-SO-02 175 c) Integration: The third view, which is actively followed in the recent years, is that of integration. The policy of isolation is neither possible nor desirable, and that of assimilation would mean imposition. Hence integration alone can make available to the tribes the benefits of modern society and yet retain their separate identity. This view recommends the rehabilitation of the tribes on the plains along with the mainstream population, but away from their native places such as hills, mountains, forests, etc. This suggestion has also been criticized as this has often been advocated to further the interests of industrialists and capitalists. This solution is not appreciated on the ground that it may create economic and moral decadence to those who are separated from their beloved land to plains. Still, the policy of integration which aims at developing a creative adjustment between tribes and non-tribes has been supported by thinkers and writers like Pandit Jawaharlal Nehru. Pandit Jawaharlal Nehru in 1957 in his foreword to Verrier Elwin's "The Philosophy for NEFA", has laid down five principles, that is, "Panchasheela", the policy of integration. The tribal "Panchasheela" or five principles as has been enunciated by him are as follows: (i) Nothing should be imposed on the tribal people. They must be allowed to develop along the lines of their own genius. We should try to encourage in every way their own traditional arts and culture. (ii)

58%

MATCHING BLOCK 53/104

W

Tribal rights in land and forests should be respected. (iii) Attempt must be made to train and build

up a team of their own people to the work of administration and development. Some technical personnel from outside will be of great help for them in the beginning. But too many outsiders must not be sent to the tribal territory. (iv) Over-administering the tribal areas or overwhelming them with too many schemes must be avoided. We should not work against their own social and cultural institutions. (v) The results of the work must be adjudged by the quality of the human character that is evolved and not by statistics or the amount of money spent. The policy of isolation is neither possible nor desirable, and that of assimilation would mean imposition. Hence integration alone can make available to the tribes the benefits of modern society and yet retain their separate identity. The policy of integration which aims at developing a creative adjustment between tribes and non-tribes has been supported by thinkers and writers.

NSOU CC-SO-02 176 12.8 Linguistic Classification Among Tribes in India Most of the tribal communities speak non- Aryan languages which are divided into four linguistic families: (a) Austro-Asiatic - Khasi, Nicobari, Santhali, HO, Mundari (b)Tibeto-chinese - Bhotia, Lepcha, Abor, Miri, Dafla, Garo, Naga (c) Dravidian-Korwa, Badaga, Toda, Kui, Kota, Gondi, Maler, Oraon, (d)Indio-European - Hajong, Bhili. 12.9 Summary The tribes of different parts of India are passing through an accelerated phase of transformation and have greatly disturbed the equilibrium in the traditional society. As a result of their long and continuous contacts with the regional Hindu castes, many tribal groups have long been assimilated as castes in the regional caste hierarchy. Numerous other tribes have undergone selective acculturation and have added selected traits or features of the regional Hindu castes. In this process, they have failed to occupy any rank in the caste hierarchy. The spread of Christianity through the Western missionaries succeeded in bringing about a marked change in the sacred, social, educational and economic status of the converted tribal groups. In recent years, urbanization and industrialization have brought about revolutionary changes in some parts of tribal India. These have led to the development of communications within the tribal areas and with the outside world, introduced monetized economy, spread formal and modern education, led to the extension of facilities like medical and administrative aids and introduction of advanced technology to exploit the mineral, forest, power and other industrial resources. But the rate of change evidently differs among different types of tribes.

Moreover, they have retained the traditional elements of their ways of life, though these are modified to a greater or lesser extent.

12.10 Model Questions 1. Short type question (5 marks) A. Define tribes. B. Write down the popular names of Indian tribes.

NSOU CC-SO-02 177 C. Briefly discuss the geographical distribution of Indian tribes. D. Briefly discuss the economical problems of Indian tribes. E. Write down the linguistic classification among the Indian tribes. 2. Answer in detail (10 marks) A. Discuss the major problems faced by Indian tribes. B. Classify the Indian tribes on regional basis. C. Discuss the basic features of Indian tribes. D. Discuss the major approaches to solve the tribal problems in India. E. Discuss the major problems and the solution of Indian tribes. F. Define tribes. Discuss the major feature of Indian tribes. G. Discuss the popular names and geographical distribution of Indian tribes. 12.11

Objectives After you have read this unit you should be able to describe

Cultural traits of Indian Tribes Linguistic pattern of Indian tribes Economical structure of Indian Tribes Tribal polity. 13.1 Introduction The word "tribe" is generally used for a socially cohesive unit, associated with a distinct territory, and considered as politically autonomous. Different tribes have their own cultures, dialects, life styles, social structures, rituals, values, etc. The forest occupies a central position in tribal culture and economy. The tribal way of life is very much dictated by the forest right from birth to death. It is ironical that the poorest people of India are living in the areas of richest natural resources. Historically, tribes have been pushed to corners owing to economic interests of various dominant groups. The tribes are a part of the Indian society and general problems of consciously changing or modernizing Indian society are applicable to them. Before independence, tribes enjoyed an almost untrammelled control over forestland and its produce for their survival. Forest offered fodder for their cattle, firewood to warm their hearths, and above all a vital source of day-to-day sustenance. The wonderful equation between man and nature demolished after independence with the encroachment of rapacious contractors on tribal land and the indiscriminate destruction of forest in the name of development. 13.2 Culture A tribe is an Indian group which possesses certain qualities and characteristics that make it a unique cultural, social, and political entity. The nature of what constitutes

NSOU CC-SO-02 183 an Indian tribe and the very nature of tribes have changed considerably over the course of centuries, but certain characteristics have still remained. A tribe is viewed, historically or developmentally, as a social group existing before the development of, or outside of, states. Total population of Scheduled Tribes is 84,326,240 as per the Census 2001 which accounts for 8.2% of the total population of country. Majority of the Scheduled tribe population live in rural areas and their population is 10.4 % of the total rural population of the country. It is believed that persons of tribal origin are the earliest among the present inhabitants of our country. The historical study of human civilisation can be possible through the study of tribal Culture. The study of the tribal life will obviously show the way in which human civilisation originated, and may further reveal how the simple way of life of people living in Indian soil became so complex. There has been a continuous interaction between the tribals and non-tribals. As a result, the tribal way of life has been much influenced by their Hindu caste neighbours. In spite of this, they have retained some of the customs and traditions which form the original part of their culture. At this point, we see two things which seem to be in contrast to each other. On the one hand, the tribals are still guided by the principles of their own community and lead a distinct way of life in comparison to their Hindu caste neighbours. On the other hand, there is little difference between the tribals and the non-tribals in the economic way of life, clothing, food habits etc. 13.3 Linguistic Pattern of Indian Tribes The linguistic map of India and the languages found among the tribes indicate that the Dravidian linguistic family is found in the Dravidian region in South India and in a few pockets of middle India in Chhotanagpur and north-western border near Baluchistan. Another linguistic family, Austro-Asiatic, is found in certain pockets in the north-eastern Himalayan region in Meghalaya, in Nicobar Islands and extensively in middle India and adjoining western India. Tibeto-Chinese is the third language which is traced on the map and is prevalent all along the Himalayan region. The Indo-European language is found in the remaining part of India. All these suggest a linguistic drift from north-western to southern India and again in the pockets of middle India in the case of Dravidian languages. There is much controversy regarding the origin of the Austro-Asiatic language. W.Schmidt named the Munda language as Austro-Asiatic. Hutton opined that the Austro-Asiatic language was brought by the Kolarians through the west end of the Himalayas and by the Mon Khmer speaking people from

NSOU CC-SO-02 184 the east of the Himalayas. The Tibeto-Burmese language entered India from the north and spread all along the Himalayas. Thus the tribes of India speak different languages in different regions and groups, and can broadly be classified into four main linguistic families. These are o Austro-Asiatic Family: Mon-Khmer Branch : Khasi and Nicobari Munda Branch : Santhali, Kharwari, Ho, Mundari, Gondi, Kharia, Savara, Khond, Gadaba, etc. o Tibeto-Chinese Family : Siamese-Chinese sub-family: Tai group---Khampti, Phakial, etc. Tibeto-Burman sub-family: Tibeto-Himalayan Branch: Bhotias of Darjeeling Western sub-group of Pro-nominalized Himalayan group: Chamba, Lahauli, Swangli, Kanauri, etc. Non-Pro-nominalized Himalayan Group: Rong or Lepcha, Toto, etc. Arunachal Branch: Aka or Hrusso, Abot, Miri, Dafla, Mishmi, etc. Assam-Burmese Branch: Bara or Bodo Group: Plains Kachari, Dimasa or (Hill) Kachari, Garo, Tripura, etc. Naga Group: (i) Naga sub-group: Angami, Ao, Sema, Rengma, etc. Naga-Bodo sub-group: Kachcha Naga, Kabui Naga, etc. (a) Kachin Group: Singpho (b) Kuki-Chin Group: Kuki, Paite, Mar, Thadou, Ralte, Lushai, etc o Dravidian Family: Dravidian group: Korawa, Yerukala, Yarava, Badaga, Toda, Kota, Kurukh or Oraon, Malto or Maler, Kui Kandhi or Khond Gondi, etc.

NSOU CC-SO-02 185 o Indo-European Family: Hajong, Bhili, etc. 13.4 Dress and Ornament The use of particular dress and ornaments among tribes are important marks of distinction in culture. A particular style of dress immediately indicates a particular culture group, and can be a much more direct mark of distinction than language. Dress and ornaments are important both within and outside tribes. Ornaments and styles of dress are often indicators of an individual's status within a given tribe. To the outside world, they immediately distinguish the tribal from mainstream society. Styles of dress and ornaments are also important between tribes themselves, and particular segments of tribes. Particular ornaments can have very culturally specific meanings among proximal tribes. The preference for particular styles of dress also indicates the degree of influence the outside world has had on a tribe. Many times, the men of a particular tribe will adopt Western-style dress, while the women will maintain traditional styles of dress and ornaments. There are a number of factors that influence this, one of the most important is that men tend to have greater interaction with non-tribal cultures, often going to urban centers for employment, or engaging in trade. We will now look at some case studies. With the Mal Paharias, we find that those who live closer to the plains have adopted a style of dress influenced by the larger society. Many of the men wear dhotis and lungis, while the women often wear saris and blouses. Women also wear less clothing as the distance increases from the plains. The Mal Paharias do not use much ornamentation. The women often wear glass bangles bought from weekly markets. The lack of tribe-specific ornamentation could indicate simple tribal tradition, or could demonstrate the process of cultural assimilation and erosion. The Bondo people have very specific styles of dress and ornaments. Traditional dress is found among both men and women. The women of the tribe wear a style of dress which is very scanty. The women's ornaments are very ornate. These ornaments consist of a number of bead necklaces and aluminium necklaces and bracelets. The women also shave their heads and wear headbands of glass or beads. In Bondo culture, children are naked until the age of six or seven. The Bondos produce their own clothing on traditional looms from materials gathered from the forest. The men wear a traditional hand woven loincloth. The Bondos express their unique culture through their style of dress. The means of production of clothing and ornaments is connected with their economic system. Their economy eschews money and is based on the barter system. As compared to the Mal Paharias, the Bondos strongly maintain their culture, which is expressed through both language and dress. A Bondo tribesman is immediately recognizable by the unique style of dress. From these two brief examples it is apparent that maintenance of culture-specific styles of dress and ornamentation is a strong indicator of the vitality of their culture. It also indicates the degree of influence from the outside world on their culture. 13.5 Customs, Environment and Religion Another central mark of distinction is that of cultural customs, religious beliefs, and relation to the environment. These include everything from marriage customs, music, calendrical festivals, religious ceremonies, and economic systems. The maintenance of rituals and marriage customs often survive longer than other marks of distinction such as language and dress and ornaments. These forms of cultural expression are fundamental to the construction of unique tribal identities. Shared cultural practices create a feeling of solidarity among members of a particular tribe, and often differentiate them from other tribes and members of the plains. Rituals and festivals are of central importance to tribal identity, and can even survive in a modified form after religious conversion and prolonged contact with the outside world. Connected with these customs are often unique myths of the origin of the people, and their relation to the environment. The environment can also shape and dictate many of these customs and beliefs as well. 13.6 Communitization In the absence of any formal education, socialisation and knowledge of traditional values, arts and crafts were made possible through institutions known as bachelor's dormitories, among many Mongoloid and Austroloid tribes. Among the Naga tribes like Konyak, Ao, Zemi, Angami, Lotha, Serna and Tangukhuls it was known as Morung, Ariju, Kienga, Kichuk Champa, Dika Chung and Longshim respectively. Mizos call it Zawlbuk, Noctes Paa, Lalungs Samadi Muria Ghotu and GarosNokpantes. Tribes in Jharkhand area like Mundas call it Gitdora and Oraons Dhumkuria. Dr. S. K. Chatterjee and B.R.Choudhury have observed that this common club house system which was widespread among north Indian tribes might have come from Austric predecessors (B. R. Choudhury, NSOU CC-SO-02 187 p. 159). Scholars point out that similar dormitory system existed in many tribes, in Nigeria, Congo, New Guinea, Borneo, Newzealand and other places till the twentieth century (Ruivah, p. 170). The dormitories among various tribes have some common features like admission restricted to bachelors, common sleeping places, separate houses for boys and girls, strict exogamy, i.e.no permission to marry members of their own common house. Generally dormitories are intended to members of one clan with whom no marriage is allowed. In each village there can be one or more dormitories as required by the population or the clans. Boys' dormitories are strictly forbidden for women while girls' dormitories can be visited by boys; for the tribal's chastity begins only with marriage. The primary loyalty of a tribal boy is to his common house, which is the centre of all social and cultural activities of the village. Not only has it the duty to protect the village from enemies, but it also undertakes public works such as construction and repairs of village roads, water tanks, sowing, harvesting and hunting. It imparts traditional values to the tribe, training in arts and crafts, dancing and singing. 13.7 Tribal Economy Economy simply means economics system of institution. Economy can be understood as an institutional arrangement that facilitates acquisition, production, and distribution of material means of survival for individual and community life. The economic system or its structure is repetitive and relatively permanent. According to Dalton (1969) "an economy is a set of institutionalized activities, which combine natural resources, human labour, and technology to acquire, produce and distribute material goods and specialist services in a structured and repetitive fashion". There are three interrelated features that characterize tribal economy. They are as follows: 1. It is a structural arrangement and has enforced rules for the acquisition and production of material goods and services. 2. In the process of acquisition and production of goods and services, division of human labour, use of natural resources and application of technology (tools and knowledge) are involved. 3. In the distribution process, superficial devices and practices such as market place, device for measuring some types of transaction are involved. Thus economy can be understood as an institutional and normative structure that

NSOU CC-SO-02 188 governs the economic relations among a group of people. This group may range from a tribal village to a modern nation even the entire world. The major economic processes governed by this system are acquisition, production and distribution of goods and services necessary for human survival and sustenance. 13.8 Structural Features Of Indian Tribal Economy The structural features of Indian tribal economy can be divided into a number of segments. 13.8.1 Forest Based Economy : Tribal economy is embedded in and revolves around the forest ecology. Not only their economy, but also the culture and social organization are interwoven with forests. Forest constitutes the major natural resource base for livelihood in all the tribal regions. Tribal people depend on forests for fulfilling their basic needs. They harness the forest resources with the help of simple implements without much technological aid from the outer world. The livelihood of the tribes mainly depends on collection of minor forest produce, hunting of wild animals and fishing in the shallow waters of the forests. They collect edible roots, tubers, fruits, nuts flower, leaves, fiber, bamboo, honey, wax etc for their subsistence. Most of them hunt deer, birds and fish. They use simple indigenous tools such as wooden bamboo pots and vessels, bamboo baskets and sticks for food gathering. In hunting they employ different types of traps and weapons. Availability and adequacy of food from these sources differ according to season. 13.8.2. Domestic Mode of Production : Family constitutes the basic unit of consumption as well as production in the tribal economics of India. In the simple economy of various tribal community all the members of the family together form the unit of production and are directly engaged in economic process of production and consumption. The decision-making process of allocation of labour and produce are governed by the familial stipulations. The household production is mainly geared for fulfilling their consumption needs rather than for the market. It is appropriate to call tribal economy as subsistence economy. The division of labour in the tribal household is based on age and gender. The gendered division of labour is based on the primitive belief that women are physically weak. The boys and girls are allotted different jobs suited to their age.

NSOU CC-SO-02 189 13.8.3 Simple Technology : The development of an economy depends upon the level of its technological advancement. Technology, involves the use of tools and implements in utilization of natural as well as human resources for productive purposes. The tools and implements used in the productive and distributive process of tribal economy are generally crude, simple and indigenously developed without the aid from outside. 13.8.4 Absence of Profit in Exchange : Maximization of profit is the main goal of economic transaction that drives the modern capitalistic economies. But the profit motive is quite absent in the economic dealing in the tribal economies of India. Two major institutional factors i.e. the communal nature of economy and absence of money as a medium of exchange are responsible for this. The mutual obligation and extension of free labour to the fellow beings result in no significant surplus at all. Money as a medium of exchange is almost absent in the tribal economies. Hence, there is no scope for measuring the value of goods and services and storing the profit generated in the exchange process as wealth for posterity. 13.8.5 Community as a Cooperative Unit : Community works as a cooperative unit in tribal societies and economic activities are carried away collectively as a group. Primitive economy is embedded in other community relationships. Dalton held that the factors such as low-level technology, small size of the economy and its relative isolation from outer world contributes to mutual dependence- people sharing many social relationships. In economic interactions, each tribal village community is considered as cooperative unit. The villagers have close economic relations. Most of them are engaged in common economic activities such as grazing the cattle. Their youth jointly graze the cattle and defend their village together. The adult men and women jointly transplant and harvest paddy in each other's field on a reciprocal basis. 13.8.6. Gift and Ceremonial Exchange : Universally, reciprocal gift, giving hospitality to social intimates plays a vital part in tribal economies. Process of distribution in tribal societies is part of non-economic relational matrix and takes the form of gift and ceremonial exchange. Each group, whether a family, a group of kinsmen communities, villagers, or the tribe as a whole, implies appropriate norm of reciprocity. Economic anthropologist Dalton (1971) holds

NSOU CC-SO-02 190 that the tribal mode of transaction is that of reciprocity i.e. material gift and counter gift giving induced by social obligations of kinship. 13.8.7 Periodical Market : Market is a major economic institution that regulates as well as facilitates distribution of goods and services among the people all over. In the rural areas, periodical markets and the system of barter exchange play a vital role in the economic life of Indian Tribes. These periodical markets were weekly, fortnightly, of biweekly and are widespread in the rural areas. These periodical markets, locally known as Bazar and/or Hat, generally serve the tribal villagers within the radius of 5- 10 KMs. and function on a specific place, at regular intervals of time. In these markets, people of different tribes and caste groups come together and conduct their business transaction. 13.8.8 Interdependence : The economic relationship among the various tribal communities are often considered, as one of interdependence while the spirit of competition is almost absent in the tribal economic life. The relationship between tribes, within tribes, or tribal people and non-tribal people are functionally interdependent. Vidyarthi and Rai (1976) observed that the economic functional interdependence is similar to the Jajmani system, found among the Hindu caste groups in most of the regions of the country. Under the jajmani

92%

MATCHING BLOCK 55/104

W

system each caste group, within a village, is expected to give certain standardised services to the people of other

caste. The family head served by an individual is known as the jajman, while the man who performs is kamin of the jajman. Economic interdependence among the tribes has been observed in different tribal zones of the country in variety of ways. 13.8.9. The Plain Agriculture Type : The predominant occupation of the tribal population in India is that of settled agriculture or plain agriculture. In its simpler form plain agriculture requires tilling with a pair of animals. Two-third of the tribal population in the country is engaged in settle agriculture as their primary means of survival. However, the agriculture as practiced in tribal India is simple, less productive and at the subsistence level. 13.8.10 Cottage Industry : Among the tribes of India, a good number depends on crafts and cottage industries such as basket making, making of iron and wooden tools, spinning and weaving,

NSOU CC-SO-02 191 metal work for survival. They use simple tools in their day today work. They live in mixed tribal villages and generally have no exclusive villages of their own. They sell their finished products in the periodical markets. 13.8.11 The Agricultural and Non-Agricultural Labour Type : There is no single tribe that can be included under the agricultural labour or industrial labour type. Some of the members of agriculture and artisan tribes have taken the avenues of employment in agriculture and industries as casual labours. Agricultural Development on the one hand and industrialization in the tribal region on the other, has contributed to the emergence of these types of labour among the tribal people in the country. The tribal agricultural workers mostly work in their own locality within a radius of a few kilometers. On the other hand non-agricultural or industrial workers work in different industries. Most of the industrial labours are generally seasonal migrants to distant towns, mines, mills and wage labours in railway and road construction, forestry, civil work, etc. Sometimes they move to their workplaces in distant locations in bands inclusive of both genders. Saharia agricultural labour was found wherever there was high incidence of indebtedness. Education advancement, reservation policy of government of India etc. have prompted a significant proportion of the members to take up the skilled white collar jobs and trades of different kinds. Many individuals and households belonging to the tribes are presently working in government offices, hospitals factories and business enterprises. 13.9 Tribal Polity A tribe's political organization is generally formed to satisfy the basic needs of the group. Though the groups are egalitarian, the leaders of the group, mostly male, enjoy formidable power based on both their ascribed and achieved status. 13.9.1 Chieftainship in Tribal Society : In most of the tribal societies, the system of administration was based on the system of 'chieftainship'. Therefore, the kind of early state formation among the tribal was first seen in the form of Chieftainship system. The term 'Chief' cannot be equated with the term 'King' in many respects. But in some cases, the use of king and Chief seems to be interchangeable as it is confusingly used in many places. However, many a times, tribal Chiefs are also referred to as kings, depending on the size of population

NSOU CC-SO-02 192 they ruled; for example, the ruler of Buganda in Uganda who ruled over nearly two million people was known as the 'King', whereas the Chief implies smaller size of population, for example: Chief of Ubungu in Tanzania who ruled about twenty thousand people. But the use of the terms king or Chief does not have any conspicuous implication in the African context. Likewise, the Mizo word 'Lav' signifies a person who is above all others, the supreme head and military leader in times of war and the repository of an authority within his dominion regardless of the number of subjects he had. Peter Skalnik further observes from his field work in Nanun, South Africa, that kingdoms and monarchies were just states, which carried various epithets such as primitive, archaic, traditional, tribal or early, to distinguish them from the modern state. Marshal Sahlin view that state represents the final stage of our stage evolutionary process through which the early society develops. These are: band, tribe, chiefdom and state. He says that the tribal state was characterized by a segmentary lineage system and this lineage system is a social means of intrusion and competition and tends to be economically and politically autonomous because they are fissioning down the generations and occupying separated territories which too are further differentiated through internal and external intrusion. This segmentation could be genealogical as well as territorial. In this state there is a virtual lack of economic solidarity, the polity therefore is fragmented, materially the society remains in a 'simple Neolithic mode of production' typified by shifting agriculture and simple pastoralism'. It is only when these segments begin to become rank differentiated internally, and several of them also become rank relative to each other, thus creating a more extensive polity, does the tribal society progress into next stages of chiefdom and state. They may form a segmentary hierarchy. A tribe tends to remain egalitarian in that no one of the families is politically superior or more powerful in hereditary ranks than any other. In a tribal system differentiation of structure however, has not been carried to the point where separate bodies of political control, full economic specialization or true full time religious specialization have developed. On the contrary, Elman R. Service observes that, in contrast to the ideal egalitarian tribal system we find cases which involve rise in the prestige of the person holding the office of Chief. 'Chiefdoms' are thus characterized by hereditary ranks. Chiefdoms are closely related to redistribution as a mode of exchange, whereas in the tribes it is typically reciprocal. The chiefdom provides a centralized direction to a hitherto tribal society and gives greater productivity without necessarily any change in

NSOU CC-SO-02 193 technological methods. But they do not have true government. The chiefdom is a development of the segmentary tribal system to higher level of integration. A chiefdom is, however, not a class society. Regarding egalitarian society, it is observed that, 'political authority is uncentralized, and there is no permanent, institutionalized inequality among fundamental social units such as families and villages. Leadership tends to be ephemeral, and the individual leaders that emerge do so because they exhibit unusual personal characteristics, like intelligence and bravery, that attracts followers. Leadership status is achieved, not ascribed at birth'. In Mizo society, the Chieftainship was based on the power one derived from his decent, kin connections, control on land, forests, hills and rivers beyond his own village. It is further argued that chiefdoms will inevitably evolve into states, nor as static. Besides, chiefdoms are prone to repeated cycles of political growth, marked by an increase in the power and resources (both human and nonhuman) controlled by the chief, followed by a period of decline. This proved to be true in the case of Sailo (Lusai) Chieftainship as their superiority was attained because of political power over time and subsequently in their interest they developed the notion of superiority by making the Chieftainship hereditary and the most prominent ruling clan in Mizoram became the Sailo. There was a feeling of strong solidarity which gave rise to the feeling of high rank and supra-local solidarity. In rank societies chiefdoms, or authority is permanently centralized in the office of Chief, which exists apart from the person who occupies it and upon his death must be filled by someone of similarly elite descent, high status is largely inherited. However, in the case of Lushai Chieftainship, the leadership was confined to their respective village units. In other words it was one - village authority. Despite the existence of chief clans and the chieftainship, the Lushai society lacked centralised political structure. The villages did not form the smallest unit in the pyramid form of the social structure. Independent village chief did not combine themselves. In fact, the concept of the social structure of the society was alien to the tribe. The state organization and the pyramid-like authority and leadership structure was conspicuous by their absence. There was no gradation of the Chiefs. All the Chiefs were independent in the areas of operation. The political authority naturally was widely distributed and diffused among a large number of villages.

NSOU CC-SO-02 194 13.10 Power and Functions of the Chief In Mesoamerica, Peru, Egypt, Mesopotamia, the Indus valley and China, it is observed that, the origin of bureaucracy can be found in those cases where chiefdoms evolved into the first pristine states through the process of primary state formation worldwide. In Mizo society, the Lushai Chiefs had more than one village and the other villages than his own was under a headman. The main village used to have during pre-colonial period up to 400 houses. In later time its number decreased. The Chief with his upa, zalen and ramhual used to look after the judicial as well as executive matters including the agricultural activities. The headman of a satellite village used to look after his village affairs in consultation with the chief. A big headman was allowed to trace his descent in the Patrilineal line; he used to emphasise his blood relations with the Chief. The sons of concubines only in rare circumstances could become a Chief. The right to rule over the people was enjoyed by the one who had the power and ability to command a large number of people and to repeal any attack by other Chiefs. Thus, chieftainship originated in the physical and intellectual power of a person. Or a person who had the power of giving security to the people became a chief.

According to Parry, 'A chief is the repository of all power, and the fountain head of justice. He is also 'the father of his people'. His role is multifunctional despite the institution of the chief's non-chiefly assistant'. As an administrator and supreme head of the village, the Chief enjoyed the right : 1. To order capital punishment to those who committed murder or rape, 2. To seize food stores and property of the villagers who wished to transfer their allegiance to other Chief, 3. To levy tax from traders who were doing business within his jurisdiction, 4. To attach the property of his villagers when he wished or deemed fit, with or without fault on the part of the villagers, 5. To help bawi who were by custom not open to redemption, 6. To freedom of action in relation to making his son Chief within his land, 7. To freedom of action in relation to all kinds of bawi who constituted the means whereby the Chief could cultivate and acquire the ability to sustain his village in peace and in war time, and

NSOU CC-SO-02 195 8. Proprietary rights over lands. It was a fact that the chief had the right over the life and death of his subjects.

13.11 Summary It can be concluded that culture as a learned behaviour is a continuous process which passes from one generation to the other. Therefore, culture is basically a process of evolution. In the evolutionary process of development, different cultures have taken different shape according to the time and social requirement. Hence, there is cultural multiplicity and diversity of various cultural traits among different communities. Some see their own culture as superior and the culture of others as, inferior. This ethnocentric bias has developed cultural relativism leading to cultural typologies like 'barbarism', 'uncultured', 'pre-civilised', 'primitive', etc. But a value neutral analysis proves that every culture is shaped by the prevailing socio-economic milieu and various cultural traits are related to the life pattern and economic activities. Specially, tribal culture is shaped by their economic activities and vice versa. Their polity, religious practices and worldview act as binding forces to keep their society together as a coherent force. Their social practices, marriage system and social system as a whole still retain its uniqueness in spite of cultural contact with their non-tribal neighbours and the impact of modernity. These unique characteristics are said to be the core of tribal society and culture that can be distinctly studied from tribe to tribe and even among the same tribe from place to place. 13.12 Model Questions 1. Short Type Question (5 marks) A.

Write down the domestic mode of production among the Indian tribes. B. What do you know about the chieftainship in tribal polity?

C. Write a short note on the dress and ornaments as a distinct features of tribal culture. D. Write a short note on tribal economy. 2.

Answer in Detail (10 marks) A. Write down the linguistic pattern of tribal community. B. Explain the basic feature of tribal economy.

NSOU CC-SO-02 196 C. Discuss the power and function of the chief in a tribal community. E. Explain the tribal economy system. F.

Discuss the tribal polity. G. Discuss the cultural traits of Indian tribes . 13.13 References and Suggested Readings 1. Annual Report

Objectives After you have read this unit you should be able to describe

Studies in Indian villages. Village as a community. Characteristics of Indian villages. Changes in village community. 14.1 Introduction Among the earliest human groups, gathering was the main source of food. Gradually man acquired the skill and knowledge in agriculture. With the development of agriculture, people began to lead a settled life and human communities became more stationary. The emergence of village signified that man has passed from nomadic mode of collective life to the settled one. India is a land of villages. A great majority of villages are small with only around five hundred population each. Mahatma Gandhi's view that India lives in villages still holds good, at least from the demographic point of view. The village social life has its own peculiar characteristics. The village social 198

NSOU CC-SO-02 199 life norms strengthen the authoritarian and hierarchical norms in administration. The village social life, based on the hierarchical exchange relations greatly influence the behavior of civil servants in public organizations. Sociologists think that for defining an Indian village, its population, physical structure, and modes of production are definitely important. Usually, a village has less than five thousand individuals. Agriculture is the main occupation of the Indians and a majority of people in India live in the villages. Our villages help in strengthening our social bonds and bringing stability to our society in many ways. Our villages also help our society in another way namely that of preserving our culture. Village habitations have been an enduring feature of all human societies from the very dawn of human civilization and the idea of the village has occupied an important place in India. It has been one of the core categories

95%**MATCHING BLOCK 57/104****W**

through which India has been imagined and imaged in modern times.

It has preserved Indian culture and has its own social, cultural, economic and political importance. It has retained some of its individual features despite the passage of time. 14.2 Studies on Indian Villages According to M.N. Srinivas, "The studies of village communities which are currently being carried out in the different parts of the country would provide the future historian with a vast body of facts about rural social life, facts collected not by travelers in a hurry, but by men who are trained to observe keenly and accurately. These studies therefore constitute valuable contributions to the social, political, economic and religious history of our country. The study of Indian Rural Society has helped in developing certain analytical categories. Srinivas has pointed toward a social process, which he termed as Sanskritization, through which the lower castes try to bring about changes in their life-ways to obtain greater ritual purity, and thereby attain a higher status in the ritual hierarchy of castes. Marriott discovered the processes of Universalisation and Parochialization which explain the complexity of Indian civilization and the communication channels that exist between the Great and Little traditions of the country. S.C. Dube suggests that "the concepts of Great and Little Traditions, sanskritization, and universalization and parochialization offer us a good starting point, and from here we should build step by step a series of hypotheses and concepts that would ultimately lead to meaningful generalizations regarding the structure and processes of Indian NSOU CC-SO-02 200 society." He says, The structural-functional approach provides us with more or less satisfactory conceptual tools for the study of village communities. Robert Redfield's "folk-urban continuum' provides one such conceptual framework." Redfield brings out the idea that folk societies gradually transform themselves into village communities and isolate themselves from the ideal types. In India, both sociologists and anthropologists are jointly exploring the village community with a largely common methodology. In the year 1955, Dube's Indian Village, Majumdar's Rural Profiles (ed.), Marriott's Village India(ed.), and Srinivas' India's Villages (ed.) were the major publications. An Introduction to Rural Sociology in India, an anthology edited by A.R. Desai, appeared in a revised and enlarged version in the year 1959. Yogesh Atal points out that "every village has a distinct 'personality' of its own. It has its distinctive structure, network of kinship-affiliations, caste-composition and dominance, and leadership patterns. The south Indian village is different in many respects from a north Indian village. "On "village studies" in India, Prof. Ramkrishna Mukherjee suggests that there is the need to take up these studies from the perspective formulated and interpreted by cultural and social anthropologists and sociologists and we may also note the distinct importance of portraying the peculiar and specific way of life of a village. Prof. Mukherjee emphasizes that the merit of "village studies" usually conducted by social anthropologists and sociologists cannot be denied but the point remains that the two streams of "village studies" carrying the imprint of economists or social anthropologists or sociologists must meet at relevant sites. He maintains that until and unless the "economic" and "social" perspectives towards "village studies" meet at critical points, it is not possible to obtain a composite understanding of village life and a balanced view of the dynamics of village society. 14.3 The Village as a Community Distinguishing between "association" and "community", Maclver defines "community" as "circle of people who live together, so that they share not this or that particular interest, but a whole set of interests wide enough and comprehensive enough to include their lives" while an association "is a group specifically organized for the purpose of an interest or group of interests which its members have in common". In the light of the above definition it must not be assumed that in all areas noted in the Census Report, there were in existence village communities in the sense of

NSOU CC-SO-02 201 close corporations of people living a more or less common life. It is true that village community must have existed in some form or other in nearly every part of India; and evidences of its survival are still found, though less easily distinguishable in some places than others. While the "Indian village" is ancient, the actual villages have had short histories in the constant process of founding, conquest, destruction and depopulation. There are certain regions, however, where the system of village communities does not appear to have existed at all, as is evident from the earlier discussion. And, therefore, when we speak of village community and its self-governing institution we do not mean what is almost entirely an artificial creation for revenue and administrative purposes but one where the feeling of community centering on the village is the strongest, where it is a social unit of settlement of the village type. This also includes the village consisting of a central unit with one or more satellite hamlets together constituting a social unit. In areas like Kerala and Himachal Pradesh the emergence of community feeling centering on the village is very weak or virtually absent. In such areas where the settlement pattern is of homestead or dispersed hamlet type, the introduction of settled administration has tended to the formation of artificial villages as local units. But whenever the term "village" is applied, it must be understood to mean little more than the administrative area occupied by a group of people and does not necessarily connote any settled corporate life. The assumption that the "Indian village" is a community has, as already noted, a strong basis in historical fact even present fact more or less. The people living in a village had intimate social and economic relationships which were regulated by tradition and institutions which had evolved over centuries, unlike the comparatively superficial or transitory interests and ties which bind the neighborhood or a residential suburb in a modern city.

14.4 Characteristics of Indian Villages

Villages play an important part in Indian life. From the prehistoric times, the village has been enjoying an important place as the basic unit of Indian social structure. India can rightly be called a land of villages. The bulk of her population lives in the villages. According to the census of 1991, about 75 per cent of the total population lives in villages. There are 5, 75, 721 villages in the country, 26.5 per cent of the total rural population lives in small villages (under 500 persons), 48.8 per cent in medium sized villages (between 500 and 2,000 persons), 19.4 per cent in large villages (between 2,000 and 5,000 persons). The basic characteristics of Indian villages are as follows:

NSOU CC-SO-02 202 (i) Isolation and Self-Sufficiency: Almost till the middle of the 19th century, the villages in India were more or less self-contained, isolated and self-sufficient units. The inhabitants of the village had very little to do with the people outside. All of their essential needs were satisfied in the village itself. This feature of the Indian village is described graphically as follows: Each village tends to be self-contained, in each will be found persons with permanent rights in the lands as owners or tenants with hereditary occupancy rights; of these some cultivate all they hold, others with large areas at their disposal rent out to tenants on a yearly agreement a part or whole of their lands; below these in the scale are agricultural labourers, some have a field or two on rent, some work in the fields only at times of pressure and are mainly engaged in crafts, such as leather work, or in tasks regarded as menial. In all but the smallest village, there are one or two skilled artisans, carpenters or blacksmiths who provide and repair the simple agricultural implements, bullock gear and water-lifts. The household requirements are supplied by a shop or two whose owners usually provide the first market for the village produce and add to their earnings in money-lending. In short, it was more of a society within itself. However, changing political and economic conditions are putting an end to the isolation and self-sufficiency of the Indian village. The rapid development of the means of transport and communication has broken the barriers between the village and city. The former is now socially and even economically connected with the neighbourhood city or town. Political parties have made village the centre of their activities as much as the city.

(ii) Peace and Simplicity: The second feature of an Indian village is the atmosphere of simplicity, calmness and peace prevailing therein. In the village there is no noise and little sophistication. The humdrum activities of modern civilization are rarely seen there. Though occasionally a car or a bus rolling along the kutchra road enveloped in thick clouds of dust may be seen there, but, on the whole, life in the village moves with traditional quietude and peace. The villagers lead a simple life, eat frugally, dress simply, and live in mud-walled houses completely lacking in the trappings of modern civilization. But here also the old order is yielding place to a new one. The mud-walled houses are giving place to well designed buildings. Fashion is making its inroads in the life of young men and women of the village. Here and there notes of music issue from dry cell radio. However, this change is gradual and slow.

NSOU CC-SO-02 203 (iii) Conservatism: The inhabitants of the village are strongly attached to old customs and traditions. Their outlook is primarily conservative and they accept changes with extreme reluctance. They love old ways and are less eager to follow the advice of zealous social reformers regarding their marriage and other customs. Writing on Indian villages, Sir Charles Metcalfe wrote, "they seem to last where nothing else lasts. Dynasties tumble down; revolution succeeds revolution. Hindu, Pathan, Moghul, Maratha, Sikh, English all the masters change in turn, but the village communities remain the same." (iv) Poverty and Illiteracy: Probably the most glaring and also depressing features of Indian villages are the poverty and illiteracy of the village people. They are generally poor with a very low income. They take coarse food and put on rough clothes. The pressure on land is high resulting in fragmentation of holdings and poor productivity. Besides poverty the village people are steeped in ignorance and illiteracy. The opportunities for education are meagre in the villages. The village school is generally in a dilapidated condition. Facilities for higher education are practically nil. Due to poverty the villagers cannot send their sons to city for education. Due to illiteracy they cannot improve upon their agriculture or supplement their income by other means. Poverty is thus the cause and effect of illiteracy and the backwardness of the villagers. However, recently the need has been realised for rural reconstruction. An all India organisation under the name of 'All India Kissan Sammelan' has been formed to focus the attention of the government on the problems of peasantry class. There is greater realisation now that the country can march ahead only if its villages are prosperous. The governments, both at the centre and states, have launched numerous schemes like total literacy programme, fertilizer subsidy, crop insurance, free power, concessional water-rate, minimum procurement price and low-interest loans for liquidating illiteracy and removing poverty of the people living in the villages. Agricultural production is becoming more and more mechanized and agricultural products are fetching high prices.

(v) Local Self-government: The villages in ancient India enjoyed a considerable measure of autonomy or self-government. The villagers managed their own affairs through the traditional institution of Panchayat. The central government had neither the inclination nor the means for interfering with the self-government of villages.

NSOU CC-SO-02 204 With the advent of Britishers in India and their introduction of a highly centralised system of administration the importance of Panchayats began to decline. Their judicial powers were taken over by the British courts and the officers were appointed to look after the administrative affairs of the villages. This change produced unpleasant results. Since the times of Lord Ripon attempts were made to revive the old system of village local self-government, but the progress was very slow in this direction. With the attainment of freedom now fresh efforts are being made to strengthen the panchayat system and make Panchayats play a better part in the work of national reconstruction. The 73rd Amendment Act, 1993 has laid the foundation of strong and vibrant Panchayati Raj institutions in the country. (vi) Pattern of land ownership: The pattern of land-ownership, tenancy and labour frequently cuts across the village. The land which is included within the boundary of an official or administrative village is not always owned by those residents in it. Some of the land is usually owned by people in neighbouring villages or towns. During the last hundred years or more, there has come into existence a class of absentee landowners, people who reside in towns but own land in villages. Again, members of a village are commonly found to own some land in neighbouring villages. Even tenants and labourers are occasionally found cultivating land lying in another village. In some irrigated areas where the density of population is high, it is not unknown for a tenant to cultivate land lying six or seven miles from where he is staying. (vii) External trade: It is often assumed that trade and commerce did not touch villages in India. This assumption was perhaps true only of villages in the tribal areas. In the non-tribal areas, however, village economy has for a long time been integrated in varying degree with regional, national and even international trade and commerce. In certain regions, such as Gujarat, and Kerala and Coromandel coasts, there was a high degree of integration of village economy with the economy of the wider world. These coastal areas had maritime commerce with overseas countries since at least the beginning of the Christian era. The exports of Gujarat included, for instance, agricultural and forest produce as well as finished goods. In the former category may be mentioned indigo, cotton, wheat, rice, tobacco, edible oil, ghee, honey, lac, hides, dried ginger and myrobalan. In the latter category there were goods of three kinds: firstly, goods such as cotton cloth, yarn, cushions, canopies, carpets and cotton tape, which were manufactured mostly by urban artisans but the raw materials; for which were supplied NSOU CC-SO-02 205 by villagers; secondly; goods such as precious stones which were manufactured by urban artisans from indigenous minerals; and thirdly, goods such as silk cloth and objects of metal and ivory which were manufactured by urban artisans from imported raw materials." (viii) Dependence on towns: The villagers also depended upon towns for certain specialized services. Whenever they wanted to build a brick-and-mortar structure, whether it was a dwelling house, a well a hospice (dharmasala), a village meeting house (chavadi), or a pigeon-tower (chabuturi), they had to call in brick-layers and limeworkers from nearby towns. They also get their gold and silver ornaments made by a town smith. Though mud pots and pans were popular in the house, the few metal vessels which were in use, and the immense metal utensils for cooking community dinners, were bought and repaired in the town. The florist, the tailor, the washerman, the vahivancha (genealogist) and the grain parcher were all to be found only in the towns and very large villages. (ix) Weekly markets: There are also single-caste milages. Where these villages are of artisans, they sell their goods in nearby towns, or more frequently, in the weekly markets. The latter are an eloquent testimony to the Indian village's lack of self-sufficiency. They also imply a certain amount of monetization of the economy which in turn means that the village was part of a wider politico-economic system. Weekly markets again vary in their range. Some are patronised by people living in a few neighbouring villages while others are patronised by people spread over a wide area. Occasionally, there is also a certain amount of specialisation in weekly markets; one market is famous for trade in cattle, another in sheep and poultry, a third in woollen blankets, and so on. Pilgrimages also take the villager beyond the village, and occasionally into a different language area. The periodical festival of a deity attracts devotee and others from nearby villages, and a bazaar springs up around the temples. The prospect of buying and selling at the festival is as strong an attraction as the religious one. There are fairs which are famous for the sale of cattle, and nowadays, cattle are moved by lorry by a distance of two or three hundred miles to reach a fair. Such fairs occur all over the country and they reveal the fact that the peasant's social and economic universe is very much wider than his village. (xi) Political structure: The assumption that the Indian village community was not influenced by, and did not in turn influence, the wider political structure, is also facile. This assumption is a result of looking only at the top and not at the base of

NSOU CC-SO-02 206 the political structure, a result of concentrating on the history of kings and generals and not of the people. At the village or slightly higher level, there was usually the dominant caste, the members of which owned a good deal of the available arable land, and also wielded political power in addition. Each such caste had a leader whose position was further strengthened by ties of kinship and affinity, and by his capacity to confer favours on his clients. Such chieftains stood at the base of the political pyramid everywhere in India. Above them was the Raja or king, the viceroy of an Emperor, and the Emperor himself, in ascending order of importance. The lower-level authority acknowledged the supremacy of the higher authority when he paid tribute, and declared his independence from the latter when he stopped payment. There was a continuum of power relations from the lowest to the highest levels, and changes at each level were followed by changes at the other levels. In 'orthodox' histories changes at the higher levels are said to be the cause of change at lower levels, but not the other way round. 14.5 The Change in Village Community in Different Spheres (i) Caste System: The British rule in India gave a serious blow to the caste system in the villages. The economic policy and the laws of British rulers induced the different castes to adopt occupations other than the traditional ones. The hold of caste panchayat was loosened. The status of a village man was determined on the basis of his economic position and personal attainments. The restrictions on food, dress, mode of living and other matters imposed under caste system were removed. Even untouchability was weakened. Thus caste system has now lost its traditional hold in the villages, however, casteism is getting strengthened on account of selfish political interests. (ii) Jajmani System: 'Social Stratification in India, the "Jajmani" system, a feature of village community in India has now weakened due to the governmental efforts to raise the status of the lower castes and impact of urbanisation. The occupations adopted by the village people are not entirely hereditary or based on caste system, nor the payment for services rendered by the lower caste is in kind; it is now mostly cash payment. (iii) Family System: The joint family system is no longer the peculiar characteristic of the village community. Nuclear families have taken its place. The family control over its members in matters of diet, dress and marriage has weakened. The family is

NSOU CC-SO-02 207 no longer an economic unit. Several activities which once were carried within the family are now performed by outside agencies. The education of village girls has raised the status of rural women. (iv) Marriage System: Change can also be seen in the institution of marriage. Although inter-caste marriages are rare and parents continue to dominate the mate-choice, yet the boys and girls are consulted by the parents in the matter of mate-choice. Love marriages and divorces are almost non-existent. The individual qualities like education, economic pursuit, beauty and appearance of the marriage partners are given preference over the old family status. There is now less expenditure on marriages. The marriage rites also have been minimised. The custom of child marriage is being abolished. (v) Living Standards: The standard of living in the village community is gradually going higher. The rural diet no more consists of coarse food only. It now includes vegetables, milk, bread, tea and vegetable ghee. The dress is getting urbanized. The youths put on pants and the girls put on frocks and Bell Bottoms. Even the old ladies put on blouses instead of shirts. The mill cloth is used in place of handloom cloth. Gold ornaments have replaced the old heavy silver ornaments. The young boys live bare-headed with well combed long hair while the girls use cosmetics. There are now 'pucca' houses to live. These are now better ventilated, well furnished, and in some cases electrified too. The ceiling fans can also be seen in some houses. Lanterns have replaced the earthen lamps in most houses. Gobar gas plants have also been installed in some houses. The sanitary habits of the people have improved. They now use soap for bath and washing the clothes. The safety razors are used for shaving. The drainage system is also better one. The primary health centres have made the village people health conscious. The threat of epidemics has lessened due to the vaccination and other preventive measures taken to the villages. The family planning program has been understood by the village people who now adopt measures to limit the family size. Schools have been opened. In some villages degree and post degree colleges can also be found. Agriculture Institutes and other Rural Institutes have also been opened in some villages. (vi) Economic System: Change has also taken place in the economic field. The educated rural youth seeks jobs in the cities rather than settling on the land. The demand for new scientific instruments of agriculture is increasing. The farmers have NSOU CC-SO-02 208 been taught new methods to raise their production. The rural cooperative societies have lessened the woes and miseries of the village people in getting seeds, fertilizers and credit. The 'Sahukara' system is on the wane. More and more banks are being opened in the villages. The Government gives financial assistance and other facilities for setting up industries in the villages. The per capita income has increased. Economic exploitation has decreased and the farmers get good price for their products. (vii) Political System: The setting up of 'panchayats' has led to the growth of political consciousness among the village people. The newspapers, radio and television in some areas have added to the political knowledge of the villagers. However, the political parties have divided the people into groups and led to groupism among them. Caste conflicts and group rivalries have increased. The community feeling has decreased. Selfishness and individualism are growing.

14.6 Summary It is thus evident that the Indian village is not a static community. It is dynamic. Sir Charles Metcalfe was wrong to hold that the village communities in India seem to last where nothing else lasts. The villages in India are at present passing through a transitional period. From the sociological point of view the old social relations, bonds and ties have disappeared. The community consciousness is steadily decreasing. Politics of the country has made deep inroads into the peaceful life of the village people and has divided them into political and sub-caste groups. The joint family system is fast disintegrating and morality has gone down. The only feature of the village community now left is agriculture. In India the task of rural reconstruction is a big and complicated affair, not to be accomplished easily. As we have seen above, 75 per cent of population lives in villages. To raise the standard of living of 64 crores of people is no easy task. However, the trends show that considerable progress is under way despite great difficulties. A Ministry of Rural Development has been formed at the centre to look after the overall task of rural development and co-ordinate the different schemes in this direction. Agricultural development along with irrigation and generation of electric power had the highest priority in the First Plan. Both the short term and long term objectives of the First Plan were by and large achieved. In the Second Plan new targets of agricultural production were laid down which have been more than achieved. In the Third and Fourth Plans also adequate importance was NSOU CC-SO-02 209 given to the task of rural reconstruction. The successive plans also have given due attention to the programme of rural development. Various schemes like Small Farmers Development Project (SFDP), Marginal Farmers and Agricultural Labourers Project (MFAL), Drought Prone Areas Programme (DPAP), Integrated Rural Development Programme (IRDP), Applied Nutrition Programme (ANP) and finally Jawahar Rozgar Yojna Programme have been in vogue for the upliftment of rural masses. The rural school is undergoing transformations under the impact of Operation Blackboard. It is now better equipped and adequately staffed. The introduction of labour-saving machinery has shortened farm hours, decreased the difficulty of labour and increased the amount of leisure time. Link roads are being constructed in the villages, electricity provided, sanitary conditions improved, health facilities provided and well-equipped hospitals with qualified doctors opened. Many of the conveniences and comforts of the city are being introduced into rural homes. The 73rd Amendment Act, 1993 has sought to make the Panchayati Raj System more effective and role playing in the field of rural development. With the passing of the unattractive, barren and drudgery features of village home, it is hoped, there would come a new appreciation of the deeper rural values so that the young men would not flee to the cities, depriving the village of energetic and educated rural leadership.

14.7 Model Questions 1. Short type question (5 Marks) A. What is jajmani system? B. Explain the political system in Indian villages. C. Write down the major characteristics of Indian villages. D. Write down the changes in village economy system. 2. Answer in detail (10 Marks) A. Explain the village as community. B. Write down six major characteristics of Indian villages. C. Explain the changes in living standard of village communities. D. Explain the changes in political system of village communities. E. Write down the importance of local self govt. In Indian villages.

NSOU CC-SO-02 210 F. Explain the changes in the village communities. G. Illustrate the major characteristics of Indian villages.

Solidarity structure within various levels of family. Solidarity Structures at the Village Level. 211

NSOU CC-SO-02 212 Solidarity Structures in the Caste System Solidarity Structures Within the Jajmani System 15.1 Introduction Among the institutions that compose the society, the family is the most important. It has been its very foundation. It plays

100%**MATCHING BLOCK 63/104****W**

a decisive role in the material and cultural life of

the mass aggregate and in moulding the psychological characteristics of an individual as well as its collectivity. In fact, according to some thinkers, family and familism impress their stamp on the entire rural as well as urban structure. Familism permeates them from top to bottom. A systematic study of village family, its structure, functions, evolutions and interrelations with other institutions are necessary to study the village solidarity. In almost all fully developed agrarian societies, depending on plough agriculture, the patriarchal joint family is the basic of social solidarity in the rural areas. There are three aspects to the structure of solidarity which must be considered in analyzing any relationship between the differentiated roles- "the various positions and activities distinguished" allocated through the nine different criteria of: age, generation, sex, economic allocation, political allocation, religion, cognition, nonhuman environment and solidarity. we shall use Levy's definitions for each of the three following aspects: content, strength and intensity. The content of any relationship is defined as "... the type of relationship that is to exist and the members between (or among) whom it is to exist." The strength of any relationship is defined as "...the relative precedence or lack of precedence taken by this relationship over other relationships of its general sort, and over other obligations and commitments in the larger social sphere." The intensity of the relationship is defined as "... the state of affect involved in the relationship." There are two possible types of variation in the state of affect: first, the type of affect involved (e.g. love, hate, anger, joy, respect, etc.); and second, the degree of affective involvement that is expected (e.g. whether the relationship is to be intimate or one of avoidance). If we grant the above by way of explaining and defining the structure of solidarity then it follows that the structure of solidarity is crucial in at least two circumstances: first, where the frequency of interaction is high; and second, where relationships are strategic to the system (strategic relationships may have a high incidence of interaction, but this need not be the case).

NSOU CC-SO-02 213 It is neither possible nor is it desirable for the purposes to treat all of the relationships which can occur between roles within the village. Theoretically we should find it necessary to analyze only the relationships which exist between roles in the village social system, but, as per the role differentiation, the solidarity structure of the lower level social units (the household) must be considered as well because they so colour the upper level relationships that the upper level relationships cannot be fully understood without knowledge of lower level relationships. Thus, we must begin by discussing the structure of solidarity as it functions at the level of the household. 15.2 Solidarity Structure Within the Household Of the many possible relationships which exist between members of the household there are two which must be understood in order to comprehend the structure of solidarity at the village level. These are the father-son relationship and the brother- brother relationship. At the village levels females do not figure as possibilities for the roles which are to be allocated. At the household level, females do affect the content, strength, and intensity of the above mentioned male relationships, but ideally at least they should not affect the content, strength or intensity of the village level relationships. The

76%

MATCHING BLOCK 64/104

W

rural family is far more homogeneous, stable, integrated and organically functioning than the

urban family. The ties binding the members of the formal, for instance, the husband and wife, the parents and children are stronger and last longer than those in the case of urban family. The Indian village still remains a cluster of joint families though due to a number of historic-economic causes, the joint family has been exhibiting a tendency of slow and steady disintegration. 15.2.1 Peasant Household : Another essential

60%

MATCHING BLOCK 65/104

W

characteristic of the rural family is that it is generally based on peasant household. All its members are engaged in the agricultural occupation.

Work is distributed among them mainly on lines of age and sex distinctions. "The community household, common land and common economic functions along with the common kinship bond create the peasant household." Since the members of rural family form a single economic unit and constantly co-operate with one another in agricultural operations, since they

84%

MATCHING BLOCK 66/104

W

hold property in common usually managed by the eldest member of the family. Since also they spend most of their time together,

the psychological traits they develop are similar.

NSOU CC-SO-02 214 15.2.2. Greater Discipline and Interdependence : The rural family is characterised by greater discipline among its members than the urban family. Further, since there is considerably less state or public provision for meeting the educational, cultural, or social needs of the people in the rural area than in the urban. The rural family attempts also to satisfy these needs of its members. It thus serves as a school, a recreation centre, as well as a maternity or non-maternity hospital. 15.2.3 Dominance of Family Ego : The interdependence of the members of the rural family and the dependence of its individual member on it are therefore, far greater than in the case of the urban family. This welds its members into a homogenous, compact, egoistic unit, strengthens emotion of solidarity and co-operation among them and fills them with family pride. They develop more collective family consciousness and less individualistic emotion. In a rural society, a family is discredited if any of its individual members perpetrates an infamous act. Similarly, the glory of his or her achievement accrues to the family from which he or she springs. The urban family in contrast to the rural family, is less authoritarian of the family even at the cost of their lives. 15.2.4 Authority of the Father : Since the rural family is more integrated and disciplined unit than the urban family, the head of the rural family exercises almost absolute power over its members. It is he who distributes the work of the peasant household among the family members on lines of sex and age differences; arranges marriages of sons, daughters, nephews and nieces; administers a joint family properly according to his wisdom; and trains the youngsters for future agricultural work and social life. All initiative and final authority are vested in him. In fact, "the head of the family has had the rights and authority to be the ruler, the priest, the teacher, the educator and the manager of the family." Thus, the family, through its head, subordinates its individual members to itself. The later are completely submerged in the family; hence, they hardly develop any individuality or personality. 15.2.5 Closer Participation in Various Activities : One striking feature of the rural family lies in the fact that its members, being

NSOU CC-SO-02 215 engaged in work connected with the peasant household, spend practically the whole day together. In contrast to this, the members of the urban family engage in different occupations or being educated outside home, spend only a small portion of the day together. Even the recreational centres such as clubs and others lie outside the home. Hence, the home becomes only a temporary nightshed for the members of the urban family. 15.2.6 The Father-Son Relationship : Before continuing, we must mention another major problem which we have been unable to solve. Social relationships are dynamic, not static. Ideally the role of both father and son does not change with time, nor does the solidarity structure which orders the relationship. Actually the content of the relationship changes drastically over time as does the strength and intensity. The father-son relationship is not the same when the father is twenty-five and the son five as it is when the father is sixty and the son forty. The best that we can do in these circumstances is to examine the father-son relationship at different stages in its development. In a social system which is characterized as patriarchal, patrilocal and patrilineal, and it can be safely be assumed that the type of relationship will be that of superordinate- subordinate. The father has complete control over the actions of the son. However, the situation is never clear-cut because the young father is as dominated by his father, as he is dominant over his young son (ideally he is dominated whether the father is still alive or not). The following rather lengthy quote, from G. Morris Carstairs' book, *The Twice Born* describes the kind of relationship which exists between father and son among the upper castes in the village he was observing: In striking contrast to all this attentive mothering, the child's father is an aloof seemingly unwelcome figure. The reason for this is that a man, so long as he remains under his own father's roof, must keep up the fiction of denying that he leads an active sexual life of his own. Not to do so is to be disrespectful. Consequently, a man and his wife can never talk to each other naturally, in his parents' presence; nor is it proper to either of them to show affection for their own children in front of their elders. This obligatory suppression of any overt show of tender feelings is relaxed only when the child cries. Then his needs take precedence even over the grandparents' authority, so that he will be handed over to his mother, often with the command "Give him the breast." A father, however, experiences no such exception to the demand that he remain impassive and detached. Even if his wife or child falls ill he must contain his

NSOU CC-SO-02 216 feelings and surrender the responsibility of tending them to his own parents. This taboo perpetuates in each generation the tension which exists between father and son; and it is very strong. Young Chauthmal, who lived in his father Bhurmal's house, had a boy of eighteen months, and often the grandfather could be seen carrying this child in his arms, or dandling him while they sat at their shop-but never Chauthmal: " I don't like to fondle him, even when we are alone in our room," he said: "if I did, he might get into the habit of running to my knee in the bazaar, and that would not look right." ... On the other hand, there were three among my younger informants who disregarded the rule, and openly fondled their young children. They were able to do so because in each case their fathers were dead, and they were the heads of their several households: but still the consensus of opinion condemned their unashamed display of affection... the usual father-child relationship, then, was drained of spontaneous warmth of feeling. Instead it was governed by strict obligations on either side...the obligation of each to the other, of financial support and instruction on the one hand, and dutiful service throughout one's father's life (and after his death) on the other, were constantly emphasized, but personal intimacy was conspicuously absent. The above observations, made on the content, strength and intensity of the father- son relationship among the three highest castes in the village of Deoli, are made on a situation, where, in fact, there is more opportunity to live up to the ideal father-son relationship. Among the lower castes one would not expect these observations to be made for at least two reasons. As Carstairs observed, it is the presence of the grandfather and/ or grandmother which constrains the behaviour of the father with respect to the son in the upper castes. Among the lower castes the presence of grandfathers and grandmothers within the family is even more unlikely than among the upper castes where the probability is only about fifty-fifty that both parents will be surviving at the time of the son's marriage. There is a fairly good correlation between caste ranking and wealth (the higher the caste, the more likely that caste will be wealthy) and there is a fairly high correlation between wealth and life expectancy. The second reason is that among the lower castes there is very little opportunity for a father to accumulate wealth over which he has control in his old age. In a wealthy household, the aged father has no real need of physical strength; he merely needs the mental ability to make decisions concerning its disposition. The father can be traditionally oriented because he has the power to back his position. Among the poor lower castes, when a man loses his physical powers, as he inevitably must, he can hope that his son will follow tradition and provide for him in his old age. Thus,

NSOU CC-SO-02 217 when the son is the main contributor or only source of household income, he need not pay attention to the demands of his father. It is much easier in the poorer households for the son to take over from his father and begin to make decisions about the disposition of the household income. Concomitantly the poorer household heads may exhibit different behaviour patterns towards their sons than is found among the wealthy, high-caste households. Fathers and sons will probably spend more time, more pleasantly and less formally, with one another. A third factor which is probably not as important as the first two is that while there is a lot of direct contact between father and son among poor households, this does not hold among wealthy households. The father in the wealthy household appears, and more likely is, as a more distant figure to the son. He does not have many direct dealings with him. Mother, grandparents, teacher and possibly servants will stand between him and his father. Even among wealthy households, however, it is possible for the father to fly in the face of tradition with respect to his behaviour towards his son. While it is important to know that extreme variations can and do exist with regard to the content, strength and intensity of the father-son relationship, so we can say that normal type of solidarity structure that exists between some roles on the village level more nearly resembles that of the wealthy household than that of the poorer households. The intervention of caste into the structure of solidarity at the village level resembles the intervention of the mother, grandparents, teacher and servants at the household level. We shall discuss shortly which roles in the village seem to have a solidarity structure modeled after the solidarity structure of the father-son relationship, but before we do so, let us discuss the solidarity structure of the brother-brother relationship on which other village roles are based. 15.2.7 The Brother-Brother Relationship : One cannot say that the brother-brother relationship is a strong one except in certain circumstances. There are a number of other household relationships which can and do assume precedence over the brother-brother relationship. Some examples are the father-son, mother-son and husband-wife relationships. The differentiation of brothers occurs on the basis of relative age. The eldest son is expected to take over the household and ritual obligations of the father after the father's death. Neither the eldest brother nor the younger brother(s) have much power to make decisions while the father is alive (and capable of making decisions) so that the difference in roles is

NSOU CC-SO-02 218 not much emphasized. As the brothers grow up they receive the same sort of treatment from others in the household. The younger brother may in fact receive more attention simply because it is the older brother who will have the advantage when the father dies. In addition, the above brothers inherit equally from the estate from the father- although the senior son may be granted something extra from the estate to compensate for the extra ritual expenses being head of the family. Although in theory the elder brother should stand in the same kind of relationship to his younger brother as the father stands to his son, this kind of relationship cannot be maintained- particularly after the father is dead. The father can control his son because whatever wealth the household has is in his name, but each brother has his own source of wealth if any. In principle, the same subservience was postulated in relation to one's elder brother. Younger siblings often show the same respect to the elder brother the father usually enjoys. May be , in their everyday activities they do not wait for the permission of the elders , in general, however ,in not so distant past elder brothers were accorded, at least in public, the deference due to their position in the family; and the same restraint was observed by a younger brother in suppressing all show of affection towards his wife and children before an elder brother, as before his father. Family conventions require that husband will not display any affection for the wife in front of the elders including the elder brother. Even if she is sick, the husband should not say this to his elder brother-but if younger brother is there, he can be asked to go for medicine. Traditionally village people believe that every man has got five fathers, and it is his duty to obey them without question, whatever they ask him to do. They are, his father, his elder brother, his king, his guru and his friends. It would seem from the above that the distinction between brothers is perhaps most important after childhood; and its all the more important that brothers stick together in economic and political matters because they have more power as a group than as individuals. This combined with the power of traditional respect for the elder brother means that it will be the elder brother who makes decisions after taking into consideration the attitudes and desires of his younger brother. Often the brothers will maintain joint property even though they have set up separate households. The ideal is a joint household, but this is difficult to maintain because the wives so often quarrel with one another about who is to make what kinds of decisions within the household.

NSOU CC-SO-02 219 Sometimes brothers do quarrel and decide to go separate ways. This is usually at the instigation of their respective wives. What happens in effect is that the wives have forced their husbands to give precedence to the husband-wife relationship over the brother-brother relationship. When the brother-brother relationship is forced to give precedence to other relationships, it may break down completely. Brothers actually join political factions which are opposed quite bitterly to one another. They may even be the heads of these factions. 15.3 Solidarity Structures at the Village Level During the rest of this chapter, we shall be discussing the solidarity structures which exist for relationships at the village level. Just as the individual is the basic unit of the household so on the village level the household is the basic unit. The eldest male is the head of the household and in any relationships outside of the household at the village level, the head of household represents the household. Households are interacting and the points of interaction are the respective household heads. There are essentially two types of relationships into which households enter at the village level: first, those in which caste is involved; and second, those which have to do with jajmani system. 15.4 Solidarity Structures Within the Caste System Solidarity structures order the relationships which exist in both intra-caste and inter-caste situations. we shall discuss first the intra-caste situation and second the inter-caste situation. 15.4.1 Solidarity Structures within Intracaste Relationships : The relationships of an intracaste nature are ordered in much the same fashion as the brother-brother relationship is ordered. The behaviour which is manifested by the interaction of brothers is very similar to that manifested when the household heads who make up the caste panchayat interact. Membership in the caste panchayat is ascribed to the same degree that the male sibling group is ascribed within the household. Relative age is important in determining who will be the head of the caste panchayat. However, instead of relative age as the prime selective factor for panchayat leadership, it is the size and wealth of the household which the individual represents. That individual who has the largest and wealthiest household behind him will be the ranking member of the caste panchayat unless of course he is much younger than any of the

NSOU CC-SO-02 220 other panchayat members. As the head of the household is responsible for the behaviour of all the members of the household, so the head of the caste panchayat will be held responsible for the behaviour of the members of the caste resident within the village. This responsibility is more theoretical than real, although it does have realistic elements, because, just as the eldest male of the sibling group does not have absolute authority over his siblings and must secure their consent in some sort of household council, so that ranking panchayat member must secure the consent of his fellow members. More simply stated the ranking member of the caste panchayat and the eldest male of the sibling group are each in their setting the first among equals. Like the sibling group there are times when other relationships take precedence over this particular one. Inter-caste relationships seem to take precedence over intra-caste relationships just as the father-son relationship takes precedence over the brother-brother relationship. There is a greater frequency of interaction at the intra-caste level and less power differential between the heads of households in the same caste and hence there would seem to be a greater possibility for affection to be manifested for the relationships to be more intimate. The development of intimate and affectionate relationships depends, upon the size of the caste. If there are only four or five households living within the village it is much easier for household heads to behave as siblings toward one another. Just as one can imagine it to be a difficult thing for a large sibling group to act in concert in all matters so it is difficult for a caste panchayat of twenty or thirty members to maintain agreement on all matters affecting them. Normally, what happens is that, factions appear. There will be several groups of household heads within the Panchayat—each group acting as a unit with a head who interacts with the heads of the other groups.

15.4.2 Solidarity Structures in Inter-caste Relationships : If the behaviour patterns manifested in intra-caste relationships bear close resemblance to those of the brother-brother relationship, then inter-caste relationships bear a similar resemblance to the father-son relationship. Just as the father gives orders and instructions to the son and expects them to be carried out, so a higher caste gives orders and instructions to a lower caste and expects them to be obeyed. As the son is responsible to the father and the father is responsible for the son so is with the upper caste and lower caste. As the son depends upon his father for support but not vice versa, so the lower castes depend upon the upper castes but not vice versa. As the father-son relationship takes precedence over any other relationship for the son but not vice versa, so the upper caste-lower caste relationship takes precedence over

NSOU CC-SO-02 221 any other relationship (at the village level, of course) for the lower caste but not vice versa. Just as the father-son relationship is cold, distant and formal so the inter-caste relationship is cold, distant and formal. As the father-son relationship appears to be asymmetrical so does the inter-caste relationship appear.

15.5 Solidarity Structures Within the Jajmani System The second type of relationship at the village level which involves the head of the household acting as the representative of the unit is the jajmani-kamin relationship. This relationship is in content essentially an economic one—although it does have definite political overtones—in which the kamin is in an inferior and dependent position relative to the jajman. The relationship is defined by the type of service which is exchanged between jajman and kamin households. As in the caste oriented relationships the point of contact is the heads of the two households, but in some ways the relationship can be regarded as an unwritten contract between two households so that the relationship can exist through more than one generation. It is up to each head of household to see that the terms of the agreement are lived up to. In the case of the joint household—brothers after the death of the father—it is the eldest brother who as head of household assumes the rights and duties of the previously existing agreement. If the jajmani household is small and the kamin household is large, it may be that the services of only part of the kamin household are needed. In that case the unneeded portion of the joint household will have to form a new relationship with another jajmani. The situation may, of course, be reversed. The content of the jajman-kamin relationship is very similar to that of the father-son relationship. The kamin is in an inferior position with respect to the jajman because of his caste and occupation, and the behaviour patterns manifested in interaction patterns between the two are very similar to those between father and son. The kamin always shows a great deal of respect, deference and obedience to his jajman. The jajman in turn expects this and so long as that kind of behaviour is forthcoming treats the kamin as though he were a son. The relationship for the jajman is not a strong one just as it is not for the father in the father-son relationship. For the kamin, the relationship with his jajman may take precedence over any of the others he might form at the village level. For example, the kamin will observe his obligations to his jajman before he observes the obligations he has, to his caste panchayat.

NSOU CC-SO-02 222 15.6 Summary Solidarity structures at the village level operate to order the significant relationships— intra and intercaste and jajman-kamin relationships—in a manner very like the father-son and brother-brother relationships at the household level. The village can be viewed almost as the household writ large with each household as an individual writ large.

15.7 Model Questions

1. Short type question (5 Marks) A. Write a short note on solidarity structure in intracaste relations. B. Write a short note on solidarity structure in intercaste relations. C. What do you mean by structure of solidarity?

2. Answer in detail (10 Marks) A. Explain the brother-brother relationship in relation to the village solidarity system. B. Explain the father-son relationship in relation to the village solidarity system. C. What do you mean by structures of solidarity within jajmani system? D. How does the structure of solidarity affect the various relationships within household? E. What do you mean by solidarity structure in the caste system? Give a comparison between the intercaste and intracaste order of relationships.

Objectives After you have read this unit you should be able to describe:

Definition of kinship system; The significance of kinship; Main approaches to the study of kinship in India; The principles of descent; The types of descent; 16.1 Introduction Man does not live alone in society. From birth till death he is surrounded by a number of people. Some of these people are his relatives, some are friends, and some are neighbours while all others are strangers and unknown to him. He is bound to all these people who are related to him either on the basis of blood or marriage. The relations based on blood or marriage may be close or distant. The bond of blood or marriage which binds people together in groups is called kinship. According to the Dictionary of Anthropology, kinship system includes society recognized relationships based on supposed as well as actual genealogical ties. These relationships are the result of social interaction and are recognized by society. A society is a network of interlocking groups which are related to each other through institutionalized patterns. One of the most important structural subsystems of all societies is the kinship system. Kinship groups occupy an important place in an individual's life. The kinship system includes socially accepted relationships based on fictional as well as actual ancestral ties. These relationships are established due to social interaction and accepted by the society. According to Murdock "it is a structural

78%**MATCHING BLOCK 71/104****W**

system of relationship in which kins are bound to one another by complex inter-locking ties. Kinship

is one of the most fundamental principles for organizing individuals into social groups, roles, categories, and genealogy." 16.2 Definition of Kinship There are multiple definitions of kinship given by different sociologists and anthropologists in different periods of time. These definitions reflect different aspects of kinship in society. For the benefit of our discussion we are presenting here some NSOU CC-SO-02 226 of these definitions. 1. Robin Fox: "Kinship is simply the relations between 'kin' that is persons related by real putative or fictive consanguinity". 2. Aberchrombie and others: "The social relationships deriving from blood ties (real and supposed) and marriage are collectively referred to as kinship". 3. A.R. Radcliffe Brown : Kinship is "

96%**MATCHING BLOCK 72/104****W**

a system of dynamic relations between person and person in a community, the behaviour of any two persons in any of these relations being regulated in some way, and to a greater or less extent by social usage".

To put it simply we can say the bond of blood or marriage which binds people together in group is called kinship. So the

67%**MATCHING BLOCK 73/104****W**

kinship system refers to a set of persons recognized as relatives either by virtue of a blood

relationship or by virtue of a marriage relationship. In sociology, all blood relationships are known by a technical term, consanguinity. Similarly, all relationships through marriage are given the term affinity. For example, the relationships between mother and son/daughter, sister and brother/sister, father and son/daughter are consanguinal, while relationships between

100%

MATCHING BLOCK 74/104

W

father/mother-in-law and daughter/son-in-law are affinal.

Mostly,

92%

MATCHING BLOCK 75/104

W

it is the social recognition of these relationships that is more important than the actual biological ties. Networks built around kin relationships play a significant role in both rural and urban social life in India. 16.3

Significance of Kinship As described above, the

67%

MATCHING BLOCK 76/104

W

kinship system refers to a set of persons recognised as relatives, either, by virtue of a blood

relationship technically called consanguinity, or by virtue of a marriage relationship, that is through what is called affinity. Most of us tend to regard the kinship system into which we are born and in which we are reared as natural. It will seem natural and right to us that certain close relatives should be tabooed as marriage and sexual partners, and we feel quite certain that disastrous consequences would follow any infringement of the taboos. We may similarly think it natural that certain classes of persons be preferred as marriage partners, or we may on the contrary think it very unnatural that any persons be so designated. We all have very strong ideas, too, about what is the correct and proper behaviour of different kin towards each other—deference, respect, familiarity, avoidance, kindliness, protectiveness,

NSOU CC-SO-02 227 and so on, as the case may be. All such aspects of kinship relation tend to be taken for granted unless, or until, one is confronted with the kinship practices of other peoples. Initially, different practices may appear as disgusting or inhuman, exotic or fantastic, strange or primitive, etc. Earlier anthropologists spent a great deal of labour on trying to work out the various stages through which they believed kinship systems had progressed in the course of human history. However strange other peoples' kinship practices may at first appear to be, a closer look will usually show them to be functional. They are useful for the maintenance of the society as a whole, contributing to its continuity over time and containing the conflicts that might potentially disrupt it. This is not to say that all practices are for the best for all members of the society and for all time. One certainly need not justify customs like sati, female infanticide, child marriage, amniocentesis or killing of the female foetus etc. One would here try to understand how these practices are (or were) consistent with the principles and values at work in the wider society. 16.4 Main Approaches to the Study of Kinship System in India Sociological studies of kinship in India cover descriptions, comparisons and analytical problems based on the findings from various regions.

100%

MATCHING BLOCK 77/104

W

Approaches to the study of kinship can be broadly classified under two headings (i) the Indological approach and (ii) the Anthropological approach.

Here, we will discuss these approaches one by one. 1. Indological Approach : As the

100%

MATCHING BLOCK 78/104

W

social institutions of Indian society are rooted in literary and learned traditions, many sociological studies have made use of textual sources for explaining

the ideological and jural bases of our institutions. For example, K.M. Kapadia (1947) has used classical texts to describe Hindu kinship. Hindu Social Organisation by P.H. Prabhu (1954) is also based

72%

MATCHING BLOCK 79/104

W

on Sanskrit texts. Similarly, Irawati Karve (1940, 43-44 and 1958) and G.S. Ghurye (1946, 1955) have extensively worked on Indian kinship system. Both have

used textual sources to explain kinship pattern in different regions of India from a socio-historical perspective. We can, therefore, say that

81%**MATCHING BLOCK 80/104****W**

Indological approach to the study of kinship has provided a framework to understand the elements of continuity and change in the system (see Jain 1994). 2. Anthropological Approach: Descent and Alliance : Anthropologists have looked at kinship systems from the point of view of descent and alliance.

NSOU CC-SO-02 228 16.5 Descent Approach 'Descent' refers to the social recognition of the biological relationship that exists between the individuals. The 'rule of descent' refers to a set of principles by which an individual traces the descent. 16.5.1 Principles of Descent : Descent is the principle whereby a child is socially affiliated with the group of his or her parents. In some societies the child is regarded as a descendant equally of both the father and the mother, except that titles and surnames are usually passed down along the male line. Such a system is termed Bilateral or Cognatic. The individual belongs simultaneously to several descent groups - those of the two parents, the four grandparents, the eight great-grandparents, and so on. This link is limited only by memory or by some conventionally determined cut-off point at, say, four or five degrees removal. In small intermarrying communities, membership will probably overlap, and in case of dispute or feud, the individual might find his or her loyalties divided. There are some cognatic systems where the individual has the right by descent to membership of several cognatically recruited groups, but this right is actualised only if the person is able to reside in a particular group's territory. Modern nationality laws often make this type of requirement. 16.5.2 Types of Descent : Kinship in our society is used for establishing clear-cut corporate social units. Each one of us is a member of such a cooperating and closely bound group of people. One

69%**MATCHING BLOCK 81/104****W**

can depend upon the help and support given by such people. Such cooperating local groups are always larger than elementary families of spouses and their children. When these groups are recognised or defined on the basis of shared descent, anthropologists call them descent groups.

Formally speaking there are six possible avenues for the transmission of descent group membership, from parents to children. These are: a. Patrilineal Descent : According to this rule, descent is traced through the father's or men line. Here the descent criterion is restricted to males, and only descendants of a common ancestor of the male line will be recognised as kin. These are known as agnatic or patrilineal kin. b. Matrilineal Descent : Here the descent of the individual is traced through the mother or female exclusively. The descendants are called here uterine or matrilineal kin. These two modes of tracing the descent are called "unilineal", that is, they select one "line", either the male or female. These principles or rules are not necessarily mutually exclusive within society. c. Bilateral Descent : Where attributes are transmitted equally through both parents. Here no uni-lineal group can be formed but group structure can be cognatic, that is, the group of kin persons on the father's and mother's side. Membership can be acquired through either the father or the mother. d. Double (duo-lineal or bi-lineal) : Where descent is traced in both the father's line as well as mother's line for different attributes such as movable property in one line and immovable in another. e. Parallel descent : A very rare form of descent where descent lines are sex specific. Men transmit property to their sons while women to their daughters. f. Cross or alternative type descent : This is also very rare. Here men transmit property to their daughters and women to their sons. 16.6 Functions of Descent Groups Apart from the function of exogamy, unilineal descent groups tend to be 'corporate' in several other senses. Their members may often come together for ritual and ceremonial functions, for instance, for collective worship of lineage gods, totems or ancestors. The descent group will have a built-in authority structure, with power normally exercised by senior males, and it may well own corporate property. An individual's economic rights and responsibilities will be defined by his or her position in the descent group in many societies. Unilineal descent groups are also jural units, internally deciding their own disputes, and externally acting as a unified group in the conduct of feud, etc. For this reason, lineage structure is often coterminous with the political structure in societies lacking a centralised state structure. Lineages cannot expand indefinitely in a single locality and often segment into smaller, more manageable and economically viable lineage segments. You can see the lines of segmentation of the ground, as it were. Consider the pattern of land ownership in an Indian village; or at the pattern of village or urban settlement; a particular quarter of the village or town may be inhabited by the descendants of a single founding ancestor. Often, the large havelis are divided among brothers or step-brothers, and these quarters are

NSOU CC-SO-02 230 further divided among their descendants. In case a line dies out, the property would be reconsolidated. Given the range of social functions that descent groups may potentially perform, it is little wonder that concern with the principles of unilineal descent has dominated the work of many students of comparative kinship. However, even these scholars realize that unilineal descent is not the whole story. In ancient Rome, women after marriage severed all contact with their natal group. In certain slave societies, the slave has no 'family' of his or her own. In patrilineal systems, the mother's father, mother's sister, and especially the mother's brother, are important relationships which need further discussion. To take note of the importance of relationships, the scholars have identified another principle. This has been termed the principle of complimentary filiation which explains the significant ritual and social roles of the mother's brother(s) in the lives of their sister's children. It reminds us that, in most societies, an individual is a child of both parents, in whichever way descent is formally reckoned. 16.7 Inheritance Rules Rules of inheritance tend to co-ordinate with the reckoning of descent in most societies, but not necessarily in a one-to-one manner. In fact, it is quite often the case that certain types of property pass from father to son, and other types from mother to daughter. In most parts of India, in the past, immovable property such as land and housing, was inherited only by sons. In the absence of sons, except under rare circumstances, it goes to the nearest male relatives on the father's side. On the other hand, movable property in the form of cash and jewellery is given to the daughter at the time of her marriage, with a certain amount of jewellery also passing from the mother-in-law to the daughter-in-law. In addition to property of various kinds, rights and obligations, esoteric knowledge, crafts and skills, etc., might be passed on in accordance with kinship roles. Succession to office to chieftainship, kingship, etc. and to other social roles and statuses, is also very often determined by kinship criteria. In such cases, the individual's status is said to be 'ascribed', not 'achieved'. It is commonly asserted that ascriptive status is accorded more importance in modern, industrial societies. There is a great deal of truth in this statement, but one should not underestimate the importance of kinship connections in modern societies too. Often one finds that in a family if father is a doctor or lawyer the son or daughter is also likely to choose the same occupation. Most of the Indian

NSOU CC-SO-02 231 women who have been successful in the political domain are either daughters, sisters or wives of people who have been active in politics. One such example is the Nehru family of India. 16.8 Rules of Residence Rules of residence, meaning residence after marriage, are an important variable in a kinship system, and substantially affect the quality of personal relations within the kin network. If the husband and wife set up their own independent home after marriage, as is usually the case in modern western society, residence is said to be Neolocal. Where the wife goes to live with the husband in his parents' home, residence is described as Virilocal, Patrilocal, or Patrivifolocal, and where the husband moves to live with the wife, it is termed Matrilocal. Rules of residence may or may not 'harmonise' with the rules of descent. On the whole, patrilineal descent systems correlate with either neolocal or patrivifolocal residence patterns. However, matrilineal descent systems may be combined with all three types of residence. It is also combined with what is called Avunculocal residence, that is, residence with the mother's brothers. 16.9 Patriarchy and Matriarchy A society is said to have a patriarchal structure when a number of factors coincide, i.e. when descent is reckoned patrilineally, when inheritance of major property is from father to son, when residence is patrilocal, and when authority is concentrated in the hands of senior males. There is, however, no society on earth, nor any society actually known to have existed, whose features are the exact reverse of these. For even in matrilineal, matrilocal systems, which are fairly rare, major property is usually controlled by males. And authority is normally exercised by males, though women may well have a higher status in the family and greater powers of decision-making than in the patriarchal set up. Some anthropologists assert that in societies with very simple technology and minimal property, relations between the sexes are relatively egalitarian, whether descent is formally matrilineal, patrilineal or bilateral, but others insist that women, and children, have played subordinate roles in all human societies. For this reason, the term 'matriarchy', though often found in the literature, is probably a misnomer, best avoided, and there is certainly no conclusive evidence to support the view that matriarchy was a universal early stage in the development of kinship systems.

96%

MATCHING BLOCK 82/104

W

In India, we generally find the patrilineal and matrilineal descent systems. Of the

NSOU CC-SO-02 232

100%

MATCHING BLOCK 83/104

W

two, patrilineal system is more common. The description and analysis of kin relationships in a descent group have given us a fairly comprehensive sociological understanding of certain types of kinship systems in India.

For example, E.K. Gough (1956) has

93%

MATCHING BLOCK 84/104

W

discussed the unity of the lineage with corporate rights on land. She has focused on roles and inter-personal relationships in the wider kinship.

T.N. Madan (1965) has studied

92%

MATCHING BLOCK 85/104

W

the role of kinship as an organising principle in the Kashmiri Brahmin society. He has brought out the strong patrilineal ideology that characterises kinship system of the Kashmiri Pandits. We already see in detail how

92%

MATCHING BLOCK 86/104

W

the study of descent groups has helped our understanding of patrilineal kinship system in North India. Sociologists like, A.C. Mayer, T.N. Madan, Oscar Lewis while studying

80%

MATCHING BLOCK 87/104

W

kinship organisation in North India, have taken the descent approach. They have described in detail various levels of kin groups and their activities. In sociological studies the terms 'line', 'lineal', 'lineage' etc. with or without the prefix 'patri' or 'matri' have in the past been used in at least four different ways. 1. They have been used

86%

MATCHING BLOCK 88/104

W

to denote corporate descent groups, i.e., lineage proper, 2. Often employed to denote the chosen line of inheritance, succession etc. in a given society, 3. In the study of relationship terminologies the expression "two line prescription" has sometimes been used

97%

MATCHING BLOCK 89/104

W

to refer to terminological structures which are consistent with "bilateral cross-cousin marriage", 4. Regardless of which lines (matriline or patriline or both) are chosen

97%

MATCHING BLOCK 90/104

W

for the above three purposes, lineal relatives refer to one's ascendants or descendants. Lineal relatives are those who belong to the same ancestral stock in a direct line of descent. Opposed to lineal relatives are collaterals who belong to the same ancestral stock but not in a direct line of descent.

All of these usages, except the fourth,

78%

MATCHING BLOCK 91/104

W

are context specific. i.e., they refer to particular situations. Here, social relations and groups are emphasised

85%

MATCHING BLOCK 92/104

W

and sociologists study them in terms of interaction, norms and values of a particular society. For example, some scholars, following the theory of lineages or descent groups,

92%**MATCHING BLOCK 93/104****W**

have discussed the relation between mother's brother and sister's son in patrilineal societies. They use the idea of 'complementary filiation', i.e., the relationship ego one has with the relatives on the mother's side in a patrilineal society. In a matrilineal society it refers to the relationship ego one has with the relatives on his father's side. In a patrilineal society a person's maternal group is the affinal group of that person's father.

NSOU CC-SO-02 233

93%**MATCHING BLOCK 94/104****W**

This is the group, from which the person's father has taken a wife. For this reason some sociologists like to consider the question of affinity in its own right, rather than as a complementary set of relationships. We may say that in descent approach, the emphasis is laid on social organisation of descent groups.

As a result, there is little focus on the 'affinity' aspect of relationships. Now, in the next sub-section we

100%**MATCHING BLOCK 95/104****W**

look at the approach, which focuses on relationships arising out of marriage alliance. 16.10 Alliance Approach

Another concept that figured prominently in the study of kinship systems in India is that of alliance. Kinship includes the consideration of

87%**MATCHING BLOCK 96/104****W**

the patterns and rules of marriage. When a sociologist pays special attention to these aspects of kinship, we say that he/she is following the alliance approach to understand the patterns of kinship. Many studies of kinship in India have focused on marriage as an alliance between two groups and on kinship terminology, as a reflection of the nature of alliance. Because of their concentration on relationships arising out of marriage, we say that these studies follow the alliance approach. The main exponent of this approach is Louis Dumont (1950, 1953, 1957 a and b, 1959, 1962 and 1966). He has emphasised the role played by marriage in the field of kinship in South India. By showing the opposition between consanguines and affines as reflected in the Dravidian kinship terminology, Dumont has made an important contribution to our understanding of kinship system in India in general and of South India in particular. He has applied to South India a structural theory of kinship. It brings out the repetition of intermarriage through the course of generations. This pattern highlights the classification of kinsmen into two categories of parallel and cross relatives. The alliance approach to the study of kinship has helped sociologists to discuss and explain the distinction between bride-givers and bride-takers. In addition, it has also included the discussion on the notion of hypergamy (i.e., the bride takers are always superior to bride-givers), practice of dowry in relation to hypergamy and ideas of exchange in marriage. 16.11

Types of Kinship Most of the sociologist and anthropologist agree that kinship is based on two broad categories : birth and marriage. Some others thinker say third category of kinship involves social ties. These three types of kinship are: 1. Affinal Kinship: The bond of marriage is called 'affinal' kinship. When a

NSOU CC-SO-02 234 person marries, he establishes relationship not only with the girl whom he marries but also with a number of other people in the girl's family. Moreover, it is not only the person marrying who gets bound to the family members of the girl but his family members also get bound to the family members of the girl. Thus, a host of relations are created as soon as a marriage takes place. For examples, after marriage a person becomes not only a husband but he also becomes brother-in-law and son-in-law. Here it may be noted that in English language a number of relations created by marriage are referred to by the same term. Thus, the same term brother-in-law is used for bahnoi, sala, jija and saddhu. On marriage a person also becomes foofa, nandoi and mausa. Likewise a girl on marriage becomes not only a wife but also becomes a daughter-in-law, a chachi,/bhabhi,/ devrani/ jethani/ mami etc. Thus marriage creates a host of relationships which are called affinal kinship.. 2. Consanguineous Kinship: The bond of blood is called consanguineous kinship. The consanguineous kin are related through blood whereas the affinal kin are related through marriage. The bond between parents and their children and that between siblings is consanguineous kinship. Siblings are the children of the same parents. Thus, son, brother, sister, uncle (chacha), elder uncle (tau) nephew and cousin are consanguineous kin, i.e. related through blood. In this connection, it may be pointed out that an adopted child is treated as if it were one's own biologically produced child. Thus, blood relationship may be established not only on biological basis but also on the basis of social recognition. 3. Social kinship: Schneider argued that not all kinship derives from blood (consanguineal) or marriage (affinal). There are also social kinships, where individuals not connected by birth or marriage may still have a bond of kinship, he said. By this definition, two people who live in different communities may share a bond of kinship through a religious affiliation or a social group, such as the Kiwanis or Rotary service club, or within a rural or tribal society marked by close ties among its members. A major difference between consanguineal or affinal and social kinship is that the latter involves "the ability to terminate absolutely the relationship" without any legal recourse, stated Schneider in his 1984 book, "A Critique of The Study of Kinship".

NSOU CC-SO-02 235 16.12 Degree of Kinship On the basis of nearness or distance, relatives can be classified in several categories. Some relatives are very close, direct and near, for example, father-son, sister-brother, husband-wife. They are called primary kin. According to Dr. Dubey, there are eight such primary kins. They are

57%

MATCHING BLOCK 97/104

W

husband-wife, father-son, mother-daughter, father-daughter, mother-son, younger-elder brothers, younger-elder sisters and sister-brother. 1. Secondary Kins:

They are primary kin of primary kin. In other words, they are related through primary kin. They are not our primary kin but are the primary kin of our primary kin, hence our secondary kin. For example, father's brother (chacha) and sister's husband (bahnoi) are secondary kin. The father is one's primary kin and his brother is the primary kin of father. Therefore, father's brother is my secondary kin, the primary kin of primary kin. Similarly, sister is my primary kin but her husband is my secondary kin. 2. Tertiary Kins: There are tertiary kins. They are secondary kin of our primary kin and the primary kin of our secondary kin. Thus the wife of brother-in-law (sala) called sarhaj in Hindi, is tertiary kin because brother-in-law is one's secondary kin and his wife is the primary kin of brother in-law, similarly, the brother-in-law of one's brother is one's tertiary kin because the brother is the primary kin and his the brother-in-law is the secondary kin of the brother. 16.13 Kinship Terms Kinship terms are those terms which are used in designating kin of various types. Morgan made an important study of kinship terms. He classified these terms into (i) Classificatory system, and (ii) Descriptive system. (i) Classificatory System: Under the classificatory system the various kin are included in one category and all are referred to by the same term. Thus, the term 'uncle' is a classificatory term. It is used for chacha, mama, mausa, foofa, tau, etc. Similarly the terms 'nephew' 'cousin' and 'in-law' are classificatory terms. The Sema Naga of Assam use aja for mother, father's brother's wife, and mother's sister. Among kuki clans, hepu, is used for father's father, mother's father; brother's son; wife's brother wife's brother's son. Thus, people of various age groups are designated by the same term. Among the Angami Nagas, the same terms are used for members of opposite sexes. The word she

NSOU CC-SO-02 236 stands for elder brother, wife's elder sister; husband's elder brother, elder sister's husband, brother's wife; father's brother's wife. In Hindi the word 'Sambadhin' is a classificatory term as it refers to father and mother of daughter- in-law and of son-in-law. (ii) Descriptive System: Under descriptive system one term refers to only one relation. It describes the exact relation of a person towards another. For example, father is a descriptive term. Similarly, mother is a descriptive term. In Hindi we have mostly, descriptive terms. Thus the terms chacha, mama, mausa, tau, sala, bahnoi, nandoi, bhanja, bhatija, bhabhi, devar, etc. are descriptive terms and designate the speakers's exact relation. It may be remarked that there is no place in the world where either the pure descriptive or the pure classificatory system is used. Both the systems are found prevalent. 16.14 Kinship Usages The study of kinship system does not end with the description of various kin and the basis of their classification but it also includes the study of behaviour patterns of different kin. Every relationship involves a particular type of behaviour. The behaviour of a son towards his father is one of respect while the behaviour of husband towards wife is one of love. The behaviour of a brother towards his sister is one of affection. There are some usages which regulate the behaviour of different kin. These usages are called kinship usages. Some of these usages are the following: (i) Avoidance : In all societies the usage of avoidance is observed in one form or another. It means that the two kin should remain away from each other. In other words, they should avoid each other. They should not only avoid sexual relationship but in some cases avoid seeing the face of each other. Thus, a father-in-law (sasur) should avoid daughter-in-law. The son-in-law should avoid the mother-in-law. The purdah system in the Hindu family illustrates the usage of avoidance. Different explanations have been given for the usage of avoidance. Two of them are functionalist explanations given by Fred Eggan and G.P. Murdock. According to them, avoidance serves to foster further and more serious trouble between relatives. The third is the Freudian explanation according to which avoidance represent a sort of institutionalized neurotic symptom.

NSOU CC-SO-02 237 (ii) Joking Relationship: It is the reverse of avoidance relationship. Under it a relation is permitted to tease or make fun of the other. The relationship between devar-bhabhi, jija-sali, is joking relationship. The joking may amount to exchange of abuse and vulgar reference to sex. (iii) Teknonymy : The word 'teknonymy' has been taken from the Greek word and was used in anthropology for the first time by Taylor. According to this usage a kin is not referred to directly but he is referred to through another kin. A kin becomes the medium of reference between two kin. Thus in traditional Hindu family a wife does not utter the name of her husband. She calls him through her son or daughter. He is referred to by her as the father of Guddu or Tannu. (iv) Avunculate : This kinship usage is a peculiar feature of matriarchal system. It gives the maternal uncle (mama) a prominent place in the life of his nephews and nieces. He has special obligations towards them which exceed those of father. He has a prior right over their loyalties. He comes first among all male relatives. (v) Amitate : When a special role is given to the father's sister, it is known as amitate. The father's sister gets more respect than the mother. (vi) Couvade : This is a queer usage which is found among many primitive tribes like

76%

MATCHING BLOCK 98/104

W

the Khasis and the Todas. Under this usage, the husband is made to lead the life of an invalid along with his wife whenever she gives birth to a child. He refrains from active work

and takes sick diet. He observes the same taboos which are observed by his wife. This kinship usage thus involves both the husband and wife. Kinship usages accomplish two major tasks. First, they create groups; special groups; special groupings of kin. This marriage assigns each mother a husband, and makes her children his children, thereby creating a special group of father, mother and children, which we call "family". The second major function of kinship usages is to govern the role relationships betweenkin; that is how one kinsman should behave in a particular kinsman's presence, or what one kinsman owes to another. Kinship assigns guidelines for interactions between persons. It defines proper, acceptable role relationship between father and daughter between brother and sister, between son-in-law and mother-in-law and between fellow lineage members and clansmen. Kinship thus acts as a regularizer of social life.

NSOU CC-SO-02 238 It may, however, be noted that rules governing the relationship between a pair of kinsmen may be highly "patterned" in some societies to allow little leeway for spontaneity or individual differences, while in other societies, such rules may be less "patterned" so as to leave much room for individualised behaviour. 16.15 Summary Marriage is a universal social institution. It is associated with mutual rights and obligations. It serves protective, regulatory, emotional and economic functions. Marriage ties result in formation of kinship network which organize individuals into social groups. In Hindu society marriage is deeply linked with religion and considered a sacrament. Hindu Marriage is a sacrament although certain changing trends can be observed due to various factors like urbanisation, industrialization, legislations and education. The classical thinkers like Durkheim views family as an important institution for maintaining social order and a moral society. Weber considers marriage as an essential institution which regulates the behaviour and desires of individuals. The modern thinkers relates marriage customs to habitus and cyclical changes in marriage to changes in economic system. Becker has analysed marriage on the basis of gains to trade model. Ulrich Beck elaborates on risks associated with marriage in the contemporary risk society. The post-modern thinkers like Foucault emphasize on deconstructing the institutions of family and marriage. Due the forces of globalization, modernization and legislations, changing trends can be observed in Hindu marriage. In spite of several changes, due to several customs and traditions, gender inequality can be observed in certain marriage practices and rituals. Divorce and widowhood are considered to be a stigma for women in Indian society. The issue of remarriage of women is associated with several religious and cultural practices. 16.16 Model Questions 1. Short question (5 Marks) A. Define kinship system. B. Write down the significance of kinship. C. What is the alliance approach to the kinship system? D. What is affinal kinship? E. What is social kinship? F. What do you mean by 'rules of residence'?

NSOU CC-SO-02 239 2. Answer in detail (10 Marks) A. Discuss the types of kinship. B. Write down the functions of kinship. C. Discuss the descent approach of kinship. D. Discuss the alliance approach of kinship. E. What do you mean by inheritance rules? F. Discuss the major approach to the study of kinship. G. Define the kinship system ? Illustrate the types of kinship. H. Explain the kinship term as classified by Morgan ? write down the significance of kinship. 16.17 References and Suggested Readings 1. Unit 17 Religion and Society Structure 17.0 Objectives 17.1 Introduction 17.2 Sociological Approach of Religion 17.2.1 The History of Religion as a Sociological Concept 17.2.2 Classical sociology: Emile Durkheim 17.2.3 The Protestant Work Ethic in the Information Age 17.2.4 Karl Marx on Religion 17.3 Anthropological Approaches 17.4 Types of Religious Organizations 17.5 Religion and Social Change 17.6 Summary 17.7 Model Questions 17.8 References and Suggested Readings 17.0 Objectives The unit looks into the subject of religion to understand its associated aspects like— The Sociological Approach. The history of religion. Important sociological theories of religion. Anthropological Approach to understand primitive rituals and beliefs. Inter-relationship between religion and social change. 243

NSOU CC-SO-02 244 17.1 Introduction Modern societies have generally been recognized as sites of human engagement that undermine the role of the spiritual/transcendental in the actual course of everyday human existence everywhere this has rarely been the case. The general trend of thinking within the social sciences and more specifically within sociology has been that the growing rationalization and secularization of human knowledge must result in a state of disenchantment of the transcendental, more specifically, the world of religion. While it is true that there are modern societies where religion has been successfully relegated to the domain of the private and the personal, it is equally true that in other modern societies, religion persists, one might even say that in many of these societies religious consciousness co-exists with its modern counterpart. In acknowledging this relationship of religion and society, it is important to stress at the very outset that notwithstanding the modernist contention on religion both within sociology and other fields of the social sciences there has been an active intellectual engagement that seeks to understand and probe the various dimensions of this society-religion interconnection. Within sociology this relationship has been viewed in many different ways not only highlighting the specificities of theoretical traditions but also the methodological underpinnings of that which constitutes religion in the modern world. From its location in the discipline of sociology, this module attempts to explore the multi-faceted relationship that exists between religion and society not only as an ongoing theoretical concern but also as an empirical object that merits its own sets of observations, analysis and interpretation. It may be useful to point out here that as a subject of sociological engagement, religion has from the very beginning occupied an important place of theoretical engagement within the discipline of sociology. In their own ways all the major classical sociologists from Marx, Durkheim, Weber etc., invested a huge amount of intellectual engagement with the field of religion. Given the vast diversity of religious practices that exist within society, the issue of identity emerges as significant not only in the domain of the religious context but also in terms of how these identities come to be represented in the everyday life of the believers. On the one hand, we consider how Hindu nationalism emerges as an ideology in the context of modern Indian society, on the other, we look at the growth of secularism and how secularism as an ideology and practice has sought to configure a distinctive relationship between religion and society in modern India. Continuity and change in the context of religion-society interrelationship. While continuity and change

NSOU CC-SO-02 245 affects the working of this relationship in all societies everywhere in the world, it is both relevant and significant to understand how a religion changes for its practitioners as a result of diverse forces that act upon it both internally and externally.

17.2 Sociological Approach of Religion From the Latin religio (respect for what is sacred) and religare (to bind, in the sense of an obligation), the term religion describes various systems of belief and practice concerning what people determine to be sacred or spiritual. Throughout history, and in societies across the world, leaders have used religious narratives, symbols, and traditions in an attempt to give more meaning to life and understand the universe. Some form of religion is found in every known culture, and it is usually practiced in a public way by a group. The practice of religion can include feasts and festivals, God or gods, marriage and funeral services, music and art, meditation or initiation, sacrifice or service, and other aspects of culture. While some people think of religion as something individual because religious beliefs can be highly personal, religion is also a social institution. Social scientists recognize that religion exists as an organized and integrated set of beliefs, behaviours, and norms centred on basic social needs and values. Moreover, religion is a cultural universal found in all social groups. For instance, in every culture, funeral rites are practiced in some way, although these customs vary between cultures and within religious affiliations. Despite differences, there are common elements in a ceremony marking a person's death, such as announcement of the death, care of the deceased, disposition, and ceremony or ritual. These universals, and the differences in how societies and individuals experience religion, provide rich material for sociological study. In studying religion, sociologists distinguish between what they term the experience, beliefs, and rituals of a religion. Religious experience refers to the conviction or sensation that one is connected to "the divine." This type of communion might be experienced when people are praying or meditating. Religious beliefs are specific ideas that members of a particular faith hold to be true, such as that Jesus Christ was the son of God, or believing in reincarnation. Another illustration of religious beliefs is that different religions adhere to certain stories of world creation. Religious rituals are behaviours or practices that are either required or expected of the members of a particular group, such as bar mitzvah or confession (Barkan and Greenwood 2003).

NSOU CC-SO-02 246 17.2.1 The History of Religion as a Sociological Concept : In the wake of 19th century European industrialization and secularization, three social theorists attempted to examine the relationship between religion and society: Émile Durkheim, Max Weber, and Karl Marx. They are among the founding thinkers of modern sociology. As stated earlier, French sociologist Émile Durkheim (1858-1917) defined religion as a "

100%

MATCHING BLOCK 99/104

W

unified system of beliefs and practices relative to sacred things".

To him, the sacred meant extraordinary-something that inspired wonder and which seemed connected to the concept of "the divine." Durkheim argued that "religion happens" in society when there is a separation between the profane (ordinary life) and the sacred. A rock, for example, isn't sacred or profane as it exists. But if someone makes it into a headstone, or another person uses it for landscaping, it takes on different meanings- one sacred, one profane. Durkheim is generally considered the first sociologist who analyzed religion in terms of its societal impact. Above all, Durkheim believed that religion is about community: it binds people together (social cohesion), promotes behaviour consistency (social control), and offers strength for people during life's transitions and tragedies (meaning and purpose). By applying the methods of natural science to the study of society, he held that the source of religion and morality is the collective mind-set of society and that the cohesive bonds of social order result from common values in a society. He contended that these values need to be maintained to maintain social stability. Religion then provided differing degrees of "social cement" that held societies and cultures together. Faith provided the justification for society to exist beyond the mundane and partial explanations of existence as provided in science, even to consider an intentional future: "for faith is before all else an impetus to action, while science, no matter how far it may be pushed, always remains at a distance from this". But what would happen if religion were to decline? This question led Durkheim to posit that religion is not just a social creation but something that represents the power of society: when people celebrate sacred things, they celebrate the power of their society. By this reasoning, even if traditional religion disappeared, society wouldn't necessarily dissolve.

NSOU CC-SO-02 247 17.2.2 Classical Sociology: Émile Durkheim : Durkheim's sociological analysis of religion in *The Elementary Forms of the Religious Life* (1912) was an example of this. In this work he was not interested in the theological questions of God's existence or purpose, but in developing a very secular, sociological question: Whether God exists or not, how does religion function socially in a society? He argued that beneath the irrationalism and the "barbarous and fantastic rites" of both the most primitive and the most modern religions is their ability to satisfy real social and human needs. "There are no religions which are false" he said. Religion performs the key function of providing social solidarity in a society. The rituals, the worship of icons, and the belief in supernatural beings "excite, maintain or recreate certain mental states" that bring people together, provide a ritual and symbolic focus, and unify them. This type of analysis became the basis of the functionalist perspective in sociology. He explained the existence and persistence of religion on the basis of the necessary function it performed in unifying society. Whereas Durkheim saw religion as a source of social stability, German sociologist and political economist Max Weber (1864-1920) believed it was a precipitator of social change. He examined the effects of religious belief on economic activities and noticed that heavily Protestant societies-such as those in the Netherlands, England, Scotland, and Germany-were the most highly developed capitalist societies and that their most successful business and other leaders were Protestant. In his writing *The Protestant Work Ethic and the Spirit of Capitalism* (1905), he contends that the Protestant work ethic influenced the development of capitalism by overturning the traditional anti-materialist Christian values of poverty. 17.2.3 *The Protestant Work Ethic in the Information Age* : Max Weber (1904) posited that, in Europe in his time, Protestants were more likely than Catholics to reflect the values of hard work and savings conducive to capitalist ideology. Focusing on Calvinism, he showed that Protestant values influenced the rise of capitalism and helped create the modern world order. Weber thought the emphasis on community in Catholicism versus the emphasis on individual achievement in Protestantism made a difference. Weber's century-old claim that the Protestant work ethic led to the development of capitalism has been one of the most important and controversial topics in the sociology of religion. In fact, some scholars have found little merit to his contention when applied to contemporary society.

NSOU CC-SO-02 248 The work ethic in the information age has been affected by tremendous cultural and social change, just as workers in the mid to late 19th century were influenced by the wake of the Industrial Revolution. Factory jobs tend to be simple and uninvolved and require very little thinking or decision making on the part of the worker. Today, the work ethic of the modern workforce has been transformed, as more thinking and decision making is required. Employees also seek autonomy and fulfillment in their jobs, not just wages. Higher levels of education have become necessary, as well as people management skills and access to the most recent information on any given topic. The information age has increased the rapid pace of production expected in many jobs. 17.2.4 Karl Marx on Religion: German philosopher, journalist, and revolutionary socialist Karl Marx (1818-1883) also studied the social impact of religion. He believed religion reflects the social stratification of society and that it maintains inequality and perpetuates the status quo. For him, religion was just an extension of working-class (proletariat) economic suffering: "Religion

94%

MATCHING BLOCK 100/104

W

is the sigh of the oppressed creature, the heart of a heartless world, and the soul of soulless conditions. It is the opium of the people".

In reviewing the development of the Sociology of Religion, it is necessary to comment on some contributions that stood outside the positivistic, evolutionary tradition. In his early works with Engels, Karl Marx (1818-1883) concentrated on the political aspects of religion and its use or abuse as a means of moral and intellectual repression. According to Marx, the discussion of labour in a capitalist society, the development of the structure of the market and the consequent exploitation of labour by subjugating humans to the products of their own labour, led to a condition of alienation of humans. Humans, who were unable to regulate their own world, turned to religion. This approach precisely shifted the focus to a more materialist, pragmatic critique of religion. Marx observed that there is a parallel between religious and socio-economic activity. Marx and Engels saw religion as a social product, emerging out of social relations. Religion did not exist all by itself, independent of the social and economic forces. It became a means to control the masses and an instrument in legitimizing injustice. It was during the Renaissance and the Reformation that the authority of religious

NSOU CC-SO-02 249 institutions was questioned. Science, up until then had been under the direct control of the Church. A protest against religion began with the understanding that it was necessary to get rid of religion if humanity had to progress, as it posed as an obstacle to scientific, rational thought. Up until then, science had been but a humble hand maiden of the Church. At the same time for the growth of material production, the bourgeois required a science that could explain the physical properties of natural objects. When science and reason rebelled against the Church, the bourgeoisie joined this struggle. Along with a struggle against feudalism, it was also a struggle against an older belief system that restricted rational thought. It was the bourgeoisie class that attempted to replace the Church's feudalism with a religious belief system more compatible with industrial growth and materialism. This led to the resultant Protestant Reformation. (Engels 1880) Protestantism was more compatible with materialism since it preached a doctrine of 'calling'. For the bourgeois, Protestantism justified accumulation of wealth, while for the lower classes it promoted a strong work ethic of hard work. In his work *The Introduction to the Critique of Hegel's Philosophy of Right* (1844), Marx wrote, 'Religion

77%

MATCHING BLOCK 101/104

W

is the sigh of the oppressed creature, the heart of a heartless world. It is the opium of the people'.

Fear had created the gods. The helplessness of the oppressed in their struggle against the exploiters led to a belief in a better life beyond the grave. The hope of a reward in the form of seeking heaven after death caused them to be more humble in accepting their sufferings on earth. Escape is the essential thing that religion offered the oppressed. While for those who are the owners of means of production, it offered an ideology, a system that legitimized poverty, injustice and suffering as the will of God. Marx states thus, 'The social principles of Christianity preach the necessity of a ruling and an oppressed class, and all they have for the latter is the pious wish that the former will be charitable...The abolition of religion, as the illusory happiness of the people, is required for their real happiness. The demand to give up the illusions about its condition is the demand to give up a condition which needs illusions. Religion was a false consciousness, an illusionary happiness. It preached the existence of a class structure and validated its unjust nature. A critique of religion was necessary according to Marx, so as to make humans see reason, to think and act and shape their reality according to reason. For Marx, religion was only an illusion, God a human creation and not the other way round. Religion and the capitalist mode of production both were the causes of man's alienation albeit in different ways. Religion stripped humans of their most valued ideals and projected them onto a supernatural being, a deity. Like any other dominant ideology, religion then legitimizes the ideas of the ruling class, in this case, the bourgeois. Capitalism on the other hand, projected human-like values to the products of human labour, alienating man's labour. Religion's ideological function is, for Marx, related to the idea of reification. Reification occurs when the social character of labor becomes objectified and obscured by ideologies in which "divine law" (rather than human beings with particular interests) is viewed as the true author of social relations. Reification thus conceals that which is actually arbitrary and socially changeable by representing it as immutably given. As such, reification is an excellent form of social control, since the workers control themselves rather than forcing the owners to control them in visibly unjust or brutal ways. As religion robs humans of their merits projecting them to a god, so does the capitalist economy rob us of our labour, transforming it to another commodity, into the hands of those who can buy it. Religion strips humans of qualities and assigns them to a supernatural being, thus being just another kind of fetishism. Thus Engels wrote in *Anti-Duhring* (1878) how we have already seen, more than once, that in existing bourgeois society, men were dominated by the economic conditions created by themselves, by the means of production which they themselves have produced, as if by an external force. So religion would not vanish unless the social conditions that accompanied a belief in religion were removed. As long as humans were made to believe that an external force held some power over them, whether economic or social, religion would exist and accompany the ongoing class struggles. For Durkheim, Weber, and Marx, who were reacting to the great social and economic upheaval of the late 19th century and early 20th century in Europe, religion was an integral part of society. For Durkheim, religion was a force for cohesion that helped bind the members of society to the group, while Weber believed religion could be understood as something separate from society. Marx considered religion inseparable from the economy and the worker. Religion could not be understood apart from its ideological role in perpetuating or mystifying the inequalities of capitalist society. Despite their different views, these social theorists all believed in the centrality of religion to society.

NSOU CC-SO-02 251 17.3 Anthropological Approaches to the Study of Ritual and Belief in Non-Western Societies a) Edward Burnett Taylor on Beliefs as Mistaken Inferences in 'Primitive' Culture: A leading figure of nineteenth-century evolutionary anthropology, Edward Taylor, in *Primitive Culture* (1871), argues that the study of culture and civilization allows for the understanding of the general laws of human thought and action. Just as one finds uniform laws in the realm of nature, one can apply the same principle to civilizations. According to Taylor, the job of the student of culture is to find general principles of human action. One can embark on this study by analyzing "survivals", those elements in the present that are carried over from the past, reflecting beliefs, customs and conditions of an older time. Survivals include traditional games, popular sayings, customs, and 'superstitious belief'. According to Taylor, many parallels have been observed between ancient human tribes and the existing savage tribes and hence, by studying the present-day 'savage-tribes', one could learn about this story of civilization. In his book *Theories of Primitive Religion* (1965) E.E. Evans-Pritchard critiques the theories of evolutionary anthropologists. The way both Taylor and Frazer argue is a form of a priori speculation. It proceeds by imagining oneself in place of a person living in primitive conditions and recreating the logic that would lead one to uphold primitive beliefs. "A logical construction of the scholar's mind is posited on the primitive man, and put forward as an explanation of his beliefs." It is possible that this is how 'primitive' beliefs came about, but there is no way to verify it. b) Functional (and Structural) Explanations of Belief and Ritual by Bronisaw Malinowski (1884-1942) goes back to the distinction between magic and religion, as well as magic and science. His work emerges as a critique of those who do not demarcate a scientific approach from a magical one within primitive society. According to Malinowski, it is not possible to carry on everyday life without sound generalizations and logical reasoning, which are needed for normal activities and are the basis of production. However, no matter how extensive one's knowledge, there will always be limitations, and it is never possible to completely eradicate an unexpected turn of events. He traces the need for, and existence of, a special type of ritual activity (known as magic) in both modern and primitive society, where one realizes the impotence and limits of knowledge. Ordinary work and skill is never replaced by magic, which shows that science doesn't develop out of magic (as Frazer had claimed).

NSOU CC-SO-02 252 The force of magic can only be produced within a traditionally-defined dramatic and emotional milieu, which creates the atmosphere of the supernatural. He emphasizes the functional nature of magic in terms of individual psychology and its cultural and social value. One finds a different kind of functionalism in Alfred Radcliffe-Brown (1881- 1955), who also draws on the structuralism of Durkheim. In his influential work, *The Andaman Islanders*, he examines different types of social action and devotes significant attention to "ceremonial customs." In interpreting these customs, he shows how "every custom and belief of a primitive society plays some determinate part in the social life of the community, just as every organ of a living body plays some part in the general life of the organism." (Radcliffe-Brown in Morris 1987: 124) According to Morris, Radcliffe-Brown's interest is not in historical origins of social institutions, but in the interpretation of their "meaning," or their function. c) Ritual in terms of Rebellion, Communities and Mystification : When theorizing ritual, Max Gluckman's work and subsequently Edward Norbeck's critique pose an interesting question. Durkheim's idea of ritual as confirming group solidarity didn't quite fit for Gluckman, who in his work on South East Africa looked at examples of certain rites where people in a subordinate position performed a reversed role in the ritual. For instance, women would assert dominance over men in a certain rite. Gluckman called these "rituals of rebellion" embedded in a "repetitive social system", where the act of rebellion had rebels but no revolutionaries, and ritual eventually supported the same structure. Edward Norbeck in his critique suggests that instead of rituals of rebellion, these could be seen as simply part of a larger category of rituals that allow for a momentary relaxation of social rules. Thus, ritual could be seen as exaggerating "real conflicts" but affirming unity despite conflict. (Morris 1987: 248-251) The terms 'rites of passage', usually associated with initiation rituals, came into usage more broadly as a concept when developed by Arnold van Gennep. The term depicts transition and change of status through ritual. The ritual can be for different occasions such as marking a new stage in a person's life or change of seasons or rituals associated with territorial movements, initiation into groups etc. All rites of passage have an underlying pattern with three phases: the first stage is a separation from the previous state, place, time or status. d) The characteristics of the liminal personae ("threshold people") are necessarily ambiguous, since they cannot be identified with the web of classifications

NSOU CC-SO-02 253 that normally persist. This ambiguity is expressed in diverse ways. It may include subjecting the liminal entities to nudity or disguising them as monsters, inflicting some arbitrary punishment, expecting humble behavior, erasing distinctions of rank or status or rendering them uniform. "It is as though they are being reduced or ground down to a uniform condition to be fashioned anew and endowed with additional powers to enable them to cope with their new situation in life." What Turner finds interesting about liminality is the space it produces, characterized by lowliness and sacredness, allowing for homogeneity and comradeship. In such rites, one is presented with a momentary image of a generalized social bond that has ceased to exist and yet it is about to be classified into a variety of hierarchical, structural bonds. According to Turner, the liminal phase is not simply a distinction between "sacred" and "secular"; rather, "this 'sacred' component is acquired by the incumbents of positions during the rites de passage, through which they changed positions. Something of the sacredness of that transient humility and modelessness goes over, and tempers the pride of the incumbent of a higher position or office." (Turner 2002 [1969]: 360). Turner states that this isn't simply about giving legitimacy to existing social structures but is rather a recognition of an "essential and generic human bond, without which there could be no society". Liminal situations are also almost everywhere attributed to magico-religious properties and often accompanied by ideas of danger, inauspicion, pollution, taboo etc. Turner suggests that this should be seen from the perspective of maintaining the status quo, and thus the form of the *communitas* must appear as dangerous or anarchical and have to be surrounded by conditions and prescriptions.

e) Ritual as Mystification : Peter Van Der Veer compares Maurice Bloch's approach towards studying rituals to Clifford Geertz's, for whom symbols, as vehicle, allow for meaning to be communicated. These symbols constitute the worldview of a society, and ritual does the significant job of retaining this worldview by making it seem real. While society actually changes over the course of time, ritual action retains the traditional worldview. Bloch, also interested in studying symbols, critiques the functionalist, intellectualist and the symbolist approach for assuming that rituals are as they are in order to fulfill one particular function that is explanation. According to Bloch, even a less simplified approach like Turner's which brings together the symbolic, emotional and sociological aspects of ritual doesn't quite situate the symbolic in the social. This, he states, is not

NSOU CC-SO-02 254 possible to do on a short-term scale. He thus attempts to study the circumcision of the Merina in Madagascar as a symbolic system being created in history. (Bloch 1986: 8) 17.4 Types of Religious Organizations Religions organize themselves-their institutions, practitioners, and structures-in a variety of fashions. For instance, when the Roman Catholic Church emerged, it borrowed many of its organizational principles from the ancient Roman military, turning senators into cardinals, for example. Sociologists use different terms, like *ecclesia*, denomination, and sect, to define these types of organizations. Scholars are also aware that these definitions are not static. Most religions transition through different organizational phases. For example, Christianity began as a cult, transformed into a sect, and today exists as an *ecclesia*. Cults, like sects, are new religious groups. In popular usage, this term often carries pejorative connotations. Today, the term "cult" is used interchangeably with the term new religious movement (NRM). However, almost all religions began as NRMs and gradually progressed to levels of greater size and organization. In its pejorative use, these groups are often disparaged as being secretive, highly controlling of members' lives, and dominated by a single, charismatic leader. Controversy exists over whether some groups are cults, perhaps due in part to media sensationalism over groups like polygamous Mormons or the Peoples Temple followers who died at Jonestown, Guyana. Some groups that are controversially labelled as cults today include the Church of Scientology and the Hare Krishna movement. A sect is a small and relatively new group. Most of the well-known Christian denominations in North America today began as sects. For example, the Presbyterians and Baptists protested against their parent Anglican Church in England, just as Henry VIII protested against the Catholic Church by forming the Anglican Church. From "protest" comes the term Protestant. Occasionally, a sect is a breakaway group that may be in tension with larger society. They sometimes claim to be returning to "the fundamentals" or to contest the veracity of a particular doctrine. When membership in a sect increases over time, it may grow into a denomination. Often a sect begins as an offshoot of a denomination, when a group of members believes they should separate from the larger group.

NSOU CC-SO-02 255 Some sects evolve without growing into denominations. Sociologists call these established sects. Established sects, such as the Hutterites or Jehovah's Witnesses in Canada fall halfway between sect and denomination on the *ecclesia*-cult continuum because they have a mixture of sect-like and denomination-like characteristics. A denomination is a large, mainstream religious organization, but it does not claim to be official or state sponsored. It is one religion among many. For example, The Church of England in Canada, the Presbyterian Church, the United Church, and Seventh-day Adventist are all Christian denominations. The term *ecclesia*, originally referring to a political assembly of citizens in ancient Athens, Greece, now refers to a congregation. In sociology, the term is used to refer to a religious group that most members of a society belong to. It is considered a nationally recognized, or official, religion that holds a religious monopoly and is closely allied with state and secular powers. Canada does not have an *ecclesia* by this standard. One way to remember these religious organizational terms is to think of cults (NRMs), sects, denominations, and *ecclesia* representing a continuum, with increasing influence on society, where cults are least influential and *ecclesia* are most influential. 17.5 Religion and Social Change Religion has historically been a major impetus to social change. In early Europe, the translation of sacred texts into everyday, non-scholarly language empowered people to shape their religions. Disagreements between religious groups and instances of religious persecution have led to mass resettlement, war, and even genocide. To some degree, the modern sovereign state system and international law might be seen as products of the conflict between religious beliefs as these were founded in Europe by the Treaty of Westphalia (1648), which ended the Thirty Years War. As outlined below, Canada is no stranger to religion as an agent of social change. Secularization At the same time that religion is still a major force in Western society, it is within a backdrop of societies becoming more and more secularized. Secularization as a social and historical process has been outlined by the sociologist Jose Casanova as three interrelated trends, all open to debate: 1) the decline of religious beliefs and practices in modern societies, 2) the privatization of religion, and 3) the differentiation

NSOU CC-SO-02 256 of the secular spheres (state, economy, science), usually understood as "emancipation" from religious institutions and norms. Historical sociologists Émile Durkheim, Max Weber, and Karl Marx and psychoanalyst Sigmund Freud anticipated secularization, claiming that the modernization of society would bring about a decrease in the influence of religion. Weber believed membership in distinguished clubs would outpace membership in Protestant sects as a way for people to gain authority or respect. Religious independent schools teaching from kindergarten to grade 12 receive varying degrees of public funding across Canada. In British Columbia, these schools are countering the student population declines found in the public schools and have generally increased enrolments annually. The power of the sociological study of religion goes well beyond how we think and behave over religion. These views and behaviours spill over in fundamental ways into other important arenas within our lives. Whether we consider our views on politics, homosexuality, or our children's education, the sociological study of religion provides valuable insights into our collective behaviour. 17.6 Summary Three different perspectives in the study of religion were discussed. While Marx held a strong critical view of religion, Durkheim appraised it as the glue that held social groups together. Weber on the other hand made a comparative analysis of world religions and the way in which religious worldviews and socio-economic activities influence each other. The common thread that links these scholarly works is their attempt to grapple with large scale changes that gripped the European society. Sociological terms for different kinds of religious organizations are, in order of decreasing influence in society, ecclesia, denomination, sect, and cult. Religions can be categorized according to what or whom its followers worship. Many of the classical sociological theories predicted that levels of religiosity in Western societies would decline due to the process of secularization. The clash of secular and religious values in modern society produces issues that are difficult to resolve.

NSOU CC-SO-02 257 17.7 Model Questions 1. Answer briefly the following questions: (5 marks) a) Define religion as a sociological concept. b) What are the anthropological approaches to the study of rituals and beliefs in non western countries? c) Point out the three major theoretical perspectives on religion. d) Write a short note on cult. 2. Answer in detail the following questions: (10 marks) a) Write a detailed note on Durkheim about religion. b) Contrast the views of Weber and Marx on religion. c) Discuss in detail the different religious organizations. d) Explain the relationship between Religion and Social Change. e) Elaborate views of three sociological thinkers on religion. f) Analyse Anthropological approach of rituals and beliefs in non western countries. g) Describe the theoretical perspective on religion and religious organization 17.8 References and Suggested Readings Bowie, Fiona. 2000. *The Anthropology of Religion: an introduction*, Oxford: Blackwell Publishers. NSOU CC-SO-02 258 Unit 18 Religion as an Institution Structure 18.0 Objectives 18.1 Introduction 18.2 Religion: A Sociological Definition 18.3 Functions of Religion 18.5 Role of Religious institutions in Society 18.6 Summary 18.7 Model Questions 18.8 References and Suggested Readings 18.0 Objectives From this unit students will come to know of : How religion is defined in sociology. What functions it performs in society. What role religion plays in social life. The nature and scope of religion as a social institution. 18.1 Introduction In viewing religion as an institution, sociologists evaluate its impact on human societies. As an institution, religion has operated to standardize the religious emotions, beliefs and practices, and to spread and perpetuate them. It is a powerful instrument of social control and social integration. It is a strong bond of social unity through promoting a community of thought. It deals with divine sanctions as well as with present and future rewards and punishments. Through this, it exercises a profound influence on one's behaviour. In viewing religion as a social institution, sociologists have also evaluated its impact on individuals and society as a whole. As an institution, religion is characterized by its universality, its rituals, its sacredness and its persistence. 258

NSOU CC-SO-02 259 Religion can be viewed from individual and societal points of view both. The functions of social cohesion and social control are oriented towards the larger society while providing emotional and social support and other psychological explanations are more oriented towards the individual. Although religion, like all other institutions, has changed, it continues to be a potent force, rather with more vigour in our lives throughout the modern neo-liberal risky world. The assertion that 'God is dead' is not true for a large part of world's population. Despite the incredible growth in the importance of science and empiricism since 19th century, which has caused many people to regard religion as a superstition, an irrational belief and religiosity and spirituality among people is increasing in some or the other way. At many times, religion persists in the face of scientific evidence. Even, the men who call themselves as scientists are not fully devoid of religious beliefs and they take part in many religious rituals in the home as well as at workplace. We often hear a doctor saying that he or she will do his/her best to save the life of the patient but it is ultimately He (God) who saves. This proves that religion has always been present and has also been a prominent institution. In traditional societies the religious and non-religious spheres of life are not sharply differentiated. But, in modern industrial societies, religion and society are not the same. The emergence of different modes of life experience leads to different meanings about life, producing a religious differentiation. Religion may still provide cohesion, but now only for sub-groups of society. 18.2 Religion - A Sociological Definition Societies make distinctions between the sacred (anything that is considered to be part of the supernatural world and that inspires awe, respect and reverence) and the profane (anything considered to be part of the ordinary world and, thus, commonplace and familiar). This distinction is the basis for of all religions (systems of roles and norms that are organized around the sacred realm and that bind people together in social groups). Religion is a basic institution, yet it exists in many different forms because different societies give sacred meaning to a wide variety of objects, events and experiences. Religion is not just defined in terms of superhuman agents but also in terms of textual traditions. Religion in Fitzgerald's (2000) opinion is vaguely used to refer to rituals directed towards God and that it becomes a habitual reflex than a deliberate

NSOU CC-SO-02 260 and sustained policy. Religion may also be used deliberately as a non-theological analytical category to make distinctions between religious and the non-religious. Fitzgerald (2000) outlines certain assumptions that lie behind the phenomenology of religion, such as, it is a universal phenomenon to be found in principle in all cultures and all human experiences. Another pervasive assumption is that religions are defined by a common faith in the transcendent or the divine-belief in superhuman agencies, or preferably in one Supreme Being, who gives meaning and purpose to human history. In his opinion, religion should be studied as an ideological category, as an aspect of modern western ideology and as a basis of modern form of theology, with a specific location in history. Thus, according to him, the ethnocentric Judeo-Christian theological semantic association of the word religion has not been sufficiently neutralized. Attempt is made to smuggle in some ecumenical assumptions about what can and cannot be sacred or transcendental. With the onset of the twentieth century, other faiths aspired for world religions and described their eligibility based on dominant characteristics of a recognized religion. The world religions according to Weber (1946); are the five religions (Confucian, Hinduist, Buddhist, Christianity, and Islam, Judaism) or religiously determined systems of life-regulation which have known how to gather multitudes of confessors around them. According to him, the religiously determined way of life is itself profoundly influenced by economic and political factors operating within given geographical, political, social, and national boundaries. Marx too accepts the view that religion represents human self-alienation. He declared in a famous phrase that religion has been the opium of the people. Religion defers happiness and rewards to the after-life, teaching the resigned acceptance of existing conditions in this life. Attention is thus diverted from inequalities and injustices in this world by the promise of what is to come in the next. Religion has a strong ideological element, religious beliefs and values often provide justifications for inequalities of wealth and power. In Marx's view religion in its traditional form will and should disappear. Ambedkar (1987) also illuminates that religion is an institution or an influence and like all social influences and institutions, it may help or it may harm a society which is in its grip. It is a force which can be accepted as good without examining the form it takes and the ideal it serves.

NSOU CC-SO-02 261 18.3 Functions of Religion Religion is a cultural universal because it fulfills several basic functions within human societies. It is a basic requirement of group life. In sociological terms, these include both manifest and latent functions. Among the manifest (open and stated) functions of religion are included defining the spiritual world and giving meaning to the divine. Religion provides an explanation for events that seem difficult to understand. By contrast, latent functions or religion are unintended, covert, or hidden. Functionalists suggest that religion is a requirement for society and individual both because it serves both manifest and latent functions. 1. Religion as an Integrative Force: Durkheim believed that the primary function of religion was to preserve and solidify society. It functions to reinforce the collective unity or social solidarity of a group. Sharing the same religion or religious interpretation of the meaning of life unites people in a cohesive and building moral order. The social cohesion is developed through rituals such as reciting prayer in the honour of God, institutions of worship (church, temple, mosque, etc.), performing Namaz, and multitudes of observances and ceremonies practised by different groups. The unifying rituals of different faiths are also observed by individuals on the most significant occasions such as birth, marriage and death. This integrative function of religion was particularly apparent in traditional, pre-industrial societies. Durkheim was particularly concerned with a perplexing question, 'How can human societies be held together when they are generally composed of individuals and social groups with diverse interests and aspirations'. In his view, religious bonds often transcend these personal and divisive forces. It gives people certain ultimate values and ends to hold in common. 2. Creating a Moral Community: Religion provides a system of beliefs around which people may gather to belong to something greater than themselves in order to have their personal beliefs reinforced by the group and its rituals. Those who share a common ideology develop a collective identity and a sense of fellowship. Members of moral community also share a common life. This moral community gives rise to social community through the symbolism of the sacred that supports the more ordinary aspects of social life. Religion then legitimizes society. It provides

NSOU CC-SO-02 262 sacred sanction for the social order and for its basic values and meanings. 3. Religion as Social Control: Frank E. Manuel (1959) had said that 'religion was a mechanism which inspired terror, but terror for the preservation of society'. While conservatives have valued religion for its protective function, radicals have also often recognized that religion can be a support of the established order, and have, consequently, been critical of religion. Friedrich Engels, a life-long close associate of Karl Marx, once noted that religion could make the masses 'submissive to the behests of the masters it had pleased God to place over them'. Durkheim also emphasized that besides acting as an integrating force, religion also reinforces social control in oppressive society. Religious beliefs can influence the conduct of those who believe in them. It keeps people 'in line' through folkways and mores. It

59%

MATCHING BLOCK 102/104

W

provides a foundation for mores of society. Religious sanctions are sought for certain desirable patterns of behaviour to persist in society

in the forms of mores. Thus, many taboos in various cultures have religious sanctions, e.g., the taboo against eating of pork in Jewish and Muslims and cows meat in Hindus. 4. Provides Rites of Passage: Religion helps us in performing ceremonies and rituals related to rites of passage (birth, marriage, death and other momentous events) which give meaning and a social significance to our life. 5. Religion as Emotional Support: Religion is a sense of comfort and solace to the individuals during times of personal and social crises such as death of loved ones, serious injury, etc. This is especially true when something 'senseless' happens. It gives them emotional support and provides consolation, reconciliation and moral strength during trials and defeats, personal losses and unjust treatments. It provides a means whereby man can face the crises and vicissitudes of life with strength and fortitude. The concepts of karma and transmigration among Hindus and Jesus Christ as son of God and prayer among Christians seek to provide such fortitude and strength. Thomas O'Dea (1970) writes, 'Men need emotional support in the face of uncertainty, consolation when confronted with disappointments and anxiety.' It is often said that visiting places of worship and holy premises serves as outlets for releasing tension and stress.

NSOU CC-SO-02 263 Religion offers consolation to oppressed peoples also by giving them hope that they can achieve salvation and eternal happiness in the afterlife. Religion increases the 'God will provide' the attitude. 6. Religion Serves a Means to Provide Answers to Ultimate Questions: Why are we here on earth? Is there a supreme being? What happens after death? All religions have certain notions and beliefs that provide answers to the above questions. These beliefs are based on the faith that life has a purpose, and there is someone or something that controls the universe. It defines the spiritual world and gives meaning to the divine. Because of its beliefs concerning people's relationships to a beyond, religion provides an explanation for events that seem difficult to understand. 7. Religion as a Source of Identity: Religion gives individuals a sense of identity- a profound and positive self-identity. It enables them to cope effectively with the many doubts and indignation of everyday life. Religion may suggest people that they are not worthless or meaningless creatures and thus helps them alleviating the frustrating experiences of life which sometimes force a person to commit suicide. According to Thomas Luckman (1983), 'The prime function of religion is to give personal meaning to life'. In industrial societies, religion helps to integrate newcomers by providing a source of identity. For example, Bangladeshi immigrants in India, after settling in their new social environment, came to be identified as Indian Muslims. In a rapidly changing world, religious faith often provides an important sense of belonging. 8. Legitimizing Function of Religion: According to Max Weber (1930), religion may be used to explain, justify or rationalize the exercise of power. It reinforces the interests of those in power. Even in societies not as visibly ruled by religious dogma, religion legitimates the political sector. For example, India's traditional caste system defined the social structure of society. According to one theory, caste system is a creation of the priesthood (Brahmins)-the uppermost stratum of this system, but it also served the interests of political rulers by granting legitimacy to social inequality. Marx has acknowledged that religion plays an important role in legitimating the existing social structure. The values of religion reinforce other social institutions and the social order as a whole and as a consequence it perpetuates social inequality in society.

NSOU CC-SO-02 264 9. Psychologizing Religion: The notion of 'positive thinking' serves as an example of psychologizing religion. It provides peace of mind, promises prosperity and success in life, as well as effective and happy human relations. It is thus a source of security and confidence, and also of happiness and success in this world. But at times religion can be debilitating and personally destructive. Persons convinced of their own essential wickedness can suffer extreme personal difficulties. As Kingsley Davis (1949) noted, 'Like other medicines, it (religion) can sometimes make worse the very thing it seeks to remedy. Innumerable are the psychoses and neuroses that have religious content'. But, in this role, religion is not always harmful. Many times, it serves as a liberating and integrating force for individuals. For instance, it helps in bringing change (sobriety) to seemingly hopeless alcoholics. 10. Religion Acts as Psychotherapy: In modern world, religion has also become a supporting psychology-a form of psychotherapy. Now, God is conceived of as a humane and considerate God. Such a hopeful perception helps the sufferer in alleviating his/her personal and social crisis. A new vocation of religious practitioner has recently come up in the mental health field as a helping professional. It already existed in village India and other places in the form of shamans, priests and magicians (shamans are treated as super-humans endowed with supernatural powers in some tribal societies). 11. Religion as an Agent of Social Change: While religion supports the status quo in its priestly function, it inspires great change in its prophetic function. It can enable individuals to transcend social forces; to act in ways other than those prescribed by the social order. Mahatma Gandhi, Jesus, Thomas More all died upholding spiritual beliefs that were not those of the social order in which they lived. Religion, in its prophetic function, provides individuals with an unshakable foundation of social criticism which later on becomes the basis for social change. Many religious groups of the world protested against Vietnam and Iraq wars and an age-old Buddha statue in Afghanistan. 12. Religion as an Agent of De-politicization: According to Bryan Wilson (1976), religion functions as an agent of de-politicization. Marxists suggest that by inducing a 'false consciousness' among the disadvantaged, religion lessens the possibility of collective political action. In simpler terms, religion keeps people away from seeing their lives and societal conditions in political terms.

NSOU CC-SO-02 265 13. Religion Controls Sexuality: According to B. Turner (1992), 'religion has the function of controlling the sexuality of the body, in order to secure the regular transmission of property via the family'. In feudalism, and now in capitalism, religious control of sexuality is an important vehicle for the production of legitimate offspring. In the end, it may be said that in spite of being regarded as superstition, religion is persisting for such a long time as a social institution because of its varied functions cited above that it performs for the welfare of the individual and the society both. At many times, even the so-called educated people regard religious laws as superior to the man-made laws. In primitive and traditional societies and even some sections of modern societies, despite all-round attack over it, religion is a pervasive matter, and religious beliefs and rites play an important part in the activities of various kinds of groups—from family to occupational groups. Though inhabitants and citizens of a 'modern' society, many remain traditional in their religious and moral outlook. For some, this means that religious authority and principles override that of secular law.

18.4 Nature and Scope of Religion The theological concept of religion which is reflected in the popular ones centers round as supernatural power, other than independence, of human experience. The assurance of God's being comes in this approach, not from any internal experience but, from the faith in an external revelation, primary emphasis thus, seems to be on belief and faith and not on inner experience, though even this approach has to recognize that man's religion is conditioned to a large extent by man's interest in his own destiny. On the other hand, man's inner experience is of primary importance for the psychoanalytical writers and humanist thinkers with existentialist sympathies. If man experiences God, argues Ludwig Furbish, this experience gives us greater information about the man himself than about God, God being regarded by him as the projected image of man himself. No man of religion would agree with this reduction of God to a creation of the human mind. Religion, as it is generally understood, is not only based on a central revelation, but its entire development is also determined in a way by that revelation thus, the most basic tenet of Christianity is God's revelation to mankind in and through Christ, the son of god. This forms not only the basis of the Trinitarians concept of god and the entire church creed regarding the atonement, resurrection etc, the faith in Christ as the saviors and the son of god has been the greatest determining factor in the religions experience of the Christians- For example, the awareness or NSOU CC-SO-02 266 experience of the Divine presence is more often interpreted by Christian mystics and saints as that of Christ the son and not that of god, the father.

18.5 Role of Religious Institutions in Society As religion so its institutions also play an important role in social life. None can deny the fact that the different kinds of social institutions such as, domestic, economic and political influence on religious institutions. But it is also true that these institutions are sometimes influenced by religious institutions. An important aspect of religion is prayer and different classes of people belonging to different castes of society assemble in religious institutions for performing prayer and worship. By these activities there forms common feelings which thereby further generate a common sentiments and fellowship amongst the worshipers of a particular religion. Sometimes it is found that the members of a particular religion unite together, and for the greater interest of the society they perform different humanitarian activities. It is evident from the above that religious institutions perform not only their religious activities, they also discharge different types of activities related to social welfare such as, charitable hospitals, schools, homes for the homeless. These institutions also run orphanages and collect money for the poor people. It cannot be denied that religion has an external form of social control. The different activities of the people and their different spheres of social life are still influenced by religious rites and ceremonies. People generally express their religious feelings through rituals and ceremonies. It is also true that almost all the aspects of lives of primitive people were covered by religious practices, although these were crude in nature and did not have any precise organization. We find that there are different important occasions in our social life such as, birth, marriage, harvesting, hunting, death etc. and in all these activities religious rites were performed in primitive societies. By doing these activities there developed a common feeling s and actions which are very much other than religious functions. Not only in primitive societies but also in modern societies religious activities occupy an important place. The different occasions of social life, such as birth, death, marriage etc. religious rites are performed. Similar activities are found in the events related with economic life also. Moreover, it is found that, in almost all communities religious rites are common practices during various occasions in social life such as, inauguration of a new building, oath taking etc. From the above description of the role of religion in social life, it is evident that a regular order of procedure is developed by religion in society and thus it helps to control the society. Religion helps to shape the character

NSOU CC-SO-02 267 of an individual and thereby it moulds social life. It brings forth the sense of social value in the mind of people. In obeying the social laws or to respect the elders and to show sympathy towards the feelings of others, or to discharge the social obligations faithfully, the role of religion is immense. In those cases it acts as a teacher. Not only this, a sense of fellow feeling amongst the people belonging to different communities is also taught by religion. Moreover, religion teaches that the man's love and services to God will be real only if he loves and serves humanity. In developing moral consciousness amongst people, religion acts as an inspiring factor. Religion enforces uniformity of behaviour and it strengthens social solidarity and thereby acts as an instrument in stabilizing social order. In primitive age the influence of religion was very great in controlling society and this feature is not totally lost even today. Social life of primitive people were controlled by inspiring God-fear in their minds but in modern age people are inspired not by fear but by the hope for the attainment of virtuous and noble life. Thus by fostering patriotic sentiments in men, religion helps to maintain social integration. In describing the role of religion Dr. S. Radhakrishnan says that religion has innumerable effects. Religion not only guarantees values but it also gives meaning to life. Moreover, the confidence to go on adventures is also inculcated in our mind by religion. Thus narrating the role of religion he says, "Religion is the discipline which touches the conscience and helps us to struggle with evil and sordidness, saves us from greed, lust and hatred, releases moral power and imparts courage in the enterprise of saving the world". 4 People live in the third world countries such as, India, Africa, Brazil etc. derive their sense of life from religion and as such religion is very important to them. They get the answers of many questions that appear in their minds. The questions such as, who we are? What is the purpose of life? What is life and what is death? Is there anything after this life? - are very common for human being and they are curious to have answers of these questions. But in the third world countries science is not so developed to answer these questions. Thus, it is religion from which they seek to get answers of these questions. 18.6 Summary The study of 'religion' further makes clear the relation between institutionalised values of the specific societies and the legitimation of power. The term 'religion' requires introducing the category of 'religion' into the context of non-western and indigenous societies. Such studies are needed to clarify why a shift in the meaning of 'religious' or 'secular' is of crucial importance, which would identify a lacuna in

NSOU CC-SO-02 268 contemporary research in the social sciences and religious studies. The convergence of religious studies with cultural studies and anthropology into the field of humanities/ social science/ethnographical studies will encompass the field of 'religion' to useful analytic categories such as soteriology, ritual, politics, culture/tradition, social organisation, customary practice (caste system in India) etc., while simultaneously paving the way towards a genuine decolonisation of the study of religions in India. Religion restricts free thinking of human beings. It produces a sense of numbness in man and thereby makes him insensible to the actual happenings of the world. It teaches people to live in the world of determinism. People forget the capacity of their free thinking and which ultimately makes them blunt in analyzing the natural phenomena scientifically. It is true that in primitive society science was not so developed and people were ignorant about the happenings of natural phenomena. At that time religion was necessary to control the barbarous and ignorant people. People were satisfied with the answers given by religious institutions. Even in mediaeval period people were convinced that the sun moves round the earth and challenging which the great scientist Galileo, on a charge of heresy, had to spend the rest of his life under house arrest. But now it is scientifically proved that the earth moves round the sun. Thus if institutional religion is eradicated from the society, people will live peacefully and there will be less possibility of quarrels and bloodshed amongst the people. They will also be able to understand the happenings of natural phenomena scientifically. 18.7 Model Questions 1. Answer briefly the following questions: (5 marks) a) What are the main functions of religion? b) Give two sociological definition of religion. c) Give two scopes of religion. d) Note down broadly different types of religion. e) Briefly point out how religion establishes connection with emotion. 2) Answer in detail the following questions: (10 marks) a) Discuss in details the major functions of religion. Do you think religion plays an important role in ones social life? Give reasons. b) Evaluate the sociological definition of religion and identify the nature of religion.

NSOU CC-SO-02 269 c) "Religion a social institution after family and marriage"....give suitable points to elaborate the above statement. d) "Religion is the belief in Spiritual Beings" critically evaluate the saying. e) Differentiate between sociological and personal functions of religion. f) Explain in details different types of religion. g) Write in detail the role of religion in society. 18.8 References and Suggested Readings 1. NSOU CC-SO-02 270 Unit 19 Relation Between Magic, Science and Religion Structure 19.0 Objectives 19.1 Introduction 19.2 Religion 19.3 Science 19.4 Magic 19.4.1 Magic and Science 19.4.2 Magic and Religion 19.4.3 Science and Religion 19.5 Summary 19.6 Model Questions 19.7 References and Suggested Readings 19.0 Objectives This unit examines intimately the relations between magic-science and religion. From this unit students will learn about - Religion, Science and Magic. The difference between these three. The inter-connection between religion, magic and science. 19.1 Introduction In every primitive community, studied by trustworthy and competent observers, there have been found two clearly distinguishable domains, the Sacred and the Profane; in other words, the domain of Magic and Religion and that of Science.The credit of 270

NSOU CC-SO-02 271 having laid the foundations of an anthropological study of religion belongs to Edward B. Tylor. In his well-known theory he maintains that the essence of primitive religion is animism, the belief in spiritual beings, and he shows how this belief has originated in a mistaken but consistent interpretation of dreams, visions, hallucinations, cataleptic states, and similar phenomena. The extended and deepened outlook of modern anthropology finds its most adequate expression in the learned and inspiring writings of Sir James Frazer. In these he has set forth the three main problems of primitive religion with which present-day anthropology is busy: magic and its relation to religion and science; totemism and the sociological aspect of early faith; the cults of fertility and vegetation. It will be best to discuss these subjects in turn. Magic, based on man's confidence that he can dominate nature directly, if only he knows the laws which govern it magically, is in this akin to science. Religion, the confession of human impotence in certain matters, lifts man above the magical level, and later on maintains its independence side by side with science, to which magic has to succumb. While science is based on the conception of natural forces, magic springs from the idea of a certain mystic, impersonal power, which is believed in by most primitive peoples. This power, called [MB 20] mana by some Melanesians, arungquitha by certain Australian tribes, wakan, orenda, manitu by various American Indians, and nameless elsewhere, is stated to be a well-nigh universal idea found wherever magic flourishes. According to the writers just mentioned we can find among the most primitive peoples and throughout the lower savagery a belief in a supernatural, impersonal force, moving all those agencies which are relevant to the savage and causing all the really important events in the domain of the sacred. Totemism, to quote Frazer's classical definition, is an intimate relation which is supposed to exist between a group of kindred people on the one side and a species of natural or artificial objects on the other side, which objects are called the totems of the human group. Totemism thus has two sides: it is a mode of social grouping and a religious system of beliefs and practices. As religion, it expresses primitive man's interest in his surroundings, the desire to claim an affinity and to control the most important objects: above all, animal or vegetable species, more rarely useful inanimate objects, very seldom man-made things.

NSOU CC-SO-02 272 Primitive religion, as fashioned by modern anthropology, has been made to harbor all sorts of heterogeneous things. At first reserved in animism for the solemn figures of ancestral spirits, ghosts and souls, besides a few fetishes, it had gradually to admit the thin, fluid, ubiquitous mana; then, like Noah's Ark, it was with the introduction of totemism loaded with beasts, not in pairs but in shoals and species, joined by plants, objects, and even manufactured articles; then came human activities and concerns and the gigantic ghost of the Collective Soul, Society Divinized. 19.2 Religion Malinowski saw religion as basically a way of utilizing belief in inferred, imaginary supernatural beings and forces to satisfy the emotional needs of the "savage." He said nothing about the civilized folk, but one assumes he was, as usual, sideswiping them via the Trobriands. He never forgot his self-imposed mission to confront his elite European readers with an ironic reflection of themselves. One can also assume that, like many early-20th-century social scientists, he expected religion to wither away in the near future. Malinowski's "religion" was strongly individualistic and psychological. He rejected Durkheim's idea of religion (Durkheim 1995/1912) as the projection of society, and, by implication, Marx' somewhat similar (though materialist) view. He dismissed Durkheim's theory as mere mysticism, which, along with much else, proves that he did not understand Durkheim very well. Religion is now almost invariably defined as belief in supernatural beings. However, Malinowski (and others of his time) differentiated religion from magic, which also depends on supernaturals. And belief in supernatural beings is generally not considered adequate to make a religion. For Scott Atran, author of one recent major book on the anthropology of religion, Mickey Mouse doesn't count, and neither do devoutly held but allegedly "factual" or "scientific" belief systems like Marxism; religion must involve not only supernaturals but also counter-evidential beliefs and emotional sacrifices. Others disagree, finding Marxism and "capitalism" more like religion than like science or spirituality. In general, most anthropologists have defined religion as belief in supernaturals. Many other social scientists, on the other hand, seem to stay with Durkheim, and define religion as a social institution characterized by rituals and moral codes. However, Malinowski, as well as many historians and theorists of religion, saw religion as

NSOU CC-SO-02 273 basically defined by spiritual emotion-specifically, a sense of awe and reverence. Often this is opposed to the coldly practical sense that is alleged to animate science. Yet, many scientists feel awe, reverence, and veneration when contemplating the universe. Conversely, many, perhaps most, religious people seem to view religion simply as routine social practice. It is something they do without much feeling. Recent events have reminded us that still other people, worldwide, have violent hatred as their sole religious emotion. The emotional phenomenology of religion is too complex and diverse to be defining. Recent anthropological accounts of religion tend to exaggerate the distinction from science by highlighting the aspects of religion that seem most exotic and irrational to the writers. The problem here is that religion, everywhere in the world, is far more often a matter of going politely and sociably to church, temple, ch'a'chaak, or witchetty grub ceremony, there to sit patiently and be bored to death. The ordinary humdrum side of religion is far more common, typical, and important to believers than the exotica. By contrast, spirituality is, by definition, emotional; it is the individual's experience of awe, reverence, entrancement, enchantment, or similar emotions or transcendent feelings, inspired by natural or supernatural entities or forces. Religion usually stimulates spirituality, and may be influenced by it. The current claim that "secularism" or "secular humanism" is a "religion" does not make the grade by any standards. First, secularism has no supernaturals-by definition. Second, it has no communitas; nobody purports to be part of the secularist church or congregation or communion, nor does secularism have festivals, rituals, temples, or anything else to show. Third, it has no body of beliefs. The few secular humanists out there do agree on some facts, but they have no litmus test, no professions that they must accept. Indeed, skeptics differ enormously in world views-they are united only by skepticism. 19.3 Science The division between magic, science, and religion was also important to Lévi- Strauss (1962) and others of the time. All the thinkers of the structural and cognitive traditions of the 1960s emphasized the rational, systematic, empirical side of traditional knowledge, Lévi-Strauss' "science of the concrete." In the 1950s and 1960s, interest in such systems climaxed in the development of the field of "ethnoscience." This field arose from the researches of several of George Murdock's students, sent to work in

NSOU CC-SO-02 274 Micronesia and the Philippines (Conklin 1957; Frake 1980). The word was coined from the earlier term "ethnobiology," introduced by John Harshberger in 1895. Soon, terms like "ethnobiology," "ethnozology" and "ethnoornithology" followed. The word "ethnoscience" seems to have disappeared somewhere in the intervening years, but the other terms persist, in spite of an attempt by Scott Atran to substitute "folkbiology" and other "folk-" words (Medin and Atran 1999). Many of these systems are as purely empirical, self-correcting, developing, and truth-driven as any western science (Anderson 2000, 2003, 2005). They also share with scientists a concern with insight, sensed experience, testing and probing, and the like (David Kronenfeld, personal communication, comment on draft of this paper, 2004). As science, they are limited more by lack of scope and equipment than by lack of some (mythical?) scientific mentality or method. However, many, as we shall see, have supernatural entities built into them. These problematize still more the basic distinction. Insight and sensed experience are basic to both science and religion, narrowing somewhat the gap between them. As ethnoscience was developing, the term "science" was being subjected to a great deal of critique. For thousands of years-ever since the Greeks began to talk of scientia-it had had something like the straightforward, common-sense meaning that Malinowski knew. It referred to systematized knowledge, as opposed to faith (belief without evidence) on the one hand and techne, mere craft, on the other. Considering all folk explanations, and classifying the traditional ones as "religion," Edward Tylor classically explained magic and religion as, basically, failed science (Tylor 1871). He came up with a number of just-so stories explaining how religious beliefs could have been reasonably inferred by fully rational people who had no modern laboratory devices to make sense of their perceptions. Malinowski's portrayal of religion as emotiondriven was part of a general reaction against Tylor in the early 20th century. Indeed, Tylor discounted emotion too much. On the whole, however, there is still merit in Tylor's work. Postmodernists dismiss science-and sometimes all truth-claims-as just another social or cultural construction, as solipsistic as religion and magic. Some anthropologists still believe, or at least maintain, that cultural constructions are all we have or can know. This is a self-deconstructing position; if it's true, it isn't true, because it is only a cultural construction, and the statement that it's only a cultural construction is only a cultural construction, and we are back with infinite regress and the Liars Paradox.

NSOU CC-SO-02 275 The extreme cultural-constructionist position is all too close to, and all too usable by, the religious fundamentalists who dismiss science as a "secular humanist religion." Both the postmodernists and the fundamentalists are, alas, all too often answered only by the self-styled apologists for science who maintain that science is True and is All Facts. Thus, it is sometimes difficult to distinguish science from religion. However, we can say that science is made up of facts that are empirically proved and ideas that can be theoretically proved, or at least tested, while religion is made up of things that must be taken on faith because they simply cannot be proved or disproved by any evidence. Stephen Jay Gould (1999) has recently given us a strong argument for this position, and for the fundamental complementarity-and therefore the fundamental difference-of religion and science. Yet Gould has to admit that his own science, paleontology, cannot be directly tested-and that not only traditional religions, but also modern fundamentalist religions, make a number of statements that can be tested. At least, like paleontological ideas, they could be proved or disproved if we had a time machine. The reality of six-day creation in 4004 BC, Noah's flood, and Joshua's musical destruction of Jericho have all been established as fact to fundamentalists' satisfaction; geology, archaeology, and other sciences are bent to their ideas. The same objective data serve to disprove the same events, of course, in the eyes of other observers. Gould simply argues that this is a mistake-the religious are trying to do science, and shouldn't mix the two. The fundamentalists, of course, disagree. As Gould points out, the "conflict between science and religion" is an 18th and 19th-century invention. (Admittedly, it had an ancestry going back to the 17th century.) Before then, people did not think the two were mutually exclusive or occupied different spheres. Gould tries to eliminate the conflict, but only by making the difference even more profound. Religion is heavily involved with morals, while science is traditionally considered to be values-neutral. The separation owes a great deal to David Hume's argument that one cannot deduce an "ought" from an "is" (of course, Hume was more nuanced and subtle than this canned, though useful, summary of his philosophy; see Hume 1975). Religion can prescribe morality, justifying it from divine law. Science cannot. Supposedly, it is about "is," not about "ought." Ethical bias in science is often seen as a contamination, inevitable or not. (The fundamentalist claim that science is really a religion of "secularism," faked up to sell evil and cutthroat morals under the name of "evolution," is based on complete lack of knowledge of science.)

NSOU CC-SO-02 276 In short, separating religion from science and both from magic is analytically important, valuable, and interesting, but it must always be a somewhat arbitrary separation. It is constantly being problematized by the messiness of the real world and the messiness of real human thought. No matter how defined, "religion" and "science" (to say nothing of "magic") are ideal types-idealtypen-that do not describe the real world very neatly. Ethnoscience and folk science studies have been criticized for using the term "science" broadly enough to include a good deal of mystical and supernatural belief. Modern science is not-it is internationally constructed and stated, and is proved by tests rather than by social usefulness. Religion can be seen as partly based on plausible but wrong inferences about ultimate cause. Thus, in explaining the world, people naturally infer spirits and gods. There appears to be a genuinely natural tendency for people to assume that trees, rocks, and animals are "people," in some sense-having volition, consciousness, and humanlike will. The Durkheimian observation that religion is a projection of the social order naturally follows from this (a point Atran rather misses). There is obviously a great deal more than this to what we normally call "religion," but inferences about the "people" out there clearly comprise one of the building blocks from which religion is made. In short, inferred black-box causal arguments, once they are superseded, can get called either "science" or "religion," depending largely on the whims and prejudices of the person doing the calling. Magic, science, and religion as very useful terms, but terms that are limited in their application. 19.4 Magic Magic never originated, it never has been made or invented. All magic simply "was from the beginning an essential adjunct of all such things and processes as vitally interest man and yet elude his normal rational efforts. The spell, the rite, and the thing which they govern are coeval. Thus, in Central Australia, all magic existed and has been inherited from the alcheringa times, when it came about like everything else. In Melanesia all magic comes from a time when humanity lived underground and when magic was a natural knowledge of ancestral man. In higher societies magic is often derived from spirits and demons, but even these, as a rule, originally received and did not invent it. Thus

NSOU CC-SO-02 277 the belief in the primeval natural existence of magic is universal. As its counterpart we find the conviction that only by an absolutely unmodified immaculate transmission does magic retain its efficiency. The slightest alteration from the original pattern would be fatal. There is, then, the idea that between the object and its magic there exists an essential nexus. Magic is the quality of the thing, or rather, of the relation between man and the thing, for though never man-made it is always made for man. In all tradition, in all mythology, magic is always found in the possession of man and through the knowledge of man or man-like being. It implies the performing magician quite as much as the thing to be charmed and the means of charming. It is part of the original endowment of primeval humanity, of the mura-mura or alcheringa of Australia, of the subterrestrial humanity of Melanesia, of the people of the magical Golden Age all the world over. Magic is not only human in its embodiment, but also in its subject matter: it refers principally to human activities and states, hunting, gardening, fishing, trading, love-making, disease, and death. It is not directed so much to nature as to man's relation to nature and to the human activities which affect it. Moreover, the effects of magic are usually conceived not as a product of nature influenced by the charm, but as something specially magical, something which nature cannot produce, but only the power of magic. The graver forms of disease, love in its passionate phases, the desire for a ceremonial exchange and other similar manifestations in the human organism and mind, are the direct product of the spell and rite. Magic is thus not derived from an observation of nature or knowledge of its laws, it is a primeval possession of man to be known only through tradition and affirming man's autonomous power of creating desired ends. Thus, the force of magic is not a universal force residing everywhere, flowing where it will or it is willed to. Magic is the one and only specific power, a force unique of its kind, residing exclusively in man, let loose only by his magical art, gushing out with his voice, conveyed by the casting forth of the rite. It may be here mentioned that the human body, being the receptacle of magic and the channel of its flow, must be submitted to various conditions. Thus the magician has to keep all sorts of taboos, or else the spell might be injured, especially as in certain parts of the world, in Melanesia for instance, the spell resides in the magician's belly, which is the seat of memory as well as of food. When necessary it is summoned up to the larynx, which is the seat of intelligence, and thence sent forth by the voice.

NSOU CC-SO-02 278 the main organ of the human mind. Thus, not only is magic an essentially human possession, but it is literally and actually enshrined in man and can be handed on only from man to man, according to very strict rules of magical filiation, initiation, and instruction. It is thus never conceived as a force of nature, residing in things, acting independently of man, to be found out and learned by him, by any of those proceedings by which he gains his ordinary knowledge of nature. To most types of magical ritual, therefore, there corresponds a spontaneous ritual of emotional expression or of a forecast of the desired end. To most features of magical spell, to the commands, invocations, metaphors, there corresponds a natural flow of words, in malediction, in entreaty, in exorcism, and in the descriptions of unfulfilled wishes. To every belief in magical efficiency there can be laid in parallel one of those illusions of subjective experience, transient in the mind of the civilized rationalist, though even there never quite absent, but powerful and convincing to the simple man in every culture, and, above all, to the primitive savage mind. Thus the foundations of magical belief and practice are not taken from the air, but are due to a number of experiences actually lived through, in which man receives the revelation of his power to attain the desired end. We must now ask: What is the relation between the promises contained in such experience and their fulfilment in real life? Plausible though the fallacious claims of magic might be to primitive man, how is it that they have remained so long unexposed? The answer to this is that, first, it is a well-known fact that in human memory the testimony of a positive case always overshadows the negative one. One gain easily outweighs several losses. Thus the instances which affirm magic always loom far more conspicuously than those which deny it. But there are other facts which endorse by a real or apparent testimony the claims of magic. We have seen that magical ritual must have originated from a revelation in a real experience. But the man who from such an experience conceived, formulated, and gave to his tribesmen the nucleus of a new magical performance — acting, be it remembered, in perfect good faith — must have been a man of genius. The men who inherited and wielded his magic after him, no doubt always building it out and developing it, while believing that they were simply following up the tradition, must have been always men of great intelligence, energy, and power of enterprise. They would be the men successful in all emergencies. It is an empirical fact that in all savage societies magic and outstanding personality go hand in hand. Thus magic also coincides with personal success, skill, courage, and mental power. No wonder that it is considered a source of success.

NSOU CC-SO-02 279 This personal renown of the magician and its importance in enhancing the belief about the efficiency of magic are the cause of an interesting phenomenon: what may be called the current mythology of magic. Round every big magician there arises a halo made up of stories about his wonderful cures or kills, his catches, his victories, his conquests in love. In every savage society such stories form the backbone of belief in magic, for, supported as they are by the emotional experiences which everyone has had himself, the running chronicle of magical miracles establishes its claims beyond any doubt or cavil. Every eminent practitioner, besides his traditional claim, besides the filiation with his predecessors, makes his personal warrant of wonder-working. It can be said without exaggeration that the most typical, most highly developed, mythology in primitive societies is that of magic, and the function of myth is not to explain but to vouch for, not to satisfy curiosity but to give confidence in power, not to spin out yarns but to establish the flowing freely from present-day occurrences, frequently similar validity of belief. The deep connection between myth and cult, the pragmatic function of myth in enforcing belief, has been so persistently overlooked in favor of the etiological or explanatory theory of myth that it was necessary to dwell on this point. 19.4.1 Magic and Science: First of all, magic is surrounded by strict conditions: exact remembrance of a spell, unimpeachable performance of the rite, unswerving adherence to the taboos and observances which shackle the magician. If any one of these is neglected, failure of magic follows. And then, even if magic be done in the most perfect manner, its effects can be equally well undone: for against every magic there can be also counter-magic. If magic, as we have shown, is begotten by the union of man's steadfast desire with the wayward whim of chance, then every desire, positive or negative, may — nay, must — have its magic. Now in all his social and worldly ambitions, in all his strivings to catch good fortune and trap propitious luck, man moves in an atmosphere of rivalry, of envy, and of spite. For luck, possessions, even health, are matters of degree and of comparison, and if your neighbor owns more cattle, more wives, more health, and more power than yourself, you feel dwarfed in all you own and all you are. And such is human nature that a man's desire is as much satisfied by the thwarting of others as by the advancement of himself. To this sociological play of desire and counter-desire, of ambition and spite, of success and envy, there corresponds the play of magic and counter-magic, or of magic white and black. Magic is akin to science in that it always has a definite aim intimately associated

NSOU CC-SO-02 280 with human instincts, needs, and pursuits. The magic art is directed towards the attainment of practical aims. Like the other arts and crafts, it is also governed by a theory, by a system of principles which dictate the manner in which the act has to be performed in order to be effective. In analyzing magical spells, rites, and substances we have found that there are a number of general principles which govern them. Both science and magic develop a special technique. In magic, as in the other arts, man can undo what he has done or mend the damage which he has wrought. In fact, in magic, the quantitative equivalents of black and white seem to be much more exact and the effects of witchcraft much more completely eradicated by counter-witchcraft than is possible in any practical art or craft. Thus both magic and science show certain similarities, and, with Sir James Frazer, we can appropriately call magic a pseudo-science. 19.4.2. Magic and Religion: Both magic and religion arise and function in situations of emotional stress: crises of life, lacunae in important pursuits, death and initiation into tribal mysteries, unhappy love and unsatisfied hate. Both magic and religion open up escapes from such situations and such impasses as offer no empirical way out except by ritual and belief into the domain of the supernatural. Both magic and religion are based strictly on mythological tradition, and they also both exist in the atmosphere of the miraculous, in a constant revelation of their wonder-working power. Magic, the specific art for specific ends, has in every one of its forms come once into the possession of man, and it had to be handed over in direct filiation from generation to generation. Hence it remains from the earliest times in the hands of specialists, and the first profession of mankind is that of a wizard or witch. Religion, on the other hand, in primitive conditions is an affair of all, in which everyone takes an active and equivalent part. Every member of the tribe has to go through initiation, and then himself initiates others. Everyone wails, mourns, digs the grave and commemorates, and in due time everyone has his turn in being mourned and commemorated. Spirits are for all, and everyone becomes a spirit. The only specialization in religion — that is, early spiritualistic mediumism — is not a profession but a personal gift. One more difference between magic and religion is the play of black and white in witchcraft, while religion in its primitive stages has but little of the contrast between good and evil, between the beneficent and malevolent powers. This is due also to the practical character of magic, which aims at direct quantitative results, while early religion, though essentially moral, has to deal with fateful,

NSOU CC-SO-02 281 irremediable happenings and supernatural forces and beings, so that the undoing of things done by man does not enter into it. The maxim that fear first made gods in the universe is certainly not true in the light of anthropology. In order to grasp the difference between religion and magic and to gain a clear vision of the three-cornered constellation of magic, religion, and science, let us briefly realize the cultural function of each. The function of primitive knowledge and its value have been assessed already and indeed are not difficult to grasp. By acquainting man with his surroundings, by allowing him to use the forces of nature, science, primitive knowledge, bestows on man an immense biological advantage, setting him far above all the rest of creation. The function of religion and its value we have learned to understand in the survey of savage creeds and cults given above. We have shown there that religious faith establishes, fixes, and enhances all valuable mental attitudes, such as reverence for tradition, harmony with environment, courage and confidence in the struggle with difficulties and at the prospect of death. This belief, embodied and maintained by cult and ceremonial, has an immense biological value, and so reveals to primitive man truth in the wider, pragmatic sense of the word. Magic fixes upon these beliefs and rudimentary rites and standardizes them into permanent traditional forms. It enables man to carry out with confidence his important tasks, to maintain his poise and his mental integrity in fits of anger, in the throes of hate, of unrequited love, of despair and anxiety. The function of magic is to ritualize man's optimism, to enhance his faith in the victory of hope over fear. Magic expresses the greater value for man of confidence over doubt, of steadfastness over vacillation, of optimism over pessimism.

19.4.3 Science and Religion : Science is not a mess of facts; it's a system that is meant to represent the world accurately and empirically. It necessarily includes a lot of black-box variables that is hypothesized but is generally under examination, and that often turn out to be wrong. Religion is not just a bunch of supernatural beliefs; it too is a system, in which emotionally compelling beliefs collectively represent social contracts and sell social ethics. Magic partakes uncomfortably of both, and is thus a dicey term, very hard to use beyond a low level of abstraction. Thus, when we focus on religion as supernaturals, we are focusing on the wrong thing. We should be focusing on religion as part of society, the part that stirs deep emotions to persuade its membership to follow the social codes. There is some truth to the old cliché that "the Indians" live in a religious or NSOU CC-SO-02 282 spiritual world, but that cliché misses the point, which is that the Indians live in a world about which they know an incredible amount of factual information and toward which they have an intensely ethical stance. The detailed factual knowledge and the free-standing moral philosophy are not separable from each other, or from the supernatural beliefs. The problem of deducing an "is" from an "ought" is resolved by seeing the "oughts" as natural laws, part of the "ises." The need to represent factual knowledge and ethical treatment of resources in one system means that Native American systems of thought cannot be separated into "religion" and "science." There is thus a very basic, very fundamental way in which we cannot see these systems in terms of "religion" and "science." This has often been pointed out in anthropology, but it needs continual reassertion.

19.5 Summary "Science," then, can be seen as the ideal word to use if one is looking at the empirical, evidence-driven side of a knowledge system. Science is empirical, and rests on open-minded inquiry. It is done by individuals who are concerned with verifiable, empirical results, and often with probing further into new realms. "Religion" is used if one is looking at the belief-driven or tradition-driven side of human knowledge. It is based on widely-shared social beliefs, usually of very long standing and of very high levels of perceived antiquity and legitimacy. Science and religion, however, overlap broadly when one looks at inferred explanatory variables, and also when one looks at complex and emotional attitudes toward the world. Magic-basically a sciency agenda done in a religious way-disappears analytically, though the concept still may have uses for someone somewhere. These terms, when applied to societies other than modern western or western-influenced ones, do not refer to identifiable and institutionalized sectors of activity (as they do in the modern US). Instead (as Malinowski knew) they provide a rather arbitrary classification system for knowledge, imposed in a thoroughly etic way. Other societies have their own, quite different, systems for classifying knowledge. Usually, their cultural models do not include a natural/supernatural split. Thus, "magic, science, and religion" are not very adequate terms to represent traditional knowledge systems.

NSOU CC-SO-02 283 Classifications are about being useful, not about being cast in stone. We of the modern international scholarly community have found a particular way of classifying knowledge to be rather useful. Perhaps it is not so useful now. Meanwhile, other cultures have classified knowledge in radically different ways. These often overlap our classification system. This does not mean they are wrong; it means they serve different purposes. Traditional people usually do not want to separate environmental knowledge from ethics, or either one from ritual."

19.6 Model Questions 1. Answer briefly the following questions: (5 marks) a) Write a short note on magic. b) Write a brief note on science. c) Briefly state meaning of religion. d) Distinguish between science and religion. e) Distinguish between magic and science. 2. Answer in detail the following questions: (10 marks) a) Define magic and show its relation with science and religion. b) How religion is related with magic? Elaborate with suitable examples. c) Explain in detail how science is related with magic. d) Evaluate the relation between religion science and magic. e) Critically illustrate the relation between religion, society and magic.

NSOU CC-SO-02 284 Unit 20 Religion and Globalisation / Social Conflict Structure 20.0 Objectives 20.1 Introduction 20.2 Globalization and Religion in the Contemporary World 20.3 Religion as Transnational Institution 20.4 Religion as Cultural and Political Resource 20.5 Religion and Religions as Globalizing System 20.6 Religion, Globalization and the Human Condition 20.7 How Globalization has Encouraged Hinduism: The Case of India 20.8 Impact of Globalization Upon Diasporic Religious Communities 20.9 Summary 20.10 Model Questions 20.11 References and Suggested Readings 20.0 Objectives The unit gives important insights into: Relations between and other institutions in contemporary world. The impact of globalization on religion. Religion as cultural and political resource and many other related issues. 20.1 Introduction Religion and globalization can, in various manifestations, be seen as partners. History pays testimony to the fact that the growth and influence of Christianity was a result of a link between its own global ambitions and the expansion of various 284

NSOU CC-SO-02 285 political and economic regimes. Elements of similar historical pattern can be found in Buddhism, Islam, and other faiths as well. Globalization has led to massive social changes in the world. Undoubtedly, religion is not immune from these changes and their burgeoning effects brought about by globalization. This also includes rapid changes in the moral beliefs and value system of people. New religious networks are emerging which are transnational in character. As globalization disembeds religions from their historic homelands and scatters them around the world we can clearly observe how social processes try to globalize a particular religion. For instance, the way Hindu temples and ashrams are becoming increasingly transnational and how African and Korean churches are booming in Europe and North America (Nanda, 2009) is relatively a new phenomenon. John Zavos (2012) refers to three organizations: the National Council for Hindu Temples (NCHT), the Hindu Council UK (HCUK) and the Hindu Forum of Britain (HFB). Together these three organizations purporting to represent Hindus have developed a public profile in the UK over a period of 30 years. They have a significant role to play in the public representation of Hindu - ness. It is also surprising to see how in most of Europe, including in France where the age of enlightenment originated, beliefs in occult powers and reincarnation (Johnson, 2007) have gained firm grounds. Therefore, we can say that globalization has played a tremendous role in the revivalism and resurgence of some religions as they are today not relegated to the few countries where their roots began (Azzouzi, 2013). It is here, that Arjun Appadurai's idea of mediascape and technoscape (1996) needs to be mentioned. When we see growing number of T.V. channels, radio stations and print media founded solely for advocating religious values, the role of media in the globalization process becomes observable. For instance, we see how India's devotional channels like Aastha, Sanskar, MH1 Shraddha, Bhakti TV and God Asia are gaining popularity. Taking Islam as an example, we find T.V channels like Iqrae, Ennass, Majd, El Houda, Erahma, etc. which are purely religious channels created for the purpose of strengthening and the fortification of Islam (Azzouzi, 2013). Besides, as the technology grew under globalization, improvements in the transportation means contributed considerably to the emergence, revivalism and fortification of religion. Rise of Spiritual Market: The neo : Hindu cults driven by a new concept of guru who is leader of a spiritual movement or organization now focus on this - worldly concerns derived from

NSOU CC-SO-02 286 modern western technologies of self healing, highlighting transcendental meditation and yoga rather reincarnation and karma in South Asian religious cultures. New rituals and new gods are being invented in the market where spiritualism is mixed with capitalism and consumerism. Examples are plenty to illustrate the process of commodification of religion. The Gayatri Parivar's novel and scientific interpretation of the Gayatri Mantra and the horse yajna invented a whole new way of explaining the significance of a ritual. Nanda (2009) notes that apart from popularizing the Gayatri Mantra and yajnas, the Parivar also offers courses in moral upliftment and stress management to the government and private sector professionals. Besides, the local gods and goddesses which were until recently associated with the more plebeian masses, are finding new homes in swanky new suburbs with malls and multiplexes. Globalization if on the one hand has led to the commodification of religion. 20.2 Globalization and Religion in the Contemporary World Although it is doubtful whether we can confidently propose an idea of 'global religion' in the present times because a global religion would have to presuppose a global community where people must share common beliefs, experiences and sentiments. Turner (2006) argues that unfortunately global networks are too thin and fragile to serve as the social carriers of a shared set of symbols and practices. Globalization may bring about the unpacking of local cultural complexes. It may also create multifarious local identities so much so that diversity is seen in local spaces. To illustrate with examples, Caribbean Pentecostal Churches, Nigerian 'Aladura' Churches or branches of the Zimbabwe Assemblies of God Africa in Britain and Ghanaian Pentecostal churches are so different from any British religious institution (Lehmann, 2004). Turner (2006) further argues that in the globalized world, local (or mass religion) and the elite religion interact to result in religious glocalisation which means "the simultaneity — the co-presence — of both universalizing and particularizing tendencies" (Robertson, 1992). For instance, Vale Do Amanhecer is a rapidly expanding Brazilian religion where elements of Christianity, Brazilian indigenous beliefs and European spiritism appear merged together with Afro - Brazilian traditions. Oomen (2003) argues that there is no possibility of a global culture as there are four interrelated processes involved in its creation: homogenization, pluralization, traditionalization and hybridization. Homogenization refers to popularization and diffusion of cultural symbols to reduce cultural diversity (Jennings, 2010). The homogenization thesis proclaims that global culture is becoming standardized around a Western or American

NSOU CC-SO-02 287 pattern. Rapid communication and constant flow of products across the borders often give us the impression of homogenization. For instance, popularity of blue jeans or pop music or democratic ideas can be seen as part of homogenizational process. It is important to remember here, that homogenization can often lead to hegemonization i.e. assimilation of the minority and weaker groups into the mainstream. From the religious perspective, it can be seen that the attempts of extreme Hindu right, the Sangh Parivar in India is believed to impose its homogenizing fascism on the lines of Brahmanic ethos. There have been repeated attempts by such Hindutva groups to bring homogeneity by forced conversions and communal tensions. Increasing incidences of violence against Muslims, Christians and Dalits especially in the decade of 1980s were conducted by different organizations like BJP, VHP, Bajrang Dal, Hindu Jagran Manch and Hindu Munnani for the specific agenda of homogenization of Hindutva politics (Puniyani, 2000). T.N Madan (1993) on the contrary says that Hinduism which is demographically dominant and even hegemonic is nothing but a federation of faiths. It has both horizontal and vertical distribution rather than a single homogenous religion. In this line, we can say that pluralism and not homogeneity is inherent in Hinduism because it comprises many regional cultural groups. Pluralization implies existence and practice of more than one forms of culture simultaneously. In the process of adaptation we retain some of the traditional aspects and intertwine them with some modern aspects this is a process usually referred to as hybridization. For instance, Sri Sri Ravi Shankar who has built a global spirituality programme conduct 'rock satsangs' in his Bangalore ashram almost every evening where people sing along and dance to his devotional songs. It is one of the clearest manifestations of hybridization where rock music is blended with traditional and devotional touch to cater to the needs of Indian masses. Following Arjun Appadurai (1996), we can call such global markets for religion as the 'religioscape of modernity.' Bryan Turner (2006) argues that glocalisation has also somewhat blurred the distinction between what Weber (1996) calls virtuoso and mass religion. He differentiates between the two as this: the religion of the elite satisfies the moral and intellectual needs of religious virtuosi and the religion of the masses caters to the thaumaturgical interests of the disprivileged by people from all rungs of Indian society can be seen as an apt example of glocalisation. The way Sanskrit texts like Upanishads and Vedas are now open to the mass interpretation were kept reserved for the elite Brahmins in India.

NSOU CC-SO-02 288 Lehmann (2004) says that the interaction of religion and globalization seems to change boundaries in two ways: one, which he calls cosmopolitan, brings old practices to new groups in new settings - a variant of disembedding. For instance, reshaping of Eastern religion outside Asia in the form of transcendental mediation, yogic breathing practices, etc. The other variant, which he calls global, extends and intensifies transnational links among groups similar in their practices and creates tightly knit communities of people. 20.3 Religion as Transnational Institution The relative absence of religion from many globalization perspectives and theories is in some respects quite surprising, especially when one looks at the issue historically. Of the forces that have in the past been instrumental in binding different regions of the world together, in creating a larger if not exactly a geographically global system, economic trade and political empire have certainly been the most obvious; but in conjunction with these, it is equally clear that what we today call religions have also at times played a significant role. The more or less permanent displacement of large numbers of people from diverse regions and cultural backgrounds to many other parts of the world, but notably from non-Western to Western countries, has like few other phenomena brought home to an increasing range of observers just how much humanity is now living in a single world where identity and difference have to be renegotiated and reconstructed. Dialogical theories of globalization and those that stress globalization from below have been particularly apt to analyze the consequences of global migration, but the issue is not missing from many that understand globalization primarily in economic or political terms. Like global capitalism or international relations, this question is not susceptible to easy understanding on the basis of theories that take a more limited territory, above all a nation-state or a region like Europe, as their primary unit of analysis. In the context of the various other structures that make the world a smaller place, global migrants in recent times maintain far stronger and more lasting and consequential links with their countries of origin. Globalization approaches allow a better understanding of why they have migrated, what they do once they migrate, and the dynamics of their integration or lack thereof into their new regions. Given that religious institutions, religiously informed worldviews, and religious practice are so often instrumental in these processes, the growing number of efforts

NSOU CC-SO-02 289 to understand religion's role among global migrants is not surprising. Such contributions have focused on the concrete religious institutions of the migrants in their new homes, the immigration and integration policies and attitudes of the host countries, the transnational links and flows that the migrants maintain, and the influence of these diasporic communities on the global religions that are usually involved. Not infrequently in such analyses, the sorts of transnational religious organizations and movements just mentioned are salient topics, since the migrant communities are often instrumental in bringing about, developing, and maintaining their global character. Moreover, the consideration of the role of transnational religious institutions in the context of global migration already implicates the second way that religion has been understood as a significant contributor to globalization processes, and that is as a cultural, but especially political resource. 20.4 Religion as Cultural and Political Resource The role of religion in providing, broadly speaking, cultural resources in a global context is not limited to the situation of migrants, however. Globalization, irrespective of which meaning one favors, implies a kind of compression of space in which the upheaval and uprooting characteristic of the migratory experience are the lot of a great many of the world's people, whether they leave their homes or not. Parallel circumstances in Africa and Latin America can serve to make this similarity clear. Both these continents have large regions and large populations that are effectively excluded from the main globalized power structures, yet their lives are nonetheless profoundly affected by them. Religion and religious institutions are important resources for responding to the situation. In Latin America, for instance, one reason for the rapid rise of Pentecostal Christian churches along with significant growth among Afro-Brazilian religions like Candomblé and certain Roman Catholic movements is that these institutional religious forms provide people with ways of understanding themselves and coping in a world where their situation is changing and often precarious. They afford people narratives with attendant life practices by which they can give themselves a meaningful and dignified place in this world. Religion lends them a measure of power. Even more clearly, in sub-Saharan Africa above all Christian and Islamic organizations, centers, networks, and movements offer large numbers of people at least some access to an institution that actually functions reasonably to their benefit. Although they are localized institutions and largely in the control of local people, a far from insignificant part of the appeal of these religious establishments is that they

NSOU CC-SO-02 290 have links to and represent access to the wider globalized world. This has always been one of the attractions of both Christianity and Islam; they have in effect been global religions for many centuries. In today's world they continue to fill that role. The degree to which religions contribute to the globalized circumstance as well as their character as globalized institutions becomes evident in these cases. As noted earlier, the one phenomenon that has attracted the most attention to the global significance of religions is the proliferation of effective religio-political movements in almost all regions of the world. From the rise of Hindu nationalism in India and the heavy political involvement of certain Buddhist organizations in Japan to the many highly politicized Islamicist movements in countries as diverse as Iran, Indonesia, and Nigeria, politicized religion has been a constant feature of the global world since at least the 1960s and in many respects well back into the nineteenth century. Although the literature often analyzes them under the somewhat tendentious label of fundamentalisms, two of their most basic features illustrate quite clearly how relevant they are for theories of globalization and how they manifest the global nature of so much contemporary religion. 20.5 Religion and Religions as Globalizing System A further theoretical approach to the role of religion and religions in globalization goes beyond the idea that religious worldviews and institutions have participated in the process. It focuses on the degree to which both modern institutional forms and modern understandings of religion are themselves manifestations of globalization. With the centuries-long development of what is today a globally extended society, religion came to inform what is today a globally extended religious system consisting primarily of a series of mutually identified and broadly recognized religions. These religions, in virtually every region of the globe, include Christianity, Islam, Hinduism, and Buddhism, but a variable list of other religions receives almost as broad legitimacy. Among these are Judaism, Sikhism, Daoism, and Jainism, followed again by another set of less consistently or more regionally accepted ones such as Bahá'í, Shintō, Candomblé, African Traditional Religions (ATR), Scientology, and so forth. The idea that religion manifests itself through a series of distinct religions may seem self-evident to many people, including a great many of their adherents. Yet that notion is historically of quite recent provenance. In Europe, where this understanding first gained purchase, it dates back at the earliest to the seventeenth century. Elsewhere, such as in most regions of Asia, one must wait until at least the nineteenth century.

NSOU CC-SO-02 291 Its development and spread is entirely coterminous with the period most theories identify as the prime centuries of globalization. A strict corollary of this theory, a consequence of the selective nature of this religious system, is that new religions will constantly try to form and that much religiosity will escape the system. The existence of this global religious system, simultaneously at the global and local levels, therefore spawns its constant development and the constant challenging of the way it operates. That idea leads logically to consideration of the religiousness of the global system itself. 20.6 Religion, Globalization and the Human Condition More than a few theories of globalization explicitly address what one might call its ideal dimension, the way it shapes how people understand the nature and purpose of the world and their place in it. Given that such questions of ultimate concern or purpose often appear as defining features of religion, this ideal dimension can also be conceived as its religious dimension, although thereby not necessarily referring to the role of religious traditions and institutions in it. One can divide the analyses of this dimension of globalization according to whether it is seen as a positive or negative feature, and whether unity or diversity of vision dominates. Unitary but negative visions share most of these characteristics but reject the idea that any of these developments can have a positive outcome. Sometimes these take world-rejecting communitarian directions, advocating retreat from the globalized world. Ironically perhaps, it is not uncommon for these visions to espouse precisely the sort of egalitarian values typical of the positive versions but insist that this is only possible in a separated-and usually quite small-scale-society. Some subdivisions of environmental and back-to-nature movements exemplify this possibility. In many respects they are mirror images of globalized society, and in that respect reflections of it. By contrast, there are those rejections of a unitary globalization that insist on the unique validity of a particular culture or society. Some so-called fundamentalist visions fall in this category, but it must be stressed how comparatively rare they are. The Afghan Pashtun Taliban, in contrast to most Islamicist perspectives, may have been one of the few. Pluralist visions of the world are variations on the unitary ones, putting greater stress on, respectively, the difference or the irreconcilability of diverse worldviews. The clash of civilizations model made famous by Samuel Huntington is representative of a negative version, dependent as it is on the idea-not to say ideal-that quasi-

NSOU CC-SO-02 292 essential civilizations with particular characteristics actually exist logically prior to the globalized context in which mutually identifying them might make sense. Pluralist positive perspectives, by contrast, are even more mere variations on the unitary variety: the value of pluralist and egalitarian inclusion here is simply more strongly emphasized. What is therefore especially noteworthy of all these representations of globalization's ideal dimension is just how close they are to one another. Without in the least underplaying the degree to which globalization entails vast differences in power and influence among different regions and different people; without denying the significant contestation, even conflict, between different visions of what the global world is or should be; this seeming narrowing of alternative world visions may in the end be one of the most powerful symptoms of the social reality which the idea of globalization seeks to name.

20.7 How Globalization has Encouraged Hinduism: The Case of India

The phenomenon of globalization buttresses the neo - liberal ideology too. The core of neo - liberalism is the belief that unconstrained market forces will bring prosperity, democracy and peace to all people in all societies. The underlying principle is that the borderless markets should lead without the government intervention (Nanda, 2009). While privatization, disinvestment and deregulation are the pillars of neo - liberalism the state is not made entirely irrelevant. The state's topmost priority under the regime of neo - liberal globalization is to facilitate the smooth running of the markets. Much of the contemporary critique of neoliberalism can be traced to the works of Karl Polanyi (1944). He argues that the laissez - faire system came into existence with the help of the state. Expansion of the free market and the self protective reaction against it by the state and the society is called 'double movement' (D. Hall, 2007). Polanyi's hope lay with society and the nation-state but today they have been rendered less powerful with the rise of globalization (Ritzer, 2011). On the contrary, what is emerging is that neo liberalism is changing the texture of democracy: the accumulation of private profit has become the highest social good that the government promotes. Meera Nanda (2009) writes that when government becomes more like a for-profit corporation, the citizens are rendered to the position of consumers. Their relationship with the state changes from that of citizens to that of clients of government services. This model of market place is encouraged by the World Bank and the International Monetary Fund where the better off and more educated 'customers -

NSOU CC-SO-02 293 citizens' manage to get more choices while the poor are bypassed. With the fall in public investment and growth of the commercialized agriculture in Andhra Pradesh, as noted above, many poor farmers and indebted laborers committed suicide. A triangular relationship that has emerged between the state, the corporate and the Hindu leaders in India which Meera Nanda (2009) calls a 'state - temple - corporate complex' has created new institutional spaces where maximization of profits through Hinduism is renewing itself. She further writes that Indian state and its functionaries operate on the unstated assumption that Hinduism is not merely one religion among other religions of the Indian people, but rather the national ethos, or the way of life, that all Indians must learn to appreciate, if not actually live by. There are two broad areas where an outright influence of globalization can be seen upon Hinduism in India: education and tourism (Nanda, 2009). With the commercialization of higher education in India new priest training schools and deemed universities are mushrooming. Meera Nanda records how such universities produce English - speaking, computer - using pujaris, astrologers, vastu shastris and other providers of religious services. Gurus and swamis are entering into the business of conferring degrees in priestcraft and astrology and even setting up modern institutions with a traditionalist bent. The best example could be Sri Sri University set up by the spiritual leader Shri Shri Ravi Shankar in 2009 which boasts its tag line as 'Holistic modern education combined with ancient Indian values'. Besides, Swami Vivekananda Yoga Anusandhana Samsthana (SVYAS) in Bangalore and Bihar Yoga Bharati in Fort Munger in Bihar offer advanced degrees all the way to Ph.Ds in yogic sciences. Further, the Sandipani Pratishthan established in 1987, an autonomous organization of the Ministry of Human Resource Development funds gurukuls all across the country and serves as their accrediting body. Another sector where the corporate and even the state are making a common cause with Hinduism is the religious tourism. It is quite common to see how temple management departments are actively trying to turn some remote temple into a pilgrimage spot by inventing a history behind it. For instance, the newly invented rituals like gold car in temples of Tamil Nadu or the reenactment of the Shiva and Parvati wedding. Another example to show government's involvement in propagating religious tourism can be seen in the fact that how Devaswom board of the Sabarimala temple in Kerala in full complicity with the government's electricity board was involved in the fraud of lighting the 'divine light' also called Makaravilakku for which millions of pilgrims turn out every year ('Makaravilakku is lit by hand: Tantri' in The Hindu, May 28, 2008).

NSOU CC-SO-02 294 20.8 Impact of Globalization Upon Diasporic Religious Communities The internet and other means of mass communication holds the diasporic community together as it provides an obvious method for dialogue within and between diasporic groups but at the same time, Turner (2006) notes, that the unintended consequence of globalization is often that the diasporic politics and their intellectual elites come to depart radically from tradition, building up their own internal notions of authority, authenticity and continuity. The globalization of religion in the twentieth century has strong connections with the evolution of a global business ethic and global corporations. One aspect of the Appadurai's global religioscape is the adoption and adaptation of religions to the social needs of new middle classes. For instance, in the Welsh countryside of Great Britain, Turkish migrants have brought their 'whirling dervishes' to village life, where the local inhabitants are made to believe that whirling is psychologically good for them. Yoga practices from Hinduism have been widely adopted in the West where practice is stripped of its spiritual significance and developed merely as a meditation technique. Such flows of religious beliefs in the globalized world also threaten to denude them of their authentic meaning and significance. 20.9 Summary Globalization refers to the historical process by which all the world's people increasingly come to live in a single social unit. It implicates religion and religions in several ways. From religious or theological perspectives, globalization calls forth religious response and interpretation. Yet religion and religions have also played important roles in bringing about and characterizing globalization. Among the consequences of this implication for religion have been that globalization encourages religious pluralism. Religions identify themselves in relation to one another, and they become less rooted in particular places because of diaspora and transnational ties. Globalization further provides fertile ground for a variety of noninstitutionalized religious manifestations and for the development of religion as a political and cultural resource. Peter Berger (2003) says that virtually all religious communities are today, if not globalizing, reaching across the borders of their traditional territories. But they differ in their intention or capacity to create new forms of modernity. For instance, we

NSOU CC-SO-02 295 discussed Oomen's take on homogenization, traditionalization, pluralization and hybridization. Globalization has not only disembedded religions from their historic homelands but also led to the resurgence of spiritual market. Next, we also saw how with the advent of globalization and neoliberalism Hindu religiosity is facilitated by the Indian state and corporate interests. Meera Nanda (2009) argues that new religiosity of middle class Indians which has been aggravated by globalization is openly ritualistic, ostentatious and nationalistic. Globalization also opened the avenues for private education which is today surreptitiously bringing religion into the school and college instruction. The Indian state entered into partnership with the corporate in order to accumulate capital has opened new institutional spaces where Hinduism can renew itself. The effect of globalized economy can also be seen on diasporic communities who negotiate with their religion in different forms. 20.10 Model Questions 1. Answer briefly the following questions: (5 Marks) a) What is globalization? Identify its features. b) Why religion is known as a transnational institution? c) How religion becomes a political resource? d) Briefly state the interconnection between Religion and globalization. 2. Answer in detail the following questions: (10 Marks) a) Write a broad outline of the rise of spiritual market in the era of globalization. b) Write a detailed note on relationship between religion, globalization and human condition. c) Analyse the relation between globalization and religion...give suitable examples to enrich your answer. 20.11 References and Suggested Readings 1) Ahmed, Akbar S. <p>the patterns and rules of marriage. When a sociologist pays special attention to these aspects of kinship, we say that he/she is following the alliance approach to understand the patterns of kinship. Many studies of kinship in India have focused on marriage as an alliance between two groups and on kinship terminology, as a reflection of the nature of alliance. Because of their concentration on relationships arising out of marriage, we say that these studies follow the alliance approach. The main exponent of this approach is Louis Dumont (1950, 1953, 1957 a and b, 1959, 1962 and 1966). He has emphasised the role played by marriage in the field of kinship in South India. By showing the opposition between consanguines and affines as reflected in the Dravidian kinship terminology, Dumont has made an important contribution to our understanding of kinship system in India in general and of South India in particular. He has applied to South India a structural theory of kinship. It brings out the repetition of intermarriage through the course of generations. This pattern highlights the classification of kinsmen into two categories of parallel and cross relatives. The alliance approach to the study of kinship has helped sociologists to discuss and explain the distinction between bride-givers and bride-takers. In addition, it has also included the discussion on the notion of hypergamy (i.e., the bride takers are always superior to bride-givers), practice of dowry in relation to hypergamy and ideas of exchange in marriage. 16.11</p>		<p>the patterns and rules of marriage. When you find a sociologist paying special attention to these aspects of kinship, you can say that he/she is following the alliance approach to understand the patterns of kinship. Many studies of kinship in India have focused on marriage as an alliance between two groups and on kinship terminology, as a reflection of the nature of alliance. Because of their concentration on relationships arising out of marriage, you can safely say that these studies follow the alliance approach. The main exponent of this approach was Louis Dumont (1950, 1953, 1957 a and b, 1959, 1962 and 1966). He focused on the role played by marriage in the field of kinship in South India. Dumont focused on the opposition between consanguines and affines as reflected in the Dravidian kinship terminology, and made an important contribution to our understanding of kinship system in India in general and of South India in particular. Following the implications of Levi-Strauss's theory, Dumont (1971: 89-120) applied to South India a structural theory of kinship that brought out the repetition of intermarriage through the course of generations. This pattern highlighted the classification of kinspersons into two categories of parallel and cross relatives. The alliance approach to the study of kinship has helped sociologists to discuss and explain the distinction between bride-givers and bride-takers. In addition, it has also included the discussion on the notion of hypergamy (i.e. the bride-takers are always superior to bride-givers), practice of dowry in relation to hypergamy and ideas of exchange in marriage.</p>

8 NSOU CC - SO - 03 1.11 Questions 1.12 References 1.13 Suggested Readings 1.14 Glossary 1.1 Objectives After going through this unit, you can understand the meaning of sociological perspective and why there is plurality of perspectives in sociology. the meaning, features and basic elements of sociological theory and various scholarly debates relating to the development of such theories. different types of and different schools of sociological theory. 1.2 Introduction Sociology, defined as the scientific understanding of society (i.e. the web of human interrelationships arising out of human interactions), strives to analyze, explain and understand social phenomena- ranging from the occurrence of unit interaction to the vast array of social change- in a systematic way that allows for every single social occurrence to be understood with all-round satisfaction in its light. Sociologists are also interested in developing a systematic way or schema of approaching social phenomena through the process of thought that inculcates variety of information in a rigorous and objective way so as to create a synthesized view of society. This synthesized view of society, developed by a particular way or schema of approaching social phenomenon, is called sociological perspective. Since the emergence of the discipline it has been the centre of concern, ambiguity and dispute. However, the eternal spring of challenge, creativity, and innovation on the other hand is still there. The sociological perspective may be defined as an approach to understand human behaviour by placing it within its broader social context. 1.3 Why is there a plurality in sociological perspective? The history of the emergence of sociology as an academic discipline entails that the discipline was born as an answer or solution to the resultant necessity aroused at the confluence of two dialectical intellectual forces that had been swaying the intellectual sphere in Europe,

NSOU CC - SO - 03 9 namely the Enlightenment Philosophy of the late 18 th Century and the Counter- Enlightenment Philosophy (Romantic Conservative Philosophy) of the early 19 th Century. The 18 th century philosophy of Enlightenment offered reason and empiricism (importance of fact, proof, evidence) to be the twin pillars of knowledge; advocated strong arguments in favour of individual freedom and liberty; emphasized on human capability in controlling the world around them and strived for seeking true knowledge in every sphere by mastering the skill and methods of natural sciences. As was promised by the French Revolution, in the post-revolution scenario man was to develop a secular society based on the principles of equality, liberty and fraternity. In reality it was evident that men through their struggle had indeed succeeded in disheveling the older form of society that had been fettered by monarchy and religious orthodoxy; but the emerging society not only appeared non- conforming to the design they had dreamed of, but proved also to be out of their control. According to Gouldner (1977:13-17), the new society appeared to be a world of contradictions: a world created by man, but not the creator's world, i.e. man could no more control the emerging shapes, forms, features and processes that the society continued to display. Hence, the concepts of society and culture, which form the foundation of the emerging academic social science called 'sociology', developed as ambiguous conceptions, as being creations of man and as having lives and histories of their own- life independent of the men who create, embody and enact them. In sociological analyses the concepts of culture and society were continued to be expressed as autonomous things-independent and existing for themselves (sui generis meaning 'in and of itself'). They came to be viewed as any other 'natural' phenomena having laws of their own, and the discipline that studied them came to be viewed as 'natural' science. Man accepted defeat in his effort to control the social world and this defeat was expressed in the duality of ambivalence that featured into the 'objectivity' of the emerging academic social science, nay, sociology: i) man's effort to accommodate to alienation, and ii) expression of his muted resentment towards this alienation. While the assumption of the autonomy and uncontrollability of society and culture as normal and natural condition generated the core of the repressive component of sociology, the feature of suppressed resentment allowed for the liberating potential of the discipline. Sociology thus develops a total conception of man that promoted the distinctiveness of the discipline, featuring a unique contradiction which constituted the core of the concept: man as the controlled product of society and culture (the dominant focal view), and man as the maker of society and culture (the subsidiary but promising view).

10 NSOU CC - SO - 03 The ambivalence or contradictions inherent in the domain assumptions- Man, Society and Culture- led to the development of different perspectives and different schools of Sociology; and shaped the basic charter of Sociology as an academic discipline. 1.4 Sociological Theory: Definition and Features Development of theory lies at the core of any study of science. For a scientific study of society sociology should develop theories like other scientific disciplines. Now, what is a theory? According to Turner (1974), "theory is a mental activity. It is a process of developing ideas that can allow us to explain how and why events occur."

100%

MATCHING BLOCK 1/320

W

A theory is a set of propositions that provide an explanation by means of a deductive or inductive system

and its major functions are description, explanation and prediction based on hardcore empirical facts. In the case of Sociology,

93%

MATCHING BLOCK 2/320

W

a theory is a set of interrelated concepts used to describe, explain, and predict how society and its parts are related to each other. Theories are sets of interrelated concepts and ideas that have been scientifically tested and combined to clarify, and expand our understanding of people, their behaviours, and their societies.

The basic characteristics of a scientific theory are: i) it aspires to transcend the time and space limit, and hence generic, timeless and universal in character; ii) it

97%

MATCHING BLOCK 17/320

W

is stated in neutral, objective, and unambiguous terms so that the theory means the same thing to all who examine it; and,

iii) it is designed to be repeatedly and

100%

MATCHING BLOCK 3/320

W

systematically tested with replicable methods against the facts of particular empirical settings.

79%

MATCHING BLOCK 4/320

W

Sociological theory is a set of assumptions, assertions, and propositions, organized in the form of an explanation or interpretation, of the nature, form, or content of social action. Sociological theory is defined as a set of interrelated ideas that allow for the systematization of knowledge of the social world. This knowledge is then used to explain the social world and make predictions about the future of the social world. Therefore, the important characteristics of sociological theory are as follows i. Sociological theories are abstract generalizations. ii. Sociological theories are logical propositions. iii. Sociological theories are conceptualizations regarding social phenomena. iv. Sociological theories are empirical generalizations. v. Sociological theories are factual. NSOU CC - SO - 03 11 vi. Sociological theories are provisional in nature. vii. Sociological theories are verifiable. 1.5 Building Blocks of Sociological

Theory As we have already discussed, the history of its very emergence led to different and varying perspectives or approaches in understanding social organization, development of theory in sociology also led to various arguments and debates among the sociologists relating to its nature, scope and levels of analysis. Nevertheless, all the theories have been following four common elements which are considered the building blocks of sociological theories: concepts, variables, statements and formats.

95%

MATCHING BLOCK 5/320

W

Concepts: Generally, concepts denote phenomena. A concept describes the aspects of the social world that are considered essential for a particular purpose. Concepts are constructed from definitions. A definition is a

statement or system of terms used to express the meaning of a word or word group or a sign or symbol; a statement expressing the essential nature of something that

100%

MATCHING BLOCK 6/320

W

allows visualizing the phenomenon that is denoted by the concept. It enables all investigators

universally and instantaneously to point at

75%

MATCHING BLOCK 7/320

W

the same thing and to understand what it is that is being studied. Thus, concepts that are basic elements for building theory must strive to communicate an uniform meaning to all those who use them. However, since concepts,

especially used in social sciences,

90%

MATCHING BLOCK 8/320

W

are frequently articulated with the words of everyday language, it is difficult to avoid words that

may suggest

91%

MATCHING BLOCK 9/320

W

varied meanings— and hence point to different phenomena for varying groups of people. It is for this reason that many concepts in natural sciences are expressed in technical or more neutral languages, such as the symbols of mathematics. In sociology, expression of concepts in such special languages is sometimes not only impossible but also undesirable. Hence the symbols (

words/ terms) used to develop a concept must be chosen and

100%

MATCHING BLOCK 10/320

W

defined as precisely as possible so that they point to the same phenomenon

unambiguously and universally. It is hard to reach a perfect consensus in defining a concept

72%

MATCHING BLOCK 11/320

W

with conventional language, a body of theory rests on the assertion that researchers will ultimately define concepts unambiguously. The concepts of theory

are of two types: concrete and abstract.

85%

MATCHING BLOCK 12/320

W

Some concepts relate to concrete phenomena at specific times and places. Other, more abstract, concepts depict phenomena that are not related to concrete times or places. For example, in the context of small-group research, concrete concepts would refer to the persistent interactions of particular individuals (

e.g. 2nd semester undergraduate students of a particular department
12 NSOU CC - SO - 03 of a particular college under the University of Calcutta in the year 2019),

100%

MATCHING BLOCK 13/320

W

whereas an abstract conceptualization of such phenomena would refer to those general properties of face-to-face groups that are not tied to particular individuals interacting at a specified time and location. Whereas abstract concepts are not tied to a specific context,

time and space, concrete concepts are. Although it is important

89%

MATCHING BLOCK 14/320

W

that some of the concepts of theory go beyond specific times and places, it is equally critical that there be procedures for making these abstract concepts pertinent to observable situations and occurrences. The utility of an abstract concept can be demonstrated only when the concept is brought to analyze some specific empirical problem encountered by

researchers. As a formal procedure for attaching abstract concepts to observable events, some argue that the

89%

MATCHING BLOCK 15/320

W

abstract concepts should be accompanied by a series of statements known as operational definitions, which are sets of procedural instructions telling researchers how to go about discerning phenomena in the real world that are denoted by an abstract concept. Others argue, however, that the nature of our concepts in sociology precludes such formalistic training. At best, concepts can be only devices that must change with the changes in society, and so we can only intuitively and conditionally apply abstract concepts to the actual analysis. Variables:

While building theory, two general types of concepts are used: (1) those that simply label phenomena (e.g. social group, social class etc.) and never reveal the ways in which the concepts may differ in terms of properties like size, volume, weight, age etc in reality; and (2) those that refer to phenomena with their variable properties so as to attribute them with certain ability to respond to the wide differences found in social world.

100%

MATCHING BLOCK 16/320

W

Concepts that denote properties as size, weight, density, velocity etc. refer to differences in degree among phenomena.

This second type of concepts is called variables, which aims at describing varying states of particular events denoted by concepts. According to Turner (1974), if Sociology is to follow the path of other natural sciences, concepts are to be translated into variables so that they can help visualize

100%

MATCHING BLOCK 18/320

W

how variation in one phenomenon is related to variation in another

phenomenon. However, Sociologists, who are hardly interested to view the discipline on the same boat with natural sciences, are more interested in making the concepts more sensitizing, more alert and concerned towards grasping the dynamic nature of important social processes than in converting each and every concept into variable, i.e. into some measurable metrics.

NSOU CC - SO - 03 13

80%

MATCHING BLOCK 19/320

W

Statements and Formats: The concepts of theory must be connected to one another and these connections among concepts constitute theoretical statements. These statements

not only identify

84%

MATCHING BLOCK 20/320

W

the way in which events denoted by concepts are interrelated, they also provide an understanding of how and why events should be connected. When these theoretical statements are grouped together, they constitute a theoretical format (

Turner 1974). As there are ample disputes among sociologists regarding the scientific status, degree of subjectivity and objectivity in sociology, there are dramatic debates relating to the structure of theoretical statements and their organization into

100%

MATCHING BLOCK 21/320

W

formats. There are five basic approaches in sociological theory for generating theoretical statements and formats: (1)

meta-theoretical schemes, (2) analytical schemes, (3) discursive schemes, (4) propositional schemes, and (5) modelling schemes.

100%

MATCHING BLOCK 22/320

W

Concepts are constructed from definitions; theoretical statements link concepts together; and statements are organized into five basic types of formats.

However, these five formats can be executed in a variety of ways. So, in reality, there are more than just five strategies for developing theoretical statements and formats. Moreover, these various strategies are not always mutually exclusive; rather in executing one of them, we are often led to another as a kind of next step in building theory. Yet—and this point is crucial—these various approaches are often viewed as antagonistic. Moreover, even within a particular type of format, there is constant battle over the best way to develop theory. This rancour represents a great misfortune because in a mature science—which, sad to say, sociology is not—these approaches are viewed as highly compatible. Before pursuing this point further, we need to discuss in more detail each of these approaches. 1.5.1 Issues and approaches in Sociological Theory 1)

100%

MATCHING BLOCK 23/320

W

Meta-theoretical schemes deal with the basic issues that a theory must address. In many sociological circles, meta-theory is considered

a crucial precondition to adequate theory building. Some of the basic questions that the meta-theoretical scheme seeks answer to are: i. What is the basic nature of human activity about which a theory must be developed? ii. What is the appropriate way to develop theory and what kind of theory is possible? iii. What is the critical problem that the theory in Sociology must concentrate on?

100%

MATCHING BLOCK 24/320

Analytical Scheme is a classification scheme that denotes the key properties, and interrelations among these properties, in the social universe. There are many different varieties of analytical schemes, but they all share an emphasis on

typologizing, i.e. classifying basic properties

100%

MATCHING BLOCK 26/320

W

of the social world. Explanation of an empirical event comes whenever a place in the classificatory scheme can be found for

that

94%

MATCHING BLOCK 27/320

W

empirical event. There are two basic types of analytical schemes: (1) naturalistic schemes, which try to develop a tightly knitted system of categories that is supposed to capture the way in which the invariant properties of the universe are ordered and (2) sensitizing schemes, which are more loosely assembled categories of concepts intended only to sensitize and orient researchers and theorists to certain critical processes. 3) Discursive Schemes are typically easier to understand than those that are more formal, but the weakness is that the variables and forces highlighted and the dynamic relations among them are vague and imprecise. Even with certain vagueness in language, it is still possible to recognize the basic theoretical argument and convert it into a more formal format like an analytical model or propositional scheme.

NSOU CC - SO - 03 15 4)

100%

MATCHING BLOCK 28/320

W

Propositional Scheme is a theoretical statement that specifies the connection between two or more variables. It tells us how variation in one concept is

caused by or related to

100%

MATCHING BLOCK 29/320

W

variation in another. Propositional Schemes vary perhaps the most of all theoretical approaches. They vary primarily along two dimensions: (1) the level of abstraction and (2) the way propositions are organized into formats. Some are highly abstract and contain concepts that do not denote any particular case but all cases of a type. By using these two

above mentioned

100%

MATCHING BLOCK 30/320

W

dimensions, several different types of propositional schemes can be isolated: (a) axiomatic formats, (b) formal formats, and (c) empirical formats.

We shall examine each of these schemes below: a) Axiomatic

95%

MATCHING BLOCK 31/320

W

Formats: An axiomatic organization of theoretical statements includes a set of concepts some of which are highly abstract in nature; others, more concrete. Second, there is always a set of existence statements that describe those types and classes of situations in which the concepts and the propositions that incorporate them apply. Third, propositional statements are stated in a hierarchical order. At the top of the hierarchy are axioms, or highly abstract statements, from which all other theoretical statements are logically derived. The axioms should be consistent with one another, although they do not have to be logically interrelated. The axioms should be highly abstract; they should state relationships among abstract concepts. These relationships should be law-like in that the more concrete theorems derived from them have not been disproved by empirical investigation.

b) Formal Formats:

93%

MATCHING BLOCK 32/320

W

Formal theories are loose versions of axiomatic schemes. The idea is to develop highly abstract propositions that are used to explain some empirical event. Some highly abstract propositions are seen as higher-order laws, and the goal of explanation is to visualize empirical events as instances of this covering law. Deductions from the laws are made, but they are much looser, rarely conforming to the strict rules of axiomatic theory. Moreover, there is recognition that extraneous variables cannot always be excluded, and so the propositions have a condition that if other forces do not interfere, then the relationship among concepts in the proposition should hold true. c) Empirical Formats:

They

87%

MATCHING BLOCK 33/320

W

consist of generalizations from specific events, in particular empirical contexts. They are too tied to empirical contexts, times, and places. In fact, they are generalizations that require a theory to explain them. There are other kinds of empirical generalizations also, which are often termed as middle-range theories, 16

NSOU CC - SO - 03

94%

MATCHING BLOCK 34/320

W

because i) they are more abstract than a research finding, and ii) their empirical content pertains to variables that are also found in other domains of social reality. 5) Analytical Modelling Scheme is a diagrammatic representation of social events. The diagrammatic elements of any model include: (1) concepts that denote and highlight certain features of the universe; (2) the arrangement of these concepts in visual space so as to reflect the ordering of events in the universe; and (3) symbols that mark the connections among concepts, such as lines, arrows, vectors etc. The elements of a model may be weighted in some way, or they may be sequentially organized to express events over time, or they may represent complex patterns of relations and other potential ways in which properties of the universe affect one another. In sociology, most diagrammatic models are constructed to emphasize the causal connections among properties of the universe. That is, they are designed to show how changes in the values of one set of variables are related to changes in the values of other variables. Sociologists generally construct two different types of models, which are known as analytical models and causal models. Analytical models are more abstract

and tend to

100%

MATCHING BLOCK 35/320

W

highlight more generic properties of the universe, and they portray a complex set of connections among variables. In contrast, causal models are more empirically grounded

and provide for a more detailed interpretation of an empirical generalization. 1.6. Elements in Sociological Theory In view of the century long enormous debate and discussion among scholars regarding how theory should be developed in sociology to grasp the dynamics of social world comprehensively, Tom Bottomore suggests examining sociological theory as it has developed up to the present time, under three headings: A) Types of generalization, B) Basic Concepts and schemes of Classification, and C) Explanatory Theories. 1.6.1 Types of Generalization: Following M. Ginsberg, Bottomore suggests six types of generalizations in social science: i. Empirical relationship between concrete phenomena (e.g. urban life and rate of divorce). ii. Generalizations formulating the conditions under which institutions or other social formations arise (e.g. various accounts of the origin of capitalism). iii. Generalizations asserting that changes in a given institution are regularly associated with changes in other institution (e.g. Marx's theory of changes in class structure and changes in different institutions)

NSOU CC - SO - 03 17 iv. Generalizations asserting phase-sequence of various kinds (e.g. attempts to distinguish the 'stages' of economic development by Bucher, Schmoller and others). v. Generalizations describing the main trends in the evolution of humanity as a whole (e.g. Comte's law of the three stages, Marxist theory of development from primitive society to communist society etc.). vi. Laws stating the implications of assumptions regarding human behaviour (e.g. some laws in economic theory). These types of generalizations are diverse in range and level and there are disputes regarding the extent to which they can be regarded as validated. However, sociological theorizing should, from the empirical correlations which have been established, be increasingly committed to the construction of broader generalizations, which then can be open to test by further research. Thus the discipline may reach nearer to cumulative theory construction like other sciences. The sociologists will get a device to curb the harmful propensity for fresh departures and choosing specific facts while curbing out others in order to favour a particular generalization or theory.

1.6.2 Basic Concepts and schemes of Classification: Concepts serve two purposes: i) they distinguish and help denoting phenomena which had not until then been considered as forming separate classes; and ii) they serve as shortened description of phenomena and as instruments for further analyses and study. Construction of a strong conceptual framework was emphasized by the founding fathers of sociology, like Durkheim (social fact) and Max Weber (ideal types), who introduced and defined concepts, while writing their explanatory theories. In the field of classification we find the following schemes in sociological theorizing: i) Various attempts to classify societies (e.g. Karl Marx's attempt on the basis of economic criteria, attempt of Comte and Hobhouse against the criteria of the level of intellectual development etc.) ii) Classification of social groups on the basis of their size, structure, pattern of interaction, duration, recruitment of members and so on. iii) Classification of social relationships (e.g. Hobhouse's distinction between three broad 'types of social union' based respectively upon kinship, authority and citizenship, Durkheim's distinction between two types of social solidarity: mechanical and organic, 18 NSOU CC - SO - 03 distinction between community and society made by Tonnies, Von Wise's distinction of social relationships on the basis of their tendency towards association , or dissociation, towards their diminishing or increasing the social distance between individuals.etc.) iv) Classification in terms of social action originated by Max Weber v) There is a new trend of classifying phenomena with the character of industrial societies and with the changes in the economically underdeveloped societies.

1.6.3 Explanatory Theories: Generally speaking, explanatory theories are meant to answer the question "why?" This may take two forms: i) causal explanations which is of the kind "because of....." , and ii) teleological explanations which are of the kind "in order that.....". The later kind may be further differentiated into: explanation in terms of purpose and explanations in terms of end-states. According to many of the classical sociologists, as a generalizing science sociology should aim at establishing causal connections and causal laws. But explanations of human individual behaviour at first appearance fall in the category of teleological, in terms of purposes. Hence, there is a significant dispute between scholars regarding whether the discipline should take shape as an 'interpretative science' or continue as a 'natural science of society'. However, the effort of classical sociologists and their followers to develop grand all-encompassing theories of society has been failed as the grand schemes (Functionalism of Durkheim and Radcliff Brown, Conflict theory of Karl Marx) faced rigorous criticism for serious reasons, from scholars advocating for 'interpretative science', the trend of building all-embracing explanatory theory has lost its pace. It is a hopeful sign that attention is being paid to theories that keep close to the empirical data, and thus to verification. But sociological theory still suffers from an excessive specialization which has separated theory and research, and from some misinterpretation about the nature of scientific theory.

1.7 Types of Sociological Theory 1.7.1 Speculative

100%

MATCHING BLOCK 36/320

W

Theories vs. Grounded Theories Speculative theories are abstract, impressionistic and rooted in a philosophical system. The founding fathers of sociology,

86%

MATCHING BLOCK 37/320

W

Comte and Spencer, have synthesized the findings of a variety of disciplines to derive a formidable collection of theoretical statements to explain social processes and organizations. These are essentially theories generated by logical

NSOU CC - SO - 03 19

94%

MATCHING BLOCK 38/320

W

deduction from a priori assumptions. They are based on certain methodological and philosophical assumptions and generate theoretical entities and conceptual schemes. Grounded theories, on the other hand, are based on the findings of empirical research and they are appropriate to their specific uses. They produce specific sociological laws, principles and empirical generalizations. Grounded theory is

partly a

97%

MATCHING BLOCK 39/320

W

theoretical framework and partly research methodology. It combines theory and research and serves as a guide for many social science researchers in their projects. Grounded theory is an attempt to develop theories from an analysis of the patterns, themes, and common categories discovered in empirical research. It emphasizes research procedures when developing theories. 1.7.2 Grand Theory vs. Miniature Theory A grand theory is a broad conceptual scheme with systems of interrelated propositions that provide a general frame of reference for the study of social processes and institutions. However, it is different from speculative theory. The grand theory is rooted in the empirical world - however loosely, whereas speculative theories are based on philosophical systems. The

grand theory is a comprehensive formulation. It provides a master scheme of general sociological orientations. Grand theories are full of jargon and intuitive statements.

The system theory of Talcott Parsons

73%

MATCHING BLOCK 40/320

W

and Sorokin's theory of socio-cultural dynamics are examples of grand theories. Miniature theories are what Merton called as Middle range theories,

i.e.,

95%

MATCHING BLOCK 41/320

W

theories intermediate to the minor working hypotheses evolved during the day-to-day routines of research, and the all inclusive speculations comprising a master speculative scheme from which it is supposed to derive a very large number of empirically observable uniformities of social behaviour. The miniature theories are partial, more specific and their frame of reference is considerably limited. They are less pretentious than the grand theories. Merton's theory of reference groups is an example of such a theory. 1.7.3 Macro Theories vs. Micro Theories Macro theories are broader in scope and encompass

an

90%

MATCHING BLOCK 42/320

W

array of laws while micro theories have a narrower frame of reference. Macro theories are concerned with total societal patterns. Theories of society, culture and institutions constitute the tradition of macro sociology. Micro sociology is concerned with interactions among the units of society. Small group theories represent the micro tradition in contemporary sociology. The distinction between the two types of theories is based on the size of the unit of analysis rather than the level of analysis. Macro theories deal with society as a whole. Micro theories deal with the 20 NSOU CC - SO - 03 subsystems that constitute the whole. System theory

of Talcott Parsons is macro whereas Homan's exchange theory is an example of micro-level theory. Macro theories belong to the

100%

MATCHING BLOCK 43/320

W

grand theory category; Micro theories come under miniature theories. 1.8 Major schools of sociological thought

and their basic assumptions 1.8.1

88%

MATCHING BLOCK 44/320

W

Functionalism Functionalism is a sociological theory that attempts to explain social institutions as collective means to meet

social needs. The basic concern of functionalism is to explain

93%

MATCHING BLOCK 45/320

W

the apparent stability and internal cohesion of societies necessary to ensure their continued survival over time. Many functionalists argue that social institutions are

mutually interdependent and interconnected to form a stable and coherent

95%

MATCHING BLOCK 46/320

W

system and that a change in one institution will inculcate change in other institutions. Societies are seen as coherent, bounded and essentially relational constructs that function like organisms, with their various parts or social institutions working together to maintain and reproduce them. The various parts of society are assumed to work for the overall social equilibrium. All social and cultural phenomena are therefore seen as being functional in the sense of working together to achieve this

stable unified

95%

MATCHING BLOCK 47/320

W

state. These components are then primarily analysed in terms of the functions they play. A function is the contribution made by a phenomenon to a larger system of which the phenomenon is a part,

in order to maintain the unity of the system.

94%

MATCHING BLOCK 48/320

W

Functionalism addresses society as a whole in terms of the function of its constituent elements- norms, customs, traditions, institutions

and so on. The founding fathers of Sociology, like Auguste Comte, Emile Durkheim, and Herbert Spencer etc. were the great advocates of Functionalist theory of society. Later Functionalist trend of theorizing was developed by social anthropologists like Bronislaw Malinowski and Radcliffe Brown; and eminent sociologists like Talcott Parsons, and Robert K. Merton were other two important figures in the functionalist school of Sociology.

89%

MATCHING BLOCK 49/320

W

A common analogy, popularized by Herbert Spencer, presents these parts of society as "organs" that work toward the proper functioning of the "body" of society as a whole. 1.8.2 Structuralism

Another important theoretical approach to the concept of social structure is structuralism (sometimes called French structuralism), which studies the underlying, unconscious regularities of human expression—that is, the unobservable structures that have observable

NSOU CC - SO - 03 21 effects on behaviour, society, and culture. French anthropologist Claude Lévi-Strauss derived this theory from structural linguistics, developed by the Swiss linguist Ferdinand de Saussure. According to Saussure, any language is structured in the sense that its elements are interrelated in non-arbitrary, regular, rule-bound ways; a competent speaker of the language largely follows these rules without being aware of doing so. The task of the theorist is to detect this underlying structure, including the rules of transformation that connect the structure to the various observed expressions.

In structuralism all

elements of human culture, including literature, are thought to be parts of a system

86%

MATCHING BLOCK 50/320

W

of signs. The major propositions of Structuralism are listed below: i. The underlying elements of the structure remain constant, and it is the varying relationships between them that produce different languages, systems of ideas, and types of society. ii. There is the proposition that what appears to us as solid, normal, or natural, is in fact the end result of a process of production from some form of underlying structure. iii. Structuralism transforms our commonsense notions of individuals. Individuals are seen as the product of relationships, rather than as the makers of social reality. iv. Structuralism holds the view that history is discontinuous and marked by radical changes. 1.8.3 Conflict Theory

Whereas the functionalist perspective views society as composed of different parts working together to maintain social solidarity and stability, the conflict perspective views society as composed of different groups with varying interests competing for power and resources.

100%

MATCHING BLOCK 51/320

W

Conflict Theory claims that society is in a state of perpetual conflict and competition for limited resources. Marx and Weber were the major proponents of conflict theory. Conflict Theory assumes that those who have wealth

and/power

65%

MATCHING BLOCK 52/320

W

perpetually try to increase their resources at the expense and suffering of others (majority) in a society. It is a power struggle which is most often won by wealthy elites and lost by the common people of common means. Power attributes its owner the ability to get what

s/he wants irrespective of and insensitive to the will of others. When power is legitimized either by tradition or by charismatic qualities of certain individuals or by rational legal institutions it is transformed into authority.

100%

MATCHING BLOCK 60/320

SA Four sociological theories.docx (D147302220)

The origins of the conflict perspective can be traced to the classic works of Karl Marx.

Ralph Dahrendorf, Lewis Coser etc. are other proponents of conflict perspective in sociological theory. The following are three principal assumptions of conflict theory:
22 NSOU CC - SO - 03 i.

100%

MATCHING BLOCK 53/320

W

Competition over scarce resources is at the heart of all social relationships. Competition rather than consensus is characteristic of human relationships.

ii.

97%

MATCHING BLOCK 54/320

W

Inequalities in power and reward are built into all social structures. Individuals and groups that benefit from any particular structure strive to see it maintained. iii. Change occurs as a result of conflict between competing interests rather than through adaptation. Change is often abrupt and revolutionary rather than evolutionary. 1.8.4 Interactionism Interactionism –

or Symbolic Interactionism- is a broad sociological perspective. It is a micro action theory and is interpretative rather than objective in nature. Associated with George Herbert Mead and Max Weber, it is a perspective that views society as the product of human interactions, and the meanings that individuals attach on those interactions. Instead of trying to explain human behaviour in the context of large social structures or fundamental conflicts in society, they look on a smaller level, suggesting that human beings have agency and are not always swayed by the forces outside their control; and they can create their own meanings. Weber recognized that both the small-scale interactions and social structures influenced human behaviour. It

94%

MATCHING BLOCK 55/320

W

is a theoretical perspective that derives social processes (such as conflict, cooperation, identity formation etc.) from human interactions. It is the study of how individuals act within society.

This perspective in sociology

99%

MATCHING BLOCK 56/320

W

has grown in the latter half of the twentieth century and has become one of the dominant sociological perspectives in the world today. Interactionism was first linked to the work of James Parker. George Herbert Mead, as an advocate of pragmatism and the subjectivity of social reality is considered a leader in the development of interactionism. Herbert Blumer expanded on Mead's work and coined the term "Symbolic Interactionism". Symbolic Interactionism is a theoretical approach to understand the relationship between humans and society. The basic notion of Symbolic Interactionism is that human action and interaction are understandable only through the exchange of meaningful communication or symbols. In this approach, humans are portrayed as acting as opposed to being acted upon. The main principles of Symbolic Interactionism are: i. Human beings act toward things on the basis of the meanings that things have for them ii. These meanings arise from social interaction

iii.

100%

MATCHING BLOCK 57/320

W

Social action results from a fitting together of individual lines of action

NSOU CC - SO - 03 23 The focus of Symbolic Interactionism lies

100%

MATCHING BLOCK 58/320

W

on the concrete details of what goes on among individuals in everyday life.

It studies how individuals in society

92%

MATCHING BLOCK 59/320

W

use and interpret symbols not only to communicate with each other, but also to create and maintain impressions of themselves, to create a sense of self, and to create and sustain what they experience as the reality of a particular social situation. From this perspective, social life consists largely of a complex network of countless interactions through which life takes on shape and meaning. 1.9

Conclusion In this module, you have learned about how different theoretical paradigms are used in sociology to understand the social world. A paradigm is a broad viewpoint, perspective, or lens that permit social scientists to have a wide range of tools to describe society, and then to build hypotheses and theories. Paradigms are also considered as guiding principles or belief systems. In the sociological texts, the word 'paradigm' is used interchangeably with perspective, theory, or approach. We have already discussed here three main perspectives that we find in sociology: the functionalist perspective, the conflict perspective, and the Symbolic Interactionist perspective. However, we do not suggest that they are all inclusive; there are others and more specific topic-based variations of each of the aforementioned three theories. In order to provide you with a better understanding of the pluralistic nature of sociological understanding, in this concluding part of the module, I am presenting a very common every day event in our life- food consumption- as viewed from different sociological perspectives. Eating, i.e. food consumption is a very common daily occurrence in human life all over the world. We eat for meeting physical need; we also eat to celebrate important moments in our lives. Eating may be individual action; may involve sharing; it may be group activity. Eating habits, i.e., the items we eat, the way we eat, the manner we process our food may be source of similarity and difference among human beings. If viewed from a larger context, i.e., the context of society, the condition of food system in our country is at the core of numerous social movements and policies, political issues, and economic debates. Now, let us explore the event of food consumption as analyzed from the three main sociological perspectives mentioned above: From the perspective of structural-functionalism, a researcher may find interest in the role of agriculture (basis of food production) in the national economy and its evolution through ages from the most primitive era of manual farming to contemporary mechanized

24 NSOU CC - SO - 03 production. Another study may focus on the interconnectedness and interdependence between various functions (for example, farming, harvesting, packaging, marketing and mass consumerism) that take place in food production. This may further lead to the examination of how the entire process of production, distribution and consumption of food in a particular society is functioning to maintain social solidarity and equilibrium through the elaborate system of division of labour and mutual interdependence among different groups of people in modern society. Conflict perspective may invoke interest of scholars in studying variation in the pattern of food consumption between different social classes, in order to reflect the severe presence of inequality within society that reveals the difference of nutrition among different classes due to differential access to nutritious food in capitalist society, and therefore, differential access to basic life chances predominating in modern capitalist society. Another study may reveal interest in how power differential in contemporary society plays its role in the regulation of food, and how people's right to information comes into conflict with corporation's thrust for profit, and government's role in mediating the two opposing interests. Symbolic Interactionism inspires micro-level studies. Hence a sociologist may study how particular food items carry symbolic meaning in religious rituals; or how homogeneity in food consumption forms an important part of identity for a particular group, while evoking hostility to another group as the latter consumes a particular kind of food which the former considers to be a taboo; or, role of food in the interaction of people in social gatherings (wedding ceremony, family dinner, picnic etc.). Hence the numerous events in the laboratory of sociologists, i.e., our society, await the sociological minds to explore and understand them from multiple angles, varied perspectives and pluralistic viewpoints; and thus to enhance knowledge and widen their understanding in order to develop a critical, inclusive and sympathetic science of human society.

1.10 Summary We have introduced our learners to our approach to sociology. The diversity in such perspectives have been explained. We tried understanding the primary block of sociological theory as well as its types. Major schools have been discussed along with their assumptions.

NSOU CC - SO - 03 25 1.11 Questions A. Answer briefly (6 marks) i. What do you understand by sociological perspective? ii. Why are there different perspectives in Sociology? iii. What is sociological theory? What are its main features? iv. How are variables important in sociological theorizing? v. Write a short note on conceptualization and classification in sociological theory. vi. Write the differences between: (a) speculative theory and grounded theory (b) grand theory and miniature theory (c) macro theory and micro theory in Sociology. vii. What do you understand by Symbolic Interactionism? viii. What are the basic assumptions of conflict perspective in sociology? B. Answer in detail (12 marks) i. Discuss the basic building blocks of sociological theory. ii. Following Bottomore, analyse the development of sociological theory. iii. Discuss in detail different schools of sociological thought. iv. Following Gouldner, discuss the ambivalence or contradictions inherent in the domain assumptions in Sociology. v. How statements are organized into formats in sociological theory? vi. Define sociological theory. Discuss its features and types. C. Essay Type Question (20 marks) i. How did different perspectives develop in Sociology? ii. Write an essay on the development of theory in Sociology. iii. Discuss critically how different perspectives in Sociology attempt to understand social reality.

A perspective is simply a way of looking at the world. A theory is a set

86%

MATCHING BLOCK 83/320

SA Four sociological theories.docx (D147302220)

of interrelated propositions or principles designed to answer a question or explain a particular phenomenon;

and it comes out with a perspective. Sociological theories help us to explain and predict the social world NSOU CC - SO - 03 31 in which we live. Functionalism or Functional perspective is the oldest and till date, one of the most dominant perspectives in sociology, as other perspectives in the discipline emerged either as a challenge to or in support of it. Abandoning the numerous partial explanations and deterministic theories (e.g. of classical economic theory: man as economic being- rational and utilitarian pursuing his self-interest and social order emerging out from open competition in free markets), when social science was looking for a more comprehensive theoretical and methodological tool for the analysis of various social phenomena and their interrelatedness, functionalism emerged in the tradition of great sociological theories deliberating its own orientation to that great convention while continually developing them (Eisenstadt 1976:181). It offers sociology a new and powerful paradigm to explain a wider variety of social events; and the nature of its investigation involves: i) examining the role that any social phenomenon (institution, activity, event, behaviour and so on) plays in society and the way it is related to other social phenomena; and ii) explaining it in essentially social terms (Davis 1959:757772). The functionalist perspective sees

100%

MATCHING BLOCK 84/320

SA Hridinayana Dutta.docx (D16101320)

society as a complex system whose parts work together to promote solidarity and stability.

This approach looks at society through a macro-level orientation and broadly focuses on the social structures that shape society as a whole.

48%

MATCHING BLOCK 90/320

SA Four sociological theories.docx (D147302220)

The functionalist perspective is based largely on the works of Herbert Spencer, Emile Durkheim, Talcott Parsons, and Robert Merton. Functionalism views society as a system of interconnected parts that work together in harmony to maintain a state of balance and social equilibrium for the whole.

According to this approach, each of the social institutions contributes important functions for society. As for example, family provides a context for reproducing, nurturing, and socializing children; education offers a way to pass on a society's skills, knowledge, and culture to its younger generation; politics offers a means of governing members of society; economics contributes in the production, distribution, and consumption of goods and services; and religion stands to provide moral guidance and an outlet for worship of a higher power, thus promoting solidarity. The quest for social order (or how society remains relatively stable) led the classical sociologists (who were also the early functionalists) like Auguste Comte, Herbert Spencer, Emile Durkheim etc. to borrow heavily from the Biological Sciences, especially the extension of the many analogies between society and organism (Spencer's organismic analogy and social evolutionism, Durkheim's concept of organic solidarity etc.), and offer the view that: i) society is more than the summation of its parts (primarily institutions); ii) it is independent and existing of itself (suigeneris meaning 'in and of itself'); iii)

32 NSOU CC - SO - 03 each of the constituent parts

80%

MATCHING BLOCK 85/320

W

of society is organized to meet different needs and each has particular consequences for the form and shape of society;

and iv) it is the parts, which being mutually interdependent and interconnected to each other, contribute to the maintenance of the social whole which they belong to.

100%

MATCHING BLOCK 86/320

W

Thus functionalism is simply a view of society as a self-regulating system of interrelated elements with structured social relationships and observed regularities. Functionalism

is often named as a consensus theory as it is characterized by the idea that society requires shared norms and values in order to function properly. Institutions in society (such as the family, education, the media, etc.) have clear social functions, which ensure there is a broad consensus about the norms and values of society and which enable organic and orderly social change. Functionalists often use the human body or organic analogy to explain how the different aspects of society are all interconnected and interdependent and problems in one area of society might be symptoms of dysfunction elsewhere. 2.3 Structural Functionalism This perspective is often called "structural functionalism", as it focuses, firstly, on the functional requisites, or "needs", of a social system that must be satisfied for the survival of the system as a whole; and secondly, on the relating structures that meet these requisites. Functionalism perceives the task of sociological analysis as to look for and study the social structures that perform the tasks that are necessary requisites for the sustenance of the social system. Over the years, functionalism manifests itself in a great variety of approaches so as to influence and in return being flourished by the field of social anthropology as well (e.g. B. Malinowski's individualistic functionalism which treats

100%

MATCHING BLOCK 87/320

social and cultural systems as collective responses to fundamental biological needs of individuals modified by cultural values;

and R. Brown's emphasis on

81%

MATCHING BLOCK 88/320

W

structured social relationships which focuses on the function of each element in the maintenance and development of a total structure); and

two major theorists of this perspective, namely Robert K. Merton and Talcott Parsons have often been referred to as structural Functionalists. The uniqueness of the structural functional model also lies in the fact that its origin and development can be traced from a variety of authors and their intellectual theoretical writings. In 1945, Kingsley Davis and Wilbert Moore published a famous paper, which was a short summary of their theses on social stratification; and that is considered as one of the important contributions in the realm of structural functionalism. Robert Merton is another well known social anthropologist, who provided some important structural functional theoretical statements. Including Talcott Parsons and Robert K, Merton, all

NSOU CC - SO - 03 33 of these theorists pursued their academic career mostly in the United States; and hence, this approach is often associated with sociology in the United States. Wallace and Wolf (2006) have mapped out the path of development of structural functionalism from the writings of classical sociologists like, Auguste Comte, Herbert Spencer, and Durkheim, who were of European origin. Later, the functional approach was developed from the 1930s through the 1960s in the United States. Parsons studied Durkheim and Weber, and translated some of their writings into English. Parsons thus became a major interpreter of these European theorists in America, and his interpretation may be considered to have developed the influence of these writers in a particular way. Although a liberal within the American context, Parsons used concepts and models from Weber and Durkheim to establish a sociological approach which countered the Marxian view. It was the sociological approach that dominated entire American sociology from the 1940s through to the early 1970s so strongly that without a few exceptions, Marxian concepts and approaches were almost entirely absent from sociology textbooks. While this approach was not conservative in the sense that it never called for return to an earlier society, it also did not advocate for or offer support to any radical change. Politically, it was harmonized with the cold war liberal and pluralist political approach that became dominant in American universities during this period. Part of this was also aimed at countering any influence of communism, socialism, or Marxism. In the 1960s, the structural functional approach started encountering multiple attacks from theoretical and political stances and ultimately was discredited. It was unable to explain a number of features of American society, such as poverty, social change, dissent, and the continuing influence and political and economic power of the wealthy. As sociologists began to read more of Weber and Durkheim, it became clear that the structural functional interpretation missed much of the subtlety of these writers. Marxist analysis of social structure and social change also attracted scholars of social science. Further, feminist approaches debated continuously against functionalism, arguing that the structural functionalists provided a rationalization for male privilege and ignored the past and potential contributions of women. Functionalism was not as influential among Canadian sociologists as in case of the sociologists of the United States. Sociology in Canada was influenced by some of the British and European approaches. The structural functional model also did not seem to have the same applicability here as in the U.S. partly because equality of opportunity and individualism were not as highly developed here. The different ethnic groups and their history have also been considerably different in Canada than in the United States. When Canadian sociology did develop, some of the political economic approaches were

34 NSOU CC - SO - 03 incorporated into Canadian sociology to create a somewhat different discipline than in the U.S. As a consequence of challenges and disputes in the 1970s, structural functionalism became unpopular in the realm of sociology. However, it is still an important model in the study of sociology. First, outside sociology itself, structural functional approach received growing acceptance. In addition, some of the structural functional arguments are used by those in power to justify inequalities and explain the value of their contribution to society. This is a consensus model, one which can be used to support the social order. Second, it may be regarded as the sociological equivalent of many economic models of inequality. In particular, it fits well with the human capital model of education and the economy and complements some models of liberalism in the political sphere. For example, the notion of equality of opportunity should be a crucial part of this model. Third, even though it may provide an inadequate model of explanation, it may be useful as a model for description. Much of the quantitative information concerning the structure of society has been developed by sociologists working in the functionalist perspective. While the exact connection of these quantitative studies to the structural functional approach may not be clear, much quantitative analysis makes many of the same assumptions as do functionalists. Some of these have provided very useful data for understanding society and investigating the nature of social inequality.

2.4 Functionalism Defined

What is functionalism? A Modern Dictionary of Sociology defines functionalism as, "The analysis of social and cultural phenomena in terms of the functions they perform in sociocultural system. In functionalism, society is conceived of as a system of interrelated parts in which no part can be understood in the isolation from the whole. A change in any part is seen as leading to a certain degree of imbalance, which in turn results in changes in other parts of the system and to some extent to a reorganization of the system as a whole." (Theodorson and Theodorson 1969:167) The functionalist perspective highlights the interconnectedness of society by focusing on how each part influences and in return, is influenced by other parts. For example, the increase in single-parent and dual-earner families has resulted in less availability of parental care to children's homework and study, which in turn contributed to the number of children who are failing in school. As a result of changes in technology, colleges are offering more vocational training programs, and many adults are returning to these

NSOU CC - SO - 03 35 educational institutions to learn new skills that are required in the workplace. The increasing number of women in the workforce has led to the formulation of policies against sexual harassment and job discrimination. Functionalism is

90%

MATCHING BLOCK 89/320

W

concerned with the overall features of social structure and the general nature of social institutions;

hence it falls under the category of macro-sociological theory. In functionalist theory, the different parts of society are primarily composed of social institutions, each considered to fulfil different needs. Family, government, economy, media, education, and religion- all institutions are important to the understanding of this theory. According to functionalism, an institution only exists because it serves a fundamental role in the functioning of society. If it no longer serves a role, an institution will die away. When new needs evolve or emerge, new institutions will be created to meet them.

88%

MATCHING BLOCK 91/320

SA Four sociological theories.docx (D147302220)

Functionalists use the terms functional and dysfunctional to describe the effects of social elements on society. Elements of society are functional if they contribute to social stability and dysfunctional if they disrupt social stability.

Some aspects of society can be both functional and dysfunctional. For example, crime is dysfunctional in that it is associated with physical violence, loss of property, and fear. But according to Durkheim and other functionalists, crime is also functional for society because it leads

100%

MATCHING BLOCK 101/320

SA Four sociological theories.docx (D147302220)

to heightened awareness of shared moral bonds and increased social cohesion.

Following the above stated definition, we can define function as any act or event or process that is contributing for the maintenance of the whole. Accordingly, the act or event which is not contributing to the maintenance of the whole, and/or which is interrupting or contrary to the maintenance of the stability of the whole is referred to as dysfunction; and these ultimately leads to reorganization of the parts in order to bring back social stability. Thus, while focusing primarily on social order, stability and equilibrium, functionalism recognizes and provides answer to social change as well.

72%

MATCHING BLOCK 92/320

W

Functionalism emphasizes the harmony and order that exist in society, focusing on social stability and shared community values. From this perspective, disorganization in the system, such as deviant behaviour, leads to change because

social

76%

MATCHING BLOCK 93/320

W

components must adjust to attain stability. When one part of the system is dysfunctional, it affects all other parts and creates social problems, prompting social change. 2.5

General Arguments Sociologists have further identified two types of functions: manifest and latent (Merton 1968). Manifest functions are consequences that are intended and commonly recognized. Latent functions are consequences that are unintended and often hidden. For example, the manifest function of education is to spread knowledge and skills to society's young generation. But pre-primary schools also serve as babysitters for parents engaged in 36 NSOU CC - SO - 03 different works, and colleges offer a place for young adults to grow political orientations. The baby-sitting and political functions are not the intended or commonly recognized functions of education; hence they are latent functions. (Mooney, Knox, and Schacht, 2007) The basic assumptions of functionalism are as follows: i. The parts of a social system are mutually interrelated and interdependent. ii. A social system tends to retain a 'normal' state of affairs, or state of equilibrium, comparable to the normal or healthy organism. iii. There is a way by which all parts of a system tend to reorganize in order to maintain the state of equilibrium. That means,

100%

MATCHING BLOCK 94/320

W

if all goes well, the parts of society produce order, stability, and productivity. If all does not go well, the parts of society then must adapt to recapture a new order, stability, and productivity.

iv.

100%

MATCHING BLOCK 95/320

W

Social consensus, order and integration are key beliefs of functionalism as this allows society to continue and progress because there are shared norms and values that mean all individuals have a common goal and have a vested interest in conforming and thus conflict is minimal.

v Some basic features of structural functionalism that became popular from the 1930s as the dominant theoretical approach in American Sociology are as follows: i. The theorists

98%

MATCHING BLOCK 96/320

W

coined pivotal concepts, such as 'role', 'norms', and 'social systems' that came to form the basic building blocks of contemporary sociology. Moreover, a few concepts

used by the theorists,

92%

MATCHING BLOCK 97/320

W

such as 'role model' and 'self –fulfilling prophecy', have entered our colloquial vocabulary as well. ii. It is most well known not for the specific concepts that it introduced but rather for the meta-theoretical framework on which it is based.

iii. It envisions society as a system of interrelated parts, and it emphasizes

100%

MATCHING BLOCK 98/320

W

how the different parts work together for the good of the system. The classic structural functionalist image of society is as an organism such as body, with different parts working together

in

70%

MATCHING BLOCK 99/320

W

an interdependent way. iv. In addition, structural functionalism emphasizes 'systems within system'. For instance, while

a College

100%

MATCHING BLOCK 100/320

W

can be considered its own self contained 'system' or unit, it is also a component of

the University to which it is affiliated; the University is the component of the Higher Education system of a state; again the Higher Educational system is one component of the whole Education system of the state; as well as the Administrative system, Legal system, Judicial system, Economic system etc. are components of a larger social system as a whole, the State. v. It typically emphasizes how the various systems and sub systems work together.

NSOU CC - SO - 03 37 2.6 Conclusion We have tried introducing you to the concept of function in sociological theory. We have traced the emergence and development of functionalism as a theory. We tried outlining the general arguments of functional theory. We also traced the development of structural functionalism as well as briefed you about its features. Therefore, functionalism is a theory that attempts to explain the apparent stability and internal integration of society as well as to create and restore equilibrium.

2.7 Summary We spoke here about functionalism in general and as well as structuralism. We explained their in general arguments and characteristics 2.8 Questions A. Answer briefly (6 marks) i. What do you understand by functionalist perspective in sociology? ii. Write a short note on importance of the concept of function in sociology. iii. What do you understand by structural functionalism? What are its main features? B. Answer in detail. (12 marks) i. How is Functionalism related to Biology? -Explain in detail. ii. Discuss the path of development and importance of Structural Functionalism in Sociology. iii. Discuss the nature of investigation offered by functional perspective in Sociology. C. Essay Type Question. (20marks) i. Explain in detail how functionalism as a theory and methodology views society. ii. Critically evaluate the importance of functional perspective in Sociology. 2.9 References: Davis, K. (1959). The Myth of Functional Analysis as a Special Method in Sociology and Anthropology. The Evolution of Societies (1977) 3.3 Theory of Functionalism by Talcott Parsons Parson's sociology was highly influenced by the works of classical European sociologists like Durkheim and Weber. Concepts such as order, solidarity and integration, which dominate his theoretical writings, are clear indication of Durkheimian tradition. The contribution of Weber in Parsons is also apparent in several ways: First, Weber was concerned with (i) analysis of social structures as a whole; and (ii) social action. Parsons refers to his own theory as action theory and his theoretical approach as a general theory of action system. He argues that social phenomena must be understood in terms of individual meaning, but also must be examined at the "level of collective action among groupings of actors." (Turner 1974: 47). Like Weber, Parsons is concerned with the question, "how do the subjective states of actors influence emergent patterns of social organization, and vice versa?" (Turner 1974: 47). Second, Parsons develops many concepts and elaborates conceptual schemes that resemble the Weberian scheme of ideal types. These concepts are built to emphasize important features of social systems, and of the type that Parsons considers to be important for purposes of his analysis of social integration; and serve in different contexts as important means of comparing concrete situations, to see the extent to which the concrete data conform or deviate from these ideal types. (Turner 1974: 47-8). Parson's contribution in functionalism can be discussed under four broad headings: A) Theory of action, B) Theory of social system, C) The pattern variables, D) The functional system problems- AGIL. 3.3.1 Theory of Action In his The Structure of Social Action (1937), Parsons states that action must not be viewed in isolation. Society, which is

100%

MATCHING BLOCK 129/320

W

affected by environments, heredity and culture on the one hand and religious, metaphysical and political systems on the other,

embraces the entire social field of man; it covers and touches all relationship, and thereby all interactions of man with man. According to Parsons, actions are not empirically discrete but occur in constellations that we call systems. He

79%

MATCHING BLOCK 130/320

W

defined social action as a process in the actor situation system which has motivational significance to the individual actor or NSOU CC - SO - 03 45 in the case of collectivity, its component individuals. Social actions are concerned with organism (actor/s),

84%

MATCHING BLOCK 131/320

W

actor's relations with other persons, and social institutions. Parsons used the term "unit act" to refer to a process involving: i) a hypothetical

actor, motivated to spend energy for reaching ii) a desirable goal as defined by the cultural system s/he belongs to, in iii) a hypothetical situation including means (facilities, tools or resources available) and conditions (obstacles that may arise in the path) and iv) the normative standards of the social system (the most important element in Parson's theory of action) , which regulates all the three aforementioned elements.

85%

MATCHING BLOCK 132/320

W

Instead of constructing action in terms of something concrete Parsons conceptualized action systems as a means for analyzing social phenomena. Parsons (1937)

and later, Parsons and Shils in Towards a General Theory of Action (1951)

100%

MATCHING BLOCK 133/320

W

further maintain that actions are organized into three modes or realms: social systems, personality systems and cultural systems. These systems are analytically rather than empirically distinct;

and

94%

MATCHING BLOCK 134/320

W

these systems are not physically separate entities but rather a simplified model of society that Parsons and Shils (ibid) use to explain the organization of action.

However, for Parsons, the three systems: social systems, personality systems and cultural systems are intertwined to encompass all actions of the behavioural organisms and thereby all social life. Fig. 2.1 Theory of Action
46 NSOU CC - SO - 03 3.3.2 Theory of social system The concept of social system lies at the core of any discussion of Parsonian theory. In The Social System he shifts his emphasis from 'unit acts' to institutional orders and the system becomes the primary unit of analysis. For Parsons, there are many systems or action systems. A system is something that has a boundary, so that there is an inside and an outside to the environment comprising the system. Examples of systems are the social, cultural, and personality systems (Wallace and Wolf 2006: 28). Systems have interdependent parts, order or equilibrium, and a tendency to maintain the boundaries and relations of the parts to the whole. These could be the society as a whole, structures or institutions within society (economy, legal system, religious institutions), or smaller subsystems (family or individual) that form part of society. These are action systems in the sense that they involve social action, and each system has certain needs or conditions that are necessary for the survival and continued operation of the system. Systems also have goals that may be created as a result of needs and desires of members of these systems. However, Parson's concept of 'social system' is an analytical conceptual framework; not an empirical referent. As stated earlier, the general theory of action, in which Parsons offers the overall picture of how societies are structured and fit together, includes four levels of system: the cultural system, the social system, the personality system and the behavioural organism as a system. The cultural system: the basic unit of analysis at this level is 'meaning' or 'symbolic system' (e.g. language, national flag, national values etc.). At this level, Parsons focuses on the shared values. According to him, cultural traditions are made up of shared symbolic systems. A key concept here is socialization, the process by which societal values are internalized by the members of a society; and they grasp the values as their own. For Parsons, socialization is the powerful integrative force for maintaining social control and holding a society together (Wallace and Wolf 2006:26) The social system: In his scheme, Parsons has elaborated this level the most. Here the basic unit is 'role interaction'. According to Parsons, "a social system consists in a plurality of social

94%

MATCHING BLOCK 135/320

W

actors interacting with each other in a situation which has at least a physical or environmental aspect, actors who are motivated in terms of tendency to the 'optimization of gratification' and whose relations to

the

85%

MATCHING BLOCK 136/320

W

situations, including each other, is defined and mediated in terms of a system of culturally structured and shared symbols." (Parsons 1951:5). Thus a social system

can be made up of two people interacting with each other to the relationship within a nation, where the actors are members of a nation. The relationship between the cultural and social systems is apparent from the reference to "culturally structured and shared symbols" that defines the way actors interact.

NSOU CC - SO - 03 47 The personality system: Here the basic unit is individual actor, the human person. At this level Parsons focuses on individual needs, motives, and attitudes, which are referred to as the "tendency to the 'optimization of gratification'" in his definition of social action. The behavioural organism: in this fourth system level the basic unit is the human being in its biological sense, i.e., the physical aspect of the human person, including the organic and physical environment in which the human being lives. Parsons here referred explicitly to the organism's central nervous system and motor activity. (Parsons 1971:5) Parson's view of socialization helps illustrating the interrelatedness of these four systems. At birth a human being is simply a behavioural organism; as s/he develops among other actors (human beings) s/he gains any personal identity. Through the process of socialization s/he internalizes the values of the society, i.e., s/he makes the social values of the cultural system her/his own by learning from other actors in the social system what is expected from her/him. Thus s/he learns role expectations and becomes full participant in the society. Therefore, we find that the values come from the cultural system; the normative or role expectations are learned from the social system; the individual identity comes from the personality system; and the biological equipment comes from the behavioural organism. 3.3.3 The

95%

MATCHING BLOCK 137/320

W

Pattern Variables In Toward a General Theory of Action (1951), Parsons and Shils develop a set of concepts called the pattern variables. The pattern variables are a dichotomous set of five-

fold choices that categorizes expectations and structure of relationships; and is applicable

93%

MATCHING BLOCK 138/320

W

not only to the individual level but to the collective level as well. They refer at once to the variant normative priorities of social system, the dominant modes of orientation in personality systems, and the patterns of values in cultural systems.

Parsons defines

78%

MATCHING BLOCK 139/320

W

a pattern variable as a dichotomy, one side of which must be chosen by an actor before the meaning of a situation is determinate for him, and thus

before he can act with respect to the situation. It

100%

MATCHING BLOCK 140/320

W

describes alternatives of action between which each person (and group) has to choose in every situation. The actions are shaped by the three systems: personality, cultural, and social.

Following are the five-fold pattern variables described by Parsons: 1. Affectivity/ Affective-Neutrality: It concerns the amount of emotion or affect that is appropriate in a given interaction situation. For example, a mother is expected to express a great deal of emotion in her interaction with her baby; but a teacher

48 NSOU CC - SO - 03 examining answer sheets of students, or an employee in a bureaucratic organization

100%

MATCHING BLOCK 141/320

W

is expected to be emotionally "neutral". 2. Self-orientation/Collectivity-orientation:

It denotes the extent to which action is to be oriented to self-interest and individual goals or to group interest or goals. For example, a person buys from a market objects of his/her own need, interest and choice (Self-orientation); whereas, a person donates a good sum or offers a good deal of own labour for the preparation of community festival (Collectivity- orientation). 3.

Universalism/Particularism: It points to the problem of whether evaluation and judgment of others in an interaction situation is to be applied to all actors or should all actors be assessed in terms of the same standards. For example, the rights, duties and obligation of a doctor to his/her patients are same irrespective of the caste, creed, race, nationality, gender and religion of the doctor and the patient and it is the illustration of Universalism; whereas, a person offering special support and care to his/her ailing friend is an instance of Particularism. 4. Ascription/Achievement: It deals with the issue of how to assess an actor, whether in terms of his/her performance or on the basis of his/her qualities attributed to him/her at birth (e.g. age, sex, race, caste, family status etc.). For example, being eligible for casting vote depends on attaining a specified age (Ascription); whereas, being eligible for a job position or receiving an academic degree depends on a person's performances (Achievement). 5. Specificity/Diffuseness: it denotes the problem of how far reaching obligations in an interaction situation are to be. Should the obligations be narrow and specific, or should they be extensive and diffuse? For example, clerk/customer role-relations and Teacher/student role-relations which have narrowly and clearly defined criteria for interaction (specificity); whereas, a group of students

89%

MATCHING BLOCK 142/320

W

becoming friends with a teacher go beyond the clear boundaries of teacher/student relation (

Diffuseness). Parsons' conceptualization of pattern variables was inspired by

100%

MATCHING BLOCK 143/320

W

a renowned dichotomy first formulated by the German theorist Ferdinand Tonnies,

who distinguished between Gemeinschaft (community) and Gesellschaft (purposive association). Emile Durkheim's conceptualization of "mechanical" versus "organic solidarity" also had a profound influence on Parsons.

95%

MATCHING BLOCK 144/320

W

According to these classic dichotomies, modern societies are based on individualistic "purposiveness" and functional interdependence, whereas traditional societies are rooted in collectivistic "sameness" (or community) and an intense feeling of community.

Though, both the choices in each set

65%

MATCHING BLOCK 145/320

W

of pattern variables are perceptible NSOU CC - SO - 03 49 in contemporary society at all three levels (social, cultural and personality), the

dichotomy lies in the fact that while one choice of each set matches more to the values of pre- modern societies (e.g. affectivity, ascription, specificity etc.) the other (e.g. affective- neutrality, achievement, diffuseness etc.) suits more with the values of contemporary modern society. In The Social System, Parsons illustrates pattern variables as value orientations that encompass the norms of the social system and the decisions of the personality system. Thus, the structure of the personality and the social system is considered by Parsons, as a reflection of the dominant pattern of value orientation in culture. Parsons, in his later works, explicitly emphasizes on the impact of cultural patterns on regulating and controlling other systems of action. Integration among systems and action: Parsons now returns to the vital question which has guided all his subsequent theoretical formulation: How do social systems survive? Why do institutionalized patterns of interaction persist? More specifically, how do systems resolve the problem of integration? Parsons emphasizes on the equilibrating tendencies of social systems, which leads to severe criticisms against him by scholars of different sociological perspectives. However, at the most abstract level Parsons conceptualizes two mechanisms that integrate personality into social system: i) mechanisms of socialization, and ii) mechanisms of social control. Mechanisms of socialization, are viewed by Parsons as the means through which cultural patterns- values, beliefs, languages, and other symbols- are internalized into the personality system, thereby circumscribing its need structure (Turner 1974:67). They also provide stable and secure interpersonal ties which help in reducing much of the strain, anxiety, and tensions associated with acquiring proper motives and skills. Mechanisms of social control involve the ways in which status roles are organized in social systems to reduce strain and deviance. The numerous control mechanisms of the social system are: a) institutionalization that makes role expectations clear and unambiguous (e.g. bureaucracies, tradition etc.), b) interpersonal sanctions and gestures, c) ritual activities, d) safety-valve structures (e.g. Policing, administrative system, legal institutions etc.) e) re-integration structures (e.g. correctional institutions) f) institutionalization in some sectors the capability to use power and coercion (e.g. Policing, Judiciary etc.).

50 NSOU CC - SO - 03 Fig. 2.2 Conception of Integration of systems of action (Turner 1974:67) 3.3.4 The Functional System Problem- AGIL W. B. Canon's idea of homeostatic stabilization of physiological processes and his own exposure to Biology at Amherst inspired Parson's interest in equilibrium model of society; and consequently, led him to develop a functionalist model of society as interdependent and self-equilibrating system. Parson argues that, in case of society, certain institutions and structures maintain equilibrium by fulfilling needs and solving recurring problems. In his analysis of system problems, Parsons offers his view on what any action system needs to achieve equilibrium. According to Parsons, all action systems face four major problems or have four major needs: adaptation; goal attainment; integration; and pattern maintenance or latency ('latent pattern maintenance-tension management' as he later renamed it). Parsons pictures the society or social system as a large square which is further divided into four equal square parts representing the four functional survival requirements/problems, represented by AGIL (see Fig. 2.3). 'A' stands for adaptation, which involves the problem to secure from the environment sufficient facilities/ resources and then to disburse the facilities throughout the system. 'G' stands for goal attainment that refers to the problem of establishing priorities among system goals and mobilizing system resources for their attainment.

NSOU CC - SO - 03 51 'I' stands for Integration, which points to the problem of coordinating and maintaining viable interrelationships among system units. 'L' stands for latency, which embraces two related problems: pattern maintenance and tension management. Fig. 2.3 Parsons' Functional Imperativist View of Social Systems (Turner 1974:71) Adaptation Goal attainment Latency Integration Introduction of AGIL, however, made a shift in the focus of analysis from structure to function. Structures are now viewed explicitly in terms of their functional consequences for meeting the four requisites. Now, in

91%

MATCHING BLOCK 146/320

W

Parsons' conceptual scheme, social systems are divided into sectors, each corresponding to a functional requisite- that is, A, G, I, L. Any sub-system can be divided into these four functional sectors; and then each of these sub-systems can be divided into four functional sectors; and so on.

This process of functional sectorization, as Turner (1974:79) named it, is illustrated for the adaptive requisite in Fig. 2.3. 3.4 Criticism of Parsons' Functionalism: Despite his original thinking and significant contribution on the premise of early functionalism, theory of Parsons faces severe criticisms from scholars. Some of the criticisms are briefly listed below: 1. Scholars of conflict perspective like Ralph Dahrendorf criticize his portrayal of society for revealing no developmental history, overemphasizing on integration of components and focusing only on mechanisms that preserve status quo, especially through the conceptualization of four functional requisites. For these critics, such

52 NSOU CC - SO - 03 an image of society is utopian as this never reveals the possibility of conflict, deviance and change, presence of which is ubiquitous in social reality. 2. Much like the early functionalists like Spencer and Durkheim, Parsons also stresses on equilibrating tendency of social systems; hence the conceptualization of social change in his theory only speaks of evolutionary change, as opposed to revolution and other forms of violent disruptions to social systems. 3. Like the early functionalists, Parsons also carries in his theory the legacy of a logical error called teleology, which means circular kind of reasoning. For Parsons, social actions, whether individual or collective, are always goal oriented. This conceptualization of goal attainment as a basic system requisite leads inevitably to teleological propositions: social action can only be understood in terms of the ends in terms of the end it is desired to serve. 4. The conceptualization of four functional requisites in the work of Parsons is based on the assumption that if these requisites are not met, the system's survival is threatened. But Parsons never mentions any way to determine what constitutes the survival and non-survival of a system, and the level to which the needs must be met for the

80%

MATCHING BLOCK 147/320

W

survival of the system. Hence, the propositions documenting the contribution of items for meeting survival

requisites reveal tautology (another logical error and also the legacy of early functionalism):

100%

MATCHING BLOCK 148/320

W

the items meet survival needs of the system because it exists and, therefore, must be surviving. (

Turner 1974:84) 3.5 Contribution of Talcott Parsons: an overview: Talcott Parsons was one of the most dominant theorists of his time. His functionalist theory not only surged waves of criticism in the arena of social science, it profoundly influenced future theory building in sociology also. Parsons in his theory of social action reveals enormous amount of continuity in developing and expanding concepts- starting with unit act and expanding it into hierarchy of control among the system of action; which fulfils the major requirement of consistency in construction of theory in Sociology. Despite enormous criticisms against his functionalist view of society and logical problems in theory building, its influence in sociology has been so widespread that many other theoretical perspectives in sociology start with criticizing against and then proceeding with desirable alternatives to Parsonian functionalism. According to Turner (1974:86), no theory in sociology is considered adequate unless it has performed at least some portions of ritual rejection of analytical functionalism offered by Parsons.

NSOU CC - SO - 03 53 3.6 Functionalism of Robert King Merton: A General Introduction Robert King Merton (1910-2003), born in a Jewish immigrant family in a slum of South Philadelphia, with his passion for learning and profound interest in social science, managed to join Harvard University as a student and became one of the earliest and most important graduate students of Talcott Parsons. Merton's interest in sociology grew with "

100%

MATCHING BLOCK 149/320

W

the joy of discovering that it was possible to examine human behaviour objectively and without using loaded moral

preconceptions" (Hunt 1961).

100%

MATCHING BLOCK 150/320

W

He was educated with prominent socialists like Sorokin, Harold Garfinkel and others in the Harvard University under the tutelage of Talcott Parsons.

Beside Parsons, the works of early sociologists like Emile Durkheim and George Simmel, and researches and thoughts of his contemporary scholars like P. Sorokin and Paul K. Lazarsfeld also cast influence on Robert K. Merton's theory. Though he is renowned in sociology for introducing the "middle range theory" in the discipline, his theory of deviance, clarification and refocusing of functional analysis, development of

100%

MATCHING BLOCK 151/320

W

concepts like self fulfilling prophesy, role model, deviant behavior and focus groups

etc. are also important with enormous influence in future sociological research. Some of R.K. Merton's important works include: i. Social Theory and Social Structure (1949) ii. Mass Persuasion (1946) iii. On the Shoulders of Giants (1965) iv.

84%

MATCHING BLOCK 152/320

W

On Theoretical Sociology (1967) v. Social Theory and Functional Analysis (1969) vi. The Sociology of Science (1973) vii. Social Ambivalence and Other Essays (1976) 3.7

Contribution of Merton in Functionalism Robert K. Merton's contribution in functionalism can be analysed briefly under following broad headings: Advocating the theories of middle range as an alternative to grand theoretical schemes As a functionalist, Merton started with a critique of Talcott Parsons' functional strategy for building a grand sociological theory by developing an all-encompassing system of concepts. For Merton, a grand theoretical scheme is hardly scientifically defensible without the necessary theoretical and empirical groundwork, which the discipline is

54 NSOU CC - SO - 03 still waiting for. He was equally sceptic about the promise of building inventories of low level empirical propositions. Hence, as an alternative, he suggested the need for the 'theories of middle range' in sociology. Such theories are couched at a lower level of abstraction than the analytical functionalism offered by Parsons; and they are connected to the empirical world by constructing clearly defined and operationalized concepts that can be incorporated into statements of relationship for a limited range of phenomena. According to Merton, such theorizing strategy will encourage the interplay between theory and empirical research; thus, making the latter more systematic and meaningful for expanding a body of sociological knowledge. Merton's Paradigm for Functional Analysis Merton's contribution to the codification and systematization of functional analysis begins with the review and critique of what he thinks the three essential postulates of functionalism: i) the functional unity of social systems, ii) the functional universality of social items, and iii) the indispensability of functional items for social systems. i) The functional unity of social systems: Based on biological analogy this postulate views society as a well integrated, consistent system containing mutually interdependent elements which contribute to the maintenance of the whole. According to

89%

MATCHING BLOCK 153/320

W

Merton, to begin analysis with the postulate of functional unity or integration of social whole diverts attention away from

the vital empirical questions about the levels of integration existing for different systems, the processes leading to the different levels, forms and kinds of integration in different spheres of social system etc. Further, this postulate ignores the variety of

92%

MATCHING BLOCK 154/320

W

consequences of a given social or cultural item for diverse social groups and various individual members of these groups.

For Merton, functional unity of a social system

90%

MATCHING BLOCK 155/320

W

cannot be assumed; at most it is an empirical question to be determined by social research. Further, it is possible for some social or cultural items to have functions for some groups within a social system and not for others. Instead, Merton offers a "provisional assumption" that widespread and persisting socio-cultural forms have a "net balance" of positive over negative consequences (Elwell 2013). Merton

begins to suggest that functional analysis should divert its focus from total system as a whole, and emphasize

90%

MATCHING BLOCK 156/320

W

on how different patterns of social organization with more inclusive social systems are created, maintained, and changed not only by the requisites/

needs of the total system but also by interactions among the socio-cultural items within the systematic wholes. ii) The functional universality of social items: This postulate assumes that if a social item exists in an ongoing system, it must, therefore, contribute positively or have NSOU CC - SO - 03 55 some positive consequences for the maintenance of the integration of the total social system; and such assumption leads to tautological (the repetitive use of phrases or words that have similar meanings) statements: a system exists; an element is a part of that system; therefore, the item is positively functional for maintenance of the system. Merton suggests that socio-cultural

91%

MATCHING BLOCK 157/320

W

systems may well have functional needs or prerequisites, but these needs may be met by a diversity of forms. Calling it a "major theorem of functional analysis," Merton asserts, "just as the same item may have multiple functions, so may the same function be diversely fulfilled by alternative items" (Merton 1948/1968: 87–88). 3.7.1 Concept of

Dysfunction and Manifest vs. Latent Function: According to Merton, if an investigation of empirical systems is undertaken, a wider range of empirical possibilities will be revealed. Firstly, items may be not only positively functioning for a system or any part of a system, but also dysfunctional for either other particular item/s of the system or the system as a whole. In order to compensate for the excessive

100%

MATCHING BLOCK 158/320

W

focus on stability of traditional functionalism, Merton introduces the concept of "dysfunction". Whereas functions contribute to the adjustment of the system, dysfunctions are those consequences that lead to instability and ultimately change.

Merton asserts that the task of an analyst is to recognize

100%

MATCHING BLOCK 159/320

W

that institutional structures and cultural elements are interrelated and mutually supporting, and that the dominant orientation of

socio- cultural

87%

MATCHING BLOCK 160/320

W

systems is towards stability. "As we survey the course of history, it seems reasonably clear that all major social structures have in due course been cumulatively modified or abruptly terminated. In either event, they have not been eternally fixed and unyielding to change" (Merton, 1948/1968: 95). Merton insists that social structures can only be analyzed in terms of both statics (stability) and dynamics (change). The concept of dysfunction, which allows functional theory to focus on change, is based on tension, strain, or contradictions within component elements of socio-cultural systems. Dysfunctional elements create pressures for change within the system (Merton, 1948/1968: 176). Social mechanisms within the system, including the interrelation of predominantly mutually supporting elements of the system, operate to keep these strains in check, in an attempt to limit or minimize change of the social structure. However, such mechanisms are not always effective, and the amassing of stress and resulting conflict often

bring change in a system.

100%

MATCHING BLOCK 161/320

W

One of the primary goals of functional analysis is to identify these dysfunctions and examine how they are contained or reduced in the

socio-cultural

100%

MATCHING BLOCK 162/320

W

system as well as how they sometimes cause systemic or fundamental change. (Merton, 1948/1968: 107)

According to

98%

MATCHING BLOCK 163/320

W

Merton, "Functions are those observed consequences which make for the adaptation or adjustment of a given system; and dysfunctions, those observed consequences which lessen adaptation or adjustment of the system." Motive, on the other hand, is the 56

NSOU CC - SO - 03

95%

MATCHING BLOCK 164/320

W

subjective orientation of the actor engaged in the behavior (Merton 1948/1968: 105). The failure to distinguish between functions and motives is one of the principal sources of confusion for students of functionalism.

Secondly, Merton offers two new concepts: manifest function and latent function; the distinction between which is regarded as one of his major contributions in functionalism. Some consequences of the items in a system, whether functional or dysfunctional, are expected or intended or recognized by the members of the society; and hence are manifest. The other consequences may not be recognized or expected or intended by the members of the system; and therefore they are latent. The latent functions can take place only as a consequence of the manifest functions for which the members are

97%

MATCHING BLOCK 165/320

W

not prepared. Merton argued that it is the job of the sociologist to uncover the latent functions of social activities and institution.

Merton argues that the analysis of diverse

100%

MATCHING BLOCK 166/320

W

consequences or functions of socio-cultural items-whether positive or negative, manifest or latent- "for individuals, for subgroups, and for the more inclusive social structure and culture" (

Merton, 1968:84) is necessary for building a meaningful theory of society. He

77%

MATCHING BLOCK 167/320

W

visualizes contemporary functional thought as compensating for the ambitious over-emphasis of earlier theorists on the crucial types of consequences of socio-cultural items for each other and if the facts dictate, for the social whole. iii. The indispensability of functional items for social systems:

This postulate is based on

88%

MATCHING BLOCK 168/320

W

the assumption that if a social pattern is well established, it must be meeting some essential needs

for the system; and hence, the pattern is indispensable for the survival of the system. The basic assumption is itself double-barrelled as it considers some functions to be

85%

MATCHING BLOCK 169/320

W

indispensable for the survival of the system; and again, certain social or cultural forms

to be indispensable for fulfilling those functions. Merton proposes that

94%

MATCHING BLOCK 170/320

W

functional analysis should concern with various types of "functional alternatives," or functional equivalents," and "functional substitutes" within social systems. In this way, functional analysis

can avoid the trap of assuming an item in the social system as indispensable for

91%

MATCHING BLOCK 171/320

W

the continued existence of a system. Rather, functional analysis must specify (1) Social patterns, whether a systematic whole or some subparts, under consideration; (2) the various types of consequences of these patterns for empirically established survival requisites; and (3) the processes whereby some patterns rather than others come to exist and have the various consequences for each other and for systemic wholes.

NSOU CC - SO - 03 57 3.7.2 Functional Alternatives Merton devises alternative concepts known as the 'functional substitutes', 'functional alternatives', or 'functional equivalents' which can analyze

89%

MATCHING BLOCK 172/320

W

the sort of functions advocated by Talcott Parsons in the form of functional prerequisites. Merton argued that use of religion as a therapeutic device could be substituted effectively by the alternative

healing and restorative devices

71%

MATCHING BLOCK 173/320

W

like counselling and reasoning which can help members understand the values of normal life in society.

Further, Secular education, vocational training can liberate their minds from religious superstitions, and guide

100%

MATCHING BLOCK 174/320

W

them to become work-oriented, independent and self-reliant; which

in turn, may help them recover from stress and depression, despair and obsession, aggravation and frustration; thus assuring their conformity to the values of the social system. Merton argued that functionalist approach should be aware

95%

MATCHING BLOCK 175/320

W

of the fact that any part of society may be functional or

dysfunctional for other parts or for the whole system; and may remain non functional for the system as well. 3.8

96%

MATCHING BLOCK 176/320

W

A Protocol for Executing Functional Analysis To explain the causes and consequences of particular structures and processes, Merton insists that functional analysis begins with "sheer description" of individual and group activities. In describing the patterns of interaction and activity among units under investigation, it will be possible to distinguish clearly the social items to be subjected to functional analysis. Such descriptions can also provide a major clue to the functions performed by such patterned activity. The first of these steps is for investigators to indicate the principal alternatives that are excluded by the dominance of a particular pattern. The second analytical step beyond sheer description involves an assessment of the meaning, or mental and emotional significance, of the activity for group members.

This can shed some tentative light on the manifest functions of an activity. The third step involves discerning some array of motives (other than the objective description or subsequent assessment of function served by the pattern) for conformity or for deviation among participants. The configuration of motives for conformity and deviation, in turn, indicates the psychological needs served or not served by a pattern; and thus offers clue to the various additional functions of the pattern. For understanding the latent consequences of an activity, Merton suggests his final analytical step that involves the description of how the patterns under investigation reveal regularities not recognized by participants but appear to have consequences for both the individuals involved and other central patterns or regularities in the system.

it is possible to establish both the manifest and latent functions of an item, as well as the net balance of functions and dysfunctions of the item for varied segments of a social system. 3.10

Conclusion R. K. Merton's contribution in functionalism is not beyond criticism. Following are some of the criticisms put forward against Merton's theory: 1. Like the early functionalist theories, Merton's theory also falls into the trap of tautology. Merton's assumption that "ordinarily" persistent structures serve positive functions for meeting the needs of some population segment, leads to the indication that if in an existing system an item persists, then it is functional, perhaps latently for some groups. This assumption that an item exists means that it must serve a function, either latent or manifest, for either the whole or for some part of the whole; is obviously an example of tautological error. 2. Merton's functional theory is not free from the trap of teleology too. Like his predecessors in functionalist tradition, his analysis often fails to separate causes from consequences. For example, he analyses the emergence and persistence of political mechanism as a response to needs, without the necessary precision in documenting the causal chains through which needs cause the emergence and persistence of an event. However, R.K.Merton's original thought and concern for constructing a meaningful body of theory in sociology; his introduction of the theories of middle range, which boosts up the interplay between theory and empirical research, and helps defending sociological theory with appropriate empirical groundwork; his conceptualization and clear operationalization techniques along with introduction of new concepts like dysfunction, latent and manifest function, functional alternative etc., which later transforms into the colloquial terms in the writings of future sociologists, especially of the functionalist

NSOU CC - SO - 03 59 school; all together leads to a revival of functionalist analysis in Sociology, attributing Merton an immortal place in the history of sociology. 3.11 Summary We introduced our learners to the major functionalists such as Talcott Parsons and R. K. Merton. We have discussed their contributions to the making of the functionalist theory. We concluded with a brief overview on each of the thinkers. 3.12 Questions i. Write a short note on pattern variables. ii. What are functional alternatives? Discuss with suitable examples. iii. Write the differences between: (a) latent function and manifest function (b) function and dysfunction. iv. What do you understand by middle range theory? v. How did Merton criticize the postulate of functional unity? B. Answer in detail. (12 marks) i. Discuss the social action theory by Parsons. ii. Following Parsons, analyse the problem of functional systems. iii. Discuss in detail the social action theory by Talcott Parsons. iv. Analyse Merton's paradigms for functional analysis. v. How did Merton criticize Parsons for his theoretical approach? What was Merton's protocol for theory building in sociology? vi. How did Parsons conceptualize the integration among systems and action? C. Essay Type Question. (20marks) i. Critically evaluate the contribution of Talcott Parsons in Functionalism. ii. Critically evaluate the importance of empirical functionalism proposed by R.K. Merton in Sociology. 3.13 References

society as a system of interconnected parts that work together in harmony to maintain a state of balance and social equilibrium for the whole.

According to this approach, each of the social institutions contributes important functions for society. A change in any part is seen as leading to a certain degree of imbalance, which NSOU CC - SO - 03 61 in turn results in changes in other parts of the system and to some extent to a reorganization of the system as a whole.

Organismic analogy The Organismic analogy which is a staple of ancient and medieval thought was reformulated by Spencer, who recognized the similarities (and dissimilarities) between society and organism as the first step towards a general theory of evolution. The same definition of life applies to both biological and social organism.

Organic solidarity As part of his theory of the development of societies in, *The Division of Labour in Society* (1893), sociologist Emile Durkheim characterized two categories of societal solidarity: organic and mechanical. Mechanical solidarity is the type of social cohesion and integration that comes from the homogeneity of individuals: people in societies of small-scale technology feel connected to each other through similar life-ways, i.e., similar work, educational and religious training, and lifestyle, which is often based on the kinship ties of familial networks. Organic solidarity is social cohesion based upon the dependence individuals have on each other in more advanced societies. It comes from the interdependence that arises from specialization of work and the complementarities between people.

Structure The complex and stable framework of society that influences all individuals or groups through the relationship between institutions (e.g., economy, politics, religion) and social practices (e.g., behaviours, norms, and values). The terms "structure" and "social structure" are used interchangeably in a sociological context. According to [functionalism], a society is composed of interrelated parts, each of which serves a function and (ideally) contributes to the overall stability of the society. Societies develop social structures, or institutions that persist because they play a part in helping society survive.

Equilibrium Social equilibrium, a theoretical state of balance in a social system referring both to an internal balance between interrelated social phenomena and to the external relationship the system maintains with its environment. In sociology, a system is said to be in social equilibrium when there is a dynamic working balance among its interdependent NSOU CC - SO - 03 62 parts. Each subsystem will adjust to any change in the other subsystems and will continue to do so until equilibrium is retained. The process of achieving equilibrium will only work if the changes happen slowly, but for rapid changes it would throw the social system into chaos, unless and until a new equilibrium can be reached.

Functional pre requisites The provisions that all societies are required to make in order to come into existence, survive and maintain order. Talcott Parsons identified four fold set of functional pre-requisites in his social system model.

Social action In sociology, social action, also known as Weberian social action, is an act which takes into account the actions and reactions of individuals. According to Max Weber, "an Action is 'social' if the acting individual takes account of the behavior of others and is thereby oriented in its course"

Social system In sociology, social system is the patterned network of relationships constituting a coherent whole that exist between individuals, groups, and institutions. Parsons organized social systems in terms of action units, where one action executed by an individual is one unit. He defines a social system as a network of interactions between actors. According to Parsons, social systems rely on a system of language, and culture must exist in a society in order for it to qualify as a social system.

Personality system The term personality is derived from the Latin word *persona* meaning a mask. Personality is a patterned body of habits, traits, attitudes and ideas of an individual as these are organized externally into roles and statuses and as they relate internally to motivation, goals and various aspects of selfhood.

Cultural system According to the Action Theory of Talcott Parsons, culture is understood as an ordered symbolic system, that is, a symbolically mediated pattern of values or standards of appropriateness that permits the construction of a set of action-guiding, normative, conventional rules through which significant cultural objects are generated and used. If a symbolic system has validity for all of the participating actors, it is able to give order to action.

NSOU CC - SO - 03 63

Value Values are a culture's standard for discerning what is good and just in society; and this standard is shared by the people of that society. Values are deeply embedded and critical for transmitting and teaching a culture's beliefs. Functionalists believe that all members of society are socialized into these norms and values, first through the family and later through institutions such as education, the media and religion. It is in this secondary socialization that people learn universalistic values rather than just those particular values to their own family or community.

Adaptation In AGIL model illustrated by Parsons, which represents the four basic functions that all social systems must perform if they are to persist, the first function is adaptation. In any system or sub-system, adaptation stands for the problem of acquiring sufficient resources.

Deviance An action or behavior that violates social norms, including a formally enacted rule (e.g., crime), as well as informal violations of social norms (e.g., rejecting folkways and mores).

Latency In AGIL model illustrated by Parsons, which represents the four basic functions that all social systems must perform if they are to persist, the fourth function is latency. In any system or sub-system, it is the organization for pattern-maintenance. E.g. values which serve to legitimate and authorize decision-making rights in system.

Functional alternatives Functionalists believe societies must have certain characteristics in order to survive. Merton shares this view but stresses that at the same time particular institutions are not the only ones able to fulfill these functions; a wide range of functional alternatives may be able to perform the same task. This notion of functional alternative is important because it alerts sociologists to the similar functions different institutions may perform and it further reduces the tendency of functionalism to imply approval of the status quo.

Grand theory Grand theory is a term coined by C. Wright Mills (1960) to describe the abstract generalized system building of structural functionalists, notably in the work of Talcott Parsons. In the social sciences, grand NSOU CC - SO - 03 64 theory refers to those efforts devoted to abstract, analytical theory building.

Middle range theory Middle-range theory, developed by Robert K. Merton, is an approach to sociological theorizing aimed at integrating theory and empirical research.

Tautology A kind of logical error: a compound propositional form all of whose instances are true, as "A or not A."

Teleology A kind of logical error: circular kind of reasoning.

Manifest function The anticipated and intended goals of an action or social structure.

Latent function Unanticipated and unintended consequences of an action or social structure.

The philosophical error/ bias for which functional theory is vehemently criticized iv. Functionalism's struggle to combat all the above mentioned criticisms

4.2 Introduction In social studies, the first hint of functionalist approach is found in the rational-choice approach. It says that if the choice is successful, the action is deemed to have been objectively rational; if not, the action is said to have been only subjectively rational. In either case, the formalism is saved at the outlay of substance or, rather, mechanism, namely interaction. For this reason, we regard the rational-choice approach as an illustration of formalist functionalism in social science. Not referring to social mechanisms, the rational-choice approach fails despondently to explain the very existence of social systems, from the family to the worldwide corporation. This failure is a necessary outcome of its explicit implementation of ontological and methodological individualism. (Bunge, 1996:

66 NSOU CC - SO - 03 Ch. 14) Still, when used in restraint, this approach may have some heuristic value. Indeed, it suggests looking for the reasons, good or bad, which motivate decisions. (Boudon, 1999) It also suggests explaining some failed actions as results of miscalculations. (By contrast, success may be explained either by correct calculation or by favorable circumstances.) What is known as social functionalism is a version of adaptationist functionalism. It focuses on social systems and their specific functions or activities. It also studies both the cohesive or system-preserving ("functional") and the divisive or system-interfering ("dysfunctional") consequences of a system's activities. Social functionalism is an alternative to both Marxist economic determinism and the traditional or culture-historical approach centered on statesmen and battles (Trigger, 1989). Though fathered by the classical Sociologists like A. Comte, H. Spencer and most prominently E. Durkheim at the turn of the century, functionalism flourished particularly in the UK and the US between 1920 and 1960, in the works of B. Malinowski and E. R. Radcliffe- Brown in Anthropology, G. Childe in Archaeology, and T. Parsons and R. K. Merton in Sociology. The functionalists in the realm of Sociology postulated that all the social items (mechanisms, roles, norms, patterns, institutions, etc.) come into being and persist because they are useful to the social system concerned, or even to society at large. Put negatively: the social items that have ceased to discharge any useful function eventually disappear. (Mahner et.al., 2001) Functionalism in sociology includes the assumption that the social system is homogeneous, so that what is useful for its cohesion or preservation is good for every member of it. This presupposition is not even true for primitive societies, all of which retain negative items such as crippling kinship conventions and counter-productive superstitions. Thus, it is an instance of the fallacy of division. However, some functionalist questions may be rewarding. The reason is that many social functions are indeed aptations, or even adaptations. And the existence of such functions, poses the problem of their origin and persistence. Now, every such problem can be analyzed non-teleologically as the sequence of questions: What is the internal activity in question? What is its role? Are the activities and roles valuable to the group (or the society) as a whole? If in fact they are aptations (any character currently subject to selection whether its origin can be ascribed to selective processes (adaptation) or to processes other than selection or selection for a different function (exaptation)), are they also adaptation? (Mahner et.al. 2001)

4.3 Critique Functionalism and latter, structural functionalism has recurrently been accused of being teleological in explanation.

Teleology (from Greek telos meaning 'end' and logos meaning scientific knowledge or 'reason') is a philosophical error of explaining something by referring to its purpose, goal, end or function. Functionalism falls in this trap for its over emphasis on the concept that social structures have specific goals. It tries to justify why structures exist without sufficient empirical substantiation (Ritzer & Goodman, Chapter 7 summary, 2004). It attempts to describe social structures through the purposes they fulfil, but doesn't explain the cause of their existence. Thus it offers the final cause of existence of a social structure, but fails in providing explanation of the efficient, material causes, i.e. the stuff out of which a thing is made (Encyclopaedia Britannica). In this regard, Durkheim said that "the determination of function is necessary for the complete explanation of the phenomena" (Coser, 1977) and "when the explanation of a social phenomenon is undertaken, we must seek separately the efficient cause which produces it and the function it fulfils" (Coser, 1977). The excerpts denote that the classical functionalist was aware of the theoretical task of explaining separate cause and effect for existence of any fact. Since Parsons was highly influenced by the writings of Durkheim it is likely that he used this notion when creating his theory. Still the theoretical model often remained trapped into the teleological reasoning of explaining cause of effect. Merton disregards this as he says that functional analysis doesn't try to explain cause of effects so is not teleological. (Encyclopedia, n.d) Another question raised against the functional approach is that it never determines what is functional and what is not, and for whom each of these activities and institutions are functional. If there is no method to sort functional from non-functional aspects of society, the functional model can become tautological – without any analytical control in which any activity is regarded as functional. Many critiques argue that society cannot have needs in the same way a human does, and if it has some needs also, there is hardly any necessity to meet those needs. Anthony Giddens suggests that functionalist explanations could be rewritten as historical accounts and not as a theory. Giddens offered a perspective of structuration that aims at explaining society as a dynamic process of continuous interaction between structure and agency (Human agency). According to Giddens, although all human action is performed within and influenced by a pre existing social structure, and is often determined by the rules of that structure; the rules are not permanent, but can change according to human action. (Giddens, 1986) Structural functionalism dominated the realm of sociology as the major theoretical credence throughout most of the 20th century. It has been criticised, however, for accepting existing

68 NSOU CC - SO - 03 social order without considering how they might take advantage of some groups or individuals within society. (Newman, 2010) A critique of structural functionalism is that it assumes regular interaction between a political system and its environment. This ultimately led the approach to recognize the likelihood of change and so ignores the potential for political conflict. It indirectly supports the existence of the status quo. (Kamrava, 1996) Another criticism against the functional model in the area of politics is that of ethnocentrism. Structural functionalism does not account for authoritarian or dictatorial political systems. The system- environment interaction makes it only applicable to western democratic political systems. There are many places in the earth, where some group of people in society have no input in the world of politics (mainstream politics/governance of the state). These people, their interaction with the state etc. are often left out by the description provided by the structural functional model of analysis. (Kamrava, 1996)

4.4 Limitation for Social Change

Functionalism has been mostly criticized by scholars as being a static perspective because of its limitation to explain social change. Though Talcott Parsons opposed this view by explaining his idea of moving equilibrium that does account for change in social order (Parsons, *Theories of Society: foundations of modern sociological theory*, 1961), the fact that the functional model does stress on equilibrium and quick return to social order, rather than investigating the wide spectrum of social change is a proven fact. Further, if we keep in mind the time period when 20th century functionalism, especially, structural functionalism was developing in the U.S. intellectual arena- just aftermath of the 2nd world war- we can easily grasp the urge of the then intellectuals of social science for explaining social order rather than social change. A further criticism is that functionalism doesn't explain why people choose to conform to norms or seeks to deviate from them. Functionalism faces severe criticism from the theorists of conflict perspective, Marxist intellectuals and feminist scholars. Feminists argue that functionalism fails to address the problem of gender discrimination in society. Parsons in his theory focuses on positive functions of the family for the society as a whole and never mentions it as a structure of oppression for women. Conflict theorists oppose it for excessive reliance on consensus and harmony within society while ignoring conflict and contradiction, which have obvious presence in society. Further Functionalism is criticised for disregarding individual freedom and will (Holmwood, 2005). According to Lockwood, Parsons does not account for organisations that do not work together and NSOU CC - SO - 03 69 thus cause conflict. Parsons thwarted this opposition by stating that issues of conflict and cooperation were included and analysed in his model (Holmwood, 2005). Parsons created an ideal for society and by doing this he restricted his analysis. R.K. Merton's contribution to functional theory addresses the issue of conflict and tension in society and introducing the idea of tension and conflict into structural functionalism, he offers a way to the model to counteract these stark criticisms. (Merton, 1957) Some critics, like Italian theorist Antonio Gramsci, claim that the perspective justifies the status quo and the process of cultural hegemony that maintains it. Functionalism does not encourage people to take an active role in changing their social environment, even when doing so may benefit them. Instead, functionalism sees agitating for social change as undesirable because the various parts of society will compensate in a seemingly organic way for any problems that may arise. Overall, the main assumptions of structural- functional theory are that external social constraints create confines in individual behaviour; and that social order is based on shared values. The system of social structure and social order has needs that have to be met for its survival and stability. This theory allows for social change but assumes the change to be slow and evolutionary, so as the social structures may adapt to fit the requirements of system. For functionalists like Parsons, inequality may be seen as functional for society. The theory is promising in the sense that it explains predictable patterns of behaviour within social groups, and the influence of culture and society on individuals. This approach is associated with the positivist thesis and quantitative methods.

4.5 The Negative Consequences for Social Order

We have already mentioned that functionalism has been highly criticized because of its neglect of the often negative consequences of social order. As for example, the functionalist perspective of gender inequality was most robustly articulated in the 1940s and 1950s, and was propagated by Talcott Parsons in his model of the nuclear family. This theory states that gender inequalities exist as an efficient way to create a division of labour that serves as a mechanism for maximizing resources and efficiency in the family. A structural- functionalist view of gender inequality shows predefined gender roles as harmonizing: women take care of the home while men provide for the family. Thus gender, like other social institutions, contributes to the stability of family system, and thus solidifies the order of society as a whole. In sociological studies, functional prerequisites stand for the basic needs (food, shelter, clothing etc.) that an individual requires to survive and sustain in the social world. Functional prerequisites may also refer to the factors that allow a society to maintain

70 NSOU CC - SO - 03 social order. According to structural functionalists, gender roles serve to maintain social order by providing and ensuring the stability of such functional prerequisites. Hence, this view has been accused for reification, rather than reflection of gender roles. While gender roles, according to the functionalist perspective, have positive contribution for maintaining stable social relations, Feminist scholars argue that gender roles are discriminatory and should not be upheld. The feminist movement, which was on the rise at the same time that functionalism began losing popularity, takes the position that functionalism neglects the suppression of women within the family structure.

4.6 Conclusion Overall, the main assumptions of structural- functional theory are that external social constraints create confines in individual behaviour; and that social order is based on shared values. The system of social structure and social order has needs that have to be met for its survival and stability. This theory allows for social change but assumes the change to be slow and evolutionary, so as the social structures may adapt to fit the requirements of system. For functionalists like Parsons, inequality may be seen as functional for society. The theory is promising in the sense that it explains predictable patterns of behaviour within social groups, and the influence of culture and society on individuals. This approach is associated with the positivist thesis and quantitative methods. However vehemently criticized and fiercely debated the propositions of functionalism might have been, it remains productive throughout the century. The functional perspective can be applied to nearly all the key topics in sociology, for example Durkheim used functionalism to explain suicide rates in particular groups and societies. (Gingrich, 1999). Other themes including family, education, religion and deviance –everything that means the existence of social relationship can be understood, analysed and explained from the perspective of functionalism. Many scholars like to view and analyze social reality, and functionalism remained one of the favourite tools for many scholars to explain the way we live. Partially in response to the criticisms discussed above, scholars aligned with the functionalist approach initiated systematic theorizing and empirical research on the issue of change. Differentiation theory was one of the products of this collective intellectual effort.

4.7 Summary We presented a critique of the functional theory. We concluded with the limitation for social change. We also discussed the virtues of the theory as well.

NSOU CC - SO - 03 71 4.8 Questions A. Answer briefly (6 marks) i. What is teleology? How does functionalism fall under its trap? ii. How does Giddens criticize the functional perspective of viewing society? iii. How does functionalism explain gender roles in society? iv. "What is known as social functionalism is a version of adaptationist functionalism."- Justify. v. Why do functionalism and later structural functionalism seem so obsessed with explaining social order? B. Answer in detail (12 marks) i. How does functionalism explain social change? ii. How does functionalism attempt to analyse inequality in society? iii. Why do feminist scholars criticize functionalism? iv. Why has Functionalism been target of criticism by Marxist scholars? C. Essay Type Question (20marks) i. Evaluate the importance of functionalist school of thought in the development of sociology as an academic discipline.

Talcott Parsons identified four fold set of functional pre-requisites in his social system model. Social action In sociology, social action, also known as Weberian social action, is an act which takes into account the actions and reactions of individuals. According to Max Weber, "an Action is 'social' if the acting individual takes account of the behavior of others and is thereby oriented in its course" Social system In sociology, social system is the patterned network of relationships constituting a coherent whole that exist between individuals, groups, and institutions. Parsons organized social systems in terms of action units, where one action executed by an individual is one unit. He defines a social system as a network of interactions between actors. According to Parsons, social systems rely on a system of language, and culture must exist in a society in order for it to qualify as a social system.

NSOU CC - SO - 03 75 Personality system The term personality is derived from the Latin word persona meaning a mask. Personality is a patterned body of habits, traits, attitudes and ideas of an individual as these are organized externally into roles and statuses and as they relate internally to motivation, goals and various aspects of selfhood. Cultural system According to the Action Theory of Talcott Parsons, culture is understood as an ordered symbolic system, that is, a symbolically mediated pattern of values or standards of appropriateness that permits the construction of a set of action-guiding, normative, conventional rules through which significant cultural objects are generated and used. If a symbolic system has validity for all of the participating actors, it is able to give order to action. Value Values are a culture's standard for discerning what is good and just in society; and this standard is shared by the people of that society. Values are deeply embedded and critical for transmitting and teaching a culture's beliefs. Functionalists believe that all members of society are socialized into these norms and values, first through the family and later through institutions such as education, the media and religion. It is in this secondary socialization that people learn universalistic values rather than just those particular values to their own family or community. Adaptation In AGIL model illustrated by Parsons, which represents the four basic functions that all social systems must perform if they are to persist, the first function is adaptation. In any system or sub-system, adaptation stands for the problem of acquiring sufficient resources. Deviance An action or behavior that violates social norms, including a formally enacted rule (e.g., crime), as well as informal violations of social norms (e.g., rejecting folkways and mores). Latency In AGIL model illustrated by Parsons, which represents the four basic functions that all social systems must perform if they are to persist, the fourth function is latency. In any system or sub-system, it is the organization for pattern-maintenance. E.g. values which serve to legitimate and authorize decision-making rights in system. Functional alternatives Functionalists believe societies must have certain characteristics in order to survive. Merton shares this view but stresses that at the same time particular institutions are not the only ones able to fulfill these

76 NSOU CC - SO - 03 functions; a wide range of functional alternatives may be able to perform the same task. This notion of functional alternative is important because it alerts sociologists to the similar functions different institutions may perform and it further reduces the tendency of functionalism to imply approval of the status quo. Grand theory Grand theory is a term coined by C. Wright Mills (1960) to describe the abstract generalized system building of structural functionalists, notably in the work of Talcott Parsons. In the social sciences, grand theory refers to those efforts devoted to abstract, analytical theory building. Middle range theory Middle-range theory, developed by Robert K. Merton, is an approach to sociological theorizing aimed at integrating theory and empirical research. Tautology A kind of logical error: a compound propositional form all of whose instances are true, as "A or not A." Teleology A kind of logical error: circular kind of reasoning. Manifest function The anticipated and intended goals of an action or social structure. Latent function Unanticipated and unintended consequences of an action or social structure.

NSOU CC - SO - 03 77 Module - II : Interpretative Sociology Unit - 5 General Arguments Structures 5.1 Learning Objectives 5.2 Introduction 5.3 Definition: Interpretive Sociology 5.4 Historical and Philosophical Background/Context of Interpretive Sociology 5.5 Interpretive Sociology: General Arguments 5.6 Conclusion 5.7 Summary 5.8 Questions 5.9 References 5.10 Glossary 5.1 Objectives • To introduce a specific perspective within sociological knowledge formation, namely, interpretive sociology to the students. • To present interpretive sociology as an alternative to sociological positivism where- by the students will be made familiar with the critical discourse regarding methodological issues in social sciences. • To understand the complexity and criticality involved in studying social sciences whose primary subject matter involves conscious thinking, acting and interpreting individuals. • To be able to distinguish sociology from psychology irrespective of the focus on the subjective intent and motive of actors.

78 NSOU CC - SO - 03 5.2 Introduction Interpretive sociology is a specific domain of sociology that lays emphasis on the meaning and motive of social actions by individual social actors. The focus is on intentions behind human behaviour. It also considers that social life is a subjective reality and so it needs to be interpreted. Unit 1 explores how interpretive sociology emerged as an alternative perspective to positivism and countered the idea of sociology as a science studying objective social facts. The movement against blind acceptance of methods of natural sciences in social sciences started as back as 1880 through Neo-Kantianism. Proponents of Neo-Kantianism made it clear that social sciences study different form of reality and therefore the knowledge produced is not nomothetic (law giving) , rather social science involves human judgments, intents, values. Therefore social sciences cannot follow the same method as natural sciences. The failure of positivism to grasp the nature of social reality also paved the way for development of hermeneutic school by the end of 19 th century. German Philosopher Droysen first used the term Verstehen to denote that the goal of human sciences is 'understanding' (Verstehen) in contrast to explanation which is the goal of natural sciences. Dilthey, a prominent figure of the hermeneutic school along with Weber emphasized on the historical character of social knowledge and discussed on the methods on how to study such a reality. The following section discusses the basic premises of interpretive sociology in general in depth. The most fundamental idea behind interpretive sociology is that human action and behaviour involves meaning; behaviour and meaning are intrinsically connected and action logically entails intend. However the meaning involved cannot be explained in terms of universal causal laws. The meaning needs to be interpreted. Interpretation involves understanding based on empathy. Interpretive sociology is distinct from psychology. Individual actors is an important unit in interpretive analysis because unlike animals and lifeless objects, men can introspect, have intentions and motives and are capable of interpreting intent and motive of other men and thereby orient their action accordingly. Verstehen is also a central concept to interpretive sociology where in it can be regarded as a method, as an experiences ad as an explanation. Its significance lies in the fact that it demands empathy to understand subjective meaning of an action that is the meaning of the action for the actor himself. Interpretive sociology has influenced varieties of perspectives such as symbolic interactionism, phenomenology , ethnomethodology etc.

NSOU CC - SO - 03 79 5.3 Definition: Interpretive Sociology Interpretive sociology involves a variety of forms of sociology (approach of Weber, Symbolic Interactionism, Sociological Phenomenology) united by an emphasis on the necessity for sociologist to understand and interpret actors' meanings. (Jary et al 2000: 313). All social reality is taken as pre-interpreted in that it only has form out of social actors' meanings. As a method interpretive understanding stresses on the importance of intentional human actions. What distinguishes the interpretive paradigm with any other account of interpretation is the recognition that any statement about the social world is necessarily relative to any other. The guiding principle of interpretive sociology is that social life is subjective and therefore it is amenable to interpretation. Sociology, as a science of society was modeled upon natural sciences by positivist thinkers such as Durkheim in the late 19 th and early 20 th century. It is established that sociology is to study the objective 'social facts' external to the individual and a reality 'sui generis'. This view was criticized by Max Weber. He outlined the basic premises of interpretive sociology while developing a theory of social action in *Economy and Society*, between 1911 and 1920. Weber perused the idea that a theory of society had to take a new direction and stated 'sociology is a science concerning itself with the interpretive understanding of human social action" (Weber 1978:248). Social action is social because of the subjective meaning the acting individual associates with it and social because it takes behaviours of others into consideration while orienting its course. So interpretive sociology seeks to understand the society by studying how individuals attach meaning and interpret their social world, actions and identities.

5.4 Historical and Philosophical Background/Context of Interpretive Sociology Interpretive sociology is formed as an alternative and critic to the adherence of methods of natural sciences in social sciences, in understanding human actions. This methodological controversy concerning over the supremacy of methods followed in natural sciences over social sciences dated back to 1880 till 1900, a period marked by dramatic growth of natural sciences in Europe (Morrison, 2008:330). There was open clash between natural sciences and social sciences over question of knowledge and historical and philosophical sciences such as economics, sociology, and political economy were being

80 NSOU CC - SO - 03 criticized as being non-scientific, intuitive and speculative. In 1890, the movement referred to as Neo-Kantianism criticized the work of Kant and questioned the validity of scientific knowledge. Two central thinkers of neo-Kantian movement are Wilhelm Windelband and Heinrich Rickert. Windelband basically was the man who according to contemporaries started the war against positivism and scientific methodology. He stated that Kant in deciphering the steps for natural sciences to gain valid knowledge excluded historical and ethical dimension of human action from domain of legitimate knowledge. He made the following points: (a) natural and social science are distinct in terms of the type of knowledge they aim to investigate, i.e. they simply describe different levels of reality; (b) in case of natural sciences, there is fact and observable world where laws and can be found but in case of social sciences there is knowledge of human values, ethics, which are products of human culture; (c) the methodological approach is different; natural sciences aim at providing laws (nomothetic or law-giving) and explain events through observation and deductive methods whereas the aim of social sciences is to focus on individual events such as development of capitalism, determine the causes and conjure the whole picture based on inductive method (ideographic); (d) human perception of the world involves judgment which involves interpretation, therefore human social action cannot be reduced to mechanistic motives of utility and sense of observation. Heinrich Rickert, a student of Windelband and a contemporary of Weber, concentrated on subject matter and method. According to Rickert the act of judgment precedes act of knowing, and physical reality only has substance through act of judgment, not through mere observation. He stated that observation is nothing but human judgment operating in the visible world. And so knowing itself is a kind of valuing and therefore has a basis in the empirical world. He made the following points: (a) social science explained individual non-recurring events (ibid:336) as distinct from lawfully recurring nature of the reality studied by natural sciences. Natural sciences explain empirical world by generalizing methodology in contrast to individualizing methodology of the social sciences; (b) human actions are guided by practical values and standards which are products of history. So, unlike natural sciences which search for facts, social sciences are concerned about knowledge of values. Broadly speaking, thinkers in social sciences mostly either advocate positivism following natural scientific models or a more interpretive, hermeneutic model. Positivism followed a rejection of ontology in favor of epistemology, an empiricist epistemology, and a deductive-

NSOU CC - SO - 03 81 nomological account of scientific explanation. That is, it focused on arguments about "what is" toward those about "what can be known". (Gimbel, 2016:73). Empiricist epistemology derives knowledge from observation and validity of our knowledge is directly associated with validity of observations. Validity of the observations that require conscious interpretation on the part of the researcher remains a suspect. Another basic belief of positivism is scientific knowledge is objective and value-neutral (ibid: 74). The difficulty with Positivism is that the objects of social scientific study are themselves conscious subjects and unlike the objects of natural scientific studies, they have their own notions of how they should behave. The history of sociological theory is an ongoing struggle between positivism and hermeneutic positions. The hermeneutic school arose as a prominent anti-positivist position towards the end of nineteenth century, being influenced by German idealistic philosophy. German philosopher Droysen was first to use the terms understanding (*verstehen*) as the goal of human sciences in contrast to explanation (goal of natural science). Dilthey, as a proponent of hermeneutic school sought for a foundational science that would serve the human sciences as mathematics and mechanics served the natural sciences- as the shared, universal basis that provided methodological coherence to the disparate sciences of physics, chemistry, and so on. Dilthey took the task of establishing coherence, legitimacy and independence within the domain of human sciences. According to him, the human sciences need to complement the natural sciences but must remain separate from them. Unlike explanation through causal laws, Dilthey's hermeneutics sought understanding. This distinction between explanation and understanding, borrowed in part from Droysen, is Dilthey's most important and controversial contributions to the philosophy of science. The historical debate within the philosophy of science between positivism and Dilthey's hermeneutics serves as the frame of reference based on which contemporary discourse within social sciences seek to understand whether interpretation as a method is valid and whether it can yield objective science. Both Dilthey and Weber were leading thinkers for whom the historicity of human existence and the historical character of knowledge was a central problematic. To put Weber in this context, he attended the disputes in social sciences that threatened the validity of its methods. The discourse also involved question of subject matter, whether values will dominate over facts; choice in type of investigating method to be used in social sciences and the decision about what is the main purpose and aim of social science. Weber was highly influenced by idealist philosophy and sought to establish

82 NSOU CC - SO - 03 a middle ground between positivism and idealism. According to Gimbel (2016), Weber did acknowledge the difference between the sciences of nature and the sciences of man; the peculiarities of human social behaviour as a subject for science, but believes it possible to allow for them without compromising scientific method (ibid: 75). So, Weber's philosophy of social science manages to incorporate features of both positivist and humanist visions of science. He maintains a place in the social sciences for causal, explanatory laws, but also attempted to incorporate the concept of interpretation into his account of social-scientific explanation. He retains a place for the interpretation of subjective intentions and the subjective understanding of meanings as well as allowing for the subjective orientations of the scientist, but stated that the research in the cultural sciences cannot only have subjective results, being valid for one person and not for others.

5.5 Interpretive Sociology: General Arguments

The following points outline the general arguments of interpretive sociology in depth. (a) Interpretive analysis means an attempt to understand and explain human action in terms of the intention it expresses (Hayes 1985:1). The presupposition is, human action involves meaning and there is intrinsic connection between behaviour and meaning associated with it. But it cannot be claimed that intent causes action. Intent and action cannot be regarded as logically independent of each other as it is defined in case of cause and effect relationship. For example, one cannot logically separate the action of waving to someone with the intention of waving to someone. It is also important to note that, to intent to act is not same as to act and to intent to act does not always entails performance of the act, as in case of some resolution taken but not performed. In cases where the intention is followed by performance of work, even then the intent cannot be regarded as cause of the action as the action logically entails the intent. Causal analysis and interpretive analysis as two genres within the broad spectrum of sociological theory are irreconcilable, from the beginning. Causal analysis and positivism followed by Saint Simon, Comte and Durkheim regarded human activities as 'a piece with the rest of the nature' (ibid: 2) in that it shows same form of regularities and uniformities that is explainable in terms of invariable and causal laws. Here the elements are considered to be extrinsically related and therefore same method of inquiry as in natural sciences can be applied. Therefore the 'positivists' try to

NSOU CC - SO - 03 83 explain social phenomena by presupposing the existence of universal causal regularities or laws. On the other hand, for hermeneutic theorists such as Hegel, Dilthey and Gadamer, the most important aspect of human activity is how they express 'meaning', a quality of life that cannot be adequately explained in terms of universal causal laws and therefore the methodological inquiry of human science need to be significantly different from that of natural sciences. The hermeneutists use interpretive analysis to understand and explain human action. (b) Interpretive sociology is not regarded as being part of psychology. This is so because in case of instrumentally rational action which has the most understandable meaning structure, both the actor and the observer the action is subjectively, rationally, rigorously oriented to means that are unequivocally held adequate to fulfill clearly comprehended ends. One cannot infer about such action from psychic data. Rather one should infer from ones subjective expectation related to behaviour of objects and from expectations formed on the basis of valid experiences. In case of irrational processes (where objectively correct condition of instrumentally rational action is not considered) in order to know which aspects of such action is psychologically explicable, it is necessary to understand how pure ideal-typical rationality would have proceeded. It is possible then to determine objective and subjective irrational components of the action. Interpretive sociology is also distinct from dogmatic disciplines such as logic, jurisprudence and therefore meaning do not refer to objective meaning which is 'true' or 'valid' in some metaphysical sense. (c) Weber defines Interpretive Sociology as a science concerned with interpretive understanding of social action as well as causal explanation of its course and consequences. Individual behaviour (overt or covert; omission or acquiescence) is regarded as action when the actor attaches subjective meaning to it (Weber, 1978:4). Interpretive sociology focuses on the unique nature of human behavior whereby it is possible to 'intelligibly interpret' (Weber, 1981:151) its relational contexts and regularities. Understanding the context and verifying it through causal attribution ensures validity of the 'intelligible explanation'. Action is identified as significant for Interpretive Sociology. It consists of behaviour that: (a) in terms of the subjectively intended meaning of the actor, is related to the behavior of others, (b) is codetermined in its course through this relatedness, and thus (c) can be intelligibly explained in terms of this (subjectively) intended meaning. (ibid:152) An action is regarded as
84 NSOU CC - SO - 03 social when its subjective meaning takes others' behaviour into account and it is oriented in its course accordingly (Weber,1978:4). The "others" may be an individual person, someone known or an indefinite unknown plurality (ibid:22). Interpretative sociology considers the individual and his action as the basic unit. In sociology, concepts such as 'state', 'association', 'feudalism' are regarded as certain categories of human interaction. Hence it is the task of sociology to reduce these concepts to 'understandable' action, of participating individual men (Gerth and Mills 1946: 55). Max Weber incorporated the problem of understanding in his sociological approach, which, he emphasized as one type of sociology among other possibilities. Interpretive sociology, as conceptualised by Weber was largely influenced by philosophical thoughts associated with Enlightenment, where his point of departure and most important unit of analysis is the individual person (ibid:55). This way of thinking was opposed to the existing dominant influence of Hegel and Ranke, according to which emphasis is given on the interpretation of the union between the comprehensive totality and its part. The individual, institution, act, all is seen a document and manifestation of the whole. To Weber, 'Understanding' was a unique approach of the moral or cultural sciences, dealing with man and not with other animals or with lifeless nature. Man can introspect and understand his own intentions and at the same time can interpret the motives behind the actions of other men in terms of their professed or ascribed intentions. (d) The concept of verstehen is central to interpretive sociology. Introduced by Droysen and used by Dilthey, verstehen is a concept that differentiates social sciences as opposed to natural sciences. Usually verstehen is described as something related to the explanation of human action; it may be an experience, a method or an explanation (Bourgeois, 1976: 26). Verstehen involves the idea that a social scientist must empathize with his subjects in order to understand his subjects' actions as social actions. Though there is a tendency among proponents of verstehen to make empathy as a quintessential feature of social sciences, Nagel is a prominent exception to this rule. Nagel puts forward verstehen as a heuristic tool, "a way of generating suggestive hypotheses for explaining social action" (ibid:28). According to Natanson, verstehen is interpretive understanding. Here again one needs to refer to Weber to get a clear idea about verstehen. Weber maintains that the primary task of the sociologist is to understand the meaning an act has for the actor himself, not for the observer. The kind of

NSOU CC - SO - 03 85 understanding involved is precisely that of *verstehen* (ibid: 29). *Verstehen* is not only a skill of the sociologist. According to Schutz, it is the particular experiential form in which commonsense thinking takes cognizance of the social cultural world (Parsons 1978:1). The social agent is a "sociological person" or practical sociologist, as Schutz referred to him, who relies upon the techniques of *verstehen* in his routine social relations. (e) Recent research in interpretive sociology is informed by a variety of perspectives, among them are sociolinguistics (Hymes), symbolic interactionism (Blumer, Denzin) ethnomethodology (Goffman) and phenomenology (Schutz). In spite of significant differences, all these approaches to the study of society have emphasized on two significant and interrelated insights. First, the everyday social actor does not merely internalize norms whose implementation are not as automatic as the stimulus response behavior sequences learned in operant conditioning (as functionalists emphasizing the importance of functional integration and social consensus often imply); rather, the actor is a conscious agent continuously mindful of and responsible for the active application of normative codes in the interpretation of social reality. In this view, society is not the unfolding of pre-established behavior patterns in (an assumed) highly stable environment of others and material objects but the creative production of interacting and interdependent agents who are skillful at interpretively understanding and communicating the sense of their own social worlds. Second, these approaches point to the importance of interpretation not only in sociological inquiry, as does the tradition of interpretive sociology to which they often trace their inspiration, but in the particular social reality under study (Parsons 1978:111). Schutz is acknowledged as the pioneer in the new approaches of interpretive sociology since he accentuated the importance of *verstehen* in the everyday world in *The Phenomenology of the Social World* (ibid: 112). Many recent works in interpretive sociology by Garfinkel, Goffman, Schutz and Wilson, have drawn extensively from the phenomenological tradition. An incorporation of phenomenological insights is a wise strategy for interpretive sociology since if interpretive sociology focuses only on the methods for the construction and communication of meaning it gets restricted. Incorporation of phenomenological insights takes into consideration the substantive senses of the meanings upon which actors/agents rely (ibid: 114).

86 NSOU CC - SO - 03 Interpretive sociology has also influenced the emergence of symbolic interactionism and ethnomethodology. Interpretive sociologists often employ ethnography, participant observation and interviewing in order to empirically situate analyses with the lived experiences of social actors in their social world. Often set in contrast to more structural or critical perspectives, interpretive sociology is concerned with how people go about defining and making sense of their situations, others and themselves. Such a mandate lends itself to inquiry that is more sensitive to qualitative methodologies and subjectively based analysis. Rather than establishing specific correlations between operationalized variables and causation, analytical attention is given to the processual nature of the human lived experience as it relates to people's everyday lives. Data is collected and analyzed through various forms of participant observation, interviewing, and historical documents. Symbolic Interactionism as a perspective and methodology was formulated by Herbert Blumer, his inspiration came from the American pragmatists, including Charles Pierce, William James, John Dewey and, most notably, George Herbert Mead. These thinkers developed concepts which emphasized human life as one of shared understandings between reflective and interpretive members. Blumer proposed that sociologists should focus on the subjective and interpretive aspects of peoples' shared meanings. He argued that social structures are ongoing accomplishments of 'joint action', and emphasized human agency to shape social contexts that are never completely external to the individual or obdurate in their influence and impact (Adorjan et. al., 2017:3). It is not roles and values that guide action, but our perceptions and interpretations of these that matter. Blumer's focus on shared meanings emphasized the examination of language and interaction, leading to his endorsement of the direct examination of the empirical world through ethnography, participant observation, as well as life history (i.e. the examination of diaries and letters), and interviews. Pragmatism and Symbolic Interactionism led to the formulation of grounded theory, by Barney Glaser and Anselm Strauss. Glaser and Strauss emphasized a comparative method that avoids mapping empirical data onto pre-existing theory. Unlike natural science methodology (which, due to its emphasis on validity and reliability require antecedent operationalization), grounded theory seeks to push researchers to perpetually revise their ideas regarding social life by going back and forth between the empirical world and their own concepts and ideas. Grounded theory allows methodology to

NSOU CC - SO - 03 87 take precedence insofar as it informs theoretical generation through ongoing comparison. Harold Garfinkel formulated ethnomethodology based on interpretive sociology during 1950, which centered on the 'method' that people engage in to uphold their every day sense of identity, action and continuity between individual and society (ibid:4). Garfinkel asked how, within our daily actions, is society perpetuated; how are transactions of equilibrium enacted. Similar to symbolic interactionism, ethnomethodology seeks to capture the real lived experiences of members within society, favouring the direct observation of people, especially focusing on microinteractions. Both perspectives emphasize negotiation and interpretation, and suggest that only through direct participation can researchers explicate the life world of members. Thus interpretive sociology emerged as an alternative paradigm to positivism and objectivism practiced within sociology. It established the importance of understanding subjective meaning and influenced a whole gamut of theoretical perspectives and methodological dispositions within social science domain.

5.7 Summary Interpretive sociology involves a variety of forms of sociology (approach of Weber, Symbolic Interactionism, Sociological Phenomenology) united by an emphasis on the necessity for sociologists to understand and interpret actors' meanings. All social reality is taken as pre-interpreted in that it only has form out of social actors' meanings. As a method interpretive understanding stresses on the importance of intentional human actions. What distinguishes the interpretive paradigm with any other account of interpretation is the recognition that any statement about the social world is necessarily relative to any other. The guiding principle of interpretive sociology is that social life is subjective and therefore it is amenable to interpretation. Interpretive sociology is formed as an alternative and critic to the adherence of methods of natural sciences in social sciences, in understanding human actions. Interpretive analysis means an attempt to understand and explain human action in terms of the intention it expresses. The presupposition is, human action involves meaning and there is intrinsic connection between behaviour and meaning associated with it. Weber defines Interpretive Sociology as a science concerned with interpretive

88 NSOU CC - SO - 03 understanding of social action as well as causal explanation of its course and consequences. The concept of verstehen is central to interpretive sociology.

5.8 Questions Answer briefly (6 marks) i. Briefly define interpretive sociology. ii. Briefly state the basic premises of interpretive sociology. iii. What is the significance of neo-Kantianism in history of social science? iv. Briefly explain role of hermeneutic school with reference to Weber. v. Discuss the relationship between interpretive sociology and psychology. vi. Define verstehen. Answer in detail (12 marks) i. Describe the historical and philosophical context of interpretive sociology. ii. Analyze the significance and centrality of verstehen to interpretive sociology. iii. Discuss the various perspectives influenced by interpretive sociology. Essay Type Question (20marks) i. Discuss the basic arguments of interpretive sociology.

5.10 Glossary Enlightenment: The period of intellectual ferment leading up to the French Revolution, which was distinguished by a fundamental questioning of traditional modes of thought and social organization, and sought to replace these with an exclusive reliance on human reason in determining social practices. Ethnomethodology: The theoretical and specialist approach within sociology initiated by Harold Garfinkel, that sets out to uncover the methods and social competence that we, as members of social groups, employ in constructing our sense of social reality. Hermeneutics: A theory and method of interpreting human action and artefacts. Dilthey used the term to refer to 'cultural sciences' i.e. the subjects that forge 'shared understanding' between creator and the interpreter. Interpretive analysis: An attempt to understand and explain human action in terms of the intention it expresses. The presupposition is, human action involves meaning and there is intrinsic connection between behaviour and meaning associated with it. Neo-Kantianism: In 1890, this movement began through criticism of the work of Kant and questioned the validity of scientific knowledge. Two central thinkers of neo-

90 NSOU CC - SO - 03 Kantian movement are Wilhelm Windelband and Heinrich Rickert. Windelband (1848-1915) basically was the man who according to contemporaries started the war against positivism and scientific methodology. He stated that Kant in deciphering the steps for natural sciences to gain valid knowledge while excluding historical and ethical dimension of human action from domain of legitimate knowledge. Phenomenology: A Philosophical approach particularly associated with Edmund Husserl in which philosophy is seen to rest fundamentally on the introspective examination of one's own intellectual processes in the experiencing of phenomena. Alfred Schutz's Social Phenomenology involves a critical appropriation of Husserl's approach and an application of this to the study of the assumptions involved in and the constitution of everyday social knowledge. Positivism: The doctrine formulated by Comte which asserts that the only true knowledge is scientific knowledge i.e. knowledge which describes and explains the coexistence and succession of observable phenomena, including both physical and social phenomena. Sociolinguistics: The study of the sociological aspects of language. The discipline concerns itself with the part language plays in maintaining the social roles in a community. The basic notion underlying sociolinguistics is quite simple: Language use symbolically represents fundamental dimensions of social behavior and human interaction Symbolic Interactionism: A theoretical approach in US sociology which seeks to explain action and interaction as the outcome of the meanings which the actors attach to things and to social action, including themselves. Verstehen: The concept is central to interpretive sociology. Introduced by Droysen and used by Dilthey, verstehen is a concept that differentiates social sciences as opposed to natural sciences. Usually verstehen is described as something related to the explanation of human action; it may be an experience, a method or an explanation. It involves the idea that a social scientist must empathize with his subjects in order to understand his subjects' actions as social actions.

The section begins with a brief biography of Weber which enables the reader to understand how Weber's scholarship was nurtured by his sociological conditions and family

92 NSOU CC - SO - 03 background. The following section provides the in-depth discussion on interpretive sociology of Max Weber. The subject matter and methodology of interpretive (verstehenden) sociology involves a discussion of how Weber defines the various categories such as social action, types of social action, social relationship, association, institution and so on. The last section specifies the unique contribution of Max Weber in delineating the methodology of sociology. He successfully focused on both human understanding as well as causal adequacy. He integrated both hermeneutical concern and explanatory objectives in his methodological deliberations. 6.3 A Brief Biography of Max Weber Max Weber was born in Erfurt, Thuringia in 1864. His father, Max Weber, Sr., was a trained jurist and municipal counselor. In 1869 the Weber family moved to Berlin where, Weber, Sr. became a prosperous active politician. It is important to note that young Weber, his family residing in west-end suburbs of Berlin, came to know many academic and political notables who visited their family, such as Dilthey, Mommsen, Julian Schmidt, Sybel, Treitschke, and Friedrich Kapp. Weber's mother, Helene Fallenstein also belonged to a cultured and liberal family background (many were teachers and small officials) and was of Protestant faith. She was tutored in the several humanist subjects by Gervinus, the eminent liberal historian and a close friend of her family. Max Weber corresponded with her in long, intimate, and often learned letters, until she died, in 1919 (Gerth and Mills 1946:3). Exploring Weber's biography helps a reader understand how personal experiences, relationships, political and cultural contexts and struggles shaped Max Weber as a thinker. To begin with, observing the differences between his parents and the deceptive processes within a Victorian patriarchal family, it was clear to young Weber that no words or actions could be taken on face value (ibid: 5). That, in order to get to truth one need to access direct, first-hand knowledge. Weber showed religious indifference from an early age and did go against the authority of his elders and his father. He went to Heidelberg and enrolled as a student of law. Along with law, he studied history, economics, and philosophy under eminent scholars, participated in the theological and philosophical controversies of the day. At the age of 19, Weber moved to Strassburg in order to serve in the army but he did not give up his intellectual pursuits. The military year was over in 1884 and at the age of 20 Weber resumed his university studies in Berlin and Goettingen,

NSOU CC - SO - 03 93 where, two years later, he took his first examination in law. During his years at Strassburg, Weber experienced friendship, profound emotional experience and intellectual discourse in the company of his familial relations (his mother's sisters were married to Strassburg professors and his mother's side of the family was prone to mystical and religious experiences). From his experiences with these relationships, Weber came to learn how to appreciate and sympathize to diverse values. He also took to pragmatic view that it is not fruitful to stick to one's introspective awareness but focus the consequences of various decisions and course of actions (ibid: 9). After finishing studies, Weber took up service in the law courts of Berlin. His interests rested around the field in which economic and legal history overlapped. His Ph.D. thesis (1889) was based on the history of trading companies during the Middle Ages. In 1890 he passed his second examination in law and established himself as a scholar on commercial, German, and Roman law. His treatise titled *The History of Agrarian Institutions* (1891) covered a sociological, economic, and cultural analysis of ancient society. It is subjects to which Weber remain occupied with, throughout. In the spring of 1892, a grand niece of Max Weber, Sr., came to Berlin in order to educate herself for a profession. Weber married his grand niece Marianne Schnitger in 1893. After marriage Weber lived a life of active and successful young scholar in Berlin. Filling in for ill teacher of economics, he spent hours in lecture hall and seminar. He was active consultant and worked for government agencies. In 1894, he accepted a full professorship in economics at Freiburg University. From this time Weber put himself under enormous work load. Weber accepted a chair at Heidelberg in 1896. He thus became the colleague of former teachers, Fischer, Bekker, and others. His circle of friends included Georg Jellinek, Paul Hensel, Karl Neumann, the art historian, and Ernst Troeltsch, the religionist, who became one of Weber's greatest friends and intellectual companions (ibid:11). Max Weber's father died in 1897, and hereafter crisis in his personal life and health began. Weber considered himself guilty of his father's death (his father died in few days after a heated discussion with Weber, an unrectifiable act of hostility in his own opinion). Shortly after this, Weber fell ill with fever and psychological maladies. As the academic year began, he collapsed from tension, remorse, exhaustion, sleeplessness and anxiety. For the rest of his life he suffered intermittently from severe depressions, punctuated by manic spurts of extraordinarily intense intellectual work and travel; every mental effort, especially speech, was felt to be detrimental to his entire being (ibid:12). Weber recovered during

94 NSOU CC - SO - 03 his vacation in Italy and could return to Heidelberg in 1902 to resume into a light schedule of work. At this time he read extensively on art history, economics, politics and the economic history of monastic orders (ibid:14). But there were again set back and at his request Weber was removed from professorship and made a lecturer. At this juncture he was able to start writing again. He first focused on problems of method in the social sciences. At the same time he edited along with Sombart in the leading social science journal in Germany (*Archiv für Sozialwissenschaft und Sozialpolitik*). This editorship connected Weber with a wide circle of scholars and politicians and aided in broadening the focus of his own work. By 1904, he published essays on the social and economic problems of Junker estates, objectivity in the social sciences, and the first section of the *Protestant Ethic and the Spirit of Capitalism*. During his travels in America Weber became interested on the role of bureaucracy in a democracy. He was drawn into academic politics and tried to open up opportunity for scholars such as Georg Simmel and Robert Michels, who were victims of anti-Semitism. In Heidelberg, during 1906 to 1910, Weber participated in intense intellectual discussions with eminent colleagues such as his brother, Alfred Weber, Otto Klebs, Eberhard Gothein, Wilhelm Windelband, Georg Jellinek, Ernst Troeltsch, Karl Neumann, Emil Lask, Friedrich Gundolf, and Arthur Salz (ibid:20). Weber was also regularly visited by Robert Michels, Werner Sombart, the philosopher Paul Hensel, Hugo Münsterberg, Ferdinand Tönnies, Karl Vossler, and, above all, Georg Simmel. Among the younger scholars to whom Weber acted as mentor were Paul Honigsheim, Karl Lowenstein, and Georg Lukacs. Weber's circle included the non-academic also such as Mina Tobler, the musician to whom Weber dedicated his study of Hinduism and Buddhism, Karl Jaspers, a psychiatrist who later turned into philosopher and H. G. H. Gruhle, a psychiatrist interested in modern art. In 1908 Max Weber was active in establishing a sociological society. He decided the level of discussion at the meetings and defined the scope of future work. He motivated research works on voluntary associations (ranging from athletic leagues to religious sects and political parties), on a methodical study of the press and on industrial psychology. After First World War, in April 1918, he moved to Vienna for a summer term at the university where he gave his first university lectures after nineteen years titled, 'A Positive Critique of the Materialist Conception of History,' where he presented his sociology of world religions and politics. His lectures were stupendously successful, attended by professors, state officials, and politicians. A whole series of academic positions were offered to him, he accepted the Munich offer in 1919. His last lectures were worked out at the request of his students and have been published as *General Economic History*. He died in June 1920.

NSOU CC - SO - 03 95 According to Gerth and Mills (1946) there are definite sociological conditions that account for kind of scholarship Weber displayed. His early education equipped him in many Indo-Germanic languages, his intellectually stimulating family background made it possible for him to study an unusual combination of specialized subjects (ibid: 24). He was a lawyer as well as a well-equipped economist, historian, and philosopher. Max Weber's intellectual orientations took shape within a context characterised by conflicting classes, parties, and intellectual currents (ibid: 46). As a result, when his analytic conceptions and broad historical views are studied, one finds an assimilation of conservative, liberal, and socialist elements of thought that has been transformed and integrated in his work. Max Weber spent the early years of the twentieth century engaged in a series of methodological debates within the Neo-Kantian tradition. Along with a few of his contemporaries, Wilhelm Dilthey and Heinrich Rickert, Weber sought to establish a valid social science that possessed a methodology that was better suited to study the social world than the positivist models provided by the natural sciences (Naturwissenschaften).

6.4 Interpretive Sociology of Max Weber

Max Weber outlines the basic tenets of interpretive sociology by laying down its subject matter and methodological foundations. In order to delineate how Weber conceptualizes "Interpretive ("verstehenden") Sociology", his book *Economy and Society*, Volume 1 (1978:3-29) and his article, *Some Categories of Interpretive Sociology* (1981) have been referred. In the following section, the propositions and arguments made by Weber have been discussed. In prefatory note to his deliberations on laying the foundations of Interpretive Sociology, Weber acknowledges the influence of Karl Jaspers, Heinrich Rickert and Simmel in conceptualizing 'understanding'. However Weber departs from Simmel in methods by distinguishing between subjectively intended and objectively valid meanings. Ferdinand Tonnies and his work *Gemeinschaft and Gesellschaft* is also mentioned in this note.

6.4.1 Definition :

Weber defines Interpretive Sociology as a science concerned with interpretive understanding of social action as well as causal explanation of its course and consequences. Individual behaviour (overt or covert; omission or acquiescence) is regarded as action when the actor attaches subjective meaning to it (1978:4). Interpretive sociology focuses on the unique nature of human behavior whereby it is possible to 'intelligibly interpret' (1981:151) its relational contexts and regularities. Understanding the context and verifying it through causal attribution ensures validity of the 'intelligible explanation'. Validity is important here because human behaviours can be based on varied 'constellation of motives' (ibid: 151) in spite of being similar in its external course and results. An understanding of human behaviour is based on varying degrees of specific qualitative 'self-evidence'. The instrumentally rational interpretation has high measure of 'self-evidence' as it is exclusively oriented to subjective means to attain fully comprehended subjective goals. It is also possible to understand the typical course of emotion and its consequences for behaviour. Some behaviours such as those involving ecstasy or mystical experiences, that of children and that having psychopathic context may not be understandable and amenable to interpretive explanations. The course of memory and intellectual exercises are only partly understandable. Interpretive sciences treat the ascertainable regularities of such psychic processes just as they treat physical laws of nature.

Definition of Social Action:

Action is identified as significant for Interpretive Sociology. It consists of behaviour that: (a) in terms of the subjectively intended meaning of the actor, is related to the behavior of others, (b) is codetermined in its course through this relatedness, and thus (c) can be intelligibly explained in terms of this (subjectively) intended meaning. (Weber 1981:152) An action is regarded as social when its subjective meaning takes others' behaviour into account and it is oriented in its course accordingly (1978:4). The "others" may be an individual person, someone known or an indefinite unknown plurality (Weber 1978:22). "Social action" (*Gemeinschaftshandeln*) is for us the behaviour of individuals, either (a) historically observed or (b) theoretically "possible" or "probable", behavior related to the actual or anticipated potential behaviour of other individuals (Weber 1981:160). Overt action is not social if it is oriented solely to behaviour of inanimate objects. Subjective attitudes constitute social action when it is oriented to the behaviours of others. For example a solitary prayer, a religious behaviour is not social. But an economic behaviour becomes social when the actor assumes that others will respect his actual control over goods. Not every type of human contact can be termed social but only those that are meaningfully oriented to others. For example, two cyclists colliding is not social reality but their attempt to avoid any form of conflict over the collision is social action. Social action is not identical to similar action of many persons or with

NSOU CC - SO - 03 97 every action influenced by others. It will be an action conditioned by crowd when many people take out umbrella apprehending it to be raining anytime. Action influenced by media is also caused by the fact that the individual is member of the 'mass' of which he is aware of. Imitation of action of others is also not social action as it is purely reactive with no meaningful orientation. An example will be imitation of fashion as some objective facts. However, if the actor imitates as because the actions of others are traditional or fashionable then it is social action because it is meaningfully oriented to action of the third person or the source of the imitation or both. The boundary is not always very distinctive. The reason behind this indefiniteness is that the actor is not fully self-conscious of the meaning that he attributes to his actions. Weber stated that social action may be oriented in four ways (ibid: 24); (a) Instrumentally Rational that is determined by expectations related to the behavior of object in the environment and that of other humans. These expectations are regarded as conditions to means with the help of which the actor will attend his rationally calculated ends; (b) Value-Rational, that is determined by a conscious belief in the value in itself leading to ethical, esthetic, religious behaviors which are independent of its prospects of success; (c) Affectual (emotional) that is determined by the specific affects and state of feelings of the actor and (d) Traditional that is determined by ingrained habituation. Traditional behaviors and affectual behavior both are close to borderline of what can be termed as meaningfully oriented action. In case of traditional behavior it is often an automatic reaction to habitual stimuli whereby the behavior is repeatedly followed. On the other hand affectual behavior may consist of uncontrolled reaction to exceptional stimuli. Value-rational action is distinguished from affectual action as it is a clearly self conscious formulation of values that governs the action and the action's planned orientation to these values. An example of value rational orientation will be the action of individuals who in spite of being aware of the probable cost to themselves, act according to their convictions, such as those actions driven by duty, honor, loyalty and so on. In case of instrumentally rational action, the ends of the action, the means to the ends and the secondary results are all rationally taken into accounts and weighed. In here alternative courses of action are considered. However, actual cases of social action which are oriented in one or another of the ways mentioned above, are unusual to find. The above classification is also not exhaustive; it is only useful for the purpose of investigation.

98 NSOU CC - SO - 03 Definition of Social relationship: Social relationship consists of a probability that there will be a meaningful course of social action irrespective of the basis of probability. It existed, exists and will exist appropriate to the meaning. The meaning here is the meaning attributed by the parties involved in a given concrete case on the average or in a theoretically formulated pure type. The subjective meaning may not be same for the parties involved in case of 'asymmetrical' social relationship but there is still mutual orientation as one party assumes an attitude towards himself by the other party and orient his action according to that expectation. In case of symmetrical relation both the parties cater to same meaning. However, completely corresponding meaning among parties to social relationship is a limiting case in reality. The subjective meaning of a social relationship may change; from solidarity to conflict. It may partly change when acquiring a new meaning and partly remain constant. The aspects of meaning which remains constant can lead to formulation of maxims which the parties expect to be adhered to on an average. The meaning of social relationship is also agreed upon by mutual consent when parties make promises about their future behaviour towards each other. In part the actor orients his promise rationally and in part he is driven value-rationally by a sense of duty. Interpretive sociology does not include physiological phenomena such as pulse rate or psychic conditions such as feeling tension. It is concerned about typical meaningful relationships of action. As such instrumentally rational action is taken as an ideal type which in turn makes it possible to assess the significance of irrational action. Subjectively intended meaning of action relationship is regarded as designating the inner state of human behaviour, thus ensuring that interpretive sociology consider each phenomena inside out. However, this does not mean that one needs to enumerate psychic conditions. For identical relationship of meaning may not be linked to completely opposite psychic constellations. It also does not mean that purely psychic facts are sociologically irrelevant because they are not subjectively related to the behaviours of others. Nor can one isolate an economic actor from his orientation to the outer world. The relevance of these processes to sociology which are devoid of subjective meaning is that they act as conditions and consequences towards which meaningful action is oriented. The processes of heredity cannot be understood in terms of subjectively intended meaning, in case of which interpretive sociology has to interpretively explain as to what are the intelligible consequences this (heredity-conditioned) effort has had upon the meaningful behavior of others (Weber 1978: 153).

NSOU CC - SO - 03 99 6.4.2 Methodological Foundations of Interpretive Sociology: (a) Weber begins with his deliberation on meaning that is to be interpreted and understood in case of social action. Meaning here can be actual meaning in a concrete case of an actor or it can be meaning the average meaning attributed by a plurality or this meaning can be a theoretically abstract one attributed to hypothetical actors. Sociology as an empirical science of action is distinct from dogmatic disciplines such as logic and jurisprudence and therefore meaning does not refer to objective meaning which is 'true' or 'valid' in some metaphysical sense. Sociologically relevant purely rational actions are often reactive behaviours with no subjective meaning attached to it and it is often not empirically distinguishable from meaningful action. Weber suggests that in such cases action may include intermingled understandable and non-understandable components. (b) All interpretations (like scientific facts) need to have clarity; all insights and comprehensions need to be verifiable. This certainty can be achieved through either rational method or one can be certain of one's understanding by being emotionally empathic or artistically appreciative. Accuracy in case of the latter is possible if through sympathetic participation one can understand the emotional context in which the action took place. However some values and ends of human action though intellectually grasped, may not be fully understandable and may not show the certainty of interpretation as in case of rationally purposeful actions. The more the values and ends of an action are different from those who are interpreting the more difficult it is to empathically understand actions. In such cases Weber states that one needs to be content with its purely intellectual understanding or accept them as given data. The more one is exposed to emotional reaction such as love, jealousy, anger, anxiety and the irrational behaviour growing out of it, the more it is possible for them to empathize with such behaviour. A purely rational course of action serves as an ideal type for the sociologist. It has clear understandability and is less ambiguous. All irrational actions are deviation from purely rational action; by comparing with it one can understand the irrational factors. According to Weber, ideal type is a methodological device; it should not represent rationalistic bias of sociology for it does not say anything about the predominance of rationalistic factors in human life.

100 NSOU CC - SO - 03 (c) Human actions governed by stimulus are those which are devoid of subjective meaning. That is actions which are not associated with intended purpose. Only stimulus is present, favoring or hindering circumstances. For example, there are the actions which are oriented towards human mortality. Other actions associated with psychic or psycho-physical phenomena such as fatigue or sudden state of euphoria are all devoid of subjective meaning. However, the actor and the sociologist both should accept them as data and take them into account. (d) Two kinds of understanding are mentioned and explained by Weber. Firstly there is direct observational understanding of the subjective meaning of a given act; such as observational understanding of irrational emotion of anger through facial expression or rational observational understanding of the act of a woodcutter. Secondly, there is explanatory understanding of actions. In here, one understands in terms of motive as to what meaning the actor attaches to his actions. Here one tries to understand what makes an actor act in a particular way, at a particular moment, under particular circumstances. This form of understanding places the act in an intelligible and inclusive context of meaning. For example direct observational understanding of a man firing may be interpreted as that the man has been commanded to do so but understanding motive can reveal the presence of underlying irrational emotions such as rage or revenge which can be in turn be explained (that they may be caused by insult or jealousy). In all cases understanding involves interpretive grasp of meaning of actions present in one of the following contexts: firstly, as actually intended meaning for concrete individual action (historical approach); secondly, average or approximation to the actually intended meaning (sociological mass phenomena) and thirdly, meaning appropriate to a scientifically pure type (ideal type). Weber places a word of caution stating that no matter how clear an interpretation appears, based on meaning, it should be regarded as a plausible hypothesis, as the motives are often not revealing to actors themselves. Actions which are similar may be caused by various motives having absolutely opposite interpretations. (e) Interpretation of a logical, consistent course of action is considered to be subjectively adequate (adequacy on the level of meaning) when it constitutes a typical complex of meaning based on habitual modes of thought. For example, the interpretation of action such as correct answer to an arithmetic problem is subjectively adequate being based on correct norms of calculation. In case of a sequence of events, the

NSOU CC - SO - 03 101 interpretation is said to causally adequate if it is based on established generalizations derived from experiences. For example, the causally adequate interpretation of the above mentioned action (correct arithmetic answer) would be the statistical probability that it will actually always occur in the same way. Correct causal interpretation of an action is possible when the overt action and the motives both have been correctly apprehended and their relationship is meaningfully comprehensible. (f) Statistical uniformities are understandable action but they constitute sociological generalizations only when they are manifestations of understandable subjective meaning of a course of action. Some statistics of processes are devoid of subjective meaning such as death rates and amount of rainfall. But in regard to crime rates, occupational distributions, the phenomena are meaningful and therefore sociologically relevant. It is for one or more individuals, action exists as a subjectively understandable orientation of behaviour. The psychic elements of individuals and their behaviour are not understandable subjectively as they are formulated from the point of view of natural sciences. In case of subjective understanding of action in sociology, collectivities such as state, associations, Business Corporation are to be treated as solely the resultant modes of organization of particular acts of individual persons. This is so because; (a) similar concepts and terminology are used such as the 'state' is used both in legal terminology and in everyday speech to denote the legal concept of state as well as a phenomena of social action to which legal rules are relevant, (b) these collectivities have a meaning in the minds of actors who orient their action to them and the ideas have power enough to causally influence action (normative prescriptions and prohibitions), (c) it is necessary to go beyond functional analysis of these collectivities so that sociology can interpret the subjective understanding of the actions of the component individuals. In comparison to external observations, interpretive understanding is hypothetical and provides fragmentary results but nevertheless Weber asserts that subjective understanding is the specific characteristic of sociological knowledge. (g) Sociological generalizations are typical probabilities that confirm through observation that under given conditions an expected course of social action will occur. Generalizations are highly definite in case of rigorously rational pursuits with clearly defined goals, when actors have no alternative course of action. According to Weber this case demonstrates why it will be an error to consider any kind of psychology as the foundation of sociological interpretation of knowledge. For psychology employs methodological approach of natural sciences to distinguish between the 'physical' 102 NSOU CC - SO - 03 and the 'psychic'; something which is alien to disciplines concerned with human behaviour. Also the error lies in the concept of psychic and that everything which is not physical is regarded as psychic. But in case of rational action the train of mathematical reasoning that a person carries out is not psychic. However psychology that employs method of subjective understanding, can contribute in explaining irrational actions sociologically. The relationships of interpretive sociology to "psychology" are formed differently in each individual case. Objectively correct rationality serves sociology as an ideal type in relation to empirical action; instrumental rationality as an ideal type in relation to what is psychologically understandable; the meaningful as an ideal type in relation to "meaningless" action (Weber 1981: 157). Through comparison with the ideal type, the casually relevant irrationalities (different on each level) can be established for the purpose of causal attribution. (h) Weber distinguished between sociology and history stating that whereas history seeks causal analysis and explanation of action and structures having cultural significance, sociology seeks to formulate types, concepts and generalized uniformities of empirical process. (i) Sociological concepts and generalization contribute to causal explanation of historically and culturally important phenomena. Sociological concepts being abstract strive for highest degree of adequacy at the level of meaning. In case of both rational and irrational (affectual modes of actions) actions, sociological analysis abstracts from reality and helps to understand it. It shows with what degree of approximation concrete historical phenomena can be included in one or more sociological concepts. As such, the sociologist necessarily needs to formulate pure ideal types of corresponding actions. Ideal types involve highest possible degree logical integration as they have high degree of adequacy at the level of meaning. And so it is not possible to ever find real phenomena that correspond to an ideal type. Ideal type does not refer to average type because motives behind actions are highly heterogeneous. Ideal types are used to understand deviation in actions caused by traditional restraints, affects and so on. Ideal types are also applied to subjective processes. In majority of cases actual action takes place in a state of unconsciousness of its subjective meaning. This fact needs to be taken into consideration at the time of sociological and historical investigation. (j) Following Weber, "Verstehen" is the key to understand why within interpretive (verstehenden) sociology, the single individual and his action is the basic unit (atom).

NSOU CC - SO - 03 103 Other disciplines treat the single individual as a complex of psychic, chemical, or other "processes". For sociology everything that is below the threshold of meaningfully interpretable behaviour, oriented toward inner or outer objects, is considered as the processes of nature; they are not the condition neither the object of orientation for the actor. For the same reason, the individual is, for interpretive sociology, above this threshold and the only agent of meaningful behavior. Concepts such as the "state", "association", "feudalism" and the like generally indicate for sociology categories of certain kinds of joint human action. For Weber, it is the task of sociology to reduce these concepts to "understandable" action; as the action of the participating individuals. This is not necessarily true for disciplines such as Jurisprudence. (k) Social action is referred to as "associational action" (Gesellschaftshandeln) when and insofar as (a) it is oriented in meaning toward expectations that are held on the basis of rules (Ordnungen), (b) formulation of these rules has resulted purely rationally (zweckrational) in view of the expected action of those associated (Vergesellschaftete), and (c) the meaning orientation is subjective. (Weber 1981: 160). The association exists so long and insofar as an action oriented toward the rules in accordance with their average intended meaning, still occurs within a practically relevant range. But this is a fluid situation. The rational ideal type of association is the "voluntary association" (Zweckverein). It entails associational actions where in all participants have rationally agreed on an order defining the purpose and the methods of their joint act (ibid: 163). (l) Weber explains actions based on Consensus (Einverständnis). These are the complexes of social action, which in the absence of a rational agreement or an order, (a) may in effect operate as if such an agreement has taken place and (b) in which this specific effect is codetermined through the nature of the meaning of the action of the individuals (ibid:164). Consensus is evident in instrumentally rational exchange of money. In here, the individual act of associating with the exchange partner includes a relationship to the future action of an indistinctly perceived and conceivable group of actual and potential owners, collectors, and traders of money. Individual's action is oriented toward the expectation that makes the use of money possible; that others will also 'accept' money. Another example will be a language community where individual instances of social action are oriented toward the expectation of reaching an "understanding" of an intended meaning with another person. Thus consensus is a situation where an action is oriented toward expectations about the behavior of others and the expectations has an empirically realistic chance of being fulfilled

104 NSOU CC - SO - 03 because of the objective probability that these others will treat those expectations as meaningfully "valid" for their behavior, despite the absence of an explicit agreement. Social action oriented toward such "consensus" probabilities is referred to as "consensual action". The transition from consensual action to associational action is fluid (ibid: 171). (m) Weber designates "institutions" or compulsory associations (Anstalten) as such communities which are; (a) characterized by ascribed participation in contrast to the voluntary association on the basis of purely objective facts independent of declarations by those persons ascribed; (b) they are not amorphous, in contrast to consensual social relationship because they lack an intentional rational order; here action is co-determined by rational man-made rules and coercive apparatus. A language group into which one is born is not an "institution" as they lack the rational status. Example of "institution" will be political community designated as "state". (n) The institution or compulsory association with its rational statutes is related to the organization (Verband). Organizational action (Verbandshandeln) is oriented toward consensus. It is a consensual action wherein (a) the ascription of participation of the individual follows from consensus, without his own rational effort toward that end; (b) despite the absence of a formally enacted order, certain persons (power holders) issue consensually effective rules for the action of those consensually counted participants of the organization; and (c) the power holders themselves or other persons are prepared to use any kind of physical or psychic coercion against those participants who violate the consensus. 6.5 Interpretive Sociology: Contribution of Max Weber Weber was one of the first sociologists to recognize the role 'human understanding' and interpretation plays in social action and the fashioning of social order without losing sight of what he terms 'causal adequacy'. He argued that sociology is a science that "attempts the interpretive understanding of social action in order to arrive at a causal explanation of its course and effects" (Weber 1978: 4). Although committed to causal analysis, Weber believed that it was inappropriate to apply the hypothetico-deductive model to the study of history, culture, society and individual motive. A majority of Max Weber's work focused on exploring the unique significant cultural conditions that gave rise to specific historical outcomes. This line of inquiry moved him to design a methodology within the social sciences that integrated both hermeneutical

NSOU CC - SO - 03 105 concerns and explanatory objectives. Because human beings have a subjective inner world, a different methodology and conceptual framework was necessary. He stressed that sociology must reject the presumption that understanding and causal explanation have no relationship to each other. It was Max Weber's use of ideal types, as a conceptual apparatus, that allowed him to establish various forms of causal understanding and interpretation within his diverse substantive areas of study. Weber's philosophy of social science manages to incorporate features of both positivist and humanist visions of science (Gimbel 2016:76). In his methodological deliberations, he maintains a place for causal, explanatory laws as well as incorporated the concept of interpretation into his account of social-scientific explanation within social sciences. Thus he bridged the chasm that Dilthey and others had created between 'explanation' and 'understanding'. Max Weber's most popular application of his Verstehen style of sociology can be found in his book entitled *The Protestant Ethic and the Spirit of Capitalism* (1905). Weber acknowledged that economic factors could influence how people define themselves and their world. However, he presented an alternative subjective causal explanation, for example by demonstrating that a group's interpretive schema could also affect material reality. Weber, in contrast to Karl Marx's historical materialism, believed that people's interpretation and implementation of societal ideas and values (i.e. weltanschauung), could have a dramatic impact on economic and social change. The "Protestant work ethic" is perhaps Weber's most famous ideal type as it best exemplifies his commitment to a methodology that is sensitive to the integration of causal analysis with human subjective meaning. His interpretive analysis of how a group of people shaped the world with their beliefs inspired generations of sociologists to acknowledge the power subjective meaning making activities have on the social construction of reality. For philosophers and social scientists, the works of Weber are significant because of the view that empathy is somehow essential to the social sciences. Weber's position finds its strongest statement in the essay, 'Objectivity in Social Science and Social Policy' (1904). Here he states that an objective analysis of cultural events which reduces the empirical reality to laws (according to the thesis of ideal science) is meaningless. According to Weber the transcendental presupposition of every cultural science does not lie in our finding a certain culture or any culture in general to be valuable but rather in the fact that we are cultural beings, endowed with the capacity and the will to take a deliberate attitude towards the world and to lend it significance (Bourgeois 1976:29). Thus verstehen

106 NSOU CC - SO - 03 as an empathic explanation is needed. The objective analysis of cultural events does not account for (unverifiable) presence of intentions, attitudes and values in the subjects of study. Without knowing which it is not possible to empathize with the subject and therefore one fails to understand his actions. Weber actually prescribes a combination of both empathic explanation and statistical regularities to give an account of a social event because he considered verstehen as logically incomplete and it needs to be supplemented by different method such as the collection of statistics. Many theorists tried to cover the gap between positivism and hermeneutic and to develop theories with both nomological and interpretive elements. For example, Weber defined sociology as science which is to provide interpretive understanding of social action and thereby the causal explanation of its course and consequences. Marx too was interested in both the position. But satisfactory integration of the positions is yet to be achieved. Relevant passages from Weber's *Economy and Society*, volume 1, deliberates on the criteria of adequacy for the explanatory interpretation of a course of conduct but in here it is not clear as to how it is to be shown that causal and interpretive understanding is complementary and mutually reinforcing. For example, Weber writes that verstehen enables us to understand why a course of action is taken place in terms of putative motive or intended meaning but to be sure that this is the true explanation we need to establish a causal correlation between motive and action, by comparing with concrete course of events. Following Weber, interpretive understanding without causal explanation remains a plausible hypothesis, and causal explanation without interpretive understanding will not be sociologically relevant. Given such attempt to integrate, in analyzing a course of action one will be needing to specify those theoretical units which are both organized as 'a complex of meaning' and 'a sequence of events' as one need to understand which of these relations are intrinsic and which are extrinsic under specific theoretical description. Such an idea provided by Weber is seen as a job left in an 'extremely rough-hewn state' (Hayes 1985:3). Fulbrook (1978) evaluating Weber's work on religion claims that he has not followed his own methodological dispositions in his own work. Summarizing Weber's methodology in few words, Fulbrook states that it consists of interpretive understanding of a meaningful complex of action, causal explanation of this action in terms of motives and the verification or validation of this explanation by referring to typical courses of action that occur normally (ibid: 72). Weber considered that sociological explanation is important to explain the causal chain behind historical developments. But how much in his actual attempt to

NSOU CC - SO - 03 107 understand and analyze the role of ideas, motives and meaning in comparative-historical studies of world religion did he followed his own conception of sociology. In his definitional work and construction of types Weber explicitly focused on motives and modes of orientation but to what extent this focus is consistent in his comparative historical study of world religion, where his purpose was to understand the unique attributes of western modern capitalism need to be examined. Parsons supported Weber stating that Protestant ethic as a religious factor did attain causal influence in Weber's explanation of socio-cultural and economic development. However, Giddens disagrees with Parsons and criticized interpretation of Weber's work stating what Weber actually stressed on was a combination of mental and ideal factors rather than independent influence of beliefs and ideas. Fulbrook goes beyond Giddens' criticism to state that in Weber's study of religion the role of motives and meaning remains an intermediary one; they act as intervening variables that is they influence the direction of the action but they do not in themselves constitute a sufficient explanation of the action and its outcome (ibid: 73). Weber, according to Fulbrook actually investigated the structural conditions under which certain forms of idea systems and associated meanings and motivations can arise and achieve historical efficacy. Fulbrook analyzes this disparity between Weber's conception of interpretive sociology and his actual practice to suggest that may be while emphasizing on meaningful behaviour of actors and its consequences, Weber underplayed the structural aspects involved in sociological explanation. His methodology was an attempt to address the controversies of his time regarding positivism and hermeneutic debate. It can be argued in support of Weber that in his substantive work he was able transcend this demarcations and so he did not followed his own methodological precepts in his own work.

6.6 Conclusion

Weber defines Interpretive Sociology as a science concerned with interpretive understanding of social action as well as causal explanation of its course and consequences. Individual behaviour (overt or covert; omission or acquiescence) is regarded as action when the actor attaches subjective meaning to it. Interpretive sociology focuses on the unique nature of human behavior whereby it is possible to 'intelligibly interpret'. Action is identified as significant for Interpretive Sociology. It consists of behaviour that: (a) in terms of the subjectively intended meaning of the actor, is related to the behavior of others, (b) is codetermined in its course through this relatedness, and thus (c) can be intelligibly explained in terms of this (subjectively) intended meaning. An action is regarded as social when its subjective meaning takes others' behaviour into account and

108 NSOU CC - SO - 03 it is oriented in its course accordingly. Weber stated that social action may be oriented in four ways (a) Instrumentally Rational, (b) Value-Rational, (c) Affectual (emotional) and (d) Traditional. Following Weber, "Verstehen" is the key to understand why within interpretive (verstehenden) sociology, the single individual and his action is the basic unit (atom). Other disciplines treat the single individual as a complex of psychic, chemical, or other "processes". For sociology everything that is below the threshold of meaningfully interpretable behaviour, oriented toward inner or outer objects, is considered as the processes of nature; they are not the condition, neither the object of orientation for the actor. For the same reason, the individual is, for interpretive sociology, above this threshold and the only agent of meaningful behavior.

6.7 Summary

A majority of Max Weber's works focused on exploring the unique significant cultural conditions that gave rise to specific historical outcomes. This line of inquiry moved him to design a methodology within the social sciences that integrated both hermeneutical concerns and explanatory objectives. Because human beings have a subjective inner world, a different methodology and conceptual framework was necessary. He stressed that sociology must reject the presumption that understanding and causal explanation have no relationship to each other. For philosophers and social scientists, the works of Weber is significant because of the view that empathy is somehow essential to the social sciences.

6.8 Questions Answer briefly (6 marks).

i. Define social action following Max Weber. ii. Define social relationship following Weber. iii. What is associational action? iv. What is consensual action? v. Define consensus. vi. Define institution.

NSOU CC - SO - 03 109 Answer in detail (12 marks) i. Define social action and discuss the types of social actions. ii. Discuss methodology of interpretive sociology following Weber. iii. Discuss the categories of interpretive sociology following Weber. iv. Evaluate the contribution of Weber with reference to interpretive sociology. Essay Type Question (20marks) i. Evaluate significance of Weber in delineating methodology of social sciences with special reference to interpretive sociology. ii. Critically analyze interpretive sociology of Max Weber.

110 NSOU CC - SO - 03 6.10 Glossary
Ideal type: It refers to any conceptualization (idealization) of a general or particular phenomenon which, for analytical and explanatory purposes, represents this phenomenon only in its abstracts or 'pure', 'idealized' form(s).
Interpretive Sociology: It is a specific domain of sociology that lays emphasis on the meaning and motive of social actions by individual social actors. The focus is on intentions behind human behaviour. It also considers social life as a subjective reality and so it needs to be interpreted. Interpretive sociology involves a variety of forms of sociology (approach of Weber, Symbolic Interactionism, Sociological Phenomenology) united by an emphasis on the necessity for sociologist to understand and interpret actors' meanings. Weber defines Interpretive Sociology as a science concerned with interpretive understanding of social action as well as causal explanation of. **Social Action:** An action is regarded as social when its subjective meaning takes others' behaviour into account and it is oriented in its course accordingly. The "others" may be an individual person, someone known or an indefinite unknown plurality
Social relationship: Social relationship consists of a probability that there will be a meaningful course of social action irrespective of the basis of probability. It existed, exist and will exist appropriate to the meaning.

Mills • G.Simmel In the evolution of the conflict Perspective • The main arguments of the conflict perspective • Defining the term Conflict Perspective Module - III : Conflict Perspective

112 NSOU CC - SO - 03 7.2 Introduction As a sociological Theory, conflict perspective understands the social reality in terms of competitions and conflicts that ensue between different groups because they have common interest. It is due to lack of resources and increase in competition that conflict seems to be the only route to maximize one's desires and gains, and conflict is the natural consequence as the attainment of one's desires is stopped by the other, thereby creating a relation of inequality and subordination. In such scenario, conflict seems to be the only route to attain equality, and hence change in the existing social structure. Conflict theorists emphasized the proactive roles of individuals who were capable of being actors, in achieving their own goals. Machiavelli and Hobbes initiated the basic stance of cynical realism about human society. Individuals' behavior is explained in terms of their self-interests in a material world of threat and violence. Social order is seen as being founded on organized coercion. There is an ideological realm of belief (religion, law), and an underlying world of struggles over power; ideas and morals are not prior to interaction but are socially created, and serve the interests of parties to the conflict 7.3 Conflict perspective as a criticism to Structural Functionalism Conflict perspective developed as a major theoretical alternative to the structural functional perspective. The Structural-Functional perspective of Talcott Parsons which was based on the principle that societies and social institutions work as a unit and if there are anomalies or conflict within, then there are alternatives to tackle the conflict. The functionalist perspective points to the ways in which different parts of a system are interdependent and work together to keep the system working together and hence there is always peace in society. There cannot be any anomaly as all the parts necessary for the smooth functioning of the society help and work in a coordinated manner. Functional perspective was criticized as it could not apprehend social change; hence functionalist were termed as being politically conservative as they focused on the cultural and political norms and values rather than understanding the phenomenon of power and resource. As the structural functionalists focused on norms, they failed to look into the dynamic nature of actors who could change the situation through social action. In contrast to the single way of understanding of the society, there were various other ways of looking at society. These were the major criticisms labelled against the Structural Functional Perspective, which brings us to the forerunners of the Development of the Conflict Theory. The main NSOU CC - SO - 03 113 personalities who developed the Conflict Perspective are – Karl Marx (1818-1833), C.W Mills (1916-1962), Gumplowicz etc. Gumplowicz theorized that large complex human societies evolved from the war and conquest. The winner of a war would enslave the losers; eventually a complex caste system develops.[3] Horowitz says that Gumplowicz understood conflict in all its forms: "class conflict, race conflict and ethnic conflict", and calls him one of the fathers of conflict theory. 7.4 Contribution of Karl Marx Karl Marx was a humanist who was moved by the immense sufferings of the working class under the pressure of capitalism. Hence an undeniable social reality was the prevalence of conflict and contradictions, which he calls dialectics, among the various levels of social reality. Marx analyses society in the form of a stratified system where relation between a group of men and the means of production becomes the starting point of conflict. According to Karl Marx, the major classes in a capitalist society are on the one hand owners of capital i.e., owners of labour power and landowners on the other hand. Individuals are self-seeking, guided by their own interests. Hence the major cause of destruction of the capitalist system is the increase in the self-interest of the capitalist. When due to the increase in network of communication there develops some form of organization and people have a common enemy the masses convert from just an aggregate of individuals to self-conscious individuals. In a capitalist society when the workers unite on understanding their extreme exploitation at the hands of the capitalists, they convert themselves from class-in-itself to class-for-itself so that they realise that conflict is the only way to their attaining freedom. According to Karl Marx conflict is the major reason for change in society from feudal to capitalist which is propelled by the economic causes as economy forms the substructure of society upon which the superstructure is based. Thus Karl Marx viewed society as a form of stratified class structure, where social groups were based on their relations of production. In a stratified society there are mainly two classes the ruling class or the Bourgeoisie and the working class or the Proletariat. The Bourgeoisie derive their power from the ownership and control of the means of production. The ruling class deprives the working class of all their basic pay and exploits them by expropriating the surplus values. The Surplus value is the difference in the actual value of the product once it is sold in the market and the value that the proletariat receives. The proletariat receives only a meager amount just enough to maintain the bare existence of the proletariat while the surplus is expropriated by the capitalist. In this way the working class is alienated from his livelihood, his product and consequently from all the social and cultural values and hence alienated from himself.

114 NSOU CC - SO - 03 Thus, according to Karl Marx, history has been moving through different stages and these changes have been initiated by social conflict, where the subordinated and oppressed classes come in conflict with those holding the power and dominating positions. Due to the dialectics between the dominating and the oppressed classes, a new socio – economic order is created and new classes are formed. In the stages of conflict, three factors become absolutely necessary, which are – 1. The power of the productive forces, 2. The mode of production, and 3. relations of production, (the classes involved in the struggle). And 4. The role played by ideology. According to Karl Marx, society has passed from primitive communism, ancient society, feudal society and industrial capitalist society. In this society as well conflict between the working labour class and the ruling bourgeoisie class shall result in a new era which shall be marked by classlessness. In the primitive communist stage, there were no classes because there was no private property. In the ancient society, there were visible classes- the serfs and the masters. In the feudal society conflict between the serfs and the feudal lords resulted in the industrial society. The ruling class in all these epochs formed the minority but they were in control over the means and forces of production while the subject classes were the slaves, serfs and workers. The subject classes formed the majority but they were dominated, controlled and their means of sustenance was controlled by the ruling classes. The relation between the ruling and the subject classes was marked by exploitation and oppression. In all these societies the real wealth laid in the labour of the oppressed classes. The ruling classes controlled the labour by giving them wages. But the wages were not equivalent to the labour power given to produce a certain product. Thus conflict ensued between the classes as there was stark difference between the rewards received for labour compared to the reward received in exchange for the product that was finally sold in the market. The contributory factors that initiated and intensified the conflict between the classes are 1. Conflict over economic rewards between the classes. 2. Physical concentration of masses of people. 3. Easy communication among the people in the same class position. 4. Development of solidarity (class consciousness) 5. Political organization and role of ideology 6. Revolution that changed the entire social structure. The society shall hence be known as Socialist Society where all men shall be treated equal, but as state is always controlled by the ruling class it becomes necessary to annihilate

NSOU CC - SO - 03 115 the State, which will result in Communism on the basis of withering away of the state and classes. Thus, Karl Marx's conflict perspective is known as the Materialist conception of history or Dialectical Materialism, where matter or the economy is the main cause of generating conflict and thereby creating social changes. Do you know? The major causes of conflict, according to Marx, are- • Marx indicated the material conditions that mobilize particular class interests into action and that make it possible for the classes to articulate their ideas. • 2. The material conditions for mobilization as a coherent, intercommunicating group also vary among social classes. • 3. Classes differ in their control of the means of mental production. These Marxian principles, with certain modifications, provide the basis for a conflict theory of stratification. Thus Karl Marx can be rightly called the father of Conflict perspective, who understood the inequalities that prevailed in society which could only be corrected through conflict which in turn shall bring social change. 1. Historically, particular forms of property (slavery, feudal landholding, capital) are upheld by the coercive power of the state; hence classes formed by property divisions (slaves and slave-owners, serfs and lords, capitalists and workers) are the opposing agents in the struggle for political power and the underpinning of their means of livelihood. 2. Material contributions determine the extent to which social classes can organize effectively to fight for their interests; such conditions of mobilization are a set of intervening variables between class and political power. 3. Other material conditions— the means of mental production—determine which interests will be able to articulate their ideas and hence to dominate the ideological realm. Marx's idea about Theory of Stratification According to Marx, conflict leads not only to ever-changing relations within the existing social structure, but the total social system undergoes transformation through conflict. During the feudal period, the relations between serf and lord and between burgher and gentry, underwent many changes both in law and in fact. Yet conflict finally led to a breakdown of all feudal relations and hence to the rise of a new social system governed by different patterns of social relations. It is Marx's contention that the negative element,

116 NSOU CC - SO - 03 the opposition, conditions the change when conflict between the sub-groups of a system becomes so sharpened that at a certain point this system breaks down. Each social system contains elements of strain and of potential conflict; if in the analysis of the social structure of a system these elements are ignored, if the adjustment of patterned relations is the only focus of attention, then it is not possible to anticipate basic social change. Exclusive attention to want and use, to the customary and habitual bars access to an understanding of possible latent elements of strain which under certain conditions accentuate in overt conflict and possibly in a basic change of the social structure. 7.5 Critique of Karl Marx Karl Marx's theory was heavily criticized for the following reasons – (1) Societies are not simply reflections of the economic inequalities. There are other forms of inequalities as well. (2) Apart from social classes there are also interest groups in societies that are unrelated to social classes but demand benefits. (3) Those who possess power in capitalist society are not always those with the highest income or the owners of the most property. There are other criterion of assuming power in society. (4) Conflict in a large modern society is rarely bipolarized. Society is not simply characterised by the working proletariat and ruling bourgeoisie classes, rather the nature of classes has changed in accordance with the change in the society and (5) Social conflict does not always lead to structural social change. Social conflict might lead to reformation or change in the social parts but not necessary a total revolution. 7.6 Contribution of Max Weber We now turn our attention to Max Weber who also made an important contribution in throwing a new dimension to conflict perspective. He was preoccupied with the issues of power and conflict. He suggested that the capitalist world of rational calculation and profit necessarily involved the sublimation of erotic desires. Conflict and search for power were for Weber , endemic in all social relationships .The key determinants in social relationships was power , which he defined

as the "probability that one actor within social relationship will be in a position to carry out his will despite resistance ,

regardless of the basis on which this probability rests." A more refined definition, he

NSOU CC - SO - 03 117 went on, would include the basis for the probability that a command will be obeyed. "Domination, a related concept, he defined as the possibility that a command will be obeyed by a given group of persons.(1925,1:53) Weber pointed out that every social sphere was influenced by the structures of domination. The concept could be applied to relations " a drawing room as well in the market, from the rostrum of a lecture hall as well as command post of a regiment , from an erotic or charitable relationship as well as from scholarly discussions or athletics (1925, 2:943). Weber was primarily concerned with domination related to administration. Domination, "expresses itself and functions through administration and every administration needs domination because it is always necessary that some powers of command be in the hands of somebody. (1925,2:948) German sociologist Max Weber adopted many aspects of Marx's conflict theory and further refined the idea. Weber believed that conflict over property was not limited to one specific scenario. Rather, he believed that there were multiple layers of conflict existing at any given moment and in every society. Whereas Marx framed his view of conflict as one between owners and workers, Weber also added an emotional component to his ideas about conflict. He stated: "It is these that underlie the power of religion and make it an important ally of the state; that transform classes into status groups, and do the same to territorial communities under particular circumstances...and that make 'legitimacy' a crucial focus for efforts at domination." Weber's beliefs about conflict extend beyond Marx's in that they suggest that some forms of social interaction, including conflict, generate beliefs and solidarity between individuals and groups within a society. In this way, an individual's reactions to inequality might be different depending on the groups with which they are associated, whether they perceive those in power to be legitimate, and so on. He agreed with Marx but also believed that, in addition to economic inequalities, inequalities of political power and social structure cause conflict. In addition to that Weber noted that different groups were affected differently based on education, race, and gender, and that people's reactions to inequality were moderated by class differences and rates of social mobility, as well as by perceptions about the legitimacy of those in power. Weber shows that several different forms of property conflict coexist in the same society, and hence, by implication, allow the existence of multiple class divisions. He elaborates on the principles of organizational intercommunication and control thereby adding a theory of organization and yet another sphere of interest conflict, this time intra- organizational factions; he also emphasizes that the violent coercion of the state is

118 NSOU CC - SO - 03 analytically prior to the economy, and thus transferred the center of attention to State as the control of the material means of violence. Max Weber noted that different groups were affected differently based on education, race, and gender. People's reactions to inequality were moderated by class differences and rates of social mobility, as well as by perceptions about the legitimacy of those in power. Max Weber's contribution a. Like Marx, Weber too believed that men are motivated by their self-interest and society has paid importance to aggrandisement of wealth. b. People manoeuvred circumstances to suit their interests. c. Power is a defining principle in society and people dominate others using power. Legitimate power is called authority, which implies that certain people have the right to be obeyed. d. Other than wealth, an individual's status and life chances were equally important in determining the power that an individual had in society. 7.7 Contribution of Georg Simmel German sociologist Georg Simmel (1858–1918) believed that conflict can help integrate and stabilize a society. He said that the intensity of the conflict varies depending on the emotional involvement of the parties, the degree of solidarity within the opposing groups, and the clarity and limited nature of the goals. Simmel also showed that groups work to create internal solidarity, centralize power, and reduce dissent. Resolving conflicts can reduce tension and hostility and can pave the way for future agreements. Georg Simmel analyzes conflict in terms of interactive processes and depicts conflict as "a form of socialization." No group can be entirely harmonious, for then it would lack process and structure. Group formation is a result of both association and dissociation, so that both conflict and cooperation serve a social function. Some certain degree of conflict is an essential element in group formation. Simmel in the chapter on "Sociology: Studies in the Form of Sociation" writes about the social significance of conflict. He maintains that one should not overlook the positive aspect of conflict and just focus on the destructive tendencies of conflict. In Simmel's view, conflict serves as maintaining and increasing the integration within group. "It is a way of achieving unity"

NSOU CC - SO - 03 119 He analyses conflict as a social form. The fighting instinct is the ultimate cause of social conflict because conflicts are means to achieve the end rather than merely an instinctual reactions to external stimulus. It means that conflict is the fundamental principle by which individuals achieve their purposes in innumerable social contexts like marriage, work , politics, play hence it is viewed as a social form. Moreover, conflict is nearly always combined with cooperation ; people agree on norms that regulate when, where and how to fight with one another. As he writes, "there probably exists no social unit in which convergent and divergent currents among its members are not inseparably interwoven." He then goes on to illustrate conflict between groups and conflict within groups. Conflict within groups revolves around three forms – 1. Conflicts in which opposing groups possess common personal qualities. 2. Conflicts in which opposing parties perceive each other as threat to the existence of the group and 3. Conflict in which the opposing parties recognise and accept each other as legitimate opponents. Conflict between groups – Simmel analyses the consequences that "conflict between groups has for the inner structure of each party itself." He was concerned with the consequences of conflict on social relationships with regard to (1) degree of centralisation of authority within each group, (2) degree of social cohesion / solidarity within each group and (3) likelihood of coalitions among groups having similar opponents. Things to do Have you ever fought with your classmates? Write about the changes that you see in the friendship after the in- group fight.

7.8 Contribution of C.W.Mills C.W. Mills or Charles Wright Mills was an American sociologist and a professor of sociology at the Columbia University. He was born in 1916 and died in 1962. Mills was a known figure in the popular and intellectual journals. He wrote several books which highlighted several relationships among the American elite and the common people during the post-World War 2 era. There are three books which define his term as a sociologist: 'The Power Elite' looks to focus on the relationships and the class alliances among the US political, military and economic elites, 'White Collar: The American Middle Classes' which was a study of the American middle class and 'The Sociological Imagination', which presents a model of analysis for the interdependence of subjective experiences within a person's biography, general social structure and historical development. He is known as the founder of the modern conflict theory. He regards society as a dynamic entity constantly undergoing change as a result of competition over scarce resources. The theory regards life competition and focuses on the distribution of resources and power. The conflict theory is better at explaining social change. In his work, he believes social structures are created because of conflict between differing interests. People are directly influenced by the social structures which are formed due to difference in power and because of the power struggle between the "elite" and the "others". People feel the impact of social structures, and the usual result is a differential of power between the "elite" and the "others". C. Wright Mills writes about the governing elite in America in his book the Power Elite and argues that a few individuals within the political, military and corporate realms hold power within the United States and they make decisions that affect the common lives of the Americans. The executive branch, military leaders and corporate leaders occupy the topmost portion of the power structure, the interest group leaders, legislators and local political leaders occupy the middle; and the common masses (the everyday people) at the bottom. Therefore the 'national upper class' that own most of the country's wealth, run its banks and corporations, are in control of the universities and mass media and staff some of the highest ranking positions within government and courts and these elites move fluidly between positions within the three controlling realms. Mills noted that these power holders. usually were people who interacted with each other regularly and typically held the same political and economic views or agendas. Therefore the few individuals who have so much power that the wishes of the average people are not heard. Those at the top of the social structure are so distant from the average people and that they are so powerful that there isn't any true competition for them. Thus, they usually tend to get what they want. The labour class had always been of interest to Mills. He strongly believed that the labour class was a strong force against the monopoly of the corporate capitalist in economic, political and cultural terms. He further stated that mass society and culture could affect the governing elites at that point of time. Other contributors of the conflict theory are Vilfredo Pareto, Mosca and Michels and Thorstein Veblen.

NSOU CC - SO - 03 121 Thorstein Veblen said that modern society is characterised by conflict between opposing economic groups. People demanded high esteem of others that naturally motivated them to engage in leisure activities or in consumption behaviour. According to Pareto, men in power always exert authority over the others. People who occupy the position of authority share a common culture and they act together to defend their position. 7.9 The main arguments of the Conflict Perspective Thus the main tenants of the Conflict perspective can be summarized as follows. Conflict theory states that tensions and conflicts arise when resources, status, and power are unevenly distributed between groups in society and that these conflicts become the engine for social change. In this context, power can be understood as control of material resources and accumulated wealth, control of politics and the institutions that make up society, and one's social status relative to others (determined not just by class but by race, gender, sexuality, culture, and religion, among other things). It is stated that a. People are power hungry and work towards their own interest. b. The source of conflict in society is power which is scarce and unequally divided. Power is also coercive. c. Groups and units in society fight for power and resources. d. Conflict implies one group is able to suppress its rivals, temporarily. The strife continues in a cycle as when one group rises to power, the rival determines to throw them down and rise to power. e. The institutions created by the State shall benefit those in power and the others shall stay deprived. f. An important aspect of Conflict perspective is that, they see values and ideas that can be used by different groups to achieve their own ends, rather than defining goals for the society. People have defined 'true' interest that works in their favour. g. Marx had analysed societies historically and concluded that there have always been conflicts between different classes, which was also responsible for social change. Marx established the link between ideas and 'interests' who developed those ideas and concluded that the 'ideas of an age always reflected the ideas of the ruling class'. He also said that the nature of property ownership determines the nature of people and social conflict

122 NSOU CC - SO - 03 7.10 Conclusion Conflict Theory : A social science perspective that holds that stratification is dysfunctional and harmful in society, with inequality perpetuated because it benefits the rich and powerful at the expense of the poor. Conflict theory sees social life as a competition, and focuses on the distribution of resources, power, and inequality. • Unlike functionalist theory, conflict theory is better at explaining social change, and weaker at explaining social stability. • Conflict theory has been critiqued for its inability to explain social stability and incremental change. • Conflict theory derives from the ideas of Karl Marx Why do conflicts occur? There is conflict because violent coercion is always a potential resource to achieve one's gain but being coerced is an intrinsically unpleasant experience, and hence that any use of coercion, even by a small minority, calls forth conflict in the form of antagonism to being dominated. What are the different Schools of Conflict Perspective? a. The first group of thinkers believe that fact is inseparable from value, hence social scientists have the moral obligation to criticize society thereby eliminating all sources of social conflict. Thinkers in this category were influenced by the work of Karl Marx like C.W Mills, Pierre Bourdieu, neo Marxism and the Frankfurt school. b. The second group of thinkers believe that fact and value should be separated and be objective like the natural sciences, in understanding the social phenomenon. These thinkers believe that conflict is an essential part of every society. We shall discuss the second group of thinkers – Ralf Dahrendorf and Lewis Coser. 7.11 Summary We have presented the general arguments of conflict theory. We have discussed the contributions of Karl Marx, Max Weber, George Simuel, C. W. Mills etc. We also presented a critical overview.

NSOU CC - SO - 03 123 7.12 Questions a. Analyse the Marxian notion of class conflict. b. Write the concept of power and domination as mentioned by Weber . How does power lead to conflict? c. Elaborate on Simmel's notion of social conflict. d. Do you think Marxism is still relevant in the present post Capitalist age ? e. Make a list of classes that you see in society. f. Is society only divided into the bourgeoisie and the proletariat classes? g. What is the most common form of domination in the present age ? h. How will you link class and the WhatsappUsage ? Answer briefly 1. What are the major criticisms levelled against Karl Marx? 2. Write a short note on the different schools of social conflict. 3. What are the main arguments of conflict perspective ? 4. Write a brief note on the different types of conflict as given by Simmel Answer very briefly. 5. Who are the governing elite ? 6. How does conflict help in social cohesion. 7. State one similarity and one difference between Weber and Marx. 8. Name the sociologist who lonked authority and culture ? 9. Key Terms- conflict, power, resource, stratification, class, economy, ruling class, oppressed class 7.13 References Randall Collins, Conflict Sociology. New York: Academic Press, 1974, pp.56-61.

126 NSOU CC - SO - 03 8.2 Introduction Dahrendorf attempts to synthesize the Marxian concepts of class, class interests, and class conflict on the one hand and the methodology and the concepts of the modern theory of action, on the other, in his analysis of social conflict and change. In his theory, Dahrendorf attempts to understand authority as it appears as the focus and cause of social conflicts and plays a dual role in social structures, as both an integrative force and a source of conflict. In each social structure ("imperatively coordinated association") there are two classes, rulers and ruled, whose conflicting interests are defined in terms of role- expectations. Likewise Dahrendorf cannot fulfil his promise to provide a concept of change which transcends given structures, in the Marxian sense. However his explanation of change turns out to be identical with that of social mobility. Dahrendorf's criticism is directed against those sociologists whose works suggest that industrial society is characterised by consensus and integration. He wants to redirect the focus of inquiry to the phenomena of inequality, power, and social conflict. a. He stresses the importance of power which inevitably results in conflict. b. He is concerned with the ways in which social institutions generate groups with conflicting interests and the circumstances in which such groups become active and organized. Marx's notion of social structure and power is the starting point of the production and reproduction of the material culture in which human life is embedded. Capitalism is a form of social production process that generates material conditions which in turn are vehicles of the social conditions to which individuals are subjected. Property arrangements underlie the existence of "surplus" labour, performed in excess of the socially "necessary" labour, by those who do not own any means of production. In this sense property is conceived of as the basis of the master-servant relationship, in which the worker possesses only his marketable labour. This antithesis of capital and wage labour, of power and subjection, is for Marx the basis of the social structure. Society is divided into two principal classes arising from this structural antithesis, whose objective interests arise from their respective positions in the production process. The class structure, for Marx, is identical with the power structure. For Marx, power is not an irreducible phenomenon it is explained through a dialectic inherent in power. The social class which becomes the ruling material force of the society is forced to promulgate its particular interest as the common interest of the whole society. The objective conflicts which continue to exist between rulers and ruled are merely suppressed. With every new class rising to

NSOU CC - SO - 03 127 power, new conflicts evolve. In this way ruling classes produce the conditions of their own destruction. These conditions are the dynamic elements of history. Parsons' explanation of power : For him, social order is realized basically through the internalization of norms and values, but value consensus alone cannot guarantee order. There is also the need for "some supplementary coordination provided by explicit prescriptive or prohibitory role expectations (e.g., laws) enunciated by actors in specially differentiated roles to which is attached 'responsibility'. In this context, authority is identical with social controls, external to "ego," and has an integrative function which goes beyond that of internalization in that it helps to define norms and secure their observance. From Marx's theory Dahrendorf borrows one central element, the notion of social change as a normal and continuous phenomenon of society; not only isolated parts of society but its entire structure change. Conflicts, as the cause of change, are inevitably produced in the social structure. Dahrendorf points out, however, that property has been replaced in the course of history with authority relations as the basis of social conflict. Thus, authority becomes the key analytical category of his theory. In his efforts to direct sociological theory out of a "functional utopia," Dahrendorf has reformulated in even more extreme form some of Marx's key assumptions: (1) Social life is typified by opposed interests cohering around differences in the distribution of power; (2) Opposed interests will inevitably result in conflict between those who have and do not have power; (3) Conflict is dialectical since the resolution of one set of conflict relations establishes the conditions of opposed interests for subsequent conflict; (4) Social change ensuing from conflict dialectics is therefore an inevitable feature of social systems. 8.3 Vision of Society: Authority and Class a. Society Dahrendorf explains his dialectical conflict theory through integration and conflict where there is a dialectical relation between stability and change. To balance the image of society as integrated, Dahrendorf begins by outlining conflicting elements. The dynamics of social structures develops from authority relations. According to this "central thesis"

128 NSOU CC - SO - 03 the basic phenomenon, social conflict, is found in all societies at all times. Authority is an element of social structure, but, according to Dahrendorf does not contribute to that structure's functional integration. Consequently, authority must be defined in terms other than those of structural-functional theory. 8.3.1 Authority Dahrendorf's analytical concept of structure, his normative definition of the term, leads him back to structural-functional theory and its difficulties in explaining conflict and change. The connection of authority to social structure, in which he tries to locate the origin of social conflicts in the social structure, means in this context nothing else but that authority resides in roles. Authority is linked to role and derived from it. Authority thus turns out to be defined as legitimate institutionalized role-expectation of superordination and subordination. Although Dahrendorf takes the definition of authority from Weber, it is identical with Parsons' conception. Authority is an institution as it is for Parsons. In this sense authority relationships are nothing else but a specific form of complementary social behavior. Authority is only one integrated pattern of action in the whole role structure of a social system. From the concept of social structure defined in terms of social action, the explanation of authority, coercion, conflict, social classes, class interests, and social change emerge. In his model of society, the function and genesis of authority necessarily are defined in a different way, methodologically, than Marx defines them. Authority is a source of conflict. But Dahrendorf's theoretical foundation of authority varies somewhat with various contexts. Authority, to Parsons, is a necessary supplement to the normative system which can never be explicit enough to guide all action in every possible circumstance. Dahrendorf's differences with Parsons begin where he attaches to authority functions that are not integrative, but are sources of conflict. Thus, he says, the same structure of authority which guarantees integration also becomes the source of conflict. The reason for this is that authority is always coercion, the rule of some over others. Coercion implies, further, the particularization of interest and permits the conclusion that authority not only enforces norms, but performs a norm-setting function as well. This aspect is most important to Dahrendorf when he wants to explain conflict and change, in opposition to Parsons, who stresses authority as an integral subpart of the normative system. With the norm-setting function, Dahrendorf can explain authority only as a prerequisite of ruling groups. This other-wise implicit formulation can be found in his use of the reference-group concept. Here norms originate from social groups in authority positions who use their authority in order to legislate norms.

NSOU CC - SO - 03 129 On the one hand, authority functions to integrate society under a common normative system and to act as a mechanism of social control. On the other hand, it has the instrumental capacity to impose a value system derived from the goals of a minority. Dahrendorf's attempt to evade the consequences of structural-functional theory confronts a difficulty. He has to explain both the integration of society and the conflicts for the attainment of authority as the resultants of the will and intention of a social power group which is able to institutionalize its ends as a comprehensive normative system. 8.3.2 Class Dahrendorf defines classes as being identical with the antagonistic role aggregates of rulers and ruled. The criterion for the definition of classes is not property but the possession of authority positions. Accordingly, in each ICA, there can be only two classes. Therefore, "class" is not, in Dahrendorf's scheme, an independent analytical concept. Classes represent merely the positional (factual) aspect, while class interests are role-expectations or in other words authority. In the context of this reinterpretation of the role-concept, Dahrendorf has to see conflict as arising from the expectations of obedience which the rulers address to the ruled, on the one hand, and the interests of the ruled in authority. The interest in authority exists because authority has the implicit instrumental value for the realization of different end. The importance for the theory lies in the fact that they are automatically in conflict with each other, implying either the preservation or change of the status quo. d. The Explanation of Conflict and Change Dahrendorf's concept of structure does not imply the dialectic of self-originating antagonisms as he intends to show, but that conflict is postulated as a prerequisite of the social structure. The ubiquity of authority, in the context of this theory, correlates perfectly with the ubiquity of conflict. The plurality of values as a source of conflicts. The object of conflicts is not the scarcity of means but authority. The distribution of facilities and rewards, for Dahrendorf, is only an ancillary consequence of the institutionalization of interests as values which the possession of authority makes possible. He defines structural change as the "deviation of values (normative structure) or institutions (factual structure) of a structural entity at a given point of time . . . from those of a preceding point of time". The change of the value system is concomitant with the change of the normative institutions.

130 NSOU CC - SO - 03 8.4 Society as "imperatively coordinated association" By means of conflict theory Dahrendorf (1958b:82) intends to present a model which is known as, the "structural origin of social conflicts." He argues that the structural origins of social conflicts are found in the authority relations of organized social entities, and that these entities appear as coercively integrated Class and Class Conflict in Industrial Society for which Dahrendorf uses the ponderous translation of Weber's term, "imperatively coordinated association." Authority, in the ICA as in the social system, constitutes the "coercive, controlling element". It is understood as a functional imperative. Coercion which, in contrast to normative consensus, is the integrating force of the ICA is defined, exactly as in Parsons' "system," as the sanction against deviation from norms. Dahrendorf thus fails to establish that coercion is unique to it or that it is a specifically different aspect of authority from that term's structural-functional definition. Indeed, the coercive nature of authority simply results from its integrative function. Basically, coercion in Dahrendorf's understanding does not differ from social control. Dahrendorf has to demonstrate that authority coercively integrates and causes conflict. Dahrendorf can thus establish the structural conflict of positions in the social structure. The ICA then is split into two role aggregates according to their "possession of or exclusion from legitimate power". This opposition becomes comprehensible as the starting point of the conflict theory if different and contradicting role-expectations are associated with the authority and non-authority roles. For Dahrendorf, the individual acts in compliance with his role if he contributes to the conflict of contradicting interests, and not to integration. This clearly demonstrates that "conflict" serves as an analytical point of reference in the same manner as "integration" does for the structural-functional theory. That is, integration and conflict are both "prerequisites" of society. This implies obviously an a priori solution of the problem posed: to analyze conflict as generated by structural causes.

8.5 The Intensity of Conflict for Dahrendorf The concept of intensity refers to the degree of psychological commitment of parties to pursue conflict. For Dahrendorf, the more the conditions of organization are met, the more the distribution of scarce resources are correlated, and the less the mobility of the deprived, the more intense will be the conflict.

NSOU CC - SO - 03 131 Major Propositions: • Dahrendorf outlined his theory in the book, Class and Class Conflict in Industrial Society. He argues that there is an inherent tendency to conflict in society. Because

80%

MATCHING BLOCK 195/320

W

the groups with power will pursue their interests and those without power will pursue theirs.

The interest of these groups are different. According to Dahrendorf, distribution of power is a crucial determinant of social structure. He uses Weber's definition of power. Power is the "

100%

MATCHING BLOCK 196/320

W

the probability that one actor within a social relationship will be in a position to carry out his own will despite resistance

regardless of the basis on which this probability rests." • Social system is in a state of continuous conflict that is generated by the opposed interest that is inherent in social systems. Opposed interests arise in society due to differential distribution of power. • Conflict is part of every social life and society deals normally with conflict by institutionalizing it. Class antagonism between factory workers and owners in the late nineteenth century gave rise to political solutions establishing new norms for negotiating grievances like legalization of unions for airing grievances. • Conflict is dialectical, because the resolution of a conflict gives rise to another set of opposed interest that under certain conditions shall generate further conflict.

8.6 Dahrendorf's Theoretical Formulation According to Dahrendorf, there are processes in the society other than conflict that operates in the society. However, the conflict model, according to him, presents the clearer representation of the workings of the human society. Society, according to him, has two sides- one consensus the other that of conflict. He is influenced by the Parsonian model and says how the process of institutionalization creates ICA or the imperatively associated associations, who are characterized by differential power relations with some roles having authority to demand conformity from the others. The social order is maintained by creating various types of authority relations and therefore the ICA becomes legitimate groups. As power and authority are scarce in the society, subgroups within ICA struggle to obtain a greater share of authority. The outcome of the conflict is determined by how the groups within ICA stand in relation to authority. Thus two types of roles can be classified in ICA – the ruled and the ruling. The ruling has an interest of preserving the status quo, while the ruled has interest in distribution of power or authority. Under

132 NSOU CC - SO - 03 certain condition the ICA gets polarized into two conflict groups - each having their objective interests. The resolution of conflict in the ICA only result in the reorganization of the ICA. So, while for Marx, the source of authority relations is superstructure created by the dominant classes, that can be destroyed by conflict, Dahrendorf acknowledges that the source of conflict lies in the dominant classes but the cause of conflict remains the legitimized authority relations of the ICAs. Hence unlike Marx who sees power in property ownership, Dahrendorf locates that in authority. The similarity between Marx and Dahrendorf lies in the changes that conflict does to the restructuring of social structures. The relations of domination and subjugation, created by opposite interests, awareness of the subjugated classes to the opposed interests, the formation of political organization upon the presence of the suitable conditions and consequently polarization of the subjugated groups who are then in conflict with the dominant group form a new pattern. A new set of relations of domination and subjugation further leads to a new set of conflict that changes the social organization. Marx's notion of class consciousness is similar to awareness among the quasi group as given by Dahrendorf. Similarly Marx's class-for-itself is similar to Dahrendorf's conflict group. Dahrendorf in his ICA elaborates on the intervening empirical conditions on the conditions under which legitimized authority relations are converted into relations of domination, coercion and subsequently conflict. Hence according to him, conflict can hinder changes unless the intervening variables are present. The intervening variables cause the quasi group to become conflict group as well affect the intensity (or involvement of the members) of the conflict, violence or the degree of regulation of conflict and the rate of structural changes caused by it.

70%

MATCHING BLOCK 197/320

W

Dahrendorf outlines three types of intervening variable conditions-1. Condition of organization that affects the transformation from quasi group to

61%

MATCHING BLOCK 198/320

W

conflict group, 2 conditions of conflict that determine the form and intensity of conflict. 3. Condition of structural changes that influence the kind, speed, and depth of changes in the social structure. The variables in his theoretical scheme are – 1. Degree of conflict group formation 2. Degree of intensity of conflict 3. Degree of violence of the conflict NSOU CC - SO - 03 133 4. Degree of changes in the social structure 5. And rate of such

changes. Dahrendorf sees conflict as the growing awareness among the subjugated groups about their conditions and their formation into conflict groups. The more the technical conditions of the quasi group become aware of their objective interest, the more conflict is likely to occur. The more leaders among the quasi group can be developed and the more there are codified idea system the more the technical conditions can be met. More the sense of deprivation, greater shall be the violence of conflict which is closer to Karl Marx's analysis.

51%

the conflict. The more the distribution of authority and other rewards are associated with other, the more intense will be the conflict. Less the mobility between the super and subordinate groups, the more intense will be the conflict.

In this proposition, Dahrendorf was much influenced by Weber and Marx. The greater the realisation that distribution of rewards are based on relative basis rather than on absolute terms, more shall be the violence of the conflict. Less the ability of the conflict group to develop regulatory arrangements, more shall be the violence of the conflict. Greater the intensity in a conflict, greater shall be the structural changes and its reorganisation. This too is also obtained from Marx's analysis. In this analysis, it is observed that Dahrendorf was influenced by Marx and Weber. Marx's correlation between awareness of the subordinate group's interest and its subsequent formation into conflict group is similar to Dahrendorf's analysis of a conflict group. 'less the technical, political and the social conditions of the organisation, greater shall be the intensity of the conflict'. This proposition of Dahrendorf is borrowed from Simmel's

134 NSOU CC - SO - 03 proposition that if the organisation is not well organised then conflict shall be emotionally involving. In the proposition where Dahrendorf talks about the distribution of rewards as it is associated with conflict, he borrows this from Weber, when he claims that the greater is the superimposition of rewards – or the privilege of those who enjoy prestige, privilege greater shall be the involvement of the subordinates in pursuing conflict. 8.7 Dahrendorf's Idea of Conflict 1. Social stratification is based on different social positions of wealth and reputations which is expressed in a rank order of social status. Therefore stratification is caused by norms which makes certain things desirable and others not. 2. For Dahrendorf, the source of conflict lies in the institutionalized authority relations of ICAs. ICA or Integrated Coordinated Association consists of authority relations that forms the 'factual substrates', or the source of conflict. ICA is characterized by relations of domination and subjugation which creates an inherent opposition of interest. Under certain conditions when opposed interests lead to political organization then polarization of subjugated groups creates new patterns of conflict. 3. There are certain intervening conditions that affect the degree of conflict. 4.

Criticism Some of the criticisms levelled against Dahrendorf can be mentioned below: 1. Dahrendorf does not clearly specify the variables 2. Although he gives a dialectical conflict theory, it was more akin to Talcott Parson's theory of institutionalisation where presence of authority is the beginning of conflict. 3. He defines authority as a relation of domination-subjugation that makes it structural dichotomy necessary for the beginning of his dialectical theory. 4. Turner explains that the concepts of authority, domination, and interest have their own intervening empirical conditions that also influence the extent, violence and intensity of the conflict. 5. Although Dahrendorf positions himself as a critique of functionalism, rather he is a critique of Parson's theory of shared values or generalized value system in society. Dahrendorf's Imperatively Coordinated Associations are similar to Parsons' view of the social world in terms of institutionalized patterns. 7. The legitimized normative patterns reflect power differentials. This is similar to Parsons. concept of power, as the legitimate right of some status roles to regulate the expectations attendant upon others statuses. 8. In Dahrendorf's model, deviation from the norm established by status- roles will lead dominant groups to attempt to employ negative sanctions. This position is similar to Parsons' concept that power exists to correct deviations from within the group. From the above position, it can be observed that for Dahrendorf power differentials cause integration through legitimized authority relations and disintegration through

136 NSOU CC - SO - 03 persistence of opposed interests . This further implies the functional strands that are visible in Dahrendorf's position. When he says that conflict arises out of legitimized authority, it implies that opposed interests exist and cause conflict. Therefore he assumes that authority is functional requisite for system integration and that conflict that emerges from authority relations is a functional requisite for change. 8.9 Conclusion Dahrendorf was much influenced by Parsons' functional analysis. Parsons' theory of social system is similar to Dahrendorf's ICA, Parsons' function of role as associated with social control is similar to Dahrendorf's concept of role and authority. Conflict is pre-requisite to meet the needs for social change. Due to these reasons Dahrendorf's theory can be called functional theory of conflict. He emphasizes on functions of social conflict because conflict has become an essential part of social structure that allows scope for co-existence and interdependence of numerous groups with diverse and conflicting values. Dahrendorf's conflict theory represents a mixed system having some properties of both alternative approaches. Dahrendorf's starting point

100%

MATCHING BLOCK 207/320

W

is that neither structural functionalism nor Marxism alone provides an acceptable perspective on advanced society.

89%

MATCHING BLOCK 208/320

W

Dahrendorf contends that post capitalist society has institutionalized class conflict into state and economic spheres. For example, class conflict has been habituated through unions, collective bargaining, the court system, and legislative debate. In effect, the severe class strife typical of Marx's time is no longer relevant.

According to Dahrendorf, Marx's notion of class is justifiable because in his time capitalism was dominated by owner-managed firms where ownership and authority were concentrated in the same hands. In contemporary economy, however, the most representative form of business organisation is a joint-stock company with dispersed share ownership. In this situation control over the means of production is wielded by professional managers, and not by legal owners. This shows, in Dahrendorf's opinion, that the priority order of ownership and power should be reversed, it is no longer, as in Marx's time, that ownership entails authority, but, contrariwise, property is subordinated to authority. This is its special case. On the basis of his assumptions, Dahrendorf argues that

100%

MATCHING BLOCK 209/320

W

society can be split up into the "command class" and the "obey class" and class conflict should refer to situations of struggle between those with authority and those without.

However, there are several serious problems with that notion. Dahrendorf claims that all conflicts only involve two contending parties. This view of conflict appears too simplistic to apply to advanced society, the very same inaccuracy NSOU CC - SO - 03 137 Dahrendorf accuses Marx of. Furthermore, on the basis of Dahrendorf's theoretical premises, one can in fact distinguish innumerable classes. For Dahrendorf classes are present in each so-called imperatively-co-ordinated group, be it a nonprofessional theatrical troupe, football club or a business corporation. In each such case one can discern two opposed groups : superiors and the subordinated. Needless to say, this leads to rather odd conclusions. From his definition of social class, if we see all authority relations as class relations, it follows that a conflict between parent and child, for instance, is a class conflict. Besides, he fails to establish the difference between authority resulting from truly legitimate power and authority stemming from a situation where a subordinate is regularly obedient to a superior for other reasons.

To understand the causes of conflict. To understand the types and functions of conflict To understand the relation between conflict and social change. 9.2 Introduction Lewis Alfred Coser was born on 27 November 1913 in Berlin. He was a German-American sociologist. His father was a successful Jewish industrialist. In 1933 he fled from the Nazi Germany to Paris and in 1941 he left Nazi occupied Paris for the United States where he married Rose Laub. In the Fifties, he enrolled as a graduate student in sociology at Columbia University, taking his PhD at the age of forty-one. Coser first taught at the University of Chicago and then the University of California. He then founded the sociology department at Brandeis University and taught there for 15 years before joining the sociology department of the State University of New York at Stony Brook.

140 NSOU CC - SO - 03 Lewis Coser revealed recently that "the latent motives for doing much of my work are probably formed in the vicissitudes of my life and career" (Rosenberg 1984, p. 52). In addition, Coser has published several autobiographical writings (Coser 1988a, pp. xi- xx; 1988b). Together these writings can be taken as an invitation to pursue a contextualist interpretation of his sociological oeuvre. This Paper offers one modest contribution to such an undertaking: an examination of some neglected aspects of Coser's reception of Georg Simmel. Coser's dissertation-as-book, The Functions of Social Conflict (1956a), hereafter called Functions, will be the main focus of analysis. It is the thesis of this paper that Coser's reception of Simmel and his theory of conflict were a function of his reaction to the postwar loss of Marxist "revolutionary self-confidence and theoretical self-certainty" 1 and of his consequent search for new ideals and intellectual directions. It is basic to our argument that Coser's study on conflict was a deeply personal book and a historically situated statement. The following discussion will substantiate this biographical and historical argument and will draw implications for current sociological theory and research. Lewis A. Coser was born in 1913, in Berlin, to Martin and Margarete (Fehlow) Cohn. 2 His father, a banker and stockbroker of German-Jewish heritage, did not himself attempt to assimilate, but changed the family name to Coser for the sake of his son, It is significant for his later intellectual career that Coser did not identify directly with his father's Jewish heritage or with the upper middle-class background of his youth, but rather with the cause of socialism and radical politics. Still, Coser was to benefit from his father's economic situation and the educational opportunities it entailed. Following his father's wishes to gain international experience, he traveled to England in the early 1930s. He moved on to Paris rather than returning to Berlin in order to escape persecution by the virulent anti-communist campaigns of the ascendant Adolf Hitler. In Paris, Coser not only attended classes in sociology at the Sorbonne, taught by the aging Durkheimians Bougle and Fauconnet, but also became intensely involved in radical political groups. Coser was the first sociologist who tried to bring together structural functionalism and conflict theory. His work was focused on finding the functions of social conflict. Coser argued with Georg Simmel –

93%

MATCHING BLOCK 215/320

W

that conflict might serve to solidify a loosely structured group. In a society that seems to be disintegrating, conflict with another society

or inter-group conflict, may restore the integrative core. For example, the cohesiveness of Israeli Jews might be attributed to the long-standing conflict with the Arabs. Conflict with one group may also

91%

MATCHING BLOCK 216/320

conflict, can bring some ordinarily isolated individuals into an active role.

The protest over the Vietnam War motivated many young people to take vigorous roles in American political life for the first time. NSOU CC - SO - 03 141 Conflicts also serve

94%

MATCHING BLOCK 226/320

W

a communication function. Prior to conflict, groups may be unsure of their adversary's position, but as a result of conflict, positions and boundaries between groups often become clarified, leaving individuals better able to decide on a proper course of action in relation to their adversary.

In his major work, "The Functions of Social Conflict", (1956), he enumerates the functions or role of social conflict. Coser has also published several autobiographical writings (Coser 1988a, pp. xi-xx; 1988b). 9.3 Causes of Conflict Yet, not all social systems contain the same degree of conflict and strain. The sources and incidence of conflicting behaviour in each particular system vary according to the type of structure, the patterns of social mobility, of ascribing and achieving status and of allocating scarce power and wealth, as well as the degree to which a specific form of distribution of power, resources and status is accepted by the component actors within the different sub-systems. But if, within any social structure, there exists an excess of claimants over opportunities for adequate reward, there arises strain and conflict. Any social system implies an allocation of power, as well as wealth and status positions among individual actors and component sub- groups. As has been pointed out, there is never complete concordance between what individuals and groups within a system consider their just due and the system of allocation. Conflict ensues in the effort of various frustrated groups and individuals to increase their share of gratification. Their demands will encounter the resistance of those who previously had established a 'vested interest' in a given form of distribution of honour, wealth and power. To the vested interests, an attack against their position necessarily appears as an attack upon the social order. Those who derive privileges from a given system of allocation of status, wealth and power will perceive an attack upon these prerogatives as an attack against the system itself. However, mere 'frustration' will not lead to a questioning of the legitimacy of the position of the vested interests, and hence to conflict. Levels of aspiration as well as feelings of deprivation are relative to institutionalized expectations and are established through comparison. When social systems have institutionalized goals and values to govern the conduct of component actors, but limited access to these goals for certain members of the society, 'departures from institutional requirements' are to be expected thereby causing conflict. Similarly, if certain groups within a social system compare their share in power, wealth and status honour with that of other groups and question the legitimacy of this distribution, discontent is likely to ensue. If there exist no institutionalized provisions for the expression

142 NSOU CC - SO - 03 of such discontents, departures from what is required by the norms of the social system may occur. These may be limited to 'innovation' or they may consist in the rejection of the institutionalized goals. Such 'rebellion' 'involves the direct or vicarious experience of frustration leads to full denunciation of previously prized values'. Thus conflict is not mere deviation from the norms of a society rather it involves frustration over the distribution of value system. Thus the causes of conflict can be summarized as follows ; 1. The more

79%

MATCHING BLOCK 218/320

W

the subordinate members in a system of inequality question the legitimacy of the existing distribution of scarce resources, the more likely are they to initiate conflict. 2. The fewer the channels of redressal of grievances over the distribution of resources , the more likely are they to question the

legitimacy. 3. The greater the ego deprivation of those without grievance redressal, greater are they likely to question the legitimacy. 4. The more privilege of membership is sought without allowing their participation, and lesser the possibility of mobilization, greater is the grievance. 5. The more deprivation is transformed from absolute to relative, greater is their grievance. 9.4 Types of Conflict Coser attempts to demonstrate theoretically the potential danger to individuals and social structures in a society intolerant of conflict. To this end, he presents the distinction between "realistic" and "nonrealistic" conflict. Coser uses interesting terms to describe "realistic" and "non-realistic" conflicts. "Conflicts which arise from frustration of specific demands within the relationship and from estimates of gains of the participants, and which are directed at the presumed frustrating object, can be called realistic conflicts, insofar as they are means toward a specific result. Non-realistic conflicts, on the other hand, although still involving interaction between two or more persons, are not occasioned by the rival ends of the antagonists, but by the need for tension release of at least one of them" Coser is very clear in his justification for the creation of the new terms, "realistic" and "nonrealistic" conflict: the times demanded the distinction (Coser 1956a, pp. 50-54).

NSOU CC - SO - 03 143 According to Coser, workers fighting for higher wages through strike or union activity were being equated in the literature with frustrated individuals displacing onto their bosses their oedipal hatred toward their father. The distinction between types of conflict would help to avoid confusing these two dissimilar social types (p. 50). a. Is a conflict that ensues between groups essential in establishing group identity? He states with Simmel that conflict sets boundaries between groups by strengthening group consciousness and awareness of separateness from other groups. Reciprocal antagonisms between groups preserve social divisions and systems of stratification. These reciprocal "repulsions" both establish the identity of the various groups within the system and also help to maintain the overall social system. b. External conflict can strengthen the group and makes the group conscious of its identity by introducing a strong negative group to which they contrast themselves. Internal Conflict – a. Internal conflict or conflict with the deviants makes apparent to the group members what they ought to do. Therefore internal conflict is essential in determining group identity. b. Internal conflict can increase group's survival or stability. c. Stability within a loosely structured society can be viewed as a product of the continuous incidents of conflicts crisscrossing each other, therefore they are less likely to break the society apart. 5. Functions of Social Conflict In The Functions of Social Conflict, Coser analyses the functions, rather than the dysfunctions, of conflict. Published in 1956, it considers 16 propositions contained in another book – Conflict, by Georg Simmel examining, elaborating, extending, changing, and then reformulating Simmel's original points. Coser arranges Simmel's propositions into seven groups, covering: ? The way that conflict helps bind groups together; ? The functions of hostility and tensions in relationships; ? Conflict inside groups; ? Conflict with other groups; ? Conflict and ideology; 144 NSOU CC - SO - 03 ? How conflict binds and unifies groups; ? The ways in which conflict promotes alliances between groups. Coser cites the functions and the dysfunctions of conflict. He also focuses on the latent and the manifest functions of conflict. According to Coser, conflict generates new norms, new institutions by stimulating the economic and technological realm. Economic historians often have pointed out that much technological improvement has resulted from the conflict activity of trade unions through the raising of wage levels. A rise in wages usually has led to a substitution of capital investment for labour and hence to an increase in the volume of investment. But a successful reduction of industrial conflict may have unanticipated dysfunctional consequences for it may destroy an important stimulus for technological innovation. Coser goes on to mention the necessity of conflict in a modern state. He says, conflict within and between bureaucratic structures provides means for avoiding the ossification and ritualism which threatens their form of organization. Conflict, though apparently dysfunctional for highly rationalized systems, may actually have important latent functional consequences. By attacking and overcoming the resistance to innovation and change that seems to be an occupational psychosis always threatening the bureaucratic office holder, it can help to insure that the system does not stifle in the deadening routine of habituation and that in the planning activity itself creativity and invention can be applied. Yet, it may be well to repeat that mere 'frustration' and the ensuing strains and tensions do not necessarily lead to group conflict. Individuals under stress may relieve their tension through 'acting out'. In special safety-valve institutions in as far as they are provided for in the social system and bring about change in this way. The strain leads to the emergence of specific new patterns of behaviour of whole groups of individuals who pursue 'the optimization of gratification by choosing what they consider appropriate means for the maximization of rewards. Social change which reduces the sources of their frustration may come about. This may happen in two ways: if the social system is flexible enough to adjust to conflict situations we will deal with change within the system. If, on the other hand, the social system is not able to readjust itself and allows the accumulation of conflict. Thus conflict acts as safety valve. ? According to this theory, Coser maintains, conflict "serves as an outlet for the release of hostilities which, were no outlet provided, would sunder the relation between antagonists" (1956a, p. 41). The "hydraulic" imagery that Coser uses in

NSOU CC - SO - 03 145 this and other related passages-“safety-valves,” “accumulation,” “blockage,” “release”-is not only difficult to locate in the cited quotation from Simmel; it is also not consistent with Simmel’s view of the origins of conflict. Simmel conceived the “hostility drive” as apriori: “It seems impossible to deny an apriori fighting instinct” (1955, p. 29). According to Simmel, a priori drives are a part of human experiential equipment that shape experience (Weingartner 1962, pp. 56-61; see also Oakes 1977, pp. 23-24; 1980, pp. 8-27). For example, the concept functions as an apriori in Simmel’s sense when it serves “as a criterion by means of which certain contents are selected as belonging [to experience] and others are rejected as not belonging to it” (Weingartner 1962, p. 58). The “hostility drive” is such an operative principle for human emotional experience. Simmel’s language reflects this active, formative view rather than the hydraulic “safety-valve theory” of conflict set forth by Coser. “Safety-valve” institutions – processes such as grievances, whistle-blower policies, complaint mechanisms – tend to focus on releasing tension. Over time, this kind of displacement towards non-realistic aims is dysfunctional for the social system since the fundamental causes of the conflict are not addressed (pg 46), while pressure to modify the system to meet changing conditions is reduced (pg 48). In Coser’s terms, therefore, conflict has adaptive role, as conflict promotes integration based on solidarity, functional interdependence and normative control. He divides the function of conflict into two basis – a. For the system as a whole in which conflict occurs – or intra group conflict b. Conflict between the respective parties

72%

the greater will be the level of internal social integration and greater the capacity to adapt to the external environment.

Thus, the more people are emotionally involved, greater is the intensity of the conflict, greater is the integration as the central power increases and deviance is suppressed. However, Coser does not specify the conditions when the inherent dialectics within party shall cause it to disunify. In case of conflict for the entire society, where there are likely to be more inter-connectedness, there is greater likeliness to have greater conflict but less emotionally involving and less violent than systems that are less complex. Due to the frequent interval along which conflicts erupt, emotions are not allowed to build up causing it to be more violent. System with low functional interdependence, will polarize into two hostile camps and make the conflict violent and intense Frequent conflicts of low intensity have the following positive functions 1. Development of normative procedures like laws, mediating agencies 2. Increased sense of realism, as the parties are able to articulate their goals 3. Conflicts promote coalition among parties who are threatened by the actions of the other parties 4. These conflicts help in release of hostilities Infrequent hostile conflicts accumulate emotions and they are likely to be polarized into hostile camps.

NSOU CC - SO - 03 147 9.5 Functions of Social Conflict a. Conflict is functional because it serves as safety valve without which social hostility would eventually disrupt the society. When conflict emerges after being suppressed after a long time, it splits the group around basic issues and principles. b. External conflict can only strengthen a group. It makes group members conscious of their identity. c. A group's conflict with the 'deviants' makes apparent to the group what they ought to do. d. Conflict brings stability within loosely structured society. e. A society where there is little expression for antagonistic claims, conflict provides scope for venting out antagonistic sentiments. f. The distinction between one's own group and "outsiders" is established in and through conflict. This includes conflicts between classes, nations, ethnic groups, and political parties. g. Coser describes some positive functions served by the expression of hostility in conflict. Coser maintains that such expressions of conflict maintains relationships under conditions of stress and thereby prevents group dissolution. 9.6 Social Conflict and Social Change Lewis Coser first dealt with some functions of conflict within social systems, more specifically with its relation to institutional rigidities, technical progress and productivity. He then expressed his concern to the relation between social conflict and the changes of social systems. Coser gives the observation of George Sorel in his Reflections on Violence where Sorel wrote: We are today faced with a new and unforeseen fact-a middle class- which seeks to weaken its own strength. The race of bold captains who made the greatness of modern industry disappeared to make way for an ultra-civilized aristocracy which asks to be allowed to live in peace. The threatening decadence may be avoided if the proletariat hold on with obstinacy to revolutionary ideas. The antagonistic classes influence each other in a partly indirect but decisive manner. Everything may be saved if the proletariat, by their use of violence, restore to the middle class something of its former energy. Sorel's specific doctrine of class struggle is not of immediate concern here. What is important for us, says Coser, is the idea that conflict (which Sorel calls violence,

148 NSOU CC - SO - 03 using the word in a very special sense) prevents the ossification of the social system by exerting pressure for innovation and creativity. Though Sorel's call to action was addressed to the working class and its interests, Coser conceived conflict to be of general importance for the total social system; to his mind the gradual disappearance of class conflict might well lead to the decadence of European culture. A social system, he felt, was in need of conflict if only to renew its energies and revitalize its creative forces. This conception seems to be more generally applicable than to class struggle alone. Conflict within and between groups in a society can prevent accommodations and habitual relations from progressively impoverishing creativity. Social conflict was the result of difference in interest between those who had vested interest and others who demanded their share of power, wealth and status. Thus the real reason for the origin of conflict was power, wealth and status. In this regard Coser was much influenced by the idea of social stratification as given by Max Weber. ? In groups that appeal only to a peripheral part of their members' personality ... in which relations are functionally specific and affectively neutral, conflicts are apt to be less sharp and violent than in groups wherein ties are diffuse and affective, engaging the total personality of their members. In effect, this suggests that conflicts in groups such as Rotary Clubs or Chambers of Commerce are likely to be less violent than in groups such as religious sectors or radical parties. ? Coser asserts that closely-knit groups with high personality involvement tend to suppress conflict, as the intensity and intimacy of relations means that conflict is threatening, dangerous. Feelings of hostility tend to accumulate, and when conflict does break out, it is particularly intense, firstly "because the conflict does not merely aim at resolving the immediate issue ... all accumulated grievances which were denied expressions previously are apt to emerge ... secondly, because the total personality involvement of the group members makes for mobilisation of all sentiments in the conduct of the struggle ... likely to threaten the very root of the relationship" 9.7 Intensity of Conflict In relationships in which individuals are very deeply involved, both feelings of attraction as well as feelings of hostility are likely to arise. The closer the relationship, the greater the affective investment, and the more potential there is for ambivalence. Antagonism is a central part of intimate social relations and a by-product of cooperation and frequent

NSOU CC - SO - 03 149 interaction. Close social relationships may therefore be said to contain an essential element of ambivalence. Coser suggests that the closer the relationship, the more intense the conflict. Given the ambivalence described above, it is understandable that conflict would arouse very strong feelings and lead to intense conflict. Also, the fear of intense conflict is likely to lead parties to suppress their hostile feelings, the accumulation of which is likely to further intensify the conflict once it breaks out. If parties' total personalities and identities are involved in the relationship, there is greater likelihood that non-realistic, hostile elements will come into play. For example, individuals who participate extensively in certain groups are typically concerned with that group's continuance. They are likely to react violently if someone with whom they have shared the cares and responsibilities of group life wishes to break away from the group. Such antagonism threatens group unity and is often perceived by a close group as a symbolic threat to its identity. Violent reactions to disloyalty may result. Intense conflict and group loyalty are thus two aspects of the same relation. The more frequent the interaction, the more occasions arise for hostile interaction. However, frequent occasions for conflict do not necessarily result in frequent conflicts. This is because the closeness of relationship and the strong mutual attachment may induce parties to avoid conflict. As stated previously, when conflict does occur, it is likely to be intense. However, conflict also has the potential to re-establish unity. Much depends on the issues that are at stake in conflict and the type of social structure in which conflict occurs. There is a distinction to be made between conflicts over basic matters of principle and conflicts over less central issues. Insofar as conflict resolves tension between antagonists it can serve to integrate relationships. However, conflict tends to serve this positive function only when it concerns interests or values that do not contradict the basic assumptions upon which the relation is founded. Loosely structured groups and open societies that are capable of avoiding conflicts over core values will tend to be most stable. The absence of conflict within a relationship cannot serve as an index of its underlying stability. In fact, parties are more likely to express their hostile feelings if they feel secure and stable in the relationship. They are more likely to avoid acting out their hostile feelings if they fear the termination of the relationship. The fact that a relationship is free of conflict cannot be taken to indicate that it is free from potentially disruptive elements. In fact, if parties' relationship is stable, conflicts are likely to arise between them. For this reason, occurrence of conflict can actually indicate the strength and stability of a relationship. Conflict can serve as a balancing mechanism.

150 NSOU CC - SO - 03 Coser begins to discuss the impact that conflict with out-groups has on the structure of in-groups. First, he considers the idea that conflict with outside groups tends to increase internal cohesion. Coser suggests that whether increase in centralization likewise results depends on the character of the conflict and the type of group. Centralization is more likely in cases of warlike conflict and in social structures with a marked division of labour. Despotism is likely where there is a lack of group cohesion. And both centralization and despotism depend on the group's structure and common values prior to conflict. Social systems that lack solidarity are likely to disintegrate in the face of conflict with outside groups. In some cases, groups may actually search for or invent enemies in an effort to maintain unity and internal cohesion. Groups engaged in continual struggle with outside groups tend to become intolerant within and are less likely to tolerate even limited dissent. These groups maintain and reinforce their unity in the face of dissent through the voluntary or forced withdrawal of those who threaten the group's solidarity. In some cases, they may even search for internal dissenters in order to serve as scapegoats. On the other hand, groups that do not make such strong claims on people's identity and establish no rigid criteria for membership are more likely to be large, and able to resist outside pressures. They also tend to be more flexible in structure and more capable of tolerating conflict within the group. Coser makes a distinction between two types of conflict: that in which the goal is personal and subjective, and that in which the matter in contention has an impersonal, objective aspect. He notes Simmel's claim that objectified struggles, which go beyond personal issues, are likely to be more severe and radical. These are conflicts in which parties understand themselves as representatives of collectives or groups, fighting not for themselves, but rather for the goals and ideals of the group. Elimination of personal reasons tends to make conflict more intense. On the other hand, when parties are pursuing a common goal, objectification of the conflict can serve as a unifying element. There are also cases where the very act of entering into conflict establishes relationships where none previously existed. Once relations have been established through conflict, other types of relations are likely to follow. Conflict often revitalizes existent norms and creates a new framework of rules and norms for the contenders. This is because conflict often leads to the modification and creation of laws as well as the growth of new institutional structures to enforce these laws. The presence of antagonistic behaviour makes people aware of the need for basic norms to govern the rights and duties of citizens. The resulting creation and modification of norms makes readjustment of relationships to changed conditions possible. However, this is possible only if there is a

NSOU CC - SO - 03 151 common organizational structure in place to facilitate the acceptance of common rules and conformity with them. Also, if the parties are relatively balanced in strength, a unified party prefers a unified party. Each group's having a centralized internal structure ensures that once they have devised some solution, peace can be declared and maintained. There will be no lingering enemies to disrupt the relationships. Finally, conflict is integrative insofar as it allows parties to assess their relative power and thus serves as a balancing mechanism to help consolidate societies. Conflict also leads to the formation of coalitions and associations between previously unrelated parties. If several parties face a common opponent, bonds tend to develop between them. This can lead to the formation of new groups or result in instrumental associations in the face of a common threat. In short, conflicts with some produce associations with others. However, the unification that results when coalitions are formed simply for the purpose of defence need not be very thoroughgoing. Alliance can simply be an expression of groups' desire for self-preservation. Of course, such alliances may be perceived by other groups as threatening and unfriendly. This may lead to the creation of new associations and coalition, thus drawing groups into new social relations. In conclusion, Coser suggests that conflict tends to be dysfunctional only for social structures in which there is insufficient toleration or institutionalization of conflict. Highly intense conflicts that threaten to "tear apart" society tend to arise only in rigid social structures. Thus, what threatens social structures is not conflict as such, but rather the rigid character of those structures.

9.8 Conclusion Coser's theory has introduced Simmel's ideas into conflict theory. Although Coser begins with the hostile nature of the world, he quickly enters into the integrative function of conflict. Thus the adaptive functions of conflict are quickly transformed to functional requisites that cause conflict. We can alongside add also a short critique of it.

Critical Overview 1. Coser starts with the inevitability of conflict but soon makes conflict adaptable to the social situation. 2. He emphasizes on the integrative functions of conflict that necessitate the occurrence of conflict. 3. He emphasizes on how society produces conflict to meet its integrative forces, making his perspective a skewed one.

152 NSOU CC - SO - 03 9.9 Summary We discussed the contributions of Lewis Coser. We explained types, functions and intensity of conflict. We also related conflict with social change. 9.10 Questions Write in brief: 1. What is the 'safety - valve' theory as given by Lewis Coser? 2. What are the integrated functions of conflict? 3. How does conflict promote social change? 4. What are the different types of conflict? 5. Differentiate between external and internal conflict. Write in detail: 1. Write a detailed note on the functional theory of conflict as given by Lewis Coser. 2. How is social conflict related to social change? 9.11 References Randall Collins, Conflict Sociology. Dahrendorf uses the terms contests, competitions, disputes and tensions and manifest clashes between social forces. Dahrendorf's definition is consistent with the dialectical framework that he sets through the ICA, which reveals the clash of interest among quasi group. Under the technical, political and the social conditions the quasi groups are converted to conflict groups. For Coser conflict is the antagonistic dispositions of the subgroups in a system, where antagonism has promoted integration and adaptability among the parties or the system

154 NSOU CC - SO - 03 as a whole. He prefers to use 'antagonistic' disposition because violence would make it more disruptive and its integrative tendencies would be ignored. Every social system produces conflict inducing tendencies. The Dialectical Conflict theorist, Dahrendorf focuses on the violent conflict that causes the redistribution of resources forming a more equal society. Coser develops a functional perspective on conflict to show how the violent conflict contributes to integration to make the system adaptable. Both Dahrendorf and Coser are not interested in the factors causing conflicts, rather what conflict does for the entire system. However, conflict is dependent upon factors that vary in case of Coser and Dahrendorf but both agree that conflict produces change in the system. We shall now draw our attention to the points of compatibility and incompatibility between the two thinkers. 10.3 Comparison between Coser and Dahrendorf Much like Dahrendorf, Coser also views functional theorizing as having "too often neglected the dimensions of power and interest." But in contrast to Dahrendorf, he has not followed Marx's emphasis on conflict dialectics and their consequences for perpetual reorganization of social systems. On the contrary, Coser has sought to correct Dahrendorf's oneness with another one-sidedness emphasizing the "integrative" and "adaptive" functions of conflict for social systems. In so doing, Coser has been led to embrace many of the organismic assumptions of Simmel's (1955) earlier analysis of conflict: (1) social life tends to be organized into systems, whose interrelated parts reveal imbalances, tensions, and conflict of interests; (2) under different conditions, processes in social systems operate to maintain, change, and increase or decrease not only the system's integration but also its "adaptability"; and (3) some of these processes-notably violence, dissent, deviance, and conflict-can, under certain conditions, strengthen

MATCHING BLOCK 230/320

W

the intensity of conflict. The more primary are the relations among the parties to a conflict, the more

emotional involvement is caused. a. The smaller the primary group where conflict occurs , the more emotional the involvement b. The more primary the relations among parties , the less likely the open expression of hostility, but the more the expression in a conflict situation 2. The more secondary relations among parties to a conflict, the more segmental their participation and the less emotional involvement a. The more secondary relations, the more frequent the conflict, but the less the emotional involvement . b. The larger the secondary group, the more frequent the conflict The more ideologically unified a group, the more conflicts transcend self-interest. The more ideologically unified a group , the more common are goals of group. 10.4 Coser's Propositions Coser highlights on the factors determining the intensity of conflict – 1. The more frequent and less intense conflicts, the more likely are groups to centralize in an effort to promote conformity of each groups's membership to the norms governing the conflict. 2. The less rigid system , the more likely it is that conflict can establish balances and hierarchies of power in a system 3. The less knowledge of the adversary's strength and the fewer the indexes of such strength, the more likely is the conflict between the groups.

156 NSOU CC - SO - 03 4. The less rigid the system the more likely is the conflict to cause formation of associative coalitions that increase the cohesiveness and integration of the system. 5. The more other parties in a system are threatened by coalitions of other parties, the more likely they are to form associative coalitions (1956). The more a system is based on functional interdependence, the more likely coalitions are to be instrumental and less enduring. 6. The more a system reveals crosscutting cleavages, the more likely groups in a coalition are to have their own conflicts of interests, and the more likely is the coalition to be instrumental. 7. The more a coalition is formed for purely defensive purposes, the more likely it is to be instrumental. The more tightly structured and primary the relations in a system, the more likely coalitions are to develop common norms and values and form a more permanent group. The more coalitions are formed of individuals (or more generally, the smaller the units forming a coalition), the more likely they are to develop into a permanent group. The more interaction required among the parties of a coalition, the more likely it is to form a permanent group.

forced conformity to norms and values. The more conflict between groups leads to forced conformity, the more the accumulation of hostilities and the more likely internal group conflict in the long run .

V. The less rigid the social structure where conflict between groups occurs and the more frequent and less intense the conflict, the more likely is conflict to change the system in ways promoting adaptability and integration.

NSOU CC - SO - 03 157 VI. The less rigid the system, the more likely is conflict to promote innovation and creativity in the system. The less rigid the system, the less likely is conflict to involve displacement of hostilities to alternative objects and the more likely is conflict to confront realistic sources of tension. VII. The more a system is based on functional interdependence, and the more frequent and less intense the conflict, the more likely it is to release tensions without polarizing the system. The more stable the primary relations in a system, and the more frequent and less intense is the conflict, the more likely it is to release tensions without polarizing the system, but not to the extent of a system based on secondary relations. VIII. The less rigid the system, the more likely is conflict to be perceived by those in power as signals of maladjustment that needs to be addressed. The more frequently conflict occurs, the less likely it is to reflect differences over core values and the more functional for maintaining equilibrium it is likely to be . IX. The more a conflict group can appeal to the core values of a system, the less likely the conflict to create dissensus over these values and the more likely it is to promote integration of the system X. The more a conflict group does not advocate extreme interpretations of core values, the less likely a counter conflict group to form and the less disruptive the conflict for the system. The more frequent and less intense are conflicts, the more likely they are to promote normative regulation of conflict. XI. The less rigid a system, the more frequent and less intense the conflict . The less rigid the system, the more likely conflict to revitalize existent norms. The less rigid the system, the more likely conflict to generate new norms. 10.5 Dahrendorf's Propositions The more members of a quasi-group in the ICA

Intensity of the conflict is determined by For Dahrendorf,

94%

MATCHING BLOCK 239/320

W

the more the technical, political and social conditions of organization are met, the more intense is the conflict. The more the distribution of authority and other rewards are associated with each other, the more intense is the conflict The less the mobility between super and subordinate groups, the more intense is the conflict.

Dahrendorf's Proposition states the conclusion reached in the discussion of the causes of conflict: if the technical, political, and social conditions of organization cannot be met, conflict will be less structured and regulated. Thus, for Dahrendorf, conflict will be violent when the parties are emotionally aroused, the conditions of organization are not met, and the conflicting parties cannot develop regulatory agreements. For Coser, conflict is over objective interests that represent an important set of conditions facilitating or inhibiting violence. Dahrendorf recognizes this condition in his discussion of how awareness of true interests is a result of the conditions of organization being met. But Coser specifies additional conditions which can supplement Dahrendorf's limited discussion. Furthermore, Coser's inventory has already incorporated the relative deprivation hypothesis at a more appropriate place in the overall inventory of propositions on conflict. Also, Coser's inventory specifies some of the conditions under which Dahrendorf's "regulatory agreements" inhibiting violent conflict will be likely to emerge between conflicting parties. And finally, Coser places more significance on the impact of values on conflict-a variable Dahrendorf only implicitly acknowledges in discussion of the technical conditions of organization. Thus, for both Coser and Dahrendorf the degree of organization of the conflict parties, the capacity of the more inclusive system to institutionalize conflict relations, and the ability of conflict parties to articulate their interests independently of core values will influence the degree of violence in the conflict between the deprived and privileged. NSOU CC - SO - 03 159 10.6 The Outcomes of Conflict For Dahrendorf, the only outcome of conflict is social change, with only the amount and the rate of such change visualized as varying. In contrast, Coser has developed propositions on integrative and adaptive outcomes

58%

MATCHING BLOCK 240/320

W

of conflict for both the parties to a conflict and the social whole within which the conflict occurs.

In the first group of propositions conflict can cause a shoring up of group boundaries, centralization of decision-making, ideological solidarity, and increased social control. As with previous propositions, these events occur only under specified conditions, including the degree of rigidity and differentiation in social structure, the intensity of the conflict, and the extent to which conflict is perceived to affect all factions of the group. Furthermore, in this particular inventory it is not immediately evident that stating the inverse of the propositions would reveal the conditions under which conflict would lead to disintegration of conflict groups. Furthermore, under conditions of conflict frequency and intensity, conflict can promote varying degrees and types of equilibrium, normative regulation, and associative coalitions. While the inverse of some of these propositions perhaps reveals a few of the conditions promoting disequilibrium, anomie, and antagonisms among subgroups, the propositions still remain overly loaded. Turner has pointed out that they fail to conceptualize adequately the conditions under which conflicts of varying degrees of violence cause certain outcomes in the short and long run for both conflict parties and the more inclusive system. For example, does violent conflict always result in rapid change of a system? It is clear that such a proposition would hold true only under conditions which would have to specify the causal impact of such variables as the duration of the violence, the repressive powers of the privileged, the nature and composition of the deprived who initiate the conflict, the issues over which the conflict is fought, the values involved to justify the violence, and so on. Turner writes that Coser's propositions would seem to provide a list of variables influencing outcomes; but unfortunately the variables of "intensity" and "violence" are not clearly defined in this context. Hence, the propositions on outcomes are not systematically linked to the conditions causing conflict of varying degrees of violence. To take another example from Dahrendorf's analysis of outcomes: Does organized conflict of high intensity necessarily lead to "more structural change?" Or, could not the regularization of conflict among highly organized groups result in forms of competition which maintain the status quo? This possibility is, of course, the point to be emphasized by Coser's propositions, 160 NSOU CC - SO - 03 and a number of suggestive variables are introduced to explain when such an outcome is likely. But Coser's inventory again raises as many theoretical questions as it answers. For example, does frequent and violent conflict in flexible social systems which have clear-cut mechanisms for regulating conflict lead to change? And could one objectively describe either outcome as increasing integration or adaptability? Turner also writes about the kinds of problems presented by Coser's and Dahrendorf's propositions on the outcomes of conflict. Seemingly, the one-sided assumptions underlying their analysis forced evaluative conclusions about the desirable outcomes of conflict— for Coser, such as integration and adaptability, and for Dahrendorf, social change and reorganization. As such, the analysis of outcomes is not easily connected to their more interesting analysis of the causes of conflicts of varying degrees of violence. Coser provides a suggestive list of variables: but no clear causal relations can be inferred from this list because they are not clearly linked to the conditions affecting the causes and violence of conflict. 10.7 Critical Appraisal of the Conflict Theory Predictably, conflict theory has been criticized for its focus on change and neglect of social stability. Some critics acknowledge that societies are in a constant state of change, but point out that much of the change is minor or incremental, not revolutionary. For example, many modern capitalist states have avoided a communist revolution, and have instead instituted elaborate social service programs. Although conflict theorists often focus on social change, they have, in fact, also developed a theory to explain social stability. According to the conflict perspective,

94%

MATCHING BLOCK 241/320

W

inequalities in power and reward are built into all social structures. Individuals and groups who benefit from any particular structure strive to see it maintained.

For example, the wealthy may fight to maintain their privileged access to higher education by opposing measures that would broaden access, such as affirmative action or public funding. Turner questions Dahrendorf's easy usage of the concepts in such a way that they can be applied to wide ranging phenomenon thereby making the testing of a theory problematic. For instance, the concepts of power, authority, interest and domination can be used in all empirical situations. Secondly, Turner questions the guidelines for measuring the intensity of conflicts. He uses vague concepts to conform his scheme. Both these create problematics for empirical investigation.

NSOU CC - SO - 03 161 Yet, he has been one of the harshest critiques of functionalism. He provides a dialectical – functional approach that will explain the understanding of human society. Parsons’ social system is similar to Dahrendorf’s ICA, where systems are broken up into subsystems, involving organization of roles. Deviation from the roles leads to imposition of sanction. The dialectics in Dahrendorf’s theory observes that arrangement of roles implies integration and deviation from norms that cause the employment of negative sanctions or presence of opposed interests. However, the real genesis in Dahrendorf’s model remains unexplained because Dahrendorf marks authority as the main cause of conflict, which further reiterates that opposed interests are the causes of conflict. Here there is lack of detailed sequences in the origin of conflict. Thus the assumption that conflict groups emerge from authority is a reflection of the hidden assumption that authority is a functional requisite for system integration . Dahrendorf is also unable to explain the organization of the ICA, and to explain why they are organized solely on the basis of power and authority. He does not mention the mechanism of how they are organized. He emphasizes on the presence of authority that causes conflict and makes the system amenable to change, imputing a teleological error to his theory. Coser begins with the inevitability of conflict and then turns into a reason for integration. He elaborates on the functions that conflict serves for group maintenance rather than focusing on the reason for conflict. Both Dahrendorf and Coser keep the ‘units’ of their conflict vague that makes their theory applicable to all situations from small groups to nation states. However, both agree that inequality is the ultimate cause of social conflict. Coser through his functional conflict theory and Dahrendorf through the dialectical conflict theory are not interested in what causes conflict, rather they are focused on the consequences of conflict and what conflict does for the whole system. However, they fail to delineate the units which will be involved in the conflict. This makes ‘conflict’ an independent variable in their proposal. 10.8 Conclusion Dahrendorf’s contribution lies in his analysis of the ubiquity of conflict everywhere and the change in society that comes along with it.

Since differential distribution of authority is the fundamental source of conflict, changes resulting from conflict are essentially changes in the authority system.

Structural changes can be brought about by total or near total exchange of dominant positions as in the case of the revolutionary overthrow of the governments or partial exchange of personnel as in the case of coalition and class alliances. By pointing to the general theory of conflict Dahrendorf has developed a general theory of social conflict of his own. By doing so he has made a significant contribution to the dialectic of sociology. However, Dahrendorf is guilty of the fallacy of the binary model. The attempt to trace all conflicts to dichotomous authority relations involves straining the facts. Class is defined in terms of authority so that class conflict revolves round the struggle for authority. Authority, however, is not the only determinant of class. Income, status, prestige, life style and material possessions are also significant ingredients of class structures. Nor is authority the only or primary source of social conflict. Inter caste and inter religious conflicts are seldom based on authority relations. Throughout human history , ideology, values , lifestyles, customs, belief systems have provided ammunitions for social unrest. However, Dahrendorf’s analysis of social conflict cannot analyse social changes in all the societies. His position that social change is necessarily the result of change in the authority structure is not always proved correct, because changes have been found in societies without corresponding changes in the authority system. He rejects the Marxian emphasis on property as the determinant of class and substitutes it with authority. However , he neither demonstrates why authority is prior to the relations of means of production nor convincingly demonstrates how classes are different from conflict groups and hence why they should be treated as a special analytical category. He, just like Marx, sees authority as structurally induced. They kept power at the centre of their theoretical scheme. In terms of power relations they saw a structural tendency towards polarization into two class model – the ruled and the rulers. Dahrendorf rejects Marx’s overemphasis on the primacy of class conflicts and their revolutionary character. While Marx saw class antagonism manifest in violent and abrupt changes, Dahrendorf also apprehended the possibilities of gradual and peaceful changes as well. Dahrendorf’s

dialectical sociology is the systematic study of social conflict which involves conceptualization of opposing forces with conflicting interests. The dialectical model begins with a dichotomy of opposites such as individual and

society, lords and serfs, rich and poor, elites and the masses, majority and minority, liberals and conservatives

NSOU CC - SO - 03 163 etc.

89%**MATCHING BLOCK 245/320****W**

Dahrendorf's model is a dialectical model because he saw conflict as inherent in the dichotomous division of all social organisations into contending categories of roles— those who have authority and those who are subjected to authority.

Since conflict is conceived as a process arising out of opposing forces within authority structures, innovations and revolutions do not eliminate conflicts. They only introduce new authority structures which perpetuate the dichotomous division of associations into superordinates and subordinates and thus the endless process goes on. Dialectical sociology does not begin with a specific social problem, rather it begins with society as a whole and seeks to demonstrate how conflicts emanate from structural arrangements. Dahrendorf has been successful in developing a scientific theory of conflict, which attempts to explain the possibilities of change in society, the structural origin of dissent as well as the multiplicity of forms of conflict and their degree of intensity. The dialectics of internal contradictions is the essential feature of the contemporary conflict theory. Coser is primarily concerned with how conflict prevents the ossification of the social system by exerting pressure for innovation and creativity. He

70%**MATCHING BLOCK 246/320****W**

allows expression of hostility and mending of strained relations. It leads to the elimination of specific sources of conflict between parties and enables redressal of conflict between parties through establishments of new norms or affirmation of

the old ones. Hostility towards the out- group unifies the in-group , when there is a need felt for greater solidarity , members of in-group tend to exaggerate conflicts with other groups and where such conflict exists any deviation from the group norms is severely condemned. Social conflict not only generates new norms but also brings forth new coalitions and alliances. They bring improvement and

79%**MATCHING BLOCK 247/320****W**

revitalize the economy , lubricate the social system, facilitate release of tension and frustration and enable social system to adjust itself. However, conflict

within and between groups in a society can prevent accommodations and habitual relations from progressively impoverishing creativity. But the internal conflict between vested interests and new strata demanding share of power, wealth, status does not contradict the basic assumptions that relationships tend to be functional for the social structure. 10.9 Summary We presented the propositions of Coser and Dahrendorf. We discussed the critical overview of the theory.

Kluwer: Dordrecht, Neth. 10.13 Glossary Conflict- Conflict is a clash of interest. The basis of conflict may vary but it is always a part of society. Basis of conflict may be personal, racial, class, caste, political and international. Conflict in groups often follows a specific course. Routine group interaction is first disrupted by an initial conflict, often caused by differences of opinion, disagreements

NSOU CC - SO - 03 165 between members, or scarcity of resources. At this point, the group is no longer united, and may split into coalitions. This period of conflict escalation in some cases gives way to a conflict resolution stage, after which the group can eventually return to routine group interaction. A System is a group of interacting or interrelated entities that form a unified whole. A system, surrounded and influenced by its environment, is described by its boundaries, structure and purpose and expressed in its functioning. Systems are the subjects of study of systems theory. Status quo or Statu quo is a Latin phrase meaning the existing state of affairs, particularly with regard to social or political issues. In the sociological sense, it generally applies to maintaining or changing existing social structure and/or values. With regard to policy debate, it means how conditions are inviting a good or bad analysis of them, for example, "The countries are now trying to maintain a status quo with regard to their nuclear arsenal which will help them if the situation gets any worse turn. Imperatively Co-ordinated Association (ICA) Multiple roles within the structure of authority may have

97%

MATCHING BLOCK 248/320

W

conflict when different positions call for different things. According to Dahrendorf, these different defined areas of society where people's roles may be different are called imperatively coordinated associations. The groups of society in different associations are drawn together by their common interests. 166

NSOU CC - SO - 03 167 11.1 Objectives To understand the history of social exchange. To understand the concepts of social exchange theory. To understand the general arguments of exchange theory. To understand the propositions offered by Homans. 11.2 Introduction Social exchange theory is a socio-psychological theory which focuses on social behaviour in the interaction of two parties. Proponents of social exchange theory suggests that calculations occur on romantic relationships, friendships, professional relationships etc. We always weigh pros and cons. They are often interchanged for "risk" and "reward". Social exchange theory applies similar principles while dealing with interaction among people. One of the most influential conceptual paradigms for understanding marketplace behaviour happens to be social exchange theory. The theory emerged during the 1920s (e.g. Malinowski, 1922; Mauss, 1925). Disciplines such as Anthropology, Social Psychology and Sociology were bridged together. Social exchange involves different perspectives. Theorists are mostly in favour of the fact that social exchange encapsulates a series of interactions that generate obligations. These interactions are normally perceived as interdependent and contingent on the actions of another person. The major focus of these interdependent transactions is upon the capability to generate high-quality relationships. Different domains like social power, networks, board independence, organisational justice, psychological contracts, leadership etc have been influenced by social exchange theory. Social exchange theory refers to the fact that it is a socio-psychological and sociological perspective that explains social exchange and stability as a process of negotiated exchanges between parties. The theory got its formal development in 1958 by George Homans. He defined social exchange as the

100%

MATCHING BLOCK 249/320

W

exchange of activity, tangible or intangible and more or less rewarding or costly, between at least two

people. Peter Blau and Richard Emerson also came forward to develop the theory. 11.3 History of Social Exchange Theory Several distinct lines of theoretical work in the social sciences has been largely instrumental in shaping of exchange theory. They are behaviorism, utilitarianism and functionalism

168 NSOU CC - SO - 03 (Turner 1986). Major proponents of social exchange perspective within sociology include Homans, Blau and Emerson. Thibout and Kelly also contributed to a great extent to social exchange theory in their emphasis on the interdependence of actors and the social implications of different forms of interdependence. The contribution of anthropologists such as Malinowski, Mauss, Schneider and Levi-Strauss towards social exchange theory is highly appreciable. It is important to remember here that the foundation of microeconomics has much in common with some variants of social exchange theory. It has a clear reflection in Blau's exchange and power in social life and in subsequent theoretical developments (e.g. Cook and Emerson 1978; Coleman 1972, 1990). Social exchange theory has a continued significance in the social sciences. Social exchange theory dates back to 1958, through the work of the American sociologist George Homans. He portrayed a vivid image of social exchange in his article "Social Behaviour as Exchange". Homans designed a framework which was a culmination of behaviorism and basic economics. Social exchange theory is based on the principle that the relationship between two people is made through a process of cost-benefit analysis. It is like a metric system which is designed to determine the effort poured in by an individual in person to person relationships. This theory is unique in nature. It measures relationships on mathematics and logic to determine the balance within a relationship. The theory can be applied to both romantic as well as friendly relations. Exchange theory has been influenced by different intellectual currents. Rational choice theory was one of them which shaped the development of exchange theory. Exchange theory is also rooted in behaviorism. 11.4 Behaviourism Behaviourism is very crucial in behavioral sociology, most significantly in

71%

MATCHING BLOCK 250/320

W

exchange theory. The behavioural sociologist focuses upon the relationship between the effects of an actor's behaviour on the environment and their impact on the actor's later

behaviour. In operant conditioning, this happens to be the pivotal point of discussion where "behaviour is modified by its consequences". It is important to note that whether it is social or physical environment, it is definitely affected by the behaviour and in turn "acts" back in many ways. Here the reaction strongly affects the actor's later behaviour. If the actor finds it rewarding then

69%

MATCHING BLOCK 251/320

W

the same behaviour is likely to be repeated in future in similar situations. However if the reaction has been painful or punishing then there is less

chance of repeating it again.

NSOU CC - SO - 03 169 Here we have to remember that the behavioural sociologist revolves around

100%

MATCHING BLOCK 252/320

W

between the history of environmental reactions or consequences and the nature of present

behaviour. Behaviourists are mainly interested in rewards (or reinforcers) and costs (or punishments). The ability to strengthen (i.e. reinforce) behaviour is known as rewards while cost refers to those which reduce the likelihood of behaviour. 11.5 Rational Choice Theory Rational choice theory has influenced the development of exchange theory to a great extent. Let us first understand it. Neoclassical economics (as well as utilitarianism and Game Theory) paved the way for rational choice theory. This theory puts actors in the pivotal position. They are seen as active, purposive beings. Their behaviours are directed towards some goals. Actors do have preferences. Rational choice theory takes into consideration two major constraints on action. The first is scarcity of resources. Actors have access to different resources. People who have lots of resources, it becomes easy for them to achieve the ends. On the other hand, those who do not have access to scarce resources, achieving goal becomes difficult. Here, in this particular context the idea of opportunity costs (Friedman & Hechter) is very much closely associated with scarcity of resources. While setting a goal, social actors must be cautious about the costs of forgoing their next-most-attractive action. Actors are viewed as trying to maximize their profits. Social Institutions happen to be another source of constraints on individual action. These institutional constraints, provide both positive and negative sanctions that stimulate certain actions and discourage others. Homans basically advanced statement of human rationality. He always emphasized on rationality. A debate can be put forward that people repeat rewarding actions, respond to stimuli associated with such rewards and act on the basis of the values they attach to things. This is, in fact, to state that they are rational. While examining the deterrent effects of arrest rates and sentencing, this principle is being employed by criminology. This principle suggests that more often the crimes succeed, the more people will commit them. This evidence is to a great extent in accord with this argument. This approach is also very much relevant to the poor quality education pattern which many children obtained in inner city schools and the overt war between teacher and pupils that characterizes many inner city classrooms. Basically students are less interested towards studies and more inclined towards warfare.

170 NSOU CC - SO - 03 However, this idea of rationality, especially the notion that people choose courses of action on the basis of their potential value, has been criticized by other exchange theorists. What Homans originally established was value proposition as an empirically verifiable proposition. On the other hand, his critics argued that it was a tautology. Sociologists in the rational choice or exchange theory tradition assumes that certain values and objectives are very common. They predict that people value survival, approval and power. This value proposition provides an inadequate explanation of guide to behaviour. On the other hand, people are in a situation of uncertainty or risk where they cannot be sure of the outcomes of their actions or which is the most valuable alternative. This principle is very complicated. It is not possible for anyone to be alert with calculations all the time. According to this principle, on the basis of our perception of risks and rewards react objectively and in a logical manner. This does not mean that we are always right. Next school of thought which also influenced the growth of exchange theory was : The Social Psychology of Groups. 11.6 The Social Psychology Groups As highlighted by Thibaut and Kelly (1959) the bulk of Social Psychology of Groups is dedicated to dyadic relationships. They are fully immersed in interaction and its consequences for the members of the dyad. Just like in behaviourism and in exchange theory, rewards and costs are central to Thibaut and Kelly's analysis of dyadic relationships. Molm and Cook observed that three aspects of Thibaut and Kelly's theory were significant to the development of exchange theory. First is their interest in power and dependence. Thibaut and Kelly are of the opinion that power is derived from the ability of one actor in a dyad to affect the quality of outcomes achieved by the other actor. They distinguish between two forms of power. When actor A affects the outcomes of actor B "regardless of what B does" then it takes place. The second is behaviour control : "If by varying his behaviour A can make it desirable for B to vary his behaviour too, then as put by Thibaut and Kelly, A has behaviour control over B". The relationship is the main focus of attraction in a dyad. Thus, each can exercise power over the other to some degree. Another key idea put forward by Thibaut and Kelley is that of ideas of Comparison Level (CL) and Comparison Level for alternatives (CL alt). These are standards for the evaluation of outcomes of relationships. Thibaut and Kelley come forward with another interesting contribution that is the notion of the "outcome matrix" which is a way of visually depicting "all of the possible events that may occur in the interaction between A and B".

NSOU CC - SO - 03 171 These schools of thought came forward with their own set of ideas and finally laid the foundation of exchange theory of George Homans and Peter Blau at least in the initial level. Next, let us focus on utilitarianism which is another very influential school of thought in the development of exchange theory. 11.7 Utilitarianism The contribution of Adam Smith, David Ricardo, John Stuart Mill etc can be included in the school of utilitarianism. They viewed humans as rational beings who seek to maximize their material benefits or utility, from transactions or exchanges with others in a free and competitive marketplace. Social actors and free national units in the so-called marketplace. They have access to all necessary information. All available alternatives can be considered by them and on the basis of that they rationally choose the cause of activity that will maximize material benefits : Here, it is crucial to keep in mind that there has been a continuous debate between intellectual descendants of utilitarianism and those reacting to this perspective. Like Talcott Parsons, modern exchange theorists have attempted to reformulate the utilitarian principles into various theories of social exchange. The alternative assumptions are as follows : 1. Humans do not seek to maximize profits but they always attempt to make some profit in their social transactions with others. 2. Humans are not perfectly rational, but they do engage in calculations of costs and benefits in social transactions. 3. Humans do not have perfect information on all available alternatives but they are usually aware of at least some alternatives which form the basis for assessments of costs and benefits. 4. Humans always act under constraints but they still compete with each other in seeking to make a profit in their transactions. 5. Humans always seek to make a profit in the transactions but they are limited by the resources that they have when entering an exchange solution. Turner added two more assumptions. They are : 6. Humans do engage in economic transactions in clearly defined market places in all societies but these transactions are only a special case of near more general exchange relations occurring among individuals in virtually all social contexts.

172 NSOU CC - SO - 03 7. Humans do pursue material goals in exchanges but they also mobilize and exchange material resources such as sentiments, services and symbols. Turner said that some forms of modern exchange theory have also followed the strategy of utilitarians for constructing social theory. Utilitarians claimed that social actors are rational. They proposed that exchanges among people can also be studied by a rational science, one in which the "laws of human nature" would stand at the top of a deductive system of explanation. He further observed that utilitarianism influences exchange theory in an indirect manner. He pointed out that utilitarianism initially passed through Social Anthropology and then on to Sociology. While talking about social Anthropology mention must be made of Sir James George Frazer. He wrote Folklore in the Old Testament. It was most probably the first explicit exchange theoretic analysis of social institutions. Following the footsteps of Frazer, Malinowski and Levi Strauss, modern exchange theory in Sociology inspires a similar concentration of social organization : 1. Exchange processes are the result of efforts by people to realize basic needs. 2. When yielding payoffs for those involved, in exchange processes lead to the patterning of interaction. 3. Such patterns of interaction not only serve the needs of individuals, but they also constrain the kinds of social structures that can subsequently emerge. Bronislaw Malinowski also contributed to a great extent towards building up of modern exchange theory. Argonauts of the Western Pacific is a famous work of Malinowski. He observed an exchange system termed the Kula Ring, which was a closed circle of exchange relations among individuals in communities inhabiting a wide ring of islands. Turner paid immense importance to Malinowski's analysis and stressed that it had made innumerable contributions to modern exchange theory. Let us see in what way is Malinowski's work significant through the following propositions. 1. In Malinowski's words, "the meaning of Kula will consist in being instrumental to dispel [the] conception of a rational being who wants nothing but to satisfy his simplest needs and does it according to the economic principle of least effort". 2. Psychological rather than economic needs are the forces that initiate and sustain exchange relations and are therefore critical in the explanation of social behaviour. 3. Exchange relations can also have implications beyond two parties for, as the Kula demonstrates, complex patterns of indirect exchange can operate to maintain extended and protracted social networks.

NSOU CC - SO - 03 173 4. Symbolic exchange relations are the basic social process underlying both differentiation of tanx in a society and the integration of society into a cohesive and solidary whole. Another scholar whose work also had a huge impact on the development of exchange theory was Marcel Mauss. He felt that it was "force" which compelled reciprocity in society. He said that in the end, exchange relations create, reinforce and serve a group morality that is an entity. Thus, his work also helped in the growth of present day exchange theory. Next, Levi-Strauss came up with his sophisticated structural exchange perspective. He also came forward towards the development of exchange theory. In contrast to Frazer he illuminated the fact that "it is the exchange which accounts and not the things exchanged". He defined exchange in terms of its functions for integrating the largest social structures. He is strongly against the fact that there exists psychological interpretations of exchange processes. He is of the opinion that humans possess a cultural heritage of norms and values. This separates their behaviour and societal organization from that of animal species. He stated that exchange is more than psychological needs. It cannot be understood only in terms of individual motives. Exchange relations are basically a reflection of patterns of social organization that exist as an entity, sui generis. It is regulated by norms and values. Levi Strauss emphasized on two points which exerted a strong influence on modern sociological theory. They are as follows : 1. Various forms of social structure rather than individual motives are the critical variables in the analysis of exchange relations. 2. Exchange relations in social systems are frequently not restricted to direct interaction among individuals, but protracted into complex networks of indirect exchange. On the one hand, these exchange processes are caused by patterns of social integration and organisation; on the other hand, they promote diverse forms of such organization. 11.8 Advantages of Social Exchange Theory 1. It is a scientific theory. It explains that individuals minimize their cost and maximize their rewards within a relationship. 2. It tells one how to sustain and keep relationships. 3. It is a timely and systematic approach. The theory is almost applicable in all situations.

174 NSOU CC - SO - 03 4. It helps us to understand that when we give something in any relationship then we expect something in return to maintain the relationship. 5. The theory is fairly simple, allowing for most people to understand its general assumptions and relate to them. 6. When a person becomes knowledgeable of this theory, he or she can work towards having more balanced relationships. This knowledge can also provide awareness of what one's own costs are to other people. 11.9 Disadvantages of Social Exchange Theory 1. The whole theory revolves around the rewards only and it neglects the cultural contexts and variations of cultures. 2. Social Exchange Theory makes people seem individualistic and reward-seeking people. 11.10 Homans' Propositions The system of social exchange theory was summarized into three propositions. They are as follows : 1. Success Proposition : when a person is rewarded for his or her actions, he or she tends to repeat the action. 2. Stimulus Proposition : The more often a particular stimuli has resulted in a reward in the past, the more likely it is that a person will respond to it. 3. Deprivation : The more often in the recent past a person has received a particular reward, the least valuable any further unit of that reward becomes. 11.10.1 The Objective Behind the Development of this Theory Social exchange theory did not crop up all of a sudden. People have always been involved in social interactions and in various forms of relationships with others. This dimension actually paved the way towards its development. To put in a nutshell, the objectives were as follows : 1. Helping people in understanding relationships well. It opened the eyes of the individuals as to why some relationships are successful and why some are doomed to failure. 2. Secondly, to understand what makes us to start and continue certain relationships.

NSOU CC - SO - 03 175 3. To explain communication and introduction as well as factors governing interaction in humans. 11.11 Purpose of Social Exchange Theory Social exchange theory observes that social behaviour is the result of an exchange process. Maximizing benefits and minimising costs happen to be the sole concern of social exchange theory. It is two-sided process involving two actions - one is to give and the other is to get something in return. This theory posits that the individual measures all social interactions against personal gains that he achieves. The proponents of this theory highlight that all individual actions and decisions are driven by a self-serving motivation. The Basic Formula For Predicting Behaviour : Behaviour (Profit) = Reward of Interaction - Cost of Interaction. 11.12 Basic Concepts of Social Exchange Theory This theory mainly explains the behaviour of people while exchanging something. Human beings are studied with respect to their circumstances. The following are the various concepts of this theory : 1. Costs : costs can be anything whether time, effort or money. 2. Rewards : it can be anything whether the sense of acceptance on support and companionship. It is assumed by simple social exchange models that rewards and costs drive relationship decisions. 3. Resources : Any commodity whether material or symbolic which can be transmitted through interpersonal behaviour and which gives one person the capacity to reward another is referred as resource. Outcomes = Rewards - Costs. In other words, social exchange theory is a model which interpret society as a cluster of interactions among people which are based on estimates of rewards and punishments. This perspective makes us perceive interactions from the angle of rewards or punishments, which we expect to receive from others. We measure them using a cost-benefit analysis model(consciously or subconsciously). The crux of the theory is that an interaction that elicits approval from another person is more likely to be frequent than interaction that elicits disapproval. If we receive more rewards from a particular interaction, which naturally surpasses punishment, then it is quite natural that we will get involved in that interaction once more.

176 NSOU CC - SO - 03 According to this theory the formula for predicting the behaviour of any individual in any situation is :
Behaviour (Profits) = Rewards of interactions - Costs of interactions. 11.12.1 Different Forms of Rewards It is fascinating to note that rewards can take various dimensions like : social recognition, money, gifts and even subtle everyday gestures like smile, nod or a pat on the back. Let us delve further into social exchange theory with the help of an example. For example a guy named A has invited a girl B on a date. If B accepts the invitation then it can be said that A has gained a reward and so it is quite obvious that he is likely to repeat that interaction again. On the other hand, if B would have rejected the invitation then it would have been a punishment for A. After that he would avoid asking B again in future. 11.13 Basic Assumptions of Social Exchange Theory People who are involved in the interaction are rational seeking to maximize their profits. Most gratification among humans comes from others. People have access to information about social, economic and psychological aspects of their interactions that allow them to consider the alternative, more profitable situations relative to their present situation. People are goal oriented in a freely competitive system. The exchange operates within cultural norms. Social credit is preferred over social indebtedness. The more deprived the individual feels in terms of the act, the more the person will assign a value to it. People are rational and calculate the best possible means to compete in rewarding situations. The same is true of punishment avoidance situations. Thus, on the basis of the above assumptions certain observations can be made. The assumptions, as discussed earlier, is indeed an eye-opener for all if we think in depth. For instance, individuals engage in interactions with the motive of fulfilling their desires. Major emphasis is given on relationship between actors. Exchange theorists are of the opinion that social relations and social structures generated by the ties that bind people in different

NSOU CC - SO - 03 177 forms of association happen to be the central object of sociological inquiry. Key forces like power and status relations among actors in different types of social structures are actually responsible for determining the nature of structural change over time. While formulating theories, exchange theorists regard power, structural sources of power and the dynamics of power as primary issues of concern. 11.14 Basic Propositions of George Homans George Homans stated several propositions. They have been discussed below. The Success Proposition This proposition means that there is a high chance of asking others for service if that person has been rewarded in the past with useful advice. So, based on past positive experience of receiving useful service, the person will request more advice. In this proposition three stages are involved : First, action of a person, next is a rewarded result and ultimately, a repetition of the original action or at minimum one similar action. The Stimulus Proposition In this proposition the stimulus or a set of stimuli of the past is likely to stimulate a person's action. If the person's action has been rewarded by a series of stimulus in the past and if at present the stimuli are similar to that of the past, then there is a high chance that the person is likely to perform that action once more. The Value Proposition Homans says that the more valuable is the result of a person's actions, the more likely he is to perform the action. Homans introduced the concepts of rewards and punishments. He defined rewards as actions with positive values; so an increase in rewards is more likely to elicit the desired behaviour. Punishments are actions with negative values; an increase in punishment means that the actor is less likely to manifest undesired behaviours. The Deprivation - Satiation Proposition Homans says that more often in the recent past a person has received a particular reward, the less valuable any further unit of that reward becomes for him. In our daily life when person and other rewards each other frequently for giving and getting advice then the rewards tend to be less valuable to each other. A crucial factor is time as people become satiated if they go on receiving specific rewards over a prolonged period of time. Homans also mentioned about cost and profit which will be discussed in the next chapter.

178 NSOU CC - SO - 03 The Aggressive Approval Propositions Homans says if a person's action does not receive the reward he expected or if he receives punishment which he did not expect, then the consequence is that he will be angry. In this proposition Homans mentioned about frustration and anger. The Rationality Proposition This proposition clearly brings to the surface the influence of rational choice theory on Homans approach. Homans said that people compare between two courses of action. They think in terms of the rewards associated with the actions. An interaction takes place between the value of reward and the likelihood of attainment. Rewards which are very valuable and highly attainable are the most desired ones. On the other hand, those which are not very valuable and are unlikely to be achieved are the least desirable ones. Homans relates this proposition to the success, stimulus and value proposition. 11.15 Conclusion This chapter highlights about the importance and significance of social exchange theory in our life. Social exchange theory only focuses on social behaviour of human beings. Social exchange theory is based on certain principles when it comes to interaction among people. While studying about social exchange theory one needs to know about the contribution of some great exchange theorists like Homans and Blau. The chapter deals mainly with the general principles which will definitely help students of sociology to understand market place behaviour. The main emphasis is upon quality of relationships. 11.16 Summary Social exchange theory looks into domains like social power, networks, independence, psychological contracts etc. This chapter also deals with the different intellectual currents like behaviourism, rational choice theory, the social psychology of groups and utilitarianism. Advantages and disadvantages of social exchange theory have also been discussed here. This will help readers to have a thorough understanding of social exchange theory. 11.17 Questions 1. What led to the emergence of social exchange theory? 2. Discuss the basic concepts of social exchange theory. 3. State the basic assumptions of social exchange theory. 4. Highlight the different intellectual currents behind social exchange theory.

NSOU CC - SO - 03 179 5. State the basic propositions of George Homans. 6. What are the advantages and disadvantages of social exchange theory? 11.18 References Cook, Karen S., ed. 1987. Networks, exchange, and coercion: The elementary theory and its applications. New York: Elsevier. 11.19 Glossary Behavioural Psychology : Behaviorism, also known as behavioral psychology, is a theory of learning based on the idea that all behaviors are acquired through conditioning. Behaviourism : the theory that human and animal behaviour can be explained in terms of conditioning, without appeal to thoughts or feelings, and that psychological disorders are best treated by altering behaviour patterns.

180 NSOU CC - SO - 03 Rationality : the quality of being based on or in accordance with reason or logic. Tautology :A tautology is a proposition that is true by definition (such as 'all mothers are female') or one in which the same thing is said twice in different words Utilitarianism :Utilitarianism is a moral theory that advocates actions that promote overall happiness or pleasure and rejects actions that cause unhappiness or harm. Propositions :A theory is a proposition or a set of interrelated propositions that purports to explain a given social phenomenon. It is a systematic explanation for the observed facts and laws (or principles). Stimulus :something that causes a reaction, especially interest, excitement or energy. Punishment :The sociology of punishment seeks to understand why and how we punish, the general justifying aim of punishment and also the principle of distribution. Positive rewards :Rewards are the elements of relational life that have positive value for a person.

182 NSOU CC - SO - 03 12.1 Objectives To have an idea about the exchange theorists, George Homans and Peter Blau. To understand the general arguments of Homans and Blau. To make a critical appraisal of both. To understand the general concepts of exchange as designed by them. 12.2 Introduction George Caspar Homans(1910 - 1989) was a humanist and a sociologist. He took birth in the prosperous Back Bay district of Boston, Massachusetts. He did not do graduation in sociology or in any other subject. He received education from the readings done by his peers and from his own "field work" among different social groups. He was the president of American Sociological Association. His two major works are The Human Group and Elementary Social Behaviour. He was a firm believer in social science. He was one of the pioneers of modern exchange theory. The famous "Mayo studies" executed under the influence of industrial psychologist Elton Mayo provided the foundation for Homan's work. He made a major contribution towards the in-depth study of small group theory and research. significant fact is the exploration of the activities of individuals in his famous work Social Behaviour. Homans put forward the dynamics of friendship and conformity in small groups. Homans opined that people recognised some precise rules regarding the relationship between rewards, cost and investments. He claimed that people believe the relative amount they put into something including costs, contributions and investments must be equal to what they get. It is interesting to note that Homans was deeply influenced by Pareto. 12.3 Intellectual Influences When George Homans was in his undergraduate years at Harvard University he came under the influence of physiologist cum sociologist Lawrence J. Henderson. It was through Henderson that Homans was introduced to the notion of the conceptual scheme. The set of variables which needs to be taken into account while studying a set of phenomena makes up the conceptual scheme. It also includes a framework of the given conditions within which the phenomena is to be comprehended and analysed. Moreover, it should contain a statement which says that variables are related to one another. Homans was highly impressed with Henderson's notion of the conceptual scheme. In order to study small groups, Homans developed his own conceptual scheme as well. He

NSOU CC - SO - 03 183 observed that a conceptual scheme of a social system provides the sociologist "with the mental pigeonholes he needs and some notion of the relations between the materials in them and it will help him to new discovery if he does not let it altogether master his thinking". The behavioral psychology of B.F. Skinner has been highly instrumental in shaping up his theory. During his days at Harvard University, their friendship became stronger. He was always fascinated with Skinner's behavioral psychology. 12.4 Exchange Theory and Communicative Action Homans spoke about human interaction. He showed how interaction ultimately led to social processes and social structures. On the basis of four different social groups, he developed his theory. These social groups are : the street gang, the working group of factories, the Royal System of Private Island and the New England village. These observations aided him to develop five propositions to form the power of the group. There are four social psychology theories. They include : similarity attraction theory, social exchange process theory, casual attribution process theory, group originality theory. For intergenerational communication, communication between young people and the elderly and intercultural communication, this theory has been continuously in application. 12.5 Primary Observations of Homans It is interesting to note that Homans began his tenure at Harvard University through the popularity of the book English Villagers of the Thirteenth Century. He got training to search for relationships between variables. In his investigation, two kinds of variables of field systems were arrived at. He found a high statistical correlation between the open field system and the village settlement pattern. During his primary investigation, he never liked cultural explanations. Homans always believed in the folk adage that human nature is the same the world over. R.Firth's ethnography of Tikopia always fascinated Homans. 12.6 Theory of Stratification In his book Social Behaviour: It's Elementary Forms, he described and explained small group behaviour as an emergent social system of rewards. He applied the logic of Hermstein's positive reinforcement propositions. The most significant contribution in Elementary Forms was his theory of stratification. It was enunciated in a series of scattered propositions and definitions. They are as follows :

184 NSOU CC - SO - 03 The more valuable to other members of a group are the activities a person emits to them, the higher is the status they give him in return. The higher a person's status in a group, the greater his power is apt to be. The more members of a group a person is regularly able to influence, the greater his power. The value of what a member receives by way of (monetary) rewards should be proportional to his status in the group. Distributive injustice occurs to the extent that the monetary rewards members receive are disproportionate to their relative status in the group. Homans hypothesized that differences in status and power are natural. He predicted that the productivity and morale of group members naturally, inevitably would suffer. Homans' theory provided an alternative to the Marxist formulation that stratification refers to differences in monetary rewards and it was the root cause of all social problems. He further put forward a set of propositions which form the basis of his exchange theory. It states that individual assessments of costs and benefits are the basis of such social phenomena as competition and cooperation, authority and conformity. Other than contributing to social theory, he also enlightened us with industrial sociology and historical sociology. Some other popular works of Homans are : Sentiments and Activities, Certainties and Doubts. His autobiography Coming to My Senses is also very popular. 12.7 Homans and Social Interaction Homans' contribution towards social interaction is indeed remarkable. He came forward with certain innovative ideas. He analysed social interaction from a new dimension that is from the perspective of psychological principles. He designed his social model in such a way so that it would elaborately discuss how any group at all gets started and creates its own culture and structure. However, while working on this model he realised a problem and then in his later system (1961) formulated a principle to deal with it. Thus he developed the principle of marginal utility, which was taken from economics. The principle says that the more persons possess some particular reward the less rewarding are further increments of that award. This means when interaction takes place within certain individuals, it is highly rewarding. When this same social interaction reaches a specific level where individuals meet each other a lot, it ultimately reaches a stage where the attraction of

NSOU CC - SO - 03 185 the interaction becomes less desirable. It simply fades away gradually. Hence, no further growth occurs in intensity of social bonding. It is similar to other processes which are linked to the interaction loop : common sentiments and behaviours build up as liking which reinforces interaction, though it levels out at some point, thereby strengthening the group in having a common culture which remains fairly stable. After stating the first proposition, Homans found out that introduction is not always rewarding. So, if the introduction itself is not fruitful then it is unlikely that people will like each other. This intrigued him further and he proposed something new. He propounded that the interaction will be mutually rewarding only when the persons are equal; if they are unequal, the one with the lower rank or power will find the exchange unpleasant and will avoid further interaction. It was derived empirically from the role of the maternal uncle in tribal societies with patrilineal kinship. So he formulated that unequal relationships are unrewarding to at least one partner, hence the result is avoidance, while equal relationships allowed the principle to play itself out that interaction leads to liking. Homans also concentrated upon the status of the group leader. According to him, the leader is the person who conforms to most of the group norms. It is the leader who represents the ideal attitudes and behaviour in the group culture. His perception of the leader is one who conforms to the group norms and at the same time has many social contacts within the group, one who initiates as well as receives communications. He visions leader as one who interacts the most with the members of the group. Homans says that the sentiments and activities of the leader should be similar to the group's own. Thus, he analysed a leader in an entirely different perspective. He placed the leader at par with others. He didn't favour the gap between the leader and the group members. It helps in strengthening the group bond and strengthens the relationship. It would definitely boost up the functionality of the group members. It would lead to the feeling of 'we- ness'. While explaining about a leader, he illustrated the incidence of the popular work of William F. Whyte's Street-Corner Society. On the basis of the several studies Homans concluded that the operative principles in social relationships are psychological laws. He was of the view that society had been constituted out of common sense and rational behaviour of individuals with special emphasis on rewards. Homans claimed

that people are social and spend a significant amount of their time interacting with other people.

While discussing about interaction he agreed with Durkheim that interaction leads to the emergence of something new.

186 NSOU CC - SO - 03 A comprehensive program was carried out to "bring men back into" Sociology. The structural functional theory of Talcott Parsons motivated Homans to a large extent. 12.8 Power, Equity and Games With regard to friendship and conformity Homans identifies social approval as the good people offer, when there is nothing else to exchange. When one party or the other has relatively little to offer, a situation of imbalance takes place. This lies at the root of Exchange Theory's analysis of power. Homans defined power as the ability to provide valuable rewards. His explanation of power is quite similar to that of economists. Power is evaluated on the basis of the price people get for their services. This is paid usually in the form of some concrete exchange, such as money, or in a more generalised form, such as obedience to orders. Being the master of valuable resources does not mean that a person can exercise full power over others. Or else it leads to imbalance. The practicality of Homans's analysis of power lies in the fact that it can be exercised in the case of both coercive power and non-coercive power too. Let us understand the two types of power. Coercive power refers to the ability to punish while non-coercive power refers to cases where both sides achieve some degree of extra reward. For instance, mugging victims generally believe their choice to be between losing life (and thus money too) or just using money. Homans says non-coercive power is more reliable and effective. He found that theories of punishment often stir up rebellion and then may not yield the desirable behaviour. 12.9 Homans' Propositions Success Proposition For all actions taken by persons, the more often a particular action of a person is rewarded, the more likely the person is to perform that action (Homans, 1974 : 16). This proposition states that an individual is more likely to ask others for advice if he or she has been rewarded in the past with useful advice. Based on the weightage of receiving useful advice in the past, a person is likely to request for more advice. This proposition consists of three stages; first, a person's action, next, a reward result; and finally, a repetition of the original action or at minimum one similar in at least some respects. Homans listed some features of success proposition. The first one is that this reciprocating relationship that frequents rewards lead to increasing the frequent actions will not continue for an unlimited span of time. Secondly, the shorter the interval

NSOU CC - SO - 03 187 between behaviour and reward, the more likely a person is to repeat the behaviour. On the other hand, longer the interval between behaviour and reward, lower the likelihood of repeat behaviour. Finally, Homans claimed that intermittent rewards are more likely to elicit repeat behaviour than regular rewards. While regular rewards lead to boredom and satiation rewards at irregular intervals are very likely to elicit repeat behaviours. So, basically the success proposition deals with a man's (or woman's) action towards obtaining success in receiving a desirable result. It is popularly called "the law of effect" in classical psychology. The proposition states nothing about the reasons behind the performance of the person. In case of experimental animals like pigeon its repertory of innate behaviour seems to include a tendency to explore or investigate its environment by pecking at the objects within it. The cage has been arranged in such a way that the motion of a mental key will release a grain of corn to the pigeon. Now while exploring the cage, if the pigeon pecks at the key, it will get the corn and eat it. This leads to the probability that pigeon will peck the target again and again. Automatically it will increase its likelihood. Through this experiment, it was proven that men share a similar behaviour like animals. In other words, success proposition states that whatever be the cause behind the performance of an actor, once he has done it and its successful, the person is obviously going to repeat it. It can also be regarded as a positive value. The consequence of an action is what follows it. The success proposition holds good even if success was not in the eyes of some informed observers caused by the action of what was rather a matter of chance. It may seem that the proposition has said that an action was caused by its result. It will definitely be observed to those who does not believe in teleology. However, it does not see that. Within this proposition there is a sequence of at least three events. They are : (1) A person's action which is followed by (2) a rewarding result and then by (3) adaptation of the original action i.e. an action which is similar to the original. It is this combination of (1) and (2) which causes event (3). As the former two precede the latter in time, the question of teleology does not occur. The proposition contends that an increasing frequency of reward leads to an increasing frequency of action, at the same time, it is quite obvious that such an increase will not go on indefinitely. This proposition has its own built-in-limits, which will be explored later while discussing deprivation-satiation proposition. According to this proposition, the less often an action is rewarded, the less often it is likely to be repeated. If we

188 NSOU CC - SO - 03 consider the extreme situation, if an action once rewarded, is never rewarded thereafter, a person will never ever perform it. Technically this behaviour can be described as one which becomes extinguished. In this context, it is highly crucial to highlight some qualifications of the success proposition. The shorter the interval of time between the action and the reward, the more likely the person is to repeat it. So, positive reinforcement plays an important role here. It is fascinating to note that the principle on which "teaching machines" are based owes its roots here. For instance, when we expect a person to learn, we have to do well in order to reward his correct responses promptly. The Stimulus Proposition With respect to the second proposition, let us first concentrate on what Homans said. According to him, if in the past occurrence of a particular stimulus or set of stimuli, has been the occasion on which a person's action has been rewarded, then the more similar the present stimuli are to the past ones, the more likely the person is to perform the action or some similar action. Homans took up a very humble approach while illustrating this proposition. He offered a squared and impressive example : "A fisherman who has cast his life into a dark pool and has caught A fish becomes more left to fish in dark pools again" (1974:23). What interested Homans was the process of generalisation, i.e. the tendency to extend behaviour to similar situations. In the above example the tendency to move from fishing in dark pools to fishing in any pool with any degree of shadiness is one aspect of generalisation. Another dimension says that success in catching fish is likely to lead from one kind of fishing to another or even from fishing to hunting. Other than generalisation, discrimination is equally common here. Under the circumstances, the actor may fish only during particular time periods which proved successful in the past. It must be remembered here, that if complicated conditions lead to success then similar conditions may not stimulate behaviour. If there is a long gap between the crucial stimulus and the behaviour which is required then it may not actually stimulate that behaviour. Suppose the stimuli which is presented to the actor is very valuable then it can lead to over sensitization. In fact, the individual can respond to irrelevant stimuli at least until the situation is corrected by repeated failures. It is the individual's alertness or attentiveness to the stimuli which affects his responses. This proposition is concerned with the impact on the action of the circumstances catering to it. In many narrations of operant or voluntary behaviour, these attendant circumstances are called stimuli. Hence they are referred to as the stimulus proposition.

NSOU CC - SO - 03 189 There are some psychologists who include the reward of the action itself among the stimuli in their endeavour to construct theories. So it is referred as a reinforcing stimulus. In case of social behaviour, individuals and their qualities become crucial stimuli. Under normal circumstances, human social behaviour is simple. Unfortunately it is the verbal language which makes everything complicated. What sets apart human beings from animals, is the application of language. Same set of general propositions are applied to the behaviour of both men and animals. As the stimuli available to men are highly complex in nature, it leads to an increased state of complexity in their behaviour. The degree of similarity between present stimuli and those under which an action was rewarded in the past is the most crucial variable in this proposition. This similarity may vary across different dimensions. It depends on a complicated pattern of measures. In this context we must introduce ourselves to a new fact. The ways in which people discriminate or generalise different stimuli is known as perception or cognition in Psychology. The Value Proposition The more valuable to a person is the result of his action, the more likely he is to perform the action (Homans). In this proposition Homans speak about an office situation, where some individuals offer rewards to others. Now, if these rewards are valuable, then the incidence of performing those actions gets accelerated. On the other side if the rewards are not valuable then the chance of performing those behaviours reduces. These helped Homans to reach a new level where he introduced the concept of rewards and punishments. He defined rewards as actions with positive values; an acceleration in rewards is more likely to elicit the desired behaviour. Punishments, Homans contented, are actions with negative values. So an increase in punishment means that the actor is less likely to manifest undesired behaviour. Homans felt that punishments are an inefficient means of getting people to change their behaviour as people may react in undesirable ways to the punishment. Then, such kind of behaviour eventually gets extinguished. By values, he means both positive and negative values depending on the situation. He stated that rewards are the positive values that result from a person's actions while results which lead to negative values are punishments. In this proposition, zero point is a very significant feature. It is that point on the scale where the person is indifferent to the result of his action. Thus the proposition contends

190 NSOU CC - SO - 03 that just as an increase in the positive value of the rewards makes it more likely that the person will perform a particular act, so an increase in the negative value of the punishment makes it less likely that he will do so. While discussing about reward it must be mentioned here that there are two classes of reward : intrinsic reward and avoidance of punishment. Similarly there two classes of punishment : intrinsic punishment and the withholding of reward. Generally it is believed that the use of punishment is an inefficient means of getting another person to change his behaviour. There is no surety that it will definitely work. If we look at the other side of the coin, we will see that it gives immense pleasure as well as great emotional satisfaction to the actor who actually punishes. However, no one is sure about the result. Another efficient alternative means of extinguishing an undesirable activity is to just let it go unrewarded, i.e. simply ignoring it. For instance a child is crying only to get attention. Once others understand this, they start to ignore it. In case of a mother, it really takes strong nerves to carry out such a strategy. It is obviously quite heartbreaking for her. We must keep in mind that punishment leads to hostile emotional behaviour in the person punished and we must be prepared to deal with it tactfully. Reality says that positive rewards are always in short supply so there will be times when punishment will become necessary in order to control undesirable behaviour. The objects which men regard is rewarding i.e. their values will definitely vary from one person to another. Some of them are genetically determined so they are shared by many men, such as the value set on food and shelter. A value is learnt by being linked with an action that is successful in obtaining a more primordial value (Staats and Staats, 1963 : 58-54). A mother who often hugs her child, gets hugged in return as an innate value in circumstances where the kid has behaved differently from others. As the mother says "better" than "behaving better" than others is a means to a rewarding end and is surely to become "rewarding in itself". This is a perfect situation where acquired value comes to the forefront. This reward may generalise and the child may set a high value on status of all kinds. Through these processes of linking, people learn and maintain long chains of behaviour leading to some ultimate reward. All of us have some kind of experience in our daily life. The impact of those diverse experiences is indeed very strong in nature. Individuals face different kinds of upbringing, this acquires various types of values. There are some values which men of particular societies would have difficulty in not acquiring. These are generalised values. Money and social approval can serve as rewards for a broader spectrum of actions. In this sense, they are generalised values.

NSOU CC - SO - 03 191 The Deprivation-Satiation Proposition The more often in the recent past a person has received a particular reward, the less valuable any further unit of that reward becomes for him. Homans says that at the workplace person and other may reward each other very often for giving and getting advice. This makes the rewards less valuable to each other. Time plays a crucial role here. It is important to remember that if particular rewards are stretched over a long period of time then social actors are less likely to become satiated. In this context, Homans introduced two other critical concepts : cost and profit. Cost has been referred to as the rewards lost in foregoing alternative lines of action. Profit has been explained as the greater number of rewards gained over costs incurred. The latter led Homans to recast the deprivation-satiation proposition as "the greater the profit a person receives as a result of his action, the more likely he is to perform the action" (1974:31). This proposition is concerned with how valuable a person's values are, how valuable an individual finds a particular reward in comparison with other rewards. It has got two aspects; Is the same kind of reward more valuable on one occasion than on a different occasion? Is it like catching fish today maybe more rewarding than it will be in the afternoon? Secondly, is one kind of reward more valuable than a different kind on the same occasion? In our everyday walk of life if we receive rewards often then we would be satiated with it. Naturally, it's value will decrease and according to the value proposition we will be less interested to perform that action which would be followed by that reward. Here, the proposition emphasizes the "recent past" as there are innumerable rewards with which an actor can only be temporary satiated. In this case food is a good example. On the other side, if a man has mastered the skill to value a particular reward but has received it seldom in the recent past, it is said that he is deprived of it. According to this proposition the individual is more likely to perform an action that is followed by this reward. In this way, the value increases for the men. This proposition states a very general tendency. It holds good that the recent past within which deprivation or satiation takes place must vary for various kinds of rewards. For instance food can satiate men quickly but soon recovers its value. Additionally, what is worth remembering here is that these values can be assigned in some kind of rank order or hierarchy of values.

192 NSOU CC - SO - 03 The Aggression Approval Proposition Proposition A : when a person's action does not receive the reward he expected, or receives punishment he did not expect, he will be angry; he becomes more likely to perform aggressive behaviour and the results of such behaviour becomes more valuable to him. This proposition is based on the "law of distributive justice". It refers to the fact whether the rewards and costs are distributed fairly among the individuals involved. Homans said that "The more to a man's disadvantage the rule of distributive justice fails of realisation, the more likely he is to display the emotional behaviour we call anger" (1961:75). Often we see that an employee does not get the advice he or she expected and others are not embraced with the appreciation which they desired. The consequence is both are angry. Homans gives this instance of office case. Frustration and anger in spite of being mental states are highly significant in Homan's theory. It was admitted by him that "When a person does not get what he expected he is said to be frustrated..." (1974:31). He further clarified that frustration refers not only to an internal state but also to "wholly external events" as well. Proposition A on aggression-approval refers only to negative emotions, whereas proposition B refers to more positive emotions. Proposition B : When a person's action receives the reward he expected, especially a greater reward than he expected or does not receive the punishment he expected, he will be pleased; he becomes more likely to perform approving behaviour and the results of such behaviour become more valuable to him. With respect to the proposition B let us trace back to the office circumstance. If we assume that the person is given the advice which is expected by him on her and others feel blessed with the praise received then both are pleased. Thus, both are more likely to get or give advice. Hence, advice and praise complement each other and becomes more valuable to each other. In other words, approval can become an instrument as men may find the approval from others as rewarding. So, one can highlight the fact that approval like aggression may become a voluntary as well as emotional action. Over the passage of time, the unexpected and unusual reward takes the shape of an expected and usual reward. In this process the whole mechanism works.

NSOU CC - SO - 03 193 The Rationality Proposition In choosing between alternative actions a person will choose the one for which, as perceived by him at the time, the value V , of the result, multiplied by the probability p , of getting the result, is the greater. This proposition clearly demonstrates the influence of rational choice theory on Homan's approach. In economic terms, actors act in terms of rationality proposition thereby maximizing their utilities. Normally, people examine and make calculations about the various alternative actions open to them. Actors compare the amount of rewards related with each course of action. They wait in anticipation of receiving the rewards. If actors are unable to achieve the highly valued rewards then they tend to become devalued. On the other hand, if lesser valued rewards become attainable, then they get enhanced. So, the value of the reward and the likelihood of attaining it shares a very strong relationship. Rewards which are very valuable are the most desirable and highly attainable ones. Less valuable rewards are the least desirable ones. Homans relates this proposition to the success, stimulus and value propositions. This proposition states that depending on the perception of probability of success, people are likely to perform an action. Depending on past successes and similarity of the present situation to past successful situations, the perception of whether the chance of success is higher or lower is determined. He says that an actor is a rational profit seeker. He always worked at the level of individual behaviour. It was observed that exchange processes are "identical" at the individual and societal level although he granted that at the societal level "the way the fundamental processes are combined is more complex". People are rational in the sense that they repeat rewarding actions, they respond to stimuli associated with such rewards and act on the basis of the values they attach to things. It is interesting to note that criminology draws on this principle when examining the harmful effects of arrest rates and sentencing. This principle conveys that other things being equal, the more often crimes succeed, the more people will commit them. This approach is very beneficial when it comes to analysing problems like poor education, overt war between teacher and pupils etc. His rationality proposition is based on the first three propositions. Homans explains his proposition in terms of multiplication of value of an action's possible reward. This is based on the probability whether the value of a reward will multiply or not. For example, when we think about which career we should select we compare the probable rewards among the fields selected. Stock market

194 NSOU CC - SO - 03 also tends to involve people comparing the likelihood of further rises on the basis of past experience. The rationality principle also includes people's use of "rules of thumb" to shorten decision making that proves successful most of the time. Hence, we can see that this principle teaches us to act rationally on the basis of our perception of risks and rewards, no matter whether they are right or wrong. Here, we reach the end of our discussion about the different propositions stated by George Homans. The crucial point is that we all apply these propositions very much in our day to day life. The only difference is that we are not aware of these all the time. Next, let us introduce another very influential social thinker who went beyond George Homans and investigated further. His name is Peter Blau. 12.10 Peter Blau The two sociologists who were popularly responsible for bringing about exchange theory were Peter Blau and George Homans. Peter Blau was close to mainstream of American Sociology. He was born in Vienna in 1918 to a secular Jewish family. He had been involved in underground socialist politics as a teenager and was imprisoned for his activities. He taught at the University of Chicago for many years. In 1964, Blau became President of the American Sociological Association. Peter Blau is popular specifically for his combination of original empirical research with general and theoretical propositions. He gave emphasis on occupational variation. While Homans believed in psychological factors, Blau gave importance to social factors as well. Blau believed that the study of the "simpler processes that pervade the daily intercourse among individuals" is vital for comprehending social structures. As a direct contribution to exchange theory, Blau came up with the book: Exchange and Power in Social Life. Blau missions exchange as one particular aspect of most social behaviour. He focuses upon "all voluntary actions of individuals that are motivated by the returns they are expected to bring. Blau moves beyond Homans' analysis of interpersonal relationships with more lucid discussion of price mechanisms in social exchange. Blau's major contribution to exchange theory lies in the concern with the relationship between exchange and the integration of society at large. He also questioned the exchange basis of power in large institutions as well as small groups. He said that social exchange is very important in social integration. It was highlighted that the creation of bonds of friendship happens to be one of the functions of social exchange. Establishing subordination or domination is another function. It is through creating trust, increasing differentiation, enforcing conformity with group norms, developing collective values that exchanges increase social integration.

NSOU CC - SO - 03 195 Peter Blau discussed about "impression management" too. He put forward the social process of how people present themselves to others. Observation says that people want to be accepted in two ways : as associates who promise rewarding extrinsic benefits and can therefore command favourable returns and as companions whose presence is intrinsically rewarding. Thus impressions are very important to the "prices" at which social exchange is conducted. Here Blau relies on the work of Erving Goffman. Goffman introduced the notion of "role distance". Blau related role distance to social exchange as people wish to demonstrate how efficient they are. In this way they proved their services to be very valuable. In Blau's theory, we also come to know about the determinants of friendship and love. On the basis of the assumption that value status, he defined status as the common recognition by others of the amount of esteem and friendship that someone receives. It means that social intercourse and friendship generally occurs among people whose social standing is roughly equal; secondly relationships between unequals are less strained when the inequality is clear and marked (Wallace & Wolf). Blau says that people with firmly established status are unaffected by any kind of exposure. For instance, modern social scientists concluded that overt racial prejudice is strongest among those whites whose own status is least secure. it was also pointed out that some social associations are intrinsically valuable. Blau insisted on intrinsic elements of social exchange. He did not say much about the emotional aspects of exchange. Behind this process of social exchange, lies the fundamental social norm of reciprocity. Thus Peter Blau's goal was "an understanding of social structure on the basis of analysis of the social processes that govern the relations between individuals and groups. The basic question is how social life becomes organised into increasingly complex structures of associations among men" (1964:2). Blau proved further than Homans, regarding the elementary forms of social life and commented that "The main sociological purpose of studying processes of face to face interaction is to lay the foundation for an understanding of the social structures that evolve and the emergent social forces that characterize their development" (1964:13). According to Blau, this process of social exchange guides much of human behaviour and underlying relationships among individuals as well as among groups. He developed a four stage sequence leading from interpersonal exchange to social structure to social change :

196 NSOU CC - SO - 03 Step 1 : Personal exchange transactions between people give rise to... Step 2 : Differentiation of status and power which leads to... Step 3 : Legitimization and organisation which sow the seeds of... Step 4 : Opposition and Change. It must be remembered here that Blau's theory is limited to actions that stop when expected reactions are not forthcoming. There are different kinds of reasons which binds people together, thereby ending up into social associations. After the preliminary bonding takes place, it is the rewards which serves to maintain and enhance the bonds. The opposite circumstances is also possible : insufficient rewards lead to weak associations. Rewards are of two types : intrinsic and extrinsic. It is really not possible to reward each other equally. If there is an unequal exchange, a difference of power will emerge within an association. Blau extended his theory to the level of social facts. He realised that it is not possible to analyse processes of social interaction without the social structure. They are inextricably connected to each other. Social groups make interaction functional. Depending on the value of rewards and how loving they are, social beings actually get inclined towards some particular groups and not all. In order to be members of that group, these new people must give many rewards to those in the group. If the newcomers are successful in impressing the group members, then only the bonding among all members gets strengthened. Peter Blau based his theory on the societal level. Distinction was made between two types of social organisation. First is the emergent properties of social groups, which emerge from the processes of exchange and competition. Second is the establishment of social organisation in order to achieve specific objectives, for instance manufacturing goods that can be sold for a profit, participating in bowling tournaments etc. In addition to this, he was concerned with subgroups within them. He stated that leadership and opposition groups are found in both types of organisation. The difference between Blau and Homans lies in the fact that while Blau identified the essential difference between small groups and large collectivities, Homans on the other hand minimised this difference in his effort to explain all social behaviour in terms of basic psychological principles. The complex social structures that characterize large collectives differ fundamentally from the simpler structures of small groups. A structure of social relations develop in a

NSOU CC - SO - 03 197 small group in the course of social interaction among its members. Since there is no direct social interaction among most members of a large community or entire society, some other mechanism must mediate the structure of social relations among them. Blau pointed out that norms and values mediate among the complex social structures. He utilizes this concept of norm to the level of exchange between the individual and collectivity. On the other hand the concept of values takes Blau to the largest scale societal level as well as to the analysis of the relationship among collectivities. So, we can understand that Blau was mainly interested in groups, organisations, collectivities, societies, norms and values. He investigated what holds large-scale social units together and what sets them apart. Blau based his exchange theory on the basis of face to face relations.

12.11 Critical Appraisal of Homans and Blau As Homans said "no theory can explain everything". It is necessary to ignore some things and assume them to be given for the purposes of explanation at hand. The same applies for his theory as well. Homans' proposition on rationality was criticized as it was against utilitarianism. He met this criticism partially. He recognised that people make calculations by weighing costs, rewards and the probabilities of receiving rewards and avoiding punishments. However, people do so in terms of value. It is to be remembered that what is rewarding is a personal matter and unique to all individuals. It is the past experiences, that help people to establish their own values. Hence, rationality occurs in terms of calculations of personal value. Homans is also criticized on the ground that does all human actions involve calculations or not. Critics say that people receive rewards without prior calculations. For instance, when a person receives a gift or becomes the beneficiary of another's desire to bestow rewards, prior calculations are not involved. Rewards or reinforcement are nonetheless involved. 12.12 The Issue of Tautology The problem of tautology is fundamental to the exchange perspective. window key concepts like value, reward and action are examined, they appear to be explained in terms of each other. Rewards are gratifications that has value. Value is the degree of reward or reinforcement. Action is reward seeking activity. It is really not possible to build a theory from tautological axioms. For example; Homans's proposition that "The more valuable to a person is the result of his action, the more likely he is to perform the action" could be considered a tautology. Value is defined as the degree of reward and action is defined as reward seeking behaviour (Turner). He feels that this can be solved by deductive

198 NSOU CC - SO - 03 theory. Thus "a tautology can take part in the deductive system whose conclusion is not a tautology". Here, critics say that rigorous deductive systems are absent in Homans's theory. 12.13 The Issue of Reductionism Homans' theory leads to the rise of the issue of reductionism. He failed to resolve sociologist's concern with the kind of reductionism. He is of the view that psychological axioms "cannot be derived from psychological propositions...this condition is unlikely to last forever". Critics have charged Homans by saying that he is a "nominalist", one who asserts that society and its various collective forms (groups, institutions, organisations and so forth) are mere names that sociologists assign to the only "really real" phenomenon, the individual. (Turner) 12.14 The Fallacy of "Misplaced Concreteness" Homans was criticized on the basis of the fallacy of misplaced concreteness. He was criticized on the ground that behaviour of persons or "men" are the basic units whose laws are to be understood in order to explain complex socio-cultural arrangements. Turner stated that Homans' sociological laws are subsumable under more general psychological laws, which, with more knowledge and sophisticated intellectual techniques, will be inclined to more general set of laws. He further says that Homans is not a nominalist in disguise, rather sociological realist. 12.15 The Utility of Homans' Reductionist Strategy Homans's reductionism is a theoretical strategy. It does not deny the metaphysical or ontological existence of emergent phenomena. Critics pointed out that reductionist strategy will affect the kinds of theoretical and research questions that sociologists will ask. If the sociologists are concerned only with psychological laws as explanatory principles, then research questions and theoretical generalizations will revolve around psychological and social-psychological phenomena. Thus the adoption of a reductionist strategy for building theory will naturally result in the avoidance of the more patterns of social organization. So, it is the reductionist strategy which gives rise to one-sided research and theory building. Further, his theory has been criticized on the ground that adherence to his strategy at present will lead to logically imprecise and empirically empty theoretical formulations.

NSOU CC - SO - 03 199 12.16 Critical Appraisal of Peter Blau Peter Blau has offered a most varied image of society. He has synthesized several theoretical traditions. This in turn helps other sociologists. His concept of mediating values, types of institutions has proved very beneficial for the functionalists. Blau's dialectical conflict perspective emphasized on the inevitable forces of oppositions in relations of power and authority. This provided an insight for the conflict theorist. With respect to interactionists, his analysis of elementary exchange processes places considerable emphasis on actions of people in interaction. However, Turner said that Blau left a number of theoretical issues unresolved. In his early exchange approach Blau tried to resolve the problem of how groups, organisations, communities or social systems are similar or dissimilar. He attempted it in several ways : 1 By assuming that the basic exchange processes of attraction, competition, differentiation, integration and opposition occur at all levels of social organisation. 2 By explicating general exchange principles and incorporating abstract exchange concepts that can account for the unfolding of these processes at all levels of organisation. 3 By enumerating additional concepts, such as mediating values and institutionalization, to account for emergent phenomena at increasingly more levels of social organisation. 4 By classifying the generic types of organisation or categories, communities organised collectives and social systems (Turner). Turner says this is a great effort in order to bridge the micro-macro analytical gap in sociological theorizing. Unfortunately, a number of problems persist. Firstly, Blau explained organised collectivities very elaborately. They included social phenomena ranging from small groups to complex organisations. One must be alert that the concepts and theoretical generalizations appropriate to the small primary group, the secondary group, a crowd, a social movement etc. are different in some way or the other. Blau failed to resolve the problem of emergent properties Next, Blau asserts that elementary exchange processes occur at macro levels of organisation. Now, if these emergent levels of organisation are to be understood, then mediating values are needed. He only says that mediating values are critical and thus avoids answering theoretically important questions. Finally, Blau's presentation of exchange concepts and their incorporation into exchange principles is vague. Turner concluded by saying that Blau has simply stopped trying to

200 NSOU CC - SO - 03 view macro-processes as fundamentally connected to micro-exchanges. In Turner's observation, exchange theory is one of the rare approaches which can reach this gap with common principles. 12.17 Summary Homans has helped us to understand power, equity and games. Homans has laid down some important propositions. Peter Blau put forward the determinants of friendship and love. The more we have a clear conception about these concepts, the better it is in dealing with our day to day life. It improves our basic social interaction patterns with others. 12.18 Conclusion This chapter deals with the contribution of George Homans and Peter Blau. It has been felt that it's very significant to be familiar with the contributions of George Homans and Peter Blau. George Homans had showed how social interaction leads to social processes and social structures. The readers will come across certain valuable principles and works of these great social exchange theorists. Without understanding about Homans and Blau, it is not possible to have a thorough perception regarding social interaction. 12.19 Questions 1 Discuss George Homans's basic propositions. 2 How far do you feel these propositions to be relevant in our day to day life? Elucidate this with respect to examples. 3 On what basis can we differentiate between George Homans and Peter Blau? 4 Mention Peter Blau's four stage sequence. 5 How does Peter Blau envision exchange theory? Discuss this with reference to the modern world. 6 What was Peter Blau's main goal? 7 Compare and contrast Homans's and Blau's theory. 8 Make a critical appraisal of George Homans. 9 Critically evaluate the social exchange theory of Peter Blau. 10 Write in your own words whose social exchange theory is more practical and relevant in today's society. Which one do you find interesting?

Emerson, R. 1977 "Social Exchange Theory" in Sociological Theories in Progress, V. II, edited by A. Inkeles, et al. Palo Alto, CA: Annual Reviews, Inc. Homans, G. 1974 Social Behavior: Its Elementary Forms (rev. ed.), New York: Harcourt, Brace, Jovanovic Parsons, T. 1968 "Utilitarianism and Sociological Theory" in International Encyclopedia of the Social Science. New York: Macmillan Rubin, J. and B. Brown 1975 The Social Psychology of Bargaining and Negotiation. New York: Academic. 12.21 Glossary Cost :The fundamental concept of the theory of social exchange is cost and rewards. This means that cost and reward comparisons drive human decisions and behavior. Costs are the negative consequences of a decision, such as time, money and energy. Investment :The investment model was proposed by CarylRusbult. It is a useful version of social exchange theory. According to this model, investments serve to stabilize relationships. Communicative action : Co-operative action undertaken by individuals based upon mutual deliberation and argumentation. Human interaction :A social interaction is an exchange between two or more individuals and is a building block of society. Ethnography :It is defined as an illuminative account of social life and culture in a particular social system based on multiple detailed observations of what people actually do in the social setting being observed Distributive justice :In social psychology, distributive justice is defined as perceived fairness of how rewards and costs are shared by (distributed across) group members. Homans's Equity : It proposes that individuals in social exchange relationships compare each other the ratios of their inputs into the exchange to their outcomes from the exchange. Coercive Power :the ability of a manager to force an employee to follow an order by threatening the employee with punishment if the employee does not comply with the order.

For example, a word which is a linguistic sign (something that stands for something else) can only be understood within a certain conventional system of signs, which is language, and not by itself. A particular relationship within a society (e.g., between a male offspring and his maternal uncle) can only be understood in the context of the whole system of kinship (e.g., matrilineal or patrilineal). Module - V : Structuralism

NSOU CC - SO - 03 203 Structuralism holds that, according to the human way of understanding things, particular elements have no absolute meaning or value: their meaning or value is relative to other elements. Everything makes sense only in relation to something else. An element cannot be perceived by itself. In order to understand a particular element we need to study the whole system of relationships or structure. A particular element can only be studied as part of a greater structure. In fact, the only thing that can be studied is not particular elements or objects but relationships within a system. Our human world, so to speak, is made up of relationships, which make up permanent structures of the human mind. Structuralism obviously involves a focus on structures, but they are not in the main the same structures that concern the structural functionalists. While the latter, indeed most, sociologists, are concerned with social structures, of primary concern to structuralists are linguistic structures. This shift from social to linguistic structures is what has come to be known as linguistic turn which significantly altered the nature of the social sciences. The focus of a good many social scientists shifted from social structure to language or more generally to signs of various sorts. 13.3 Linguistics as a Major Starting Point of Structuralism One of the earliest influences in the development of structuralism was Ferdinand de Saussure's Course in General Linguistics, a text published posthumously in 1916 that was compiled by his colleagues from students' notes of a series of lectures he gave at the University of Geneva from 1906 to 1911. Saussure applied structural analysis only to linguistic systems but many philosophers and intellectuals chose to apply his reasoning more widely, and his assumptions and methods were subsequently modified and extended to other disciplines and to nonlinguistic phenomena. Structuralism was increasingly taken up within fields such as anthropology, psychoanalysis, literary theory, and architecture, to the extent to which it became an influential intellectual movement that, by the 1960s and 1970s, had to a large extent eclipsed phenomenology and existentialism. From the late 1940s through the 1970s (and to a diminished extent beyond), structuralist thought had a significant and explicit purchase on disciplines such as Anthropology, Cognitive Development, Literary Criticism, Mathematics, Political Science, and Sociology. Structuralism assumes that all human social activities – the clothes we choose to wear, the books we write, the cultural rituals we practice – constitute languages and that their regularities can therefore be codified by abstract sets of underlying rules. Thus, for

204 NSOU CC - SO - 03 example, the psychoanalyst Jacques Lacan asserted that the unconscious was structured like a language, and Michel Foucault's early writings characterized knowledge as what can be spoken of in a discursive practice. Structuralism emerged from diverse developments in various fields. The source of modern structuralism and its strongest bastion to this day is linguistics. The work of the Swiss linguist Ferdinand de Saussure (1857 – 1913) stands out in the development of structuralism in various other fields. According to Saussure, language is structured prior to its realization in speech or writing. Language consists of a set of signs, each of which is constituted by a signifier (a sound or inscribed image) and a signified (a concept or meaning). Other scholars use different words for signifier and signified, and most add a third aspect to Saussure's linguistic sign so as to include nonlinguistic objects or referents. For Saussure, signs are arbitrary because a word (signifier) is linked to a concept or meaning (signified) by the conventions and common usages of a particular speech community. Signs do not exist outside of a system and a word's meaning is determined by its relationships to, and differences from, other words, with the result that binary distinctions or oppositions tend to determine the content and normative commitments of the structure. Saussure also distinguished langue (language) from parole (speech) and his structural linguistics focuses on language (the totality of signs that constitute a natural language, such as French or English) and not on particular utterances. Of particular interest to us is Saussure's differentiation between langue and parole which was to have enormous significance. Langue is the formal, grammatical system of language. It is a system of phonic elements whose relationships are governed, Saussure believed, by determinate laws. The existence of langue makes parole possible. Parole is actual speech, the way that speakers use language to express themselves. Langue, then, can be viewed as a

87%

MATCHING BLOCK 254/320

W

system of signs – a structure – and the meaning of each sign is produced by the relationship

among signs within the system. Especially important here are relations of difference, including binary oppositions. Structuralism holds that understanding can only happen if clearly defined or 'significant' differences are present which are called oppositions (or binary oppositions since they come in pairs). This means that meaning is not something absolute but relative and depends on binary oppositions. We cannot understand something unless we first perceive how it is different from something else, or its 'opposition'. For example, there is no meaning 'hot' unless there is also 'cold', no 'good' without 'evil', no 'male' without 'female' and so on. All terms, so to say, 'generate' their opposites. In fact, it is this selection of the significant differences or opposites that create the world of objects for our mind. Another very

NSOU CC - SO - 03 205 important area where oppositions or significant differences are crucial is language where oppositions between sounds or words are crucial for understanding. For example, the only sound that makes the words 'dog' and 'dock' different is the last letter. If we make sounds 'g' and 'k' indistinguishable in pronouncing them, we distinguish these two words: it means that the distinction in pronunciation of 'g' and 'k' is a significant difference or opposition that is crucial to understanding. On the other hand, even if we pronounce the word 'rock' with a rolling R (as Italians or Russians do), we can still understand it: therefore 'r' or 'R' is not a significant difference or opposition crucial to our understanding. Therefore, what determines our understanding of someone's accent is whether the person can create enough difference between sounds that constitute binary oppositions that are significant for

83%

the structure of the language. Thus, instead of an existential world of people shaping their surroundings, we have

here

100%

MATCHING BLOCK 256/320

W

a world in which people, as well as other aspects of the social world, are

being shaped by the structure of language. These observations prove the existence of a structural principle in language: in language what makes any single item meaningful is not its particular individual quality but the difference between this quality and that of other sounds or words, or its position within the structure (system of relationships). These observations were made by Ferdinand de Saussure, in the *Course in General Linguistics*. The term "structuralism" was coined in the ongoing work in Linguistics, Semiotics, and Literary Analysis of Roman Jakobson. In this development, structuralism should be seen as a subdivision or a methodological field in the larger area of semiotics that finds its origins in the work of Ferdinand de Saussure. Saussure's work was an attempt to reduce the huge number of facts about language discovered by the 19th century historical linguistics to a manageable number of propositions based upon the formal relationships defining and existing between the elements of language. Saussure's systematic re-examination of language is based upon three assumptions: i. The systematic nature of language, where the whole is greater than the sum of its parts ii. The relational conception of the elements of language, where linguistic 'entities' are defined in relationships of combination and contrast to one another iii. The arbitrary nature of linguistic elements, where they are defined in terms of the function and purpose they serve rather than in terms of their inherent qualities.

206 NSOU CC - SO - 03 All three of the above assumptions gave rise to what Roman Jakobson came to designate as 'Structuralism' in 1929. 13.4 The Scope of Structuralism Structuralism is not just limited to or about language and literature. When Saussure's work was 'co-opted' in the 1950s by the people we now call structuralists, their feeling was that Saussure's model of how language works was 'transferable', and would also explain how all signifying systems work. The anthropologist Claude Lévi-Strauss applied the structuralist outlook to the interpretation of myth. He suggested that the individual tale (the parole) from a cycle of myths did not have a separate and inherent meaning but could only be understood by considering its position in the whole cycle (the langue) and the similarities and difference between that tale and others in the sequence. Contextually, it can be stated that fashion, for instance, can be 'read' like a language. Separate items or features are added up into a complete 'outfit' or 'look' with complex grammatical rules of amalgamation: we don't wear an evening dress and carpet slippers, we don't come to lectures in a military uniform, etc. Likewise, each component sign derives its meaning from a structural context. Of course, many fashions in clothing depend on breaking such rules in a 'knowing' way, but the 'statement' made by such rule-breaks (for instance, making outer garments which look like undergarments, or cutting expensive fabrics in an apparently rough way) depends upon the prior existence of the 'rule' or convention which is being conspicuously flouted. In the fashion world today, for instance, the combination of such features as exposed seams, crumpled-looking fabrics, and garments which are too big or too small for the wearer signifies the fashion known (confusingly, in this context) as deconstruction. Take any one of these features out of the context of all the rest, however, and they will merely signify that you have your jacket on inside out or don't believe in ironing. Again, these individual items have their place in an overall structure, and the structure is of greater significance than the individual item. The other major figure in the early phase of structuralism was Roland Barthes, who applied the structuralist method to the general field of modern culture. He examined modern France (of the 1950s) from the standpoint of a cultural anthropologist in a little book called *Mythologies*, which he published in France in 1957. This looked at a host of items which had never before been subjected to intellectual analysis, such as: the difference

NSOU CC - SO - 03 207 between boxing and wrestling; the significance of eating steak and chips; the styling of the Citroën car; the cinema image of Greta Garbo's face; a magazine photograph of an Algerian soldier saluting the French flag. Each of these items he placed within a wider structure of values, beliefs, and symbols as the key to understanding it. Thus, boxing is seen as a sport concerned with repression and endurance, as distinct from wrestling, where pain is flamboyantly displayed. Boxers do not cry out in pain when hit, the rules cannot be disregarded at any point during the bout, and the boxer fights as himself, not in the elaborate guise of a make-believe villain or hero. By contrast, wrestlers grunt and snarl with aggression, stage elaborate displays of agony or triumph, and fight as exaggerated, larger than life villains or super-heroes. Clearly, these two sports have quite different functions within society: boxing enacts the stoical endurance, which is sometimes necessary in life, while wrestling dramatizes ultimate struggles and conflicts between good and evil. Barthes's approach here, then, is that of the classic structuralist: the individual item is 'structuralized', or 'contextualized by structure', and in the process of doing this layers of sig[n]ificance are revealed.

13.5 Fundamental Concepts of Structuralism The impact of Ferdinand de Saussure's ideas on the development of linguistic theory in the first half of the 20th century cannot be overstated. Two currents of thought emerged independently of each other, one in Europe, the other in America. The results of each incorporated the basic notions of Saussurian thought in forming the central tenets of structural linguistics. In Europe, the most important work was being done by the Prague School. Most notably, Nikolay Trubetzkoy and Roman Jakobson headed the efforts of the Prague School in setting the course of phonological theory in the decades following 1940. Although it is difficult to find a set of common criteria on which all structuralists would agree, a number of general principles seem to unite at least Saussurean structuralism and the various schools which developed from it after World War I. These principles were interpreted in various ways by different scholars who supplemented them with own theoretical and epistemological assumptions. In very general terms, then, the following principles may be said to hold at least for the European structuralists: Firstly, languages should be studied as systems, and the relations constituting a language system have priority over the linguistic units they generate. Structuralism constitutes a radical rejection of the atomism of the neo-grammarians who dominated the latter decades of the 19th century linguistics.

208 NSOU CC - SO - 03 Secondly, languages should first be studied from a synchronic point of view, not a diachronic one, since the latter is dependent on the former. From the synchronic viewpoint a language is a system of signs for its speakers. Again, this was a reaction to the predominantly historical perspective of the 19th century linguistics. Thirdly, structuralists tend to stress the autonomy of the language system vis-a-vis other aspects of language, such as sociological, psychological and pragmatic or discourse factors, which are considered 'external'. Different structuralist schools, however, held different opinions on this particular issue. The view that language is an autonomous, self-contained system also entails that there are as many particular systems as there are languages (which, of course, does not exclude cross-linguistic similarities or the existence of language universals).

Fourthly, European structuralists put particular emphasis on the view that meaning is an inherent aspect of the language system, not reducible to external factors or reference. Moreover, they postulated that meaning can be analyzed with the methodology they had been developing for analyzing languages into phonemes. Again, this is a reaction to the 19th century linguistics, in particular to a strong positivist tendency which can be traced back to the work of such linguists as A. Schleicher (who believed language to be a natural organism), and, again, the neo-grammarians. Fifthly, structuralism grew out of the finding that from the vantage point of linguistics language is not a substance but rather a form or, more generally, a structure. A linguist, therefore, should not study language with the methodology of the natural sciences but develop new methods appropriate to the requirements of the linguistic object he has in mind. For a considerable period of time, structuralism was viewed as a genuine 'paradigm shift' in linguistics, and, in Europe at least, Saussure's *Cours de linguistique generale* (CLG) was read as a revolutionary work full of novel ideas. This had two effects. First, many linguists tended to overestimate the originality of Saussure's work, forgetting that he stood in a long tradition. Conceptual correspondences (and, occasionally, direct influences, although this has been a hotly debated issue) have been convincingly demonstrated between Saussure and W. von Humboldt, W. D. Whitney, J. Baudouin de Courtenay, E. Durkheim and other scholars. This lack of awareness of the historicity of Saussure's thought also resulted in uncritical interpretations of the CLG which attempted to downplay its ambiguities and inconsistencies (which nevertheless were often, as is not uncommon in a major seminal work, highly thought-provoking). Second, from the

NSOU CC - SO - 03 209 late 1960s onwards, linguists started to neglect structuralism because of its supposed over-abstract concepts and mistaken overall view on language. This not only resulted in an occasionally deplorable ignorance of the basic tenets of structural linguistics, especially among younger generations of linguists, but also in the unduly negative connotation from which the term 'structuralism' suffers today, notwithstanding the lasting value of the scholarly work of many structural linguists. 13.6 Structuralism: Basic Assumptions By the early 1960s, many Continental scholars were working with structuralist ideas, although many resisted being labeled as such and some eventually became more identifiable as poststructuralists. For example, Roland Barthes and Jacques Derrida explored structuralist approaches to literary criticism (although Derrida now is chiefly associated with deconstruction, which is a complex response to several theoretical and philosophical movements, especially phenomenology, psychoanalysis and structuralism) and, as already noted, Jacques Lacan applied Saussure's structuralism to psychoanalysis. Methods of structural analysis (as distinct from structuralist assumptions) appear to have informed Jean Piaget's studies in developmental psychology, although he is more likely to have described himself as constructivist. Foucault explicitly denied his affiliation with structuralism in his later works, but his 1966 book, *The Order of Things*, seeks to explain how structures of epistemology (episteme) in the history of science have determined the ways in which we imagine knowledge and knowing. Thomas Kuhn also investigated the structured production of scientific knowledge and methods in his 1962 book, *The Structure of Scientific Revolutions*, which demonstrated how the conventions of scientists' speech communities shape standard practice and discourage deviations from 'normal science' under most circumstances. Structuralism is basically the study of a text as a whole and the kinds of interrelationships or contrasts that the system builds into it to make it meaningful. Contrasts are often times highlighted by calling attention to their basic oppositional or binary structure. Structuralism as a concept is grand, controversial and elusive. For critical purposes, it can be understood at two levels of generality: 1. As a broad intellectual movement, one of the most significant ways of theorizing in the human sciences in the twentieth century; 2. As a particular set of approaches to literature.

210 NSOU CC - SO - 03 Structuralism, thus, can be defined as the study of the elements of consciousness. The idea is that conscious experience can be broken down into basic conscious elements, much as a physical phenomenon can be viewed as consisting of chemical structures that can, in turn, be broken down into basic elements. In order to reduce a normal conscious experience into basic elements, structuralism relied on a method called 'introspection'. An important principle of introspection is that any given conscious experience must be described in its most basic terms, so that a researcher could not describe some experience or object as itself, such as describing an 'apple as an apple'. Such a mistake is a major introspection faux pas and is referred to as the "stimulus error". Therefore, it can be stated that the premise of structuralism is human activity and its products - even perception and thought itself - are constructed and not natural. Structure is the principle of construction and the object of analysis, to be understood by its intimate reference to the concepts of system and value as defined in Semiotics (Science studying Signs). Structuralism, therefore, is an aesthetic theory which is based on certain key philosophical assumptions which are as follows:

- a. All artistic works of art or 'texts' possess a fundamental deep structure.
- b. Texts are organized like a language with their own grammar.
- c. The grammar of a language is a series of signs and conventions which draw a predictable response from human beings.
- d. The signal-response model forms the basis of all textual operations.

Following from these key philosophical assumptions, the basic assumptions of the structuralist theory can be traced as under: (a) According to the structuralist theory, meaning is not a private experience, as Husserl thought, but the product of a shared system of signification. A text is to be understood as a construct to be analyzed and explained scientifically in terms of the deep-structure of the system itself. For many structuralists, this 'deep-structure' is universal and innate. (b) One should make it clear at the back of his mind that literature is not only the work of art, but there are several forms like painting, sculpture, music etc. apart from literature. And structuralism can be applied to all these forms. NSOU CC - SO - 03 211 (c) If we consider the application of structuralism to art and extend the monetary analogy, we can think of paintings as comprised of many languages or sets of conventions that play a role in the exchange of signs. For example, the language of western academic painting can be contrasted with the language of African sculpture or Japanese brush painting. Just as one word in the English language is paired with a concept, so a visual image, icon, or symbol is paired with a concept or idea that it is said to 'express'. Such a study of signs in the most general sense, whether visual or verbal, is called Semiotics. In the West, art schools are the institutions that have the function of passing on these visual conventions. (d) It should be noted that in structuralism, the individual is more a product of the system than a producer of it. Language precedes us. It is the medium of thought and human expression. Thus, it provides us with the structure that we use to conceptualize our own experience. (e) Since language is arbitrary, there is no natural bond between words and things. There can be no privileged connection between language and reality. In this sense, reality is also produced by language. Thus, structuralism can be understood as a form of idealism. Therefore, it is clear from what we've just said that structuralism undermines the claim of empiricism that what is real is what we experience. It can also be seen as an affront to common sense, especially to the notion that a text has a meaning, that is, for all intents and purposes, straightforward. This conflict with common sense, however, can be favourably compared with other historical conflicts. In other words, things are not always what they seem. Thus, the idealist claim of structuralism can be understood in the following way: Reality and our conception of it are 'discontinuous'. This view has important implications. According to the structuralist theory, a text or utterance has a "meaning", but its meaning is determined not by the psychological state or "intention" of the speaker, but by the deep-structure of the language system in which it occurs. In this way, the subject (individual or "author") is effectively killed off and replaced by language itself as an autonomous system of rules. Thus, structuralism has been characterized as Anti-humanistic in its claim that meaning is not identical with the inner psychological experience of the speaker. It removes the human subject from its central position in the production of meaning much as Copernicus removed (decentered) the Earth from its position at the

212 NSOU CC - SO - 03 centre of the solar system. And since language pre-exists us, it is not we who speak, but "language speaks us".

13.7 Conclusion Structuralism rose to prominence in France through the application by the French Anthropologist, Claude Levi-Strauss, of Saussurean structural linguistics to the study of such phenomena as myths, rituals, kinship relations, eating conventions. Literature seemed especially appropriate to a structuralist approach as it was wholly made up of language. Structuralism does not make a difference between literature and other forms of writing or value judgments between good and bad literature. Working from Saussure's perception that meaning is relational, structural anthropology identifies the binary oppositions in a culture as they are manifested in story and ritual. In so far as stories mediate between irreconcilable oppositions, myth making is a survival strategy. Ironically, structuralism has had to sustain the opposing charges that it lacks humanity because it subjects literature to scientific analysis, and it is over-idealistic because it searches for universals and gives greater privilege to synchronic systems than to historical change.

13.8 Summary Structuralism is an approach that grew to become one of the most widely used methods of analyzing language, culture, and society in the second half of the 20th century. 'Structuralism', however, does not refer to a clearly defined 'school' of authors, although the work of Ferdinand de Saussure is generally considered a starting point. Structuralism rejected existentialism's notion of radical human freedom and focused instead on the way that human behaviour is determined by cultural, social, and psychological structures. Broadly, Structuralism seeks to explore the inter-relationships of elements (the 'structure') in, say, a story, rather than focusing on its contents, through which meaning is produced within a culture. It is also accepted as a distinctive methodological theory in science, humanities and philosophy, began to develop in the Czech region in the mid-20s of the century. The Postmodernists themselves prove, more than any other group, that, in terms of the generation of meaning, structuralism is the Westerner's first and foremost ontological and epistemological foundation.

NSOU CC - SO - 03 213 13.9 Questions 1. What do you understand by Structuralism? Discuss. 2. Discuss Linguistics as a major starting point of Structuralism. 3. Elucidate the concepts of Langue and Parole as discussed by Ferdinand de Saussure. 4. Analyze the basic assumptions of Structuralism. Answer in Brief: 5. What is Langue? 6. What are the three basic assumptions of Saussure? 7. Where was the book 'My Theologies' published? 8. Why are signs arbitrary? 13.10 References Barthes, R. (1972). *The Structuralist Activity: Critical essays*, pp.213-20 Genette, G. (1988). SAGE Publications. 13.101 Glossary Structuralism - It holds that, according to the human way of understanding things, particular elements have no absolute meaning or value: their meaning or value is relative to other elements. Everything makes sense only in

214 NSOU CC - SO - 03 relation to something else. An element cannot be perceived by itself. In order to understand a particular element we need to study the whole system of relationships or structure. Linguistics - It is the scientific study of language. It involves analysis of language form, language meaning, and language in context, as well as an analysis of the social, cultural, historical, and political factors that influence language. Kinship - It is the web of social relationships that form an important part of the lives of all humans in all societies, although its exact meanings even within this discipline are often debated. The study of kinship is the study of what man does with these basic facts of life - mating, gestation, parenthood, socialization, sibling ship etc. Human society is unique, he argues, in that we are working with the same raw material as exists in the animal world, but [we] can conceptualize and categorize it to serve social ends. These social ends include the socialization of children and the formation of basic economic, political and religious groups. Myth- It is a folklore genre consisting of narratives that play a fundamental role in a society, such as foundational tales or origin myths. The main characters in myths are usually gods, demigods or supernatural humans. Stories of everyday human beings, although often of leaders of some type, are usually contained in legends, as opposed to myths.

NSOU CC - SO - 03 215 Unit-14 Contributions of Claude Levi-Strauss Structure 14.1 Objectives 14.2 Introduction 14.3 Claude Levi-Strauss: His Life and Works 14.4 Structuralism as a Method 14.5 Levi-Strauss and his Contributions 14.6 Levi-Strauss's Idea of Totemism 14.7 Summary 14.8 Conclusion 14.9 Questions 14.10 References 14.11 Glossary 14.1 Objectives To understand the concept of Structuralism as a method To understand and analyze Claude Levi-Strauss's interpretation of Structuralism To get acquainted with the life and works of Claude Levi-Strauss To learn about and analyze Levi-Strauss's idea of totemism To develop a sociological conception of Levi-Strauss's idea of totemism as a structure 14.2 Introduction Structuralism is the name given to a method of analyzing social relations and cultural products, which came into existence in the 1950s. Though it had its origin in linguistics, particularly from the work of Ferdinand de Saussure, it acquired popularity in anthropology, from where it impacted the other disciplines in social sciences and humanities. It gives primacy to pattern over substance. The meaning of a particular phenomenon or system comes through knowing how things fit together, and not from understanding things in

216 NSOU CC - SO - 03 isolation. A characteristic that structuralism and structural-functional approach share in common is that both are concerned with relations between things. However, there are certain dissimilarities between the two. Structural-functional approach is interested in finding order within social relations. Structuralism, on the other hand, endeavours to find the structures of thought and the structure of society. Structural-functional approach follows inductive reasoning; from the particular, it moves to the general. Structuralism subscribes to deductive logic. It begins with certain premises. They are followed carefully to the point they lead to. Aspects from geometry and algebra are kept in mind while working with structuralism. For structuralism, logical possibilities are worked out first and then it is seen, how reality fits. For true structuralists, there is no reality except the relations between things. Language is not the only area where structural principles can be applied. Anthropologists apply them to societies and kinship systems. Claude Levi-Strauss also tried to apply structural principles to cultural phenomena such as mythology. According to him, myth can be organized according to a certain structure, just as language. In language this structure can be roughly called "grammar" which is based on its system of significant differences or oppositions. Myth also has its system of oppositions and 'grammar'. If we know this 'grammar' of myth well enough we might be able to decipher the 'message' that myth is trying to convey to us. When we master the grammar of myths we can read their hidden messages, much as we can read 'between the lines' for political statements and agendas in newspapers. However, in order to 'read' myths successfully, we must know the whole system of relationships in a particular myth, or its structure. This is what Levi-Strauss is attempting to do in his "Story of Asdiwal".

14.3 Claude Levi-Strauss: His Life and Works Claude Levi-Strauss (1908-2009) is often described as the 'last French intellectual giant', the 'founder of Structuralism in Anthropology', and the 'Father of Modern Anthropology'. Born on 28 th November, 1908, in Belgium, he was one of the greatest Social Anthropologists of the 20 th century, ruling the intellectual circles from the 1950s to the 1980s. Levi- Strauss studied at the University of Paris. From 1935-39, he was the Professor at the University of Sao Paulo making several expeditions to central Brazil. From 1942-1945, he was the Professor at the New School for Social Research. In 1950, he became the Director of Studies at the 'Ecole Pratique des Hautes Etudes'. In 1959, Levi-Strauss assumed the Chair of Social Anthropology at the College de France. His books include 'The Raw and the Cooked', 'The Savage Mind', 'Structural Anthropology and Totemism'.
