NSOU CC - SO - 03 217 In 1949 Levi-Strauss published his first major work, 'The Elementary Structures of Kinship'. He attained popular recognition in 1955 with 'A World on the Wane', a literary intellectual autobiography. Other publications include the revised edition entitled 'Structural Anthropology' in 1961, 'The Savage Mind' (1962), and 'Totemism' (1962). His massive Mythologies appeared in four volumes: 'The Raw and the Cooked' (1964), 'From Honey to Ashes' (1966), 'The Origin of Table Manners' (1968), and 'The Naked Man' (1971). In 1973, a second volume of 'Structural Anthropology' appeared. In 1983, he published a collection of essays, 'The View from Afar'. In this connection, it can very well be stated that Levi-Strauss's structuralism was an effort to condense the vast amount of information about cultural systems to what he believed were the prerequisites, the formal relationships among their elements. He viewed cultures as systems of communication, and he constructed models based on structural linguistics, information theory, and cybernetics in order to interpret them. Later, the popularity of his method, known as structuralism, became suppressed with the new approaches and paradigms taking its place, but he never went to the backseat. Even when structuralism did not have many admirers, it was taught in courses of Sociology and Anthropology and the author whose work was singularly attended to was none other than Levi-Strauss. Each year he was read by scholars from Anthropology and the other disciplines with new insights and transformed interests. He was one of the few Anthropologists whose popularity spread beyond the confines of Social Anthropology. He was (and is) read avidly in literature. Although he did not do, at one time, it was thought that every social fact, and every product of human activity and mind, of any society, simple or complex, could be analyzed following the method that Levi-Strauss had proposed and defended. In 1935, Levi-Strauss got an appointment at the University of Sao Paulo to teach sociology. His stay in Brazil exposed him to the 'anthropological other'. By then he had already read Robert Lowie's 'Primitive Society' and formed a conception of how anthropological studies were to be carried out. Contextually, Levi- Strauss (1962) said: I had gone to Brazil because I wanted to become an anthropologist. And I had been attracted to an anthropology that was very different from that of Durkheim, who was not a fieldworker, while I was learning about fieldwork through the English and the Americans... (p.46) During the first year of his stay in the University, he started ethnographic projects with his students, working on the folklore of the surrounding areas of Sao Paulo. He then went to the Mato Grosso among the Caduveo and Bororo tribes; Levi-Strauss (1968) described his first fieldwork in the following words:

218 NSOU CC - SO - 03 I was in a state of intense intellectual excitement. I felt I was reliving the adventures of the first sixteenth century explorers. I was discovering the New World for myself. Everything seemed mythical; the scenery, the plants, the animals... (p.34) A big article that Levi-Strauss wrote on the Bororo attracted the attention of Robert Lowie, who invited him to the New School of Social Research to take up a teaching assignment. Levi-Strauss's stay in New York was extremely fruitful. He had a chance to look at the rich material that the American anthropologists had collected on the Indian communities. He went about analyzing it, but at the same time carried several short first-hand field studies, although they were not of the same league as was the masterly fieldwork that Bronislaw Malinowski had carried out among the Trobriand Islanders. However, whatever fieldwork he carried out, he thought, was enough to give him an insight into the 'other'. He saw himself as an analyst and a synthesizer of the material that had already been collected. Since his aim was to understand the working of the human mind, he wanted to have a look at the ethnographic facts and the material cultural objects from different cultural contexts. In other words, Levi-Strauss was not interested in producing a text or a monograph on a particular culture, but a text that addressed the understanding of the 'Universal Man' rather than the 'particular man'. Some reasons for his extreme popularity are identified in his rejection of history and humanism, in his refusal to see Western civilization as privileged and unique, in his emphasis on form over content and in his insistence that the savage mind is equal to the civilized mind. Levi-Strauss appeals to the deepest feelings among the alienated intellectuals of our society.

14.4 Structuralism as a method

Claude Levi-Strauss, a leading French Philosopher, Social Theorist and Anthropologist, is associated with the development of structuralism as a method in both the social sciences and humanities. Aside from a period spent teaching in Brazil before World War II and a few years as an academic and diplomat in the United States during and after the war, Levi-Strauss has lived and taught in France. His researches have focused on the massive amount of ethnological materials collected by field-workers worldwide. In the tradition of the 19th and early 20th century French sociology (which included anthropology), pioneered by figures such as Emile Durkheim, Levi-Strauss is a theorizer on a grand scale. By developing a sophisticated means of analyzing the cultural artifacts of preindustrial, non-literate peoples, he has sought to discover underlying structures of thought that characterize not only the so-called primitive societies — the anthropologist's specialty NSOU CC - SO - 03 219 - but also the formal structures of general human mentality. In other words, Levi-Strauss's ethnological work has been at the origin of structuralism's success - and literary criticism. Relying on the work of Roland Barthes, Levi-Strauss concluded first of all an interpretation of the most pronounced social phenomenon - kinship - which he elaborates on the basis of the Jakobsonian linguistic model, having transposed the latter onto the ethnological plane. Levi-Strauss derived his structuralist method from structural linguistics. Considering the perspective of structural linguistics appropriate for culture and thought, as well as for language, he attempted to demonstrate that the cultural features of tribal societies were assemblages of codes, in turn reflecting certain universal principles of human thought. Structuralism actually came into being as a distinct method of investigation through Levi-Strauss's anthropological investigations. His innovative analysis of myth (ancient Greek myths, but also Amerindian ones), representing a response to the former psychologically oriented interpretations, was made much the same way linguistics studies sentences in order to discover their "grammar". Unlike previous analysts of myth, Levi-Strauss holds that meaning does not reside in the essential significance or representation of a particular element in a mythical story. Rather, a myth's meaning is hidden in the underlying relationships of all its elements, which can be discovered only through structuralist analysis. As Levi-Strauss's works became available in English in the 1960s, his structuralist method gained popularity in the United States in such fields as sociology, architecture, literature, and art, as well as anthropology.

14.5 Levi-Strauss and his Contributions

Levi-Strauss derived structuralism from a school of linguistics whose focus was not on the meaning of the word, but the patterns that the words form. Levi-Strauss's contribution gave us a theory of how the human mind works. Man passes from a natural to a cultural state as he uses language, learns to cook, etc... Structuralism considers that in the passage from natural to cultural, man obeys laws - he does not invent it's a mechanism of the human brain. Levi-Strauss views man not as a privileged native of the universe, but as a passing species, which will leave only a few faint traces of its passage when it becomes extinct. In addition, Levi Strauss is also known for his structural analysis of mythology. He was interested in explaining why myths from different cultures from around the globe seem so similar. He attempted to answer this question not by the content of the myths, but by their structure. To make this argument, Levi-Strauss insists that myth is a language because myth has to be told in order to exist. A myth is almost always set some time long ago, with a timeless story. He says myth is actually on a more complex level

220 NSOU CC - SO - 03 than language and it shares certain characteristics with language. Firstly, it's made of units that are put together according to certain rules, and secondly, these units form relationships with each other, based on opposites, which provide the basis of the structure. It provides a means to account for widespread variations on a basic myth structure, and is logical and scientific. This was important for the scientist in Levi-Strauss. He says that repetition, in myth as in oral literature, is necessary to reveal the structure of the myth. Because of this need for repetition, the myth is told in layer after layer. However, the layers aren't the same, and it's eventually shown that the myth "grows" as it is told, but the structure of the myth does not grow. Between 1964 and 1971 was published Levi-Strauss's magnum opus, the four volume Mythology series. In total, these volumes, running into two thousand pages, analyze 813 myths and their more than one thousand versions. The Raw and the Cooked analyzes myths from South America, particularly central and eastern Brazil. The second volume, From Honey to Ashes is also concerned with South America, but deals with myths both from the south and the north. The Origin of Table Manners begins with a myth that is South American, but from further north. The final volume, The Naked Man, is entirely North American. The interesting fact Levi-Strauss finds is that the "most apparent similarities between myths are found between the regions of the New World that are geographically most distant." Beginning with the mythology of central Brazil and then moving out to other geographical areas, and then returning to Brazil, Levi-Strauss realizes that "depending upon the case, the myths of neighbouring peoples coincide, partially overlap, answer, or contradict one another." Thus, the analysis of each myth 'implied that of others'. Taken as the centre, the myth 'radiates variants around it.' It spreads from one neighbour to another in 'several directions at once.' His book, The Jealous Potter, was also a part of the series on the analysis of myths. The important fact here is that in spite of his widely acclaimed volumes on mythology, Levi-Strauss thought that the science of myths was in its infancy. According to structural theory in anthropology and social anthropology, meaning is produced and reproduced within a culture through various practices, phenomena and activities that serve as systems of signification. A structuralist approach may study activities as diverse as food-preparation and serving rituals, religious rites, games, literary and non-literary texts, and other forms of entertainment to discover the deep structures by which meaning is produced and reproduced within the culture. Contextually, Levi- Strauss analyzed in the 1950s cultural phenomena including mythology, kinship (the alliance theory and the incest taboo), and food preparation. In addition to these studies, he produced NSOU CC - SO - 03 221 more linguistically focused writings in which he applied Saussure's distinction between langue and parole in his search for the fundamental structures of the human mind, arguing that the structures that form the 'deep grammar' of society originate in the mind and operate in people unconsciously.

14.6 Levi-Strauss's Idea of Totemism

Levi-Strauss's Totemism, was published in French in 1962. A year later came its English translation, done by an Oxford anthropologist, Rodney Needham, and it carried more than fifty pages of Introduction written by Roger C. Poole. In appreciation of this book, Poole wrote: In Totemism Levi-Strauss takes up an old and hoary anthropological problem, and gives it such a radical treatment that when we lay down the book we have to look at the world with new eyes (p.9). Before we proceed with Levi-Strauss's analysis, let us firstly understand the meaning of totemism. Totemism refers to an institution, mostly found among the tribal community, where the members of each of its clans consider themselves as having descended from a plant, or animal, or any other animate or inanimate object, for which they have a special feeling of reverence, which leads to the formation of a ritual relationship with that object. The plant, animal, or any other object is called 'totem'; the word 'totem', Levi-Strauss says, is taken from the Ojibwa, an Algonquin language of the region to the north of the Great Lakes of Northern America. The members who share the same totem constitute a 'totemic group'. People have a special reverential attitude towards their totem – they abstain from killing and/or eating it, or they may sacrifice and eat it on ceremonial occasions; death of the totem may be ritually mourned; grand celebrations take place in some societies for the multiplication of totems; and totems may be approached for showering blessings and granting long term welfare. In other words, the totem becomes the centre of beliefs and ritual action. Levi-Strauss does not believe in the 'reality' of totemism. He says that totemism was 'invented' and became one of the most favourite anthropological subjects to be investigated with an aim to find its origins and varieties, with the Victorian scholars in the second half of the nineteenth century. Contrastingly, Levi-Strauss's study is not of totemism; it is of totemic phenomena. In other words, it is an 'adjectival study', and not a 'substantive study', which means that it is a 'study of the phenomena that happen to be totemic' rather than 'what is contained in or what is the substance of totemism'. Interestingly, Levi-Strauss has the same data that were available to his predecessors, but the question he asks is entirely new. He does not ask the same question that had been repeatedly

222 NSOU CC - SO - 03 asked earlier by several scholars, viz. 'What is totemism?' His question is 'How are totemic phenomena arranged?' The move from 'what' to 'how' was radical at that time (during the 1960s); and Levi-Strauss's interpretation of totemism was a distinct break with the earlier analyses of totemism (whether they were evolutionary, or diffusionistic, or functional). It is because of this distinctiveness that Poole (1963) writes that with Levi-Strauss, "the 'problem' of totemism has been laid to rest once and for all." (p.9) Levi-Strauss offers a critique of the contemporary explanations that had been (and were) in vogue at that time. Firstly, he rejects the thesis that the members of the American school (Franz Boas, Robert Lowie, A.L. Kroeber) put forth, according to which the totemic phenomena are not a reality sui generis. In other words, totemism does not have its own existence and laws; rather it is a product of the general tendency among the 'primitives' to identify individuals and social groups with the animal and the plant worlds. Levi-Strauss finds this explanation highly simplistic. He also criticizes the functional views of totemism; for instance, Durkheim's explanation that totemism binds people in a 'moral community' called the church, or Malinowski's idea that the Trobrianders have totems because they are of utilitarian value, for they provide food to people. Malinowski's explanation, according to Levi-Strauss, lacks universality, since there are societies that have totems of non-utilitarian value, and it would be difficult to find the needs that the totem fulfils. Durkheim's thesis of religion as promoting social solidarity may be applicable in societies each with a single religion, but not societies with religious pluralism. Moreover, the functional theory of totemism deals with the contribution the beliefs and practices of totemism make to the maintenance and well-being of society rather than what is the structure of totemism, and how it is a product of human mind. Levi-Strauss says that totemism covers relations between things falling in two series – one natural (animals, plants) and the other cultural (persons, clans). For Levi-Strauss, the 'problem' of totemism arises when two separate chains of experience (one of nature and the other of culture) are confused. Human beings identify themselves with nature in a myriad of ways, and the other thing is that they describe their social groups by names drawn from the world of animals and plants. These two experiences are different, but totemism results when there is any kind of overlap between these orders. Levi-Strauss actually stressed on the importance of a particular 'structure' and believed that this structural activity is rooted in all societies. Therefore, it can be said that totemism isn't a phenomenon of 'primitive' man, but one kind of manifestation of the same structure all humans obey. Levi-Strauss writes: 'The natural series comprises on the one hand categories, on the other particulars; the cultural series comprises groups and persons.'

NSOU CC - SO - 03 223 He chooses these terms rather arbitrarily to distinguish, in each series, two modes of existence – collective and individual – and also, to keep these series distinct. He says that any term could be used provided they are distinct. NATURE ... Category Particular CULTURE... Group Person (Levi-Strauss 1962:16) The above table depicts binary oppositions in "nature" / "culture", "category" / "particular", and "group" / "person". These terms can be combined in four ways (1962, p.17) and every logical relation between man and nature that form totemic systems is covered in this table. It is here that his structuralist approach becomes clearer. If a greater range of societies with totemic systems were studied with reference to the four possible combinations of what constitutes totemism, anthropologists would see the system or thought structure to be more widely spread than was originally thought when only the first two combinations were considered. Levi-Strauss continues by applying this method to look at his first ethnographic examples on which he demonstrates his structural thesis. Consequently, Levi-Strauss reflects his structuralism in his opposition to functionalism. He says that the questions asked of 'totemism' by functionalists (especially Malinowski) are biological and psychological. They are no longer in the sphere of anthropology as they do not consider "why totemism exists where it exists..." (1962:58). He does however sympathize with Radcliffe Brown's functionalism and his proposing of universality as it is a step towards structuralism away from other generalizations submitted by less objective and more affective theories of totemism. Throughout his study, Levi-Strauss presents functionalist arguments and de-bunks them through careful analysis of many different sources of ethnography but also through the ethnographies of the writers who have formed the ideas he thinks are flawed and reveals their contradictions. In this way, his structuralist approach is reflected by opposing functionalism. Later, Levi-Strauss applauds the attempt of Firth and Fortes, for they move from a point of view centred on subjective utility (the utilitarian hypothesis) to one of objective analogy. However, Levi-Strauss goes further than this: he says 'it is not the resemblances, but the differences, which resemble each other' (p. 149). In totemism, the resemblance is between the two systems of differences. After these two authors are patted on the back for seemingly making headway towards a synthesis of structuralism but not quite making it all the way, Levi-Strauss discusses Radcliffe Brown's theory of totemism. Radcliffe-Brown realizes the necessity of an explanation which illuminates the principle governing the

224 NSOU CC - SO - 03 selection and association of specific pairs of species and types used in classification. In addition, in his analysis of Nuer religion, Evans-Pritchard shows that the basis of totemic phenomena lies in the interrelation of natural species with social groupings according to the logically conceived processes of metaphor and analogy. These two ideas, Levi- Strauss thinks, help in the reintegration of content with form, and it is from them that he begins. Totemism, for Levi-Strauss, is a mode of classification. Totemic classifications are regarded as a 'means of thinking' governed by less rigid conditions than what we find in the case of language, and these conditions are satisfied fairly easily, even when some events may be adverse. The functions that totemism fulfill are cognitive and intellectual. The problem of totemism disappears when we realize that all humans, at all points of time, are concerned with one or the other mode of classification, and all classifications operate using mechanisms of differentiation, opposition, and substitution. Totemic phenomena form one aspect of a 'general classificatory ideology'. If it is so, then the problem of totemism, in terms of something distinct that demands an explanation, disappears. Jenkins (1979) writes: 'Totemism becomes analytically dissolved and forms one expression of a general ideological mode of classification'. (p. 101) However, it does not imply that totemism is static. Although the nature of the conditions under which totemism functions have not been stated clearly, it is clear from the examples that Levi-Strauss has given that totemism is able to adapt to changes. 14.7 Summary To sum up, totemic phenomena are nothing but modes of classification. They provide tribal communities with consciously or unconsciously held concepts which guide their social actions. Food taboos, economic exchanges and kinship relations can be conceptualized and organized using schemes which are comparable to the totemic homology between natural species and social characteristics. Levi-Strauss (1962) also extends this analysis to understand the relation between totemism and caste system. Totemism is a relationship between man and nature. Similarities and differences between natural species are used to understand the similarities and differences between human beings. Totemism, which for people is a type of religion, is a way of understanding similarities and differences between man and nature. That is the reason why Poole says that with Levi-Strauss, the problem of totemism has been laid to rest once and for ever. To quote

NSOU CC - SO - 03 225 Poole : "If we talk about 'totemism' any more, it will be in ignorance of Levi-Strauss or in spite of him." (p.9)

14.8 Conclusion Levi-Strauss thought that anthropology was not an 'endangered science'; however, its character would be transformed in future. Perhaps, it would not be an 'object of fieldwork'. Anthropologists would become philologists, historians of ideas, and specialists in civilizations, and they would then work with the help of the documents that the earlier observers had prepared. Regarding his own work, Levi-Strauss said that it 'signaled a moment in anthropological thought' and he would be remembered for that. Levi-Strauss created a stir in anthropology. Some scholars set aside their own line of enquiry for the time being to experiment with his method, whereas the others reacted more critically to his ideas. But nowhere was his impact total and complete – he could not create an 'academic lineage'. His idea of 'universal structures' of human mind has been labeled by some as his 'cosmic ambition', generalizing about human society as a whole. While British anthropologists (especially Edmund Leach, Rodney Needham) in the 1950s and 1960s were impressed with Levi-Strauss, they were not in agreement with his abstract search for universal patterns. They tended to apply structuralism at a 'micro' (or 'regional') level. 14.9 Questions 1. Discuss the salient aspects of the works of Claude Levi-Strauss. 2. Delineate the features of the structural method. 3. What is totemism? Give its structural analysis. 4. How does Levi-Strauss's analysis of totemism differ from that of the others? Discuss. 14.10 References Jenkins, A. (1979). The Social Theory of Claude Levi-Strauss. London: The Macmillan Press Ltd. Levi-Strauss, C. (1962). The Bear and the Barber. Journal of the Royal Anthropological Institute, 93: 1-11. Levi-Strauss, C. (1963). Totemism. Penguin Books.

226 NSOU CC - SO - 03 14.11 Glossary Totemism : A totem (Ojibwe doodem) is a spirit being, sacred object, or symbol that serves as an emblem of a group of people, such as a family, clan, lineage, or tribe. While the term totem is derived from the North American Ojibwe language, belief in tutelary spirits and deities is not limited to indigenous peoples of the Americas but common to a number of cultures worldwide. Totemism is a belief associated with animistic religions. The totem is usually an animal or other natural figure that spiritually represents a group of related people such as a clan. Early anthropologists and ethnologists identified totemism as a shared practice across indigenous groups in unconnected parts of the world, typically reflecting a stage of human development. Lineage : A lineage is a unilineal descent group that can demonstrate their common descent from a known apical ancestor.

Unilineal lineages can be matrilineal or patrilineal, depending on whether they are traced through mothers or fathers, respectively. Whether matrilineal or patrilineal descent is considered most significant differs from culture to culture. Ethnology : Ethnology (from the Greek: — èñìò, ethnos meaning 'nation') is the branch of anthropology that compares and analyzes the characteristics of different peoples and the relationships between them (compare cultural, social, or sociocultural anthropology). In France and Québec, the word "ethnologie" is commonly used to refer to cultural and social anthropology.

Interaction is a way of communication both verbal and non-verbal. The study of interaction in sociology is particularly important because the study of micro-settings for the study of interactions was in opposition to the Module - VI : Interactionism

228 NSOU CC - SO - 03 macro-analyses fashionable in the discipline before it. It takes cognizance of the fact that we are humans and are not objects at the hands of the society. We are humans and subjects. This shift in position of analyses is important in Sociology. Symbolic Interactionism as a tradition is associated with wide and diverse sociologists described as the 'Chicago School'. The Chicago school is interchangeably used for the Department of Sociology under University of Chicago. This school of thought rose to prominence between 1920s and 1930s specializing in urban sociology. After the second world war, a second phase in the development of Chicago school arose who with the initiatives of the members of Symbolic Interactionism combined with the methods of field work to contribute to the development of a new body of work. Mead's social- psychological approach was the foundation for this perspective but the empirical work of W. I. Thomas and Robert Park generated a critical methodology. Field research, ethnography, interviewing, case studies, documentary sources were used in a variety of later studies inspired from this perspective. Our aim in this module is to unfold the theoretical underpinnings of this tradition in sociology. Symbolic interactionism is often labeled as a theoretical perspective associated with the concept of socialization. Socialization as a process is important in sociology. It emphasizes on the issue that we become 'social' only in the context in which we live. It means that we are born humans but become social beings only through nurturing. Therefore not only our intrinsic nature but also the way in which we are taught to behave is important in building up of our personalities. This learning and teaching takes place through interaction between individuals. So, interaction that occurs through language (verbal) and symbols (non-verbal) makes this possible. But a more thoughtful reading of the perspective will help us to understand that the perspective is used not simply in understanding socialization but interaction in general. Interaction is the process in which the ability to think is both developed and expressed (Ritzer, 2006: 358). Interaction is a process. It entails two dimensions: action and reaction. But it is not this simple. We are also as symbol- making and symbol-using beings capable of thinking and acting. Our acts are a reflection of what we think. We also think over our actions which help us to maneuver our actions in a different situation. Therefore interaction is acting, thinking, feeling and also learning and building the capacity to think. The theorists who believe we as humans are capable of using symbols in our interaction (Symbolic Interactionists) in general have made significant contributions in this direction. The central focus is how people learn the meanings of symbols they use in interaction in

NSOU CC - SO - 03 229 their socialization process in particular and during interaction in general. They conceive language as a vast system of symbols. Words are symbols because they are used and stand for certain things. Words, objects and acts exist and have meaning only because they have been and can be described through the use of words. Symbols and its use make humans different from primates. It is because of the use of symbols humans do not respond passively to a reality that imposes itself upon us but actively create and recreate the world where acts take place (Ritzer, 2006: 359). Unlike the most significant theoretical frame-work in sociology, that is, functionalism, Symbolic Interactionism differs quite widely in its orientation and stand-point. Unlike other conventional sociological thought symbolic Interactionists consider socialization as a dynamic process that allows people to develop the ability to think and develop in distinctively human ways. Socialization, to them, is not a one-way process. It is a dynamic one in which the actor shapes and adapts the information available to his or her own needs. Theorists believe that as actors we are constantly learning and acting simultaneously. We as humans think, act and learn at the same time. But we are not aware of the process because we start doing this from an early age and hence this process seems involuntary for us. The process of socialization starts early. Some theorists believe that this process starts from infant age; others believe it is not only that the infant socializes after it is born but it is a continuous process of socialization of the new mother and the baby as well. Through socialization the infant learns from the mother, its first care-giver (significant other) and then from others (generalized other). The theorist who laid the foundation for the idea was G. H. Mead (1863-1931). We will consider Mead's contributions in later Units. This tradition as in opposition to functionalism and conflict (macro-sociological traditions), was influenced by C. H. Cooley (1864-1921) among many others who influenced the development of the theoretical tradition. We will discuss the influences in later sections in detail. Symbolic Interactionism as a theoretical concern was antithetical to the mainstream/ traditional discourse in sociology of seeing society as a system, structure and process. It focused on the society and not on the acting individuals who compose it. The historical significance of the rise of symbolic Interactionism in American sociology has been forgotten today. Few sociologists recognize the role this theory played in the development and establishment of the concept of 'group' in sociology. Instead what we find today is a vast attempt to emphasize that this theoretical perspective had generated the ideas of 'self', 'identity' and 'role' in Sociology. It was a later development in the field of Interactionism which initiated an interest in self psychology and concept of identity,

230 NSOU CC - SO - 03 witnessing the development of role theory and the rise of reference group theory. The theorists aim is to understand

the impact of meanings and symbols on human action and interaction.

Partly because of the ability to handle meanings and symbols people unlike primates can make choices in actions in which they engage. Primates are also symbol- making and symbol-using creatures. But humans are capable of more complex symbolic interaction. They are also rational beings. They can use their logic in choosing between different means to achieve a particular goal.

15.3 Background of the Development of Symbolic Interactionism To symbolic Interactionists actors have at least some autonomy. To theorists who were interested in socialization it may seem that humans are socialized in the trends and traditions of the society. In this way they are not capable of making choices, but are determined by the society. But this is not true. They are not simply constrained or determined but are capable to making choices. That is they are not puppets in the hand of the society but are actors who consciously make choices to act. It is also a part played by socialization. People learn to conform as well as deviate from the normative structure through socialization. Both ways socialization plays an important role. The earlier formulations in Interactionism had initiated such later developments. The revival of symbolic Interactionism in 1950s and afterwards may be trace to the development of ethnomethodology and dramaturgical sociology in later years. Ethnomethodology as developed by H. Garfinkel is a later development in the social sciences where it is shown how individuals through their interactions create social world. Dramaturgy was developed by E. Goffman in 1959 to state micro-sociological accounts of everyday life. Thus symbolic interactionism is shaped to study how society is preserved and created through repeated interactions between individuals. The interpretation process that occurs between interactions helps to create and recreate meaning. It is the shared understanding and interpretations of meaning that affect the interaction between individuals. Individuals act on the premise of a shared understanding of meaning within their social context. Thus, interaction and behavior is framed through the shared meaning that objects and concepts have attached to them. From this view, people live in both natural and symbolic environments. Mind, Self and Society is the book published by Mead's students based on his lectures and teaching, and the title of the book highlights the core concepts of social interactionism. Mind refers to an individual's ability to use symbols to create meanings for the world around the individual – individuals use language and thought to accomplish this goal. Self refers to an individual's ability to reflect on the way that the NSOU CC - SO - 03 231 individual is perceived by others. Finally, society, according to Mead, is where all of these interactions are taking place. A general description of Mead's compositions portrays how outside social structures, classes, and power and abuse affect the advancement of self, personality for gatherings verifiably denied of the ability to characterize themselves. But it was Herbert Blumer who coined the term stating that people act according to the meanings they understand of the actions of others. He argued that it is through interaction that humans share common symbols by approving, arranging and redefining them. This emphasis on shared common ground forged the way for the importance of socialization.

15.4 Theory and Research in Symbolic Interactionism Theory and research in symbolic interactionism has developed along three main areas of emphasis, following the work of Herbert Blumer (the Chicago School), Manford Kuhn (the Iowa School), and Sheldon Stryker (the Indiana School). The main variant of symbolic interactionism was developed by Herbert Blumer (1969) at the University of Chicago in the 1950s.

15.5 The Chicago School Blumer brought Mead's philosophically-based 'social behaviorism' to sociology, even if some have seen his conception of symbolic interactionism more resembling

100%

MATCHING BLOCK 258/320

W

W. I. Thomas's (1931) notion of the 'definition of the situation'

than what is purely found in the work of Mead (Collins, 1994). Blumer laid the groundwork for a new theoretical paradigm which in many ways challenged sociology's accepted forms of epistemology and methodology. Blumer's brand of symbolic interactionism has been the most influential in sociology; most interactionist scholarship is aligned to some degree with his vision. Blumer emphasized how the self emerges from an interactive process of joint action (Denzin, 1992). Blumer, like Mead, saw individuals as engaged in 'mind action': humans do not ponder on themselves and their relationships to others sometimes – they constantly are engaged in conscious action where they manipulate symbols and negotiate the meaning of situations (Mead, 1934). Echoing Mead, Blumer believed that the study of human behavior must begin with human association, a notion that was not common in the viewpoint of early American sociology, which treated the individual and society as discrete entities (Meltzer and Petras, 1970). Blumer's symbolic interactionism centers on processes actors use to constantly create and recreate experiences from one interaction to the next. For Blumer, symbolic interactionism was simply '

100%

MATCHING BLOCK 259/320

W

the peculiar and distinctive character of interaction as it takes place between human beings' (Blumer, 1962: 179).

In his view,

232 NSOU CC - SO - 03 social institutions exist only as individuals interact; society is not a structure but rather a continuing process where agency and indeterminateness of action is emphasized (Collins, 1994). Treating society as structured, patterned, or stable is a reification to him because society, like individual actors' interactions and experiences with one another, is constantly in flux. Following Mead, Blumer's symbolic interactionism conceives social institutions as 'social habits' that occur within specific situations that are common to those involved in the situation. For Blumer, meanings are intersubjective and perceived, and constantly reinterpreted among individuals. There are no meanings inherent in the people or objects which an actor confronts – actors rather place meanings upon such entities which are perceived as unique (House, 1977). Behavior is simply an actor's distinctive way of reacting to an interpretation of a situation. It is therefore not to be examined or predicted from antecedent knowledge about how actors generally respond to given situations. This is impossible since each encounter is different from others (and therefore unique). Understanding social behavior requires an interpretive perspective that examines how behavior is changing, unpredictable, and unique to each and every social encounter. Blumer's theoretical contention was that human behavioral patterns must be studied in forms of action, and that human group life should be studied in terms of what the participants do together in units (Blumer, 1969; Shibutani, 1988). Blumer's orientation toward social phenomena centers on the notion of independent action: human society is distinctive because of the capacity of each member to act independently. Each person can regulate their contribution so that the entire group is able to achieve goals under diverse circumstances. This viewpoint understands the agent's role in society as free and flexible; an individual reacts on his or her own and without structural influence. Blumer believed that any adequate explanation of human social life must consider the autonomous contributions of each participant (Shibutani, 1988). Blumer's theoretical orientation toward symbolic interactionism can be summarized through three premises (Blumer, 1969): (1)

100%	MATCHING BLOCK 260/320	W
human beings act toward things on the basis of the meanings that the things have for them; (2)		

83%	MATCHING BLOCK 261/320	W
the meaning of things is derived from, or arises out of, the social interaction that one has with others; (3) meanings are handled in, and modified through, an interpretive process used by		

a person in dealing with the things they encounter. While these three premises remain for many the core tenets of symbolic interactionist thought, some have noted a need for their expansion. For example, Snow (2001) believes that symbolic interactionism is better conceived around four principles: the principle of interactive determination, the principle of symbolization, the principle of emergence, and the principle of human agency. For Snow, these broader principles connect a wider array of work to symbolic interactionism,

NSOU CC - SO - 03 233 helping scholars understand the various tensions within the perspective (Snow, 2001: 375). Since Mead never actually put his perspective into writing and much of his work was published posthumously, a prohibition for methodology within his symbolic interactionist framework was nonexistent until Blumer set out to develop an approach using Mead's ideas. Blumer was a staunch critic of logical empiricism, and for him the idea that science was the one and only true vehicle for discovering truth was inherently flawed. For Blumer, any methodology for understanding social behavior must 'get inside' the individual in order to see the world as the individual perceives it. A sound methodologist must take it as 'given' that patterns of behavior are not conducive for scientific insight as are other worldly phenomena because behavior takes place on the basis of an actor's own particular meanings. Blumer's methodology emphasizes intimate understanding rather than the intersubjective agreement among investigators, which is a necessary condition for scientific inquiry to have worth. Blumer's stance on social psychological methodology is particularly dismissive of empirically driven research designs which employ the scientific method to analyze loosely defined or standardized concepts. Blumer felt that empirically verifiable knowledge of social situations cannot be gleaned by using statistical techniques or hypothesis testing which employ such established research methodology, but rather by examining each social setting – i.e. each distinct interaction among individuals – directly. Blumer's more subjective methodology attempts to measure and understand an actor's experience through 'sympathetic introspection': the researcher takes the standpoint of the actor whose behavior he or she is studying and attempts to use the actor's own categories in capturing the meanings for the actor during social interactions. To summarize Blumer's methodological approach, an understanding of social life requires an understanding of the processes individuals use to interpret situations and experiences, and how they construct their actions among other individuals in society. While Blumer's work has been seen as the most comprehensive overview of Mead's symbolic interactionist ideas, the methodological aspect of his perspective was what Blumer saw as the most appropriate approach to test Mead's main tenets. Perhaps the absence of a methodological dictum in Mead's symbolic interactionist approach is responsible for the varieties of techniques that have been proposed following his work. According to Blumer, qualitative methods of study are the only way to study human behavior, by rigorously defining concepts and using them to understand the nature of behavior. However, other sociologists writing in the symbolic interactionist perspective saw the study of interaction as not limited to qualitative approaches. Manford Kuhn (1964) and Sheldon Stryker (1980) are two such sociologists who utilized positivist methods in their studies of the relationship between the self and social structure (Carter and Fuller, 2015).

234 NSOU CC - SO - 03 15.6 The Iowa School Stemming from his work in the mid-twentieth century, Manford Kuhn's positivism influenced a new sociological tradition termed the 'Iowa School' of symbolic interactionism. Kuhn sought to reconcile Mead's framework with rigorous, scientific testing of symbolic interactionist principles. Kuhn and the Iowa School emphasized process in interaction and viewed behavior as 'purposive, socially constructed, coordinated social acts informed by preceding events in the context of projected acts that occur' (Katovich et al., 2003: 122). The basic theoretical underpinning of Kuhn is summarized around four core themes (Katovich et al., 2003): the first is that social interaction can be examined through a cybernetic perspective that emphasizes intentionality, temporality, and self-correction. Second, scientists should focus their attention on dyads, triads, and small groups as these are the loci for most social behavior and interaction. Third, while social behavior can be studied in its natural form (i.e. in naturally occurring settings) it should also be studied in a laboratory; incorporating both environments allows us to articulate behaviors and identify abstract laws for behavior which can be universally applied to actors. And fourth, social scientists must endeavor to create a more systematic and rigorous vocabulary to identify the ontological nature of sociality (i.e. operationalize concepts in a much more thorough manner than what had been previously accepted by social psychologists). While Kuhn and those associated with the Iowa School follow a symbolic interactionist framework generally consistent with Mead, their methodological stance directly contradicts that proposed by Blumer. Rather than viewing quantitative analyses of social interaction as abstract empiricism, Kuhn asserted that the use of quantitative methods could provide systematic testing of Mead's theoretical principles. Kuhn saw the study of the complexity of social life and of selfhood as a scientific endeavor requiring sociological analysis. He believed that social science was indeed consistent with the quantitative study of human behaviors and conceptions of the self when properly executed. Rather than relying on subjective survey responses to assess attitudes toward the self, Kuhn developed the 'Twenty Statements Test' (TST). Following Mead's work on the emergence of the self through interaction, Kuhn's TST is based on self-disclosure of respondents in answering the question 'Who Am I?' on 20 numbered lines. Kuhn believed that responses to this question could provide a systematic study of an individual's self-attitudes and organization of identities as they emerge from symbolic interaction with others. By coding these responses, a researcher may find both conventional and idiosyncratic reflections of social statuses and identities. Furthermore, since the test relies on self-report, it serves as a useful tool for discerning individual meanings without presenting them as objective facts. Kuhn and the Iowa School utilized the TST among other quantitative measures

NSOU CC - SO - 03 235 (including data collected from laboratory experiments) to attempt to predict how individuals see themselves in situations, but did not focus solely on conceptions of the self. Despite criticism of Kuhn's techniques as being deterministic or succumbing to reductionism, the Iowa School following Kuhn's work has contributed much to research addressing the problematic nature of coordinated social action as well as meanings as responses in interaction. Kuhn's student and successor Carl Couch (1984; Couch et al., 1986) continued the symbolic interactionist tradition at Iowa, applying a more pragmatic approach to the study of social phenomena and using innovative experiments to understand interactions among actors. Couch's brand of interactionism attempted to understand individuals' orientations toward one another across time and space, improving on the cross-sectional methodological approach that mostly defined Kuhn's research (HermanKinney and Vershaeve, 2003). Couch's role in extending symbolic interactionist knowledge has led many to differentiate the Iowa School as 'old' and 'new,' representing Kuhn's and Couch's respective influence during those eras. Sheldon Stryker's work is similar to Kuhn's in its scope as well as in methods employed (Carter and Fuller, 2015). 15.7 The Indiana School As Blumer and Kuhn are associated with the Chicago and Iowa Schools respectively, Stryker is a sociologist from what is referred to as the 'Indiana School' of symbolic interactionist thought, representing theory and research generated in the mid to latter part of the twentieth century at the University of Indiana. While Mead and Blumer emphasized the fluid nature of meanings and the self in interaction, Stryker emphasized that meanings and interactions led to relatively stable patterns that create and uphold social structures. Stryker believed that symbolic interactionist ideas could and should be tested using both qualitative and quantitative methods. According to Stryker, Mead's work can be conceived of as a 'frame' rather than a coherent theory with testable propositions (Stryker, 2008: 17). Stryker expanded symbolic interactionist ideas through operationalizing variables that Mead presented as general assumptions and concepts by hypothesizing and empirically testing relationships among Mead's concepts while incorporating elements of role theory. Stryker further expanded Mead's concept of role-taking in order to demonstrate the structural aspect of interaction. Stryker's work on roles treats social roles as emerging from a reciprocal influence of networks or patterns of relationships in interactions as they are shaped by various levels of social structures. Stryker defines roles as 'expectations which are attached to [social] positions'; or 'symbolic categories [that] serve to cue behavior' (Stryker, 1980: 57). According to Stryker, expectations of roles vary across situations and within the context of cultural or social change. In taking

236 NSOU CC - SO - 03 the attitudes of others in a situation, an individual uses 'symbolic cues' built from prior experiences and normative expectations of status from social positions to assess potential lines of action. In this way, roles as they are attached to positions may be analyzed as predictors of future behavior for individuals in various social categories. As with symbolic interactionism, Stryker's structural role theory views socialization as the process through which individuals learn normative expectations for actions as they relate to role relationships. By building up from the person to the situation within the larger social structure, Stryker showed the reciprocity of the individual and society. In every situation, individuals identify themselves and others in the context of social structure. Individuals then reflexively apply what they perceive to be others' identifications of them that, over time, become internalized expectations for behavior as part of the self. These internalized expectations, when accepted and enacted by individuals in various roles, become identities. In emphasizing the impact social structure has on how roles are played in interaction, Stryker's structural approach to symbolic interactionism is an attempt to bridge the gap between micro- and macro-sociological and social psychological theories. Stryker's structural symbolic approach therefore provides significant theoretical insights to social roles in expanding symbolic interactionist concepts (Carter and Fuller, 2015). 15.8 General Arguments Blumer coined the term symbolic interactionism in 1937 (Ritzer, 2006: 340). Mead differentiated the nascent ideas of symbolic interactionism from behaviorism. He had clearly stated that the behaviorists' emphasis on the impact of external stimuli on individual behavior were clearly psychological reductionism (Ritzer, 2006: 341). Blumer was against classical sociological approach that viewed individual behavior as determined by large- scale external forces. He rather stressed on the importance of meaning in the social construction of reality. Symbolic Interactionism developed and

88%

MATCHING BLOCK 266/320

SA Smriti Chaubey Final.docx (D16121386)

stood in contrast to the psychological reductionism of behavior and the structural determinism of macro-oriented sociological theories.

Its distinctive orientation was towards the mental capacities of actors and their relationship to action and interaction. All this was conceived in terms of a process. The actor was seen as driven by either internal psychological states or large- scale structural forces. 15.9 The Epistemological Assumptions of Symbolic Interactionism The symbolic interactionist perspective may be clarified by outlining the empirical and theoretical practices interactionists value and do not value.

NSOU CC - SO - 03 237 1. Interpretative (and symbolic) interactionists do not think general theories are useful. 2. Interactionists reject totalizing, grand theories of the social; interactionists, like many post-structural (Foucault) and postmodern (Lyotard) theorists, believe in writing local narratives about how people do things together. 3. Interactionists do not like theories that objectify and quantify human experience. They prefer to write texts that remain close to the actual experiences of the people they are writing about. 4. Interactionists do not like theories that are imported from other disciplines, like the natural sciences or economics (for example, chaos or rational choice theories). 5. Interactionists do not like theories that ignore history, but they are not historical determinists. They believe that persons, not inexorable forces, make history, but they understand that the histories that individuals make may not always be of their own making. 6. Interactionists do not like theories that ignore the biographies and lived experiences of interacting individuals. 7. Interactionists do not believe in asking 'why' questions. They ask, instead, 'how' questions. How, for example, is a given strip of experience structured, lived and given meaning? (Denzin, 2000) The entire macro-sociological reasoning focused on large collectivities while micro- sociology focused on relations between individuals. Interactionism as a theoretical construction fitted between few individuals who occupy institutionalized social positions. It is assumed that the individuals who, in face-to-face interaction, occupy places in high office are crucial to the understanding of social orders that are constructed by these interactions. It is interesting to note here that the institutions can be understood in micro- forms through the interacting individuals and the face-to-face interactions. This can also be understood in macro terms raising the question of what are actually regarded as macro or micro. It means, be it institutions or interactions between two actors, both can be understood from either of the perspectives: micro or macro. It means that we can see interrelated actors through the web of relations as well as interrelated ensembles of institutional forms through interaction. It also means there is nothing new in studying interactions but it is the approach towards studying interaction from the perspective of the individual which was significant and new to the traditional ways of looking at the society (Wallace and Wolf: 2005). This new perspective in sociology was and has been put in perspective through the works of W. James (1842-1910), C. H. Cooley (1864-238 NSOU CC - SO - 03 1929), J. Dewey (1859-1952), W. I. Thomas (1863-1947) and G.H. Mead (1863-1931) as well as later works in Interactionist tradition (H. Blumer- 1900 to 1987; E. Goffman- 1922-1982). The basic element of the argument in this tradition is the underlying agreement with traditional macro-understanding on the idea that the individual and society are inseparable units. It is argued that though these two can be separated analytically but in practice they are inseparable and that understanding of one is incomplete without the understanding of the other. The relationship between the individual and the society are of mutual interdependence, not a one-sided deterministic one. Society is to be understood in terms of the individuals who make up a society

96%

MATCHING BLOCK 263/320

W

and individuals are to be understood in terms of societies of which they are members. In

Interactionists' terms individuals are seen as existing in dual systems— as both determinants and determined. So the role of the society is of a co-determinant which means that the social order is considered not more important than the individual who creates the influences that are felt in the context of the individual's environment. Since this influence is experienced by interaction, the individual learns about the influence through interaction. Therefore interaction is an important criterion of the relationship between individual and his/her relationship with the social order (Wallace and Wolf: 2005). The first important argument of Interactionists is that

96%

MATCHING BLOCK 264/320

W

human beings act towards things on the basis of meanings that the things have for them.

Interaction is not only limited to individuals. There is also a continuous flow of interactions between the individual and the world. The objects do not have intrinsic meaning but these meanings become apparent only through interaction. Here the idea of shared meaning is significant. People as actors learn and share meaning objects have from interaction with one another. For example, the idea of flying in the sky is associated with the idea of independence and freedom. Second,

100%

MATCHING BLOCK 265/320

W

these meanings are a product of social interaction in human society.

As said earlier, such meanings become apparent through interaction. It is only through living in a social environment that humans learn about such meanings and apply those on the objects, actors and interactions. It shows that interaction is a dynamic process in contrast to a static process. Third,

82%

MATCHING BLOCK 275/320

these meanings are modified and handled through interpretative process that is used by each individual in dealing with the things

that they encounter. All individuals may not give the same meaning to one object or thing. The meaning may be interpreted and reinterpreted but can be conveyed and shared only through interaction. Humans as actors are capable of interpretation and re-interpretation. The basic principles of symbolic interactionism can be summarized as:
NSOU CC - SO - 03 239 a. Humans unlike animals are capable of thought. In this respect a sharp distinction should be made between animals in general and primates. Primates of the higher order are capable of using symbols but humans' ability of use of symbols is more pronounced and of higher distinction. b. The capacity of thought is shaped by interaction. Interaction helps us in learning and picking up words, phrases and meanings that are conveyed through them. Therefore a child starts to think in terms of a language that is spoken to her or him. So language becomes a means of expression. c.

interact with themselves enabling them to examine possible courses of action, assess their relative advantages and disadvantages.
g. The intertwined patterns of action and interaction make up

society. (Ritzer, 2011, 370-80) 15.10 Conclusion Micro-sociology is one of the main levels of analysis (or focuses) of sociology, concerning the nature of everyday human social interactions and agency on a small scale, for example, face to face everyday interactions. Macro-sociology, by contrast, concerns the social structure and broader systems. Symbolic interactionism is a micro-level theory that focuses on the relationships among individuals within a society. Communication—the exchange of meaning through language and symbols—is believed to be the way in which people make sense of their social worlds. Although symbolic interactionism traces its origins

240 NSOU CC - SO - 03 to Max Weber's assertion that individuals act according to their interpretation of the meaning of their world, the American philosopher George Herbert Mead introduced this perspective to American sociology in the 1920s. Symbolic interactionism had its most significant impact on sociology between 1950 and 1985. 15.11 Summary Symbolic interactionism is a micro-level theory that focuses on the relationships among individuals within a society. Communication—the exchange of meaning through language and symbols—is believed to be the way in which people make sense of their social worlds. Social scientists who apply symbolic-interactionist thinking look for patterns of interaction between individuals. Their studies often involve observation of one-on-one interactions. 15.12 Questions 1. Answer briefly the following questions: (6 marks) a. What is Interactionism? b. What is 'self'? c. What is meant by 'taking the role of the other'? 2. Answer in detail the following: (12 marks) a. Write a note on the major arguments of Symbolic Interactionism. b. Explain how Mead had approached the idea of Symbolic Interactionism. 3. Write essay-type answers to the following: (20 marks) a. Write in detail on the major arguments of symbolic Interactionism. b. Write in detail on how symbolic interactionism developed as a theoretical construct. 15.13 Refereces Blumer, H. (1962/1969), Symbolic Interactionism, Englewood Cliff, N. J.

NSOU CC - SO - 03 243 15.14 Glossary Symbolic Interactionism: Symbolic interactionism is a theoretical construction of the middle of the twentieth century that analyzes society by addressing the subjective meanings that people impose on objects, events, and behaviors. Thus, society is thought to be socially constructed through human interpretation. People interpret one another's behavior, and it is these interpretations that form the social bond. Macro-theorizing in Sociology: Macro-theorizing in sociology is an approach which emphasizes the analysis of social systems and populations on a large scale, at the level of social structure, and often at a necessarily high level of theoretical abstraction. Macrosociology which it is often called can also be the analysis of large collectivities (e.g. the city, the church).

H. Mead, C. H. Cooley, W. I. Thomas, H. Blumer, E. Goffman who have made symbolic interactionism rich as a form of theorizing in sociology. The most prominent of all symbolic interactionist theorists is George Herbert Mead (1863-1931). The two most significant influences on Mead were the philosophy of pragmatism, more specifically the realist branch of pragmatism and psychological

NSOU CC - SO - 03 245 behaviorism. The pragmatists believed that the reality does not exist independent of the actor but is actively created by them (social construction of reality). So in order to understand the actors we need to understand what they do in the world. To the pragmatists therefore it is important to focus on the interaction between actor and the world, both the actor

70%

MATCHING BLOCK 274/320

W

and the world as dynamic processes and the actor's ability to interpret the world.

The influence over Mead of psychological behaviorism was that he was directed towards an empirical and realist way. He differed from the radical behaviorists and prioritized the social world in understanding social experience. The three important sources from where Mead had borrowed heavily were William James' concept of 'self', Dewey's concept of pragmatism and Charles Cooley's ideas on self and the social process. James recognized that humans have the capacity to look at themselves as objects and can develop self-feelings towards themselves. James called those capacities as self by which humans could denote symbolically other people and aspects of the world, develop attitudes and feelings about them and construct typical responses towards objects. Dewey stressed on the process of human adjustment to the world in which the individual continuously seek to master the conditions of the environment. Cooley on the other hand, presented a refined idea of self, viewing it as the process in which individuals see themselves as objects in their social environment and also recognizes the fact that self of individuals emerges out of interaction with others. Thus, Cooley stressed on the importance of 'primary group' in front of which the individual evaluates others' opinion of him/her. Cooley's ideas crystallized through a concept, 'looking glass self' in which gestures of others act as a mirror in which individual sees and evaluates themselves as objects in the social environment. George Herbert Mead synthesized James', Cooley's and Dewey's concepts together in a coherent theoretical perspective that linked emergence of mind (thinking mind) to self (capable of interacting with others) and society through the process of interaction. In his book, *Mind, Self and Society* (published in 1950 by his students) Mead had noted his ideas on the social self. Though he had put 'mind' first in the title of the book, he preferred to put the study of individuals in the context of the society. That is, in his theory a self-conscious individual is impossible without a social group. 16.3 G. H. Mead's Contribution The social group comes first and it leads to the development of self-conscious mental states. The states and the source in the development of the conscious self are mentioned below. Mead synthesized the ideas well into his conceptual schema where he firstly recognized two important aspects of the rise of self in society. These were: the biological

246 NSOU CC - SO - 03 weakness of humans leads them to cooperate with other humans; this compulsive cooperation helps in both the survival and adjustment of the individuals. This compulsion and adjustment makes the survival of the society possible. 16.4 The Mind Mind, to Mead is a process and not a thing. It arises in individual as an inner conversation and it arises and develops within the social process and becomes an integral part of the

80%

MATCHING BLOCK 280/320

SA

MA -II SOC Contemporary Sociological Theories.pdf
(D123321207)

process. The social process precedes the mind and is not a product of the mind.

The distinctiveness of the mind is in its ability to respond to not only himself but also to the community. So to Mead the mind is an ability to respond to the overall community and put forth an organized response. Besides this the mind is also capable of solving problems. In this way the mind tries to solve problems and permit people to operate more effectively in the world. This is the ability to respond to gestures. By perceiving, interpreting and using gestures humans can assume the perspectives of others with whom they cooperate in order to survive. By this they can imaginatively rehearse the lines along which their actions will facilitate their adjustments in society. Thus being able to put them in another's place is called by Mead 'taking the role of others'. So to Mead mind develops only when humans develop the capacity

68%

MATCHING BLOCK 276/320

W

to understand conventional gestures, employ those gestures to take the role of others and imaginatively rehearse lines of action. 16.5

The Self The self arises with the development and through social activity and social relationships. To Mead, it is impossible to imagine of a self arising in the absence of social experiences. However once it is developed it is possible for it to continue to exist without social contact. The self is dialectically related to the mind. It is important to remember that the body is not a self but it becomes a self only when a mind has developed. On the other hand, the self, and its reflexivity is essential to the development of the mind. The development of the mind is a social process. The mechanism through which the self develops is reflexivity or the ability to put ourselves unconsciously into others' place and to act as they act. As a result people are able to examine themselves as others examine them. The self allows people to take part in their conversation with others. That is one is aware of what one is saying and as a result is able to monitor what is being said and to determine what is going to be said next. The self is active and creative. It is not determined by any social, cultural or psychological variables. Functionalists like Parsons, often looked at humans as passive agents interrupted

NSOU CC - SO - 03 247 by the social and psychological forces. Mead posits that individuals act on their own environment and in doing so they create the objects that people it. He distinguishes between things and objects. Things according to Mead are stimulus that exist prior to and independent of the individual and objects are which exist only in relation to acts. The thing becomes an object when the individual by acting on it designates the thing with an expression. 16.6 Development of the Self Mead outlines two phases of the development of the self. One phase is 'I' and the other is 'me'. 'I' is the unorganized response of the organism to the attitudes of others, the natural disposition or the urge to act. The 'me' is set of organized attitudes that the self learns from others. The 'me' guides the behavior of the socialized person and in this aspect brings in the influences of others into the individual's consciousness. The 'I' allows for a certain degree of innovation and creativity as well as degree of freedom from control by others. The self consists of the acting of 'I' when the self is considered to be subject and when acted upon as 'me' is considered to be an object. The self is a social process going on in these two phases. Mead conceived the 'conversation of gestures' as the background for the development of self. The first stage is the imitative stage where a child first imitates the gestures of the mother or a primary care-giver. The 'conversation of gestures' does not involve a self since in this conversation people do not see themselves as objects.

47%

MATCHING BLOCK 277/320

W

The second stage is the play stage. In this stage children start learning to take the attitude of others to themselves.

The children start to learn this by playing the role of someone in their plays. As a result the child learns to become both subject and object and starts to build up a self. But this is an initial stage because here the child lacks general and organized sense of themselves. The third stage is the game stage. Here the sense of self develops in full form. Here the child starts taking up the role of those who are not only close to the child. Through taking up the roles of discrete others he/she starts to learn how to respond to the actions of others. The child can anticipate the moves of others involved in the interaction and act accordingly. A definite personality of the child starts to evolve at this stage. The self by emulating and taking the role of the organized other reflects the general systematic pattern of social group behavior in which it and others are involved (Mead, 1934/1962: 158). The idea of the development of self in this stage gives us a concept developed by Mead called the generalized other. The generalized other is the attitude

248 NSOU CC - SO - 03 of the entire community. The ability to take the role of the generalized other is essential to the self. It is also essential at this stage that child learns to evaluate themselves from the point of view of the generalized other. This is not essential for the development of the self only but also for the perpetuation of the society in general. A group requires that individuals direct their activities in accordance to the attitudes of the generalized other. Mead bestows importance to the social since it is through the generalized other that the group influences the behavior of individuals. At the individual level, the self allows the individual to be more efficient member of the larger society. It is for the self that people are more likely to do what is expected of them in a given situation. Since people try to live up to the expectations and demands of the society, they are more likely to avoid the influences that come from failing to do what the group expects. The self allows for more coordination in society as a whole. Because individuals can be counted on to do what is expected of them, the group can operate more effectively (Ritzer, 2011: 354). 16.7 The Phases in the Development of Self Mead identifies two aspects of the development of self. He distinguishes between 'I' and 'me'. To him the self is essentially a social process going on with these two distinguishable processes. 'I'

73%

MATCHING BLOCK 278/320

W

is the immediate response of an individual to others. It is incalculable, unpredictable, creative aspect of self.

In this stage the actions are 'meaningless' because the child in this stage lacks the ability to take the attitude of others. This ability to take the attitude of others develops gradually. In the second stage, the play stage, the child can put himself in the position of another person but cannot relate the role of other players. The connection between play and the development of 'me' and the ability to take on the role of the other is apparent in the dolls' plays the child participates in. At the game stage, several actors play together. This happens in a complex, organized game such as football, in which there are team members who anticipate the attitudes and roles of all other players. A

88%

MATCHING BLOCK 279/320

W

mature self emerges when a generalized other is internalized so that the community

starts to control over acts and conducts of its individuals. The 'me', according to Mead, is the adoption of the generalized other. In contrast to the 'I', people in this phase are conscious, or as Mead calls it has a conscious responsibility. As Mead says, the 'me' is a conventional, habitual individual (1934/1962: 197). 16.8 The Society At the general level, society according to Mead is an ongoing social process that precedes both mind and self. At another level, society to Mead represents the organized set of

SA

MA -II SOC Contemporary Sociological Theories.pdf
(D123321207)

society around with him giving him the ability through self-criticism to control

himself. The usual way of depicting a society till then was in a macro model, a system enmeshed with social institutions, groups and organizations. The macro components of the study of society are not well developed in Mead's analysis. To him, the whole community acts towards the individual under certain circumstances in an identical way. This is the basis of the formation of an institution. We as individuals carry this organized set of attitudes with us and these serve as mechanisms of control of our actions through the socialized expression of our self, that is, 'me'. He is cautious in identifying that institutions need not destroy individuality or creativity, though there are such institutions which aim at such control. Mead demonstrates a very contemporary notion of society, very different from Weber or Durkheim's concept of it. He on the other hand emphasizes on the emergence of mind and self from and within the society. He viewed society as a constructed phenomenon that arises out of interactions among adjusting individuals. Society can be reconstructed through the process that helps in the rise of mind and self. The ways are by the use of two concepts: 'I' and 'me' discussed earlier. In short, Mead represents society as a constructed pattern of coordinated activity that are maintained by and changed through symbolic interactions among and within actors. Both the maintenance and change of society occur through the processes of the development of mind and self. The possibility of spontaneous and unpredictable action has the capacity to alter the existing patterns of interactions.

16.9 The ideas of 'Generalized Other' and 'Significant Other'

When an actor tries to imagine what is expected of him, he is taking on the perspective of the generalized other. George Herbert Mead's concept of the Generalized Other is that in their behavior and social interaction individuals react to the expectations of others, orienting themselves to the norms and values of their community or group. The term Generalized Other was used by George Herbert Mead (1863-1931) to refer to an individual's recognition that other members of their society hold specific values and expectations about behavior. Mead's concept of the Generalized Other gives an account of the social origin of self-consciousness while retaining the transforming function of the personal. Contextualized in Mead's theory of intersubjectivity, the Generalized Other is a special case of role-taking in which the individual responds to social gestures, and takes up and adjusts common attitudes. The development of the Generalized Other is a concept in Mead's published and unpublished work, locating it within the framework of intersubjectivity and role-taking. A theoretically

250 NSOU CC - SO - 03 and historically embedded interpretation of the Generalized Other reveals that both the personal and the social evolve and that it is a process. The self and the social each is open to activities that bring about change. Grounded in Mead's refusal to reduce the part played by the social or the personal in the development of the self, the Generalized Other is a concept of continuing usefulness to development psychologists. Significant others imply people who play significant role in the development of the child into an individual. The child first learns to imitate from people such as these. The people involved are important for this first step. In the imitative stage the child learns gestures. This is the first step towards understanding and giving meaning to interactions that take place around the child. In the play stage, the child rehearses his or her different role plays in their play. To repeat an example often taken to show how doll-playing for girls help them to rehearse the role-playing of their parents. The girl rehearses the roles her parents play and how they react to her actions. This rehearsals help individuals to gear up for actions with strangers. In its first steps in the outer world (outside family) the child learns through interactions about what is expected of her or him, how s/he is ought to behave and what is accepted in society. Through time the child matures to interact with strangers, understand what is expected, what is the desired behavior and what can be one's reaction towards certain actions. Though the generalized other play a vital role here, the importance of the significant others is not strictly limited to the early stages of self development.

16.10 The ideas of meaning and interpretation for Mead

The word 'meaning' to Mead has importance in the word 'gesture', which he calls as the sign of a whole act. For example if a host opens the television while talking with his guests it is a gesture which signals a whole lot of actions that can follow. In this situation the gesture the first component of the act can be enough to signify that the host does not like to talk and calls out through the use of the gesture the beginning of the guests' adjustments to it. Gestures are therefore important internalized symbols because they have the same meaning for all individuals of a given society. Mead defines symbols as the stimulus whose response is given in advance. For example if someone insults you, what do you want to do? You may want to knock him down. A key element in the word becomes a stimulus whose response is given in advance in the community in question by the connotations of that word and intentions implied by its use evoke a blow as an appropriate response from a person so addressed. You should remember here that the gesture in question occurs in a process, through the conversation of gestures that goes on in the mind of the actor. So gestures are those that possess meaning. A significant

NSOU CC - SO - 03 251 symbol is that part of the act that calls out the response of the other. This assumes the interpretation of symbols as in the case of eh example of insult.

16.11 Criticism of Mead

Mead's theory is criticized for giving up mainstream scientific techniques. The critics argue that scientism and subjectivity are mutually exclusive. Critics also point out that many of Mead's concepts are confusing and vague. They critique the concepts used by Mead as incapable of providing a firm basis for any theory or research. Because the concepts are imprecise and vague it is difficult to operationalize them resulting in untestable propositions. The primary spotlight of symbolic interactionism on micro- contexts drop from its focus the sight of the social structure and the impact of macro-structures on society and behavior. The perspective ignores psychological factors that might impel actors in a particular way, instead they focus on meanings, symbols and interaction diminishing the value of all these. The result being that the symbolic interactionism of Mead makes a fetish of everyday life, reducing it to the study of immediate situations.

16.12 Conclusion

Mead's major contribution to the field of social psychology was his attempt to show how the human self arises in the process of social interaction, especially by way of linguistic communication ("symbolic interaction"). In philosophy, as already mentioned, Mead was one of the major American pragmatists. Mead believed that people develop self-images through interactions with other people. He argued that the self, which is the part of a person's personality consisting of self-awareness and self-image, is a product of social experience.

The two most important roots of Mead's work, and of symbolic interactionism in general, are the philosophy of pragmatism

and social (as opposed to psychological) behaviorism (i.e.: Mead was concerned with the stimuli of gestures and social objects with rich meanings rather than bare physical objects which psychological behaviorists considered stimuli). Mead develops William James' distinction between the concepts "I" and the "me." The "me" is the accumulated understanding of "the generalized other" i.e. how one thinks one's group perceives oneself etc. The "I" is the individual's impulses. The "I" is self as subject; the "me" is self as object. The "I" is the knower, the "me" is the known. The mind, or stream of thought, is the self-reflective movements of the interaction between the "I" and the "me." There is neither "I" nor "me" in the conversation of gestures; the whole act is not yet carried out, but the preparation takes place in this field of gesture. These dynamics go beyond selfhood in a narrow sense, and form the basis of a theory of human cognition. For Mead the thinking process

252 NSOU CC - SO - 03 is the internalized dialogue between the "I" and the "me." Mead rooted the self's "perception and meaning" deeply and sociologically in "a common praxis of subjects" (Joas 1985: 166) found specifically in social encounters. Understood as a combination of the 'I' and the 'me', Mead's self proves to be noticeably tangled within a sociological existence. For Mead, existence in community comes before individual consciousness. First one must participate in the different social positions within society and only subsequently can one use that experience to take the perspective of others and thus become 'conscious'. 16.13 Summary For Mead, the development of the self is intimately tied to the development of language. For example, a dog barks, and a second dog either barks back or runs away. The "meaning" of the "barking gesture" is found in the response of the second organism to the first. But dogs do not understand the "meaning" of their gestures. They simply respond, that is, they use symbols without what Mead refers to as "significance." For a gesture to have significance, it must call out in a second organism a response that is functionally identical to the response that the first organism anticipates. In other words, for a gesture to be significant it must "mean" the same thing to both organisms, and "meaning" involves the capacity to consciously anticipate how other organisms will respond to symbols or gestures. According to Mead, through the use of vocal gestures one can turn "experience" back on itself through the loop of speaking and hearing at relatively the same instant. And when one is part of a complex network of language users, Mead argues that this reflexivity, the "turning back" of experience on itself, allows mind to develop. Mind is developed not only through the use of vocal gestures, but through the taking of roles, which will be addressed below. Here it is worth noting that although we often employ our capacity for reflexivity to engage in reflection or deliberation, both Dewey and Mead argue that habitual, non-deliberative, experience constitutes the most common way that we engage the world. The habitual involves a host of background beliefs and assumptions that are not raised to the level of (self) conscious reflection unless problems occur that warrant addressing. For Mead, if we were simply to take the roles of others, we would never develop selves or self-consciousness. We would have a nascent form of self-consciousness that parallels the sort of reflexive awareness that is required for the use of significant symbols. A role-taking (self) consciousness of this sort makes possible what might be called a proto-self, but not a self, because it doesn't have the complexity necessary to give rise to a self. How then does a self arise? Here Mead introduces his well-known neologism, the generalized other. When children or adults take roles, they can be said to be playing these roles in dyads. However, this sort of exchange is quite

NSOU CC - SO - 03 253 different from the more complex sets of behaviors that are required to participate in games. In the latter, we are required to learn not only the responses of specific others, but behaviors associated with every position on the field. These can be internalized, and when we succeed in doing so we come to "view" our own behaviors from the perspective of the game as a whole, which is a system of organized actions. The self that arises in relationship to a specific generalized other is referred to as the "Me." The "Me" is a cognitive object, which is only known retrospectively, that is, on reflection. When we act in habitual ways we are not typically self-conscious. We are engaged in actions at a non-reflective level. However, when we take the perspective of the generalized other, we are both "watching" and forming a self in relationship to the system of behaviors that constitute this generalized other. So, for example, if I am playing second base, I may reflect on my position as a second baseman, but to do so I have to be able to think of "myself" in relationship to the whole game, namely, the other actors and the rules of the game. We might refer to this cognitive object as my (second baseman) baseball self or "Me." Perhaps a better example might be to think of the self in relationship to one's family of origin. In this situation, one views oneself from the perspective of the various sets of behaviors that constitute the family system. Mead is a systemic thinker who speaks of taking the perspectives of others and of generalized others. These perspectives are not "subjective" for Mead. They are "objective" in the sense that they provide frames of reference and shared patterns of behavior for members of communities. (This is not to say that every human community has an equally viable account of the natural world. This is in part why we have science for Mead.) However, it is not only human perspectives that are objective for Mead. While it is true that only human beings share perspectives in a manner that allows them to be (self) conscious about the perspectives of others, there is an objective reality to non-human perspectives. How can a non-human perspective be objective? In order to answer this question, a few general remarks about Mead's notion of "perspective" are in order. First, it is important to note that perspectives are not primarily visual for Mead. Mead's account of the "Me" and the generalized other has often led commentators to assume that he is a determinist. It is certainly the case that if one were to emphasize Mead's concern with social systems and the social development of the self, one might be led to conclude that Mead is a theorist of the processes of socialization. And the latter, nested as they are within social systems, are beyond the control of individuals. However, when one considers the role of the "I" and novelty in his thinking, it becomes more difficult to view him as a determinist. But his emphasis on novelty only seems to counter determinism with spontaneity. This counter to determinism in itself doesn't supply a notion of autonomy—self-governance and self-determination—which is often viewed as crucial

254 NSOU CC - SO - 03 to the modern Western notion of the subject. However, Mead was a firm booster of the scientific method, which he viewed as an activity that was at its heart democratic. For him, science is tied to the manner in which human beings have managed from pre- recorded times to solve problems and transform their worlds. 16.4 Questions 1. Answer briefly the following questions: (6 marks) a. What is the 'conversation of gestures'? b. What is the implication of the concept 'significant others' in Mead's theorizing? 2. Answer in detail the following: (12 marks) a. Write in brief on the development of Mead's arguments on the development of self. b. What did Mead mean by 'generalized others'? Discuss in this context the importance Mead gave to the idea of society. 3. Write essay-type answers to the following: (20 marks) a. Analyze Mead's contribution to symbolic Interactionist perspective. b. Discuss how Mead develops his ideas on the relation between individual and society. 16.15 References Blumer, H. 16.16 Glossary Generalized Other: "The generalized other" is a concept developed by G. H. Mead which can be thought of as understanding the given activity and the actors' place within the activity from the perspective of all the others engaged in the activity. Through understanding "the generalized other" the individual understands what kind of behavior is expected, appropriate and so on, in different social settings. 'Significant Other': A term used by George Herbert Mead to refer to those individuals who are most important in the development of the self, such as parents, friends, and teachers. 'Conversation of gestures': The 'conversation of gestures' formed the basis of George Herbert Mead's ideas of social behaviorism, a variant of pragmatism. Mead distinguished between non-significant conversation of gestures, conversation of significant gestures, and conversation of significant symbols. They correspond to the successive stages of the evolution of language and the mind. A gesture gains significance when it elicits a NSOU CC - SO - 03 257 response in an individual that resembles the response elicited by this individual's gesture in another individual, that is, when a symbol bears the same meaning to different actors. The mind emerges in language communication and is social in character, since thinking consists in the internalization of external conversations. The self of an individual forms through the internalization of interpersonal conversations. Like the conversation of significant gestures and symbols, the self is reflexive.

258 NSOU CC - SO - 03 Unit : 17 Contributions of H. Blumer Structure 17.1 Objectives 17.2 Introduction 17.3 Blumer's ideas on Meaning and Interpretation 17.4 Blumer's ideas on Structure and Process 17.5 Blumer's Methodology 17.6 Blumer's Ideas on 'Sensitizing Concepts' 17.7 Criticism against Blumer 17.8 Conclusion 17.9 Summary 17.10 Questions 17.11 References 17.12 Glossarys

17.1 Objectives • To understand Blumer's ideas on Meaning and Interpretation. • To explain Blumer's ideas on structure and process. • To have an idea of the overall theory and methodology of Blumer. 17.2 Introduction Herbert Blumer was an American sociologist of the Chicago School who wrote extensively on a series on symbolic interaction. Blumer's contribution to symbolic interactionism is his work on interpretation, ideas of structure and process and methodology. Blumer focused on the ways humans take control of their lives. The two parts that are significant in Blumer's contribution are symbols and interaction. Both produce meaningful interaction.

NSOU CC - SO - 03 259 17.3 Blumer's ideas on Meaning and Interpretation Unlike Mead, Blumer illustrated that interaction was not a simple stimuli-response sequence. Like Mead, he too, argued for the necessity of including subjective experience in explaining human interactions. He wanted to include a middle term in the couplet so that it becomes stimuli-interpretation-response. It means that two actors involved in an interaction interprets each others' actions or 'gives meaning' to them and responds to those. Thus the action of one is definitely a stimulus but it alone does not evoke response in the other. Therefore instead of merely acting to each others' actions in an automatic way (reaction) humans interpret or define each others' actions and they perform this interpretation on the basis of symbols. It means that the meaning attached to an action makes it not only meaningful to the reactor but also acts as a stimulus to his/her response. Thus the stimulus-interpretation- response process could be translated as a process of meaningful interaction. In order to understand fully the premises of Blumer's understanding of human action it is important to carefully look into the three premises as outlined by Wallace and Wolf (2006, 217- 20). 1. Humans

act towards things on the basis of the meanings that the things have for them.

It means the individual designates different objects to himself, giving them meaning, judging their suitability to his actions and making decisions on the basis of that judgment. For example if a boy sneezes at class, first he feels embarrassed about it for which he excuses himself even if no one express their dissatisfaction to the act. 2.

81%**MATCHING BLOCK 287/320****W**

The meaning of things arises out of the social interaction one has with one's fellows.

It means that 'meaning' is socially constructed. It is not inherent in things. It is out of social interactions that individuals construct meanings of the objects (things) in question. For instance, in the example stated above the sneezing in public is considered a disturbance and a part of bad manners. It is an outcome of previous interactions. It is for this the boy has learnt to excuse himself in public whenever he sneezes. 3.

The meanings of things

97%**MATCHING BLOCK 288/320****W**

are handled in and modified through an interpretative process used by the person in dealing with things he encounters.

Blumer says that individuals first communicate the meanings of things to them through talking. For example, when one talks about his worries he does so to interpret how he feels of the thing as disturbing to him.

260 NSOU CC - SO - 03 Taken together the premises stated above indicate that symbolic interactionism emerges from an individual's ability to confer meaning to a situation. 17.4 Blumer's ideas on Structure and Process Blumer emphasized on an ever-active interacting people as unit of interest in sociology. But he was skeptical of the way sociology conceptualized a society as a structure. In emphasizing on interacting individuals Blumer did not underestimate the importance of structure but does not consider it a determinant of behavior. When he speaks of role playing he does not consider the cultural dictate behind the enactment of the role but considers it to be flexible and a space for improvisation for the actor. He believes that an individual possess self which is an object to itself. This means that the individual can act towards himself as he confronts the world. Action is pieced together as individual takes the setting of the act into account in making decisions. As acting humans, people do not simply respond to others in a structured manner. Blumer says that human action is preceded by the individual briefly sketching out plans and intentions. Human action for him in the most part is constructed by people making indications to themselves of what confronts them. Mead and Blumer does not deny structured action but only seeks to find and acknowledge that individuals can act in many unstructured and undefined situations in which humans devise their own conduct. Blumer emphasized on the ability of humans to use symbols and develop capacities for thinking and self-reflection. Blumer emphasized that humans have the capacity to view themselves as objects and are active creators of the world to which they respond. Blumer stressed on the process of role taking which humans mutually produce and construe each others' gestures. Actors are able to rehearse covertly various lines of activity and then express those behaviors that allow cooperative and organized activity. Blumer stressed on the creative, evaluating, defining and mapping processes that individuals undertake in order to continue their interactions with one and another. The symbolic nature of interaction keeps an assurance of its changeable characteristic through shifting the definitions of behaviors of humans. Blumer had consistently advocated a view of the social organization as temporary and constantly changing. To him, as behavior is interpretative, evaluational and definitional, social organization represents an active and fitting together of action by those interactions. Social organization therefore must be viewed as a process and not a structure. The social structure is an emergent phenomenon and not reducible in its constituent actions of individuals. Although the interactions are

NSOU CC - SO - 03 261 repetitive and structured by commonly shared definitions, it's symbolic nature reveals the potential for new objects to be inserted or old ones to be altered. The result is a re-evaluational, recreation or remapping of behaviors. The patterns of social organization represent emergent phenomenon that can serve as objects that define situations for actors. However the symbolic processes that give rise and sustain these patterns can also operate to change and revise them. 17.5 Blumer's methodology Blumer mounted a constant and determined attack on sociological theory and research. His critical questions were aimed at the utility of contemporary research procedures for finding the symbolic processes from which social structures and personality are built and sustained. Rather than the empirical world dictates the kind of research strategies to be used Blumer argued for research strategies to find out what is to be studied. Blumer shows that unlike functionalism, symbolic interactionism is committed to inductive approach. In this method the understanding or explanations are induced from the data. It states that the researcher does not begin with a theory rather ends up with one. The approach takes into account the process by which individuals define the world from their perspective and at the same time identify their world of objects. He sketches two methods by which the researcher can get closer to the empirical social world and delve deep into it. He refers to these as exploration and inspection. The exploratory phase has two purposes: first, to provide the researcher with a close acquaintance with the sphere of social life which is unfamiliar and second, it helps to develop a focus or sharpens the researcher's investigation so that the research is grounded in the empirical world. The techniques involved are observing, interviewing, listening, reading and consulting. Inspection is intensive and focused examination of the content which is empirical in nature and involves analysis of the analytical elements used for the purpose of research. He introduces the term 'sensitizing concepts' to understand this further. A sensitizing concept lacks specification of attributes, gives the researcher a sense of reference in understanding empirical instances. It gives the researcher a sense of direction along which way to look. 17.5 Blumer's ideas on 'Sensitizing Concepts' A major area of controversy over Blumer's methodological position is the issue of operationalization of concepts. Blumer had consistently triggered his criticism against

262 NSOU CC - SO - 03 current deficiencies in research strategies while linking actual events to the empirical world. Blumer argues that it is only through the methodological processes of exploration and inspection that concepts can be attached to the empirical world. Rather than seeking false and grand scientific security in research objectives the investigators must explore and inspect events in the empirical world. He recognizes that sociological concepts do not link the empirical world to the actual. Since the world is composed of constantly shifting processes of symbolic interaction among actors in various contexts it is important to capture the contextual nature of the social world. More important is the fact that social reality is constructed from the symbolic processes among individuals stressing on the importance of looking at how this world is constructed in such a way. This is the requirement for 'sensitizing concepts'. The progressive refinement (by the process of induction) of these concepts used and by a careful and imaginative study of the world will help in understanding how this world is created through communication. Blumer discerns the use of rigid classification of concepts in a definitive form and rather proposes to see how far such concepts already in use can be molded to be more appropriate, sensitizing and explicitly communicable through description. With careful formulation and constant refinement these concepts can be used as building blocks for sociological theories. They can be used, incorporated into provisional theoretical statements that specify the conditions under which various types of interaction are likely to occur. In this way, the concepts of theory will recognize the shifting nature of the social world and provide a more accurate set of statements about a social organization.

17.7 Criticism against Blumer

Blumer was criticized as unscientific, subjectivist and astructural. The critics have argued that Blumer is very limited as he conceptualizes the idea of macro and any objective phenomenon. They point out that he is merely adopting a position with existing ideas on human agency. Further the critics point out that Blumer adopts collective entities such as organizations, institutions etc as acts and as characterized by subjective processes.

17.8 Conclusion

Blumer came up with three core principles to his theory. They are meaning, language, and thought. These core principles lead to conclusions about the creation of a person's self and socialization into a larger community (Griffin, 1997). The first core principle of meaning states that humans act toward people and things based upon the meanings that they have given to those people or things. Symbolic Interactionism holds the principal of meaning as central in human behavior. The second core principle is language. Language gives humans a means by which to negotiate meaning through symbols. Mead's influence on Blumer becomes apparent here because Mead believed that naming assigned meaning, thus naming was the basis for human society and the extent of knowledge. It is by engaging in speech acts with others, symbolic interaction, that humans come to identify meaning, or naming, and develop discourse. The third core principle is that of thought. Thought modifies each individual's interpretation of symbols. Thought, based-on language, is a mental conversation or dialogue that requires role taking, or imagining different points of view. According to Blumer's theory, interaction between individuals is based on autonomous action, which in turn is based on the subjective meaning actors attribute to social objects and/or symbols. Thus individual actors regulate their behaviour based on the meaning they attribute to objects and symbols in their relevant situation. Blumer theorized that assigning objects meaning is an ongoing, two-fold process. First, does the identification of the objects have situational meaning? Second, is the process of internal communication to decide which meaningful object to respond to? Acknowledging that others are equally autonomous, individuals use their subjectively derived interpretations of others (as social objects) to predict the outcome of certain behaviours, and use such predictive insight to make decisions about their own behaviour in the hopes of reaching their goal. Thus, when there is consensus among individual actors about the meaning of the objects that make up their situation, social coordination ensues. Social structures are determined as much by the action of individual actors as they determine the action of those individuals. Based on this, Blumer believed that society exists only as a set of potentials, or ideas that people could possibly use in the future. This complex interaction between meanings, objects, and behaviours, Blumer reiterated, is a uniquely human process because it requires behavioural responses based on the interpretation of symbols, rather than behavioural responses based on environmental stimuli. As social life is a "fluid and negotiated process," to understand each other, humans must intrinsically engage in symbolic interaction. Blumer criticized the contemporary social science of his day because instead of using symbolic interactionism they made false conclusions about humans by reducing human decisions to social pressures like social positions and roles. Blumer was more invested in psychical interactionism that holds that the meanings of symbols are not universal, but are rather subjective and are "attached" to the symbols and the receiver depending on how they choose to interpret them.

264 NSOU CC - SO - 03 17.9 Summary Blumer synthesized the pragmatist philosophy of George Herbert Mead (1863–1931) with Charles Horton Cooley's (1864–1929) notion of sympathetic introspection, particularly as it informs contemporary ethnography, to develop a sociologically focused approach to the study of human lived experience. In opposition to behaviorist, structuralist, and positivist views that have dominated the social sciences, Blumer championed using an interpretivist perspective when examining social life. He contended that theoretical and methodological approaches to the study of human behavior must recognize human beings as thinking, acting, and interacting entities and must, therefore, employ concepts that authentically represent the humanly known, socially created, and experienced world. Blumer's pioneering sociological perspective informed his analysis of a broad array of subjects including collective behavior, social movements, fashion, social change, social problems, industrial and labor relations, public opinion, morale, industrialization, public sector social science research, social psychology, and race relations. And, because his rendition of symbolic interactionism invariably portrays people as possessing agency, as reflective interactive participants in community life, he routinely called into question analyses of social life that rely on more stereotypical factors-oriented approaches. Although Blumer's 1958 article "Race Prejudice as a Sense of Group Position" challenges psychological and psychoanalytic explanations of race relations by emphasizing social processes entailed in conflict, institutionalized power relations, and collective definitions of the situation, his most consequential contribution to the study of intergroup relations was his 1971 article "Social Problems as Collective Behavior." 17.10 Questions 1. Answer briefly the following questions: (6 marks) a. What are 'sensitizing concepts'? b. What is inspection? 2. Answer in detail the following: (12 marks) a. What is the special contribution of Blumer in symbolic interpretation? b. What is the methodology that Blumer developed necessary for sociological investigation? 3. Write essay-type answers to the following: (20 marks)

NSOU CC - SO - 03 265 a. What is the fundamental difference between Mead and Blumer's approaches to Interaction? b. What are the criticisms leveled against Blumer? Discuss. 17.11 References Blumer, H. (1962/1969), *Symbolic Interactionism*, Englewood Cliff, N. J.

It can be any sociological concept which, in contrast to fully operationalized or 'definitive concepts', 'merely suggests directions along which to look'. Whereas 'definitive concepts have specified empirical referents which can be readily operationalized, e.g. 'social class' operationalized in terms of income level or years of schooling, sensitizing concepts are less precise. They alert sociologists to certain aspects of social phenomena. (Ref: Herbert Blumer. "What is Wrong with Social Theory." *American Sociological Review* 18 (1954): 3-10.) Exploration: This idea is basically about the value of exploratory studies, with an initial broad focus that is sharpened as the inquiry proceeds. It is not dependent on particular sets of techniques, the importance of seeking participants with knowledge on the area of study. Inspection: Blumer had developed two ways in which social phenomenon ought to be studied: Exploration and Inspection. Inspection is the examination of the empirical world which needs to be cast in a theoretical form. But there should be no conventional protocol, which would only serve to limit the empirical analysis. The procedure may be to examine analytical elements from different angles. The process should be flexible, creative and imaginative. 268 NSOU CC - SO - 03 Unit : 18 Critical Overview Structure 18.1 Objectives 18.2 Introduction 18.3 Criticism 18.4 Contemporary Symbolic Interactionism 18.5 Conclusion 18.6 Summary 18.7 Questions 18.8 References 18.1 Objectives •

To understand the criticism of symbolic interactionism. • To understand the nature of contemporary symbolic interactionism. • To understand the

relevance of this theory. 18.2 Introductions Critical attacks came from all sides. Psychologists interested in some of the same topics as Symbolic Interactionists tended to regard both the ideas and such methods as they saw in the work of the latter as lacking rigor and a sense of evidence, not to speak of replicable procedures by which evidence could be developed or produced committed to a behaviorist metaphysics, with occasional but comparatively rare exception they tended to deride the emphases of symbolic interactionism on minded processes, on thought, on symbols and meanings and definitions of the situation, and on the person as independent causal agent in the production of his/her own behavior. And they tended to deprecate such research as Symbolic Interactionists did accomplish to the extent that it departed (and, of course, virtually all of it did) from an experimental methodology and format (Stryker, 1987).

NSOU CC - SO - 03 269 Symbolic Interactionism as a theoretical perspective was not appreciated or recognized by the mainstream theorizing. Though it had a lasting effect on subsequent perspectives it was limited in scope for its deliberations on micro-understanding of life and social factors. The easy charge had always been that symbolic interaction was a micro sociological perspective, with no interest in structure, no belief in the power of organizations and institutions, and no constructs to examine such issues (Maines 1988). As noted earlier when considering the macro-micro debate, such a charge had always been misleading, as Blumer (1969), for instance, regularly wrote about "acting units," rather than actors. Yet, in recent years, Interactionists have more self-consciously addressed macro-sociological issues, using the intermediate level of meso-structure. This emphasis received prominence in the influential survey article by David Maines (1977) in the *Annual Review of Sociology*, titled "Social Organization and Social Structure in Symbolic Interactionist Thought," emphasizing the interactionist tradition of concern with structure, institutions, and organizations (see Overington and Mangham 1982). 18.2

Criticism There are certain criticisms directed towards symbolic interactionist paradigm. One of these criticisms is that symbolic interactionism is largely deprived of a real social envision.

In other words, symbolic interactionism does not put forward a complete picture of

91%**MATCHING BLOCK 295/320****W**

a society since it sometimes describes society as a thing only in the minds of people (Slattery, 2007). This theory, as also stated by Udehn (2001), is an "American" idea that stresses the freedom of the individual and limited role of the society. The second one of the problems of the symbolic interactionist paradigm is stressed especially and clearly: (i) not taking into account human emotions very much and (ii) getting interested in social structure to a limited extent. In fact, the first one of these two incompetencies imply that symbolic interaction is not completely psychological and the second one implies that symbolic interaction is not completely sociological (Meltzer et al, 1975: 120; Akt: Slattery, 2007: 338). This theory pictures 'meaning' as something emerging by itself during interaction under a certain condition. It

does not

88%**MATCHING BLOCK 296/320****W**

take into account the basic social context in which the interaction is positioned. Consequently, it does not produce the sources of meaning. Moreover, symbolic interactionism

does not

94%**MATCHING BLOCK 297/320****W**

perceive any social reality beyond the one that humans create with their interpretations and for that reason it denies explaining society on a more general level (Slattery, 2007: 338). In 270

summary, the principal condition for the formation of a meaning is the existence of an event. The following condition is the experience of these events. As Blumer points out; "the meaning of things directs action" (

O'Shaughnessy, 1992: 158).

100%**MATCHING BLOCK 299/320****W**

In order to understand human behaviors, it is necessary to understand definitions, meaning and processes formed by humans first. Elements such as social roles, traditional structures, rules, laws, purposes, etc. provide raw material to the individuals for forming definitions. In this context, symbolic interaction stresses social interaction, debate of definitions and taking emphatic role between people.

B. N. Meltzer (1959; 1972) and A. Brittan (1973) had presented criticisms against symbolic Interactionism in a systematic fashion. Meltzer has criticized Mead's ideas on social psychology. He contends that Mead's framework is either fuzzy or vague for providing consistency required in scientific explanation. He criticizes Mead for using improperly defined concepts such as 'mind', role-taking, 'I' etc in his presentation of his perspective. It is criticized that symbolic Interactionism has readily given up scientific techniques for qualitative analysis as if these qualitative expressions cannot be counted, enumerated and codified. These criticisms have been forwarded by Eugene Weinstein and Judith Tanur (1976) saying that science and subjectivism are not mutually exclusive. It means science can also be possible using subjective analysis. The traditional way of thinking states the opposite. It proposes science to be objective and symbolic interactionist theorizes just that which is applicable for a subjective analysis traditionally. The critics state that quantitative analysis can also be used in subjective interpretations. Manfred Kuhn, William Kolb, Bernard Meltzer, James Petras and Larry Reynolds have criticized the vagueness of symbolic interactionism (Ritzer: 2011). They say that the theory in question has puzzling and inaccurate concepts incapable for a compact basis for research. Because these concepts are imprecise they are difficult to operationalize and therefore propositions from the theory cannot be generated for testing. Weinstein and Tanur (1970) have put forward the third major criticism against symbolic interactionism. They argue that symbolic interactionism has ignored the importance of large-scale social structure. It in most cases denies the importance or the impact of social structure on micro-level communication and behavior. At the same time symbolic interactionism has been criticized for denying or ignoring psychological factors as needs, motives, intentions etc. In both cases symbolic interactionism has been accused of making a 'fetish' of the everyday life marking an over importance on the immediate situation and a fanatical concern with the periodic image of life.

NSOU CC - SO - 03 271 Turner (1995) criticizes symbolic interactionism as a vague attempt to link between the interaction processes and its social structural products leaving the perspective with few statements about how, when, where and with what probability interaction processes operate to create, sustain and change varying patterns of social organizations. Symbolic interactionism considers the individual as a subject with a social position on the one hand. It defines the individual as the designer of a contextual and communicative identity on the other hand. However, cultural studies emphasize constantly changing social descriptions, reproduction of culture and society, and power and hegemony. The structural and cognitive approach of cultural studies are harshly criticized, while symbolic interactionism is regarded as ignoring social power structures and excessively emphasizing context. Moreover, it is possible to combine action and context oriented approach of symbolic interactionism and structure oriented communication approach of cultural studies in a complementary fashion (Krotz,2007: 81-82). Ultimately Interactionists, like others in the debate, concluded that a fixed distinction between levels is misleading (Wiley 1988, Law 1984), suggesting that institutions of all sizes can be analyzed using similar analytical tools. Some argue for a seamless sociology which recognizes that "separate" levels are actually intertwined and indivisible, with micro analyses implicated in macro ones, and vice versa (Fine 1990b). The debate has been important in its attempt to bridge theory groups, bringing micro-sociologists into intellectual and personal contact with macro-sociologists, breaching sub-disciplinary isolation. One reason it can plausibly be claimed that symbolic interaction has disappeared, although not by name, is the success of the argument that all levels of analysis must be considered in an adequate analysis. The micro-sociologist whether in exchange theory, ethnomethodology, or symbolic interaction disdains any interest in questions of larger institutions. In turn, most macro-sociologists (Structuralist, Marxist, or Institutional) now accept a vision of structures ultimately grounded on the actions of participants, even if they do not emphasize the power of the actor as much as Interactionists. If the goal of symbolic interaction is to maintain itself as a distinctive oppositional movement, then it has failed, with more and more outsiders addressing central issues and more and more insiders stepping outside the boundaries, not caring about their badges of courage. Yet, if the ultimate goal is to develop the pragmatic approach to social life into a view of the power of symbol creation and interaction— then symbolic interaction has triumphed gloriously.

272 NSOU CC - SO - 03 18.4 Contemporary Symbolic Interactionism Contemporary symbolic interactionists emphasize the reflexive, gendered, and situated nature of human experience. They examine the place of language and multiple meanings in interactional contexts (see Holstein and Gubrium 2000). This reflexive or narrative concern is also evidenced in other points of view, from phenomenology to hermeneutics, semiotics, psychoanalysis, feminism, narratology, cultural, discursive and dialogical psychology, interpretive sociology and cultural studies. This narrative turn moves in two directions at the same time. First, symbolic Interactionists (and other theorists) formulate and offer various narrative versions, or stories about how the social world operates. This form of narrative is usually called a theory, for example, Freud's theory of psychosexual development. Second, symbolic Interactionists study narratives and systems of discourse, suggesting that these structures give coherence and meaning to everyday life. (A system of discourse is a way of representing the world.) Systems of discourse both summarize and produce knowledge about the world (Foucault 1980: 27). There are many in the interactionist community who reject the narrative turn (as outlined above) and what it implies for interpretive work. These critics base their arguments on six beliefs: 1. The new writing is not scientific; therefore it cannot be part of the ethnographic project. 2. The new writers are moralists; moral judgments are not part of science. 3. The new writers have a faulty epistemology; they do not believe in disinterested observers who study a reality that is independent of human action. 4. The new writing uses fiction; this is not science, it is art. 5. The new writers do not study lived experience which is the true province of ethnography. Hence, the new writers are not participant observers. 6. The new writers are postmodernists, and this is irrational, because postmodernism is fatalistic, nativistic, radical, absurd and nihilistic. These six beliefs constitute complex discursive systems; separate literatures are attached to each. Taken together, they represent a formidable, yet dubious critique of the new interactionist project. They make it clear that there are no problems with the old ways of doing research. Indeed, the new ways create more problems than they solve. These beliefs serve to place the new work outside science, perhaps in the humanities, or the arts. Some would ban these persons from academia altogether. Others would merely

NSOU CC - SO - 03 273 exclude them from certain theoretical group that is from symbolic interactionism (Denzin, 2000). The criticisms against Symbolic Interactionism can be summarized as follows: The primary evolution and amendment of the theory is primarily in terms of its focus, application, and interpretations. • Symbolic Interactionism has been criticized for failing to apply to the macro level issues of social structure, politics and history; and for missing the micro level of issues such as emotions and the unconscious. • Other criticisms include a lack of clarity about the concepts and a failure to create a systematic set of principles or propositions that can be said to truly constitute a theory. • Despite or perhaps even because of the lack of precision in the theory, there are few if any areas of human interaction to which symbolic interaction has not been applied. 18.5 Conclusion Sociological social psychology, marginalized in the 1970s, has reemerged to contribute to the broadening of the discipline. Nowhere is this more evident than in the rejuvenation of the sociological study of the self, identity, and social role. The development of the social and symbolic self, a root issue of symbolic interaction from James, Cooley, and Mead, is central to interactionist research and theory and includes such issues as self-esteem, self-feeling, self-concept, identity work, and self-presentation. Symbolic interactionism, as practiced by those sociologists trained by Everett Hughes at the University of Chicago in the late 1940s and early 1950s, tended to deemphasize self in favor of situation; the sociology of Erving Goffman, implying that there was no deeply held "real" self, only a set of masks, was a prototype for this view. Yet, despite the attention to situation, Interactionists such as Ralph Turner (1976, 1978) emphasized that the creation of the self results from social and cultural trends. Hewitt (1989), for instance, argues that a basic conflict appears in American selves between individualism (independence) and community participation (interdependence). While Interactionists hold that no "real, true, core" self can be found, analyses of how selves develop are part of interactionist analysis—both by Interpretivist theorists associated with a post-modern literary analysis, and by social realists who are more closely connected to experimentation and hypothesis testing. Interactionism pictures the self as symbolic, situationally contingent, and structured. Symbolic interactionism was not considered as a mainstream sociological theory in less than two decades ago. Slowly, this theorizing has gained popularity and many of its concepts are now accepted.

274 NSOU CC - SO - 03 The way Blumer emphasized the role of Mead in the development of the Chicago School could be seen as a process of myth making, as Mead clearly had much less influence in his lifetime than Blumer supposes. One might argue that Blumer's emphasis of the role of George Herbert Mead in the 'Chicago School' was a mythical construction aimed ultimately at his own self-exaggeration. However, even if there is some actuality in this interpretation, does it tell us anything other than that the myth of Mead's importance in the school, through the construction of a heritage, is a legitimation of particular work practices? Does such an analysis lead on to a critique, or even the identification, of ideological frameworks within which (in this case) an academic discipline operates. The answer is that it can. If we leave the analysis at the level of 'Blumer legitimated his work through the creation of a spurious heritage', we have not, from a metascientific point of view, progressed beyond the taken-for-granted of the myth, other than to suggest a motivator for its genesis. And this is quite insufficient as it merely leads to the danger of replacing one myth with another. In the example, Mead's assumed centrality is due to far more than Blumer attempting to legitimate his position. Blumer did not act deliberately to lay a false trail. Genuinely, Blumer (who taught Mead's social psychology courses after the latter's death in 1931) believed he had grasped the essence of Mead's thought and applied it to developing a more 'critical' form of interactionism, which he called symbolic interactionism. Many subsequent scholars have tended to take the Mead-Blumer heritage for granted. They, too, view the 'Chicago School' as bound up with symbolic interactionism and make Mead (often through Blumer) the provider of a theoretical context and a direct influence on the sociological practitioners of symbolic interactionism. However, an uncritical acceptance of a Mead-Blumer tradition as indicative of 'Chicago School' sociology still begs a number of questions. Why did the critique of this view take so long to emerge? How was Blumer able to gain credibility for his Meadian view of the Chicago School? While it served Blumer's perspective, did he deliberately set out to create a view of the 'School' that saw Mead as the key founding father, or did other circumstances operate to facilitate or generate this myth? Are these other circumstances 'fortuitous' and random or are they indicative of an ideology of sociology? And what relation does that ideology have with a more general ideology of science or wider social ideology? Symbolic interactionism recognizes that the genuine mark of an empirical science is to respect the nature of its empirical world — to fit its problems, its guiding procedures of

NSOU CC - SO - 03 275 inquiry, the techniques of study, its concepts, and its theories to that world. It believes that this determination of problems, concepts, research techniques, and theoretical schemes should be done by direct examination of the actual empirical social world rather than by working with a simulation of that world derived from a few scattered observations of it, or with a picture of that world fashioned in advance to meet the dictates of some scheme of 'scientific' procedure, or with a picture of the world built up from partial or untested accounts of that world (Coser: 1977). One of the principal characteristics of Blumer's writing is its critical attack. There is an overarching tendency in Blumer's accounts of his theories to attack his detractors in the midst of explaining his own point of view. No attention is given in his discussion of the faults of other methods of inquiry to the danger that direct, interpersonal observation may also skew the data collected by the presence of the researcher, for instance, but each time he seeks to describe an aspect of Social Interactionism, he includes an assertion as to why that viewpoint is superior to one not in agreement with it. He cautions us to the dangers of forming theoretical models from incomplete data. He says that it deserves careful consideration and serves to point to one of the chief difficulties of engaging in social research (Wallace and Wolf: 2005). 18.6 Summary Social Interactionism, then, comprises a micro-level framework for studying social phenomenon not afforded by other major schools of sociological thought. Blumer places his principal emphasis on the process of interaction in the formation of meanings to the individual. He proceeds to place those meanings in the central role in explaining and accounting for human behavior (Coser: 1977). Resting on this theoretical foundation are several "root images" of the nature of human social action and their relationship to the process of meaning formation. Out of these "images" derives a natural and useful research methodology — which, it must be noted, is not entirely free of potential to distort the data collected by means of it — that involves personal immersion into the world the researcher wishes to study in order to assure that the most direct possible observation of that world can be made. Many Interactionists such as Stryker (1980) have tried to connect to the macro and structural components of sociology. It is a perspective that primarily values subjective meaning and an opposition to structure and deal with a methodology that views the

276 NSOU CC - SO - 03 world of the other as seen by them did question some important mainstream sociological concepts. It is seen now as an alternative which provides some important theoretical tools missing in mainstream sociology. As a theoretical perspective it has undergone expansion beyond the limits of micro-sociology. At present the Symbolic Interactionists are increasingly involved in major issues confronting sociological theory, such as micro- macro, agency-structure etc. Once interactionism may have had a partially deserved reputation as parochial and in- bred, but this is no longer deserved. In its post-Blumerian age, interactionism might be called intellectually promiscuous. Contemporary "Interactionists" blend their interest in "classical" interactionism (micro-sociological, nonstatistical, robustly relativistic, and proudly anti-positivistic) with virtually all sociological traditions. As a result, Interactionists have integrated a "Blumerian" approach with theoretical approaches linked to Durkheim, Simmel, Weber, Freud, Habermas, Baudrillard, Wittgenstein, Marx, Schutz, phenomenology, post-modern theory, feminism, semiotics, and behaviorism. What used to be a fairly narrow, tightly focused perspective now might be faulted for deemphasizing the traditional problems of situational definition, negotiation, impression management, and meaning creation that once animated symbolic interactionism? In its fragmentation, symbolic interactionism seems bound mainly by a few broad tenets, an effective organizational infrastructure, and some active publication outlets. Of course, this may be all that many perspectives share. The post-modern, post-structural textual readings and cultural studies of Norman Denzin (1986) and Patricia Clough (1992) seem light- years from the precise experimentation and theory construction of Peter Burke (1980) and David Heise (1979). It is symptomatic of the degree of fragmentation that some of the Blumerian "old guard" would question whether any of these are "real" Interactionists. Similarly the realist, descriptive ethnographies of Ruth Horowitz (1983) and Elijah Anderson (1978) are entirely dissimilar from the intensely personal and self-reflexive accounts of Carolyn Ellis (1991) and John Van Maanen (1988). Symbolic interactionism in the 1990s has a diversity that may vitiate its center. This splintering, of course, has benefits, in that diversity produces intellectual ferment. Yet, such broadness raises the question of what, if anything, post-Blumerian symbolic Interactionists share. Does a dominant model of symbolic interaction exist? Do the theorists who label themselves (or who are labeled) Interactionists, belong to the same school? One response is that if a sufficient number of individuals label them or joins an NSOU CC - SO - 03 277 organization (like The Society for the Study of Symbolic Interaction) then such a perspective exists. Yet, this degree of semi-coherence may raise questions about its justification as a perspective. 18.7 Questions 1. Answer briefly the following questions: (6 marks) a. What is symbolic interactionism? b. Who are main proponents of symbolic interactionism? c. What is the importance of Symbolic Interactionism as a perspective? 2. Answer in detail the following: (12 marks) a. Give an account of any two major criticisms against Symbolic Interactionism. b. Discuss following Mead the relationship between individual and society. c. Discuss after Blumer on 'sensitizing concepts' and its importance in sociology. d. Elucidate on Blumer's ideas on symbolic interactionism. 3. Write essay-type answers to the following: (20 marks) a. Discuss Mead's ideas on society and how it is formed through interaction. b. Discuss Blumer's insistence on meaning in symbolic interaction. 18.8 References Blumer, H. (1962/1969), Symbolic Interactionism, Englewood Cliff, N. J.

Module - VII : Feminist Perspective

NSOU CC - SO - 03 281 19.2 Introduction What has been the focus of feminist movement today? Feminist thought has been around for over a century now, bringing to light the lives and struggles of women and gender minorities. From the early 1900's to the recent '# Me-too' movement in 2018, feminists have had a very hard time convincing the world that it is, in fact, equal rights that they want and not disproportionate 'special treatment'. However, today, feminism has become a 'bad word', especially in the digital age, where there is, an abundance of opinions on social media equating it with 'man-hating' or misogyny. Most people readily profess their commitment to 'equality', but shy away from identifying themselves as feminist. Feminists, both offline and online, continue to be dismissed, discredited and threatened with violence for demanding rights and speaking truth to power. Feminist theory is a generalized, wide-ranging system of ideas about social life and human experience developed from a woman-centered perspective. Feminist theory is woman-centered—or women-centered—in two ways. First, the starting point of all its investigation is the situation (or the situations) and experiences of women in society. Second, it seeks to describe the social world from the distinctive vantage points of women. Feminist theory differs from most sociological theories in that it is the work of an interdisciplinary and international community of scholars, artists, and activists. Feminist sociologists seek to broaden and deepen sociology by reworking disciplinary knowledge to take account of discoveries being made by this interdisciplinary community. In general, we draw on both feminist and sociological theories to reframe our understanding of women's material and cultural condition. Feminist theories often omit women's contemporary position, concentrating on historical antecedents or utopian futures. The focus on praxis is often on creating revolution, egalitarian reform or cultural utopias. Most sociology is grounded in what is the relation of the individual to the world as it exists and is maintained. Feminist theory is an emancipatory theory focusing on the relation of the individual or group to the world as it can be conceived. Much of feminist theory emphasizes a social philosophy of women as opposed to a sociology of women. According to Janet Chafetz (1988) the following elements comprise a feminist sociological theory : a. Gender comprises a central focus or subject matter of the theory. b. Gender relations are viewed as a problem. c. Gender relations are not viewed as either natural or immutable.

282 NSOU CC - SO - 03 d. The test is whether feminist sociological theory can be used to challenge, counteract or change a status-quo that disadvantages or devalues women. Chafetz deliberately omits activism as a central component of what makes a theory feminist. Earlier sociological theories, which were also feminist, claim that theory must involve praxis (Millman and Kanter,1975; Cook and Fonow,1986). The feminist sociologist is involved in changing society in the very process of doing sociology. Chafetz rejects this activist definition of sociology. To her, feminist sociology is one which can be used for activist purposes but is not by definition activist. "It is a judgment of the theory itself, not of the scholar who created it" (Chafetz, 1988:5). 19.3 Feminist Theory and Sociological Theory A genuinely feminist approach to theory draws on concepts and analytic tools that are appropriate to the questions of women's experiences of inequality that promote activism. We can begin from an understanding of our own conditions (a sociology by women). This understanding need not depend on the concepts or definitions set by traditional research. We can develop models that use nonsexist concepts and language and move away from rigid either/or dichotomies. Instead of assuming a gulf between rational concepts such as the public and private spheres, or between the subject (researcher) and object (women respondents), feminist theorists acknowledge the continuity between them (a sociology about women). This new assumption reduces that bipolarity. Finally, the products and consequences of our thinking can be assessed against the probability of change for women (a sociology for women). The reasons for such feminist approach to theory move from the criticisms toward an integrative model which allows us to : (1) examine the possibility of a theoretical integration (2) account for historical fluctuation (3) develop models that are testable and challengeable through the use of feminist methodologies and praxis. 19.4 Why build a Feminist Sociological Theory? It is clear that early patriarchal and liberal feminist theories are inadequate to explain the development and maintenance of and the change in women's oppression in different cultures (Chafetz, 1988). The reasons for building a feminist theory or explanation derived from women's studies frameworks are clear. But why build a sociological theory? Theory as a practice can itself be examined from a feminist perspective, analyzed for potential

NSOU CC - SO - 03 283 consequences, and revisioned for its potential contributions to a understanding of women's lives. Patricia Hill Collins points to those aspects of the white scholarly community that have excluded black feminist intellectual traditions. These aspects include the assumption that scientists are distanced from their values, vested interests, and emotions attached to their gender, race, or class situation (Collins, 1990). A primary characteristic of white masculinist epistemology is the distinction between wisdom and knowledge. Wisdom consists of "mother wit" and experience as a criterion of meaning. Knowledge consists of "book learning" and additive objective facts which are accumulated and legitimated through scholarly processes controlled by dominant groups. Collins notes that a Black feminist epistemology rises out of an assertion that knowledge without wisdom is "adequate for the powerful, but wisdom is essential to the survival of the subordinate" (Collins, 1990:208). Collins then challenges us to reject competitive, additive theory building processes. She draws on the processes of dialogue to assess knowledge claims, a dialogue among women who share their wisdom about the world around them. She adds to this dialogue an ethic of care which includes personal expressiveness and emotions in the knowledge validation process. Theory "seeks to explain why phenomenon exist and why they reveal certain processes and properties" (Turner and Beeghly, 1981:2). If, then, sociological theory building can be used to illuminate not only products, outcomes, properties and classification schemes but also process, then sociological theory retains utility for feminist purposes. Our purpose is to explain some dimensions of the following questions : Why does sex inequality exist? What are its origins and consequences? How is it maintained? What are the dynamics of change? These are basic questions outlined by Chafetz in *Feminist Sociology* (1988), and expanded by the epistemological frameworks of Collins (1990) and Smith (1987) who argue for a dialogue grounded in women's experiences. Currently, the process of building a theory in the social sciences involves a set of rational, objective steps. These steps must be questioned, evaluated, and revised to maintain integrity from a feminist perspective. 19.5

Basic Questions The impetus for contemporary feminist theory begins in a deceptively simple question: "And what about the women?" In other words, where are the women in any situation being investigated? If they are not present, why? If they are present, what exactly are they doing? How do they experience the situation? What do they contribute to it? What does it mean to them? In response to this question, feminist scholarship has produced some generalizable answers. Women are present in most social situations. Where they are not, it is not because they lack ability or interest but because there have been deliberate efforts to exclude them. Where they have been present, women have played roles very different from the popular conception of them (as, for example, passive wives and mothers). Indeed, as wives and as mothers and in a series of other roles, women, along with men, have actively created the situations being studied. Yet though women are actively present in most social situations, scholars, publicists, and social actors themselves, both male and female, have been blind to their presence. Moreover, women's roles in most social situations, though essential, have been different from, less privileged than, and subordinate to the roles of men. Their invisibility is only one indicator of this inequality. Feminism's second basic question is: "Why is all this as it is?" In answering this question, feminist theory has produced a general social theory with broad implications for sociology. One of feminist sociological theory's major contributions to answering this question has been the development of the concept of gender. Beginning in the 1970s, feminist theorists made it possible for people to see the distinctions between (a) biologically determined attributes associated with male and female and (b) the socially learned behaviors associated with masculinity and femininity.

MATCHING BLOCK 304/320

W

They did so by designating the latter as "gender." The essential qualities of gender remain a point of theoretical debate in feminism, and these debates offer one way to distinguish among some of the varieties of feminist theory. But a starting point of agreement among nearly all varieties of feminist theory is an understanding of gender as a social construction, something not emanating from nature but created by people as part of the processes of group life. The third question for all feminists is: "How can we change and improve the social world so as to make it a more just place for all people?" This commitment to social transformation in the interest of justice is the distinctive characteristic of critical social theory, a commitment shared in sociology by feminism, Marxism, neo-Marxism, and social theories being developed by racial and ethnic minorities and in postcolonial societies. Patricia Hill Collins (1998:xiv) forcefully states the importance of this commitment to seeking justice and confronting injustice: "Critical social theory encompasses bodies of knowledge... that actively grapple with the central questions facing groups of people differently placed in specific political, social, and historic contexts characterized by injustice." This commitment to critical theorizing requires that feminist theorists ask how their work will improve the daily lives of the people they study.

As the circle of feminists exploring these questions has become more inclusive of people of diverse backgrounds both in the United States and internationally, feminist theorists have raised a fourth question: "And what about the differences among women?" The answers to this question lead to a general conclusion that the invisibility, inequality, and role differences in relation to men that generally characterize women's lives are profoundly affected by a woman's social location—that is, by her class, race, age, affectional preference, marital status, religion, ethnicity, and global location. But feminist theory is not just about women, nor is its major project the creation of a middle-range theory of gender relations. Rather, the appropriate parallel for feminism's major theoretical achievement is to one of Marx's epistemological accomplishments. Marx showed that the knowledge people had of society, what they assumed to be an absolute and universal statement about reality, in fact reflected the experience of those who economically and politically ruled the world; he effectively demonstrated that one also could view the world from the vantage point of the world's workers. This insight relativized ruling-class knowledge and, in allowing us to juxtapose that knowledge with knowledge gained from the workers' perspective, vastly expanded our ability to analyze social reality. More than a century after Marx's death we are still assimilating the implications of this discovery. Feminism's basic theoretical questions have similarly produced a revolutionary shift in our understanding of the world: what we have taken as universal and absolute knowledge of the world is, in fact, knowledge derived from the experiences of a powerful section of society, men as "masters." That knowledge is relativized if we rediscover the world from the vantage point of a hitherto invisible, unacknowledged "underside": women, who in subordinated but indispensable "serving" roles have worked to sustain and re-create the society we live in.

100%**MATCHING BLOCK 306/320****W**

This discovery raises questions about everything we thought we knew about society, and its implications constitute the essence of contemporary feminist theory's significance for sociological theory. Feminist theory deconstructs established systems of knowledge by showing their masculinist bias and the gender politics framing and informing them. To say that knowledge is "deconstructed" is to say that we discover what was hitherto hidden behind the presentation of the knowledge as established, singular, and natural—namely, that that presentation is a construction resting on social, relational, and power arrangements. But feminism itself has become the subject of relativizing and deconstructionist pressures from within its own theoretical boundaries. The first and more powerful of these pressures comes from women confronting the white, privileged-class,

heterosexual status of many leading

feminists—that is, from women of color, women in postcolonial societies, working-class women, and lesbians. These women, speaking from "margin to center" (

hooks, 1984),

97%**MATCHING BLOCK 308/320****W**

show that there are many differently situated women, and that there are many women-centered knowledge systems that oppose both established, male-stream knowledge claims and any hegemonic feminist claims about a unitary woman's standpoint. The second deconstructionist pressure within feminism comes from a growing postmodernist literature that raises questions about gender as an undifferentiated concept and about the individualself as a stable locus of consciousness and personhood from which gender and the world are experienced. The potential impact of these questions falls primarily on feminist epistemology—its system for making truth claims. 19.6

Historical Roots : Feminism and Sociology Feminism and sociology share a long-standing relationship originating in feminists turning to sociology to answer feminism's foundational questions: what about the women, why is all this as it is, how can it be changed to produce a more just society, and, more recently, what about differences among women? Sociology was identified from its beginning by activist women as one possible source of explanation and change. One strand of this history has been women sociologists' identifying and conceptualizing gender as both a descriptive and at least partially explanatory variable in their answers, providing a tool for separating biological maleness and femaleness from social masculinity and femininity (Freee, Khan, and Moriimoto, 2007; Finlay, 2007; Tarrant, 2006). Feminism and sociology need to be understood both as systems of ideas and as social organizations—for feminism, this means as a theory and as a social movement; for sociology, as an academic discipline and as a profession. Looked at in this way, we find that women, most of whom were feminist in their understandings, were active in the development of sociology as both a discipline and a profession from its beginnings, and that repeatedly, generation after generation, these women have had their achievements erased from the history of sociology by a male-dominated professional elite (Delamont, 2003; Skeggs, 2008). Despite such erasures, the feminist perspective is an enduring feature of social life. Wherever women are subordinated—and they have been subordinated almost always and everywhere—they have recognized and protested that situation (Lerner, 1993). In the Western world, published works of protest appeared as a thin but persistent trickle from the 1630s to about 1780. Since then feminist writing has been a significant collective effort, growing in both the number of its participants and the scope of its critique (Cott, 1977; Donovan, 1985; Giddings, 1984; Lerner, 1993; Alice Rossi, 1974; Spender, 1982, 1983).

NSOU CC - SO - 03 287 Feminist writing is linked to feminist social activism, which has varied in intensity over the last two hundred years; high points occur in the liberationist "moments" of modern Western history. In U.S. history, major periods of feminist mobilization frequently are understood as "waves." First Wave feminism began in the 1830s as an offshoot of the anti-slavery movement and focused on women's struggle for political rights, especially the vote. It is marked by two key dates—1848, when the first women's rights convention was held at Seneca Falls, New York, and 1920, when the Nineteenth Amendment gave women the right to vote. Second Wave feminism (ca. 1960–1990) worked to translate these basic political rights into economic and social equality and to reconceptualize relations between men and women with the concept "gender." Third Wave feminism is used in two senses—to describe the responses by women of color, lesbians, and working-class women to the ideas of white professional women claiming to be the voice of Second Wave feminism (Free, 2009) and to describe the feminist ideas of the generation of women who will live their adult lives in the twenty-first century. Feminist ideas were, thus, abroad in the world in the 1830s when Auguste Comte coined the term "sociology" and feminist Harriet Martineau (1802–1876) was asked to edit a proposed journal in "sociology." Martineau is an important player in the history of sociology whose work has only been recovered under the impact of Second Wave feminism (Deegan, 1991; Hill, 1989; Hoecker-Drysdale, 1994; Lengermann and Niebrugge, 1998; Niebrugge, Lengermann, and Dickerson, 2010) and whose contribution undergirds the claim that women were "present at the creation" of sociology (Lengermann and Niebrugge, 1998). Sociology's development into an organized discipline in its "classic generation"—the period marked by white male thinkers who did significant work from 1890 to 1920 (e.g., Emile Durkheim [1858–1917] and Max Weber [1862–1920] overlapped with the rise in activism in First Wave feminism as women pushed their crusade for the right to vote). Feminists Jane Addams, Charlotte Perkins Gilman, Florence Kelley, and Marianne Weber played important roles in the development of sociology, creating theory, inventing research methods, publishing in sociological journals, belonging to sociological associations, and holding offices in professional associations—and directly or indirectly speaking from the standpoint of women. United States women of color Anna Julia Cooper and Ida B. Wells-Barnett, though barred by racist practices from full participation in the organization of sociology, developed both social theory and a powerful practice of sociological critique and activism. Gilman is particularly significant in the history of feminist contributions to sociology, providing the first conceptualization of what will become the idea of gender in her concept of excessive sex distinction, which she defines as socially maintained differences between men and women that go beyond the differences dictated by biological reproduction.

288 NSOU CC - SO - 03 Between 1920 and 1960 feminist thinking and activism ebbed, partly due to a sense of anomie produced by its victory in getting the vote, partly in response to social crises— World War I and its aftermath, the Great Depression, World War II and its aftermath, and the Cold War of the 1950s. Women sociologists were left without a framework for critique of their professional marginalization. They worked as isolated individuals for a foothold in the male-dominated university. Even so these women sociologists did research on women's lives and worked to conceptualize gender within the prevailing framework of "sex roles" in work such as Helen Mayer Hacker's "Women as a Minority Group" (1951) and Mirra Komarovsky's "Cultural Contradictions of Sex Roles" (1946). Beginning in the 1960s, as a second wave of feminist activism energized feminist thinking, women in sociology drew strength to confront the organization of their profession and to (re-) establish a feminist perspective in the discipline (Free, Khan, and Morimoto, 2007; Niebrugge, Lengermann, and Dickinson, 2010). Key to their success was the leadership of individual women like Alice Rossi, the establishment of the Women's Caucus within the American Sociological Association and then in 1971 of a separate feminist organization, Sociologists for Women in Society (SWS), which in 1987 undertook the financially daring launch of a new journal, *Gender & Society*, under the editorship of Judith Lorber. These moves brought women a feminist base from which to speak to the profession and a feminist publication from which to introduce ideas to the discipline. The effects of Second Wave feminism continue to this day in sociology. Women have moved into the profession in unprecedented numbers, as students, teachers, and scholars; the majority of undergraduate majors and about half of Ph.D. recipients are now women (Stacey and Thorne, 1996). Women hold office in the discipline's professional associations in percentages greater than their overall presence in the discipline (Rosenfeld, Cunningham, and Schmidt, 1997). Central to this Second Wave triumph has been establishing gender as a core concept in sociology. Gender, which is broadly understood as a social construction for classifying people and behaviors in terms of "man" and "woman," "masculine" and "feminine," is now an almost unavoidable variable in research studies—a variable whose presence implies a normative commitment to some standard of gender equality or the possibility that findings of inequality may be explained by practices of gender discrimination. The emphasis on gender vastly expanded the reach of feminist understandings to clearly include men as well as women, and the community of feminist scholars, though still primarily female, now includes important work by male feminists (Brickell, 2005; Connell, 1995; Diamond, 1992; Hearn, 2004; M. Hill, 1989; A. Johnson, 1997; Kimmel, 1996).

NSOU CC - SO - 03 289 2002; Messner, 1997; Schwalbe, 1996; Trexler,1995).Yet there remains a recurring unease about the relationship between feminism and sociology, an unease classically framed by Stacey and Thorne in their 1985essay "The Missing Feminist Revolution in Sociology" and revisited subsequently (Alway, 1995b; Chafetz, 1997; Stacey and Thorne, 1996; Thistle, 2000; Wharton, 2006). A "feminist revolution in sociology" presumably would mean reworking sociology's content, concepts, and practices to take account of the perspectives and experiences of women. This effort has been far from wholesale or systematic. Forinstance, within the sociological theory community, feminists constitute a distinct and active theory group, intermittently acknowledged but unassimilated, whose ideas have not yet radically affected the dominant conceptual frameworks of the discipline. The concern with gender has focused the energy of much feminist scholarship in sociology. But it may also have moved that energy away from two original primary concerns of feminist theory—the liberation of women and, as a means to that end, an articulation of the world in terms of women's experience. The study of gender is certainly not antithetical to these projects but neither is it coterminous with them. This issue attempts to take account of the enormous developments around the concept of gender while at the same time remembering that feminist theory is not the same thing as the sociology of gender, an awareness that may help explain recent developments in feminist theorizing such as the growth of intersectionality theory and the resurgence of sexual difference theory, as well as the persistence of materialist or socialist feminism.

19.7 A Theory for the Sociology of women
A major challenge for feminist theorists is to bridge the structural and interpretive approaches available in the social sciences and in women's studies theory. An integrative theory of women's oppression should draw from all available models, not to construct a hodgepodge, but with an eye toward the patchwork quilt of women's traditional crafts. Such a patchwork would take the useful concepts of feminist models and draw them together to make a strong theoretical fabric. We first draw on structural approaches which contribute generalizable concepts and an " anticipated social structure" (Glaser and Strass,1971). These generalizable concepts should not determine ahead of time the questions we ask of women or the answers we hear from them. Instead, these provide frameworks for anticipating those social structures and organizations that might influence women's lives. Interpretive approaches then can contribute meaning and process at the individual level (Smith,1987). We outline how the concept of value can be used to frame women's experiences of oppression from a

290 NSOU CC - SO - 03 formal perspective. The poststructuralists argue that we cannot answer the question, "Are there women?" or "What is value?" – We believe that these questions must be asked , even if the medium of language will ultimately distort the reality of women's lives.

19.8 Propositions for a Sociology of Women
What is the relationship of use value to exchange value in a given society? How does this relationship affect women in varying institutions such as the economy or the family? What are the relationships among patriarchy, colonialism and capitalism in the construction of societal values? We need to identify the relationships among different concepts in our model.

a) Economics and Value
The first proposition is that in a capitalist market economy, exchange value takes priority over use value. This model is expanded to show the interconnection of use value and exchange value in the patriarchal structure (Benston,1969). The contribution of Feminist theory has been the recognition that throughout any period of economic history women have contributed in both types of labor.

b) Sexuality and Value
In the definition and everyday experience of sexuality, there are several frames of reference.The first is the family, as this is the major institution in which sexual behaviors, attitudes and norms are structured. The other frames are the politics of motherhood and reproductive freedom, and finally, public sexuality markets of prostitution and pornography. Each of these dimensions helps us to identify the integration and contradictions in the roles of heterosexual women predominantly and the roles of all women in light of market and colonial factors.

c) Self -esteem and Value
The social- psychological construct of self- concept identifies important aspects of how society and the individual interact. Every social being has a self-concept. The self-evaluation of that identity provides the comparative concept which Weber stated we must come to understand. Use value, in this instance, would include both the individual self- evaluation which leads to personal well- being (Am I a good person? Do I have value?)and the social factors which influence the construction of that evaluation by which the self- concept becomes a resource or a liability in social settings.

NSOU CC - SO - 03 291 In a market context, self-esteem becomes both a resource and a liability. Much of the human capital required for employment is predicted on some self-resource : achievement in school; ability to persevere in the face of failure; and the presentation of a confident, skilled self. As a resource we can build self-esteem through a range of self-help courses and books, but most psychological literature indicates that females, in general, will have access to lower levels of this resource than men. Thus, we have the proliferation of consumer products targeted toward women to "assert ourselves gently", or to "dress for success".

19.9 Conclusion

MATCHING BLOCK 309/320

SA Smriti Chaubey Final.docx (D16121386)

Feminist theory develops a system of ideas about human life that features women as objects and subjects, doers and knowers. Feminism has a

history as long as women's subordination—and women have been subordinated almost always and everywhere.Until the late 1700s feminist writing survived as a thin but persistent trickle of protest; from that time to the present,

96%

MATCHING BLOCK 311/320

feminist writing has become a growing tide of critical work. While the production of feminist theory has typically expanded and contracted with societal swings between reform and retrenchment, the contemporary stage of feminist scholarship shows a self-sustaining expansion despite new conservative societal trends. 19.10 Summary Feminist

scholarship is guided by four basic questions: And what about the women? Why is women's situation as it

100%

MATCHING BLOCK 310/320

W

is? How can we change and improve the social world?

and What about differences among women? Answers to these questions produce the varieties of feminist theory. This section patterns this variety to show four major groupings of feminist theory. Theories of gender difference see women's situation as different from men's, explaining this difference in terms of two distinct and enduring ways of being, male and female, or institutional roles and social interaction, or ontological constructions of woman as "other." Theories of gender inequality, notably by liberal feminists, emphasize

100%

MATCHING BLOCK 312/320

SA Hridinayana Dutta.docx (D16101320)

women's claim to a fundamental right of equality and describe the unequal opportunity structures created by sexism.

Gender oppression theories include feminist psychoanalytic theory and radical feminism. The former explains the oppression of women in terms of psychoanalytic descriptions of the male psychic drive to dominate; the latter, in terms of men's ability and willingness to use violence to subjugate women. Structural oppression theories include socialist feminism and intersectionality theory; socialist feminism describes oppression as arising from a patriarchal and a capitalist attempt to control social production and reproduction; intersectionality theories trace

292 NSOU CC - SO - 03 the consequences of class, race, gender, affectional preference, and global location for lived experience, group standpoints, and relations among women. Today, women's empowerment is on the development agenda of governments and civil society organizations around the world, and this is owed in large part to the relentless struggles undertaken by feminists over several decades. Both governments and corporations seem to now understand the importance of women empowerment, even as they continue to keep their distance from "radical feminists". Nothing demonstrates this better than the cause of the #MeToo Movement, where, particularly the corporate sector, which had co-operated gender equality as a cause, showed that it would only care about women's rights as long as they were not asking for "too much". Closer home, schemes such as Beti Bachao Beti Padhao and the Pradhan Mantri Yojana that have been introduced to benefit women in India, still look like stop-gap measures because they only target the most visible, material parts of gender disparity. They however, do not attempt to address the patriarchal structures that cause this disparity. 19.11 Questions (1) What has been the focus of Feminism in the last decade specially in India? (2) Discuss in brief the historical roots of Feminism. (3) How far Feminist Theory is different from the grand sociological theories? (4) Do you think that women are really empowered today? Justify your answer with reasons. 19.12 References 1. Ritzer George, "Sociological Theory"(2011), Rawat Publications ; Delhi. 2. Ray, Raka. NSOU CC - SO - 03 293 Unit - 20 The Stages of Development of Feminism Structure 20.1 Objectives 20.2 Introduction 20.3 Salient Features: What is Feminism about? 20.4 Waves of Feminism 20.4.1 The First Feminist Wave 20.4.2 The Second Feminist Wave 20.4.3 The Third Wave 20.5 Criticism 20.6 Conclusion 20.7 Summary 20.8 Questions 20.9 Suggested Readings 20.10 References 20.11 Glossary 20.1 Objectives • To understand the history of feminism • To understand the rise of feminism as an ideology in Europe and America • To conceptualize feminism and to bring out its characteristics. 20.2 Introduction The rise of Feminism as an ideology in Europe and America can be traced back to the mid19 th century as a consequence of emergence of the ideals from the Enlightenment and French Revolution. The tensions and conflicts of Enlightenment made the starting point of the debate regarding the role and position of women in the society. The existing ideas at the 18 th century society was that of master-slave, based on the assumed physical

294 NSOU CC - SO - 03 and intellectual differences between them. Masculinity and Fertility were constructed as opposite two poles. The former was assigned rational, objective and scientific tone while the latter with the stereotypes of emotionalism, sensuality and irrationality. Thinkers such as Jean Jacques Rousseau (1718-78) reinforced this dichotomy. Rousseau in *Emile* (1762) propounded different models of education based on sexual differences. He proposed that education for boys should be intended to develop their natural instincts for freedom and rationality whereas the female should be educated so that they can be good mother and wife. But later the Feminist thinkers forcefully challenged the assumption about female inferiority and the birth of Feminism. These early feminist thinkers were Mary Wollstonecraft (1759- 97), Margaret Fuller (1810-50) and Harriet Martineau (1802-76). To speak precisely, the term Feminism can be used to describe a political, cultural or economic movement aimed at establishing equal rights and legal protection for women. One important point here to remember is that Feminism must not be merged with Women's Movement that encompassed a broader designation. Not all women associates are necessarily feminists. They are generally drawn from an urban elite. Feminists were and remain a minority. Sometimes they have been criticized as being "bourgeois" and critics try to discredit them. Feminism is actually a method of analysis, a way of looking at the world from women's perspective. The origin of the term can be tracked back to 1871 when it was used as a medical term to define feminisation of the bodies of male patients.

20.3 Salient Features: What is Feminism about? Before we start with Feminism let us make some points with Feminism clear. Firstly, Feminism is not the belief that women are superior. Secondly, Feminism is not hating man (Misandry). Thirdly, Feminism is not male oppression. It aims only at achieving and establishing equality between men and women. Therefore, Feminist is a person who believes in the social, political and economic equality of the sexes.

20.4 Waves of Feminism The history of the feminist movement is divided into three waves. The First wave refers to the movement of the 19 th through early 20 th centuries, which dealt mainly with suffrage, working conditions and educational rights for women and girl. The Second wave (1960- 1980) dealt with the inequality of laws, as well as cultural inequalities and the role of women in society. The Third wave of Feminism (1990-2000) is seen as both a continuation of the second wave and a response to the perceived failures. The metaphor of the wave NSOU CC - SO - 03 295 has been used extensively to characterize feminist activities. The first wave relates to the initial period of Feminism and the Second wave emerged during the late 1960's. More recently there has been a debate on the usefulness of the wave metaphor for capturing the complexities of feminism. The discussion seeks to challenge the metaphor and replace it with others, such as geological one with eruptions and flowers or radio waves with their many frequencies. Apart from all other things to understand Feminism today, it is important to know their history. As already noted, this will depend largely on the National contexts for the period being studied, for example the link between the abolition of slavery movement at the beginning of U.S. feminism or the importance of 1848 Seneca Falls Convention, the aim of which was "to discuss the social, civil, religious condition and rights of women. Born during the last decade of the 19 th century the golden age of feminism was reached prior to the outbreak of World War I in 1914. During the war the Feminists prioritized concentrating on serving their countries and they generally suspended their claims in the context of Patriotism. The assumption was like that after the war was over they will be rewarded with the granting of rights, particularly the right to vote. Although this did happen in the United Kingdom in 1918, Germany in 1919 and the United States 1920, many countries continued to deny women the franchise for many years. For example, Spain, Brazil, France Japan Argentina, Greece, India, Finland, Norway, Denmark enfranchised women after quite a long period of time. The waves of feminism are discussed in detail as follows:

20.4.1 The first feminist wave The First wave of Feminism consisted largely of white, middle class, well educated women. It refers to an extended period of feminist activity during the 19 th century and early 20 th century, in the United Kingdom and United States. Originally it focused on the promotion of equal contract and property rights for women. However, by the end of the 19 th century activism focused primarily on gathering political power particularly on women's suffrage. Discussions about the vote and women's participation in politics led to an examination of the differences between men and women. But still huge sacrifice was made by the First wave Feminists who showed enormous courage and daring in their demand not just for votes but the reform of Laws in which women and children are literally the property of man. The end of First wave is often associated with the periods in the early 20 th century during and after World War 1. To be more specific the first wave of feminism actually started in the late 1700 and lasted till the early 1900. Apart from all other things this time abuse with women began

296 NSOU CC - SO - 03 to be considered as a matter of shame to the intellectuals. This time the society and government started recognising the importance of equal rights. First Wave feminism promoted equal contract and property rights for women opposing ownership of married women by their husbands. By the late 19th Century, feminist activism was primarily focused on the right to vote. American first wave feminism ended with passage of the 19th Amendment to the US constitution in 1919, granting women voting right. But the struggle for the vote was only in the beginning and it had many different opinions. First Wave feminism promoted equal contract and property rights for women opposing ownership of married women by their husbands. By the late 19th Century, feminist activism was primarily focused on the right to vote. American first wave feminism ended with passage of the 19th Amendment to the US constitution in 1919, granting women vote right. But the struggle for the vote was only in the beginning and it had many different opinions. After securing the right to vote apparently around 1920's-the great depression of the 1930's forced the menfolk to return to the home. During this period of high unemployment, women were accused of taking the jobs from man. The interwar period was marked by the rise of Fascism in many countries, and the consequent hostile environment in which feminists were forced with limited margin from manoeuvre. With the outbreak of World War II in 1939, men were obliged to fight and women got back their jobs. Then, after the war had ended the women were expected to return to the home and take responsibility for their "Domestic obligations".

20.4.2 The second feminist wave

The second Feminist wave is often associated with the periods in the early 20th Century, during and after World War I (1914-1918) when most women in the western world were granted the right to vote. Second wave feminism broadened the debate to a wide range of issues like sexuality, family and workplace, reproductive rights and office inequalities whereas First wave Feminism focused mainly on suffrage and gender equality. Second wave feminism refers to the period of activity in the early 1960's and lasting throughout the late 1980's. It was actually a continuation of the earlier phase of Feminism. Second wave Feminism has continued to exist since that time and co-exists with Third wave Feminism. The Feminist activist and author Carol Hawick coined the slogan "The Personal is Political" which became synonymous with the Second wave. Second wave feminists saw women's cultural and political inequalities as inextricably linked and encouraged women to

NSOU CC - SO - 03 297 understand as per their personal life as deeply politicized and as reflecting sex-based power structure. The French author and philosopher Simone De Beauvoir wrote novels and now she is best known for her metaphysical novels including *The Second sex* a detailed analysis of women's oppression and a foundation base of Contemporary Feminism. It was written in 1949 and was translated in English in the year 1953. It sets out a feminist existentialism which accepted the affirmation that "One is not born a woman but becomes one". She argued that women have been considered deviant and abnormal. Even Mary Wollstonecraft considered men to be the ideal towards which women should aspire. The phrase women's liberation was first used in the United States in 1964 and first appeared in print in 1966. Bra burning also became associated with the movement though the actual prevalence of Bra burning is debatable. Within the broader second wave feminists' movement, two movements emerged; while one wants to change society from within, the other radical movement questions fundamentally if society's hierarchical and patriarchal nature was the main problem. Both these movements made major contributions however through their influence in society in general. Whereas today we take many things for granted such as women in the workforce become increasingly acceptable after the 1960's. Moreover, delaying in marriage is not a question in today's society but this was not the rule in pre 1960's and parts of Europe. Ultimately the second wave feminists movement gave women the opportunity to talk more about the condition of state and politics also. In short, the second wave Feminism has the following agenda like Birth control, Equal rights amendment, Sexual discrimination, sexual harassment and so on. Just as the abolitionists, 19th century women were more aware of their lack of power and encouraged them to form the first women's rights movement which is also termed as First Wave Feminism-the Protest movement in the 1960's inspired many white and middle class women to organize their own movement which is known as second wave Feminism. Second wave Feminism actually refers mostly to the radical feminism of the leftist movement in post war western societies-among them the student's protest, the anti - Vietnam war movement, the lesbian and gay movement and in the United states the Civil rights and the Black power movement. These movements criticised capitalism and Imperialism and focused on the notion and interest of oppressed group. The demand of the second wave was not only the political and legal equality but also control over their reproductive and sexual roles. The need for this change was originally felt during

298 NSOU CC - SO - 03 second world war which acted as a base stone for the movement that was supported by the feminist political activists. This tendency is also called Gyno-criticism and involves three major aspects. First of them examines and recognizes the work of female writers. This aspect observes their place and how they are considered in the literary history. The Second aspect of the second wave is based on how a woman is characterized by the works of both male and female authors. The third is the most important aspect which recognises the context of women empowerment and criticizing the way women have been treated in different cultures. The achievements of the Second wave were the equal pay act of 1963 Education amendment of 1972. The leaders and activists of Second wave were Betty Friedman (1921-2006), Emma Goldman (1869-1940) Margaret Sanger (1879-1966) and Hillary Clinton. Because the second wave of feminism found voice amid so many other social movements it was easily marginalized and viewed as less important. Whereas the first wave feminism was generally propelled by middle class, western and white women the second phase drew in women of colour and developing nations, seeking sisterhood and solidarity claiming women's struggle is class struggle.'

20.4.3 The Third Wave Feminism : Transversal Politics

Third wave feminism began in the early 1990's - arising as a response to perceived failures of the second wave. It seeks to challenge or avoid the second wave's definitions of feminism which overemphasized the experience of upper middle-class women. Started in the early 1990s, this wave continued until 2012. The feminists consider the role of equal civil rights and other movements during the second wave, but they see the feminism from a different perspective. They emphasise on the individual rights as well as the acceptance of diversity. Third wave feminists often focus on micro politics and challenge the Second wave's paradigm as to what is or is not good for females. Born with the privileges that the first and second wave feminists see themselves as capable, strong and assertive social agents. Third wave feminists and Post-modern Feminists attack the binaries of the masculine and the feminine sex-gender related structure. Although the term inter sectionally was coined in 1989, a few years before the Third wave began, they embraced this concept during this wave. Rebecca Walker coined the term to highlight the third wave's focus on queer and non-white women. In 1992, she published an article in response to the Anita Hill case, about how she is sick of women being silenced and man using their privileges to get away with sexual harassment and other forms of oppression. In the end she states "I am not a post-feminism feminist. I am the third wave." Walker wanted to establish that third wave feminism is not just a reaction but a movement itself, because

NSOU CC - SO - 03 299 women's issues were far from over. Third wave feminists have broadened their goals, focusing on theory, and abolishing gender role expectations and stereotypes. Unlike the determined position of Second wave feminists about women in pornography, sex work and prostitution, third wave feminists were rather ambiguous and divided about these themes (feminist sex wars). While some thought these sexual acts are degrading and oppressing women, others saw it as empowering that women own their sexuality. There was a division of opinion but Third wave feminism embraced differences, personal narratives and individualism instead of having one agenda. Its focus was less on political changes and more on individualistic identity. Third wave feminists wanted to transform traditional notions of sexuality and embrace "an exploration of women's feelings about sexuality that included vagina centered topics as diverse as orgasm, birth and rape. One of Third wave feminists' primary goals was to demonstrate that access to contraception and abortions are women's reproductive rights. Besides Third wave feminism regarded race, social class and trans gender rights as central issues. It also paid attention to workplace matters such as glass ceiling, unfair maternity leave policies, respect for working mothers and the rights of mothers who decide to leave their careers to raise their children full time. In fact, third wave Feminism broke the boundaries.

20.5 Criticism

One issue raised by critics was a lack of cohesion because of the absence of a single cause for third wave feminism. The first wave fought for and gained the right for women to have access to an equal opportunity in the work place, as well as the end of legal sex discrimination. The Third wave allegedly lacked a cohesive goal and was often seen as an extension of the Second wave. Some argued that the third wave could be dubbed the Second wave part two when it comes to the politics of feminism. Though a number of different approaches exist in feminist criticism there exist some areas of commonality. The list is excerpted from Tyson (92). Women are oppressed by patriarchy, politically, socially and psychologically. Patriarchal ideology is the primary means by which women are oppressed. In every domain, where patriarchy reigns, woman is other; she is marginalized, defined only by her difference from male norms and values. All of western (Anglo-European) civilization is deeply rooted in patriarchal ideology, for example, in the Biblical portrayal of Eve as the origin of sin and death in the world. While Biology determines our sex, culture determines our gender. All feminist activity, including feminist theory and literary criticism, has as its ultimate goal to change the world by promoting gender equality. Feminist criticism has, in many ways, followed what some theorists of the three waves of feminism had pointed out:

300 NSOU CC - SO - 03 First Wave Feminism-late 1700 s and early 1900's writers like Mary Woolstonecraft highlight the inequalities between the sexes. Activists like Susan B. Anthony contributed to the women's suffrage movement which led to National Universal Suffrage in 1920 with the passing of the 19 th Amendment. But critics considered the way novelists discriminate and marginalize the women characters here. Second Wave Feminism The second wave of Feminism was started in the early 1960's and continued till late 1970's. It was the time when the movement of equal rights and equal working conditions for women was on peak. National organization for women was started in 1966 as a movement to create equal working conditions for women in America. Many Feminist scholars see the generational division of second wave as problematic Third wave Feminism. Third wave was criticised for the lack of cohesion because of the absence of a single cause for third wave feminism. The third wave allegedly lacked a cohesive goal and was often seen as an extension of the second wave. One argument ran that the equation of the third wave feminism within individualism prevented the movement from growing and moving. 20.6 Conclusion The long, and at times radically innovative, history of feminism is all too easily forgotten. When 'second-wave' feminism emerged in the late 1960s, it seemed, at the time at least, unexpected, surprising, and exciting. One big difference during the years since then has been the way Western women have become much more aware of other feminisms – not just in Europe, but across the world – that, hopefully, may challenge our cherished ideas and certainties, and undermine any complacency that we may have developed. That wider awareness is due to a number of factors. Technical advances are certainly important: the fact, for example, that feminists in different countries can now communicate quickly and effectively, share experiences and information with large numbers of people, through the Internet. Academic feminism has played an important role in this. A great many universities, certainly in most Western countries, now run courses on women's studies, and specifically on feminism. Academic research has given us extremely valuable insights into women's lives at other times and in other cultures, inviting us to think about differences, as well as about common causes. Academic theses, scholarly articles and texts, as well as conferences, have all helped disseminate important information about feminism across the world.

NSOU CC - SO - 03 301 20.7 Summary In the 20th century, we find that the first-wave' feminists had demanded civil and political equanimity. In the 1970s, 'second-wave' feminism focused on, and gave great importance to, sexual and family rights for the women. 'The personal is the political' was a popular 1970s catch word that some contemporary feminists seem to want to oppose. The political is reduced to the merely personal questions revolving around sexuality and family life – which have other greater political implications under consideration. Natasha Walter, in her work, *The New Feminism* (1998), while reinforcing that women are 'still poorer and less powerful than men', debates that the task for recent feminism is to 'attack the material basis of economic and social and political inequality'. An important point she made though she remains extremely unclear about precisely what that attack would mean. She reveals to have come up with a new idea instead of one that had been around for long, that we want to shoulder with men to change society and do not want to pit against men. After all, especially if things are to change in the family arena, there is a need for men to take on a fair share of domestic work as more and more women move out of the home. In short, we must collaborate and work with men to create a more equal society. The long, and at times radically innovative, history of feminism is all too easily forgotten. When 'second-wave' feminism emerged in the late 1960s, it seemed, at the time at least, unexpected, surprising, exciting. One big difference during the years since then has been the way Western women have become much more aware of other feminisms – not just in Europe, but across the world – that, hopefully, may challenge our cherished ideas and certainties, and undermine any complacency that we may have developed. That wider awareness is due to a number of factors. Technical advances are certainly important: the fact, for example, that feminists in different countries can now communicate quickly and effectively, share experiences and information with large numbers of people, through the Internet. Academic feminism has played an important role in this. A great many universities, certainly in most Western countries, now run courses on women's studies, and specifically on feminism. Academic research has given us extremely valuable insights into women's lives at other times and in other cultures; inviting us to think about differences, as well as about common causes. Academic theses, scholarly articles and texts, as well as conferences, have all helped disseminate important information about feminism across the world (Walters:2005). Feminist history calls on us to imagine the world in new ways. It has the power to alter social relations by exposing the undeserved privileges that perpetuate long-standing

302 NSOU CC - SO - 03 social inequities. Feminism and its historical sequence will help you rethink history through the lens of feminist analysis. It explores the origins and strategies of women's activism, Ranging through different waves and argues for the importance of valuing women in a society that has long devalued women's contributions. The nit will help your understanding of feminist history by highlighting the regulation of sexual boundaries, with an emphasis on the elasticity of both sexual identities and sexual politics (Freedman:2006). 20.8 Questions I. Answer Briefly: a. What is First Wave Feminism? b. What is Second Wave Feminism? II. Answer in Detail: a. How will you bring out the history of the emergence of Feminism in the world? b. How is contemporary Feminism different from its classical forms? c. Write a critique of the Feminist understanding of the social world. d. What is the post modernist feminist view on the bifurcation of the masculine and the feminine issues? 20.9 Suggested Readings Sheila Rowbotham, *The Past is Before Us: Feminism in Action since the 1960s* (Harmondsworth: Penguin Books, 1990). 20.11 Glossary Enlightenment- The Enlightenment included a range of ideas centered on the sovereignty of reason and the evidence of the senses as the primary sources of knowledge and advanced ideals such as liberty, progress, toleration, fraternity, constitutional government and separation of church and state. French Revolution- The French Revolution was a period of far-reaching social and political upheaval in France and its colonies beginning in 1789. The Revolution overthrew the monarchy, established a republic, catalyzed violent periods of political turmoil, and finally culminated in a dictatorship under Napoleon who brought many of its principles to areas he conquered in Western Europe and beyond. Masculinity- Masculinity (also called manhood or manliness) is a set of attributes, behaviors, and roles associated with boys and men. Although masculinity is socially constructed, some research indicates that some behaviors considered masculine are biologically influenced. To what extent masculinity is biologically or socially influenced is subject to debate

304 NSOU CC - SO - 03 Femenity- Femininity (also called womanliness or girlishness) is a set of attributes, behaviors, and roles generally associated with women and girls. Although femininity is socially constructed some research indicates that some behaviors considered feminine are biologically influenced. To what extent femininity is biologically or socially influenced is subject to debate. It is distinct from the definition of the biological female sex as both males and females can exhibit feminine traits. Bourgeoisie- Bourgeoisie is a French term that can mean sociologically- defined social class, especially in contemporary times, referring to people with a certain cultural and financial capital belonging to the middle or upper middle class: the upper, middle, and petty bourgeoisie (which are collectively designated "the bourgeoisie"); an affluent and often opulent stratum of the middle class who stand opposite the proletariat class.

NSOU CC - SO - 03 21.2 Introduction Feminism has a history as long as women's subordination—and women have been subordinated almost always and everywhere. Until the late 1700s feminist writing survived as a thin but persistent trickle of protest; from that time to the present,

feminist writing has become a growing tide of critical work. While the production of feminist theory has typically expanded and contracted with societal swings between reform and retrenchment, the contemporary stage of feminist scholarship shows a self-sustaining expansion despite new conservative societal trends. Feminist

theory remained on the margins of sociology, ignored by the central male formulators of the discipline until the 1970s. Since the 1970s, a growing presence of women in sociology and the momentum of the women's movement have established feminist theory as a new sociological paradigm that inspires much sociological scholarship and research. Feminist scholarship is guided by four basic questions: What about the women? Why is women's situation as it

100%

is? How can we change and improve the social world?

and What about differences among women? Answers to these questions produce the varieties of feminist theory. 21.3. Varieties of Feminist Theories This variety shows four major groupings of feminist theory. Theories of gender difference see women's situation as different from men's, explaining this difference in terms of two distinct and enduring ways of being, male and female, or institutional roles and social interaction, or ontological constructions of woman as "other." Theories of gender inequality, notably by liberal feminists, emphasize

women's claim to a fundamental right of equality and describe the unequal opportunity structures created by sexism.

Gender oppression theories include feminist psychoanalytic theory and radical feminism. The former explains the oppression of women in terms of psychoanalytic descriptions of the male psychic drive to dominate; the latter, in terms of men's ability and willingness to use violence to subjugate women. Structural oppression theories include socialist feminism and intersectionality theory; socialist feminism describes oppression as arising from a patriarchal and a capitalist attempt to control social production and reproduction; intersectionality theories trace the consequences of class, race, gender, affectional preference, and global location for lived experience, group standpoints, and relations among women. At the

the fact that feminist theory is coming to be practiced as part of what Thomas Kuhn has called "normal science," that is, its assumptions are taken for granted as a starting point for empirical research. 21.3.1

Gender Difference Theories of gender difference are currently among the oldest of feminist theories experiencing a resurgence of interest and elaboration. Although historically the concept of "difference" has been at the center of several theoretical debates in feminism, we use it here to refer to theories that describe, explain, and trace the implications of the ways in which men and women are or are not the same in behavior and experience. All theories of gender difference have to confront the problem of what usually is termed "the essentialist argument": the thesis that the fundamental differences between men and women are immutable. That immutability usually is seen as traceable to three factors: (1) biology, (2) social institutional needs for men and women to fill different roles, most especially but not exclusively in the family, and (3) the existential or phenomenological need of human beings to produce an "Other" as part of the act of self-definition. There has been some interest in sociobiology by feminist scholars, most notably Alice Rossi (1977, 1983), who have explored the thesis that human biology determines many social differences between men and women. A continuation of this feminist interest in the interaction of biology and sociocultural processes is also to be found in recent statements on new (or neo-) materialism (Ahmed, 2008; Davis, 2009; Hird, 2004). But overall the feminist response to sociobiology has been oppositional (Chancer and Palmer, 2001; Risman, 2001). Theories of gender difference important in feminist theory today issue from a range of locations: the women's movement, psychology, existential and phenomenological philosophy, sociology, and postmodernism.

308 NSOU CC - SO - 03 Cultural Feminism Cultural feminism is unique among theories analyzed here in that it is less focused on explaining the origins of difference and more on exploring—and even celebrating—the social value of women’s distinctive ways of being, that is, of the ways in which women are different from men. This approach has allowed cultural feminism to sidestep rather than resolve problems posed by the essentialist thesis. The essentialist argument of immutable gender difference was first used against women in male patriarchal discourse to claim that women were inferior to men and that this natural inferiority explained their social subordination. But that argument was reversed by some First Wave feminists who created a theory of cultural feminism, which extols the positive aspects of what is seen as “the female character” or “feminine personality.” Theorists such as Margaret Fuller, Frances Willard, Jane Addams, and Charlotte Perkins Gilman were proponents of a cultural feminism that argued that in the governing of the state, society needed such women’s virtues as cooperation, caring, pacifism, and nonviolence in the settlement of conflicts (Deegan and Hill, 1998; Donovan, 1985; Lengermann and Niebrugge-Brantley, 1998). This tradition has continued to the present day in arguments about women’s distinctive standards for ethical judgment (Day, 2000; Gilligan, 1982; Held, 1993), about a mode of “caring attention” in women’s consciousness (Fisher, 1995; Reiger, 1999; Ruddick, 1980), about a female style of communication (M. Crawford, 1995; Tannen, 1990, 1993, 1994), about women’s capacity for openness to emotional experience (Beutel and Marini, 1995; Mirowsky and Ross, 1995), and about women’s lower levels of aggressive behavior and greater capacity for creating peaceful coexistence (Forcey, 2001; Ruddick, 1994; Wilson and Musick, 1997). The theme from cultural feminism most current in contemporary literature is that developed from Carol Gilligan’s argument that women operate out of a different method of moral reasoning than men. Gilligan contrasts these two ethical styles as “the ethic of care,” which is seen as female and focuses on achieving outcomes where all parties feel that their needs are noticed and responded to, and the “ethic of justice,” which is seen as male and focuses on protecting the equal rights of all parties (Gilligan and Attanucci, 1988). Although much research is concerned with whether there are gender differences in people’s appeal to these two ethics, the more lasting influence of this research lies in the idea that an ethic of care is a moral position in the world (Orme, 2002; Reitz-Pustejovsky, 2002; F. Robinson, 2001). Despite criticism (Alcoff, 1988; Aolo, 2006) cultural feminism has wide popular appeal because it suggests that women’s ways of being and knowing may be a healthier template for producing a just society than those of an androcentric culture.

NSOU CC - SO - 03 309 21.3.2 Gender Inequality Four themes characterize feminist theorizing of gender inequality. Men and women are situated in society not only differently but also unequally. Women get less of the material resources, social status, power, and opportunities for self-actualization than do men who share their social location—be it a location based on class, race, occupation, ethnicity, religion, education, nationality, or any intersection of these factors. This inequality results from the organization of society, not from any significant biological or personality differences between women and men. For although individual human beings may vary somewhat from each other in their profile of potentials and traits, no significant pattern of natural variation distinguishes the sexes. Instead, all human beings are characterized by a deep need for freedom to seek self-actualization and by a fundamental malleability that leads them to adapt to the constraints or opportunities of the situations in which they find themselves. To say that there is gender inequality, then, is to claim that women are situationally less empowered than men to realize the need they share with men for self-actualization. All inequality theories assume that both women and men will respond fairly easily and naturally to more egalitarian social structures and situations. They affirm, in other words, that it is possible to change the situation. In this belief, theorists of gender inequality contrast with the theorists of gender difference, who present a picture of social life in which gender differences are, whatever their cause, more durable, more penetrative of personality, and less easily changed.

Liberal Feminism The major expression of gender inequality theory is liberal feminism, which argues that women may claim equality with men on the basis of an essential human capacity for reasoned moral agency, that gender inequality is the result of a sexist patterning of the division of labor, and that gender equality can be produced by transforming the division of labor through the re-patterning of key institutions—law, work, family, education, and media (Bem, 1993; Friedan, 1963; Lorber, 1994; Pateman, 1999; A. Rossi, 1964; Schaeffer, 2001). Historically the first element in the liberal feminist argument is the claim for gender equality. This claim was first politically articulated in the Declaration of Sentiments drafted at Seneca Falls, New York, in 1848 with the express purpose of paralleling and expanding the Declaration of Independence to include women. It opens with the revisionist line “We hold these truths to be self-evident, that all man and women are created equal”, changes the list of grievances to focus on women’s state, and concludes with a call for

310 NSOU CC - SO - 03 women to do whatever is required to gain equal rights with men. In its arguments, the Declaration of Sentiments let the women's movement lay claim to the intellectual discourses of the Enlightenment, the American and French revolutions, and the abolitionist movement. It claimed for women the rights accorded to all human beings under natural law, on the basis of the human capacity for reason and moral agency; asserted that laws which denied women their right to happiness were "contrary to the great precept of nature and of no authority"; and called for change in law and custom to allow women to assume their equal place in society. The denial of those rights by governments instituted by men violates natural law and is the tyrannical working out of multiple practices of sexism. The radical nature of this foundational document is that it conceptualizes the woman not in the context of home and family but as an autonomous individual with rights in her own person (DuBois, 1973/1995). Liberal feminism, thus, rests on the beliefs that (1) all human beings have certain essential features—capacities for reason, moral agency, and self-actualization—(2) the exercise of these capacities can be secured through legal recognition of universal rights, (3) the inequalities between men and women assigned by sex are social constructions having no basis in "nature," and (4) social change for equality can be produced by an organized appeal to a reasonable public and the use of the state. Contemporary liberal feminism has expanded to include a global feminism that confronts racism in North Atlantic societies and works for "the human rights of women" everywhere. And this discourse has continued to express many of its foundational statements in organizational documents such as the National Organization for Women's Statement of Purpose and the Beijing Declaration. These organizational statements of purpose rely on an informing theory of human equality as a right that the state—local, national, international—must respect. These arguments are being freshly invoked in debates with the political right over reproductive freedom (Bordo, 1993; Solinger, 1998), in debates with postmodernists over the possibility and utility of formulating principles of rights (K. Green, 1995; A. Phillips, 1993; P. Williams, 1991), and in feminist considerations of the gendered character of liberal democratic theory and practice (Haney, 1996; Hirschmann and Di Stefano, 1996; A. Phillips, 1993; Thistle, 2002). Liberal feminists' agenda for change is consistent with their analyses of the basis for claiming equality and the causes of inequality: they wish to eliminate gender as an organizing principle in the distribution of social "goods," and they are willing to invoke universal principles in their pursuit of equality (Sallee, 2008). Some recent writings even argue for the elimination of gender categories themselves (Lorber, 2000, 2001). Liberal feminists

NSOU CC - SO - 03 311 pursue change through law—legislation, litigation, and regulation—and through appeal to the human capacity for reasoned moral judgments, that is, the capacity of the public to be moved by arguments for fairness. They argue for equal educational and economic opportunities; equal responsibility for the activities of family life; the elimination of sexist messages in family, education, and mass media; and individual challenges to sexism in daily life. Liberal feminists have worked through legislative change to ensure equality in education and to bar job discrimination; they have monitored regulatory agencies charged with enforcing this legislation; they have mobilized themselves to have sexual harassment in the workplace legally defined as "job discrimination"; and they have demanded both "pay equity" (equal pay for equal work) and "comparable worth" (equal pay for work of comparable value) (Acker, 1989; England, 1992; R. Rosenberg, 1992). For liberal feminists, the ideal gender arrangement would be one in which each individual acting as a free and responsible moral agent chooses the lifestyle most suitable to her or him and has that choice accepted and respected, be it for housewife or househusband, unmarried careerist or part of a dual-income family, childless or with children, heterosexual or homosexual. Liberal feminists see this ideal as one that would enhance the practice of freedom and equality, central cultural ideals in America. Liberal feminism, then, is consistent with the dominant American ethos in its basic acceptance of democracy and capitalism, its reformist orientation, and its appeal to the values of individualism, choice, responsibility, and equality of opportunity.

21.3.4 Gender Oppression

Theories of gender oppression describe women's situation as the consequence of a direct power relationship between men and women in which men have fundamental and concrete interests in controlling, using, and oppressing women—that is, in the practice of domination. By domination, oppression theorists mean any relationship in which one party (individual or collective), the dominant, succeeds in making the other party (individual or collective), the subordinate, an instrument of the dominant's will. Instrumentality, by definition, is understood as involving the denial of the subordinate's independent subjectivity (Lengermann and Niebrugge-Brantley, 1995). Women's situation, for theorists of gender oppression, is centrally that of being dominated and oppressed by men. This pattern of gender oppression is incorporated in the deepest and most pervasive ways into society's organization, a basic arrangement of domination most commonly called patriarchy, in which society is organized to privilege men in all aspects of social life. Patriarchy is not the unintended and secondary consequence of some other set of

312 NSOU CC - SO - 03 factors—be it biology or socialization or sex roles or the class system. It is a primary power arrangement sustained by strong and deliberate intention. Indeed, to theorists of gender oppression, gender differences and gender inequality are by-products of patriarchy. Radical Feminism Radical feminism is based on two emotionally charged central beliefs: (1) that women are of absolute positive value as women, a belief asserted against what they claim to be the universal devaluing of women, and (2) that women are everywhere oppressed—violently oppressed—by the system of patriarchy (Bunch, 1987; Chesler, 1994; Daly, 1973; C. Douglas, 1990; Dworkin, 1989; Echols, 1989; French, 1992; Frye, 1983; Hunnicutt, 2009; MacKinnon, 1989, 1993; Monrow, 2007; Rhodes, 2005; Rich, 1976, 1980). With passion and militance similar to the “black power” cry of African-American mobilization and the “witnessing” by Jewish survivors of the Holocaust, radical feminists elaborate a theory of social organization, gender oppression, and strategies for change. Radical feminists see in every institution and in society’s most basic stratificational arrangements—heterosexuality, class, caste, race, ethnicity, age, and gender—systems of domination and subordination, the most fundamental structure of which is the system of patriarchy. Not only is patriarchy historically the first structure of domination and submission, it continues as the most pervasive and enduring system of inequality, the basic societal model of domination (Lerner, 1986). Through participation in patriarchy, men learn how to hold other human beings in contempt, to see them as nonhuman, and to control them. Within patriarchy men see and women learn what subordination looks like. Patriarchy creates guilt and repression, sadism and masochism, manipulation and deception, all of which drive men and women to other forms of tyranny. Patriarchy, to radical feminists, is the least noticed yet the most significant structure of social inequality. Central to this analysis is the image of patriarchy as violence practiced by men and by male-dominated organizations against women. Violence may not always take the form of overt physical cruelty. It can be hidden in more complex practices of exploitation and control: in standards of fashion and beauty; in tyrannical ideals of motherhood, monogamy, chastity, and heterosexuality; in sexual harassment in the workplace; in the practices of gynecology, obstetrics, and psychotherapy; and in unpaid household drudgery and underpaid wage work (MacKinnon, 1979; Rich, 1976, 1980; L. Roth, 1999; B. Thompson, 1994; N. Wolf, 1991). Violence exists whenever one group controls in its own interests the life chances, environments, actions, and perceptions of another group, as men do to women. Patriarchy exists as a near-universal social form because men can muster the most

NSOU CC - SO - 03 313 basic power resource, physical force, to establish control. Once patriarchy is in place, the other power resources—economic, ideological, legal, and emotional—also can be marshaled to sustain it. But physical violence always remains its base, and in both interpersonal and intergroup relations, that violence is used to protect patriarchy from women’s individual and collective resistance. How is patriarchy to be defeated? Radicals hold that this defeat must begin with a basic reworking of women’s consciousness so that each woman recognizes her own value and strength; rejects patriarchal pressures to see herself as weak, dependent, and second-class; and works in unity with other women, regardless of differences among them, to establish a broad-based sisterhood of trust, support, appreciation, and mutual defense (Chasteen, 2001; McCaughey, 1997; Whitehead, 2007). With this sisterhood in place, two strategies suggest themselves: a critical confrontation with any facet of patriarchal domination whenever it is encountered and a degree of separatism as women withdraw into women-run businesses, households, communities, centers of artistic creativity, and lesbian love relationships. Lesbian feminism, as a major strand in radical feminism, is the practice and belief that “erotic and/or emotional commitment to women is part of resistance to patriarchal domination” (Phelan, 1994; Rudy, 2001; Taylor and Rupp, 1993).

21.3.4 Structural Oppression

Structural oppression theories, like gender oppression theories, recognize that oppression results from the fact that some groups of people derive direct benefits from controlling, using, and subjugating other groups of people. Structural oppression theorists analyze how interests in domination are enacted through social structure, here understood as those recurring and routinized large-scale arrangements of social relations that arise out of history, and are always arrangements of power. These theorists focus on the structures of patriarchy, capitalism, racism, and heterosexism, and they locate enactments of domination and experiences of oppression in the interplay of these structures, that is, in the way they mutually reinforce each other. Structural oppression theorists do not absolve or deny the agency of individual dominants, but they examine how that agency is the product of structural arrangements. In this section we look at two types of structural oppression theory: socialist feminism and intersectionality theory.

314 NSOU CC - SO - 03 Socialist Feminism The theoretical project of socialist feminism develops around three goals: (1) to achieve a critique of the distinctive yet interrelated oppressions of patriarchy and capitalism from a standpoint in women's experience, (2) to develop explicit and adequate methods for social analysis out of an expanded understanding of historical materialism, and (3) to incorporate an understanding of the significance of ideas into a materialist analysis of the determination of human affairs. Socialist feminists have set themselves the formal project of achieving both a synthesis of and a theoretical step beyond other feminist theories, most specifically Marxian and radical feminist thought (Acker, 2008; Eisenstein, 1979; Fraser, 1989, 1997; Fraser and Bedford, 2008; Gimenez, 2005; Hartsock, 1983; Hennessey and Ingraham, 1997; Jackson, 2001; MacKinnon, 1989; Dorothy Smith, 1979, 1987, 1990a, 1990b, 1999a, 1999b, 2000a, 2004a, 2009; Vogel, 1995). Socialist feminists accept the Marxian analysis of capitalism's class relations as an explication of one major structure of oppression. But they reject the Marxian analysis of patriarchy as a by-product of the same economic production. Instead they endorse the radical feminist argument that patriarchy, while interacting with economic conditions, is an independent structure of oppression. Socialist feminism sets out to bring together these dual knowledges—knowledge of oppression under capitalism and of oppression under patriarchy—into a unified explanation of all forms of social oppression. One term used to try to unify these two oppressions is capitalist patriarchy (Eisenstein, 1979; Hartmann, 1979; A. Kuhn and Wolpe, 1978). But the term perhaps more widely used is domination, defined above (under "Gender Oppression") as a relationship in which one party, the dominant, succeeds in making the other party, the subordinate, an instrument of the dominant's will, refusing to recognize the subordinate's independent subjectivity. Socialist feminism's explanations of oppression present domination as a large-scale structural arrangement, a power relation between categories of social actors that is reproduced by the willful and intentional actions of individual actors. Women are central to socialist feminism as the primary topic for analysis, and as the essential vantage point on domination in all its forms. But these theorists are concerned with all experiences of oppression, both by women and by men. They also explore how some women, themselves oppressed, actively participate in the oppression of other women, for example, privileged-class women in American society who oppress poor women (Eisenstein, 1994; Hochschild, 2000).

NSOU CC - SO - 03 315 21.4. Other Varieties of Contemporary Feminist Theory Let us discuss some other varieties of feminism in this connection. These are of prime importance in this regard.

21.4.1 Black Feminism Black feminists point out that while gender may be the main source of oppression experienced by white, middle class women, black women are typically oppressed by their race and class as well. What is a source of oppression for white women may be a source of liberation for blacks; whereas the family can be the principal instrument of subordination for white women, it can be a haven from a racist outside world for blacks. White women are often the racist oppressors, which hardly equates with the concept of 'sisterhood'—women's solidarity. When white women talk of the need to expand opportunities for women to work in the labor market in order to liberate themselves from the stranglehold of domesticity, they do not usually mean the kind of work many black women are forced to do, since most black women are working class. Preoccupation among some white feminists is profoundly irrelevant for many women in the third world, where poverty and starvation, lack of education are ubiquitous.

21.4.2 Post-structural Feminism In the case of Post-structural Feminism it has led its proponents to explore the implications of the use of the category 'women' in feminist analysis. In practice this means questioning whether feminism is correct to claim it speaks on behalf of all human beings who are called women. According to Butler (1990), problems arise if we assume that being called a woman indicates a life being led in a common set of circumstances and with a common set of experiences. Furthermore, there are also problems if it is assumed that 'women' all have a similar sense of themselves—that all women share a common identity. She points out that while it is useful at times to highlight the common interests of women over a specific issue, for example, over the question of equal pay, assumptions of a shared core identity between women usually backfires on feminism. Once feminism claims to be speaking for all women, a process of resistance and division almost always sets in among the very women feminism is supposed to be unifying. Butler suggests that rather than trying to make the category of women the fixed point at the center of feminism, feminist theory should encourage a flexible, open-ended exploration of what it means to be a woman. In this light, different experiences and attitudes among women are valued as sources of richness and diversity that help to empower, rather than undermine feminism.

316 NSOU CC - SO - 03 21.5. Conclusion For most of the time that sociological theorists debated the nature of modern society, a source of disadvantage experienced by half the world's population went unattended. The assumption was that the world as experienced by men was the same as that experienced by women. It was not until the political clamour of the 1960's and the renewed vigor of a woman's movement which originated at the turn of the century to secure the vote, that feminist theorizing became established as an indispensable part of sociology. During this so-called 'second wave of feminism', sociological theories began to be constructed to explain the specific experiences of women and to point out the societal route to female emancipation and fulfillment. Purpose of feminism has been to show how the acquisition of an understanding of the social conditions in which women live their lives open up the opportunity to reconstruct their world and thereby offer them the prospect of freedom. Feminist theory offers five key propositions as a basis for the revision of standard sociological theories. First, the practice of sociological theory must be based in a sociology of knowledge that recognizes the partiality of all knowledge, the knower as embodied and socially located, and the function of power in effecting what becomes knowledge. Second, macro social structures are based in processes controlled by dominants acting in their own interests and executed by subordinates whose work is made largely invisible and undervalued even to themselves by dominant ideology. 21.6 Summary Thus, dominants appropriate and control the productive work of society, including not only economic production but also women's work of social reproduction. Micro-interactional processes in society are enactments of these dominant-subordinate power arrangements, enactments very differently interpreted by powerful actors and subordinate actors. These conditions create in women's subjectivity a bifurcated consciousness along the line of fault caused by the juxtaposition of patriarchal ideology and women's experience of the actualities of their lives. Thus what has been said for women may be applicable to all subordinate peoples in some parallel, though not identical, form. 21.7 Questions a) What are the main contributions of feminism to the contemporary lifestyle? b) Discuss the main currents of feminism- black, radical and others. c) Evaluate the obstacles faced by feminists in recent times. d) Hatred to men : a myth or a real threat of feminism? Justify with reasons.

"Five Faces of Oppression," *Philosophical Forum* 19 (4), 1988. 21.10 Glossary Intersectional feminism: If feminism is advocating for women's rights and equality between the sexes, intersectional feminism is the understanding of how women's overlapping identities — including race, class, ethnicity, religion, sexual orientation and disability status — impact the way they experience oppression and discrimination. Trans-feminism: Defined as "a movement by and for trans women who view their liberation to be intrinsically linked to the liberation of all women and beyond." It's a form of feminism that includes all self-identified women, regardless of assigned sex, and challenges cisgender privilege. A central tenet is that individuals have the right to define who they are. Equity feminism (conservative feminism): Christina Hoff Sommers, a resident scholar at the conservative American Enterprise Institute, is a champion of what she calls "equity feminism." In her view, "equity feminism" is focused on legal equality between men and women, while "gender feminism" focuses on disempowering women by portraying them as perpetual victims of the patriarchy. In the words of

NSOU CC - SO - 03 319 President Trump's advisor Kellyanne Conway: "I look at myself as a product of my choices, not a victim of my circumstances, and that's really to me what conservative feminism, if you will, is all about." First wave feminism: Kicked off with the 1848 Seneca Falls Convention to discuss the "social, civil, and religious condition of woman" and continued into the early twentieth century. It culminated in 1920 with the passage of the 19th amendment, which gave women the right to vote, though some states made it difficult for women of color to exercise this right until well into the 1960s. Second wave feminism: Began in the 1960s and bloomed in the 1970s with a push for greater equality. Think Gloria Steinem, Dorothy Pittman Hughes, Betty Friedan. It was marked by huge gains for women in legal and structural equality. Third-wave feminism: Beginning in the 1990s, it looked to make feminism more inclusive, intersectional and to allow women to define what being a feminist means to them personally.

<p>Sociological theory is a set of assumptions, assertions, and propositions, organized in the form of an explanation or interpretation, of the nature, form, or content of social action. Sociological theory is defined as a set of interrelated ideas that allow for the systematization of knowledge of the social world. This knowledge is then used to explain the social world and make predictions about the future of the social world. Therefore, the important characteristics of sociological theory are as follows i. Sociological theories are abstract generalizations. ii. Sociological theories are logical propositions. iii. Sociological theories are conceptualizations regarding social phenomena. iv. Sociological theories are empirical generalizations. v. Sociological theories are factual. NSOU CC - SO - 03 11 vi. Sociological theories are provisional in nature. vii. Formal theories are loose versions of axiomatic schemes. The idea is to develop highly abstract propositions that are used to explain some empirical event. Some highly abstract propositions are seen as higher-order laws, and the goal of explanation is to visualize empirical events as instances of this covering law. Deductions from the laws are made, but they are much looser, rarely conforming to the strict rules of axiomatic theory. Moreover, there is recognition that extraneous variables cannot always be excluded, and so the propositions have a condition that if other forces do not interfere, then the relationship among concepts in the proposition should hold true. c) Empirical Formats:

<p>systems is towards stability. "As we survey the course of history, it seems reasonably clear that all major social structures have in due course been cumulatively modified or abruptly terminated. In either event, they have not been eternally fixed and unyielding to change" (Merton, 1948/1968: 95). Merton insists that social structures can only be analyzed in terms of both statics (stability) and dynamics (change). The concept of dysfunction, which allows functional theory to focus on change, is based on tension, strain, or contradictions within component elements of socio-cultural systems. Dysfunctional elements create pressures for change within the system (Merton, 1948/1968: 176). Social mechanisms within the system, including the interrelation of predominantly mutually supporting elements of the system, operate to keep these strains in check, in an attempt to limit or minimize change of the social structure. However, such mechanisms are not always effective, and the amassing of stress and resulting conflict often</p> <p>W http://www.faculty.rsu.edu/~felwell/Theorists/Essays/Merton1.htm</p>		<p>systems is to stability. <p>A Protocol for Executing Functional Analysis To explain the causes and consequences of particular structures and processes, Merton insists that functional analysis begins with "sheer description" of individual and group activities. In describing the patterns of interaction and activity among units under investigation, it will be possible to distinguish clearly the social items to be subjected to functional analysis. Such descriptions can also provide a major clue to the functions performed by such patterned activity. The first of these steps is for investigators to indicate the principal alternatives that are excluded by the dominance of a particular pattern. The second analytical step beyond sheer description involves an assessment of the meaning, or mental and emotional significance, of the activity for group members.</p>		<p>A Protocol for Executing functional Analysis To ascertain the causes and consequences of particular structures and processes, Merton insists that functional analysis begins with "sheer description" of individual and group activities. Basic Questions The impetus for contemporary feminist theory begins in a deceptively simple question: "And what about the women?" In other words, where are the women in any situation being investigated? If they are not present, why? If they are present, what exactly are they doing? How do they experience the situation? What do they contribute to it? What does it mean to them? In response to this question, feminist scholarship has produced some generalizable answers. Women are present in most social situations. Where they are not, it is not because they lack ability or interest but because there have been deliberate efforts to exclude them. Where they have been present, women have played roles very different from the popular conception of them (as, for example, passive wives and mothers). Indeed, as wives and as mothers and in a series of other roles, women, along with men, have actively created the situations being studied. Yet though women are actively present in most social situations, scholars, publics, and social actors themselves, both male and female, have been blind to their presence. Moreover, women's roles in most social situations, though essential, have been different from, less privileged than, and subordinate to the roles of men. Their invisibility is only one indicator of this inequality. Feminism's second basic question is: "Why is all this as it is?" In answering this question, feminist theory has produced a general social theory with broad implications for sociology. One of feminist sociological theory's major contributions to answering this question has been the development of the concept of gender. Beginning in the 1970s, feminist theorists made it possible for people to see the distinctions between (a) biologically determined attributes associated with male and female and (b) the socially learned behaviors associated with masculinity and femininity.

Basic Questions ? The impetus for contemporary feminist theory begins in a deceptively simple question: "And what about the women?" ? In other words, where are the women in any situation being investigated? If they are not present, why? If they are present, what exactly are they doing? How do they experience the situation? What do they contribute to it? What does it mean to them? ? In response to this question, feminist scholarship has produced some generalizable answers. Women are present in most social situations. Where they are not, it is not because they lack ability or interest but because there have been deliberate efforts to exclude them. Where they have been present, women have played roles very different from the popular conception of them (as, for example, passive wives and mothers). ? Indeed, as wives and as mothers and in a series of other roles, women, along with men, have actively created the situations being studied. Yet though women are actively present in most social situations, scholars, publics, and social actors themselves, both male and female, have been blind to their presence. ? Moreover, women's roles in most social situations, though essential, have been different from, less privileged than, and subordinate to the roles of men. Their invisibility is only one indicator of this inequality. ? Feminism's second basic question is: "Why is all this as it is?" ? In answering this question, feminist theory has produced a general social theory with broad implications for sociology. ? One of feminist sociological theory's major contributions to answering this question has been the development of the concept of gender. ? Beginning in the 1970s, feminist theorists made it possible for people to see the distinctions between (a) biologically determined attributes associated with male and female and (b) the socially learned behaviors associated with masculinity and femininity.

They did so by designating the latter as "gender." The essential qualities of gender remain a point of theoretical debate in feminism, and these debates offer one way to distinguish among some of the varieties of feminist theory. But a starting point of agreement among nearly all varieties of feminist theory is an understanding of gender as a social construction, something not emanating from nature but created by people as part of the processes of group life. The third question for all feminists is: "How can we change and improve the social world so as to make it a more just place for all people?" This commitment to social transformation in the interest of justice is the distinctive characteristic of critical social theory, a commitment shared in sociology by feminism, Marxism, neo-Marxism, and social theories being developed by racial and ethnic minorities and in postcolonial societies. Patricia Hill Collins (1998:xiv) forcefully states the importance of this commitment to seeking justice and confronting injustice: "Critical social theory encompasses bodies of knowledge... that actively grapple with the central questions facing groups of people differently placed in specific political, social, and historic contexts characterized by injustice." This commitment to critical theorizing requires that feminist theorists ask how their work will improve the daily lives of the people they study.

As the circle of feminists exploring these questions has become more inclusive of people of diverse backgrounds both in the United States and internationally, feminist theorists have raised a fourth question: "And what about the differences among women?" The answers to this question lead to a general conclusion that the invisibility, inequality, and role differences in relation to men that generally characterize women's lives are profoundly affected by a woman's social location—that is, by her class, race, age, affectional preference, marital status, religion, ethnicity, and global location. But feminist theory is not just about women, nor is its major project the creation of a middle-range theory of gender relations. Rather, the appropriate parallel for feminism's major theoretical achievement is to one of Marx's epistemological accomplishments. Marx showed that the knowledge people had of society, what they assumed to be an absolute and universal statement about reality, in fact reflected the experience of those who economically and politically ruled the world; he effectively demonstrated that one also could view the world from the vantage point of the world's workers. This insight relativized ruling-class knowledge and, in allowing us to juxtapose that knowledge with knowledge gained from the workers' perspective, vastly expanded our ability to analyze social reality. More than a century after Marx's death we are still assimilating the implications of this discovery. Feminism's basic theoretical questions have similarly produced a revolutionary switch in our understanding of the world: what we have taken as universal and absolute knowledge of the world is, in fact, knowledge derived from the experiences of a powerful section of society, men as "masters." That knowledge is relativized if we rediscover the world from the vantage point of a hitherto invisible, unacknowledged "underside": women, who in subordinated but indispensable "serving" roles have worked to sustain and re- create the society we live in.

This discovery raises questions about everything we thought we knew about society, and its implications constitute the essence of contemporary feminist theory's significance for sociological theory. Feminist theory deconstructs established systems of knowledge by showing their masculinist bias and the gender politics framing and informing them. To say that knowledge is "deconstructed" is to say that we discover what was hitherto hidden behind the presentation of the knowledge as established, singular, and natural—namely, that that presentation is a construction resting on social, relational, and power arrangements. But feminism itself has become the subject of relativizing and deconstructionist pressures from within its own theoretical boundaries. The first and more powerful of these pressures comes from women confronting the white, privileged-class,

[1] PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific / generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive and continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes of all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this, we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success. Prof. (Dr.) Subha Sankar Sarkar Vice-Chancellor

1.1 Objectives ? To learn about the roles played by Gandhi and Ambedkar in bringing social changes; ? To understand the importance of equality and curbing down discriminations in Hindu society ? To evaluate the significance of Gandhi and Ambedkar in present day Indian scenario.

1.2 Introduction Mankind has witnessed from time to time the emergence of great souls who have shown us the path of knowledge and taught us how to live an ideal life. Perhaps these two stalwarts, Mohandas Karamchand Gandhi (1869-1948) and Bhimrao Ramji NSOU ? CC-SO-04 8 Ambedkar(1891-1956) with their basic philosophy of the welfare of the poor and the down-trodden, are a part of the same Vedic heritage. Before their arrival on the scene, the Hindu social organization was based on the hierarchy of the four Varnas: the Brahmins, the Kshatriyas, the Vaishyas and the Shudras. This four-fold division of society was laid down by Manu and was generally called Chaturvarna. According to this system, the social and economic status of the Hindus was decided by their birth. There was no chance to choose their occupations by their own will. This decisive feature of the Hindu society had created a number of serious problems such as the feelings of high and low, superiority and inferiority, and inequality or unhappiness among the population. One section of the Hindu was treated by the other sections as second rate, third-rate citizens or slaves. The lower castes were suppressed, depressed and harassed.

1.2.1 Role of Social Reformers in Removal of Social Evils In order to remove such social evils several worthy sons of India have engaged their energies and talents. Twenty five hundred years ago, Buddha made the first effort. Twelfth century Basava fought against the caste orthodoxy. Saints like Kabir, Chaitanya, Eknath and Tukaram spent their life time advising and reforming the various sections of the Hindu population in different parts of the country. The Brahmo Samaj of Raja Ram Mohan Roy, and the Arya Samaj of Dayanand Saraswati showed the path of reform to the traditional Hindu society. Jyotirao Phule and Maharaja Sayajirao Gaikwad of Baroda fought against the outmoded caste practices. The Theosophical Society, the Prarthana Society Samaj, Satyashodhak Samaj, Servants of India Society did vigorous movements to bring great reforms in India. The names of Mahatma Gandhi and Dr. Ambedkar were mentionable in the line of such great reformers of the Indian society. Mahatma Gandhi's efforts were mainly spiritual and religious in character whereas Ambedkar's efforts were mainly political and legal in character. The Hindus those who studied the liberal philosophy and democratic institutions of the western countries naturally began to revolt against the caste centric attitudes. The works of Mahatma Gandhi and Ambedkar highlighted the early impulses of social reformation in India. Ambedkar was born in 1891. It was then the time of convulsive contradictions, confusions and conflicts existing in the Indian society. As Ambedkar was progressing through his early years, momentous revolutionary changes were sweeping across the land gradually. These restless decades were engaged into nationalist movements along with political ideology of deeper values restoring the traditional ethos of the Indian economy, society and culture. The pace of social change failed to satisfy the untouchables of the Indian society.

NSOU ? CC-SO-04 9 1.2.2 Ambedkar as the Emancipator of Depressed Class Ambedkar was acknowledged as the emancipator of the depressed classes in the country. He dominated the Indian political scene during the most crucial time when India was going through a series of political crises. He secured the important rights and liberties for the under-privileged sections of our country and also won a compact package of political rights especially for the depressed population of the Shudras. Having secured the coveted degrees from the different renowned universities in the world, he was well armed with a formidable knowledge of various field of sciences, Constitutions and laws of different nations. He was an erudite scholar, a great legal luminary, a great Constitutional expert, a parliamentarian, a statesman, a powerful writer, a journalist, a jurist and above all, a savior of the depressed sections of the Indian population. Despite, these achievements, the stigma of untouchability was attached to him. After his advanced education, when he accepted the post of secretary in the military department of the Baroda government, peons used to fling files at him and did not allow him to drink water from the common pot. The humiliations he suffered at the hands of the caste Hindus made him to challenge the outmoded institutions of the Hindu religion. He studied the Vedas, Shastras, Puranas, Shrutis, and all important Vedic literatures concerning Hinduism. Whenever he found any fault he laid his finger on it. Till the last breath of his life, he fought against the oppressive practices of the depressed class. His approach to any problem was comprehensive and aimed at examining and repairing the institutions which were in crises. He launched an aggressive campaign against Hinduism. He was anti-slavery, and anti-priest. He believed that unless people were awakened, it was not possible to do away with the various evils afflicting Hinduism. He did not believe in God or destiny. He believed that as long as the conscience of the slaves was not awakened against the hatred for slavery, there was no hope for salvation. Self-awakening, he believed, could provide them necessary strength to fight against evils in society. Self-help, self-elevation and self-respect were the prime ideas in his preaching. He said that all men were born equal and died equal. He held that the Hindu society should be reorganized on two main principles of equality and absence of casteism. At school and college, Ambedkar had a hard time owing to the prevailing practice of untouchability. Mahatma Gandhi was free from such harassment while his studies were in progress. He was lucky belonging to an upper caste. This is why his school and college days meant opportunities for gaining knowledge, inspiration and joy.

NSOU ? CC-SO-04 10 1.3 Obstacles Faced by Ambedkar Ambedkar faced numerous obstacles in his political career. When the British government proclaimed officially in 1932 that it would concede the demand for separate electorates for the untouchables, Gandhiji opposed the plan strongly on the ground that it would break up the Hindu community and announced his fast unto death if the scheme was not withdrawn. Ambedkar was equally determined to have it implemented. But Gandhiji 's fast forced him to accept a compromise. Thus, on humanitarian grounds, he signed the Poona Pact of 1932, to save Gandhi's life. Ambedkar stood for an opposition to the ideas of Manu. Manu codified rules, norms and regulations designed to oppress two categories of human beings- the Shudras and women. It was alarming but true that, in accepting Buddhism, Ambedkar accepted a version of Hinduism which belonged to the Shudras and which went against the ideology and institutions of Brahminical Hinduism. We should also note that Buddha exercised an equally great influence on the life of Mahatma Gandhi. 1.3.1 Both are Patriots (Gandhi and Ambedkar) Mahatma Gandhi was rightly hailed as the patriot monk and freedom fighter of India. When he saw that the Indian society was being afflicted with the various social evils, he launched a determined struggle for independence of the country and removal of the evils. He pleaded for a thorough reform of the rigid caste system and felt remorse for the bad situation of the country. Ambedkar was a great patriot too and therefore throughout his life he strove hard to restore unity and strength of the country and always came forward with practical solutions of the various problems emerging in the country. Ambedkar did recognize a myriad of other identities in India such as sub- castes, castes, groupings of castes. He, however, argued that identity should be within the bounds of rule of law, the demands of development, justice and participation. He stated

71%

SA

Political Science, Mr. Mahesh Baburao Kamble P ...
(D133919533)

that the most vital need of the day was to create consciousness among the masses. The sense of a common nationality,

the feeling not that they were Indians first and Hindus, Mohammedans or Sindhis and Kanares afterwards, but that they were Indians first and Indians last. Ambedkar thus had practical ideas to overcome the divisive forces operating in a country like India. The means adopted by Mahatma Gandhi and Ambedkar was to improve the lot of the masses in India who were stimulated in different directions. It was by employing the principles of the humanistic philosophy, Mahatma Gandhi wanted to solve all problems and develop a united strong nation. Ambedkar did not agree to this solution, humanistic and man making philosophy preached that God pervaded and dwelt among the poor. But the high caste Hindus gave discriminatory treatment to the poor and the have nots. Mahatma Gandhi

NSOU ? CC-SO-04 11 argued that the Hindus should not give up religion but should encourage the society to grow. It indicated that casteism and untouchability must be vanished from our society. This was difficult, according to Ambedkar, because the followers of Hinduism continued to practice caste based ideas and doctrines in the social and political spheres. 1.4 Reformation of Hinduism Whereas Gandhi carried on a lifelong campaign for the reform of the Hindu society, his self-description as an orthodox or Sanatani Hindu also expressed important meanings for our understanding of him, especially in view of fact that he was among the few leaders and thinkers of modern India who accepted and defended what may be described as popular Hinduism. Ambedkar also believed that any "ism" in the sense of religion which contained something that was not amenable to reason and was mainly based on belief which was erroneous. He observed that if a religion was based on principles, it could amend itself in the line with reason and logic. He did not believe that any existing religious opinions of Hinduism were amenable to reason or logic. This was one reason why Sanatana Hinduism had irrational prejudices. Ambedkar argued that initially Hinduism was a missionary religion, but gradually it developed the rigidity of the caste system which became the core of Hinduism and the missionary spirit of Hinduism was waned. The 19th century witnessed the emergence of several reformist movements in India. Mahatma Gandhi's Mission movement was the movement for the social and religious awakening of the Indian people. Mahatma Gandhi was the Hindu saint to proclaim that the religion of the Hindus was confined to their kitchen. He condemned the idea of untouchability and other social injustices and humiliations. Similar spirit of rebellion against injustice and restoring brotherhood of man guided Ambedkar in his life. Mahatma Gandhi and Ambedkar could be addressed as two radical and bold leaders of modern India. They were the defenders of the poor and the down-trodden. Both were the champions of the underdog and the emancipators of the backward people. Both were heroic and symbols of revolt. If Gandhiji was a reformer and an ascetic, Ambedkar was a fighter and a revolutionary. Both of them were phenomenally active and influential. Mahatma Gandhi and Ambedkar grew up in their own different social set-up. The circumstances of the two were remarkably different. Gandhiji's personality was unique. He stood in the tradition of the ancient seer of the Vedas and Upanishads. Several great personalities, tried to highlight the various

NSOU ? CC-SO-04 12 qualities of Mahatma Gandhi, one of the stalwarts of modern India and abroad. They also paid similar rich tributes to his intellectual and modern outlook. Mahatma Gandhi's thirst for knowledge was virtually unquestionable. Very early in his life he perceived so many great things in his society. He was side by side introduced as one of the new currents in the eastern and western philosophies. He was a great humanist, an idealist, and an ascetic pilgrim of the city of God. With his knowledge and message, he wandered from place to place and inspired the people of this land and other lands. He believed, education was the realization of the best in man-body, soul and spirit. He maintained that education must be based on ethics and morality. Ambedkar was neither born great nor his greatness thrust upon him. He achieved greatness by sheer sincere hard work. He faced endless troubles all his life. Ambedkar enthroned himself in the hearts of millions of Indians. He was considered as a second Buddha in India. His work as Constitutionalist, professor, political leader and socio-religious reformer had endeared him to the generations of Indians. Ambedkar's personality was multidimensional in nature. He was a great scholar and his writings covered with diverse fields of knowledge. Both Gandhiji and Ambedkar sought to reform the existing society by questioning its basic presuppositions. They fought against various persistent evils of the Indian society, while both were rebels and reformers, they differed considerably in their principles and ideologies. Mahatma Gandhi tried to rebuild India mainly through spiritual and higher values of the glorious ideals of India's past. Ambedkar wanted to rebuild India with a complete rejection of India's past. While Gandhiji welcomed socialism in India but he didn't envisage the political, administrative and judicial institutions for the common people. Ambedkar had a vision of the plans, policies, the form of government and institutions for the development of the depressed castes in order to reduce the economic inequalities. Ambedkar too, believed that religion was a foundation for human life and society and society could not be survived without morality. He argued that a system of moral values was necessary to promote harmonious life upholding equality and brotherhood and rejecting superstitious mysticism, irrationality and blind beliefs. As a humanist and a scientific thinker, he was a bitter critic of the Hindu social order. He hoped that Hinduism could be reformed if not revolutionized. When he considered the idea of abandoning Hinduism for some other religion, he found his answer in the message of Buddhism. Buddhism was one of Indian origins and was, according to him, superior to other religion including Hinduism. Hinduism haunted him all his life like a ghost; it was Buddhism that he finally found, his solace. Ambedkar had to face very bitter experiences right from his childhood till the independence (of the country) and even

NSOU ? CC-SO-04 13 later. The deliberate attempt was taken to harass him led to his mental torture and number of humiliations inflicted on his learning and the future works of him. The untouchables were made to suffer numerous social disabilities and they were told that this was their fate determined by their birth. Ambedkar observed that untouchables considered Hinduism as a veritable chamber of horrors ; the iron law of caste, the heartless law of the Karma and the senseless law of status by birth were veritable instruments of torture which Hinduism had forged against them. Ambedkar had to fight on two formidable fronts. To secure the social and religious rights, he had to face the opposition of the caste Hindus; he also had to struggle against the national parties and the British rule. Since no support was forthcoming from either of them, he was left with the only alternative of starting a separate organization for the upliftment of the untouchables. Thus he had to make heroic efforts to inspire the down-trodden classes to raise the banner of revolt against the oppressive ideas of an institution of Hinduism. The rebel that he was in the sense, Ambedkar protested against the socio -economic oppression of the Hindu society. He fought for the political rights and the religious beliefs. He advocated the upliftment of the down-trodden through education, organization and agitation and separate electorate for the depressed classes. Ambedkar embraced Buddhism and recommended it to his followers, but the followers themselves had not responded in any large numbers nor had they benefited from the conversion in any substantial measure. By their ideas and activities, both Gandhi and Ambedkar welcomed the rise and development of democratic institutions in India. Both these thinkers had sought to foster individual liberties and rights. On the other hand Gandhiji had gone to the extent of welcoming socialism for India and not into the details of the political, administrative and judicial institutions for the attainment of the common people. Dr. Ambedkar however spelt out the plans and policies and the form of government having different institutions for the constructive development of the depressed classes of people to reducing the gap between the haves and the have-nots. Ambedkar wanted to nationalize lands, so that the poor people could have some means of livelihood. Mahatma Gandhi encouraged the establishment of religious centers to train youths on socio-religious lines. Ambedkar fought for the creation of government institutions and machineries for the protection of the poor people and provided some means for their livelihood. He upheld the principles of equitable distribution of national wealth so that the poor people could avoid starvation in the first instance. Dr. Ambedkar was quite against the system of Panchayati Raj. The Panchayat system was a council of the village elders, usually from the upper castes. They had traditionally promoted the wealth and well

NSOU ? CC-SO-04 14 being of the upper castes and denied opportunities to the lower castes. The Panchayat system was thus destructive to the upliftment and progress of the depressed classes and hence he opposed the Panchayat system bill in the Bombay legislative council and in the Indian constituent assembly later. Generally While Ambedkar favored the Buddhist philosophy of liberation and equality, Mahatma Gandhi was in line with monism or Advaita. From Ambedkar's point of view, monism or Advaita was not of much help. According to Ambedkar, Buddhism was practicable in a poverty-stricken society like that of India because it advocated compassion and love. Under monism, man became individualistic and heartless. Generally, it was engaged to exploit others. Thus, the poverty-stricken societies were exploitable and worst sufferer further more. Mahatma Gandhi came from a high caste and therefore he had not faced such caste related trouble and he did not refer to convert any one to other religion. Although both Mahatma Gandhi and Dr. Ambedkar were comparatively great patriots, both of them were very active and energetic till the end of their lives and served for the welfare of the people. Mahatma Gandhi inspired and guided several active and prominent Indians who created various institutions and ashrams, schools and hospitals and spread his message across the Indian subcontinent and across the world. Since Mahatma Gandhi came from an upper caste background, he had no hurdles to cross or humiliations to suffer unlike Ambedkar. Mahatma Gandhi had another natural advantage. He got the backing of the educated upper caste people who had money, property, social and political high positions and connections to build and run various institutions. They could easily give and collect donations. Even they could build publishing houses to publish the works by and on Mahatma Gandhi. They could easily get the support from the government or administrative agencies or offices. When the disciples of Mahatma Gandhi held meetings or discussions, they could get audience of students and citizens. Mahatma Gandhi was a revolutionary but he was a philosophical and social revolutionary too.. He was viewed as a political revolutionary or a danger to the British Empire or the government of India. His resources and energies were not diverted for countering any unfavorable or hostile propaganda. He was wearing half necked clothes and this commanded instant reception and acceptance of his personality and mission. People listened to his lessons attentively and followed his advice readily. He acquired disciples and adherents from all over India. Dr. Ambedkar had a great initial problem. His caste always raised many questions. Although the Maharaja of Baroda and the Maharaja of Kolhapur gave him much support and assistance for his education and employment, this was not enough. He had to fight everywhere. He became educated as an advocate and became a professor but it was not easy for him like the many

NSOU ? CC-SO-04 15 upper caste friends and supporters. Most of his followers and supporters came from the lower castes, specially the Mahars and others. They did not have any privileged position in society. They were not the men of property or wealth also. They could of course follow Ambedkar sincerely. But they could not command or offer the advantages which the upper castes possessed. But on the other hand, much of the works of Mahatma Gandhi was carried out since his departure by most of his followers who belonged to the upper castes of Hindu generally. Dr. Ambedkar was not lucky to enjoy that type of advantage. However, in another sense, Ambedkar might be said to be more fortunate than Mahatma Gandhi as his programme was legal, socio-economic and political in nature. He was a minister of the government of India and influential member of the Parliament. He was in the privileged position in the constituent assembly. He was the chairman of the drafting committee. He was in a unique position to establish his own ideas into the Constitution and certainly influenced the proceedings or debates in the constituent assembly. Of course the Constitution was not up to his likings in all respects. There were many shortcomings in its framework to present to the country. But even as it was, the position he held and the powers he exercised were certainly great. The educational work done by Mahatma Gandhi and Ambedkar had been remarkably comparable and significant in the educational history of India. Although a number of schools, colleges, hostels and ashramas were established following the ideology of Mahatma Gandhi. A large number of schools and colleges also were established by Ambedkar himself in his own lifetime, and also by his followers in the later years. Ambedkar's contribution to develop India's educational institutions was particularly great. His learning and scholarships had greatly impressed the scheduled caste as well as the other section of the people of India. The three Universities were named after him and the latest one was the Marathwada University at Aurangabad in Maharashtra. There are countless schools and colleges, including the technical and medical institutions had been named after him. Mahatma Gandhi established schools and colleges throughout the country and even outside but in case of Ambedkar, the concentration of the institutions was mainly in western and southern India. Mahatma Gandhi had a unified and universal vision. Ambedkar also had a similar vision but the intensity of his feelings for the scheduled castes was so great that it often appeared that his plans and programs were mostly for his people. He stood for all people. But obviously he gave priority to the interests and problems of his own people. The present-day Indian politics might be followed to continue the philosophy and program of Ambedkar. Throughout his life he exhorted his followers to educate themselves, organize themselves at various levels and fight for their political and NSOU ? CC-SO-04 16 other rights. He stood for winning various rights and liberties for his people and wanted to fight for them continuously. Many of the people in India had a misconception that Dr. Ambedkar fought only for reservation of his people. As a matter of fact, this was largely a strategy for the upper caste people. Sardar Patel and Jawaharlal Nehru, in the mid 40s, contemplated this policy of reservation. While these leaders were the initiator of the policy, which was really known as the Congress government policy and Mahatma Gandhi got the blessings of it. Gandhi aimed at the upliftment of the Harijans and their rehabilitation in the Hindu society with honor and happiness. He recommended self-reliance for all; he certainly favoured the idea of aiding the Harijans. He was not for charity. But he was certainly for help and assistance to the unfortunate sections of society. In his own way he had initiated several ideas and experiments to aid and assist Harijans. The Harijan Seva Sangha was the organization which carried out valuable work for the improvement of the conditions of the Harijans. The most important thing to be noted here that Mahatma Gandhi, the Congress leaders and those leaders who became ministers after independence, had the common ideology and policy of treating Harijans as part of the Hindu society which meant that the presence of Hindu electorate at various levels was very natural. The later Congress leaders pursued this policy in a crude and rough-handed manner to create the vote banks of the Harijans for the Congress leaders, Harijan or non-Harijan. This policy continued to be followed in several respects even today. However Dr. Ambedkar was basically opposed to this philosophy and programme. He believed that the Hindu had no philosophy or programme to uplift the downtrodden scientifically or systematically but in a business-like way. They wanted to continue the same traditional philosophy of domination, exploitation and ill-treatment of the Harijans. Hence Ambedkar believed that any philosophy or programme which aimed at uplifting the Harijans had to be devised by the Harijans themselves. This is why he advised, his followers again and again to develop their own thinking, action plans and policies which could be pursued independently in the democratic framework and electoral politics.

1.4.1 Difference with Gandhi

Ambedkar registered his basic difference with Mahatma Gandhi in the form of the Poona Pact of 1932 by which he gave a notice to the Congress men that the Harijans would develop their own leadership and power and programme and would like to exercise their own vote in their own electorate. This thinking and programme which was in defiance of the Congress policy and programme must be taken as separate and defiant even from Mahatma Gandhi's point of view. While Mahatma Gandhi was not averse to independent challenging approaches, he was for all practical purposes for a unified and coordinated approach to the country's problems of winning independence,

NSOU ? CC-SO-04 17 socio-economic and industrial modernisation. His ideas and plans seemed nearer to the plans and programmes of the Congress party than those for which Ambedkar stood for such as separate development, separate electorate, separate parties and policies for his people because he did not trust the mainstream, predominantly upper castes Hindu, Congress leadership. It is possible that if universally oriented and bold and broad-minded leader like Mahatma Gandhi was at the helm of affairs in the Congress party or government, they would have welcomed the challenging, parallel approach of bold leaders like Ambedkar. However, as the later history showed, the Congress party or government leaders were not so broad minded and business like enough to trust Ambedkar to try his independent programmes. The Congress leaders and ministers generally failed to take Ambedkar into confidence and make his ideas and experiments a part of the Congress policies and programmes. Some fault in this matter perhaps might be lied at the door of Ambedkar too. So, as a result, the Congress developed its own schedule caste policy and programmes and had its own brand and quota of schedule caste leaders so that Ambedkar could be side tracked and left to follow his own ideas and programmes without rocking the boat of the Congress government. The Questions may be raised that the Congress leaders did not come up to the standard of genuineness, honesty, earnestness, boldness and with the universality of Mahatma Gandhi and perhaps this was the reason why they could not come in forward with the bold and constructive initiatives launched by Ambedkar at various stages in the 1930s, 40s and 50s. In 1956 he left Hinduism and embraced Buddhism. In a way, this was the point of departure from the philosophy of Mahatma. who had advocated a religious policy of understanding, tolerance, coordination and integration. This was the essence of his dream of Swadeshi and Swaraj. The thrust of Mahatma Gandhi's religious philosophy was that each religion was adequate and satisfactory to its followers; there could be exchange of opinions and views; but there was no need for any religious conflicts or wars. Conversion was also needless unless one was genuinely interested or had serious or uniquely disturbing problems in one's own religion. Mahatma Gandhi had rebuked the Christian missionaries on the ground that they were converting the poor Hindus which they did not need and did not give them bread which they badly needed. From many Hindus' point of view, Ambedkar's conversion was not a sound step although it was tolerable in view of the fact that Buddhism was another form of Hinduism and in that sense the departure was not fundamental. Perhaps Mahatma Gandhi would have viewed Ambedkar's conversion in this light although perhaps he would have liked Ambedkar to be within Hinduism and from that position to make serious efforts to reform the whole structure and process so that none ever felt the need to desert Hinduism. For about a hundred years now, Mahatma Gandhi has acted as a great source of

NSOU ? CC-SO-04 18 inspiration and guidance to the various sections of the Indian people. He has been a source of inspiration for the modernization and enlightenment to the whole subcontinent. His message has been delivered for the Hindus no doubt but also for the others unmistakable. In a way, Mahatma Gandhi has been quietly accepted and glorified and worshipped. He has not provoked any fierce opposition or controversy from any upper castes or lower castes and his message has been generally begin and progressive. It has been broad and umbrella like so that all groups of people with diverse opinions and preferences can be brought under his banner without anyone feeling small or uninvited. Gandhi's missions and institutions are accepted and functioned as spiritual and religious service and counsel to all those who care to go to these establishments. It may be said that most of the people who have taken advantage have been generally from the upper castes, but the important point is that no castes are specifically barred, much less as a policy or conscious strategy. Thus, Mahatma Gandhi and his disciples have been peacefully functioning in the midst of the generations of Indians in India and abroad. But, unlike Mahatma Gandhi, Ambedkar could not leave behind any socio-spiritual or religious order or vast organization. From his point of view, he attained his salvation by going over to Buddhism. Years ago, he had taken a sort of vow to see that he would not die in Hinduism. That vow he kept. To his good fortune, lakhs of his followers embraced Buddhism at Nagpur in 1956 and periodically a few thousands had undergone conversion to Buddhism over there. But there had been no great or well financed and efficient organization to stabilize, consolidate and spread the message and philosophy of Ambedkar. As we have said earlier that Ambedkar is rather unfortunate in having his followers who are largely poor and disadvantaged and who stand in need of various types of help. From this viewpoint, the credit has been given to the Indian people and leaders at the central as well as state level. Although Ambedkar's followers have gone over to Buddhism from time to time but since 1956, they have not been deprived of the socio-economic or other help of reservation resulting to their conversion to Buddhism. By and large, Ambedkar's followers, whether Hindu or Buddhist, have continued to obtain different types of help and concessions as deserving socio-economically backward people, so much so that, on this analogy, backward people of other communities like the Muslims and Christians have been rightly asking for such help and concessions. Thus, Ambedkar has triggered a lot of socio-economic and political changes. Ambedkar has turned into a symbol of the resurgence of the various suppressed people in the various parts of the country. Mahatma Gandhi coming from an upper caste background has been quietly accepted and assimilated by the Indians. But Ambedkar has been embraced vigorously by the backward people, the suppressed people, and the well understanding upper caste people. They have accepted him as

NSOU ? CC-SO-04 19 a great leader of their country; they cannot pretend to feel that his ideas and plans have been to their liking in all respects. Ambedkar has gone a long way in symbolizing self-respect and dignity and identity to the millions of the lower castes in the country. The upper caste followers of Mahatma Gandhi have not taken much trouble to think that they are the heir to great civilization; the people do not find it difficult and do assert their identity. For the lower caste millions of the people, the problem of identity and respectable socio-economic and political status is important and urgent. Here Ambedkar is looked upon as a savior. Not only several Universities, colleges and schools have been established in the different parts of the country, as we have referred to earlier, but more and more statues are erected to perpetuate his memory. This is not only to express our gratitude to Ambedkar but also to meet at least partially the growing demand of the lower castes to assert their identity and plant their symbol in the prominent places everywhere.

1.4.2 Present Day Scenario

In the current climate of privatization and entry into the multinational companies in India, the chances of the backward castes getting employment or other opportunities are not very bright. The main reason behind is that the better qualified and socially forward castes, with their established contacts and influence, will snap up the opportunities and positions that become available. This has been happening in different parts of the country. In this case, what needs to be done by the backward castes is to take their leader's advice very seriously. Long back Dr. Ambedkar had repeatedly advised his followers that they should take education seriously and improve their awareness and skills constantly. They should be on the lookout for opportunities and its end results. He advised them to be a part of the Indian mainstream and not keep away grumbling and complaining all the time. He also motivated them to adopt a positive approach to life, politics and social affairs. This was a challenging task for the people and society together. The question of such vow was not arising in case of the upper castes, the mainstream followers of Gandhi, because they had been generally keeping up with the latest trends in business, education, industry, employment, and so on. As a result, they would have been solving their problems and saving themselves from the various types of deprivation. The followers of Ambedkar, especially those who were the leaders and ministers at the central and state levels, did many welfare works for improving the lot of the backward castes. This was however being done gradually and indirectly. There were mostly the backward castes leaders in Uttar Pradesh and Bihar. They had launched many policies which were generally favorable to the backward castes including Harijans. Since India's socio-political, economic and industrial system were more NSOU ? CC-SO-04 20 capitalistic and less socialistic in nature, so it would help promote the progress of the well off and well educated upper castes and inversely it would slow down the progress and advancement of the lower castes. Mahatma Gandhi had advocated the philosophy of socialism for the welfare of the poor and the depressed. The poor and the depressed would be treated equally and be kept better under socialism than capitalism. Under socialism, the government is usually anxious to meet the basic needs of the citizens regardless of the differences of caste, religion etc. This advantage will not be available automatically with the progressive disappearance of the socialist ideas and practices on the economic and industrial fronts. Socialism of course had its own demerits where Ambedkar was not solely one of the admirers of socialism or communism. He strongly opposed communism and he was generally in favor of a democratic system of parliamentary type under which minorities and lower castes would be comparatively safer by means of the use of vote, political parties and an independent judiciary. Ambedkar was also put off by the lack of religion or opposition to religion implied by a communist system. Therefore, generally Ambedkar was in favor of continuing a democratic system of parliamentary type under which the poor and backward castes would be able to secure a reasonable protection of their rights and freedom and means of livelihood. Mahatma Gandhi on the whole had a constructive and even forgiving attitude towards the past history, traditions and intellectual heritage, including the ancient literature and epics and others. He certainly argued that wholesale acceptance of these sources or philosophies was insulting to human intelligence. He did emphasize a rigorous examination of the various ideas and ideals recommended by the Vedas, Shastras and the Rishis or Seers of the past. However, over all, he had an admiring attitude and he emphasized a consistent and systematic use of these sources and ideas for nursing the vision of modern India. He felt no difficulty in accepting and commending these intellectual treasures. His attitude was scientific and critical and he was of course against any blind belief and acceptance of any philosopher or hero of the past. To Ambedkar, several aspects, ideas or ideals of the past were revolting. Ambedkar rightly revolted against the exploitative tradition of the Hindus and their discriminatory caste system. He went to some length to trace the origin of the Shudras and their place in the Hindu society. Several of his criticisms appeared to be bitter and unacceptable to the old-fashioned and conservative Hindus. Some of his bold statements aroused controversies and debates. His book on the 'Annihilation of Caste' is a clear example of his bold attitude and philosophy. While some critics believed that this hurt the sentiments of the Hindus, others defended Ambedkar, saying that, as a scholar and intellectual, he had every right to study and draw his own conclusions regarding the epic heroes. The constructive critics held that those who did not agree with Ambedkar had the freedom to offer their own analysis,

NSOU ? CC-SO-04 21 criticism and views to rebut those of Ambedkar. The other dimension of the controversy was whether or not the Maharashtra government was right in bringing out the concerned publication containing Ambedkar's views. Some people felt that the government should not spend public money on such public criticism on the people's heroes like Ram. Of course this view was not accepted. Constructive critics also pointed out that there was nothing wrong if the government published the literature or books of a great leader like Ambedkar although some part of it had contained a criticism of some popular heroes or epics. Public funds were well used and the cause of freedom of expression was well served by undertaking the publication. Suppression of criticism or views even in such basic or sensitive matters was not desirable. This was the overall reaction of the people at large in regard to the issue of Ambedkar's books and arguments. In case of Gandhi, such a situation never arose because his views and arguments, however pungent, were not seen in such a light. Besides, in case of Gandhi most of the books were largely published by private publishers or institutions and the question of criticizing by any government did not arise. It can be stated that both

Dr.B.R.Ambedkar, the architect of the Constitution of India,

who worked very hard for the rights of the Dalits. These two men are highly respected as well as critiqued by many across the world. 1.6 Summary They not only helped India gain its freedom but also made efforts to eradicate the social problems that existed back then. Both of them identified the problems faced by the lower castes and helped them get empowered. They tried to bring about changes in the systems that existed and led India towards development. Though they both identified the evil of untouchability as the biggest curse of the social order, they differed in their approaches towards its removal. They also paved a way for India after independence.

Gandhi and Untouchables 2.3.1 Gandhi's Contribution 2.3.2 Serving Nation by Removal of Untouchability 2.4 Strategies for Eradication of Untouchability 2.4.1 Role of Ambedkar in Removal of Untouchability 2.4.2 Formation of Harijan Sevak Sangh 2.5 Present Day Scenario 2.6 Conclusion 2.7 Summary 2.8 Questions 2.9 Suggested Readings

2.1 Objectives ? To understand the concept of Harijans ? To learn about Gandhi's contribution towards untouchables ? To develop a view about the current situations on untouchability 2.2 Introduction In India, according to the last Census, 101 million people belong to the scheduled castes. This vast group thus, comprises 15 percent of the population but is not concentrated in one area and is widely dispersed in different parts of the country. The members of the group have been diversely known at different times. In the Gupta time they have been described as living apart from village settlements and known as 'Chandala'. The Manusmriti marks off this group as its touch pollutes; it also lays

NSOU ? CC-SO-04 24 down elaborate regulations to perpetuate their segregation from the rest of the population. Some of these regulations are extant even now in the form of disabilities for these people. They are said to be outside of the pale of the Hindu Varna vyavastha. In fact they have been described as 'a-Varna' or without Varna. This idea led the Census Superintendent for Assam in 1931 to suggest the term and throughout his report, it was said to be an improvement on earlier times like depressed classes or outcastes. These groups have been relegated by Hindu custom to such unclean and polluting professions as scavenging, sweeping, leather working and washing clothes. For thousands of years, they are forced to live apart, work apart, eat separately and worship apart. Even in death and after, the distinction lingers. They are excluded from using the common cremation ground. As late as 1946, the Mahajans of Navasari in Gujarat had to be persuaded with great effort to permit the body of an old member of a Scheduled Caste to be cremated on the common ground. Even when they give up their traditional and ritually unclean occupations or take up such respectable roles as cultivators or servants, they continue to suffer the disabilities of their caste status. In certain areas, besides being untouchables, they have been regarded as unapproachable. At one place in the south, these people had to keep away from different levels of upper caste people -33 feet from the lowest group, 66 feet from the second middling caste group, and 99 feet from the Brahmins. Rules ordained that an untouchable had to shout a warning before entering a street so that his contaminating shadow might not fall on the ritually cleaner persons. What style of dress or ornaments he could wear and what not, was prescribed by custom. He could not enjoy music at weddings. Nor could he enter a house belonging to a caste Hindu, or any Hindu temple or draw water from a common well. Disregard of these prohibitions had led to serious consequences. Chamars had been beaten for dressing like Rajputs and mounting of a horse by an untouchable bridegroom for his bridal procession had led to the boycott of the caste in question by higher caste neighbors. In 1931, the Kallar of Ramnad in Tamil Nadu framed ten prohibitions for the exterior castes, viz: 1. Adidravidas and Devendrakula Velalars should not wear clothes below their knees. 2. These men and women should not wear gold ornaments. 3. Their women should carry water in pitchers and not in copper or brass vessels. 4. Their children should not read. 5. Their children should only attend the cattle of Mirasdaras.

NSOU ? CC-SO-04 25 6. They should not cultivate the land. 7. They must sell their land to Mirasdaras at cheap rates. 8. They must work as coolies for a mere pittance. 9. They should not use Indian music in their marriage ceremonies and other festivities. 10. They must stop the practice of going on a palanquin or a horse in a marriage procession. 2.2.1

Coining of the term 'Harijans' The word harijan was used by the poet Narsi Mehta much before Gandhi used it. Mehta himself was a Nagar Brahmin but he was very close to the harijans. Shailendra Mahato, one of the prominent leaders of Jharkhand Mukti Morcha, had come out with a new finding that poet Valmiki was the first to use the term harijan. Perhaps Valmiki himself belonged to an untouchable caste. Mahato had accused Ambedkar of being anti-advasi. He put them in the category of Scheduled Tribes, just to obliterate their separate identity. Sometime back the Indigenous People's Conference was held in Geneva, which vehemently opposed the categorization of the advasi as the "Scheduled Tribes." Mahato also said that Ambedkar never wanted the advasis to have their own representation in the Indian legislatures on account of his minness. It was Gandhi who fought for the rights of all categories of the deprived people including the harijans and others. 2.2.2 Untouchables in different parts of India The untouchables in different parts of India do not form one solid mass. They are split up into hundreds of castes and sub-castes. There are about 1100 such groups. Some of these are spread out in different states and regions and share a common identity and sometimes a common name. Even if they are listed in terms of certain common characteristics and similarities there will still be some 400 separate groups. Each untouchable community has a name, a separate occupation, its own set of rules and more often than not, its own mechanism for social control. These groups practise untouchability amongst themselves. They would not eat together or accept water from the hands of any other untouchable nor do they allow inter-marriage among different groups. The untouchables of Uttar Pradesh consider the untouchables of Punjab lower than themselves. They not only do not inter- marry with them but even do not drink from the same vessel. This shows how strong the notion of untouchability is in the Indian mind. Even though the untouchables are suffering from a number of disabilities on account of this notion, they are unable to give it up even among themselves.

NSOU ? CC-SO-04 26 2.3 Gandhi and Untouchables Having brought up in an orthodox Vaishnava family in a region where untouchability is strong even today, Gandhiji realized the heavy odds against which he had to contend in the campaign for the removal of untouchability. Although he sincerely believed that uplift of the untouchables was an end in itself, there was no doubt that he realized its wide socio-political ramifications. In the unceasing efforts that he made for the attainment of this objective, he did not fail to bring in political and psychological arguments besides the religious. Sociologists have sometimes failed to reconcile Gandhiji's ideas on Varna and caste. Varna, according to Gandhiji, had nothing to do with caste. To him caste was a caricature of Varna and a source of shame to Hinduism and to India. He praised Varna for a number of reasons : it ensured hereditary skill and limited competition, released men for happiness and spiritual pursuits and rejected the idea of superiority and inferiority. The large number of castes and sub-castes together with their elaborate ceremonials did not signify any religious system or order for Gandhiji. Swami Vivekananda held that caste was simply a crystallized social institution and not a religious institution. Gandhiji stoutly denied that there was any sanction for untouchability in the Hindu scriptures. The Bhagwad Gita nowhere shows that the chandala is in any sense inferior to the Brahmin. To him untouchability was a sin. He regarded practice of untouchability as satanic activity. Confronted by a series of quotations from Manu, Brihaspati and Baudhyana , he pleaded literary ignorance of the Shastras but claimed to understand the secret o Hinduism. It was for these reasons that he regarded it is an excrescence of Hinduism. He was however, opposed to the destruction of caste although it sanctioned untouchability. It would be as wrong to do so as to destroy the body because of an ugly truth. Gandhi saw that Hindu society was sharply divided into the caste Hindus and the untouchables. This would be a serious problem for national integration. It was necessary to put up a united front against British imperialism. Removal of untouchability could be an eminently suitable step to defeat the policy of divide and rule employed by the British. It is for this reason that he advanced the argument that Indians could not claim equality to millions of their own countrymen. On one occasion he compared the atrocities committed towards the untouchables by caste Hindus to atrocities committed by the British rulers in Punjab in 1919. His heart was so much grieved at the disabilities and humiliations heaped on the untouchables that he expressed a desire to be reborn an untouchable in the next life so that he might share the sorrow, sufferings and affronts leveled at them. It was essential for religious people to embrace the untouchables as love was the root of religion and the lowly should be raised to one's heart.

NSOU ? CC-SO-04 27 Another plea he advocated that exploitation of the untouchables was the root cause of India's slavery. Gandhiji wanted the end of exploitation of one country by another, and of one person by another. He wanted the end of hatred between one community and another as he thought hate to be considered as one form of violence. Swaraj to him had no meaning unless it meant the removal of untouchability and also of its attendant disabilities. There was indeed a more dire need of Swaraj for the untouchables than for others. As he observed: 'I am not interested in freeing India merely from the English yoke. I am bent upon freeing India from any yoke whatever'. Although Gandhiji was speaking and writing against untouchability long before his epic fast in 1932, it was then for the first time that Indians and the British realized his passion for the work. When new reforms were on the anvil, separate electorate was proposed for the untouchables. He opposed this on the ground that it would perpetuate the segregation of the Harijans and thus make the institution permanent. Dr. Ambedkar favored separate electorate as the best means to give the Scheduled Castes the power to redress the wrongs. Gandhiji embarked on a fast unto death in Yervada prison. Through his fast Gandhiji wanted to throw in the scale of justice. On the sixth day of the fast the British Government relented and the Poona Pact was signed. It signified the abandonment of the scheme of separate electorate and doubled the representation of Scheduled Castes in the state legislatures. On breaking his fast he declared: 'They may hold my life as hostage for its due fulfillment'. 2.3.1 Gandhi's Contribution Gandhi has drawn a comprehensive programme for rendering service to the harijans; though he is fully convinced that one cannot achieve liberation through others. One has to work for it. He believes that unless one eats, he cannot have full stomach or one cannot see heaven unless one meets his death. Basically, his programme for the harijan liberation was for changing the hearts and minds of the caste Hindus. To that end, he and his ashram inmates engaged themselves in daily scavenging work in the ashram and even sometimes in the surrounding areas. He was firmly of the opinion that as part of their atonement for the oppressions of harijans by their ancestors for centuries, the members of the upper caste must serve them in all earnestness. He did believe that the untouchables were true harijans—the children of God. These children of God often made dirty their hands and bodies so that people of other sections of the society could lead a clean and healthy life. If the untouchables failed to perform their work, how could Brahmins lead a life of purity and cleanliness? But all this must change and even the upper caste people would have to undertake their own scavenging work. Hence, he prayed for the day when sweepers would hold the Bhagavad Gita in their hands, and the Brahmins would have

NSOU ? CC-SO-04 28 broomstick in their hands. It is only through such change of social roles that a new social order based on equity and justice could be established. Of late a very clever question has been raised by the people with vested interests. If harijans are the children of God, then are all others the children of Satan? This question itself is based on bad logic. All that Gandhi has meant that the untouchables are as much the children of God as others. Harijans may be the special children of God as they serve his creation with their all strength and sincerity. But he moves further while replying to the above question. He asserts that when the caste Hindus will give up the practice of untouchability voluntarily, only then all "touchable" people will deserve to be truly called harijans. And in such a situation alone the grace of God will come over them. Gandhi has worked for a society free from the scourge of untouchability based on equity, equality and justice. He described himself as a scavenger, weaver, peasant and worker. In the course of his trial, he described his profession as that of a scavenger. He turned himself into a scavenger on his own volition. We should not forget that the word "mehatar" (scavenger) is a derivative of the word mahatar (greater)". He looked at the elimination of untouchability as his life's work and for that he was willing to sacrifice his life. We knew that the aim of his life was to attain moksha (salvation). But he asserted that if at all he would have rebirth, he would prefer to be born as an untouchable so that he could feel their pain and suffering in his own persona. During a meeting at Ahmedabad in 1916 he said with all sincerity and seriousness at his command that he was even willing to offer his head in the course of his effort to eliminate the scourge of untouchability in the society.

2.3.2 Serving nation by removal of untouchability

For Gandhi broomstick was a symbol of revolution. He was of the opinion that society devoid of equality and brotherhood could never reach the state of revolution. Such a society could never fight against slavery. He believed that the Valmikis were the most downtrodden even among the Dalits. They occupied the same place in the society which the mother occupied in the family. He said: 'By treating removal of untouchability as an Ashram observance, we assert our belief, that untouchability is not only not a part and parcel of Hinduism, but a plague, which it is the bounden duty of every Hindu to combat. Removal of untouchability spells the breaking down of barriers between man and man, ultimately leading to unity of all beings. We find such barriers erected everywhere in the world, but here we have been mainly concerned with the untouchability which has received religious sanction in India, and reduced crores of human beings to a state bordering on slavery.'

NSOU ? CC-SO-04 29 It was Gandhiji's practice to attack evils from both ends. Thus, for the eradication of untouchability and uplift of Harijans, the latter had to play a positive role and not to remain silent beneficiaries. He asked them to lead pure lives and adopt clean habits. They should give up beef and carrion eating. They should also give up drinking and abandon untouchability amongst themselves. They were advised not to be violent. They were bound to triumph if they bore their persecution patiently. In case of persecution, they should migrate to other villages. In fact, he approved of the emigration of Scheduled Castes from village Kavitha after intense persecution by caste Hindus. Creating dissatisfaction among them would only tend to perpetuate a vicious division amongst the Hindus.

2.4 Strategies for eradication of untouchability

A number of practical steps were recommended for the removal of untouchability. All public schools, temples and roads that were open to other non-Brahmins should be open to them also. Caste Hindus were asked to open schools for harijan children, to dig wells for them and to render them all personal service that they may need. Propaganda for temperance and hygiene would have to be made among them. On the removal of untouchability, the harijans would have the same status as that enjoyed by others. Gandhiji held that education and reform among the harijans should not be a precondition for removal of untouchability. He believed that unless untouchability was removed, no reform could take place. Removal of untouchability was not an easy task and Harijan Sevaks had to contend against severe opposition. In the village of Kavitha, Rajputs mercilessly attacked helpless harijans for daring to send their children to public school. In Kathiawar, harijans were persecuted by caste Hindus as they were held to be responsible for the outbreak of epidemic among cattle. The most stubborn opposition was to the programme of temple entry by the harijans. Gandhiji insisted on it because he regarded it as one spiritual act that would constitute the method of freedom to the untouchables and assure them that they were not outcastes before God. Some of his impatient and over enthusiastic workers wanted to stage a Satyagraha at the entrance of temples along with harijans to prevent orthodox persons from entering temples. As this would have amounted to compulsion, Gandhiji did not permit it. No one can be purified against his will. The orthodox should be converted to the belief that it was wrong to prevent harijans from entering temples. The Government of Travancore by a proclamation threw upon the door of its state temples to harijans in 1936. Two years earlier, the Temple Entry Bill introduced in the Madras Assembly by a private member

NSOU ? CC-SO-04 30 could not be passed due to stiff opposition of orthodox Hindus and apathy of the Government. Gandhiji's work gave self-respect to the rising generation of Scheduled Castes. B.S.Murthy, a harijan leader from Andhra, once observed: 'The first lesson I learnt from Mahatma Gandhi fifteen years ago is that no one can suppress or depress me except myself'. Gandhi stood for sarvodaya but the journey must start with antodaya. He was never moved by the feeling of pity rather he was driven by a strong sense of duty. That was also true of his work for the harijans. That is why in his scheme of constructive programme, Harijan seva occupied a central position. In Gandhian perspective, both Nelson Mandela and Martin Luther King Jr. were the real messiahs of the poor and the downtrodden. Dr. King always underlined the fact that unless the mind of the Whites had been pure and compassionate, the problems of the Blacks could not be solved. Gandhi exhorted the caste Hindus to undertake Harijan seva as a matter of their self-assigned duty so that they could undergo a genuine change of heart and could reach a state of purity and piety.

2.4.1 Role of Ambedkar in removal of untouchability

The works done by Gandhi and Ambedkar were complementary to each other. Gandhi wanted to bring back the Dalits to the mainstream of the society through service and elimination of untouchability, primarily through a movement for the change of heart of the caste Hindu. On the other hand, Ambedkar wanted to achieve the same goal through getting them involved in a struggle for their liberation. But many people forget that without Gandhi's support, Ambedkar would not have become the Law Minister of the country. Jawaharlal Nehru wanted to bring foreign experts for the making of the Indian Constitution. It was on Gandhi's initiative that Ambedkar was made

100%

MATCHING BLOCK 6/133

SA Full Chapter.docx (D33266361)

the Chairman of the Drafting Committee of the Constituent Assembly.

Gandhi wanted Ambedkar to work as a representative of all sections of the Indian society, instead of remaining just a representative of his own community. Thus, transcending different castes and sub-castes, through the works of Gandhi and Ambedkar, a collective identity of the entire harijan community emerged. That was no small contribution. Gandhi's commitment and contribution to the harijan could be also illustrated by the fact that towards the end of his life he refused to bless any married couple if one of them was not from the untouchable community. On the other hand, we must take into account what Ambedkar said on 25 September 1932 after signing the Poona Pact with Gandhi. He said: 'I must confess that I was surprised, immensely surprised when I met him, that there was so much in common between him and me. In fact, whenever any disputes were carried to him.... I was astounded to see that the man who held such divergent views from mine at the Round Table Conference came

NSOU ? CC-SO-04 31 immediately to my rescue. I am very grateful to Mahatmaji for having extricated me from what might have been a very difficult situation' (The Life of Mahatma Gandhi, by Louis Fischer, Bhavan's eighth edition, 2003, p. 407). Gandhi tried to make caste Hindus to get rid of the feeling and practice of untouchability. Ambedkar, on the other hand, worked to organize Dalits to make them struggle to have their own dignity of life and identity. Thus, their movements, taking to different paths had the same goal—a new sense of dignity and identity for Dalits. As stated earlier, their movements were complementary to each other. It was on account of such movements that a national consensus emerged which led to the abolition of untouchability as provided under Article 17 of our Constitution. It was also made a cognizable offence. It was for the same cause that the Mahatma treated himself as harijan for all practical purposes. He identified himself entirely with them. Among the fundamental duties ascribed under our Constitution, it became the sacred duty of every Indian to work towards the spread of unity and brotherhood among the Indian people, transcending all differences and distinctions based on religion, language, region and class. That idea was also one of the major contributions of Gandhi who not only had perceived such a dream for India, but also had worked tirelessly to that end.

2.4.2 Formation of Harijan Sevak Sangh

For the uplift of the harijans and for preaching the message for the removal of untouchability, Gandhi established in 1933 the Harijan Sevak Sangha. By strenuous efforts he collected large sums for its use. When some harijans demanded that the Sangha be manned only by themselves, Gandhi insisted that caste Hindus should be engaged in this work as they had to atone for their past sins against the harijans. He asked his followers to proceed with the work with utmost patience. Once Gandhi's enthusiastic followers attacked Swami Lal Nath, leader of the orthodox group, as he attempted to make a speech. Pained at this, he undertook a seven day fast to atone for the mistake of his followers. He declared that it was impossible by violence to wean millions of caste Hindus from the evil of untouchability which they had hitherto been taught to regard as an article of faith. He said that a sacred cause cannot be served by a satanic method. He held that means was as important as the end. He asked the caste Hindus not only to show silent sympathy for the cause but to help it actively. If they did not do anything to defend the helpless and downtrodden and remained spectators, they might become abettors to the crime. He knew that untouchability could not be removed through legislation but believed that the aid of law could be invoked when it acted as hinders or interferes with the progress of reform.

NSOU ? CC-SO-04 32 Critics of Gandhi held that the harijan Movement was essentially political in nature. It was motivated by his concern for the solidarity of Hinduism and by his anxiety not to allow the harijans to go out of the Hindu fold. This allegation was promptly denied by Gandhi. The Anti- Untouchability idea had dawned upon him at the age of twelve. It was not without protest that he performed ablutions at his mother's bidding on touching a scavenger called Uka in his school. He was an ardent believer in Advaita philosophy. His passion for the untouchability work was an integral part of his life. So close was his identification with the harijans that he regarded himself as a Bhangi, a scavenger, a weaver and a labourer.

2.5 Present Day Scenario The power seekers and power brokers hardly engage themselves in creating a new social order. Rather they are ever engaged in vitiating, dividing and even destroying the social fabric. We firmly believe that the mind, social fabric and the culture of our country have been built up by our saints and sages. Even the mind of Indian society has been built brick by brick by ardent and high-minded social reformers and spiritualists. But presently a number of political parties have undertaken the task of vitiating its social and cultural mind. It is also a part of such conspiracy that a faceless and mindless assertion is being made to say that Mahatma Gandhi is an anti- Dalit and he even has heaped insults on them by calling them harijans. This is nothing but a shameless attempt to promote their own interests by making caste Hindus and the rest (particularly the Dalit) to fight each other. There is no intention of doing any good to any section of the society, at least of all to the Dalits in the entire game. This is just an attempt to butter their own bread. There is a saying in Vidarbha that which of the bulls engaged in a fierce duel wins is hardly of any concern or consequence to the plot owner. The plot in any case, would be destroyed in the process. This is an undeniable truth. We should never forget that Mahatma Gandhi belongs to all of us, indeed to all humanity. He does not belong to any particular province or caste or language. One who belongs to all, in fact belongs to none. Hence everyone has the freedom to criticize or even condemn him without any rhyme or reason. Power seekers are hardly interested in any objective study of history. They pick up some stray points or incidents out of their historical context to support their allegation even against an innocent and pure person like Mahatma. But they could not change the glaring and truthful facts of history. It is much easier to attack Gandhi without making a close study of our freedom struggle or even his life and teachings. But such attempts confuse the common man. That could be a serious cause for worry. Kusumagraj, a leading poet, has a poem called Akherchi Kamai—the last earning. It

NSOU ? CC-SO-04 33 depicts a scene where five phantoms sit together in a city place and engage each other in a kind of dialogue.

2.6 Conclusion Banishment of untouchability by law alone does not solve the problem. It has to be admitted that untouchability has not been banished from the hearts of millions of people and the hands of law cannot reach all the nooks and corners of the country where petty injustices and discriminations are practised against the untouchables. Shri Jagjivan Ram, who had been a Union Minister for more than two decades, had always been talking of social revolution and held that most harijans still live in 'Psychological cages'. Murthy has observed : 'life is more than law and law cannot solve problems of fundamental human attitudes. The mind of the so-called upper castes has changed very considerably. The change is, however, not yet complete'. This is corroborated by the annual reports published by the Commissioner of Scheduled Tribes and Scheduled Castes. In the year 1966-67, 2,981 complaints were received at the headquarters and in the regional offices of the Commissioner dealing with the practices of untouchability, harassment, land and housing problems, service matters and matters relating to education, drinking water, allotment of shops, etc. While untouchability is not generally met with in towns, it is still rampant in the countryside. At frequent intervals we read news about oppressions heaped on harijan women and children. Sometimes cases of burning of harijans are also reported.

2.7 Summary Progress in this regard is naturally slow. Mental attitudes take time to change. Education, economic betterment, technological development and social mobility are hastening the pace of change and a recent study by Sunanda Patwardhan on the Scheduled Casts of Maharashtra reveals the rapid strides made by them in western India. The twin processes of westernization and sanskritization are at work among them. With a frail body but indomitable will, Gandhiji throws himself in this work, sets its tone and directs it. It is for the present generation to carry the work forward with revolutionary fervor and establish social equality and banish discrimination based on caste. Indeed, it is no exaggeration to say that he lived and died for that cause. Ignoring all this, those who create unnecessary controversy by putting our leaders against each other are failing from their primary duty enshrined under our Constitution out of their mean mindedness and selfish interests. Nay, they are also

NSOU ? CC-SO-04 34 committing a crime against our society and against all Indian people. The whole country should realize this truth in the depth of its being. 2.8 Suggested Readings 1. Harper E.B., Social Consequences of an Unsuccessful low Caste Movement, in Social Mobility In The Caste System In India (The Hague,1968),p.36. 4. Pyarelal, The Epic Fast(Ahmedabad,1952)p.144 5. Sachidananda, Social Change In Village India,1988 6. Tendulkar D.G., Mahatma(Bombay,1952)p.235 2.8 Questions 1. Discuss in brief the role of Gandhiji in banishment of untouchability. 2. Discuss in details the factors responsible for the formation of Harijan Seva Sangh. 3. Critically analyze the role of Ambedkar in removal of untouchability 4. Evaluate the current situation of untouchables in India today. 5. Discuss the sociological significance of untouchables in Indian context. 6. Point out the importance of the position of untouchables as mentioned in ancient scripts.

Unit 3 Ambedkar : Dalit and Hindu Society Structure 3.1 Objectives 3.2 Introduction 3.3 Who are Dalits? 3.4 Gandhi – Ambedkar Debate 3.5 Dalit Identity 3.6 Ambedkar on Hindu society 3.7 Dalit Movement 3.8 Contemporary issues on Dalit 3.9 Conclusion 3.10 Summary 3.11 Questions 3.12 Suggested Readings 3.13 Glossary 3.1 Objectives ? To understand the views and contributions of B.R Ambedkar on the issues of depressed class especially Dalits, their rights and position in the mainstream society along with an extensive study on the Dalit movements. ? To understand the renowned debates between Gandhi and Ambedkar on the various issues related to untouchability, Dalits, conversion of religion, caste system prevailing in the structure of Hindu society. ? To understand the idea of the identity formation and its usage in the processes of our structural society. ? To understand the social livings of the Dalits, their various movements, the transition of their identity from the colonial to post colonial period. 3.2 Introduction “In the Hindu religion, one can[not] have freedom of speech. A Hindu must surrender his freedom of speech. He must act according to the Vedas. If the Vedas do not support the actions, instructions must be sought from the Smritis, and if the Smritis fail to provide any such instructions, he must follow in the footsteps of the great men. He is not supposed to reason. Hence, so long as you are in the Hindu religion, you cannot expect to have freedom of thought” —B.R. Ambedkar (Firstpost 2018) There is a divisional as well as hierarchical differentiation in each and every society. The masses are categorized on the basis of various determinant factors which are rigidly integrated in the structure of our society. From a sociological perspective we always tend to see such divisions as oppressor and the oppressed which is the operating principle in this society. Thereby a new deliberation is needed in order to make the academic world more sensitive and responsive towards the issues and concerns of the subaltern-oppressed communities. Amongst these, the Dalits, who constitute 15% of India’s population, their struggle for moral equality, justice, rights and position have always been a heated debate. B.R Ambedkar was an icon who was remembered principally as the chief drafts man of the Indian Constitution. Also he was a valiant fighter for finding out the suitable place for the Dalits in the existing caste structure. He himself belonged to Mahar caste of Maharashtra of the lowest caste of Maharashtra. His strategies to achieve the goal of empowering Dalits might be shifted with changing contexts but the goal always remained same i.e., attaining equality with caste Hindus in all spheres of life. Ambedkar, himself, strongly advocated for abolishing the caste system and supported Dalit struggles. Ambedkar was not just a political figure but adored by a large mass of India as a prophetic icon. For the Dalits, their transformation from having non existential identity into right bearing citizens was mostly due to his socio-political struggles. His presence provided the Dalits as an inspiration and momentum to new social movements. He inspired the Dalit Buddhist movement and also campaigned against social discrimination towards the untouchables (Dalits). 3.3 Who are Dalits? In simple terms Dalit means ‘oppressed’ ‘broken/ scattered’ in Sanskrit and Hindi. Dalit is mostly used for the ethnic groups in India that have been kept repressed.

88%

MATCHING BLOCK 4/133

W

Dalits are excluded from the four fold Varna system of Hinduism and are seen as forming a fifth Varna, also known by the name of

Panchanama. They are considered impure and polluting and are therefore physically and socially excluded and isolated

NSOU ? CC-SO-04 37 from the rest of society. The Scheduled Castes (SCs) and the Scheduled Tribes (STs) are officially designated groups of historically disadvantaged people in India. In modern literature, the Scheduled Castes are referred to as 'Dalit' which has been popularized by B.R. Ambedkar. They are also known as 'Untouchables' who are members of the lowest social group in the Hindu caste system. 3.4 Gandhi – Ambedkar Debate Gandhi is deeply religious minded in nature. He rejects untouchability, but in Smriti text preached for untouchability . He supports Varna divisions as they are occupational categories. He does not think of them as ascriptive in nature. He believes that religion is about a person's identity. Values and beliefs are attached to it and therefore one cannot change religion by which conversion is not right. On the other hand, Ambedkar argues that Hinduism should be abolished. It is not a religion but is a class ethic. It preaches inequality. There is little hope and space given to the depressed castes, therefore he has recommended change of religion or conversion to other religion. Gandhi argues that upper castes can wash their sins through inter - caste marriages. Ambedkar too recommends inter–caste marriages, but he argues that the upper castes section will never allow doing the same. While seeking solution to the problems of these depressed class called Dalits in one hand, Dr. Ambedkar has inferred from the whole ongoing situation that only the untouchables can lead untouchables towards the assertion of rights in the Hindu structural society.

mohsina phd thesis history & culture.pdf (D131894365)

He never observes the support of any caste Hindu led groups for his mission for Dalits, namely, social justice and equality.

It is very significant to mention that when he has launched his Satyagraha to establish equality among the Hindus by asking the people to allow the Harijans to enter the temples, he has not been supported by either Gandhiji or Hindu leaders or the Indian National Congress. After independence, while quitting the Nehru Cabinet in 1951, he has achieved the realization that the conversion of the Harijans into Buddhism is the only alternative to escape from the dominance of Hinduism (i.e. Brahmanism) and from the curse of untouchability, so as to enjoy an equal status and to live with pride and self-respect on par with others in the Hindu community. It has been the Satyagraha for the human rights as untouchables are denied the use of natural water like the caste Hindus everywhere in the country. They have been prevented to fetch water from the Chavadar tank of Mahad. This Satyagraha helps unite the untouchables to fight for their human rights.

NSOU ? CC-SO-04 38 It is true that Gandhiji himself denounces the practice of untouchability which has been operating in the Hindu society and therefore he has

launched the anti- untouchability campaign for awakening the consciousness of the Hindus to the wrongs inflicted on the Harijan community. He has also helped Harijans to raise their rights and status. But Dr. Ambedkar has not been satisfied with the political approach of Gandhiji and his bona fides. Consequently, Dr. Ambedkar

has been emerged as a prominent leader of the Harijan community specially at the

time of the Poona Pact in Sept. 1932. He vehemently has criticised the way of handling the problems of the Harijans by Gandhiji.

In fact, Gandhiji has viewed untouchability as a political problem and not as a social problem. But Dr. Ambedkar has been afraid that the Gandhian approach in dealing with the problem of untouchability adheres to make caste Hindus more powerful and untouchables weaker. There has been raised deep hostility

According to the Commissioner of Scheduled Castes and Scheduled Tribes, there are many areas where these weaker sections are denied even common access to drinking water. There has been a sharp increase in the atrocities on them, and their socio-economic conditions are deteriorating, despite the Dalit

movements. 3.5 Dalit Identity Sunita Reddy Bharati in her article " Dalit : A Term Asserting Unity" has stated that the term Dalit is a socially constructed identity. She has also stated that the subaltern communities who have been discriminated all these years identify themselves with Dalits. Therefore, they have come together and united in opposition to other groups of the Hindu social order.

NSOU ? CC-SO-04 39 The word Dalit was not first used by B.R Ambedkar, rather this term

70%

MATCHING BLOCK 17/133

was used in 1930's in Hindi and Marathi translation of 'depressed classes' by the British

who called as Scheduled Castes. Sunita Reddy Bharati argued that the 'Dalit Panthers' revived the term in their 1973 manifesto and explained its usage of the term to include several sections or groups such as

80%**MATCHING BLOCK 18/133****SA** Final Copy.docx (D142174335)

the Scheduled Tribes, Neo-Buddhists, working people, landless and poor peasant women and all those being exploited politically, economically, and

were also discriminated on the grounds of religion. "The clearest definition of Dalit in its contemporary usage comes from a letter written to Zelliott by Gangadhar Pantawane, a professor of Marathi at Milind College, now at Marathwada University in Aurangabad, and founder editor of Asmitadarsh (Mirror of Identity), the chief organ of Dalit literature:" To me ,Dalit is not the

caste. He is a man exploited by the social and economic traditions of this country. He does not believe in God, rebirth, soul, holy books teaching separatism, fate and heaven because they have made him a slave. He does believe in humanism. Dalit is a symbol of change and revolution" (

Bharati: 2002) Dalit identity is a term which is used as a label to identify and provide a platform for Dalits in asserting their stand and rights in the mainstream societal structure. 3.6 Ambedkar on Hindu Society For Ambedkar the Hindu code based caste system was the most ancient concept , more than the Vedas based on ascription and dominance. He argued that this form of Hindu fold caste system was the most exploitative, discriminative and rigid structure of the Indian society. He viewed caste as inhuman, undemocratic and authoritarian. His firm belief was that the caste system would hamper the fabric of social unity in the society and generate caste conflicts and wars challenging the basic structure and roots of democracy. He therefore preferred to follow the political approach in dealing with the problems of untouchables and identified their interests, by taking affirmative actions of safeguards and reservations as a solution. His ideas about religion is more of a function of a true religion which is to uplift the individual. For that purpose it should teach the virtues of fellow-feeling, equality and liberty. Religion should mainly be concerned with principles only. It cannot be a matter of rules. The moment it degenerates into rules, it ceases to be religion as it kills responsibility which is the essence of a truly religious act. Religion is for man and not man for religion (Bardia: 2009). He criticised Hinduism, its injustice, Tyranny and humbug. Ultimately Ambedkar renounced Hinduism and embraced Buddhism. Since 1935, he preached his philosophy

NSOU ? CC-SO-04 40 to renounce Hinduism. As mentioned in the earlier section that Ambedkar recommended change of religion or conversion to other religion so that there would be a space for the Dalits to rise to equal position in the mainstream society. While explaining the foundation of Buddha's religion, Ambedkar said that "Buddhism denies the existence of God and soul. The real basis of Buddhism is rational way to eradicate suffering. "There is said Buddha 'suffering in the world, suffering wide spread'. Ninety percent people were afflicted with suffering or misery of some kind or the other. The main object of Buddhism is to emancipate the suffering humanity."(Bardia:2009). Ambedkar was a great admirer of Buddhism. He embraced Buddhism because Buddhism instructed people how they should behave with one another and to do his duty towards each other. The relation with God would be revealed in the light of equality, fraternity and liberty. For him, Buddhism was based on morality. Ambedkar, in his historic speech in Nagpur on October 15, 1956, a day after he had embraced Buddhism, said, "The movement to leave the Hindu religion was taken in hand by us in 1955, when a resolution was made in Yeola. Even though I was born in the Hindu religion, I will not die in the Hindu religion. This oath I made earlier; yesterday, I proved it true. I am happy; I am ecstatic! I have left hell — this is how I feel. I do not want any blind followers. Those who come into the Buddhist religion should come with an understanding; they should consciously accept that religion"(Times of India,2019) 3.7 Dalit Movement The Indian society is segmentally divided on the basis of caste. The status of a person is determined on his caste in which he or she is born. In traditional caste system, the lowest caste lies at the bottom of the social ladder and the upper caste at the top. People belonging to lower caste have to be subjected to various caste disabilities. Amongst these low castes there belong to the Dalits who are also called untouchables and not allowed to change their caste occupation. The extent of disabilities is so high that they are not even allowed to stay in the mainstream society rather they would have to live in the peripheries or the outskirts of villages and towns. These oppressed Dalits have been raised with various struggles to fight against the social exploitation in all forms. It has become evident that there are factors which have made deep impact on caste system which has also brought social upheaval and an awakening among Dalits. Firstly, the impact of western ideas and its values such as liberality of thought, individual freedom and equality which have started making inroads into the traditional matrix of the Hindu social system and the caste and other institutions.

NSOU ? CC-SO-04 41 Secondly, the British administration with its rational and modern concepts such as equality before law and introduction of modern technology created the necessary intellectual and psychological climate for the emergence of social reforms movements. The Scheduled Castes are known as Harijans i.e., the children of God coined by Mahatma Gandhi in 1933. There are many studies on Dalits and its socio-political condition but there are only a few systematic empirically sound studies on their movements. The Mahar movement of Maharashtra has been considered as an all India movement. There has been many contributions by various proponents such as Gail Omvedt, Bharat Patankar, Ghanshyam Shah who have given an

Nandini Gooptu in her study on UP in the early 20th century briefly analysed the emergence of the Adi-Hindu movement in the urban areas of the region. Like Adi-Dharma, the leaders of the Adi-Hindu movement believed that the present form of Hinduism was imposed on them by the Aryan invaders. The movement did not pose a direct threat to the caste system. It was in essence, conceived as and remained a protest against the attribution of stigmatised roles and functions to the untouchable by means of a claim not to be Aryan Hindus; it was not developed into a full blown, direct attack on the caste system.

A section of untouchables who could improve their economic condition either by abandoning or continuing their traditional occupations launched struggles for higher status in the caste hierarchy. They followed Sanskritic norms and rituals. They tried to justify their claim to a higher social status in the caste hierarchy by inventing suitable mythologies.

struggle to get a piece of land from local authorities to install the statue.

91%

MATCHING BLOCK 47/133

SA 1103040002-S.docx (D32634442)

The statues and photos of Dr Ambedkar are an expression of Dalit consciousness and their assertion for identity.

There are several local movements in which Dalits as a mass have to migrate from their villages protesting against discrimination and atrocities. In 1980s there are five such incidents. In protest against torture and beating among the Dalits, the village Sambarda has undertaken hijarat en mass migration like refugees from their native village and camped in the open before the district collector office for 131 days in 1989. Their demand stands for alternative settlement where their life and dignity will be secured. They want to get a concrete solution: alternative land to protect their NSOU ? CC-SO-04 44 dignity. They are able to reach their mission against all odds and collusion between the ruling elite and vested interests. At last the village level movements have been succeeded in mobilizing Dalits in different parts of Gujarat. The Dalit movements are dominated by their middle class raising

100%

MATCHING BLOCK 44/133

W

issues related to identity and reservations of government jobs and political positions. There

is widespread local level assertion against the practice of untouchability and discrimination. Their struggles have brought Dalits on the agenda of mainstream politics. In academic circles the movements have forced a section of intellectuals to critically review not only Indian traditions and culture but also the paradigms of modernity and Marxism. They have exploded number of myths created by Brahminical ideology. The Dalit movements have also successfully built up a good deal of pressure on the ruling classes. However several scholars and activists feel that Dalits have been reduced to a pressure group within the mainstream politics. Gail Omvedt observes that the post-Ambedkar Dalit movement has been ironically only that in the end, a movement of Dalits, challenging some of the deepest aspects of oppression and exploitation but failing to show the way to transformation. 3.8 Contemporary Issues on Dalit The whole issue on the condition of Dalit in our country is still not solved rather it is a data sheet of tragedies. According to a report by National Human Rights Commission (NHRC) on the Prevention of Atrocities against Scheduled Castes, a crime is committed against a Dalit every 18 minutes. Every day, on an average , Dalit women are raped, murdered , Dalit houses are burnt. Dalits live below the poverty line, they are under nourished and 45 percent of the population are illiterate. The data also show that Dalits are prevented from entering police stations in 28 percent of Indian villages. They are also denied access to water sources in 48 percent of our villages because untouchability remains a stark reality even though it has been abolished in 1955. As written in

94%

MATCHING BLOCK 45/133

W

the Constitution – “ The State shall promote with special care the educational and economic interests of the weaker section of the people, and in particular, of the Scheduled Castes and the Scheduled Tribes, and shall protect them from social injustice and all forms of exploitation.” –

Article 46

of the Indian Constitution Even after more than 70 years of independence, Dalits continue to face the violence and discrimination from the contemporary society. One of the recent incident is the NSOU ? CC-SO-04 45 tragic suicide of Rohit Vermula , a Ph D student in the Hyderabad Central University who hanged himself, blaming his birth as a “ fatal accident” in a final note which portrays the failure of Constitution in providing free and fair India. Even after all such incidents there has been no creation of new laws for the protection and upliftment of Dalits. The Protection of Civil Rights Act, 1955, and the SC/ST (Prevention of Atrocities) Act,1989, prescribe punishments from crimes against Dalits that are much stringent than corresponding offences under the IPC. Special courts have been established in major states for speedy trial of cases registered exclusively under these acts. In 2006, former Prime Minister Manmohan Singh even equated the practice of “untouchability” to that of “apartheid” and racial segregation in South Africa. In December 2015, the SC and ST (Prevention of Atrocities) Amendment Bill, passed by Parliament, made several critical changes. New activities were added to the list of offences. Among them were the preventing SCs/ STs from using common property resources., from entering any places of public worship, and from entering an education or health institution. In case of any violation, the new law said that the courts would presume unless proved otherwise that the accused non- SC/ ST person was aware of the caste or tribal identity of the victim. 3.9 Conclusion The term Dalit represents a broader social category of people. With changing time and context, in more recent years, it has become a nationwide phenomenon and is widely used by all untouchables irrespective of traditional and rigid caste distinctions. It has also become a symbol of their social identity. We may be democratic republic, but justice, equality, liberty and fraternity, the four basic tenets promised in the Preamble of our Constitution are clearly not available to all. Dalits continue to be oppressed and discriminate in many villages , in educational institutions, in the job sector, etc., leaving them behind in acquiring a position as equal as others in the mainstream society. 3.11 Summary There is always a question as to why violent incidents still have never decreased but has been always on news even after such protection laws. Chandra Bhan Prasad in his co-authored book “Defying the Odds: The Rise of Dalit Enterprenuers” he has said that caste is not simply a law and order problem. Caste violence can only be

NSOU ? CC-SO-04 46 eradicated with the birth of a new social order. He has also argued that the upward mobility of some Dalits has been caused by market reforms post-1991, ironically this leads to higher incidence of atrocities in the form of a backlash. 3.11 Questions ? Multiple choice questions: 1) Who launched the Dalit Panther movement in the early 1970's? a) Dalits of Maharashtra b) Dalits of North-east c) Dalits of Andhra Pradesh d) Dalits of Uttar Pradesh 2) The book 'Annihilation of Caste' was written by- a) Mahatma Gandhi b) B.R Ambedkar c) Partha chatterjee d) Amartya Sen 3) The term 'Harijan' was coined by- (a) M.Gandhi, b) B.R Ambedkar, (c) Gail Omvedt, (d) J. Nehru ? Answer the following questions: 1) Why are Dalits considered Untouchable? 2) Compare and contrast the views on Dalit's position in the structure of Hindu society? 3) Discuss the issues and causes of the Dalit movement? 4) Enlist the various reforms and measures taken for the discrimination against the Dalit? 3.12 Suggested Readings 1. To understand the twin approaches i.e., the indological approach and ethnographic approach which have been used popularly by various scholars, sociologists and anthropologist to know Indian society. ? To understand in the upcoming sections, the usage of these approaches, its uses, its limitations and the challenges. ? To give an overview description of the process of studying societies through the key principle tools of indology and ethnography.

NSOU ? CC-SO-04 49 4.2 Introduction The

Indological perspective claims to understand Indian society through the concepts, theories and frameworks that are closely associated with Indian civilization.

Ethnographic approach is a qualitative research method. Applying this approach an in-depth study is carried upon by the researcher to study particular group, communities, etc. In this method "fieldwork" plays an important role by which the researcher studies culture of a particular society through close interaction, participation, observation and engagement in the everyday life. 4.3 What is Indology? Indology in literal terms means the study of Indian society and culture. In practice it is an approach to study Indian society with its culture, language, beliefs, ideas, customs, rituals, ceremonies, taboos, codes, institutions and related components which are guided by Indian societal values and civilization. These studies are considered different from the European society, as it has its own approach. Ideology, more specifically, deals with interpretation of ancient texts, and linguistic studies of problems of ancient Indian culture which is supplemented by archaeological, sociological, anthropological, numismatic and ethnographic evidences and vice versa. Historically, Indian society and culture are unique in itself, therefore the Indological approach rests on the assumption that the specificity of Indian social realities could be grasped better through the 'texts'. It may also be viewed that Indological approach refers to the historical and comparative method based on Indian texts in the study of Indian society. Therefore, Indologists use ancient historical texts, epics, religious manuscripts and texts, archaeological evidences, etc., in the study of Indian social institutions. The texts are basically included the classical ancient literatures of ancient Indian society such as Vedas, Puranas, Manu Smriti, Ramayana, Mahabharata and others. Indologists study social phenomena by interpreting these above classical texts. Available data in each of these fields are to be augmented by a great deal of honest, competent and exhaustive field work. None of the various techniques can, by itself, lead to any valid conclusion about ancient India. Combined empirical operations are indispensable in this field study of Indology. Apart from Sanskrit scholars and Indologists, many sociologists have also used traditional texts in extensive way to study Indian society. Therefore, it is called as "textual view" or "textual perspective" of social phenomena as it depends upon texts. Thus, textual variety of such studies that emerged in the late 1970s marks a prominent shift from the European to the American tradition of social

NSOU ? CC-SO-04 50 anthropology. Indological studies generally have been conducted during this period covering a wide range of subjects like social structure, relationships, cultural values, kinship, ideology, etc. Indology demands interdisciplinary, multi-disciplinary and cross disciplinary approaches. Indology is also older than sociology. It is antique owing its origin 1784 by Sir William Jones of Calcutta. It was in the year 1784 that Sir William Jones founded the Asiatic Society of Bengal in India to enhance and further the cause of "Oriental research", in this case, research into India and the surrounding regions. One of the main activities of this organization was to collect the old manuscripts of India, of which there was enormous collection of Sanskrit manuscripts with society. It is the beginning of Indology in India, which has been followed by several other scholars. The studies based on texts that have been conducted by many scholars, sociologist and indologists. Most of these studies are based on textual materials either drawn from epics, legends, myths, or from the folk traditions and other symbolic forms of culture. Most of these are also studied by Indian sociologists. A good number of studies following this method have been done by foreign-based scholars like B. Cohn and M. Singer also. Many founding fathers of Indian Sociology are also influenced by Indology like B.K. Sarkar, G.S. Ghurye, R.K. Mukherjee, K.M. Kapadia, Irawati Karve, P.H. Prabhu, Louis Dumont. 4.4 Orientalist Perspective Within Indology there is the bifurcation of two studies. That is Indology or Indic studies and Oriental studies. Both of them have some commonalities and differences. Indology is a sympathetic and positive picture of non-European society of the East including Indian society and culture. Orientalism gives an unsympathetic and negative account of the Indian society. Indology is said to be the result of westerners' labour of love for the Indian wisdom. And Orientalism emerged as the ideological need of the British Empire. Indologist like William Jones, Louis Renou and Celestin Bouglé in France and Wilson in British India are the reputed figures and the Orientalist include Max Muller, William Archard, Max Weber, Karl Marx. There is a general tendency among the Indologist to exaggerate the virtue of Indian culture. Orientalist were trying to see negative aspect of Indian tradition and rationalize missionary activities and colonial legacy. Indologists had given over emphasized on Indian spiritualist and under emphasized the materialistic culture but the Orientalist did the reverse as they undermined spirituality and over emphasized on materialistic

NSOU ? CC-SO-04 51 culture. The Oriental Institute in Baroda was the second important Indological center in India founded in 1893 by Maharaja of Baroda. The major objective of the institute was to develop a well equipped library of rare and unpublished manuscript and reference books on Oriental and Indological studies. Bernard S. Cohn had analysed orientalist's perspective to explain the textual view. The orientalist took a textual view of India offering a picture of its society as being static, timeless and space less. In this view of the Indian society, there was no regional variation and no questioning of the relationship between perspective, normative statements derived from the texts and the actual behaviour of groups. Indian society was seen as a set of rules, which every Hindu followed (Cohn and Singer, 1968: 8). Bernard S. Cohn further mentioned : "The orientalist tended to be better educated and from the upper classes of Great Britain; same as Sir William Jones were trained as scholars before their arrival in India and they wanted to treat Sanskrit and Persian learning with the same methods and respect as one would treat European learning..." (Cohn, 1998: 10-11). When field studies in many areas of their interest in India became difficult, textual analysis, either of classics or ethnics or field notes from an earlier data, represented a fruitful basis for continued analysis of Indian structure and tradition in the 1970s and 1980s (Singh, 1986: 41). An Indological approach has been the hallmark of several sociologists. They have hammered against the acceptance of theoretical and methodological orientations of the western countries. These scholars have emphasized the role of traditions, groups rather than individual as the basis of social relations and religion, ethnics and philosophy as the basis of social organization. For example, R.N. Saxena (1965: 1-13) agrees with this Indological or scriptural basis of studying Indian society. He has stressed on the role of the concepts of Dharma, Artha, Karma and Moksha. Dumont and Pocock (1957: 9-22) emphasize the utility of Indological formulations. They observe: "In principle,

100%

MATCHING BLOCK 51/133

W

a sociology of India lies at the point of confluence of sociology and Indology".

Indology is representative of people's behaviour or that guides people's behaviour in a significant way. The use of the Indological approach during the early years of Indian sociology and social anthropology is seen in the works of S.V. Ketkar, B.N. Seal and B.K. Sarkar. G.S. Ghurye, Louis Dumont, K.M. Kapadia, P.H. Prabhu and Irawati Karve have tried to explore Hindu social institutions and practices, either with reference to religious texts or through the analysis of contemporary practices. Initially, Sir William Jones established the Asiatic Society of Bengal and also introduced the study of Sanskrit

NSOU ? CC-SO-04 52 and Indology. The knowledge of Sanskrit also helps to understand the great culture and philosophical tradition of India. The Indological writings dealing with the Indian philosophy, art, and culture are reflected in the works of Indian scholars like A.K. Coomarswamy, R.K. Mukerjee, D.P. Mukerji, G.S. Ghurye, L. Dumont and others who have used Indological approach in their research. They have tremendously enriched the field of Indian sociology. 4.5 Indological Perspective : G.S Ghurye The salient features of Indological approach are described in this section exhaustively for better understanding of this approach . As Indian society is unique in itself and therefore can be studied through studying its values and cultures which are different from western society. Indologist emphasizes more on understanding Indian society rather than providing solution to the problems. This perspective seldom uses field view to understand heterogeneity which broadens the perspective and opens up new vistas to study Indian society. He is pioneer in the field of modern indology and he has improved a lot upon the narrow view of Indian society taken by Classical Indologists. His general view of society underlies that Indian society is unique and it should be understood in terms of concept and theories particular to Indian society.

81%

MATCHING BLOCK 52/133

W

According to him, Indian society is a 'Hindu Society' and that cannot be understood without understanding Hindu tradition. He has also emphasized on understanding of order and change in society. Order is understood in terms of specific aspects of society like — caste, religion, village, tribe, urbanization etc. He

has taken into consideration

a dynamic view of Indian society, not only in terms of continuities from the past, but also in terms of understanding the process of change in terms of British influence. The process of change is understood in terms of changing Hindu tradition and he refrains from mentioning any great modernizing influence of British rule. He has

understood caste in terms of its various features and he has mentioned six features of caste as follows: 1. Division of labor 2. Principle of purity and pollution 3. Hierarchy 4. Civil and religious disabilities 5. Hereditary nature 6. Endogamy

NSOU ? CC-SO-04 53 4.6 Categorisation of Indology Indological perspective changes with time and space and with nature of study which is broadly categorized as – 1. Classical Indology It was prevalent before 1920 and was mostly dominated by British Intellectuals. It was purely a book view approach in which Sanskrit texts were translated. Some of the profound proponents were William Jones who established Asiatic Society in Calcutta, Max Muller who wrote the famous book 'Sacred Books of the East' and translated Vedas and other sacred texts. The primary source for their study and understanding Indian society was ancient religious, historical and archaeological evidences. Western scholars had very narrow and critical view about Indian society which was continuously falsified by Indian scholars. India was considered as a land of villages which were self-sufficient, isolated, static and orthodox according to western scholars' viewpoint. Religion was considered central to understanding of other social institutions. Social relationships were guided by traditionalism and caste system. Caste system was considered as closed and a symbol of feudal and backward character of Indian society. Gradually, joint families, Panchayat system and Jajmani system etc., were considered other elements of Indian social structure. 2. Modern Indology With the establishment of sociology as a discipline, the task of understanding society came within its purview. Classical Indology was modified by combining it with various sociological perspectives leading to development of Modern Indology which was sometimes also referred as 'Social Indology'. Modern Indology was used by academicians in contrast to scholars and officials of Classical Indology. G S Ghurye was considered as 'father of Modern Indology'. He synthesized Classical Indological approach with anthropological diffusionist approach. After independence, the use of Indology was continued, but other perspectives remained predominant. Modern Indological perspective criticized orthodox picture of Indian society. Villages were not seen as isolated or static or self-sufficient. Religion was considered the central institution, but nowhere as hindrance to dynamism of Indian society. The present changes on account of colonial rule were also studied. The relevance of joint family, Panchayat systems etc., was emphasized with an Indological approach.

NSOU ? CC-SO-04 54 4.7 Subaltern Perspective Subaltern perspective brought new genre to the analysis of Indian nationalism. This school of thought adopted the "history from below" approach (like European Marxist scholars) for the analysis of Indian nationalism. It was the Antonio Gramsci who used the word 'subaltern' for the subordinate class in terms of class, gender, race, language and culture. Such perspective limits the understanding of Indian society. "In the context of India, Ranjit Guha, in his book Elementary Aspect of Peasants insurgency in Colonial India highlighted the "autonomous domain" of peasant's struggle, which is independent from the elite. According to Guha, elitist historiographies were "unable to put the peasants' conditions and their insurgency in correct perspective as they could not go beyond limitations that were existed in colonial India." Elitist historiography had the view that Indian nationalism is the product of elite. Guha questioned the interpretation of elitist historiography of Indian nationalism on two counts: first, elitist role in the construction of Indian consciousness and second, the making of India as a nation. Subaltern historiographies also question the Marxist school of thought for being tendency of merging into the "nationalist ideology of modernity and progress". Subaltern believed that Marxist school of thought ignored the "ideology of caste and religion" as a factor in Indian history. According to this subaltern school, by ignoring the ideology of caste and religion, somewhere Marxist also followed the same path like the elitists. Therefore, subaltern historiography tried to establish the voice and contribution of marginalized sections of Indian society by adopting the method of looking 'history from below'. Colonialist scholars believed that British rulers, administrators as well as policies, institutions and cultures created the India as a modern nation. On the other hand, nationalist scholars had the view that the personalities of Indian elites with the existing structure developed the ideas to counter the colonial narratives, ultimately shaped the Indian nationalism. According to Ranjit Guha, these two elitist historiographies could be understood primarily as a function of "stimulus and response". Guha argued that rather than guided by idealism or altruism, Indian nationalist tried to get the reward in "form of share of wealth, power and prestige created by and associated with the colonial rulers." For this, there were an interplay of "competition and collaboration" between colonial masters and native elites. Guha had the view that the whole natives' venture of Indian nationalism was guided by idealism in which "Indian elite led to the people from subjugation to freedom." In other words, if one sees the whole arguments of elitist interpretation of Indian nationalism then see

NSOU ? CC-SO-04 55 that it highlights the contribution made by the elites only either 'colonial' or 'native bourgeois'. This elitist historiography has ignored the contribution made by the people on their own, which is independent from elite. Now, if you try to see that later generation of Indian sociologists who had basically adopted or have been trained in the craft of Indology, Ghurye definitely had taken care of the fieldwork traditions along with the issue of the use of the ancient texts. His certain imperial works were still relevant to the social anthropology. So the contribution of Ghurye as an Indologist was very significant to learn the society and culture of Indian society. 4.8 Ethnography The term ethnography comes from the Greek words 'ethnos' (which means people or nation) and 'grapho' (which means 'I write') . Ethnography is a research method which is initially distinctive to social anthropology and later it has been used in sociology and adopted by sociologists, which has emerged to address this specific subject matter. The ethnographic method is a qualitative methodology that involves the practice of "fieldwork" in which the researcher studies, social interactions through participation , observation and engagement in the everyday life culture of a particular society through close interaction,. Thus, the information or the account that is produced from these observations is known as ethnography. When we talk about scientific research or approach it is more of systematic investigation of scientific theories and hypothesis, on the other hand the naturalist approach deals with researcher's own interpretation of the society. For Ethnographers these approaches are seen as a failure in understanding the various aspects of human behavior in a particular setting. The aim of ethnography is to give an analytical description of other cultures doing exploration of a particular phenomenon. This is done by the researcher using observation, exploration, description and explanation through the unstructured accounts and analysis of a particular phenomenon. There are certain techniques that are associated with the practice of fieldwork. The technique of observation is predominantly used as an ethnographic method, in which the researcher observes and records her or his observations of a culture and writes an account. The method of participant observation is commonly followed by ethnographers from the twentieth century onwards, which dates back to the work of Malinowski. In this method the researcher is not just an observer and scientist, but also a fellow person who participates in the life of the society or culture in which he gets immersed for an extended period as one belonging to them and find out the

NSOU ? CC-SO-04 56 hidden facts. Learning the language of a culture is often thought as a central prerequisite for ethnographic fieldwork. Establishing rapport with the 'natives' of a field is a technique that ethnographers follow. The ability to understand a culture with such participation and showing the account to readers who are alien to the culture is an important skill and integral part to ethnographic writings. Ethnography is linked to the lived experience of the ethnographer (Berry, 2011). 4.9 History of Ethnography The zoologist Alfred Cort Haddon who turned as an anthropologist was one of the first scientists who collected ethnographic material from the Torres Straits Islands. The concept of "anthropological fieldwork" was most likely introduced by Haddon from the discourse of naturalists (Stocking 1985: 80). Collections of empirical data and observation were a long tradition among missionaries and administrators of the European colonies in the nineteenth century. Among many anthropologists Lewis Henry Morgan ,who was an American Lawyer began the discourse on the development of formal ethnography from the nineteenth century . Morgan used some of the techniques associated with ethnography to investigate the kinship systems among some native American groups with the aim of comparing it with those of the European- Americans. Bronislaw Malinowski , a Polish born functionalist anthropologist who was often considered to be the founder of contemporary ethnography. Participant observation was one of the key methods in ethnography and his work was one of the most significant one in the field of ethnography. Malinowski spent six years from 1914-1920 in the Trobriand Islands, making three expeditions to his field and writing accounts work on the systems of exchange of the Trobriand Islanders. Bronislaw Malinowski also learned the language of the Trobriand Islanders instead of relying on native interpreters as his forbears had done. This had become the earliest example of a researcher's immersion in the field to produce an ethnographic account. His work was one of the most influential ethnographic works until now. In the Preface of "Argonauts of the Western Pacific: An Account of Native Enterprise and Adventure in the Archipelagoes of Melanesian New Guinea" , James George Frazer writes- "In the Trobriand Islands, to the east of New Guinea, to which he next turned his attention, Dr. Malinowski lived as a native among the natives for many months together, watching them daily at work and at play, conversing with them in their own

NSOU ? CC-SO-04 57 tongue, and deriving all his information from the surest sources - personal observation and statements made to him directly by the natives in their own language without the intervention of an interpreter" (Frazer in Malinowski 2005: v). This became the standard procedure of ethnographic fieldwork. This work set the parameters for the ethnographic method not only in Britain, but also in various debates among anthropologists in the United States of America, across Europe and indirectly it influenced future generations of social anthropologists in India. Another example of an ethnographic study is about William Foote Whyte (June 27, 1914 – July 16, 2000) who was a sociologist profoundly known for his ethnography study in urban sociology, i.e., "Street Corner Society: The Social Structure of an Italian Slum", the book which was published in 1943. He was a pioneer in participant observation, where he lived for four years in an Italian community in Boston. Street corner society described and studied various groups and communities within the district. He gave a detailed account of how local gangs were formed and organized, also described the relations of social structure, politics and racketeering in the particular district. Whyte differentiated between "corner boys" whose lives revolved around street corners and nearby shops and "college boys" who were educated with definite aims how to place them in the social ladder in his study.

4.10 Ethnographers in India

In the Indian context, some of the earliest ethnographies of the twentieth century emerged from fieldwork in the Indian villages. While this was a break from earlier studies of caste practices based on texts like the Manusmriti, it also differed from anthropological accounts of Europeans, and also the 'native' anthropologists began to interrogate and provide accounts of their 'own' cultures. M.N. Srinivas' ethnography of the village of Rampura in the Mysore District, which was published in 1976 as "The Remembered Village" was a canonical text in this regard (Srinivas 1988). This work was significant as it pointed to a shift in the objective of ethnography in the second half of the twentieth century, and because it opened up the debate of how, even a racially and linguistically "native" ethnographer of all intents and purposes, remained an outsider to her/his field. M.N. Srinivas who did his fieldwork in the village of Rampura was a classic example in understanding ethnography. Srinivas spoke the same language as those in Rampura and was by all accounts believed to be more of a native to the village in Mysore state than a British anthropologist would be. At the same time his urban upbringing, his education in other states in India and abroad, his Brahmin identity and his class background set him apart from the villagers in Rampura, a position that is reflected in his ethnography.

NSOU ? CC-SO-04 58

4.11 Thick Descriptions

The approach of 'thick description' in writing ethnography was popularised by the American anthropologist Clifford Geertz in the 1970s. Geertz wrote about thick description in "The Interpretation of Cultures" borrowing the concept from Gilbert Ryle. Thick description as an ethnographic technique is still predominant. It also implies that the observer should interpret culture and not just record actions as "facts". According to Geertz, an ethnographer must present a thick description which is composed not only of facts but also of interpretations. Thick description specifies conceptual structures and meanings, and is opposed to thin description which is a factual account without any interpretation. In his book "Interpretation of Cultures" he outlines the role of an ethnographer and analyses a culture by interpreting signs to understand the deeper meanings within its context. He explains it by giving an example of 'winking' i.e., how a winking can have different meanings and its action can itself be interpreted.

4.12 Advantages and Challenges in Doing Ethnography

The knowledge produced by ethnographic fieldwork of different cultures is different from that of archival research. It allows the researcher to record first hand observations about cultures instead of relying only on textual and other secondary materials that provide a rich source of visual data and help to reveal unarticulated needs. "In the Indian context, the interest in ethnographies of villages in the mid twentieth century emerged in the context of the nationalist imagination. They provided information of local caste practices, social transformations etc., in the villages as opposed to earlier works of indologists who primarily relied on textual sources and on informants. The shift in perspectives arising from the use of different sources of data had been identified as the shift from the "book view" to the "field view" (Srinivas 1996: 200). Ethnography thus helps in understanding the culture, traditions, everyday life of a particular group through ethnographer's lens. Researchers have to be careful so as not to romanticise the culture being observed. Bronislaw Malinowski (1930) cautioned against a tendency of ethnographers to notice and write about the sensational, and of treating customs and beliefs of a culture as a collector might treat savage "curios" (ibid:217). The researcher must not just record observations made in the field, but also try and understand the meanings attached to

NSOU ? CC-SO-04 59 the various actions and practices of the natives in the field. Researcher must be familiar in the language spoken in the field. The linguistic requisite sometimes restricts ethnographer to English speaking sites in a transcultural multi-sited Ethnography. The researcher must conform to a code of ethics so as not to harm or breach the confidence of anyone. Doing fieldwork and immersion in a field of a culture, which is different from the researcher's own culture, is challenging. But an ethnographer can face different kinds of challenges when the field is not too far away from "home", particularly in a discipline where the tradition of a faraway "other" culture has been a model for ethnography (Robben & Sluka 2011). One of the key principal challenges faced by ethnographers is on "returning" from the "field", from the break of their everyday life is how to order the diffuse and varied materials collected in the field and write it accordingly in an arranged order.

4.13 Conclusion Both the above approaches, the Indological method and the ethnographic method are significant and have been key tools for many sociologist, anthropologists, etc., in understanding the in-depth study of a particular group, community, culture, etc. Indology may be said to have come into being when European scholarship discovered Sanskrit. This is generally believed to have happened in the closing years of the 18th century. Likewise if we talk about ethnography, collection of empirical data and observation has been a long tradition among the missionaries and administrators of the European colonies in the nineteenth century.

4.14 Summary Still in the contemporary period, these approaches are used and crafted by contemporary sociologists and anthropologist. These methods have become indispensable in development of research. It helps with getting detailed accounts of everyday life of a particular group through using of scriptural texts or first hand observations.

4.15 Questions

1. Write a short note on Indological perspective of G.S Ghurye?
2. Who is one of the most influential ethnographers whose work has defined the parameters of the ethnographic method in Anthropology?
3. What is one of the central challenges of doing ethnographic fieldwork in another culture?
4. Discuss the Indological approach and ethnographic approach in understanding a particular group?
5. Write a short note on Thick description ?

claims to understand Indian society through the concepts, theories and frameworks that are closely associated with Indian civilization.

Indologists make sense of India through lens of Indian culture. ? Orientalist approach: In art history, literature and cultural studies, Orientalism is the imitation or depiction of aspects in the Eastern world. These depictions are usually done by writers, designers, and artists from the West. ? Subaltern : This describes the lower social classes and other social groups displaced to the margins of society ? Textual View : Indologists analyse social phenomena by interpreting the classical texts. Apart from Sanskrit scholars and Indologists, many sociologists have also used extensively traditional texts to study Indian society. Therefore, it is called as "textual view" or "textual perspective" of social phenomena as it depends upon texts. ? Field View: Field theory examines how individuals construct social fields, and how they are affected by such fields. Social fields are environments in which competition between individuals and between groups take place, such as markets, academic disciplines, musical genres, etc.

The role played by civil society organizations in promoting dalit human rights ? The problems of dalit politics

NSOU ? CC-SO-04 63 5.2 Introduction Dalits have been socially and economically marginalized for centuries. In their efforts to seek social justice, since the early twentieth century they have increasingly engaged with politics, though the roots of the struggles go further back into the past being embedded in their religious and social protest movements. Since the days of British rule they have tried to use the political channel to seek social justice and remedy their conditions. However, the Dalits' engagements with politics were never unilinear; there have been different political attachments, different ideological orientations – often not only diverse but conflicting, and different priorities. Patterns and extent of struggles were largely conditioned by regional social diversities and nature of leadership. The unfurling of the struggles were again impacted upon by the nuances of wider national politics. 5.3 Understanding Caste and the Dalit Status To understand the 'Dalit' and the Dalit situation in India, we need to first understand caste and caste-based stratification as it exists in the country. Caste is not an Indian word; it is a word drawn from Portuguese word 'Casta', meaning pure breed. The corresponding terms used in the Indian languages are 'varna' and 'Jati'. Varna refers to the notional four- fold hierarchic division of society into Brahmins, Kshatriyas, Vaisyas and the Sudras. Jati refers to the numerous endogamous groups, rather localized and having a regional base. Caste position has remained an indicator of both economic power and social status for centuries. Those who are at the top of the caste hierarchy have remained the main beneficiaries of goods and services, while those positioned at the lower end suffer denial. Inter-caste disparities are evident in standards of living, educational attainments, health parameters and economic levels. At the same time, the struggles for changing the balance are equally visible. Etymologically, the word "Dalit" is derived from Sanskrit word "Dalita" - means "oppressed." In the Indian socio-cultural context, they were untouchables located at the lowest end of the caste hierarchy. In ancient times, the untouchables were referred as "Chandala" or "Avarna". The official term used for this section of the population is Scheduled Caste. Today, the untouchable castes are frequently referred to as Dalits. Socio-cultural and economic factors have for thousands of years entrenched the marginalisation of the 'untouchable castes' that form the core of the Dalit population.

NSOU ? CC-SO-04 64 Caste stratification, rooted in Hindu religion, made for the inhuman degradation of a section of the population stigmatizing them as polluting and hence untouchable, leading to their persistent exclusion from goods and services. The products of their labour, of course, were not ostracized. In fact, their stigmatization formed the basis of the surplus extraction of their labour. Marked out as an identity group on the basis of their caste, they were doomed to perform certain demeaning jobs which were essentially labour-intensive, physically hazardous, and of low remunerative value. Aspirations for wealth, power and status were cut at the roots in the name of god and the god-stipulated caste norms, as members of the low castes were prohibited by religious stipulations from accumulating the fruits of their labour. This Brahminical order of society developed from the later Vedic period and crystallized over time into a rigid stratification system. Time and again, ritual power and state authority joined hands to ensure the smooth continuance of the order. The very idea of purity and pollution that stands at the centre of hierarchical caste stratification is violence entrenched. Overt and covert violence takes, inter alia, the form of limiting the social and economic space of the Dalits and has clearly dysfunctional effects in multiple senses. The freedom of socially interacting and inter-marrying is firmly circumscribed by caste norms, just as are the possibilities of economic betterment of the low castes. 5.4 Early Roots of Dalit Politics History abounds with the tales of struggles of the oppressed people. In fact, the struggles for social justice have such a long history in India that its roots are almost as old as the caste system itself. The early struggles were largely articulated in terms of religious discourse and debates, challenging the basics of the Brahminical order and positing more democratic and egalitarian alternatives. Buddhism, Jainism, the Bhakti Movement at a later period of time and numerous village deities or gram devatas were just some of the examples of the alternative non-Brahminical stream searching for a more egalitarian order. By the 1920s the autonomous anti-caste tradition had clearly begun to take shape in India. The Adi movements, unfolding in different parts of the country, were seen to be challenging Hinduism and the Hindus on racial grounds and could be regarded amongst the forerunners of the Dalit movement. In Punjab the Adi Dharm Movement, also referred to as the Ravidasi Movement, developed since the mid-1920s. It had mainly a Chamar following and rested on the preachings of the sixteenth century Bhakti poet named Ravidas. The Ravidasis

NSOU ? CC-SO-04 65 considered themselves to be the original inhabitants of India and regarded their religion as the Adi Dharm. In their opinion, the Hindus had come from outside India and enslaved them. While the first attempts to unite the untouchables could be seen in the formation of the caste federations since the early twentieth century, it was the Adi movements across the country that sought to emphasise separate identity in relation to the Hindu community. At an organizational level we find that in the 1930s three 'pan India' organizations had emerged to deal with caste issues. These early social organizations were not formally organized at an all India level but were linked to political parties through nationwide networks. Interestingly, they revealed three completely different ideological directions and represented three altogether different lines in terms of all India politics. These three organizations were [i] The Depressed Classes Federation. It was an Ambedkarite body which was connected with Ambedkar's Independent Labour Party. [ii] The Depressed Classes League or the Harijan League. It was Gandhian and connected with the Congress party. [iii] The Depressed Classes Association. This organization was linked with right wing Hindus of the Hindu Mahasabha. 5.5 Ambedkar's Struggles Ambedkar (1891-1956) is often referred to as the father of Dalit politics. On a pan- Indian scale, drawing Dalits and Dalit issues into the political arena was done by Ambedkar. B.R. Ambedkar an untouchable Mahar by birth, was born in MHOW near Indore. He has been one of the greatest votaries of social justice and democracy to have come up in modern India. With the arrival of Dr B.R. Ambedkar on India's political scene in 1919, the untouchables' demands for justice came to be articulated in terms of the modern language of politics. His struggle revolved around the vision of 'annihilation of caste'. He was seen to be carving out space for his movement for the emancipation of the untouchables in the crevices left by the contradictions between various Indian political parties and groups on the one hand, and the colonial power on the other. He struggled hard to maximise this space, an effort that eventually led to the placing of the Dalit issue on the national political agenda. At the centre of his struggles was his uncompromising commitment to social justice and his condemnation of the Hindu Brahminical social structure. Ambedkar's academic acumen, extensive knowledge of both Indian and western philosophical thought, his expertise in economics and law placed him in an

NSOU ? CC-SO-04 66 undoubtedly strong position in bargaining for the rights of the untouchables, also called the Depressed Classes. He was a member of the untouchable Mahar caste. His personal experiences as a member of an untouchable caste, the associated pain and the trauma, stimulated his determination to take up their cause for social justice. This he did with firm determination and unmatched skill. For the first time in modern Indian history, the untouchables began learning the use of political tools for protecting their rights. Dr Ambedkar's able leadership was reflected in his presentations before the Simon Commission in 1928, at the Round Table Conferences between 1930-32 as well as in the Constituent Assembly debates where he was the Chairman of the Drafting Committee and subsequently as first law minister of independent India. By the mid-1930s Ambedkar was convinced of the necessity of breaking from the Hindu folds. After long years of thought on the matter, he finally decided to accept Buddhism. His conversion to Buddhism in 1956 shortly before his death was not simply a matter of religious choice; it was essentially a social choice and was inextricably linked to his political struggle. 5.6 Post-Ambedkar Dalit Struggles Ambedkar's followers range across a wide social and political spectrum. To them, Ambedkar is virtually an icon. The untouchable castes, who are today widely known as Dalits, see in Ambedkar the vision of freedom and justice, a dream to be pursued. They do not rally under any single banner, but Ambedkar remains the father figure; each and every political and social stream espousing the cause of the dalits, claim to bear the legacy. From the purely political claims to the Ambedkarite legacy as manifest in the struggles of the Republican Party or the Bahujan Samaj Party, to the neo-Buddhist converts in search for an alternative identity of dignity, the entire spectrum of Ambedkarite following is indeed fascinating. 5.7 The Republican Party of India On 30 September 1956, B. R. Ambedkar had announced the establishment of the "Republican Party of India", but before the formation of the party, he passed away on 6 December 1956. However, his followers and activists planned to go ahead and form the party. As such, it was formally established in 1957. Its founder was N. Sivaraj, who remained its President till 1964. Several of its leaders including B.K. Gaikwad, B.C. Kamble, Dighe, G.K. Mane, Hariharrao Sonule, Datta Katti, were elected to the Parliament in 1957.

NSOU ? CC-SO-04 67 In Uttar Pradesh the Republican Party of India (RPI) was the first relatively successful attempt on the part of the Scheduled Castes to escape the political dominance of the upper castes. It was led by the more prosperous members of the Scheduled Castes in Uttar Pradesh and enjoyed a brief period of organisational coherence and electoral success in the late 1950s and early 1960s. Over the years however, the Party suffered from internal discord and several splinter groups emerged to claim the name of Republican Party of India. From the 1960s the Republican Party weakened as it suffered several splits. It was an ongoing story of splits, unity and more splits. The whole history of splits, reunions and renewed splits in the RPI had hardly any ideological basis; clash of personalities and personal political ambitions seemed to play the dominant role. 5.8 The Dalit Panthers As the Republican Party of India split following factional feuds, the Dalit Panthers emerged to fill the vacuum. In the early 1970s, the Dalit Panther Movement emerged in Maharashtra. It was, in fact, part of the country-wide wave of radical politics. The Panthers relied on the teachings of both Marx and Ambedkar and also drew inspiration from the Black Panther Movement in the USA. They attempted to build up a grand war against the varna-jati system. Their tools were both political and cultural. However, the long-lasting impact of the Panthers in the field of Dalit culture was perhaps more than in the field of politics. Through their efforts there emerged an altogether new genre of protest literature. Dalits, associated with and inspired by the movement, articulated their interests through a wide range of creations – stories, novels poetry, music and drama. In fact, it would not be an overstatement to say that since the seventies Marathi literature virtually underwent a revolution. Forceful writings came from poets like Daya Pawar, Waman Nimbalkar, Arjun Dangle, Namdeo Dhasal and J.V. Pawar, as also short story writers like Tarachandra Khandekar, Yogiraj Waghmare, Avinash Dolas, Yogendra Meshram and others. However, differences within the Panthers surfaced by the eighties. The major contentious issues were, inter alia, whether or not to include non-Dalit poor and non- buddhist Dalits; whether to give primacy to cultural or economic struggles. And then of course, there were the clashes between personalities, for example, between Raja Dhale and Namdeo Dhasal. Soon splits began to take place and different factions aligned with different political parties.

NSOU ? CC-SO-04 68 5.9 Rise of the BSP and Beyond By the end of the 1980s, Dalit pressure groups and political parties had risen to prominence. Particularly noticeable was the rise of the DS 4, and from it the Bahujan Samaj Party with assertive leaders like Kanshi Ram and Mayawati. The Backward and Minorities Employees Federation (BAMCEF) had been formed by Kanshi Ram in 1973 to further the cause of the marginalized sections. In 1981 Kanshi Ram tried to extend this activity in a political direction, while preserving the “apolitical” status of BAMCEF, by founding another organisation DS-4. The DS 4 was an abbreviation of Dalit Shoshit Samaj Sangharsh Samiti. It was founded on 6 December 1981 by Kanshi Ram to organise Dalits and other oppressed groups of India. Subsequently, Kanshi Ram opted for a political party as a means of engaging with formal politics. And, as such, the BSP was formed in 1984 under the initiative of Kanshi Ram. Here, the movement of Kanshi Ram markedly reflected a different strategy with the focus on the ‘Bahujan’ identity encompassing all the SCs, STs, BCs, OBCs and religious minorities rather than ‘Dalit’ only. It may be noted that in many respects, the BSP inherited the political tradition of the Republican Party of India in northern India. In 2001, Mayawati took the reins of the party from Kanshi Ram.

She served four separate terms as Chief Minister of Uttar Pradesh.

Her meteoric rise since the early 1990s was clearly visible. In course of time, the party’s base was sought to be expanded from bahujan samaj to sarvajan samaj by drawing in the Brahmins. But, Mayawati’s success was followed by successive setbacks over the past several years. By 2017, Mayawati was left with little more than her Jatav base. Brahmins had long abandoned her, seeing more gains elsewhere; Muslims were dismayed at her inactivity in the face of repeated communal clashes. Mayawati had painstakingly built the BSP and mobilised her constituency to produce a winning formula at the polls. But disinclination to delegate and decentralise, and distrust of competent subordinates, besides failure to meet the aspirations of young Dalits, amongst other factors, brought the BSP to a state of stagnation. For a while, the baton of Ambedkarite politics appeared to be passing on to agitationists such as the Bhim Army, and young protestors like those in Bhima Koregaon. A felt need to re-assert Dalit identity gave birth to the Bhim Army in 2015. Bhim Army and its founder Chandrashekhar shot to national prominence after a caste conflict broke out in Saharanpur. It was after the riots and the subsequent arrest of Chandrashekhar that the organisation came into national headlines. Even as its rise to prominence was

NSOU ? CC-SO-04 69 hardly sustained, it did throw up certain major questions and challenges for the existing Dalit leadership. The assertiveness of the Dalits evident in agitations spearheaded by the Bhim Army was, in a sense, replicated a few years later at Bhima Koregaon as hundreds and thousands of Mahars poured into the streets to protest attacks from upper castes on the occasion of the commemoration of the 1818 Battle of Koregaon that is considered to be of legendary importance for the Dalits. 5.10 Dalit Civil Society and the Struggles for Dalit Human Rights From the 1980s and 1990s a visible shift in the nature of social and political mobilizations of Dalits was evident. This was primarily through the rise of the so - called 'New Social Movements'. The issue of caste began to be articulated in terms of identity politics by Dalit groups across the country. Almost everywhere Dalits became more conscious and assertive of their political, legal and constitutional rights. Further, they began to increasingly structure their demands within the wider international human rights discourse. 5.11 The Formation and Role of NCDHR The National Campaign on Dalit Human Rights, known in brief as the NCDHR, was formed in 1998. Its base is in New Delhi. A significant role has been played by the National Campaign on Dalit Human Rights or NCDHR in promoting the struggle for Dalit human rights. In its first phase, it undertook interventions for raising the visibility of Dalit issues at various levels - state, national and international. In phase two, NCDHR's work was instrumental in bringing international attention and media coverage, that drew widespread attention to the injustices and oppression faced by Dalits. To name just a few, the NCHDR was involved in events such as the World Conference Against Racism in South Africa (2001), the World Social Forums, the historic 40-day Dalit Swadhikar Rally across India converging into World Social Forum in Mumbai ('04), the first ever public hearing on The Situation of the Dalits in India, at the European Parliament in Brussels (Dec '06), and the first International Conference on the Human Rights of Dalit Women at the Hague (Nov 2006). In the third phase, NCDHR sought foremost to hold the state responsible for not

NSOU ? CC-SO-04 70 checking the 'impunity' being enjoyed by non-Dalits in the criminal justice administrative system. Specifically, we challenge the state and its justice delivery mechanism, including the Human Rights institutions that are in place, to actually implement and enforce its constitutional and legislative measures to safeguard, protect and promote the basic human rights of Dalits. During this phase, the emphasis was on grass-roots mobilization, linking and strengthening campaigns, alliance building, and systematic monitoring and advocacy of atrocities against Dalits to pressure the Criminal Justice system to act. 5.12 Emergence of the NACDOR Initiated by Centre for Alternative Dalit Media (CADAM), the National Confederation of Dalit Organisations, NACDOR was launched at a three day national conference of Dalit organizations held between 8-10 December 2001 with the participation of about one hundred and fifty Dalit organisations from fifteen states. Since then, many other Dalit organisations approached and joined NACDOR. In less than five years, National Conference of Dalit Organisations (NACDOR) emerged as a powerful assertion of the Dalits. NACDOR on the occasion of India Social Forum in New Delhi, ensured the participation of more than three hundred partner Dalit Organisations. 5.13 Dalit Solidarity Networks From the late 1990s, Dalit Solidarity Networks were set up in different countries to promote the cause of Dalit human rights. Dalit Solidarity Networks have formed in the US, Germany, the UK, the Netherlands, France, Denmark and Sweden. They have brought under their folds individuals as well as concerned groups. Besides, they have linked up with international human rights organisations like Amnesty International and Human Rights Watch for the purpose. Seminars and workshops are organised, websites put up, signature campaigns and petitioning are undertaken. In March 2000, the International Dalit Solidarity Network (IDSN) was formed. It is a network of national solidarity networks, groups from affected countries and international bodies concerned about caste discrimination. It aims at linking grass- root priorities with international mechanisms and institutions to establish 'dalit rights' as 'human rights'. Its work involves encouraging the U.N., E.U. and other bodies to recognise the fact that caste based discrimination must be treated as a central human rights concern.

NSOU ? CC-SO-04 71 5.14 Recent Trends in Dalit Politics Today , alongside the earlier patterns of struggles, Dalits are increasingly attempting to articulate their demands in terms of the global human rights paradigm. A highly articulate Dalit elite, conscious of their rights, began to emerge in India from the first half of the twentieth century itself - thanks to Ambedkar's persistent efforts. Independence, subsequent legal administrative and political developments all acted as boosters in their own ways. Today, it is this Dalit elite which has come forth to assert 'Dalit rights as human rights'. The movement is not a grass-root movement, but the struggles are professedly for each and every Dalit. Those at the helm of the struggle are conscious of the many facets of Dalit oppression, understand the need to mobilise across the country and beyond; they speak of what the state had promised to give, yet failed to deliver over the years; they reprimand the state for its failure to protect Dalit human rights; and, remind the people of the democratic commitment of the state, its support for the Universal Declaration of Human Rights and the long history of struggles against racism. 'Networking' is crucial to the present form of organising. This upcoming leadership is on the whole comfortable with modern technology and use these devices such as the internet, e-mail facilities for the purpose. This is not the rustic, illiterate, unsophisticated Dalit that we come by; it is a largely transformed, intellectually sophisticated Dalit coming into the fore in the process of an unfolding identity. Collective identity, rather than icons have become significant. The 'Dalit' identity historically had reached significant levels in the seventies with the unfolding of the Dalit Panther movement in Maharashtra. Today it is once more the collective identity which comes of age as in place of projecting individual leaders collective identity gets projected as in terms of the NCDHR or Dalit Solidarity Networks. Activation of the Dalit diaspora is momentous. They have already come forth to organise several successful international conferences in different countries focusing on the demands of Dalit human rights. In bringing the issue to the attention of the global community their contributions remain far from insignificant. Dalit struggles have today drawn forth the attention of several international human rights organisations including Amnesty International and the Human Rights Watch apart from a number of NGOs working in different countries. Since the 1990s attention of UN bodies were forthcoming. The new mood and wide mobilisation on the question of Dalit human rights was sharply visible in the context of the U.N.'s 2001 Durban Conference on racism. For the first time the battle lines were elaborately drawn out at the level of the international fora on the question of Dalit human rights, and Dalit politics ascended to new heights.

NSOU ? CC-SO-04 72 Major issues that have come into focus in the course of the Dalits' struggles over the years have been questions related to educational access, land reforms, right to minimum wages, atrocities and discriminatory practices, representation in employment and implementation of reservation facilities. Today, in addition to these and encompassing these, is the question of recognition of the human rights of the Dalits. At the national level, despite a growing visibility of their presence, Dalits have had limited success in making their mark in parliament. Political activism of the Dalits, centring around Ambedkar's philosophy, is prominent mainly among educated and employed middle-class Dalits, neo-Buddhists and castes like Mahars, Chamars , Jatavs . A large section of the Dalit community still remains politically rather inactive. Further, the BSP and the Republican Party have been frequently seen to enter into manipulative politics, building opportunistic alliances with upper caste parties. These apart, several Dalit leaders have got co-opted by the dominant ruling class and are unable to carry ahead the struggle for an alternative discourse. However, the potential importance of the Dalit vote bank is hardly overlooked by mainstream political parties as we find the latter from across the spectrum attempting to reach out to the Dalits from different angles. 5.15 Problems Afflicting Dalit Politics As the Dalit movement in India seeks to strengthen itself and gain momentum, it is not without its problems. Perhaps the biggest problem is that there is no single organizational frame within which the Dalits' struggles can be accommodated. Rather than speaking of a single movement we need to speak of multiple movements; some directly political, some indirectly so. Internal tensions within the movement are clearly visible. While there appears a common bonding amongst Dalit activists in their critique of the 'Hindu' Brahminical order and the acceptance of the iconic stature of Ambedkar evident in the ritualized celebrations of his birth and death anniversaries , tensions and conflicts reflect the fragmentation of the movement. Further, networking between Dalit activists, both political and non-political, remains weak. While both the lines of struggles, the political and civil society based movements are committed to the cause of amelioration of the conditions of the Dalits, they proceed along distinctly different courses, seldom linking up. Leadership is another major problem. Following Ambedkar, no leader of similar stature enjoying support of all Dalit categories , has emerged in the field of Dalit politics. Rather, there are many leaders vying with each other and competing for attention and support of the Dalit masses . Not infrequently have Dalit political groups and parties got caught in the tangle of

NSOU ? CC-SO-04 73 vote bank politics and frequently shifting allegiances have increased their vulnerability to manipulations and criticisms. The reservation issue has been one of the major issues in focus in the contemporary Dalit movement. Yet, its appeal has remained predominantly an urban appeal; the appeal to the rural populace seems weaker. Moreover, as Dalits in their ongoing struggles critique the Brahminical system, they are yet to posit an alternative culture in opposition to it. The absence of a comprehensive alternative culture is a major weakness of the movement. Further, there appears to be an overall lack of understanding of the totality of the Dalit question and the resultant inability to network with other related struggles of marginal people, such as the working classes- tribes- religious and other minorities etc.

5.16 Conclusion The Dalit movement, despite its tremendous potential, has till now remained essentially fragmented. Major differences revolve around questions of targets, leadership, coordination, 'graded inequality', lack of awareness and understanding of the complexities of the issues; widespread illiteracy, the rural –urban divide, political fragmentation, differences along religious lines and on attitudes towards religion, class differences and lack of coordination of movements across regions are some of the visible hurdles. Even as significant advances are noticeable in the field of global networking for Dalit human rights, effective networking amongst Dalit groups have hardly developed at the grass-root levels within the country. At the grass-root levels, Dalit struggles are still waged largely along earlier lines focusing on questions of reservations, education, land rights, displacement, and citizenship rights (where relevant, as in West Bengal). What appears to be in focus at such a level is a fragmented rights approach rather than a holistic human rights perspective and a comprehensive political awareness.

5.17 Summary Dalit politics is essentially structured around the demand for social justice for the most marginalized section of Indian society. While it has early roots in different forms of protest movements, the credit of raising it to the level of a pan-Indian political movement lies with B.R.Ambedkar. The imprint of Ambedkar's struggles remain visible in the unfolding of post-Ambedkar Dalit politics, despite its many deviances. The many faces of Dalit politics as are evident today all claim to owe NSOU ? CC-SO-04 74 allegiance to Ambedkar's legacy. Today, alongside the diverse lines of political struggles undertaken by different Dalit political parties, groups and organisations at the national level, civil society activists have stepped in to take the Dalit issues to the international audience, thus giving Dalit politics a new dimension. The struggles however suffer manifold weaknesses. The future success or otherwise of the Dalit struggles would depend on how soon and how effectively the problems are addressed.

5.18 Questions Broad Questions [each question 18 marks] 1. How did Ambedkar's struggles impact upon dalit politics ? 2. Identify the recent trends in dalit politics. 3. What are the major weaknesses of dalit politics today ? Medium length answers required [each question 12 marks] 1. Discuss in brief the importance of the Dalit Panther Movement. 2. Write a note on the politics of the BSP. 1. How have civil society organizations contributed to the dalit movement ? Short questions [each question 6 marks] 1. Who is a dalit ? 2. Write a brief note on the Bhim Army. 3. Briefly discuss the role of the NCDHR in promoting dalit human rights.

How caste considerations have led to religious conversions. ? Ambedkar's conversion movement ? The plight of Dalits in minority communities. ? The mobilization attempts made by Dalits of minority communities to protect their human rights through conversions. ? The nature of responses to Dalit conversions

6.2 Introduction India is a land of many religious denominations. Hindus comprise the majority of around eighty percent of the population today, while the minorities including the Muslims, Christians, Buddhists and others make up around twenty percent of the total population. Stratification of Indian society along caste lines developed over time, with its origin going

NSOU ? CC-SO-04 76 back some thousands of years in history. Based on the Hindu Brahminical philosophy of Varnashrama Dharma it entrenched the socio-cultural and economic marginalisation of the low, 'untouchable castes', who, variedly termed, today form the core of the Dalit population. This inegalitarian social order germinated in the late Vedic period. In course of time, through the Sutras and Shastras it got firmly structured, resulting in the social marginalisation of a vast section of the population. There were those who were low down in the caste hierarchy, those who were outside the system which included the tribals and those professing other religions referred to by the derogatory term 'Mlechhas', and of course there were the women of all castes and creeds who were deemed to be no superior than the low caste Sudras. Historically speaking, members of the untouchable castes were victims of perpetual Brahminical oppression as they were stigmatized as polluting to the upper orders of society. They were relegated to perform demeaning tasks, socially humiliated, and educationally deprived, and all in the name of religion. Over and above all and subsuming all, they had been denied through generations the very basis of human rights - human dignity. Members of these castes were frequently abused, insulted, beaten up, and even massacred. It is they who form the core of India's Dalit population. It may be noted that, the caste system in India is predominantly rooted in the Hindu religious discourse. Theoretically speaking, the minority religions do not subscribe to the norms of caste- based stratification of society. Yet, at the level of ground reality, the latter are hardly free from the impact of caste and the caste system. This is borne out by several facts. First, within the respective non-Hindu communities, stratification that is akin to caste stratification and influenced by it, is often evident. Secondly, those who have moved from the Hindu fold into these communities through conversion have hardly been free of their earlier caste burdens. Thirdly, many of the converted have come from low Hindu castes or Dalit categories and have been exposed to caste oppression within the new community and also from outside the community. Fourthly, mainstream caste based Hindu society tends to stereotype all religious minorities not simply as the 'other' but rather as the 'inferior other' and thereby relegate them to the virtual position of inferior castes. Under the circumstances mentioned above, post -independence India's democratization process has seen the most complex political interfaces involving caste and assertions of the marginalized, not only belonging to the Hindu fold but also outside.

NSOU ? CC-SO-04 77 6.3 Conversion of Dalits from Hinduism to Other Religions: A Tool of Protest Conversion has long been a language of protest of the socially marginalized caste groups in India. In different parts of the country Dalits, as individuals or in groups, have from the ancient past till today sought solace in religions other than Hinduism. The history of conversion movements clearly shows that Dalits have not been converting to other religions simply because they have preferred to adhere to a different belief system. Most convert because they actively "reject" Hinduism and see conversion as a potent tool for challenging the hierarchies of caste. Sometimes the low castes have set up their own religious orders forming sects such as the Adi Dharm and Matua Dharma, at other times they have turned to alternative institutionalized religious options like Christianity and Islam. The major pre- existing institutionalized religions to which sizeable Dalit conversions have taken place over the years happen to be Christianity, Islam and Buddhism. Dalit converts to other religions are frequent victims of human rights violations. Economic marginalisation, social exclusion and humiliation continue to chase them. That is, neither have they been able to totally escape from the trappings of their earlier identity, nor could they find the anticipated human dignity within the new milieu. On the whole it seems that in many cases conversion to the otherwise egalitarian religions have failed to assure the measure of social justice which the Dalit converts had expected. Here, of course, the responses to conversion have not been uniform in all instances. Sometimes, discrimination is more overt than at other times. But, the humiliation seems to persist. Marginalized as they are, the Dalit converts to other religions have persistently been struggling for their rights. The struggles have been essentially on two fronts. One, in terms of the wider social surroundings. The other is in terms of the non-Dalits within their own religious folds. Struggles of the Dalit converts thus revolve around different issues. Most importantly, they demand social justice and human rights in society at large, within their community and from the state. It is here that the question of reservation has repeatedly come up; and, for the converts, barring the neo-Buddhists, the state response has so far been negative.

6.4 Dalit Muslims' Political Mobilization In the face of caste- based oppression, sections of low caste Hindus converted to Islam at different points of time in history, with the expectation of redemption from caste oppression. However, their problems were hardly resolved as they continued to suffer from caste oppression.

NSOU ? CC-SO-04 78 The Quran upholds the equality of all Muslims. Yet, caste (zat, jati, biraderi) remains a defining feature of Indian Muslim society, with significant regional variations. While the severity of caste among the Indian Muslims is hardly as acute as among the Hindus, and the practice of untouchability is virtually absent, caste and associated notions of caste-based superiority and inferiority still do play an important role in Indian Muslim society. In most parts of India, Muslim society is based on the existence of numerous endogamous and generally occupationally specific caste groups, that have their own caste appellations. Dalit and Backward Caste Indian Muslims are believed to be around 85% of the Muslim population and about 10% of India's population. Caste-like stratification is present amongst the Muslims. We find that Muslims are broadly divided into three categories – Ashrafs [noble born] , Ajlaf [mean and lowly] and Arzal [excluded]. Each of these in turn are sub- divided into different occupational and endogamous groups. The lowest in the hierarchy suffer from discrimination within the community as well as from outside the community. An independent research study was commissioned by the National Commission for Minorities in April 2007. It was conducted by Professor Satish Despande of the Sociology Department of Delhi School of Economics, Delhi University over a period of eight months. The National Sample Survey's 61 st Round survey data (2004-05) was the basis of the data source. It was found that the Muslim Dalits are generally worse off among all Dalits in terms of most economic and educational criteria. Despite their lowly status , the caste-related problems of India's Dalit Muslims are rarely addressed. Contrary to the position of the Dalit Hindus, Sikhs and Buddhists, they are not classified in the 'Scheduled Caste' category; this, despite the fact that they often suffer similar types of discrimination as fellow Dalits of other religious backgrounds. Apart from the lack of official classification as 'Scheduled Castes', the plight of Dalit Muslims suffer also because they receive less attention from their own society since the Muslims clerics consider the caste system , and the ensuing discrimination , as un-Islamic. They refuse to acknowledge that caste discrimination can take place among Muslims. The 1980 Mandal Commission Report had recognized the problem of backwardness among Muslims . In the wake of the Mandal Report, the politics of low caste Muslims gained impetus since 1990s. The rise of a small articulate middle class amongst the low caste Muslims facilitated the process. The All India Backward Muslims Morcha [AIBMM] was set up in 1994 under the leadership of Azaz Ali. The main demand was the scrapping of the 1950 Presidential Order that excluded Dalit Muslims /Christians from the Scheduled Caste list and the demand for making them eligible for affirmative action and other welfare policies that Scheduled Castes are entitled to. Their priority was to gain recognition for Dalit Muslims as Scheduled Castes. Following a split in the organization in 1998, the All India Pasmada Muslim Mahaz [AIPMM] was formed in that same year. This was an

NSOU ? CC-SO-04 79 umbrella organization of a number of Dalit and backward Muslim organizations from states including Bihar, Jharkhand, Uttar Pradesh, West Bengal and Delhi. In contemporary India, particularly in Bihar, Pashmanda movements have attempted to mobilize the low castes in support of their rights. With growing political consciousness, the Pasmada organisations have been attempting to forge links with other low caste organizations across religions. They were seen to mobilize around Mahadalit – MBC- Pasmada bloc . The rising political consciousness of Pasmada Muslims was evident during the 2005 Assembly elections in Bihar. 6.5 Dalit Christians' Struggles for Social Justice It is estimated that there are some sixteen million Dalit Christians in India. They comprise about sixty percent of the country's total Christian population. But, even as converts, their Dalit identity does not seem to leave them. They face discrimination from multiple sources, the most important being - non-Dalit Christians, upper caste Hindus, Dalit Hindus, the state and government and the clerical authorities in the Church. Looking at facts, it is clearly evident that on the whole the occupational patterns of the Dalit Christian are similar to that of the Hindu Dalits. Several studies and reports have highlighted that caste prejudices against Dalit Christians have remained more or less similar both inside and outside Christianity in most parts of the country, especially where the traditional social and occupational relations did not change significantly over time. Converted Dalits are very often still tied up with their caste and traditional occupations as agricultural workers in lands owned by upper castes in rural areas. This reinforces the local power relations which in a way propagate the existing caste practices. As a result, Dalit Christians often become subject to discrimination, slavery, bondage, atrocities and economic exploitation. Reports show that the incidences of atrocities on Christians in general and Dalit Christians in particular have increased in recent years mostly due to the re-emergence of Hindu nationalism and anti-conversion movements. It has been alleged, that Indian-Christian theology tends to be exclusionary and non-dialogical by turning a deaf ear to the collective religious resources of the Dalits and, seeks to foster the hegemonic objectives of the caste communities. It may further be noted that in the works of several Indian-Christian theologians of the nineteenth century emphasis was placed on reconciling the meaning of the Hindu scriptures [the Vedas] with the Christian scriptures [the Bible] and on reinterpreting the incarnation and atonement of Christ through the symbolism of Vedanta. The result was a vision of a national Christian church which would be a haven for Hindu Christians, with the Hindu component being seen primarily along Brahminic lines. This has had a long-lasting impact.

NSOU ? CC-SO-04 80 Over the years, discrimination and marginalisation of the Dalit Christians has been evident within the frame of the Church in varying degrees. This has led to the emergence of the critical Dalit response from within its parameters and has been referred to as Dalit theology. Dalit theology began to take shape in the early 1980's when A.P. Nirmal, then a faculty member at the United Theological College, floated the idea of "Shudra Theology." But now, Dalit theology has come of age and it stands by its own uniqueness and creativity. A.P. Nirmal, James Massey, M.E. Prabhakar, M. Azariah, K. Wilson, V. Devasahayam and F.J. Balasundaram are some of the prominent persons who figure in this theological movement. As theology predominantly became a vehicle to serve the elite interests, marginalizing the Dalits' faith, Dalit theology manifested itself as a counter-theology movement. The attempt was to see Christ and Christianity from a Dalit perspective, carving out their own space within the Church. With the setting up of the Dalit Christian Liberation Movement (DCLM) in south India the struggles of the Dalit Christians for equality and justice received a boost. In some of the northern states too efforts at bringing together the Dalit Christians have been under way. The DCLM submitted a Manifesto to the Tamil Nadu Bishops' conference which demanded inter alia that the Church authorities should enact necessary laws to declare the practice of untouchability within the church as a punishable offence. It also demanded that the authority structure in the catholic church should be decentralized and democratized to incorporate Dalit clergy and lay participation in the decision-making bodies such as parish councils, boards of trustees for education and multipurpose societies, etc. The Bishops of Tamil Nadu , in 1990, acknowledged caste discrimination within the Church as violative of human rights. At the end of the meeting they issued a joint statement outlining certain measures for rectification of the situation. These included the following: that in places of worship and cemeteries, catholic Scheduled Castes should be treated equally; that in admissions to Catholic educational institutions, preference should be given to Catholic Scheduled Castes; in jobs in schools run by the dioceses and religious congregations Scheduled Castes Catholics should be given preference; and, funds mobilized through the joint action of Tamil Nadu Bishops and religious congregations for the higher education of eligible Scheduled Castes Catholics. Further, continuous efforts were to be made to secure the rights of the Christian Scheduled Castes from the Centre and state governments. A National Conference on Human Rights was organised by the National Coordination Committee For Dalit Christians at YMCA in New Delhi on 27 November 1997. Bishops, Members of Parliament, Government officials, Commission Secretaries, Directors of various organisations, Theologians, Priests, Religious, Media Persons etc., participated in the meeting. On 3 October 1998, 7,000 people staged a rally in Delhi, the national capital, demanding the introduction of the long pending bill for constitutional rights for Dalit Christians. The

NSOU ? CC-SO-04 81 rally was attended by around three thousand young people sporting black bands. They came from every corner of India. The rally was inaugurated at the Sacred Heart cathedral by the Most Rev. Dr. Alan de Lastic, Archbishop of Delhi, President of the CBCI. Also present were religious superiors and Christian Dalit leaders. The delegates to the rally were welcomed by Bishop Chinnappa, Chairman Catholic Bishops' Conference of India (CBCI) Commission for SC/ST/BC. In his speech, he criticized the government for delaying the extension of equal rights despite being fully aware of the inhuman conditions in which the Dalit Christians subsist. Loudly voicing their slogans in demand of change, the rally proceeded to parliament but they were blocked in front of the parliament street police station. The Poor Christian Liberation Movement (PCLM) was established in 1990 and registered in March 2000, under Indian Public Trust Act, 1920, as a non-political, non-partisan and non-profit making organisation. The source of inspiration was stated to be Jesus Christ, Dr. Ambedkar and M.K. Gandhi. Interestingly, the PCLM submitted a Memorandum to Prime Minister Dr. Manmohan Singh on 27 August 2004 demanding that instead of meeting the demand of the Church leadership of including the converted Christians in the Scheduled Castes category, a Dalit Christians Finance and Development Board be constituted for the concerted welfare and development of converted Dalit Christians all over the country. They felt that inclusion of the Dalit Christians in the category of Scheduled Castes is not going to make any difference. This , however, seems to be a minority viewpoint amongst the Dalit Christians, as the more vocal opinion appears to be in favour of their demand for Scheduled Caste status. Nonetheless, repeated appeals for recognition of their Scheduled Caste status seems to fall to deaf ears as the Dalit Christians remain denied of reservation facilities on the ground of their being Christians. Here, religion , rather than their socio-economic condition, becomes decisive. 6.6 Ambedkar's Conversion Movement and Navayana Buddhists Ambedkar had systematically charted the course for mass conversion to Buddhism in protest against Brahminical oppression. It came at a particular phase of his struggle in continuation with the other facets of his political movement and was undoubtedly a political protest. On 14 th October 1956, Dr Ambedkar renounced Hinduism along with an estimated half a million other Dalits to embrace Buddhism. The ceremony was undertaken under the

NSOU ? CC-SO-04 82 auspices of a Buddhist monk, Sri Chandramani at Nagpur. There were three stages to the ceremony. In the first stage, Chandramani initiated Ambedkar to the Buddhist faith, the Pancha Shila i.e., the five Precepts namely abstention from killing, stealing, illicit sex, lying and taking intoxicants. This was followed by the Tri Sarana – taking refuge in the Buddha, the Sangha (Brotherhood of Monks) and the Dharma. The recitations were done in Pali, the language of the ancient Theravada literature. In the second stage, Ambedkar spoke in Marathi before the vast assembled crowd and committed himself to twenty two oaths which he had formulated. Of these, the last dozen comprised of his dedication to Buddhism, including his own rendering of the Pancha Shila. The first ten, by contrast, were devoted to a careful set of rejections of Brahminical Hinduism. In the third part of the ceremony, Ambedkar led the masses through the conversion process through a repetition of his twenty two oaths. Here, too, the proceedings were in Marathi. It may be noted that the Buddhists, converted to Buddhism under the auspices of the Ambedkar movement, are referred to as Neo-Buddhists or Navayana Buddhists. Navayana Buddhism, with its rejection of the caste system at its core, represented a revolutionary alternative to Brahminical Hinduism. A look at the twenty two oaths of the conversion, reveals that seven of the first eight oaths [1 to 6 and 8] laid down the rejection of Brahminical deities and traditions. These are followed by two more oaths [9 and 10] embracing social equality, and thus rejecting caste. One more [19] reiterates both these points, typing them up, explicitly as the negation of Hinduism through the adoption of Buddhism. The oaths were as follows: 1. I

95%

solemnly declare and affirm that I shall hereafter lead my life according to the teachings of Buddha'

s Dhamma. The effects of the conversion movement initiated by Ambedkar have been variedly evident. Its greatest impact was on Maharashtra and Uttar Pradesh. Whilst certain scholars tend to suggest that conversion has not made any major difference in the social and occupational life of the converts to Buddhism, according to others, certain advantages have accrued to the Dalits who converted to Buddhism. It is argued that they appear to have improved significantly over the Hindu Dalits in terms of several parameters such as the sex ratio, literacy and work participation. Economic and educational considerations apart, most importantly conversion or Dharmantakaran has emerged as a rallying call for identity formation of the Dalits particularly in western and northern India and continues to be so long after the death of Ambedkar. Special occasions for celebration of events have been identified in terms of the Buddhist conversion tradition. The Diksha bhoomi has virtually emerged as a place of regular pilgrimage of Dalits and the Viharas have come up as gathering grounds for the community. It is not that all, or even a majority of Dalits chose to accept the Buddhist option. In fact, a sizeable portion of the Ambedkarites stayed outside the Buddhist fold. Nonetheless, the impact made on the Dalit political movement by those who chose to become Buddhists is noteworthy. It undoubtedly contributed to the rise of a new awareness and a new elite. In

NSOU ? CC-SO-04 84 the rise of the Dalit Panther Movement in Maharashtra in the 1970s, for example, the impact of Buddhism was clearly evident. Leaders like Namdeo Dhasal and Raja Dhale, belonging to different factions of the movement, recognized the liberating significance of Buddhism. In mainstream Dalit politics of the Bahujan Samaj Party, Kanshiram spoke of Buddhism and his proposed conversion. It is reported that his last rites were done along lines of Buddhist rituals. In 1996, in the meetings aimed at reviving the Republican Party of India in U.P. many spoke about Buddhism as the philosophy that should guide the party and quoted Ambedkar's Buddha and his Dhamma. Even today, Ambedkarite Buddhism continues to be a popular option for the dissatisfied Dalits. Time and again Dalits, in face of mounting atrocities, have converted, or threatened to convert to Buddhism en masse. BSP supremo Mayawati was seen to threaten to convert to Buddhism with her many followers if BJP members did not change what she considered, their disrespectful, casteist, and communal behavior towards the Dalits. In 2001, Ram Raj, president of the All India Confederation of SC/ST Organisations and joint-commissioner in the Income-Tax Department, drove his "Chariot of Buddhism" across the country for six months, urging Dalits to leave Hinduism at a conversion rally planned for Delhi's Ram Lila grounds. In the wake of police withdrawal of permission for the meeting venue, Raj got tonsured at a new venue, changed his faith along with a few thousand of his followers, and adopted a new name, Udit Raj. 6.7 The Politics of Conversion and Re-Conversion It was since the late nineteenth century that efforts were made to draw back or retain in the Hindu fold the low caste Hindus who were seeking to cross the borders of their religion in search of equality. In this respect, the development of the Suddhi ritual by the Arya Samaj was important and came as a response to the Christian and Muslim conversion activities. By the 1890s the Arya leaders started turning their attention to groups such as the Bhangis [sweepers] and chamars [leather workers], many of whom practiced a syncretic mix of local and Islamic beliefs and practices and sought to induct them firmly into the Hindu fold by converting them to Hinduism through Suddhi. The first actual attempts at mass Suddhi among the 'Neo-Muslims' is said to have taken place in 1908 in Bharatpur in eastern Rajputana. In this endeavour, the Arya missionaries were reportedly supported by influential local Hindus. Despite the limited success of Suddhi campaigns undertaken then, and thereafter in different parts of the country, it stirred up sharp reactions from the Muslim leadership. Muslim leaders pledged to counter the Suddhi campaign unitedly, though there were significant differences of opinion amongst different groups regarding the methods to be adopted. In response to the suddhi movement,

NSOU ? CC-SO-04 85 In the early twentieth century, the tabligh made concerted efforts to spread Islam as well as reform neo-Muslims and bring their beliefs and practices in line with normative, spiritual understandings. Even as conversion or the threat of conversion has clearly been a political tool used by Dalits in their struggles for social justice since long, the mass conversion of Dalits to other religions continue to stir anxiety and anger among India's right-wing , political forces. The Suddhi programme initiated by the Arya Samaj in yester years has today virtually merged with the Ghar Wapsi programme spearheaded by right wing organizations like the Viswa Hindu Parishad and the Bharatiya Janata Party [BJP]. The ruling Bharatiya Janata Party (BJP), which is a right-wing party with close ideological and organisational links to Hindu nationalist organisations like the Hindu nationalist Rashtriya Swayamsevak Sangh (RSS), is actively working to halt Dalit conversions. For India's right-wing, it is morally and politically unacceptable for anyone to leave the Hindu religion. While the non-Hindu religious organisations organize mass conversions of Dalits to move them away from Hinduism and caste society in protest against their oppression, Hindu organizations turn to conversions or rather re-conversions of the converted Dalits, terming them as Ghar Wapsi [meaning return to the home] movements to bring the Dalits back into the Hindu fold. Today, in several states including Arunachal Pradesh, Odisha, Madhya Pradesh, Chhattisgarh, Gujarat, Himachal Pradesh, Jharkhand, and Uttarakhan, there are controversial laws placing restrictions on mass conversions from Hinduism; yet, significantly, mass conversions to Hinduism are often seen as being promoted rather than restricted. In the 1980s, the target of anti-conversion legislation was largely Muslims seeking to convert non-Muslims, while Christianity has received more attention since the 1990s . Human rights organizations and institutions have expressed concerns over the years about the rights implications of, and lack of equitable treatment under, these state anti-conversion laws. Further, Dalit converts to non-Hindu religions and those involved in converting them have in different parts of the country , not infrequently become prey of orchestrated mob violence. The excuses for perpetrating the violence have ranged from allegations of forced conversion to the consumption of beef and other prohibited food by the non-Hindu. It is interesting to note that in March 2019, in the context of the forthcoming national elections, Dalit Christians and Muslims organized a joint protest in Delhi and urged the government not to ignore their interests. Four Catholic Bishops were present at the rally as were members of the National Council of Dalit Christians (NCDC), an umbrella organisation for various Dalit Christian group; the National Council of Churches in India (Protestants and Orthodox); and the Muslim All India Jamiat Ul- Hawareen (AIJH).

NSOU ? CC-SO-04 86 6.8 Conclusion Dalit struggles against caste oppression have a long and complex history that can be traced back to thousands of years. The struggles of the low castes waged at the religious, social, economic and political levels have time and again created intricate networks for assertions. Ambedkar's conversion movement was a landmark as thousands of his Dalit followers followed his footsteps in rejecting Hinduism and converted to Buddhism. Thus was born Navayana Buddhism. It was a movement that was simultaneously religious, social and political. Dalit struggles for social justice are not confined to the Hindu Dalit population. It spreads beyond, to embrace the non-Hindu Dalit populace who are no less the victims of caste exploitation. In that struggle, 'conversion' occupies an important place as it emerges as a contentious issue in Dalit politics. The resistance to conversion, pressures for re-conversion and the struggle for dignity upon conversion are the different dimensions of the struggle. 6.9 Summary Conversion of Dalit Hindus to non-Hindu religions has been one of the important tools of struggle of the low caste Hindus since centuries back, in their efforts to escape caste oppression and gain social justice. Prominent options of the religions to convert to have been Islam, Christianity and Buddhism. While conversion itself has often resulted from political assertion, the political struggle very often has to be carried ahead by the converted individual at a different plane after conversion. This becomes necessary as , feeling let down by the state and sections of their own communities, Dalits converted to the minority communities have to come forth and mobilize to demand their rights and dignity . In the overall prevailing context of marginalization, Dalit converts to Christianity and Islam are seen to be struggling for recognition as Scheduled Castes with the hope of gaining the state extended support that Scheduled Caste categories are entitled to. 6.10 Questions Broad Questions [18 marks each] 1. Discuss the problems faced by dalits of minority communities in India. 2. Write a note on the attempts of dalit Muslims to articulate their demands.

NSOU ? CC-SO-04 87 3. Examine the nature of discrimination faced by dalit Christians. Questions where medium length answers are required [12 marks each] 1. How has conversion to Buddhism evolved as a political tool ? 2. Write briefly about the Dalit Panther Movement. 3. Write a brief note on Dalit theology. Short questions [6 marks each] 1. Who are the Navayana Buddhists ? 2. To what extent do you think has conversion helped the dalit communities in overcoming their hurdles? 3. What is the Ghar Wapsi movement ? 6.11 Suggested Readings 1. Ambedkar B. R., The Buddha and His Dhamma, Samyak Prakashan, Delhi, 2nd Edition, 2019 2. What are the safeguards for the OBCs? ? Present conditions of the OBCs. NSOU ? CC-SO-04 89 ? The nature of the minority situation in India. ? Problems faced by the minorities. ? Existing safeguards for the minorities. 7.2 Introduction India has a large and variegated population. There are differences of language, caste, religion and culture, to mention but a few. Drawing on religious traditions, complex societal norms govern the activities of the people, their interactive styles, their occupations, and in fact the entire spectrum of their day to day activities. A glance at this large, variegated population group reveals that sizeable segments of it are socially marginalized and remain excluded from the goods and services available to others. They also comprise a disproportionately large section of those who regularly suffer from a variety of atrocities and denial of rights. It becomes evident on careful scrutiny that the exclusion from goods and services and rights negations of these people is anything but accidental. There is, in fact, a distinct pattern about such marginality, exclusion and violations lending a unique character to the India social scenario. Their societal marginality is both a cause and effect of human rights violations. Moreover, it is, in itself a violation of human rights. 7.3 The Scheduled Castes Rigid , caste-based stratification marks Indian society. A birth- ascribed status in terms of the caste hierarchy imposes permanent disabilities on people at the lower ends of the schema. Inequalities and discrimination built into the system remain violative of the spirit of the Indian Constitution and universal principles of justice and equality. A sizeable section of the population located at the bottom of the social hierarchy are treated as untouchables and suffer worst forms of discrimination. It is this section of the population that has been designated as the Scheduled Castes.

63%**MATCHING BLOCK 64/133****SA** 1103040002-S.docx (D32634442)

The expression Scheduled Caste was coined by the Simon Commission and subsequently embodied in the Government of India Act 1935.

Till then, these castes were variedly referred to as 'untouchables', ' Depressed Classes', and 'Exterior Castes'. Gandhi had attempted to get them recognized as 'Harijans', a term that was not universally accepted. The term Scheduled Castes came from the attempt to list the untouchable castes in a 'Schedule' or list for purposes of granting certain safeguards and facilities to the

NSOU ? CC-SO-04 90 members of those castes for their uplift. The groups whose members were considered as 'untouchables' were listed in a Schedule' in 1936 in order to give effect to the provisions of special electoral representation as per Government of India Act 1935. This was the Government of India (Scheduled Castes) Order 1936. During the process of Constitution-making, Dr B.R.Ambedkar, as member of the Constituent Assembly and Chairman of the Drafting Committee, had repeatedly brought up the question of safeguards for the depressed sections of society. His efforts were fruitful to the extent that compensatory discriminatory measures were embodied in the Constitution to uplift amongst others, the untouchable castes. It was these castes, members of which were identified for the benefits, that continued to be referred to as the 'Scheduled Castes'. The complete list of castes for India was made available in the Constitution (Scheduled Castes) Order, 1950. Reservation for these sections of the population in educational institutions has been permitted under Article 15(4) of the Constitution, while reservation in posts and services has been provided for in Article 16(4), 16(4A) and 16(4B) of the Constitution. Article 17 of the Indian Constitution, which, along with the above mentioned articles, is a Fundamental Right, has abolished the practice of untouchability. Article 46, a Directive Principle of State Policy, speaks of

90%

MATCHING BLOCK 65/133

officer to investigate all matters relating to the safeguards for the

Scheduled Castes. Over the years, based on the framework of constitutional law, an elaborate legal network for providing assistance to members of the Scheduled Castes , also referred to as the SCs , have come into existence. These include reservation of seats in legislatures, employment and educational institutions, scholarship programmes and hostel and maintenance facilities. In addition, there is a whole package of provisions, providing financial assistance under various heads for their benefit. To effectively implement the safeguards built into the Constitution and other statutory laws, the Constitution provides for a statutory commission, namely, the National Commission for Scheduled Castes. 7.4 Problems Faced by the Scheduled Castes The Scheduled Castes comprising of the social category of untouchable castes also called Dalits, suffer various socially imposed disabilities. Traditionally, resting on the concept of purity and pollution, the untouchables were given a very low position in

NSOU ? CC-SO-04 91 the society. Socially stigmatized , they were denied access to temples, the right to use public utilities like wells, public transport as well as educational institutions. Marginalization affected all spheres of their life; there was gross violation of basic human rights such as civil, political, social, economic and cultural rights. They suffered extreme poverty , poor housing conditions as well as low access to resources and entitlements as a whole. Structural discrimination against these groups was entrenched in the form of physical, psychological, emotional and cultural abuse which received legitimacy from the social structure and the social system. Physical segregation of their settlements is common in the villages forcing them to live in the most unhygienic and inhabitable conditions. All these factors affect their health status, access to healthcare and quality of life. There are high rates of malnutrition reported among the marginalized groups resulting in mortality, morbidity and anemia. Access to and utilization of healthcare is adversely affected by their socio-economic status within the society. Constitutional and legal safeguards along with government interventions have brought forth a measure of improvement in the conditions of the Scheduled Caste population on the whole. As a consequence of government's reservation policy, a section of the Scheduled Castes has acquired higher education and thereafter achieved employment in government and non-government sectors. However, notwithstanding these advancements, their problems tend to persist as the pressures from the caste structure of society continue to weigh down on them. It is seen that the large section of child labourers, agricultural labourers, manual scavengers still come from these categories of the population. Members of these castes continue to be under-represented in the higher levels of employment, have marginal or no land holdings and still face discrimination and social stigma in violation of their human rights. They are frequently victims of various forms of atrocities perpetrated against them. In fact, such incidents are alarmingly on the rise.

7.5 The Other Backward Classes or the OBCs : Socially and Educationally Backward Sections of the Population The Objectives Resolution moved by Jawaharlal Nehru in the Constituent Assembly in December 1946 had stated that adequate safeguards would be provided for ' minorities, backward and tribal areas and depressed and backward classes'. In keeping with the spirit of this Resolution, the Constitution makers were not satisfied with simply providing safeguards for the Scheduled Castes and Scheduled Tribes. They had realized that there would be other sections of the population requiring support

NSOU ? CC-SO-04 92 for their uplift in view of their social and educational backwardness. As such, provisions were incorporated in the Constitution that recognized the possible existence of 'socially and educationally backward classes'. Article 15(4) of the Indian Constitution speaks of the socially and educationally backward class. Article 16 (4) uses the term 'backward class' and speaks of inadequate representation in services. Article 340 empowers the state to investigate the conditions of the backward classes for taking suitable measures for their uplift. Article 340 of the Indian Constitution provides for the appointment of a Backward Classes Commission to investigate the conditions of backward classes. The provisions are as follows: (1) The President may by order appoint a Commission consisting of such persons as he thinks fit to investigate the conditions of socially and educationally backward classes within the territory of India and the difficulties under which they labour

100%

and to make recommendations as to the steps that should be taken by the

Union or any state to remove such difficulties and to improve their condition and as to the grants that should be made for the purpose by the Union. (2) A Commission so appointed shall investigate the matters referred to them and present to the President

W

a report setting out the facts as found by them and making such recommendations as they think proper (3) The

President shall cause a copy of the report so presented together with a memorandum explaining the action taken thereon to be laid before each House of Parliament." 7.6 The First Backward Classes Commission or the Kaka Kalelkar Commission In pursuance of the Constitutional provisions, the First Backward Classes Commission was established by a presidential order in 1953. Kaka Kalelkar was its Chairman ; as such, the Commission is often referred to as the Kaka Kalelkar Commission. The Commission submitted its Report in 1955. As per its terms of reference, the Commission was 'to determine the criterion to be adopted in considering whether any section of the people of territory of India (in addition to the Scheduled Castes and Scheduled Tribes specified by notifications issued under Art 341 and 342 of the Constitution) should be treated as socially and educationally backward classes; and in accordance with such criteria, prepare a list

NSOU ? CC-SO-04 93 of such classes' and also 'investigate the condition of all such socially and educationally backward classes and the difficulties under which they labour.' On the basis of its findings, the Commission was

100%

CHAPTER 2 HISTORY AND EVOLUTION OF.docx
(D104810649)

to make recommendations as to the steps that should be taken by the

Union or any state to remove such difficulties and the grants that should be made for the purpose by the Union or any state. In conducting its survey, the Commission adopted certain criteria for determining backwardness which included [i] low position in the traditional caste hierarchy of Hindu society [ii] lack of educational advancement among the major section of a caste or community [iii] inadequate or no representation in government service and [iv] inadequate representation in the field of trade, commerce and industry. Based on such criteria, the Commission identified 2399 castes or communities as backward. Of these, 837 were classified as 'most backward'. The Commission, inter alia, recommended the relating of social backwardness of a class to its low position in the traditional caste hierarchy of the Hindu society. A vast array of measures was suggested which included re-distribution of land, protection of tenants, help to small agriculturists in the form of credit, price support, irrigation facilities and reservations for backward classes in government services. The recommendations of the Commission however were not found acceptable by the Government of India. Years later, the Second Backward Classes Commission was set up at the national level. 7.7 Second Backward Classes Commission: The Mandal Commission The second Backward Classes Commission was set up in 1978; it submitted its Report in 1980. This Commission is known as the Mandal Commission following the name of its Chairman B.P.Mandal who was a former Member of Parliament and headed the five-member Commission. The Commission evolved eleven indicators or criteria for determining backwardness. These were applied to each of the castes and, following extensive investigations, the Commission decided to consider caste as the basic unit for determining backwardness. Based on its investigations, the Commission identified fifty two percent of the population of India as backward. For the uplift of the conditions of the backward population, the Mandal Commission recommended a whole package of programmes including educational concessions, reservation facilities and financial assistance. The NSOU ? CC-SO-04 94 recommended quantum of reservations for the other backward classes or the OBCs was 27%. This was done in view of the legal compulsions of the Balaji Vs state of Mysore [1963] ruling to keep the total quantum of reservations below 50 %. For ten years the Mandal Commission Report was not acted upon by the Government of India. This was the period when the Indian National Congress was in power at the centre. Ten years later, with a change in government at the centre and the National Front led by V.P.Singh coming to power, the Mandal Commission Report was resurrected. In August 1990 the government made an announcement to partially implement the Mandal Report. On the one hand, this evoked sharp reactions across the country and a wave of anti-reservation movements spread rapidly. On the other hand, it also led to a consolidation of forces in support of the Mandal Report. Needless to say, through the process, politicization of castes reached a very high level. 7.8 Religious Minority Communities in India India has a sizeable religious minority population. Of them, the Muslims are the largest minority. The basic criterion for a community to be designated as a religious minority is the numerical strength of the said community. Apart from the Muslims, are the Christians, Sikhs, Buddhists, Jains and others. While the Hindus are an overwhelming majority comprising nearly eighty percent of the population, Muslims who are the largest minority community as per the 2011 Census comprise 14.23% of the total population. The minority communities in India tend to suffer from various problems in view of their minority status. While there is a measure of commonality about some of their problems, they are not identical. 7.9 The Constitutional Status of the Minorities The Indian Constitution uses the word "minority" and its plural forms in several of its articles, but does not proceed to define it. One can nevertheless infer from Articles 29 and 30 read together that the term primarily refers to religious and linguistic minorities. Article 29 of the Constitution provides for — Protection of interests

No citizen shall be denied admission into any educational institution maintained

by the state or receiving aid out of state funds on grounds only of religion, race, caste, language or any of them. Article 30

of the Constitution speaks of – Right of minorities to establish and administer educational institutions. (1) All minorities, whether based on religion or language, shall have the right to establish and administer educational institutions of their choice. (2) The state shall not, in granting aid to educational institutions, discriminate against any educational institution on the ground that it is under the management of a minority, whether based on religion or language. On the whole, it can be asserted that India's Constitution encompasses provisions that emphasize complete legal equality of its citizens regardless of their religion or creed, and prohibits any kind of religion-based discrimination. It also provides safeguards—albeit limited ones—to religious minority communities. The Constitution has several in-built legal safeguards for the minorities. Articles 15(1) and 15(2) prohibit discrimination on grounds of religion. Article 25 promises the right to profess, propagate and practise religion. It is clear that there is no legal bar on any religious community in India to make use of the opportunities [educational, economic, etc.] extended to the people. In 1992 the National Commission for Minorities (NCM) was established by the government to facilitate the safeguarding of the rights of the minorities. It was instituted under the National Commission for Minorities Act of the same year. Six religious communities have been designated as minorities by the union government. These six communities are – Muslims, Christians, Sikhs, Buddhists, Zoroastrians, and Jains. In August 2018 Parliament passed the Constitution (123rd Amendment) Bill, 2017 to grant the National Commission on Backward Classes (NCBC) constitutional status. 7.10 The Problems Faced by the Minorities A number of problems afflict the religious minorities. These problems range from discrimination faced by them to their forced conversions; other constraints faced by these communities include problems of poverty and the feeling of alienation that has developed among them. Some of the main problems faced by minorities in India can be categorized under the following heads: 1. Problem of identity 2. Problem of security 3. Problem Relating to equity. They increasingly feel alienated from the society at large, due to the deprivation faced by them as a direct result of discrimination. This has produced an acute impact on the social and economic life of the members of the minority communities.

NSOU ? CC-SO-04 96 Deprivation of job opportunities, lack of representation in the civil service and politics, and limited access to quality education have led to the members of some of these communities to struggle for maintaining minimum standards of living. The issue of identity is important. The minority communities have felt disoriented and displaced due to their fear of being engulfed by the overwhelming majority. They feel threatened by the proposition of losing their own identity to the majority religious community. Moreover, in the recent times, we have witnessed an alarming rise in communal tensions, riots and hate crimes against the minority communities in India, including the desecration of places of worship. Further, programs like the Ghar Wapsi Movement, have led to the rise of forced conversions in different parts of the country. 7.11 The Largest Religious Minority Community : The Muslims Turning to the largest minority, the Muslims, who have been in focus for social, economic and numerical reasons, to mention a few, have suffered from a persistent sense of marginality. The community has widely suffered economic and educational backwardness and faced segregation of multiple sorts. At least 82 different social groups among Muslims were declared OBCs by the Mandal Commission. According to NSSO survey, 40.7% of Muslims are Muslim OBCs, which comprises 15.7% of the total OBC population of the country. The conditions of the general Muslim category are lower than the Hindu- OBCs who have the benefit of reservation. However, the conditions of Muslim-OBCs were considered to be worse than that of the general Muslim category. While discrimination in jobs and other spheres faced by the Muslim population is rampant, it does not indicate institutionalization of such discrimination. In fact, Indian constitutional law holds out the promise of equality, secularism and justice. It has been more at the level of policy making and implementation that the lacunae becomes apparent. Time and again the government has apparently acknowledged the gravity of the situation but has done little to redeem it. In fact, its actions may be characterized as 'too little', 'too late.' 7.12 The Sachar Committee Report In March 2005 the then Indian Prime Minister Manmohan Singh appointed a high level committee to prepare a report on the Social, Economic and Educational Status of Indian Muslims. The 7-member committee, headed by Justice Rajinder Sachar (retired) submitted its report to the Prime Minister in November 2006.

NSOU ? CC-SO-04 97 The findings of the Sachar Committee revealed that the country's Muslim population are far behind other Socio-Religious Communities (SRCs) in the areas of education, employment, access to credit, access to social and physical infrastructure and political representation. The Report made numerous recommendations for urgent governmental action to redress the problem of Muslim backwardness. The Sachar Committee recommendations were at two levels: One, General Policy Initiatives that cut across different aspects of socio-economic and educational development; Two, Specific Policy Measures that deal with particular issues and/or dimensions (e.g. education, credit, etc). The main recommendations of the Sachar Committee to address the status of the Muslim community in India, included the following : 1. Need for Transparency, Monitoring and Data Availability - Create a National Data Bank (NDB) where all relevant data for various socio-religious categories are maintained. 2. Enhancing the Legal Basis for Providing Equal Opportunities Set up an Equal Opportunity Commission to look into grievances of deprived groups like minorities. 3. Shared Spaces: Need to Enhance Diversity: The idea of providing certain incentives to a 'diversity index' should be explored. 4. Education: a process of evaluating the content of the school text books needs to be initiated to purge them of explicit and implicit content that may impart inappropriate social values, especially religious intolerance. Need to ensure that all children in the age group 0-14 have access to free and high quality education. 5. High quality Government schools should be set up in all areas of Muslim concentration. Exclusive schools for girls should be set up, particularly for the 9-12 standards. This would facilitate higher participation of Muslim girls in school education. In co-education schools more women teachers need to be appointed. 6. Provide primary education in Urdu in areas where Urdu speaking population is concentrated. 7. Mechanisms to link madarsas with higher secondary school board. 8. Recognise degrees from madarsas for eligibility in Defence Services, Civil Services and Banking examinations. 9. Increase employment share of Muslims, particularly where there is great deal of public dealing.

NSOU ? CC-SO-04 98 10. Enhancing Participation in Governance: appropriate state level laws can be enacted to ensure minority representation in local bodies 11. Create a nomination procedure to increase participation of minorities in public bodies. 12. Establish a delimitation procedure that does not reserve constituencies with high minority population for SCs. 13. Enhancing Access to Credit and Government Programmes: Provide financial and other support to initiatives built around occupations where Muslims are concentrated and that have growth potential. 14. Improve participation and share of minorities, particularly Muslims, in business of regular commercial banks. 15. Improving Employment Opportunities and Conditions The Committee suggested that policies should "sharply focus on inclusive development and 'mainstreaming' of the Community while respecting diversity." 7.13 Conclusion Marginal sections of the population in India continue to suffer gross human rights violations, notwithstanding legal and administrative safeguards. The dominant, hierarchical social structure legitimizing disparity stands in the way of leveling down of the inequalities between different strata of the society. While legal –administrative measures are important and have contributed significantly towards the uplift of the marginal sections, the deep-rooted social malaise needs to be understood and addressed. 7.14 Summary In this unit we focus on the Scheduled Castes, Other Backward Classes and the Minorities in India. They are amongst the most marginal sections of India's population. As such, they face diverse problems at multiple levels leading to gross violation of their human rights. There are constitutional safeguards for them both exclusive and in common with others. Commissions and committees have been appointed to investigate the conditions of the OBCs and the minorities. Important amongst them are the Kaka Kalelkar Commission, the Mandal Commission for the OBCs and the Sachar Committee for the Muslim minority. Elaborate recommendations have been made by these bodies for the betterment of these marginal population groups.

NSOU ? CC-SO-04 99 Government action on the recommendations have however remained half-hearted, as only some recommendations have been implemented and others have not been accepted. 7.15 Questions Broad Questions [18 marks each] 1. What are the problems faced by the Scheduled Castes ? 2. Discuss the findings of the Second Backward Classes Commission and the recommendations made by it. 3. What were the main recommendations of the Sachar Committee ? Medium length answers required [12 marks each] 1. Discuss the constitutional provisions relating to the Scheduled Castes. 2. Give an overview of the minority situation in India. 3. Discuss the in-built legal safeguards for the minorities provided for in the Constitution of India. Short questions [6 marks each] 1. What was the mandate of the First Backward Classes Commission? 2. Who are the Scheduled Castes? 3. Who are the Other Backward Classes? 7.16 Suggested Readings 1. Describing the types of mobility. ? Depicting open and closed models- factors and constraints to social mobility. ? Understanding social change in modern India especially through the processes of industrialization, urbanization and modernization, 8.2 Introduction One of the most prominent features of the advanced societies of the present age is the high rate of mobility. Change is inevitable and no human society is immobile. But the rate of change varies from society to society and from time to time. Social

NSOU ? CC-SO-04 101 mobility is a process which involves socio-cultural change due to structural change in the established social, political, economic and cultural institutions of a system or a society. As a result, the attitudes, opinions, customs, ways of acting are changing and people are becoming rational, secular, modern in thought and external behavior and gradually they become individualistic. In this process individuals move from one social position to another within a social space often leading to progressive development of society with respect of time. 8.2.1 Definition by Different Scholars In the Encyclopedia of sociology "social mobility has been defined as movement through "social space" from one status category (the origin) to another status category (the destination)". According to Sorokin (1927), social mobility in its broadest sense is the shifting of people in social space. In other words social mobility is the transition of people from one social position to another. Lipset and Zetterberg (1966) points that social mobility of an individual or group is determined by the shift and ranking of occupation, consumption, social power and social class. People's beliefs, values, norms customs and some of their emotional expressions are different according to their occupational class. The rate of mobility may differ in different dimensions. There is a possibility of having a higher rate of mobility in one dimension and lower in another. Therefore to get a more qualified and accurate conclusions about social mobility they have suggested a conventional operational method of ascertaining mobility by comparing father's and offspring's occupational position. As defined by Barber (1965), social mobility refers to movement either upward or downward between higher or lower social classes; or more precisely, movement between one relatively full time, functionally significant social role and another that is evaluated as either higher or lower. Sethi (1976) states that social mobility brings structural changes in the attitudes and beliefs of the people. This leads to rationality, universality and secular ideology which means equality, freedom and independence for everyone. Kumar (1994) stated social mobilization implies the process in which major clusters of old, social, economic and psychological commitments are eroded and broken and people become available for new patterns of socialization and behavior. Sharma (1997) referred social mobility as the change in the status of individuals(s) or group(s) in relation to a given system of social stratification. This change manifests itself in two forms, either as a threat to the contiguous system and ultimately its displacement by the emergence of a new criterion of status evaluation (vertical mobility

NSOU ? CC-SO-04 102 or structural change) or through changes within the parameters of the system (horizontal mobility or positional change). The importance of social mobility as a concept in sociology is quite obvious. Any change of position in society experienced by an individual or a group has its impact not only on the individual or the group, but also on the society at large. Implicit in invoking the concept of social mobility is the recognition of gradation in a society. The gradation is normally done in terms of power, prestige and privileges. That is to say, a hierarchical structure then operates in such societies. This opens up the possibility of sociological investigation of whether or how an individual or a group gains or loses power, prestige and privileges in a society. In other words, along the line of hierarchy whether one moves up or falls down signifies change of social position that is social mobility.

8.2.2 Factors of Social Mobility

There are multiple factors contributing to social mobility such as:

- (1) Status – Every society provides a different status or position to each individual or a group. Ralph Linton (1958) the eminent anthropologist says that status is the position occupied by an individual in the total social network with respect to every other individual with whom he shares a relationship in the network. Therefore, a person's total status is the sum of his total collection of rights and duties in that society. Factors such as family, the social groups, the norms and values existing in the society determine the status of an individual. These factors are objective and they are already there before the individual is born. The Anthropologists and Socio-Psychologists believe that in a modern society the objective factors are becoming less important and they believe that in achievement-oriented society, the process of socialization and the formation of attitudes in the individual determine the status.
- (2) Education - Education is very important for all round development of an individual. Dubey (1976), Goel (2004) state that education enables the members of a society to perform gainful social roles, develop basic skills, abilities, and performance. It also promotes mobility on the thought level in the society conducive to and in support of national development goals, both long-term and immediate; it determines the aspirations, and vertical and horizontal mobility. In this context, Cohn (1961), Oommen (1964) and Kurane (1999) have stated that education is one of the factors for initiating social change leading to social mobility. Patwardhan (1968) has mentioned that mobility in present day India is determined not only by ascription but also by the level of education one acquires and higher education is an effective means to upward mobility.

NSOU ? CC-SO-04 103

- (3) Occupation – Occupation is an important indicator to study social mobility. Occupational mobility acts not only as an indicator of social change but also as a transmitting agent of new attitudes and behavior. Lipset and Zetterberg (1956) have mentioned that factors such as the growth of service industries, white collar occupation, rise in the proportion of urban occupations with decline of agricultural work, and bureaucracy- all provide impetus for greater social mobility. Further they say that social mobility of an individual or group is determined by the shift and ranking of occupation.
- (4) Change in attitudes and beliefs – To bring a change in larger society, a change has to occur in the attitudinal level of the individuals of the society leading to behavioral changes and progressive action. This in turn may lead to further structural change and social mobility. Sharma (2007) opines that urbanization leads to breakdown of traditional beliefs and this in turn, influences people in changing their attitudes, beliefs and world view and leads to individualism and formalism.
- (5) Extent of social distance – Caste system which is deeply rooted in traditional Indian society is characterized by non-recognition of personal qualities, rigid caste hierarchy, caste endogamy and restrictions regarding eating, drinking and social interaction. Marriot (1959) mentioned that the relative ranking of different castes in a locality depends on the kinds of interactions they have with other castes, particularly in taking and giving of food and water and in their participation in ritual services. But in the present age due to the changing attitudes and liberal outlook the traditional caste hierarchy has weakened. Lipset and Bendix (1967) reported that in the process of social mobility people tend to change his/her friends and move to a new neighborhood. Malik (1979) points out that social mobility brings a change in interpersonal relations.
- (6) Utilization of mass media – Exposure to and utilization of media of mass communication is directly related to mobility process. Since the level of literacy is low in India, the various prevalent social problems are closely associated with traditional attitudes, beliefs and ignorance among people. Agrawal (2004) writes that media utilization in several ways reflects the end use. People who utilize more mass media are expected to be more mobile because these media of mass communications convey new ideas and beliefs and thus help in achieving mobility. In a study conducted by Agarwal in the year 1977 showed that the women who were viewed T.V. gained more knowledge than the men in areas like family planning, health and nutrition. Jha (1985) opines that a higher degree of exposure to channels of communication such as newspapers, T.V. programs, frequency of seeing films are the facts that serve as the indices of modernization. Sanjay (1994) states that people who are exposed to mass media develop a mobile personality that encourages rationality.

NSOU ? CC-SO-04 104 According to M.N. Srinivas (1977) the factors responsible for social mobility are: (1) Sanskritization – Srinivas defines Sanskritization as the process by which a low caste or

tribe or other group follow the customs, rituals, beliefs, ideology and style of life of a high and, in particular, a 'twice-born caste'. Thus, the

lower caste

people imitate the life ways of the upper castes with a view to improve their status within the framework of caste. However, it does not lead to a structural change. Although the change is only positional yet it has significant structural consequences, especially in relation to the orientation of the lower castes towards the traditional upper castes. (2) Westernization – Westernization refers to changes brought due to contact with western culture, particularly with the British. According to Srinivas various caste groups have adopted cultural styles of the British. Besides cultural imitation, many people have absorbed western science, technology, education, ideology and values. 8.3 Social Mobility and Change in India: During British Era In India, social mobility was almost less within a caste system before the British came to India. With the establishment of British rule several new avenues of mobility opened encompassing almost all aspects of Indian society. British rules had opened the new avenues by which land could be sold to anyone, even to low castes who had money. During that period role of missionaries were immense. Land ceiling resulting in new economic opportunities, building of railways, road, canals, and introduction of plantation crops like cotton, tea etc., providing employment to thousands were mentionable. The new opportunities – educational, economical and political were open to all irrespective of caste. Thus, the low castes tried to acquire symbols of high status through possession of political power, education and new economic opportunities. With the gradual transfer of power from British to Indians, the 20th century witnessed a great increase in quantum of mobility in caste system and Sanskritization also played an important role by enabling low castes to move for high castes. In their research works both Latheef and Ahmad (1964) indicated that cause and effect relationships between industrial, agricultural, occupational and communicational changes were now taking place in India owing to increased social mobility. Silverberg (1969) Srinivas (1987) observed that studies on social mobility in India had highlighted positional changes in the form of Sanskritization and Westernization. NSOU ? CC-SO-04 105 Omvedt (1981) stated that class rather than caste was basis of social mobility implying change from agriculture to entrepreneurship and the form of migration from rural to urban areas. The emergence of new business class was not only because of economic forces, but social, political and cultural processes, particularly the social and political history of the region and of the dominant land-owning castes also played an important role. Thus, the state in India brought about economic and political changes having consequences for social mobility eliminating some old persisting tensions and of the emergence of a new system of social stratification. 8.3.1 The Indian Debate on Mobility Studies : Caste-Class Framework It is only with the undertaking of planned development in the country, the creation of the National Planning Commission in 1950, establishment of University Grants Commission in 1956 and various public and private Industries, corporations, factories and other small and medium enterprises brought in sweeping changes in country's socio-economic and political structure. Following the footsteps of west in industrial development, the Indian society began to experience slow but seismic changes in its social structure profile. Traditional markers of identity such as caste, community, clan, language etc., slowly began to co-exist with class, urban, education and occupational identities. Further with world's economic order completely restructured, in post 1990 (popularly known as post-reform period) where the transformation and growth of Indian economy had been attributed to emergence and influence of entrepreneurial private and collective firms leading to the rise of powerful socio- economic and political category called middle class (Manimala, 2011). While the concept is typically ambiguous in popular opinion and common language use, three structural changes in India namely service-sector led economic growth, rapid expansion of urbanization and higher education are undoubtedly resulting in a massive expansion of the middle class. Hence class is a socio-economic category gained attention in sociological and social science literature. Most of the literature available on social mobility in India has predominantly focused on caste mobility in terms of diversification of occupations, Sanskritization and education. The trends it has shown is the similar to the process that Lipset and Bendix in 1959 have analyzed in the inter-generational occupational mobility rankings in post-industrial societies: (1) Most non-manual occupations have more prestige than the manual occupations including the skilled ones. (2) White collar occupations generally lead to have higher incomes than manual employment. (3) Non-manual occupations require more education than the manual occupations.

NSOU ? CC-SO-04 106 (4) Holders of non-manual positions, even paid lower than that of some of the manual workers tend to think themselves as members of middle-class and act out middle class roles in their conception pattern. (5) Low-level non-manual workers are more likely to have political attitudes which resemble those of the upper middle class than those of the manual working class (Dubey, 1975). The economic forces released under British rule resulted in greater mobility within the caste system, and in post – independence period, universalization of education and wide range of technical employment slowly infused the element of class in the social structure. The post reform period introduced a cosmopolitan way of life that brought into existence of international economic organizations having wide range of specialized occupations with different ranking of status attached to it. Therefore, it is necessary for students of mobility studies to understand class element while analyzing social mobility in India but at the same time also recognize the fact that caste as the traditional stratification is not defunct. Over the years caste system has become more subtle in its manifestations in terms of opportunities in education, employment and accessibility of resources but still remains the de facto hierarchical division in terms of rituals, purity and social status rankings. Studies of social mobility in India have not only ignored the relationship between social mobility and politics but have also not come up with a class and caste schema to capture the mobility trends (Bhatt, 1971).

8.3.2 Change and Development in Rural India

Indian society is primarily a rural society though urbanization is growing. The majority of India's people live in rural areas (67 per cent, according to the 2001 Census). They make their living from agriculture or related occupations. This means that agricultural land is the most important productive resource for a great many Indians. Land is also the most important form of property. But land is not just a 'means of production' nor just a form of property or agriculture just a form of livelihood. It is also a way of life. Many of our cultural practices and patterns can be traced to our agrarian backgrounds. There is a close connection between agriculture and culture. The nature and practice of agriculture varies greatly across the different regions of the country. These variations are reflected in different regional cultures. One can say that both the culture and social structure in rural India are closely bound up with agricultural and the agrarian way of life. Agriculture is the single most important source of livelihood for the majority of the rural population. But the rural is not just agriculture. Many activities that support agriculture and village life are also sources of livelihood for people in rural India. For example, a large number of artisans such as potters, carpenters, weavers, ironsmiths, and goldsmiths are found in rural areas. They were

NSOU ? CC-SO-04 107 once part and parcel of the village economy. Their numbers have been steadily lessening since the colonial period. Rural life is also supported by many other specialists and crafts persons as storytellers, astrologers, priests, water-distributors, and oil-pressers. The diversity of occupations in rural India has been reflected in the caste system, which in most regions included specialist and 'service' castes such as washer men, potters, and goldsmiths. Some of these traditional occupations have declined. But increasing interconnection of the rural and urban economies have led to many diverse occupations. Many people living in rural areas are employed in, or have livelihood based in, rural non-farm activities. For instance, there are rural residents employed in government services such as the postal and education departments, factory workers, or in the army, who earn their living through non-agricultural activities. Several profound transformations in the nature of social relations in rural areas took place in the post-independence period, especially in those regions that underwent the green revolution. These included an increase in the use of agricultural labor as cultivation became more intensive; shift from payment in kind (grain) to payment in cash; loosening of traditional bonds or hereditary relationships between farmers or landowners and agricultural workers (known as bonded labor) and the rise of a class of 'free' wage laborers'. The change in the nature of the relationship between landlords (who usually belonged to the dominant castes) and agricultural workers (usually low caste), was described by sociologist Jan Breman (1974) as a shift from 'patronage to exploitation'. Such changes took place in many areas where agriculture was becoming more commercialized, that meant, where crops were being grown primarily for sale in the market. The transformation in labor relations is regarded by some scholars as indicative of a transition to capitalist agriculture. Because the capitalist mode of production is based on the separation of the workers from the means of production (in this case, land), and the use of 'free' wage labor. In general, it is true that farmers in the more developed regions are becoming more oriented to the market. As cultivation becomes more commercialized these rural areas are also becoming integrated into the wider economy. This process has increased the flow of money into villages and expanding opportunities for business and employment. But we should remember that this process of transformation in the rural economy in fact began during the colonial period. In many regions in the 19th century large tracts of land in Maharashtra were given over to cotton cultivation, and cotton farmers became directly linked to the world market. However, the pace and spread of change rapidly increased after independence, as the government promoted modern methods

NSOU ? CC-SO-04 108 of cultivation and attempted to modernize the rural economy through other strategies. The state invested in the development of rural infrastructure, such as irrigation facilities, roads, and electricity, and on the provision of agricultural inputs, including credit through banks and cooperatives. The overall outcome of these efforts at 'rural development' was not only to transform the rural economy and agriculture, but also the agrarian structure and rural society itself. Another significant change in rural society that is linked to the commercialization of agriculture has been the growth of migrant agricultural labor. The large-scale circulation of labor has had several significant effects on rural society, in both the receiving and the supplying regions. For instance, in poor areas where male family members spend much of the year working outside of their villages, cultivation has become primarily a female task. Women are also emerging as the main source of agricultural labor, leading to the 'feminization of agricultural labor force.' The insecurity of women is greater because they earn lower wages than men for similar work. Until recently, women are hardly visible in official statistics as earners and workers. While women toil on the land as landless laborers and as cultivators, the prevailing patrilineal kinship system, and other cultural practices that privilege male rights, largely exclude women from land ownership. The policy of liberalization that India has been following since the late 1980s have had a very significant impact on agriculture and rural society. The policy entails participation in the World Trade Organization (WTO), which aims to bring about a freer international trading system and requires the opening up of Indian markets to imports. After decades of state support and protected markets, Indian farmers have been exposed to competition from the global market. Contract farming is very common now in the production of specialized items such as cut flowers, fruits such as grapes, figs and pomegranates, cotton, and oilseeds. While contract farming appears to provide financial security to farmers, it can also lead to greater insecurity as farmers become dependent on these companies for their livelihood. Contract farming of export-oriented products such as flowers and gherkins also means that agricultural land is diverted away from food grain production. Contract farming has sociological significance in that it disengages many people from the production process and makes their own indigenous knowledge of agriculture irrelevant. In addition, contract farming caters primarily to the production of elite items, and because it usually requires high doses of fertilizers and pesticides, it is often not ecologically sustainable. Another, and more widespread aspect of the globalization of agriculture is the entry of multinational into this sector as sellers of agricultural inputs such as seeds, pesticides, and fertilizers. Over the last decade or so, the government has scaled down its

NSOU ? CC-SO-04 109 agricultural development programs, and 'agricultural extension' agents have been replaced in the villages by agents of seed, fertilizer, and pesticide companies. These agents are often the sole source of information for farmers about new seeds or cultivation practices, and of course they have an interest in selling their products. This has led to the increased dependence of farmers on expensive fertilizers and pesticides, which has reduced their profits, put many farmers into debt, and also created an ecological crisis in rural areas.

8.3.3 Change and Development in Urban India

The nature of urban society as represented in thoughts of urban theorists of modern city greatly have shown contrasting differences in their views. Every place has its distinctive urban characteristic determined by variables as mix of power, space, market and cultural practices. As a result of development in science and technology, there has been industrial development. Due to industrial development, there is urbanization as a result of which urban societies created. Every country has its own urban society. Every village possesses some elements of the city while every city carries some feature of the villages. Different criteria are used to decide a community as urban. Some of them are, for example, population, legal limits, types of occupations, social organizations. The city in the words of Louis Wirth refers to "a relatively large, dense and permanent settlement of socially heterogeneous individuals."

8.3.4 Meaning of Urban Society

An urban area is characterized by higher population density and vast human feature in comparison to area surrounding it. Urban areas are created and further developed by the process of urbanization. Urban areas are places which have the following criteria: 1. A minimum population of 5,000. 2. At least 75% of the male main working population engaged in non-agricultural pursuits 3. A density of population of a least 400 persons per sq. km. The growth of large cities that contain the bulk of a society's population is very recent development. Urbanization is a part of development process. The major features of urban society are given below: Social heterogeneity, secondary relations, anonymity, secondary control, large- scale division of labor and specialization, large-scale social mobility, individuation, voluntary association, social reference, unstable family, special segregation, lack of community feeling, lack of unity in family, moral laxity, unbalanced personality, high incidence of crime, social disorganization, peculiarities of marital life, dynamic life, voluntary

NSOU ? CC-SO-04 110 associations are formed quickly and an overall artificial life. Urban life differs with the rural. It refers to a process which envisages land settlement, agglomeration of diversities, complete transformation of economy from agricultural to industrial, commercial sectors and a wider politico-civic life dependent on institutions of modern living. The urban society is heterogeneous. It is known for its diversity and complexity. It is dominated by secondary relations. Urban society is far away from the nature and natural environment. Mass education is widespread in city. It is a "Complex Multi- Group Society". 8.3.5 City and Village : Continuity and Change in Social Mobility More striking than new opportunities for group mobility within the traditional status hierarchy has been the appearance in recent decades of new status hierarchies with new arenas for status competition. They have emerged from the impact of urbanization and westernization but are not independent of the traditional social organization in which they are based. Urbanism is nothing new in India but rapid urbanization is new. The emergency of industrial employment, of easy communication over long distances, of increasingly efficient distribution of goods and services and of more effective centralized administration has made urban living a more accessible alternative to more people in India than ever before. Urban life affords a measure of independence from the ties and constraints of membership in rural based social groups by granting a degree of individual anonymity and mobility quite unattainable in rural communities. Caste, religion, ritual, tradition and the social controls implicit therein are not as rigid or pervasive in the city. People are increasingly able to seek status and other rewards on an individual or small family basis largely independent of caste or the other larger social entities of which they are also a part. They do this primarily by going to the city although the values of the city also extend into the country-side and have loosened the hold of tradition even there. To a great extent urban Indians can achieve status as a result of behaviors and attributes rather than simply as a result of birth. According to Harold Gould industrialization brought about the transfer of specialized occupations of all kinds from the context of the kin groups to factories organized on bureaucratic principles. This meant that occupational role and role occupant would be in principle separated and that the preponderant criteria for determining occupations would be performance qualities and that economic rewards and social mobility would constitute the principal standards for evaluating the worth or the status of any given role. Traditional status -caste status did not disappear in the city. It remained important in the most private contexts; the family and neighborhood. Some neighborhoods essentially reproduced the village setting in personnel as well as social structure; others do not.

NSOU ? CC-SO-04 111 A very large proportion of city dwellers are in close touch with their native villages. Tradition and ascription are important in the city in those relationships upon which the day-to-day functioning and future composition of the family depends of which the epitome is marriage. In the city primary relationships occupy a diminishing proportion of most people's time, attention and energies. Much of the individual's interaction takes place on the basis of particular or even fragmented roles. He can often behave in a way consistent with the requirements of the situation without reference to his group membership. He is even able to pass if that is his desire by learning the superficial symbols of the status such as that of white-collar worker, student, middle class householder or professional. In these statuses skill in handling the language, in pursuing the occupation or success in acquiring money or an appropriate life style may be socially recognized and rewarded irrespective of caste and family. 8.4 Conclusion Contemporary urban life has available more means to mobility and suggests to those who seek it a greater likelihood of success than the highly structured closely controlled traditional village setting. Mobility occurs in all settings. Some low status groups have been victims of technological displacement with the result that their economic, political and social statuses have declined. They drift either into the status of rural landless laborers or into unskilled urban employment, both of which are overpopulated and underpaid. The result is underemployment, unemployment, poverty and lack of opportunity for improvement. For examples: water carriers comprise a caste whose members have been displaced in many parts of Northern India with the advent of hand pumps. In some instances, new occupations have been created and with them opportunities for enhancement of economic and social status thus allowing certain mobility. 8.5 Summary The importance of social mobility as a concept in sociology is quite obvious. Any change of position in society experienced by an individual or a group has its impact not only on the individual or the group, but also on the society at large. Studies of social mobility should also take note of the problems associated with such studies. Particular social position as determined by job-status is not immutable, because the social value attached to any occupation may change overtime. Also, while studying

NSOU ? CC-SO-04 112 inter-generational mobility it is to be carefully decided at what point of their careers should parents and children be compared. 8.6 Questions ? Discuss in detail the factors responsible for social mobility. ? Differentiate between the various types of social mobility in India. ? Assess the present day implications of mobility in India with suitable illustrations. ? What are the changes associated with mobility in rural as well as in urban areas? 8.7 Suggested Readings 1. Horizontal Mobility : Refers to shifts in Position in a society which does not involve movement between strata. ? Intra-generational Mobility : This is mobility which occurs within different generations of people. ? Inter-generational Mobility : Refers to mobility within the time span of two or more generations.

Unit 9 Middle Class Phenomenon : Role and Significance Structure 9.1. Objectives 9.2 Introduction 9.2.1 Coining of the Term Middle Class 9.2.2 The Concepts of Class and Middle class 9.2.3 Rise of Middle Classes in India During the British Rule 9.2.4 Middle classes in India After Independence 9.2.5 Why is the Middle Class Important? 9.2.6 Economic Roles of the Middle Income Groups 9.2.7 Social and Political Implications: Middle Class Beyond Income and Consumption 9.3 Conclusion 9.4 Summary 9.5 Questions 9.6 Suggested Readings 9.7 Glossary 9.1 Objectives ? To understand the concept of middle class. ? To understand the role of middle classes in contemporary society. ? To evaluate the importance of middle classes in India. 9.2 Introduction Almost everybody seems to know, what is called "the middle class", and even to belong to it. So, actually, our initial question turns to grow out into the following, more accurate, question: What do we know about the middle class? The idea and

NSOU ? CC-SO-04 114 category of middle class is not new to India. It was in the early decades of the 19th century, during the British colonial period, that the term began to be used for a newly emergent group of people in urban centres, mostly in Calcutta, Bombay and Madras, three cities founded by the colonial masters. Over time, this middle class spread its presence to other urban centres of the subcontinent as well. After independence, with development and expansion of Indian economy, the size of the Indian middle class grew manifold. Beginning with the 1990s, the story of the Indian middle class witnessed a major shift. The pace and patterns of its growth changed with the introduction of economic reforms. By incentivizing private capital and encouraging foreign investments in India, the 'neo-liberal' turn helped India accelerate the pace of its growth substantially. The process of development or modernization being experienced in our country is not confined to the economy alone. It is leading to some fundamental changes in the social structure of the Indian society. As the process of change unfolds itself, new social groups and categories of people emerge on the scene. The institutionalization of the democratic system of governance based on adult franchise and the introduction of a secular Constitution has transformed the traditional structures of power relations at different levels of social organization. The last five decades of economic development and democratic governance have also transformed the structures of social stratification in India. The earlier system of domination and subordination based largely on the principles of caste hierarchy and ownership of agricultural land has given way to a different kind of power structure. Though the caste and the ownership of agricultural land continue to be significant, particularly in the rural areas, they are no more the exclusive determinants of social stratification , in India today. A new set of power elite has emerged in India during the last fifty years or so. Similarly, we can observe the emergence of new social categories and occupational groupings of people. Middle class has been an important historical and sociological category in modern India. The idea of India as a modern and democratic nation state was imagined and articulated by the emergent middle classes during the later phase of the British colonial rule over the subcontinent. The middle class leadership of the Indian nationalist movement also provided foundational values to the newly independent country after the colonial rule had ended. Over the last two decades, the Indian middle class has been celebrated for its economic achievements in the new global economy. It has also been expanding in size, providing critical market base to the process of economic growth and stability to democratic politics.

NSOU ? CC-SO-04 115 9.2.1 Coining of the Term Middle Class The term "middle class" has had several, sometimes contradictory, meanings. Friedrich Engels saw the category as an intermediate social class between the nobility and the peasantry of Europe in late-feudalist society. While the nobility owned much of the countryside, and the peasantry worked it, a new bourgeoisie (literally "town-dwellers") arose around mercantile functions in the city. In France, the middle classes helped drive the French Revolution. This "middle class" eventually overthrew the ruling monarchists of feudal society, thus becoming the new ruling class or bourgeoisie in the new capitalist-dominated societies. The modern usage of the term "middle class", however, dates to the 1913 UK Registrar-General's report, in which the statistician T.H.C. Stevenson identified the middle class as those falling between the upper-class and the working-class. The middle class includes: professionals, managers, and senior civil servants. The chief defining characteristic of membership in the middle class is controlled of significant human capital while still being under the dominion of the elite upper classes, who control much of the financial and legal capital in the world. Within capitalism, "middle class" initially referred to the bourgeoisie; later, with the further differentiation of classes as capitalist societies developed, the term came to be synonymous with the term petite bourgeoisie. The boom-and-bust cycles of capitalist economies resulted in the periodic (and more or less temporary) impoverisation and proletarianisation of much of the petite bourgeois world, resulting in their moving back and forth between working-class and petite-bourgeois status. The typical modern definitions of "middle class" often tried to ignore the fact that the classical petite- bourgeoisie was and had always been the owner of a small-to medium-sized business whose income was derived almost exclusively from the employment of workers; "middle class" came to refer to the combination of the labor aristocracy, professionals, and salaried, white-collar workers. The size of the middle class depends on how it is defined, whether by education, wealth, environment of upbringing, social network, manners or values, etc. These are all related, but are far from deterministically dependent. The following factors are considered important in connection with the concept "middle class". (a) Achievement of tertiary education. (b) Holding professional qualifications, including academics, lawyers, chartered engineers, politicians, and doctors, regardless of leisure or wealth. (c) Belief in bourgeois values, such as high rates of house ownership, delayed gratification, and jobs that are perceived to be secure. (d) Lifestyle.

NSOU ? CC-SO-04 116 9.2.2 The Concepts of Class and Middle class The concept of class has been one of the most important categories in the western sociology. There has been a long tradition of looking at the western society through the conceptual framework of class. The classical sociological thinkers, Karl Marx and Max Weber, have written a great deal on the concept of class. Class is the most important category for Marx in his analysis of the western society and in his theory of social change. Marx's model of class is a dichotomous one. It is through the concept of class that he explains the exploitation of subordinate categories by the dominants. According to Marx, in every class society, there are two fundamental classes. Property relations constitute the axis of this dichotomous system - a minority of 'non-producers', who control the means of production, are able to use this position of control to extract from the majority of 'producers' the surplus product which is the source of their livelihood. 'Classes', in the Marxian framework, are thus defined in terms of the relationships of groupings of individuals to the 'means of production'. Further, in Marx's model, economic domination is tied to political domination. Control of means of production yields political control. The other theorists of class have assigned much more significance to the 'middle classes'. Foremost of these have been sociologists like Max Weber, Dahrendorf and Lockwood. Max Weber, though agrees with Marx that classes are essentially defined in economic terms, his overall treatment of the concept is quite different from that of Marx. Unlike Marx, he argues that classes develop only in the market economies in which individuals compete for economic gains. He defines classes as groups of people who share similar position in a market economy and by virtue of this fact receive similar economic rewards. Thus, class status of a person, in Weber's terminology, is his "market situation" or, in other words, his purchasing power. The class status of a person also determines his "life chances". Their economic position or "class situation" determines many such things considered desirable in their society which they can buy. Middle Classes in India The middle classes emerged for the first time in western Europe with the development of industrial and urban economy. We have also seen that the term middle class was initially used to describe the newly emerging class of bourgeoisie, industrial class. And later on, the term was used for social groups placed in-between the industrialist bourgeoisie on the one side and the working class on the other i.e., the skilled professional. The historical context of the development of middle classes in India was quite different from that of the west. It was in the nineteenth century, under the

NSOU ? CC-SO-04 117 patronage of the British colonial rule that the middle classes began to emerge in India. Though they emerged under the patronage of the British rulers, the middle classes played an important role in India's struggle for independence from the colonial rule. During the post-independence period also, the middle classes had been instrumental in shaping the policies of economic development and social change being pursued by the Indian state. Hence there is the need to understand the middle classes, their history, their social composition and their politics. Even though being middle class in contemporary India has, in many ways, a matter of privilege, those located in the middle class tend to be also viewed themselves as among those with a fragile sense of security. Along with the poor, they often complain about the manipulative and "corrupt" economic and political system controlled by the rich and the powerful, the wily elite. Middle classes' engagements with politics have been of crucial and critical significance in modern India; from the colonial period to present times. It is the middle class that generally produces leaders who challenge the existing power structures and provide creative directions to social movements of all kinds. The McKinsey Global Institute (2007) refers to India's expanding consumer market as the country's "bird of gold", a phrase merchants used thousands of years ago to describe its vast economic potential. The growth of a middle class is expected to play a transformative role in modernizing the Indian economy, creates new pressure points on the government to tackle the vestiges of the License Raj, and enable a more propitious environment for private entrepreneurship and job creation (Fernandes 2006). And those who are frustrated with the corruption and cronyism that has characterized Indian politics for decades view the rise of the middle class as a force for positive change, a palliative to the twin vices of identity and patronage politics (Das 2012). Despite these tall claims, the research on the middle class globally is quite divided into its social and political impact. On the one hand, one strand of the literature argues that middle class can be a dynamic force for change (Lash and Urry 1987) while on the other hand, some scholars have argued that they can often a powerful votary of the status quo and traditional social and economic structures (Erikson and Goldthorpe 1992). For instance, while the middle class might desire a reduced role of the state in the economy and a corresponding greater role for the private sector, it also wants better safety and environmental standards across a diverse array of sectors which, ironically, bring the state back in –this time in its regulatory capacity.

9.2.3 Rise of Middle classes in India during the British Rule

The British colonial rule in India was fundamentally different from all the earlier political systems and empires that existed in the sub-continent. The British not only

NSOU ? CC-SO-04 118 established their rule over most parts of the sub-continent they also transformed the economy and polity of the region. Apart from changing the land revenue systems, they introduced modern industrial economy in the region. They reorganized the political and administrative structures and introduced western ideas and cultural values to the Indian people. As middle class in Indian society pointed out by the well-known historian, B.B. Mishra, the peculiar feature that distinguished the Indian middle classes from their counter-part in the west is the context of their origin. 'In the west', the middle classes emerged basically as a result of economic and technological change; they were for the most part engaged in trade and industry. In India, on the contrary, they emerged more in consequence of changes in the system of law and public administration than in economic development, and they mainly belonged to the learned profession" (Mishra, 1961 :v). By the middle of the nineteenth century, the colonial rulers had been able to bring a large proportion of Indian territory under their rule. It was around this time that, after the success of the Industrial revolution, industrial products from Britain began to flow into India and the volume of trade between Britain and India expanded. They also introduced railways and other modern servicing sectors such as the press and postal departments. A large number of educated individuals were required to staff these administrative institutions. It was not possible to get all of them from Britain. So, in order to fulfill this need, the British opened schools and colleges in different parts of India, particularly in big cities like Calcutta, Bombay and Madras. Those educated in these new institutions of secular education were also required a medium through whom the British planned to spread western ideas and cultural values in the Indian society. They were to not only work for the British but they were to also think like them. This intention of creating a native middle class that would become the carrier of western culture in India was expressed quite openly by Lord Macaulay in 1835. In his Minute on Indian education, Macaulay said: 'We must at present do our best to form a class who may be interpreters between us and the millions we govern; a class of persons, Indian in blood and color, but English in taste, in opinions, in morals, and in intellect' (as in Varma, 1998:2). Apart from the English educated segment, there were also other sections of the Indian society who could be called the middle classes. The most prominent among them were the petty traders, 'shopkeepers and independent artisans; the social groups that were called the "old middle classes" in the western context. Merchants and artisans had always been separate social strata in the traditional structure of social stratification in India. We could easily identify separate castes of merchants and artisans who were an organic part of the village communities. As the economy began to change in

NSOU ? CC-SO-04 119 response to the new administrative policies of the colonial rulers, many of the merchants moved to newly emerging towns and cities and became independent traders. This process was further accelerated during the post-independence period. Though limited in its significance, the modern machine-based industry also began to develop during the colonial period. The establishment of railways, during the middle of the nineteenth century, created conditions for the growth of modern industry in India. The colonial rulers constructed railways primarily for the transportation of raw materials required for the British industry overseas. However, once the railways were established, the British also invested in the local industry such as plantations. The growing economic activity gave boost to trade and mercantile activity and some of the local traders accumulated enough savings and began to invest into the modern industry. The Swadeshi movement started by the nationalist leadership gave a boost to the native industry. Apart from giving employment to the labor force, this industry also employed white-collared skilled workers. Thus, along with those employed in administrative positions by the colonial rulers, the white-collared employees of the industrial sector were also a part of the newly emerging middle classes in India.

9.2.4 Middle Classes in India after Independence

Though different sections of the Indian society had participated in the struggle for freedom from colonial rule, it was the middle classes that took over the institutions of governance from the colonial rulers. It had been argued that the end of the colonial rule did not mean a total break from the past. Much of the institutional structure that had developed during the colonial rule continued to work the Independence within the ideology of the new regime. Thus, members of the middle class who were working for the colonial rulers did not lose much in terms of their position in the institutions of governance. India's independence from the colonial rule marked the beginning of a new phase in its history. The independent Indian state was committed, in principle, to democratic institutions of secularism, freedom, justice and equality for all the citizens, irrespective of caste, creed or religion and at all levels - social, economic and political. To achieve these ends, India embarked upon the path of planned development. Plans were chalked out for the development of agricultural, industrial and the tertiary sectors of the economy. There was an overall attempt to expand the economy in all directions. The government of India introduced various programmes and schemes for different sectors of the economy. The execution of these programmes required the services of a large number of trained personnel. Apart from the increase in a number of those employed in the government sectors, urban industrial and tertiary sectors also experienced an expansion. Though compared to many other countries of the Third World, the growth rate of the Indian economy

NSOU ? CC-SO-04 120 was slower, in absolute terms the industrial sector grew many folds. Growth in the tertiary sector was more rapid. Increase in population, particularly the urban population, led to a growth in the servicing industry. Banks, insurance companies, hospitals, hotels, press, advertisement agencies all grew at an unprecedented rate, giving employment to a large number of trained professionals. The next stage of expansion was in the rural areas. Various development programmes introduced by the Indian state after independence led to significant agricultural growth in the regions that experienced Green Revolution. Success of the Green Revolution technology increased productivity of land and made the landowning sections of the Indian countryside substantially richer. Economic development also led to a change in the aspirations of the rural people. Those who could afford it started sending their children not only to English medium schools but also to colleges and universities for higher studies. Consumption patterns also began to change. 'Material goods hitherto considered unnecessary for the simple lifestyle of a farmer, began to be sought. And lifestyles as yet remote and shunned were emulated' (Varma, 1998:95). A new class has emerged in rural India that partly had its interests in urban occupations. The process of agrarian transformation added another segment to the already existing middle classes. In ideological terms, this "new" segment of the middle classes, was quite different from the traditional middle classes. Unlike the old urban middle classes, this new, "rural middle class" was local and regional in character. The members of the rural middle class tended to perceive their interests in regional rather than in the nationalist framework. Politically, this class was on forefront of the movements for regional autonomy. Another new segment of the middle class that emerged during the post-independence period came from the Dalit caste groups. Government policies of positive discrimination and reservations for members of the ex-untouchable Schedule Castes enabled some of them to get educated and employed in the urban occupations, mostly in the servicing and government sectors. Over the years, a new Dalit middle class had thus also emerged on the scene.

9.2.5 Why is the Middle Class Important?

The middle class is important because it drives transformation and innovation. This role was first noted by Thomas Malthus, who suggested that intellectual improvement was most likely to occur from the "middle regions of society". Similarly, Karl Marx rooted 'civilization' to the process of creative destruction that resulted from the entrepreneurial action of the bourgeoisie (that is the middle class). In more recent times, Dierdre McCloskey convincingly argued how the rise of the middle class since

NSOU ? CC-SO-04 121 1600 (first in Holland, then in Britain) gave a reason for ordinary people to innovate. The upper class consists of those who are currently benefiting from the rents and profits of the "old" industries. They have little or no incentive to innovate because it would result in a disruption of their own rents. As for the lower class, while they may be willing to innovate, the opportunity to do so is limited. Think about the financial and human capital necessary to transform a scientific discovery into an economic innovation. Clearly, the middle class is our most likely innovator. They aspire to improve their socio-economic status and while they are willing to take risks by undertaking an entrepreneurial activity that disrupts existing ones, they are in a stronger position to do so. They have already acquired some assets and are in a position to make initial investments and obtain further credit if required.

9.2.6 Economic Roles of the Middle Income Groups The middle-income groups are located in all sectors of the economy – primary, secondary, tertiary, quaternary (intellectual activities) and the quinary (highest levels of decision making in a society or economy). Within these segments, they are overwhelmingly located in the private, unorganized sector, albeit significant proportions are also located in the formal public and private sector. The latest Economic Survey of the Union Government emphatically notes that the predominant source of economic growth in the last two decades has been primarily spearheaded by the service sector, followed by industry and agriculture. In terms of sectors of employment, middle-income groups are largely located in the service sector. Within the service sector, the middle-income groups are likely to find employment in the following : ? trade, ? tourism, including hotels and restaurants, ? shipping and port services, ? storage, ? telecommunications-related services, ? real estate, ? information technology (IT) and IT enabled services, ? accounting and auditing services, ? research and development, ? infrastructural services (roads, railways, civil aviation), ? financial services and ? social services (health and education).

NSOU ? CC-SO-04 122 These sectors are relatively well paying, have flexible employment contracts and work through the market logic of efficiency and productivity. The secondary sector draws its middle-income household largely from manufacturing, mining, electricity, basic goods, intermediate goods and consumer goods. The middle income households in the rural areas are thus constituted by large farmers and small entrepreneurs and salaried government employees. Influence of traditional social structure continues to be present in today's economy. Even the official documents of the Indian government accept this fact. The socio economically deprived groups such as Scheduled Tribes and Scheduled Castes are generally employed in land based industries like agriculture, mining and construction. Muslims have been associated with trade apart from manufacturing and transport, storage and communication services. OBC's on the other hand are employed in all the industries with the least variation in their shares across different industry groups from the overall average. Those belonging to upper castes have a higher participation in lucrative service industries like banking, finance, real estate and business services.

9.2.7 Social and Political Implications: Middle Class Beyond Income and Consumption The present-day India is shaped by the contradictions emanating from an ideological commitment to market-led development on the one hand, which is inevitably biased against the asset-less and capability-less, and to the institutions of democracy, with the promise of equitable inclusion, on the other. In other words, the tension is between the economics of markets and the politics of democracy. The former indicates economic policies directed towards a market-friendly regime, supported by international and national capital, urban-based middle and upper middle classes and neo-liberal mandarins. The politics of democracy is represented by the ever-increasing assertion of the historically deprived social categories in the electoral and social domain due to their perceived as well as real marginalization from the development processes. The Indian middle class is placed quite centrally in this emerging contradictory scenario and it carries the burden of balancing them in the 'New India'. Putting it differently, the socio-economic articulation of the middle class has acquired vast legitimacy. Their attestation of the state policies as well as any protest against the same is taken quite seriously by both the state as well as the larger society. How do we then understand the middle class as a social group, beyond income and consumption? While an understanding of income groups is indeed crucial for making sense of patterns of economic growth in any country, the middle class is also a conceptual and historical category. It represents certain values and produces hegemonic discourses. As a sociological category, it is bound to reflect the vertical and horizontal

NSOU ? CC-SO-04 123 diversities of a given society. As India develops, the diversity of its middle classes also emerges, with sections from historically marginalized groups joining the ranks. However, their value frames and attitudes towards the state, political processes, and desirable modes of organizing the economy and social institutions vary significantly. The upper caste middle class talks about efficiency through market competition and privatization of public agencies, transparency and accountability of the governance apparatus. Interestingly enough, sections of the middle class from the historically deprived social group also invoke the frame of universality. However, instead of efficiency, merit, competition and the universal values they try to ensure justice, equality, representation and rights through affirmative action. The state is a critical agency for them that ought to protect and promote these universal values and confirm their presence in the political and economic processes of the country. Of course, these values are invoked to protect the interests of their communities, and hence they are often viewed with contempt by dominant sections of the Indian middle classes. To them, these appear particularistic, and hence, "un-modern" and "anti-progress".

9.3 Conclusion

Though the middle classes have always been among the most influential segments of the modern Indian society, they were never as prominent and visible as they became during the decade of 1990s, after the liberalization process of the Indian economy began. Of the new economic policy and increasing globalization of the Indian economy have brought the Indian middle class into new prominence. The process of globalization has also generated a lot of debate about the actual size of middle classes in India, their consumption patterns, and the pace of their growth in the years to come. It has been claimed that the size of middle classes has grown to 20 percent of the total Indian population. Some others have put this figure at 30 percent. Though a large number of Indian people still live a life of poverty, it is the middle classes that have come to dominate the cultural and political life in India today. An important feature of the Indian middle class is its internal diversities of income, occupation, caste, community and region. Given that it emerges historically within a given social context it does not necessarily transform everything in the pre-existing social structures of social inequality. Even when the rise of middle class transforms the way people think, behave and relate to each other, the process does not do away with inequalities of caste and community. Those trying to move up in the new social and economic order use their available resources and networks, including those of caste and kinship to stabilize and improve their positions in the emerging social order, with a new framework of inequality.

NSOU ? CC-SO-04 124

9.4 Summary

This is also the reason why the middle class is not as homogenous as it may appear at the first instance. Diversities within the middle class are many, of income and wealth as also of status and privilege. Middle classes are often sub-classified into the "upper", the "lower" and "those in-between" segments, depending upon income, education, occupation, residence and life-style. As mentioned above, those who call themselves 'middle-class' or are classified as such, also do not abandon their other identities; particularly those that have been sources of privilege; of caste, community/ religion and region/ethnicity. Thus, we have notions such as the "Bengali middle-class" or the "Muslim middle-class" or the "Dalit middle-class". The rise and consolidation of a middle class within an "ethnic" or cultural group could work to sharpen those identities, rather than weakening or ending them. However, notwithstanding the diversity, Indian middle class also has a "dominant section", which represents dominant communities of India, i.e., the upper-caste, urban and invariably Hindu. While Indian middle classes are globally mobile, inhabit modern spaces and use the language of modernity, they also actively participate in articulations of identity politics of both the dominant "majorities" and of the "minorities". Unlike the western context, the Indian middle class lacks autonomy. It remains dependent on patronage and perpetuates the patronage culture.

9.5 Questions

1. Discuss in details the rise of middle class in India.
2. Critically analyze the role of middle class in Indian Economy.
3. What impact does the existence of middle class have in present day Indian scenario?
4. Discuss the sociological significance of Indian middle class.
5. Briefly point out the changes brought by the agency of middle class in Indian context.

NSOU ? CC-SO-04 128 10.2 Introduction 10.2.1 Women's Movements and Feminism Probably the best way to start a discussion around women's movements or women's participation in social movements is to find the thread that binds the two with the term feminism. It is correct to say that in India the term women's movement came prior to that of feminism - making it a modern concept (this is similar to the way feminism and feminist movements developed in the world). Feminism at its core strives to establish equal rights of women and aims to uplift the subordinate position of women and to end any discrimination that they face due to their sex. This ideology was mobilized through various movements that occurred around the world. The source of the term feminism lies in a 'French medical text' which was used to describe either the underdevelopment of female sexual organs or certain traits in men who were suffering from 'feminization' of their bodies. A modification of the term was given by French author and anti-feminist Alexander Duma who used the term to describe women who portrayed masculine behaviour. The term gained popularity in the middle of the 19th century when various movements spearheaded by women were gathering prominence in the United States of America. Historically Feminism as a term became popular long after women started to resist patriarchy and demand for justice. The writings of Mary Wollstonecraft ("Vindication of the Rights of Women"), a speech orated by Sojourner Truth ("Ain't I a Woman?"), the contributions of Elizabeth Cady Stanton (Organized the "Women's Rights Convention" in 1848) and Lucy Stone (The first woman to retain her surname post marriage) were notable contributions that followed. Though at the time the term 'feminist' was not popular and many expressed their discomfort in using the term, today most of the female authors, suffragists or activists have come to be known as feminists (Pande 2018). 10.2.2 Feminism in India Women's movements were associated with the first wave of feminism which began spreading in Europe in the 19th century. However, the idea of feminism was in its rudimentary stages when the first instances of female resistance were recorded in the subcontinent. In India, these movements were an immediate reaction to the deprivations and obstacles caused in the day to day lives of women. In a way, it can be said that the women who were involved in the movements had very little to do with the feminist wave that was taking over Europe and other parts of the world. Many were far from the education that modern society had to offer. What then was the impetus to these movements?

NSOU ? CC-SO-04 129 India has come a long way since the first instances of women's struggle to emancipate themselves. History of women's movements in India can be traced back to the colonial period when questions were raised against the age-old practice of Sati and widow remarriage. Yet female advocates for these demands were few, many of the movements during the colonial era were orchestrated and advocated by male reformers of the time, who were educated and exposed to the demands of a new society. These demands, articulated during the colonial period, were initiated and propagated by established male academics and stalwarts of the time, women, remained primarily recipients of the changes that were brought about. However, the most well known participation of women was in the Quit India movement. One may find the names of female activists such as Sarala Devi , Aruna Asaf Ali , Sarojini Naidu etc., who were intricately linked to India's struggle for freedom but a women's movement comprised and orchestrated by women was yet to take fruition. According to Pande (2018) women's participation in social reforms and women's movements in India can be broadly divided into three phases: 10.2.2.1 First Phase (1850-1915) Before independence, women's movements can be attributed to social reform movements of the 19th century. Western ideas of liberty, equality and fraternity had already cast an influence on the educated elite as an outcome of English education and cultural contact with the west. Western liberal thought had also addressed the critical question about the subordinate position of women in Indian society which became an impetus for social reform movements. These reform movements differed in their aims as well as in their nature. These movements were at times driven by very different ideas, but their common goal was to bring about social change by eradicating the evils. The problem however was the paradox that India posed. On one hand was the need to reform and establish a modern system and on the other was India's strict traditional base. These reform movements tried to combine the two – 'modern yet rooted in Indian tradition' and in the process faced the issues of casteism, practice of sati, child marriage and illiteracy which hindered the growth and development of women in Indian society. The aim of these reform movements was to be critical of the practices prevalent in Indian culture and to alleviate Indian society of these social evils. 10.2.2.2 Second Phase (1915-1947) In the second phase the following organizations were formed: 1. Women's India Association (WIA), 2.

71%

MATCHING BLOCK 75/133

W

National Council of Women in India (NCWI) and 3. All India Women's Conference (AIWC).

These organizations were formed in the post World War I era (between 1917 and 1927) by female founders. As the fight against imperial

NSOU ? CC-SO-04 130 rule increased within the country the foremost cause behind such agitations was nationalism. In this regard, Gandhiji played a crucial role in introducing women in the Civil Disobedience movement which was a non violent retaliation against the British Raj. This propelled women's participation in various agitations and movements in the following decades. The birth of many women's organisations in this phase continued to strive for women's equal rights and dignity. One such organization was established by Saraladevi called the Mahila Mahamandal which addressed concerns such as Purdah and to promote education among women. In 1910 the organisation held its first meeting in Allahabad. 10.2.2.3 Third Phase (1947-Present) The third phase witnessed, especially since 1975, a steady increase in the number of women's welfare organizations in India. Some issues that they addressed during this period are i) the consumption of liquor, ii) the problem of missing girl children India and iii) violence against women. In addition to this, other problems that were addressed during this period were – i) marginalized women's rights, ii) growing fundamentalism and iii) women's representation in the media had also been taken up by the Women's movement.

MATCHING BLOCK 77/133

W

From mid to late 1980s, women's groups concentrated on providing services to individual women to enable them to gain advantages already given in law.

Flavia Agnes (1992) pointed out that this

100%

MATCHING BLOCK 78/133

W

was significantly different from the welfare dispensed by earlier women's groups. The earlier groups sought amelioration; the new groups sought recognition and realization of rights.

Organisations such as SEWA, National Commission of Women (New Delhi), National Council of Women (Pune), Joint Women's Program (Delhi) and Kali for Women (Delhi) were noteworthy organisations of this period. Today, however, the nature of women's movements is strikingly different from that of its earlier form. In this regard, one of most important women's movements in post colonial India was the Chipko Movement of 1973. Did you know? We know that the father of the Indian Constitution was Dr. B.R.Ambedkar and that there were many male members of the Constituent Assembly who helped draft the Indian Constitution. However, little is said of the fifteen women who also helped draft the Indian Constitution. All these women were considered as pioneers in their own right. The list is as follows: Ammu Swaminathan, founder of Women's India Association. Dakshayani Velayudhan, who was elected to the Cochin Legislative council in 1945. Begum Aizaz Razul, a member of the Muslim League as well as elected to the Uttar Pradesh legislative Assembly NSOU ? CC-SO-04 131 in 1937. Durgabai Deshmukh, an active participant in the Non-Cooperation movement, founder of the Andhra Mahila Sabha , member of the Planning Commission, Chairperson of the National Council for Women's Education and received the Padma Vibhushan in 1975. Hansa Jivraj Mehta who served as the president of the All India Women's Council from 1945 to 1946, Vice-Chancellor of SNDT Women's University as well as the Vice-Chairman of the Human Rights Commission of the United Nations in 1950. Kamala Chaudhary was an active participant in the Civil Disobedience Movement and Vice President of All India Congress Committee. Leela Ray, an activist in the Salt Satyagraha and was the editor of The Forward Bloc Weekly. Malati Choudhury was a member of the Indian National Congress and also a fierce critic of the Emergency imposed by Indira Gandhi. Purnima Banerjee served as the secretary of Indian National Congress. Rajkumari Amrit Kaur was India's first Health Minister and the founder of All India Institute of Medical Sciences (AIIMS), Renuka Ray was an Indian freedom fighter and a member of All India Women's Conference (AIWC). Sarojini Naidu (The Nightingale of India) was an Indian Poetess and the first woman president of the Indian National Congress and the first woman Governor of state. Sucheta Kriplani was the first woman Chief Minister of India (Uttar Pradesh) and an active participant in the Quit India Movement in 1942. Vijaya Lakshmi Pandit, who became the first woman as well as the first Asian president of the United Nations General Assembly and Annie Mascarene, the first woman member of Parliament from the state of Kerala (Srivastava 2018). Things to do: Why are these movements known as women's movements? Think of few reasons as to why women thought it was necessary for them to begin movements of their own? 10.3 Chipko Andolan (1973) : An Ecological Movement in Rural India Chipko, which means 'to stick to' or 'embrace', was a movement that is often said to have drawn its significance from an incident that occurred in 18th century in Kejri village in Rajasthan. A member of the Bishnoi community, Amrita Devi had objected to the Maharaja's decision to fell trees and protested by embracing trees. However, NSOU ? CC-SO-04 132 the cutters, on being compelled to carry out the Maharaja of Jodhpur's orders, cut down the trees, killing Amrita Devi and others in the process. A century later in 1973 similar events related to the Chipko movement took place in the Garhwal Himalayas. It was a non-violent movement to stop the indiscriminate felling of trees in the region. During this time wood felling had become the target of many a company such that the locals were being deprived of the most important produce of the forest, its wood which was a source of livelihood for the villagers. In a rather one-sided policy of the government, the locals were banned from felling trees but a certain sports company was permitted to fell trees. This created an uproar and for the first time under the leadership of Chandi Prasad Bhatt, a Gandhian and the founder of Dasholi Gram Swarajya Sangh began the Chipko movement of 1973. The act of hugging trees came about when the government refused the appeals of Bahuguna and the women on many occasions. It was only when they displayed their protest by hugging trees that the government was compelled to withdraw the permit of the sports company to cut trees. In another instance in the village of Reni, where trees were being auctioned, Gaura Devi, the head of the Mahila Mangal Dal along with 27 other women embraced trees to protect them, even keeping a night vigil. In the face of abuse and threats by the loggers, these women carried out their non-violent protest till the loggers left. The most loyal followers of the movement were the women of the region as they were directly affected by the impact of logging which caused shortage of firewood and drinking water. Their contribution and due to their centrality to the movement, many social scientists termed Chipko as an 'eco-feminist movement'. Thus, sensitizing the rural folk, especially women, on the effects of cutting trees was an important requirement and the key to mobilising those who were most affected by the actions/ decisions of the government. In this regard it was important to note the role of educating the masses on the effects of deforestation which was exemplified by another Gandhian environmental activist, Sunderlal Bahuguna, popularly acknowledged as the leader of Chipko. His contribution in educating the masses was so effective that the then Prime Minister of India, Indira Gandhi took the initiative to ban logging and felling of trees. Things to do: ? Identify popular slogans of the Chipko movement. ? Find out the prominent female figures of the Chipko Movement.

NSOU ? CC-SO-04 133 10.3.1 Chipko and Its Effect on the Public: Its Symbolic Value Chipko was one of the first successful ecological movements recorded in the history of India. The movement itself became the precursor to many later movements concerning deforestation, global warming and other ecological issues both in India and the world. It also heralded and became symbolic of the success of non-violent methods of protest (Satyagraha), persistence and mobilising people in the grass roots. Vandana Shiva and D. Bandhyopadhyay had noted that Chipko could provide us with answers on the strategies of survival at the time of ecological disaster. Chipko became a tale of trust and shared suffering and was an example of how people from the most backward regions could be sensitized and mobilized to fight for causes that affected common people as well as became a source to change forest policies in the country. One example of how Chipko movement inspired later movements was that of the Appiko movement that took place in North Karnataka in 1983, headed by Panduranga Hegde. Northern Karnataka had experienced drops in its forest cover from 80% in 1950 to 25% in 1980. The alarming drop in forest cover started the Appiko movement in the Kalse forest of Karnataka which like Chipko adopted the non-violent method of hugging trees ('appiko' means 'to embrace' in Kannada). Their protests like Chipko were comprised of many women who were central to the movement as they physically averted felling of trees in the forests. Chipko and Appiko movements were therefore a witness to the increasing participation of women in social movements which later became a part of the 'development' discourse in India. Vandana Shiva, noted sociologist, has presented Chipko as the beginning of eco-feminism which tries to establish the 'intimate relationship' between women and nature. This is because, according to Shiva, women like nature have the capacity to nurture but have had to endure the oppression of patriarchy and commercial interests such that both situations lead to the lack of control over the self as well as natural resources- this makes both, ecological movements and women's movements, similar in nature. Did you know? Eco-feminism or Ecological feminism was a concept which sought to explain a certain link between ecological disasters and the oppression of women. Vandana Shiva and Maria Mies(2014) have explained eco-feminism as the process in which patriarchy has systematically devalued the contributions of women by making them unproductive and consciously excludes female work despite speaking of 'inclusiveness and 'development.' It seeks to understand ways in which patriarchal models of development driven by 'corporate globalization' has not only caused environmental disasters

NSOU ? CC-SO-04 134 but have deprived women's access to natural resources and hence limited their access to livelihoods. Ariel Salleh says, "its (eco feminism's) first premise is that the 'material resourcing' of women and of nature are structurally interconnected in the capitalist patriarchal system" (Mies and Shiva 2014). According to Salleh, eco-feminism accomplishes what previous feminist strains failed to do, That is, it was able to integrate issues concerning nature, humans, animals as well as that affect across cultures etc. Things to do: ? Identify the limitations of eco-feminism. 10.3.2 The Aftermath of the Chipko Movement Chipko had sought to not only alert rural folk on the effects of deforestation but it also became a way of holding the government accountable for years of neglect and dismissal of local demands and needs. Chipko (as well as appiko), though being spontaneous and immediate in nature, raised fundamental questions on: ? Agricultural practices that were gaining popularity in the country, but would cause long term damage to the land and its people. One such issue was the increased practice of mono-culture in the region which scientists viewed as detrimental to the region. For example the government continued to place importance on Chir Pine as opposed to more productive trees necessary for agro- forestry. ? Why trees were being auctioned to rich companies? ? Why employment in companies in the region favoured migrants than the locals? ? Why were small local production units charged higher for raw materials than big companies? ? The effects of deforestation had already been visible through the many floods that ravaged the region in 1970s (Mawdsley 1998). The results of the Chipko movement are as follows: ? The use of non-violent techniques such as hugging trees, Hindu techniques of tying raksha bandhan on trees by women, bandaging Chir Pine trees that were over tapped for resin. ? Prime Minister Indira Gandhi took decision to stop commercial felling for 15 years. ? Chipko gave an impetus to new movements such as 'Save Himalaya', Anti-Tehri Dam Movement of 1980, The Appiko Movement of 1983 etc (Ibid).

NSOU ? CC-SO-04 135 ? Haripriya Rangan(2000) observed that the Chipko movement became 'the conscience of the nation' such that the efforts were quickly recognized and lead to immediate action on behalf of the government to curtail ecological degradation and deforestation in the Himalayas. The movement fostered the ability to see various problems such as floods, poverty, out-migration, and women's sufferings- their daily struggle to collect fuel and fodder for their households-as being an outcome of indiscriminate timber extraction by forest contractors. When we move from one type of movement such as Chipko which was spearheaded by male advocates such as Chandi Prasad Bhatt or Sunderlal Bahuguna to one that is solely mobilized by women, one would have to speak of uprisings such as the Gulabi Gang of Uttar Pradesh. 10.4 Self Assessment I. Answer in detail a. What were the main objectives of the Chipko movement? b. Why was it important to mobilize women in the grassroots in the Chipko movement? c. Why do we say that Chipko movement has a symbolic value in the history of movements in India? II. Answer briefly. a. Write a short note on 'Feminism.' b. What were the strategies of protest in the Chipko movement? c. Explain what ecological feminism stands for. d. How did Chipko transform into a movement? e. Why do we categorize Chipko as a women's' movement? III. Answer very briefly a. Name 4 women who helped draft the Indian Constitution. b. Who is known as the leader of Chipko Movement? c. What is the full form of DGSS? d. Where did the Appiko Movement take place? e. How had deforestation affected the Garhwal region in 1970s?

NSOU ? CC-SO-04 136 10.5 Gulabi Gang: 'Female Vigilantism in Rural India' Bhanwari Devi, a 52 year old from Banda in Uttar Pradesh narrated the day she was raped by an upper caste man when she was in the field to relieve herself. The crops had been cut and had made the soil coarse, so she could not run as that would tear her feet. After the ordeal, the rapist spat on her and left her in the fields. When she tried to report the matter to the police, they said she had "asked for it." Slowly her husband left her and she, finding no other way for justice,joined the 'Gulabi Gang' or the 'Pink Sari Gang'(from Atrayee Sen's interview of Bhanwari Devi, member of Gulabi Gang). The Gang operated from its headquarters in Badausa in Uttar Pradesh and its 'commander-in-chief' was Sampat Pal. Pal also had a story of her own. She was married early in life and had faced stiff resistance from her family to get an education, which came to a halt when she was married. She started working as a government health worker in order to support her family which now consisted of five children. It was during her work as a health worker that she became more aware of the inequalities and problems of women in rural areas. On one occasion when she was unable to help a friend from her abusive husband, she took matters in her own hands by forming a gang of women and thrashing the husband in full public view. Thus was born Sampat Pal's Gulabi Gang. Atrayee Sen(2012) notes that the activities of the Gulabi Gang was an 'effective short term response strategy for localized forms of gender violence'(Ibid.). Did you know? Source:<https://www.dcuuniverse.com/> Female vigilantism is not a new concept and has been a source of violent justice for many in oppressive situations and state impunity. The concept has been a theme for works of fiction, popular culture such as cinema, television series as well as graphic novels.

NSOU ? CC-SO-04 137 Things to do: Watch the documentary Gulabi Gang (2012); Director: Nishtha Jain and share your thoughts on the same. Comment on the ideas of 'morality', 'violence', notions of 'justice' etc., as portrayed in the documentary. Sen continues to provide data on how the group operates, such as the way they have trained themselves in the art of lathi or stick fighting.The lathi has become symbol of justice for the group such that Suman Singh, the deputy commander of the group in an interview to television channel, Al Jazeera says, "All our women can stand up to the men and if need will seek retribution through lathis"(Desai 2014). The office of the Gulabi Gang is a busy one where women travel for miles to find solutions to their problems. She notes the cases which are handled by the gang as: Even though a majority of the gang's cases concern marital violence, dowry demands, and (or) abusive in-laws, they also address land disputes, resolve neighborhood skirmishes, and help poor women procure socio-economic benefits, ranging from school admissions to acquiring food cards (Ibid.). Though the Gulabi Gang had operated away from politics for many years, in recent years the Gang, especially Sampat Pal ventured into politics. The membership in the gang currently stands at around 40,000 women from 11 districts of Uttar Pradesh. 10.5.1 Female Vigilantism at the Time of State Impunity Gulabi Gang is the answer to prolong state impunity and the state's inability to provide protection to victims. In many cases the victims themselves are counter charged and arrested by the police.Sometimes the activities of the gang are also against state officials such as the one narrated by Amana Fontanella Khan(2013) where Sampat Pal tries to understand a case involving a village girl charged with theft from the house of a Member of the Legislative Assembly (Fontanella-Khan 2013). Another example is of a 17 year old girl who was gang raped where one of the perpetrators was a member of the local legislature. Female Vigilantism and Gulabi Gang was thus an outcome of anger and mistrust in the 'government machinery.' 10.5.2 Theorizing the Approach of Gulabi Gang Social scientists believe that the activities of Gulabi Gang and its members are under 'Soft Feminism.' Though trained in the art of violence such as stick fighting, which the members state they use only as a last resort and have had to employ the means to solve cases; the Gang's activities do not necessarily have a 'liberatory' view of

NSOU ? CC-SO-04 138 emancipation. In an example, Sampat Pal and other members seek to reinstate a woman back to her husband's house despite the woman complaining that her husband had married her for money. Activities of the Gulab Gang fail to completely sever themselves from the patriarchal ideology and despite being spontaneous in their approach, their activities have remained localized. It has been earlier stated that the Gulabi Gang can be termed as a vigilante group. However, there is a lack of consensus over what exactly 'vigilantism' is and whether it can qualify as a social movement. Though 'vigilantism' can be undertaken by the government or practiced privately such as the Gulabi Gang, the term is used to denote a wide number of activities which are either 'genuine social movements or a mere social reaction.' But, whatever may be the case, Gulabi Gang is a female vigilante group that does exhibit the six characteristics of vigilante groups like: i) the group's activities are an outcome of a certain amount of planning, premeditation and organization; ii) it involves private voluntary agency which means the voluntary involvement of private persons in vigilante acts; iii) membership is autonomous or rather vigilante groups rely on autonomous citizenship such that any state involvement is not considered as vigilante activity; iv) it uses or threatens the use of force ;v) it is seen as a reaction to crime or social deviance and lastly; vi) it is usually undertaken for personal and collective security (Ibid.).

Things to do: ? Assess the characteristics of Gulabi Gang and outline how it qualifies as a social movement. 10.6 Conclusion While different in their cause and approach, Chipko Movement and the Gulabi Gang allow us to assess the nature of women's movements in India. Chipko follows to the Gandhian means of non-violence such as Satyagraha but the Gulabi Gang resorts to violence as a means of instilling fear in the minds of its perpetrators. As Sen observes, Gulabi Gang's means of justice can be termed as 'brutal justice among fringe communities.' The role of women in both instances cannot be ignored, while Chipko observes the mobilization of women of the Garhwal Himalayas, they also receive support from empathetic men and the student community. In the case of Gulabi Gang however, it is mostly women who take membership when the state system fails to support them repeatedly. In both cases however, the women have taken the leading role for changing the earlier social system.

NSOU ? CC-SO-04 139 It is important to note that both the movements have taken place in extremely backward regions of India with its people having little access to the cultural capital required to mobilise the masses. Yet their effects have been long lasting such that almost decades later (especially in the case of Chipko Movement) it resonates with newer social problems concerning 'global warming, desertification and floods' and for Gulabi Gang, rights of women, equality and feminism. 10.7 Summary Both Chipko and Gulabi Gang did not become a movement overnight. Their protest strategies whether hugging trees or vigilantism were successful in bringing about policy changes and were mirrored by others in similar situations. HariPriya Rangan(2000), while discussing the Chipko Movement observed, 'it is in a sense the verb chipko came to be associated with social protests that emerged in Garhwal during the mid-1970s'(Ibid. 21). The main reason why Chipko became a movement rather than just a means of correcting an immediate problem of distribution of resources and access to raw materials at lowered rates was because it 'changed its objective'. It did not remain a localized protest but one that aimed to answer the fundamental truth concerning preservation of forests and those whose livelihoods depended on it. The process of it to become a movement obviously required , as Rangan observed that the contributions of the advocates of Chipko such as Sunderlal Bahuguna and Chandi Prasad Bhatt and also that of social activists and academics, Vandana Shiva and Ramachandra Guha who could be credited for starting a global discussion around Chipko. 10.8 Questions I. Answer in detail a. What is vigilantism? What were the reasons for the growth of Gulab gang? b. Identify the principles on which Gulab Gang operates. How is it different from other women's movements such as Chipko? c. Is Gulab Gang anti-establishment? Give reasons for your answer. d. Discuss the protest strategies of the Gulab Gang. How is it different from the Chipko Movement? II. Answer in brief a. Explain female vigilantism. b. Outline possible reasons for the rise of vigilantism in one of the most backward districts of India.

NSOU ? CC-SO-04 140 c. Does Gulab Gang qualify as a movement? Justify. d. Identify another vigilante group that operates in the world and compare the same with Gulab Gang. II. Answer very briefly a. Identify two characteristics of Gulab gang. b. Why is Gulab Gang a localized uprising? c. Where is the headquarters of Gulab Gang located? d. In how many districts does Gulab Gang operate? 10.9 Suggested Readings 1. Suggested Readings 11.1 Objectives ? To identify peasant movements in India. ? To understand the main causes behind peasant uprisings in India. ? To analyse the circumstances that lead to the Tebhaga Movement in India. ? To analyse the growth of Naxalbari movement in India.

NSOU ? CC-SO-04 142 11.2 Introduction The peasants are small producers who cultivate for subsistence. In the Indian economy they belong to the categories of sharecroppers, tenants, marginal farmers or agricultural labourers. In the Varna system they were known as the 'kisans' or cultivators. The other names are 'krishak', 'roytu', 'chashi'. They are also divided into 'adhiar', 'bhagchashi' and 'bargadars' and are also known as sharecroppers or tenants, 'majdoor', 'majur' or 'krishi shramik' or agricultural labourers. Social scientists believe that these terms connote the socially and economically deprived status of peasants in the country (Sinha Roy 2005). 11.2.1 Who Are the Peasants? There cannot be one universal definition of peasants and as such these perspectives can be roughly divided into three categories. The first are the historical definitions which involve 'estate like, caste like, corporate or subordinated social group' (Edelman in Rao 2016). Here, a peasant group is usually engaged in providing service to 'super-ordinate groups.' The second are the sociological or anthropological definitions that mostly identify economic groups in agrarian society found mostly in agrarian or peasant studies. The third, are the definitions put forward by activists or Human Rights Council such as the United Nations that are more interested in the marginal farmers than the rural landless ones and the term peasants is used to denote agricultural labour, those engaged in fishing, craft making, shifting cultivation, also nomads and hunters gatherers etc. (Ibid. 98-99). In India most of the peasants form the lowest socio-economic rung such that they have had to endure centuries of domination from the upper caste 'zamindars', 'jotedars' and 'jagirdars.' Sinha Roy has described peasants or 'kisans' in India as: '

97%

MATCHING BLOCK 80/133

W

peasants are socially and economically marginalised, culturally subjugated and politically dis-empowered social groups who are attached to land to eke out subsistence living'

Sinha Roy 2005). 11.2.2 Peasant Uprisings in India: A Brief History A number of identifiable peasant movements took place in India during the colonial period, many of which can further be traced in the eastern regions of India. In this regard it would be noteworthy to discuss the following peasant uprisings in India. 11.2.2.1 Indigo Rebellion or Nil Bidraha The Indigo Rebellion involved widespread peasant agitations in the Bengal region during the period from 1839 to 1860. The agitation was directed against the planters of the indigo crop and the instance was often referred to as an important period that eventually gave rise to the early nationalist movement in India. Textile industries grew at a rapid rate following

NSOU ? CC-SO-04 143 the Industrial revolution and equally important was the process of dyeing clothes which required the manufacture of dyes. This became an important branch in the apparel manufacturing industry. As an increasing number of British planters settled in India they took keen interest in the cultivation of indigo, a dye whose manufacture and supply weakened from other sources, but from India, manufacture of and export increased exponentially making India one of the key exporters of the dye. In order to carry out cultivation, large kuthis were established in different parts of Bengal, the largest being a kuthi in Nadia- Jessore-Khulna, established by the East India Company. The European planters made provisions for an advance or dadon which the peasants or ryots could borrow in order to reserve a part of their land for cultivation of indigo. The money could be repaid in small amounts which would be adjusted against the final payment at the time of delivery. The receipt of the advance by the ryot however caused them to become financially indebted to the planters. This happened in a number of districts such as Jessore, Nadia, and Pabna. The ryots were further faced with cheating and tampering of scales by the intermediaries or dealers responsible for carrying the produce to the planter's factory. The net profit earned by these ryots were almost negligible or none whatsoever. As the 'value of the produce was calculated at rates far below market price', after deductions in revenue stamps for agreement papers, transport charges and cost of seeds, there was little or no profit earned by the farmers. The tax burden further entrenched the farmer in a 'debt bondage' with the planters which was often passed on to sons. Refusal to pay or cultivate would only invite the wrath of the planters who would send armed guards or 'lathiyals' to beat up the farmers and their family members. With no legal system in place to protect the rights of the farmers or ryots, escape from the system seemed bleak. The retaliation by the peasants took the form of repeated attacks on indigo factories and their British planters. The district of Pabna witnessed some of the worst forms of violence. In this region, peasants also refused to sow indigo seeds (Chattopadhyay and Mamun 2009).

11.2.2.2 The Champaran Satyagraha

Champaran Satyagraha or farmers' agitation is also known as India's first instance of civil disobedience. Indigo plantations during the British raj had extended into the region of Bihar and a system of loans was available to the peasants. The growing textile industry had also generated the need to manufacture indigo in these regions. Most British planters who had acquired lease on land controlled large tracts of area that often encompassed entire villages. Not only were the peasants forced to grow indigo on the most fertile part of their land but there also existed the system 'tinkathia.' However, around the late 1880s with the discovery of the synthetic dye in Germany, a crisis grew in the export of indigo. Irfan Habib (2017) outlined the issues that rose with this new crisis, Decrease in indigo prices led to a sharp fall in the planters' profits from indigo manufacture, the planters in turn increased the 'rent- burden' on the peasants. The impositions took two major forms: Zamindars or thekadars

NSOU ? CC-SO-04 144 simply increased the rents paid by peasants and this increase in rent was called sarahbeshi, which was 50-60% of the previous rent. The second issue that arose was— since indigo prices fell, the peasants did not wish to produce indigo any longer under the tinkathia system. When planters refused to buy the produce, they allowed the peasant to shift to other crops only if he agreed to pay them a large amount as compensation also known as tawan. The amounts imposed were so large that the most peasants underwent tremendous difficulty not only to pay interest which was at the rate of 12% per annum but it became even harder to repay the principal amount. Forceful cultivation of land, illegal imposition of penalties and constant threat of withdrawal of tenancy, the entire 'burden of the crisis' had been shifted to the peasants which led to the Champaran Satyagraha. On 10th April, 1917, Gandhi visited Champaran with a team of lawyers to lend his support. The team included eminent lawyers and statesmen such as Brajkishore Prasad, Rajendra Prasad, Anugrah Narayan Sinha, Ramnavami Prasad and J.B. Kripalani. Local agitators such as Sheikh Gulab, Harbans Sahay, Pir Mohammed Munsif, Sant Rawat and Lomrah Singh also played a major role in resisting the panchkatiya system. Did you know? Following are some of the terms used extensively in the indigo plantation system in the Champaran region: Thekadars: Individuals leasing out land whose powers were equal to that of Zamindars. Thekas: Leased land often as large as an entire village. Tinkathia: This included the forceful cultivation of indigo on teen (three) katas of land out of every twenty katas of land in the region of Champaran in Bihar. Sarahbeshi: The increase in rent imposed on the peasants after the crisis in indigo production and export following the development of synthetic dye in Germany. However, despite the export of the dye being restored after World War I, the practice or rather the burden of Sarahbeshi did not cease for the peasants who continued to be exploited by the planters. Tawan: A compensation paid by peasants who were willing to cultivate crops other than indigo. Zira'at: Land on which indigo was cultivated by the factories themselves. Peasants were often transferred to cultivating these factory held lands once they agreed to pay a huge sum towards rent. Awab: Illegal dues

NSOU ? CC-SO-04 145 11.2.2.3 The Moplah/Malabar Rebellion In 1792 Malabar was under the British. This had caused drastic changes in the economy and especially for one particular community, the Moplahs. The Moplahs or Mappila Muslims,

once a prosperous trading community, had been reduced to poverty as the control of maritime commerce

had been brought under the English and the Portuguese. Further, Malabar's landlords under the British being mostly Hindu would often face revolt from the Moplahs in the 19th century. It was recorded that between 1836 and 1919, 29 such outrages or offensives had occurred. There was a considerable disagreement in the way the causes behind these 'outrages' were understood. While some believed it to be an uprising against the oppressive land tenure system, others believed it to be characterised by religious fanaticism. Some scholars such as Stephen Dale believed instead of one exclusive reason, there was a possibility of overlapping 'elements' which lead to these revolts. The Congress played a crucial role in mobilizing the Moplahs. Congress had launched its first mass civil disobedience movement under M.K.Gandhi in 1920. A transformation within the Congress party was brought about by MK Gandhi who had altered the very nature of the party from being an English speaking, elite group to one that could mobilize a huge number of people in British India. Before the Non-Cooperation movement began, Gandhi sought the alliance of the Khilafat Movement which had already mobilized a large number of Muslims. Gandhi and the Khilafat Leader, Shaukat Ali visited Malabar on 18th August, 1920 where a gathering of twenty thousand were urged to jointly resist the British who had deliberately '...flouted religious sentiments dearly cherished by the 70 million Mussalmans'. In the 19th century, the uprisings did not sustain for long as they were 'low in intensity' and were therefore put down by the British easily. It was only in 1921, that their movement was able to take character and became a means for asserting both their cultural identity as well as take on the nature of a nationalist movement (Daniyal 2018). Things to do: Discuss the book 'Nil Darpan' by Dinabandhu Mitra and give an account of its historical and social context, the implications of indigo farming on the peasants as well as the economy of Bengal. Or Visit Mangalgunj, Sonamukhi etc., and examine the backgrounds of Nil Kuthis.

11.3 What Caused Peasant Uprisings in India?

The agrarian structure during the colonial period was highly fragmented. The British had NSOU ? CC-SO-04 146 also introduced intermediaries to collect tax on behalf of the government. This land tenure system based on strict division of agrarian classes led to widespread economic insecurity among the peasants, the primary producers of food grain in the country. At the time of independence however, rising demands of the peasant community to abolish the intermediary system of land tenure system and providing tenurial security to tenants was gaining momentum. Initiatives were also taken to bring about changes in the agrarian structure, but the process of implementation was not adequate. The result of this was an unequal outcome of the implementation of new reform laws. In this context it is important to discuss two famous peasant uprisings which are often termed as radical in nature to have occurred in Bengal- The Tebhaga Movement of 1946 and The Naxalbari Movement of 1967.

11.4 The Tebhaga Movement: 1946

The Tebhaga movement was a result of the oppressive share cropping system prevalent in Bengal at the time. Large intermediary landlords known as 'jotedars' would rent out land to sharecroppers in return of $\frac{1}{2}$ of the produce. In addition to this the Bengal Famine of 1943 had caused widespread shortage of food rendering the sharecroppers unable to give half of their produce to the landlords. The sharecroppers demanded that they would be allowed to keep $\frac{2}{3}$ of the produce, the literal meaning of 'tebhaga,' to themselves instead of $\frac{1}{2}$.

11.4.1 Stage-I- Mobilization of Peasants at the Grassroots.

The Kisan Sabha, the peasant wing of the Communist Party of India (henceforth CPI), mobilised the peasants in order to introduce the provision of keeping $\frac{2}{3}$ of the produce and at the same time discontinue the payment of illegal cesses. The CPI had for sometime wanted to introduce the new tenurial method of keeping $\frac{2}{3}$ of the produce and the time seemed ideal for this demand to be placed. It also received an impetus from the submission of the report of the Flood Commission which expressed the need for agricultural reforms in Bengal. The demands were faced with stiff resistance from the state such that the movement felt the need to mobilize the rural masses in order to free themselves from years of exploitation. As a result, the movement witnessed the participation of about 6,00,000 peasant shailing from mainly the northern regions of Bengal. The protests included demonstration with sticks and flags and stacking of paddy in farmer's houses during the harvest of the 'aman' crop in the month of November (Custers 1986).

NSOU ? CC-SO-04 147 Did you know: The Floud Commission under the chairmanship of Sir F.C. Floud was set up in 1938 to probe into the land tenure practices prevalent in Bengal at the time. The enquiry into the existing system had exposed a number of loopholes and The Commission had successfully raised pertinent questions such as – 'Is the barga system economically sound?', 'What is a fair proportion of produce payable by bargadars?' As well as 'Do you consider that the right of occupancy and other rights should be extended to bargadars ? If not, how would you protect them and to what extent?' 11.4.2 Women's Participation in Tebhaga Movement Like Chipko movement, women had an important role to play in Tebhaga Movement's success. As Peter Custers observed, women of Bengal had provided the much needed 'spontaneity' that the movement required. Even in remote villages, where women remained confined to the processing phase of the harvested paddy, they rose to the cause as they had already borne the brunt of providing for their families at the time of the Bengal Famine of 1943. Custers further noted that, "For these women, the storing of paddy in their own houses, for the first time in their lives, was a revolutionary event. It evoked a tremendous emotional response"(Ibid: 28). The participation of rural women allowed the formation of the nari bahini or 'women's wing' of the movement where women were ready to confront police brutality with brooms, sticks and spices. While battling family problems, as women were equally oppressed in the family, women such as Bimala Maji, the Chief organiser of the Nandigram area of Midnapore, fought the odds to become a part of the short lived but successful peasant movement. Women of the region set up centres to produce goods such as mat making which would yield some income and also took the initiative to give alms and food to the poor and destitute. A noteworthy initiative by the nari bahini was to set up dheki programmes for the destitute. Women would borrow paddy and process it in order to sell them in the markets. A certain portion was paid back to the land lord or supplier. This made destitute women both employed and capable of feeding their families (Ibid.). Things to do : Identify a rural area and enumerate the proportion of share croppers or bargadars in the village. Find out the various problems faced by them. 11.4.3 Stage II-The West Bengal Land Reforms Act or Bargadar's Act of 1955 Following the Tebhaga Movement in West Bengal, The Bargadar Act or Land Reforms Act of 1955 was introduced. The Act sought to give the following things:

NSOU ? CC-SO-04 148 a) Definition of a 'bargadar': 'Bargadar' means a person who under the system generally known as adhi, barga or bhag, cultivates the land of another person on condition of delivering a share of the produce of such land to that person and includes a person who under the system generally known as kisan (or by any other description) cultivates the land of another person on condition of receiving a share of the product of such land from that person' (West Bengal Land Reforms Act, 1955; Chapter 1: Definitions.). b) Provision for inheritance: Provisions were made in the Act of 1955 for the inheritance of cultivation of land which the bargadar cultivates. This however, was not applicable to the transfer of land/property. It was stated that the lawful heir of the bargadar would become the rightful cultivator of the land. In case of an absence of an heir or inability to select an heir, it would be a competent authority who would decide the rightful heir. c) Limiting termination rights: While the renting of land is to be based on a contract (usually one year) between the owner and the bargadar, the rights of termination of the contract would no longer vest on the land lord as long as the bargadar paid his rent regularly except in the cases listed below i) If land is left uncultivated; ii) Or unless the landlord wished to take back the land for personal cultivation.' d) The aftermath of the movement: Operation Barga of 1978 : When the Land Reforms Act of 1955 came into force, it was noticed that the second clause for termination of cultivation rights of tenants/bargadars i.e., 'or unless the landlord wished to take back the land for personal cultivation' had been exploited, leaving the bargadars prone to eviction by the landowners. Further, the procedure of registration of tenants had caused relations between bargadars and land owners to become strained in many occasions which deprived the tenants of any future assistance from the land owners in the form of loan as well as the possibility of pursuing legal cases. When the Left Front ascended to power in West Bengal in 1977, they focused to give more attention to the problem that plagued the previous land reform legislation. The primary step was to do away with the clause that stated the landlord's claim to the rented land for personal cultivation. The second was to enable tenants to register themselves under the government for legal protection and benefits. The process of registration and enumeration of tenants was termed as Operation Barga and became a defining attempt to bring about agricultural reform in West Bengal by the Left Government (Bose 2013). The process of registration was elaborate where government officials undertook tasks of publicizing the procedure of Operation Barga in villages and organizing re-orientation

NSOU ? CC-SO-04 149 camps of 3-4 days where they explained the rights of bargadars and the benefits of registration under the government. Along with this, Special Revenue Officers or Sub divisional Land Reform Officers carried out Barga recording in special areas. Did you know? The idea of Operation Barga was proposed by Benoy Choudhury, who played a major role in Peasant Mobilization. He was also one of the top leaders of the Krishak Sabha. 11.5 Naxalbari Movement: Armed Revolution in Rural Bengal Following the Tebhaga Movement, many Zamindars started to own land under fictitious names or as was known, benami. It was precisely this struggle to grab land that belonged to the tillers which started the Naxalbari Movement in North Bengal. In 1967, under the leadership of the members of the Communist Party of Bengal, notably, Charu Mazumdar, Kanu Sanyal and Jangal Santhal peasants decided to undertake armed struggles against big landowners where the main

80%

MATCHING BLOCK 82/133

W

objective was to reclaim land from big Zamindars and re- distribute the same among the tilling farmers and landless labourers.

In the incident that took place in 1967, seven women peasants among the 11 were killed. It was these deaths which made the movement prominent (Ray 2014). The first instances of violence took place when

76%

MATCHING BLOCK 83/133

W

the president of the Siliguri Kisan Sabha , Jangal Santhal had begun organising people for the

struggle. In May, 1967 the struggle witnessed the killing of a sharecropper, shortly after Jangal Santhal had called for an armed struggle. The attack was carried out by a local Zamindar and his 'armed band.' As retaliation, Jangal Santhal along with few tribals attacked the police team that had come to investigate the death of the farmer. The violence culminated in the death of a sub-inspector in Naxalbari, from which the movement derived its name as it remained the site of the incident. 11.5.1 What Caused Naxalbari Movement? Speculation had surrounded around why such an armed uprising had taken place. It has been contended that one reason could be incomplete agrarian reforms, followed by extreme poverty and exploitation of landless tillers who hailed from lower castes or tribal communities by Zamindars. As the administration failed to address these problems and to provide social justice, extreme discontent developed among the masses and left-wing leaders. Other reasons include that despite Zamindari system being abolished post-independence in order to promote agrarian reforms, redistribution of land was never a priority of the government. The abolition of Zaminadri further saw the rise of new classes such as the 'neo-rich farmers' who remained profit oriented with little interest in dividing the profit among the tillers and

NSOU ? CC-SO-04 150 labourers. This widened the gap between the landowners who made rapid economic gains, and the landless were pushed to abject poverty (Dutta 2017). 11.5.2 Growth of Naxalbari Movement The Naxalbari movement instead of becoming obsolete metamorphosed into the Naxalite Movement, 2004 saw the merging of two large armed Naxalite groups, the Maoist Communist Centre and the Communist Party of India to form the Communist Party of India (Maoist) which often referred to as the Maoists. Their objective included an escalated offensive against the Indian state. The movement also expanded its operations away from the 'exposed agricultural plains' to the hill and forested regions of Bengal, Orissa, Jharkhand and Chhattisgarh. This was mostly because the new terrain allowed for guerrilla warfare and these regions were also the home of India's tribal population, which remained neglected and unaffected by any developmental processes of the Indian state. Later the issue which became a social concern was the mineral resource that the region harboured, mainly iron ore, coal, bauxite etc. The region occupied by the Naxalites became a matter of interest to big businesses especially foreign after the trade liberalization of 1990. Consequently, both the Adivasis and the Naxalites who engaged in guerrilla had been increasingly perceived of as an obstruction due to this very reason. Did you know? Guerrilla warfare, is a

96%

MATCHING BLOCK 84/133

W

type of warfare fought by rebels in fast-moving, small-scale actions against orthodox military and police forces and, on occasion, against rival insurgent forces, either independently or in conjunction with a larger political- military strategy. The word guerrilla

is derived from the Spanish Guerra which means "war."

100%

MATCHING BLOCK 85/133

W

Over the centuries the practitioners of guerrilla warfare have been called rebels, irregulars, insurgents, partisans, and mercenaries. Frustrated military commanders have consistently

labelled them as barbarians, savages, terrorists, brigands, outlaws, and bandits (Encyclopaedia Britannica). Following the formation of the Communist Party of India (Maoist), India's then Prime Minister, Manmohan Singh, declared the Naxalites to be the single greatest internal security threat in the country and soon launched counter-insurgency measures—dubbed Operation Green Hunt—against the Naxals/Maoists and anyone seen to sympathise with their cause. In 2017, an estimated 10,000 to 25,000 armed cadres with an additional 100,000 militia members were part of the Naxalites and were present in 190 out of India's 626 districts. They had the capacity to attack in 90 districts. To curtail their operations, tens of thousands of members of the armed forces, police officers, and special police officers from across the country were mobilized. It was also during this time that Salwa Judum, a counter insurgency operation became active in Chattisgarh.

NSOU ? CC-SO-04 151 Did you know? Salwa Judum or the purification hunt was a counter insurgency operation active mostly in the Bastar and Dantewada regions of Chattisgarh. Nandini Sundar (2019) elaborates on Salwa Judum as "a people's movement against the Maoists of the Bastar region. Vigilantes accompanied by security forces went through villages burning, looting, killing, forcibly removing villagers to government controlled camps. By 2009, Salwa Judum had converted into a full-fledged police and paramilitary operation known as Operation Green Hunt. In the years since the number of deaths, rapes and arrests of civilians has only grown, quite apart from the deaths of security forces and Maoist Cadres" (Sundar 2019: xii). Shah and Jain (2017) talked of counter-insurgency tactic against the Naxalites as "vigilante groups created. The most notorious of these was the Salwa Judum (literally 'Purification Hunt') in Chhattisgarh. There were gross abuses of human rights. Adivasis were pitched against each other. Villages were razed to the ground, many were raped and killed, with an overall result of more than 40,000 people being displaced. With the escalation of the military war against the Naxalites, the guerrillas claimed that their armies had grown. Hundreds of people were killed in the course of the conflict and the prisons of central and eastern India were now full of Adivasis arrested as Naxalites or for allegedly supporting the Naxalite cause" (p. 3) On 5th July, 2011, Sudershan Reddy and Justice SS Nijjar declared Salwa Judum as illegal and unconstitutional. The court order led to immediate disarmament of tribal youths who were engaged as Special Police Officers (SPOs)- either as 'Koya Commandos' or in any other capacity- in the fight against the Maoist insurgency. The court ruling was a response to a writ petition filed by social anthropologist, Nandini Sundar and others in 2007. The ruling authority observed that Chhattisgarh state had violated Constitutional principles by arming youths who had barely passed middle school and 'conferring on them the powers of police.' The bench also observed that Chattisgarh state had violated the rights of equality and the right to life under Articles 14 and 21 of those employed as SPOs and the citizens of the area and ordered that all firearms provided such as guns, rifles and launchers be withdrawn. Things to do: Identify peasant movements in colonial India.

NSOU ? CC-SO-04 152 11.6 Conclusion Peasant struggle in India had been an outcome of prolonged exploitation of peasants at the hands of the colonizers augmented by inadequate laws. It was both, the colonial administrators 'need for security' and the occasional need for 'law and order' which gave the peasant uprisings in the country, across centuries, such a violent character. The importance of and interest in the subject of peasant movements did not gain momentum at the beginning but gradually economists began considering peasant economy as a dynamic field of study. 11.7 Summary Peasant movements are linked to aspects of revenue, production of goods as well as a growing 'political force' in the country. One has to keep in mind that while other social movements are directed towards civil society, peasant movements have primarily been directed towards the state. It is the very nature of the state, such as the welfare model, which makes it accountable for addressing the needs of its peasantry. As a result, these peasant movements are a testimony to the changing relationship between the state and its people, especially those who inhabit the bottom rung of social strata. 11.8 Questions Answer in detail 1. Identify the major causes behind the indigo revolts. 2. Discuss the precursors to the Tebhaga Movement. 3. Identify the nature of the Tebhaga Movement. 4. Analyze the objectives and drawbacks of the West Bengal Land Reforms Act of 1955. 5. What is Operation Barga? 6. Discuss why the Naxalbari movement developed in the rural areas of Eastern India? 7. How did the Movement grow in later years? 8. Discuss Guerilla Warfare as a means of protest. 9. What are the similarities and dissimilarities between Tebhaga and Naxalbari movements?

NSOU ? CC-SO-04 153 Answer briefly 1. Who is a peasant? 2. Define 'Bargadar'? 3. Discuss the functions of the nari bahini in Tebhaga Movement. 4. Explain the role of Floud Commission. 5. Why did the Naxalites move to the forest regions? 6. Discuss the atrocities committed by Salwa Judum. 7. What is the source of the term 'Guerilla'? 8. In which year was Communist Party of India(Maoist) formed? Answer very briefly 1. Who is a 'jotedar'? 2. Name the peasant wing of the Communist Party in India. 3. What is the literal meaning of tebhaga? 4. Who was Benoy Choudhury? 5. What is benami? 6. Who were the leaders of the Naxalbari movement of 1967? 7. In which regions was Salwa Judum active? 8. When was Salwa Jumдум termed unconstitutional by the Supreme Court of India? 11.9 Suggested Readings 1. Bose, S. NSOU ? CC-SO-04 156 12.1 Objectives ? To build an understanding of how ethnicity and nationalism are interlinked. ? To be able to outline key reasons that lead to ethnic movements. ? To be able to understand various ethnic movements that have occurred in India's history. ? To understand the various approaches to understanding ethnic movements and identify. ? How ethnic movements differ from other social movements. 12.2 Introduction 12.2.1 What is an Ethnic Group? In order to understand an ethnic group, one must first look into how these groups of people are united. A group may be united on the basis of race, language, religion, shared experiences, heritage, physical traits or even region and locality. This is known as an ethnic group. Ethnic groups are often perceived as different from larger society as a result of their distinct characteristics. Those who belong to ethnic groups further organise themselves on activities 'built around their (real or mythical) common origin and culture.' Ethnic groups are defined by Weber (1997) as being based more on the subjective belief in their common descent established through similarities in either physical types or customs or even both. This subjective belief ensures

84%

MATCHING BLOCK 89/133

W

for the propagation of group formation. Additionally, it does not matter whether or not an objective blood relation exists

because ethnicity relies more on the existence of the belief of shared characteristics. This belief is further utilized to 'mobilize

100%

MATCHING BLOCK 90/133

W

people along some common point of reference for presenting a united front to articulate their socio-economic or political interests.' 1 Ethnicity

is well observed during the process of interaction between two or more groups. In such a situation what is observed is the maintenance of social boundaries and ethnic identities. Social boundaries are intrinsic to the formation of ethnic identities and these boundaries are not only identified by its members but are also strictly maintained such that ethnic groups identify their own members and differentiate themselves from others.

NSOU ? CC-SO-04 157 Did you know? The idea of ethno-nationalism conceives of the 'nation as a community of genealogical descent, vernacular culture and native history and popular mobilisation' (Gellner 1995). Most known ideas or territorial and administrative definitions of the nation regard it as a "community of shared culture, common laws and territorial citizenship." The ethnic concepts of the nation places utmost importance on the genealogy of its members. This genealogy is often fictive and relies on the popular mobilization of the folk. The ethnic concepts of the nation are based on, as mentioned earlier, ' on native history and customs; and on the vernacular

91%

MATCHING BLOCK 92/133

SA

SYBA SOC PAPER - II.pdf (D111235031)

culture.' Ethno-nationalism involves the transformation of ethnic groups into nationalities and their demand for autonomous governance or even secession as sovereign nation states.

Things to do: Identify two local groups/communities and trace their ancestry, religion, cultural practices, language etc. Discuss how these two groups identify themselves as being different from one another. 12.3 The Relationship Between Ethnicity and Nationalism Earlier it was believed that 'nationalism' was most closely linked to the idea of the nation. However, as Christophe Jafferlot (2003) states, a theory of nation sees it from the angle of an institution or the nation state, but nationalism falls within the ambit of 'isms' and deals with identity , something that shares greater proximity to that of ethnicity. Following Karl Deutsh's work which for the first time has showed how minority cultures are slowly subsumed into national identities, later research shows how 'modernization' and technological development have allowed isolated groups such as tribes to gather information of wider society and become aware of their differences from the rest. This generates a fear of losing one's ethnic identity making the breakout of ethnic movements become inevitable in the process of nation building. Did you know? Cultural homogenization: Sociologist George Ritzer in 1993 has told how McDonalds, a fast food chain has changed the way that the world eats. He termed this new set of business principles that have an enormous global impact as McDonaldization. What is interesting is the way people from different cultures have made this new American culinary habit of their own.

NSOU ? CC-SO-04 158 In a similar way the concept of cultural homogenization means the 'diffusion of a way of being.' Cultural homogenization may break down cultural barriers but at the same time it may result in smaller cultures to be assimilated into one single culture (Jennings 2011). Things to do: Watch the film Kakamuttai ,a Tamil –Hindi (watch preferably with subtitles) movie . Discuss the aspects of Urban Indian culture, the 'Pizza' dream and class dimensions as shown in the movie. 12.4 Ethnic Unrest in India One of the main problems that obstruct the process of nation building in India is the increasing incidence of ethnic unrest in the country. According to Kothari (1998), there are two main reasons behind these "assertions of cultures" in India- firstly, these violent ethnic agitations are an outcome of the excesses of modernization (which has been discussed in this unit) and secondly, due to the homogenizing trend of modern states as well as the nation's overall educational, technological and cultural goals. Ethnicity should therefore be understood as a response-including reaction – to the excess of the modernising project which undertook to shape entire humanity which also includes its natural resource base. It is often believed that traditional India was free from such dominant or singular identities. However, Gail Omvedt (1990) has criticized such a romanticized perception of traditional India. She instead states that traditional India was far from being a society tolerant of multiculturalism. On the contrary, traditional Indian society was characterised by social hierarchy which pervaded every sphere of an individual's social life. Keeping these points in mind, some of the main causes of ethnic conflict have been outlined below. 12.4.1 Causes of Ethnic Conflict

92%

MATCHING BLOCK 91/133

W

India being a plural society is characterized by a large diversity in its population with multitudes of castes and several religious, linguistic, cultural and racial groups living here: 1.

As these groups compete for scarce economic resources along with an increased need to preserve their age-old cultures, assertions of ethnic identities have been frequent in India. 2. Skewed economic development of the country has generated among certain groups a feeling of being marginalised or completely left behind in the development process. This has increased the propensity of a politics of ethnicity.

NSOU ? CC-SO-04 159 In India, the tribals have been alienated due to

100%

MATCHING BLOCK 93/133

SA

SYBA SOC PAPER - II.pdf (D111235031)

faulty development policies, leading to forced displacement from their age-old inhabited land and

forests causing homelessness and poverty. 3. In India, where Representative parliamentary democracy enables the formation of different ethnic groups based on castes, religious groups, linguistic groups etc., there exists a competition for political power. In this regard what we see is groups being formed on a basis of 'horizontal solidarity' and a 'consolidation of shared interests.' Issues pertaining to caste and religious identities frequently utilized by political leaders to bolster their vested interests. 4. The fear of 'assimilation' also operates among linguistic and religious minorities. The fear is of being assimilated into the dominant culture which may result in the loss of their distinct cultural heritage. This 'fear' causes a mounting pressure to safeguard their heritage and eventually leads to ethnic groups 'forging horizontal solidarity. Further, the processes of globalization and cultural homogenization have aided this process of horizontal solidarity to extend beyond transnational boundaries. Did you know? Ethnic movements (also political movements) can be broadly categorized into two groups based on their demands- Separatist movements and Secessionist movements. Separatism aims only at reducing the central authority's grasp over the specific or targeted territory and its population. Mathew Webb (2017) defines separatism as 'the advocacy of a state of cultural, ethnic, tribal, religious, racial or political separation from the parent state and its majority population.' Secessionism is defined by J. R. Wood (1981) as being, a political program based on the demand for a formal withdrawal of a bounded territory from an internationally recognized state with the aim of creating a new state on that territory, which is expected to gain formal recognition by other states (and the UN).' 12.4.2 Check Your Progress Answer in detail. 1. What do you understand by the term "ethnicity"? Explain with examples. 2. Is ethnic unrest in India a new phenomenon? Justify your answer. 3. Explore the various causes of ethnic unrest in India. 4. Discuss the relationship between ethnicity and nationalism. How is ethnic identity different from national identity?

NSOU ? CC-SO-04 160 Answer in brief 1. What is ethno-nationalism? 2. Differentiate between separatist and secessionist movements. 3. What is horizontal solidarity? 4. What is cultural homogenization? Answer very briefly 1. What is the nature of membership in an ethnic group? 2. How does ethnicity affect nation building? 3. Why are minorities fearful of dominant cultures? 12.4.2 Assertions of Ethnic Identity 12.4.2.1. Ethnicity based on Language or Linguistic Ethnicity Language has always formed the basis for asserting ethnic identity in India. The following are post colonial movements based on linguistic ethnicity: a) The Dravida Kazhagam

100%

MATCHING BLOCK 94/133

Movement in the state of Tamil Nadu in South India in 1940s and 1950s

when violent protest broke out
against

92%

MATCHING BLOCK 95/133

SA SYBA SOC PAPER - II.pdf (D111235031)

the adoption of Hindi as the national language by the government of India. The movement gave the call for the secession of Tamil Nadu from the union of India on the basis of identity centred on Tamil language.

However according to T.K. Oommen, language had more legitimacy than religion for administrative restructuring and in 1960s, the Dravida Kazhagam gave rise to two large and powerful regional political parties in Tamil Nadu- the DMK (Dravida Munnetra Kazhagam) and the AIADMK (All India Anna Dravida Munnetra Kazhagam). b) linguistic identity was again on display in the state of Maharashtra in Central India, where in the name of Marathi pride, there were concerted attacks on the helpless and poor Hindi-speaking North Indian immigrants from the states of Bihar and Uttar Pradesh. Continued assertions for linguistic ethnicity led to

89%

MATCHING BLOCK 97/133

SA SYBA SOC PAPER - II.pdf (D111235031)

many states being carved out based on languages by the State Reorganization Act of 1956.

Things to do: Identify various states in India that were formed due to assertions based on linguistic ethnicity. NSOU ? CC-SO-04 161 12.4.2.2 Ethnicity Based on Religion (Communalism) Religion has been an important socio-political issue that has continued to be an obstacle in the nation building process. The following are key examples: a) Hindu-Muslim Riots (Communalism)- Communalism, as many social scientists believe, has its roots in British imperialism and further intensified as a result

100%

MATCHING BLOCK 96/133

W

of modern politics based on mass mobilization and imaginary communal interests. The British

had effectively applied

72%

MATCHING BLOCK 98/133

W

the policy of "divide and rule" which sowed the seeds of hatred and mistrust between the Hindus and the Muslims.

Communalism is basically an ideology that generates hatred based on religious constructions. In recent times, Indians have become highly susceptible to being swayed by communal ideologies and tendencies. As India's massive population battle for acute resource imbalance, uneven development leading to poverty, inequality and unemployment as they see other communities are responsible for their deprivations and abject conditions. Religious sentiments are whipped up by religious leaders and politicians with vested interests.

b) **Khalistan Movement**- Khalistan was a 'religio-political vision' which sought to establish the "Land of Khalsa" (the literal meaning of Khalistan). This idea encouraged the Sikh imagination to believe that it was their divine right to rule Punjab. In 1710, the movement, under the leadership of Banda Singh Bahadur, successfully captured Sirhind, which served as one of the most powerful administrative centres between the cities of Delhi and Lahore during the Mughal reign. After the capture of Sirhind, the Khalistan leader established a capital in the nearby area of Mukhlispur. He repaired the Lohgarh fort and named the region the "City of the Purified". It was believed that Kalistan would be independent and self sufficient, boasting of its 'own currency, official seal, and issued letters of command invoking the authority of God and of the Gurus.' The belief that "the Khalsa shall rule" was even made a part of the Sikh liturgical prayer and it has continued to remain an important part of it. The Khalsa Raj under Banda Singh was brief and the idea of the Kingdom of Khalsa was realized only in the early 19th century in the kingdom of Maharaja Ranjit Singh . The Khalsa Raj rapidly declined and finally lost to the British in 1849. Despite the bitter experience, the hopes of the Khalsa coming to power once again has continued to thrive among the Sikhs. Before the partition of Punjab in 1947 and through lengthy periods of negotiations, it became clear that the idea as well as the demand for an independent Sikh state was a reality and had started to gain momentum. The only problem being that the Sikh population lacked numerical strength in relation to other residents of NSOU ? CC-SO-04 162 Punjab, thus making the proposition for a separate state impracticable. Violent secessionist movements followed in Punjab in the 1970s and 1980s in order to create Khalistan Punjab remained very volatile for almost a decade. The secessionist movement was supported by the All India Sikh Students' Federation and was led effectively by Sant Jarnail Singh Bhindranwale but, the Khalistan movement eventually failed. While discussing ethno-nationalism in Punjab, Gupta (1990) contends that ethnic identity or consciousness of some shared characteristics is not a sufficient condition for the rise of ethnic conflict. Political leadership which brings about the mobilization and manipulation of group identity is the reason that leads to ethnicity. He has used the term "conspiracy" to denote the deliberate and calculated manipulation on which such ethnic politics is based. Gupta observes that the agitation in

95%

MATCHING BLOCK 99/133

SA SYBA SOC PAPER - II.pdf (D111235031)

Punjab began with very secular demands like demands for the city of Chandigarh, water distribution and territorial demarcation, but it soon

took an ethnic character propagated by the political leaders and developed a communal colour , giving the impression that

100%

MATCHING BLOCK 100/133

SA SYBA SOC PAPER - II.pdf (D111235031)

they were fighting to safeguard the religious and regional identity of Sikhs in Punjab.

c) **The Politics of Identity in Kashmir** Jammu and Kashmir remain one of the most politically contested regions in India. It is a former Princely state and despite being ruled by the Hindu Maharaja, Hari Singh, the region had a majority Muslim population. Even after the partition of India and Pakistan in 1947, the Maharaja was not keen on joining both countries and had signed an agreement that would enable Jammu and Kashmir to continue trade and travel relations with Pakistan. Such an agreement, however, was not signed with India. In time as Pakistan began to exert pressure to join, Hari Singh approached India for military assistance which he would receive only if he agreed to become a part of India. In October of 1947, Jammu and Kashmir was formally added to the Indian state. Jammu and Kashmir were also given special status of independence by the Constitution of India which was revoked in 2019. The decision of the Maharaja to join India caused dissatisfaction and conflict among its population and for long this area witnessed militant anti-state activities, communal violence that led to mass exodus of Kashmiri Pandits and the cry for 'azadi' (Blakemore 2019). Things to do: Watch the movies Shikara (2020) and Widow of Silence (2019) and reflect on the narratives of victimhood, the outcomes of violence and the role of the state in both films.

NSOU ? CC-SO-04 163 12.4.2.3 Assertion of Tribal Rights (Tribal Movements) Both pre and post-colonial India witnessed the occurrence of tribal movements. The British period was full of incidents when tribes rose in revolt against the officials, the landlords and the money-lenders when they were forcibly evicted from their traditional land. a) Birsa Munda Rebellion- One of most prominent rebellions of the late 19 th century was the Birsa Munda Rebellion waged by the 'Adivasis' of Chota Nagpur region in Eastern India. In 19 th century colonial India, a number of indigenous rebellions had occurred which were carried out by the 'Adivasis,' but the Munda rebellion spearheaded by a young Adivasi freedom fighter, Birsa Munda was the most well-known. The primary reasons that caused such an uprising were 'a history of exploitation and land alienation' and it must be noted that these rebellions existed even prior to British rule. With the advent of the British colonizers, these already existing problems were augmented. The British with their "feudal-landlordism which rested on derision and apathy towards for the 'original settlers'" rendered traditional political, economic and social relations to break down and lose its significance. Most changes introduced by the colonizers in the land governance system not only did little to alleviate problems but rather 'disrupted the harmony that had been sustained for generations', as well as traditional patterns of 'collective ownership' were affected adversely. The new legal framework based on 'individual and private ownership' was opposed to traditional patterns of land use. Birsa Munda's rebellion was not just directed towards the British but was against the missionaries as well as the Zamindars, who played a key role in propagating systemic violence against the Munda Adivasi community. In the Munda uprising, Birsa Munda took up the role of a prophet who had been entrusted by the gods to bring back 'Munda Raj'. 2 Birsa Munda was a visionary who, guided by his experiences, was able to understand as to what caused the people from his community to suffer. His goal was not merely to start protests or oppose the British, but his greater aim was to create a radical break in the 'historical continuity of oppression, dominance and exploitation.' His rebellion was a representation of lived experiences of a Munda as a converted Christian, who grew up under a colonial state that propagated a belief system that taught to undervalue his own. The exploitation was to such degree that tribal people faced a huge crisis that affected their culture and history. Birsa Munda's rebellion left such an impression on the colonial state that officials were forced to introduce new legislation – the Chota Nagpur Tenancy Act of 1908 – that ensured the protection of land rights of tribals in India.

NSOU ? CC-SO-04 164 Did you know? The Chota Nagpur Tenancy Act which is applicable to the areas of North and South Chota Nagpur and Palamu Districts was enforced in 1908 in order to prohibit the transfer of land belonging to tribals to non tribals. In 1965 Economically Backward Scheduled Castes and OBCs were also brought within the purview of the act. The act, though amended numerous times, is exempted from judicial review. 12.4.2.4. Regionalism or Nativistic Movements Regionalism manifests itself in the following ways- first, as a group of peoples'

100%

MATCHING BLOCK 101/133

SA

SYBA SOC PAPER - II.pdf (D111235031)

fear of being assimilated into the dominant culture and, hence, to preserve one's language and culture by demanding an autonomous state

or through nativistic tendencies – such as the '

93%

MATCHING BLOCK 102/133

SA

SYBA SOC PAPER - II.pdf (D111235031)

sons of the soil' concept in which regional identity becomes the source of ethnic struggle. Examples include the Jharkhand movement in the

erstwhile

100%

MATCHING BLOCK 121/133

SA

SYBA SOC PAPER - II.pdf (D111235031)

state of Bihar and Telangana movement in the state of Andhra Pradesh, the attack on South Indians in Mumbai in 1960s

and the movement in Assam in the north-east to expel immigrants especially from the states of Bihar, Uttar Pradesh and Bengal which act as a form of a violent collision between the natives and the immigrants. The 'Bhumi Putra Movement' or 'Son of the Soil Movement' in post-independence India is discussed in detail below. a) Bhumi Putra movement- To understand the concept of "Bhumiputra" or "Sons of the Soil," one would have to delve into the deepest recesses of human psyche. The concept ties people to their place of birth and bestows on them certain exclusive benefits, rights, roles and responsibilities.

92%

MATCHING BLOCK 103/133

W

The 'Sons of the Soil' doctrine underlies the view that a state specifically belongs to the main linguistic group inhabiting it or that the state is the exclusive 'homeland' of its main language speakers who are the 'sons of the soil' or the 'local residents'. All others

acquire the status of a 'settler' or 'outsider' especially because their mother tongue is not the same as the state's main language. Irrespective of the time that these 'settlers' have spent in the state which may be both- being a resident

73%

MATCHING BLOCK 104/133

W

in the state for a long time or newly migrated, they are not regarded as 'sons of the soil'

or 'Bhumiputra.' The concept of 'son of the soil' is not exclusive to India. In fact, countries around the world have witnessed such nativistic sentiments. The problem with this concept of 'Son of the Soil' is that it occupies a space between two key ideas-that of equality versus the concept of fairness. The main characteristics of the sons of the soil includes conflict between members of a minority ethnic

NSOU ? CC-SO-04 165 group which is concentrated in a certain region of a country and migrants from other parts of the country who are ethnically distinct and have begun populating the same area. Second, the members of the minority group think that their group is the original inhabitants of the area. They trace their group's roots to the very region which is sometimes established due to the prolonged inter-generational residence in the region. Thirdly, these tensions are usually heightened when the migrant community has better access to education or are economically affluent than the minority ethnic group. The migrant communities usually have middle or upper middle class status and are involved in lucrative businesses, government services, shop keeping etc. In India, migration to urban areas, especially to cities had increased in the 1950s, but even in 1960s and 1970s, employment opportunities had hardly increased at the same rate. The only employment that was generated was the ones in the public sector or government services. Consequently, this led to intense competition for available jobs. In addition to this, those who spoke the state language had either been reduced to a numeric minority or a 'bare majority.' For example, in 1961, the percentage of Marathi speakers in Bombay was 42.8% of the population. The trends were similar in Karnataka and Assam where Kannada speakers were less than 25% and the Assamese were barely 33% of the population. All these factors led to the rise of nativistic sentiments among minority groups who utilized the democratic machinery to assert their demands. One such party was The Shiv Sena. The Shiv Sena, a Hindu nationalist party was at the forefront of the nativistic movement in Maharashtra. Their main area of contention was the increasing number of people who migrated into Bombay belonged to three distinct ethnic groups- the wealthy Gujarati's, the professional South Indian groups which included the Kannada, Tamil and Malayalis and finally the labourer class of Northern India. The Siva Sena's demand was that preference in the fields of educational opportunities, funding opportunities, job opportunities, etc., be given to the natives of the state rather than outsiders. 3 b) The Naga Insurgency- The Nagaland secessionist movement had its inception before Indian independence. The British had brought Assam within its control in 1826 and subsequently the Naga Hills also became a part of British India in 1881. The Nagas who were culturally different had come in contact with the Baptist missionaries but by the time India was on the road to attain freedom, they feared that they would soon be assimilated into the dominant Hindu culture. On August 14 th of 1947 the Naga National Council (NNC) headed by Angami Zapu Phizo, the Naga nationalist leader declared Nagaland as a separate state. 17 major tribes and 20 sub-tribes united under the banner of Naga National

NSOU ? CC-SO-04 166 Council (NNC) and undertook severe resistance against India. The major tribes of Nagaland who were linguistically distinct were the Ao, Angami, Sema, Lotha, Tangkhul, Konyak, Rengma and Mao tribes who came together to demand for an independent Nagaland. In a referendum passed in 1951, almost 99% demanded an independent Nagaland. In the years that followed a number of actions were undertaken by the Government of India to restrain the growing demand for an 'independent Nagaland.' These included the deployment of Armed forces in the Nagaland Hill district of Assam and the enactment of the Armed Forces Special Powers Act, 1958. The division of Assam took place on 1 st of December, 1963 and Nagaland became an independent state. In 1964, a political settlement in the form of Agreement for Suspension of Operation (AGSOP) was signed with Naga insurgents to restore peace in the region. 4 The death of the leaders of two protracted linguistic and nativist movements in India, Karunanidhi (left) and Bal Thackeray (right), being mourned by the masses. The pictures reestablish the role of politics in the assertion for ethnic identity in the country [Source of photographs : (left) Outlook India, (right) Livemint].

12.5 Approaches to the Issues of Ethnicity

As ethnic discord and assertions become more frequent, the approach to understand the idea of ethnicity has also undergone a huge transformation. Social scientists have been divided on how to perceive of the significance of ethnicity to human life and its tendency to cause violence. The primordialists "views ethnic identity as innate, fixed and permanent" and that – that the fundamental cultural differences and divergent values between ethnic groups inevitably results in a 'clash of cultures' and the emergence of ethnic violence. The instrumentalist approach has challenged the classic primordialists by arguing that ethnic groups are not 'distinct bounded units with innate cultural characteristics' NSOU ? CC-SO-04 167 (Adalparvar & Tadros 2016). Instead, they have focussed on the cultural 'content' of ethnic groups. Frederik Barth's (1969) approach to understanding ethnicity is known as the 'subjectivist standpoint', which suggests that instead of looking at ethnic identity as something innate to its members, it must be seen as selectively emphasized cultural traits whose boundaries are not fixed. Which cultural trait will receive recognition is decided upon and boundary maintenance develops at the time of interaction between 'us and them.' In this way, Barth has emphasised the relational, interactional and situational nature of ethnicity. The primordial approach was further questioned by the 'Manchester School' where the anthropologists analysed the relationship between black tribes and white colonialists in the African Copperbelt from the 1950s to the late 1970s. A key study from the Manchester School was Abner Cohen's (1969) thesis on the instrumentality of ethnic affiliation. Cohen's research on the Hausa and Yoruba tribes in Nigeria suggested that the principal function of ethnicity was informal political organisation. He argued that political elites in some cases created but also used and exploited 'primordial' symbols to gain the allegiance of potential followers. The third school of thought were the materialists who base their arguments on Marxist theories. Michael Hechter in 1978 termed ethnicity as an epiphenomenon i.e., ethnicity is a result of class relations. These crude Marxist theories also suggest that violence between ethnically aligned groups is the result of economic inequalities and elite exploitation. The constructionist approach further developed the idea of ethnicity as being "constructed." They speak of the agents that aid in the construction of ethnicity- the individual, cultural systems as well as the role of broad social, political and economic forces in the process of construction of ethnicity. In the 1980s, post modernist thought called for the concept of ethnicity to be re-thought and redefined such that there was enough clarity as to what ethnicity stood for. Some of the post modernist scholars however completely abandoned the concept, identifying the "tendency to use ethnicity as a catch-all concept for many varieties of group identity results in a loss of analytical depth. Ethnicity, it is argued, is therefore everything and nothing." The critique was directed at the over-ethnicized view of social reality.

12.6 Conclusion

The causes and nature of ethnic movements in India have been outlined in this unit. However, the occurrence and persistence of ethnic movements in India can further have two possible explanations. The first being that despite Nehruvian ideas around modernisation, which he believed would ultimately 'obliterate people's attachments to religious, ethnic or caste groups,' in reality caused a shift in demands for 'honour'

NSOU ? CC-SO-04 168 to that of 'dignity.' Vibha Pingle and Ashutosh Varshney (2006) states that 'honour' is reserved for few while that of 'dignity' can be demanded by all. 'Dignity,' they say, is intrinsic to an individual and with modernisation placing greater importance on achievements; traditional 'birth-based' or ascribed hierarchies became weak. Ethnic movements derive its nature from this 'politics of identity' in conjunction with the 'politics of difference' which was enabled with a new found definition of group identities separate from traditional patterns and aware of the 'inherited structure' of group formation and identities. 12.7 Summary In addition, modernity has also brought in 'claims for recognition,' which to Pingle and Varshney is achieved through dialogue especially when faced with questions such as "where we are coming from" and "who we are". These questions may often lead to misrecognition and cause "injury" while "withholding recognition is seen as a form of oppression" (Pingale and Varshney 2006: 357-358). These reasons became important points for the inception of various ethnic movements in the country. 12.8 Questions Answer in Detail 1. Discuss the circumstances under which the Khalistan Movement grew. 2. Write a note on the Nagaland Secessionist Movement. 3. Discuss the main features of the 'Son of the Soil' movement. 4. Discuss the incidence of communal riots in India. Answer briefly 1. Discuss how the Shiv Sena rose in Maharashtra and their main objective. 2. Why did Birsa Munda revolt against the British, the Zamindars and money lenders? 3. Identify the dissimilarities between the 'primordialist' and 'instrumentalist' approach to understanding 'ethnicity'. 4. Discuss the 'Dravida Kazhagam Movement.' Answer very briefly 1. What is the full form of NNC? 2. What is the meaning of the term Khalistan?

NSOU ? CC-SO-04 169 3. What does "Bhumiputra" mean? 4. Which legislature provides protection to the Munda community's right to land? 5. What strategy did Birsa Munda employ to mobilize the tribal population? 12.9 Suggested Readings 1. NSOU ? CC-SO-04 172 NATURAL DISASTER: THE TSUNAMI 13.1 Objectives ? To understand what causes a Tsunami and its aftermath ? To analyze disaster risk management after a natural disaster ? To understand the magnitude of man-made disasters such as the Bhopal Gas leak ? To identify the legal provisions available 13.2 Understanding Tsunami 13.2.1. What is a Tsunami? In Japanese the term 'tsunami' means 'a large harbor wave.' A Tsunami is a series of large water waves which is caused due to the sudden vertical displacement of water. Tsunamis are different from ocean waves which are caused by wind, tides and by the gravitational pull of the Moon and the Sun. Earthquakes, volcanic eruptions, meteorites and other underwater explosions above or below water all have the potential to result in a tsunami. The National Oceanic and Atmospheric Administration (NOAA) (2021) identifies the following as key characteristics of a tsunami. Tsunami waves are different from normal sea waves as the latter has longer wavelength. In the initial stages, a tsunami resembles a 'rising tide' rather than 'breaking waves.' Tsunamis are usually caused due to submarine earthquakes and volcanic eruptions though they do not increase in height rapidly in the depths of the ocean. They gain height as they travel inland due to the decrease in ocean depth in increase in coastal friction. The speed of tsunami waves is determined by the depth of the ocean and not by its distance from the 'source of the wave'. Tsunamis can decrease in velocity and can slow down considerably when the depth of the ocean decreases. The series of waves in a tsunami is called a 'wave train.' Tsunamis are different from ocean tides and therefore experts discourage the use of the term 'tidal waves' to refer to a tsunami . The ancient Greek historian, Thucydides had mentioned tsunamis as being 'submarine earthquakes' in History of the Peloponnesian War, but greater knowledge of the phenomenon was developed only in the 20 th century. However, despite the more recent findings and research on the phenomenon, much of it still remains unknown.

NSOU ? CC-SO-04 173 Did You Know? On July 21 st of 365 CE, one of the oldest and

87%

MATCHING BLOCK 110/133

W

most destructive tsunamis in history took place in the eastern Mediterranean Sea.

The island of Crete was affected by an earthquake with an estimated magnitude of 8.0–8.5 on the richter scale due to a fault slip. The magnitude of the earthquake was so powerful that

81%

MATCHING BLOCK 111/133

W

parts of the western third of the island were raised up to 33 feet. The earthquake followed by a tsunami claimed thousands of lives and caused widespread damage spanning from the 'islands in the Aegean Sea westward to the coast of present-day Spain. Tsunami waves pushed ships over harbour walls and onto the roofs of houses in Alexandria, Egypt, while also ruining nearby croplands by inundating them with salt water.' (

Encyclopedia Britannica). 13.2.2 Why and How Do Tsunamis Happen? The origin of the tsunami can be linked to aquatic earthquakes, which is the most common cause, along with 'volcanic activities, landslides and impacts of meteorites.' When vertical movement of tectonic plates, in the deep sea, continental shelf or coastal, occur, the overlying water is displaced. As waves created by these disturbances are pushed outward, away from the source, they gain height and reduce in speed when the ocean depth decreases. In deep waters these disturbances are not noticeable and resemble a 'gentle wave'. Towards the coast, along with rise in friction, the wavelength is shortened and 'the wave amplitude (height) increases'. The following facts hold true for tsunamis:

98%

MATCHING BLOCK 112/133

W

Coastal waters may rise as high as 30 metres (about 100 feet) above normal sea level in 10 to 15 minutes. The continental shelf waters begin to oscillate after the rise in sea level. Three

to

100%

MATCHING BLOCK 113/133

W

five major oscillations generate most of the damage, frequently appearing as powerful "run-ups" of rushing water that uproot trees, pull buildings off their foundations, carry boats far inshore, and wash away entire beaches, peninsulas, and other low-lying coastal formations. Frequently the succeeding outflow of water is just as destructive as the run-up or even more so. In any case, oscillations may continue for several days until the ocean surface reaches equilibrium (

The Editors, Encyclopaedia Britannica). Tsunamis are diverse in their nature and to predict one is difficult. However, the most obvious sign is the receding of water which 'exposes the shallow seafloor.' This is usually followed by a wave crest. Additionally, 'Topography', 'configuration of coastline' also determines the intensity of a tsunami (Ibid.).

NSOU ? CC-SO-04 174 Did You Know? Tsunamis have often gathered curious spectators, but the outcome of this behavior has been dangerous. In the bay of Lisbon in Portugal, a large earthquake had occurred on 1st of November, 1755, causing the coastal waters to recede. In order to watch the phenomenon that exposed the ocean floor, many spectators had gathered. What followed few minutes later was a wave crest which caused many of these spectators to drown. Further, the day the earthquake occurred was also 'All Saints Day' and many worshippers attending church that day died as buildings collapsed due to the seismic shocks (Ibid.).

13.2.3 What are the effects of a Tsunami?

The aftermath of a tsunami includes flooding and though it affects coastal areas initially, the destruction can spread inland. Damage to ocean basins and eroding the 'foundations of coastal structures' are some of the after effects of a tsunami. As mentioned before, the degree of destruction is determined by the topography of the coast. High impact tsunamis such as the 2004 Indian Ocean Tsunami affected fourteen nations and resulted in more than 230,000 deaths. Similarly the Japan Tsunami of 2011 led to 28,000 deaths. The effects of a tsunami, therefore, are human, social and economic. Given these recent tsunami disasters, a broader understanding of the characteristic effects of tsunamis on human populations could inform preparedness and response efforts (Doocy et al. 2013). The presence of a 'tectonic interactive plate' makes the islands of the Indian Ocean more prone to tsunamis. The priority of disaster management in this area is the transnational collective development of an early tsunami warning system in order to effectively and timely communicate with all the people in this tsunami-prone region (Ramalanjaoana 2011).

13.3 The Indian Ocean Tsunami on 26th December 2004

13.3.1 Causes

On December 26th of 2004, an earthquake of magnitude 9.1 on the Richter scale led to one of the most destructive tsunamis. The earthquake displaced the ocean floor off the island of Sumatra in Indonesia. This caused the Indo-Australian Plate to subduct below the Eurasian Plate. The cause for such a movement attributed to convection currents that made the two plates to move towards each other. This was followed by

NSOU ? CC-SO-04 175 aftershocks, some of which were of 7.1 magnitude on the Richter scale which led to earthquakes in neighbouring countries in Asia, east coasts of Africa as well as eastern coast of India and Sri Lanka which were hit by massive waves despite being almost 1,200km away. The impact was felt even further away, 3000 km on the Horn of Africa (Srinivas 2015).

13.3.2 Impact, Damage and Loss

86%

MATCHING BLOCK 114/133

W

More than 230,000 people were killed, most of them on Sumatra but thousands of others in India, Thailand, Sri Lanka, and more in Malaysia, Myanmar, Bangladesh, Maldives, Somalia, and other locations.

Millions more have been displaced or rendered homeless. The damage from the tsunami was particularly severe as an increasingly percentage of the population, and many key cities and towns, were within 50 kms of the ocean's edge. The impact of the tsunami in terms of damage and loss can be very broadly divided into three separate but not mutually exclusive aspects— a. Social b. Economic and c. Environmental.

a. Social Impacts of the Tsunami

i. Loss of human life: The tsunami had resulted in the death of more than 2,30,000 people.

ii. The destruction had left 1.7 million people in 14 nations homeless, some were geographically displaced, and many others became refugees, leading to 'loss of nationality and political status.'

iii. The problem of forced migration: The tsunami pushed people to migrate, especially those who had lost their homes. In some cases, the rise in sea levels due to tectonic shifts had caused islands and low-lying areas to become submerged. This resulted in not only the loss of habitat but also entire 'homelands.' This caused the homeless population to spill over into neighboring countries or areas which lead to a tremendous pressure to 'accommodate' as well as to rehabilitate them.

iv. Emergency relief including food, water and medical supplies was required for five to six million people.

v. A disaster of such magnitude had damaged the infrastructure especially waste management resources. This invariably led to the risk of disease and epidemics as fresh water reserves pipelines had become contaminated with sewage water.

NSOU ? CC-SO-04 176 vi. Loss of livelihood: 'Livelihoods depend on human, social, natural, physical and financial assets' and the 2004 Tsunami had affected every single of these adversely. For example, the tsunami had destroyed 1,500 fishing villages in Sumatra, Indonesia. The loss of lives and natural resources had stripped the fishing community of its livelihood. In addition, such destructions also limit people's access to 'credit, capital and insurance' (Wachtendorf, Kendra, Rodriguez and Trainor 2006, Srinivas 2005). 1 b. Economic Impacts of the Tsunami The tsunami destroyed livelihoods and damaged entire economies, especially in those primarily maritime countries, like Indonesia, Thailand, Maldives, and parts of India, especially the port-towns, like Vishakhapatnam, Paradwip, Port Blair, the entire Andaman and Nicobar Islands being the worst affected in India. Srinivas (2015) has outlined the extent of the immitigable loss can be briefly and objectively stated as hereunder— i. The tsunami left major harbours and ports ruined, resulting in massive loss of trade. It further resulted in severe damage to infrastructure, and burgeoning costs of reconstruction of those affected port-areas, in the aftermath of the disaster. ii. It left the fishing industry devastated - boats, nets and equipment were massively destroyed. An estimated 60% of Sri Lanka's fishing fleet stood destroyed. Banda Aceh of Indonesia, which was the worst affected, was submerged, losing out on its prime source of income through fishing. In Sri Lanka itself over 7500 fishermen had died and as many as 5600 went missing. iii. The process of reconstruction cost was billions of dollars, and most of the affected counties being LEDC's (Less Economically Developed Countries), the expenditure came at far greater cost. iv. The tsunami ravaged areas were like Bali, Indonesia, Phuket, Thailand, Maldives, Sri Lankan beach towns, The Andaman and Nicobar Islands, and all popular beach destinations across the world. The loss of national income accruing from tourism was irreparable as these areas, depended heavily on tourism as their sole source of income. v. Further, salination of the soil left agriculture crippled, and crops were damaged, creating food scarcities, and loss of agricultural income, and higher prices due to shortages of supplies, which created greater economic hardships for the already suffering people. vi. Communications including roads, bridges, aerodromes, airports and rail networks, were severely damaged, making even rescue and relief work difficult and delayed. 2

NSOU ? CC-SO-04 177 c. Environmental Impacts of the Tsunami The worst impact, in terms of long-term damage, that the tsunami had, was on the environment. It resulted in destruction of coastal ecosystems, loss of marine ecosystems and habitats, including destruction of mangroves and coral reefs. Further the problem of debris and sustainable waste-management had arisen. To objectively outline the major environmental concerns— the biggest environmental problem was with 'solid waste and disaster debris' as areas affected were left with enormous amounts of debris, far beyond the manageable capacity of cities and towns. Waste disposal and recycling became important aspect of handling the matter. Secondly, 'rapid cleanup' had resulted in the mixing up of hazardous waste with ordinary waste. Inappropriate disposal including 'air burning and open dumping' had an impact on the environment. Thirdly, as tsunamis pushed salt water inland, it affected freshwater bodies such as 'rivers, wells, inland lakes and ground water aquifers.' This adversely affected the fertility of soil and 'debris contamination' brought a decline in productivity of soil. Furthermore, waste from damaged toilets and sewage contamination of drinking water supply was also a problem. Fourthly, the damage to infrastructure such as buildings and industrial sites including water and sanitation systems and solid waste disposal sites and waste treatment centres and oil storage facilities caused a wide range of contamination and pollution of the environment was aggravated due to improper handling. Fifthly, the tsunami had destroyed both the mangroves and damaged the coral reefs leading to a long lasting impact on the 'floral and faunal species' of the region and the process of rebuilding mangroves and coral beds was tedious and time taking. It was established after a thorough review of the aftereffects of the tsunami in Sri Lanka, The Stockholm Environment Institute concluded that natural barriers or 'bio shields' such as coral reefs, mangroves, coastal dunes, peat swamps etc., could lessen the damage caused by tsunamis. Areas where environmental degradation had been considerably less experience lesser damage despite being in the 'direct path' of the tsunami such as Maldives , Srilanka's Yala and Bundala National Parks etc. (Ibid.).

NSOU ? CC-SO-04 178 13.3.3 Responses to the Tsunami a. Disaster Management Responses Post Tsunami rescue and relief to affected communities was tremendous along with United Nations , national institutions , community groups, Non-governmental organizations and others workin in collaboration to provide rehabilitation and any kind of aid to those affected The response to high magnitude disasters such as Tsunamis are broadly divided into four categories immediate and secondary responses and short term and long term: Immediate Responses Secondary Responses ? Search and rescue operations. ? Emergency food and water. ? Providing medical care to those injured. ? Temporary shelter to rendered homeless. ? Damage to transport and communications require re- establishing of infrastructure. Short term responses Long term responses ? Collaborative efforts of the communities to help themselves when external help was difficult to get. ? Burial or burning of the dead to avoid the spread of disease and epidemic. ? Providing food aid to affected people ? Financial aid from foreign governments and transparency in its utilization. Charities from the general public, NGOs and philanthropic organizations. (Tsunamis; Case study: Tsunamis at <https://www.bbc.co.uk/bitesize/guides/zbfrd2p/revision/2>) ? Restoring infrastructure and improving housing. ? Employment generation and providing support to small businesses. ? Giving advice and technical assistance. ? Continued efforts to reconstruct infrastructure. ? Setting up of tsunami warning systems internationally to alert high risk areas. ? Recovery and rebuilding damaged natural ecosystems that can operate as 'bio shields' such as mangroves and the coral reef. The restoration of natural assets. ? Support to small business and 'small scale sustainable development projects at the local level to help people regain their livelihoods.

NSOU ? CC-SO-04 179 b. Preventive Measures Hussey (2014) states that despite the difficulty in precise prediction of a tsunami, the UNESCO set up a 'tsunami- forewarning' system for the Indian Ocean after the tsunami of December, 2004. Later, the project was expanded to the entire world. Experts such as geologists, oceanographers and seismologists analyze each earthquake and decide whether or not to send out a warning. The development of automated systems such as 'bottom pressure sensors, attached to buoys are effective in monitoring 'the pressure of the overlying water column' and also in sending warning immediately after an earthquake and thereby curtail damage and loss of life. High risk and subduction prone regions use tsunami warning systems to monitor 'seismic activity in the Pacific Ocean.' One key activity of these systems is to analyze the possible extent of risk that an earthquake poses in the area. From understanding the structure of the ocean floor and coastal topography, heights of tsunami waves are also calculated. Usually, the geological society would send a warning regarding an earthquake after which meteorological agencies report sea level changes. Once the magnitude of the tsunami is estimated, governments are notified about the imminent danger and evacuation of coastal areas can be carried out at the right time. Disaster management is a collaborative effort on the part of the national, regional, and international organizations to develop tsunami programmes, fund tsunami projects, and continue research programmes. Did You Know? In 1949, The Pacific Tsunami Warning Centre was established near Honolulu, Hawaii after a submarine earthquake that occurred near the Aleutian Islands impacted the island of Hawaii causing the death of 170 people. The Intergovernmental Oceanographic Commission (IOC) was established in 1965 and is coordinated by UNESCO's

80%

MATCHING BLOCK 115/133

W

Intergovernmental Coordination Group for the Pacific Tsunami Warning and Mitigation System or the ICG/ PTWS.

The PTWS has 46 member states which comprises of 27 Pacific Rim member states and 19 Pacific Island member states (Encyclopedia Britannica, International Tsunami Information Centre). 13.4 Post Tsunami : Lessons learnt, and the way forward Rehabilitation after a tsunami firstly involves rebuilding damaged coastal regions including reforestation of coasts with mangroves and coral reefs and decrease coastal erosion. Ecologists have discovered that despite severe damage, mangroves and coral reefs have the capacity to recover and continue to provide protection from tsunamis.

NSOU ? CC-SO-04 180 However, the coasts must be protected and "buffer zones and 'no build areas'" with more strict land use policies and urban planning must be undertaken. Such projects are underway in countries such as Sri Lanka, Indonesia and Thailand. Coastal development can put unnecessary pressure on the coastal ecosystem and therefore this must be curtailed at any cost. Coastal development can greatly hinder the recovery process of the ecosystem. Secondly, rebuilding the ecosystem must be accompanied by employment generation and other income generation possibilities. This will enable the community to recover faster. As the coastal economy relies greatly on tourism, steps to restore the industry are necessary. This must however continue alongside the enforcement of land use policies and careful coastal planning. Finally, disaster preparedness is yet another aspect to be mentioned. Laws and plans that would take environmental factors into consideration and treat it both as a 'contributing factor' as well as 'affected by disaster' must be put into place. Maldives, for instance, has established 'safe islands' to protect vulnerable communities 'by measures such as specially constructed areas of high ground, taller buildings, and buffer stocks of provisions.' A combination of preparedness, conservation and awareness has been effective in disaster management and as such tsunamis have had considerably reduced impact when ecosystems were adequately protected and communities were aware of the risks. Constructions in high risk areas and close to the coastline can have dangerous outcomes at the time of a disaster. For this, awareness campaigns at multiple levels- families, communities, provinces and at the national level is essential along with a legal framework for disaster management (Srinivas 2015). Did you know? The United Nations had declared 1990s as The International Decade for Natural Disaster Reduction (IDNDR) which tried to promote disaster management as being an integral part of the 'socio-economic strategy' of any country. Despite India being a participant in the UN's mission, two massive natural disasters struck India at the start of the Millennium, The Gujarat Earthquake of 2001 and the Indian Ocean Tsunami of 2004. In 2005, The National Disaster Management Act was enacted by the Parliament. Two apex bodies were also established-the National Disaster Management Authority (NDMA) and the National Executive Committee (NEC) for the implementation and execution of disaster management policies and plans (Pandey 2016). Things to do: Identify the main provisions of the National Disaster Management Act of 2005.

NSOU ? CC-SO-04 181 13.5 Man-Made Disaster: Bhopal Gas Tragedy 13.5.1 Introduction Bhopal Gas Tragedy or the Bhopal Disaster, considered to be one of world's worst and tragic industrial disasters, took place after a gas leak in the pesticide plant of Union Carbide India Limited (UCIL). The disaster occurred in the intervening night of 2nd and 3rd of December of 1984. The incident was the cause of thousands of deaths in Madhya Pradesh. On the particular day when the chemical reaction started in the Union Carbide (India) Limited factory a leakage of Methyl Isocyanate (MIC) gas occurred from one of the tanks of the factory. The poisonous gas contaminated the air, water bodies, turning them into literal gas chambers. The disaster caused the environment to become polluted and adversely affected the ecology of the area. Approximately five lakh people were exposed to the deadly MIC gas and close to 15,000 people had died within few days of the leakage. Close to '20,000 premature deaths' took place in the following two decades. Children were born with grave medical disorders and numerous still births were also recorded. As epidemiology showed an increased mortality as well as morbidity rates , ' Bhopal became synonymous with industrial catastrophe' (Broughton 2005). Did you know?

W

Methyl Isocyanate (MIC), a chemical used in the manufacture of polyurethane foam, pesticides, and plastics, is usually handled

in its liquid form and is combustible. It is also an explosive. It has a strong odour and being a highly volatile chemical, it mixes with air quickly. However, on exposure, a person can be affected by the chemical even before the chemical is identified by its smell. The molecular formula of the chemical is CH_3NCO or $\text{C}_2\text{H}_3\text{NO}$. In the Bhopal chemical disaster about 40 tonnes of Methyl Isocyanate (MIC) gas had leaked in addition to other toxic chemicals from the Union Carbide Factory. The toxicity levels were multiple times higher than the level required to cause death i.e. 21 ppm (parts per million). (IDPH: http://www.idph.state.il.us/Bioterrorism/factsheets/methyl_isocyanate.htm) 13.5.2 How MIC Leakage Took Place in the Union Carbide Factory and What Followed: Methyl Isocyanate was used to cool the plant at the Union Carbide factory. MIC was mixed with water in Plant 'C' of the factory. As volumes of gas were generated, it put tremendous pressure on tank number 610. Due to this enormous pressure, gas from

NSOU ? CC-SO-04 182 the tank leaked and diffused over a large number of areas. The situation worsened as the alarm system of the Union Carbide factory did not work even after several hours of the leakage. The leakage is captured through an eye witness and worker of the plant: Suman Dey, a worker at the plant, noticed that the temperature gauge on tank 610 had reached 25°C, the top of its scale, and pressure was rapidly moving towards 40 psi, the point at which the emergency relief valve opens. He rushed to the storage tanks to investigate and was horrified. As he stood on a concrete slab above the storage tanks, the slab suddenly began to shake. "There was a tremendous sound, a messy boiling sound, underneath the slab, like a cauldron." He ran, only to hear a loud noise behind him. The slab, made of 60 feet of concrete at least six inches thick, was cracking. The heat was like a blast furnace. He couldn't get within six feet of it. He then heard a loud hissing sound and saw gas shoot out of a tall stack connected to the tank and form a white cloud drifting over the plant and towards the sleeping neighbourhood. In the plant, he found that the pressure indicator had gone above 55 psi, the top of the scale, and the safety valve had opened releasing MIC from the storage tank (Centre for Science and Environment p. 207).

3 The population of Bhopal in 1984 was approximately 8.5 lakhs. The morning after the leakage, more than half of the population started to show symptoms that included 'coughing, complaining about itchiness in eyes, skin and...breathing problems.' In addition to this, people also developed pneumonia, internal hemorrhage, and in many cases even death. The people living in villages and slums in the neighbouring areas were affected the most.

4 Bhopal at the time also had limited health care facilities especially hospitals were lesser in number which made it difficult to accommodate half of the city's population. The situation was such that initially patients and doctors were confused as to what had happened suddenly and why. The doctors in Bhopal had not faced a situation like this before. Reports had shown that people complained of dizziness, breathlessness, skin irritation, rashes, and even sudden blindness. They were also not experienced in dealing with medical ailments arising from industrial disasters and hence were not aware of the symptoms of MIC exposure. Reports revealed that two government hospitals of Bhopal had treated approximately 50,000 patients in two days after the MIC leakage. Those who survived were severely affected. Their lungs, brain, eyes, muscles, gastrointestinal, neurological, and reproductive and immune systems were severely NSOU ? CC-SO-04 183 damaged. It also affected fertility in men and women. Long after the disaster, traces of toxins were found in the breast milk of mothers which was transmitted to the babies. The economy had also suffered with people unable to work and thereby unable to meet their basic needs.

13.5.3 The Aftermath of the Incident The damage caused by the Bhopal disaster extended far beyond one particular day. For instance the Bhopal Gas Peedit Mahila Udyog Sangathan (BGPMUS) had alleged that toxic waste from the plant which was generated between the periods of 1969-1984 had been disposed without precaution and had contaminated the soil and water in and around the plant. The factory, therefore, despite being closed continues to pose health risks. Also, the groundwater on being tested 16 times by government and non-government agencies since 1990, had shown 'pesticides, heavy metals and poisonous chemicals, including six persistent organic pollutants, at depths greater than 30 metres and distances of several kilometers from the factory.'

56 Photograph by: Raghu Rai, who was present in Bhopal after the disaster, took this photograph as someone was burying their loved one (December 4, 1984).

7 13.5.4 Litigation and the Principle of Absolute Liability Since the disaster, many cases were filed against Union Carbide, both in Bhopal, India as well as in the USA. For those who could not sustain the legal battle for long, especially the financially weaker section, the cases were filed on behalf of these victims. In 1985, the Indian Parliament passed The Bhopal Gas Leak Disaster (Processing of Claims) Act. Section 3 of the Act stated that the Government of India could file cases on behalf of any citizen who had claim for compensation. This provision was included in Section 9 of the Act which introduced "The Bhopal Gas Leak Disaster (Registration and Processing of Claims) Scheme, 1985".

NSOU ? CC-SO-04 184 The Indian Government had also filed a lawsuit in the United States District Court of New York against Union Carbide Corporation. However, on grounds of inconvenience cited by UCC, as the disaster had taken place in Bhopal and hence all evidence would be there, a new case was filed against UCC in the District Court of Bhopal. Shortly thereafter, the District Court ordered UCC to Rs 350 crores to the victims as compensation. To this, UCC filed an appeal in the Madhya Pradesh High Court against the judgment of Bhopal District Court. This led to the decrease in the "interim compensation" from Rs 350 crores to Rs 250 crores. Further, UCC tried to settle the matter directly with the victims outside of court. To this, M.W. Deo J. of Bhopal District Court ordered UCC not to engage in any settlement with victims until further orders of the Court. It was only after the propagation of the rule of Absolute liability, that Union Carbide Corporation was held liable for the Bhopal tragedy. a. Principle of Absolute Liability or the "No-Fault Liability" In the case of 'absolute liability,' the accused is held liable without any exception of being excused from the liability. In 'absolute liability,' on the other hand, a person can be held liable even if he had no intention of committing the crime. The principle of absolute liability also bars a person who has committed the crime from escaping the liability. In 1989, based on the principle of 'absolute liability,' The Supreme Court of India ordered Union Carbide Corporation (UCC) to pay a sum of 470 Dollars or Rs. 750 crores to the victims of the Bhopal Disaster (Union Carbide Corporation (Appellant) vs. Union of India and Others 1989). Did you know? The following major Acts were passed in India after the Bhopal disaster to ensure safety and to control disasters: 1. Bhopal Gas Leak Disaster Act (1985) 2. The Environment (Protection) Act (1986), 3. Criminal liability provisions of the Environment Protection Act, (1986) 4. Factories Act (1987) 5. The National Environment Appellate Authority Act (1987) 6. Hazardous Wastes rules (1989) 7. Manufacture, Storage and Import of Hazardous Chemicals (MSIHC) rules (1989) 8. The Public Liability Insurance Act (1991) 9. The National Environment Tribunal Act (1995), 10. Chemical Accidents rules (1996), 11. Provision in Chemical Accidents Rules (1996) 12. National Green Tribunal Act (2010).

NSOU ? CC-SO-04 185 13.6 Conclusion The Bhopal Gas Disaster triggered a debate around industrial safety and risk reduction. The following were some of the key lessons learnt from the disaster and what is to be followed strictly to avoid disasters of such magnitude in the future: 1. No hazardous industry can be located close to settlements that are thickly populated. In the case of the Bhopal Gas Disaster, the Union Carbide Plant was located in the heart of a thickly populated settlement. The Central Board for the Prevention and Control of Water and Air Pollution recommends that every hazardous industry be surrounded by a 2km green belt and far away from human settlements. 2. Industries must invest in risk reduction and the cost of accidents should be high. 3. It is important to spread awareness about industrial risks, set up regulatory bodies and risk documentation should be made available to the public. Things to do: ? Find out industrial disasters that have taken place in other parts of the world. Assess their nature and also the aftermath of these disasters ? Watch the documentary and share your thoughts: Bhopal: A Prayer for Rain (2014); directed by Ravi Kumar 13.7 Summary Natural Disasters are by itself the most devastating and the debilitating types of crisis that shake the human civilization immensely prevention measures must be taken to avert such crisis as far as possible. 13.8 Questions Answer in Detail 1. What were the impacts of the Indian Ocean tsunami that occurred on December 26 th , 2004? 2. What was the response and reaction to the tsunami of 2004? 3. If a tsunami of similar magnitude were to happen again, what lessons from the 2004 tsunami would you apply, while considering tsunami predictions and disaster management?

NSOU ? CC-SO-04 186 4. Discuss what lead to the Bhopal Gas Tragedy. 5. Explain how MIC affects a person's health. 6. Was Bhopal ready to handle an industrial disaster? Justify your answer. 7. Discuss the legal battle that followed after the disaster. Answer in brief 1. What causes a tsunami? 2. What operated as bio-shields in arresting the devastation caused by the 2004 Indian Ocean Tsunami? 3. What were the hardships faced by people socially as a direct result of the 2004 tsunami? 4. What have been the foremost environmental concerns after the tsunami of 2004 happened? 5. Write a short note on The Pacific Tsunami Warning Center. 6. What is Methyl Isocyanate? 7. How did Union Carbide Corporation try to evade liability? 8. What is The Principle of Absolute Liability? 9. What precautionary measures must be taken to reduce industrial disasters? Answer very briefly 1. What does 'tsunami' mean in Japanese? 2. What is meant when the water retreats from the shore? What is it a sign of? 3. What was the magnitude of the earthquake that caused the tsunami? Where did it take place? 4. How did the tsunami impact agriculture in affected areas? 5. What should be the coastal zone management strategies with regard to tsunamis? 6. What caused soil and water contamination after the Bhopal Disaster? 7. What is the meaning of 'mens rea'? 8. What is the other name for 'The Principle of Absolute Liability'? 9. Name four rules that were passed to curb industrial disasters in India after the Bhopal Gas Tragedy. 13.9 Suggested Readings 1. Unit 14 Communalism : Factors Structure 14.1 Objectives 14.2 Introduction 14.3 Meaning of Communalism 14.4 Meaning of Communal Violence 14.5 Communalism: Perspective from Sociological Studies 14.6 Conclusion 14.7 Summary 14.8 Questions 14.9 Suggested Readings

14.1 Objectives To understand : ? The meaning of Communalism. ? The concept of communalism violence. ? The sociological perspective of violence. 14.2 Introduction Social life is not static but it is always in an incessant process of change. Change is normal and natural condition of society. This is well rendered by the metaphor of "social life". Like life itself, social life consists of incessant changes, when changes stop, life ends. Change is ubiquitous but the speed, scope, depth and tempo of changes vary from society to society. Not all changes are progress. A plethora of changes has happened in the last few decades. However, what is the direction of change? Who is being benefited by this change? The answers of these questions are very relevant to understand the nature of society. Communalism is a serious threat to maintain integrity and make economic development of the countries which have diverse religions, communities, and linguistic groups. Communalism is a permanent wound of a society. If a part of a NSOU ? CC-SO-04 190 community is infected by communalism, then it affects and creates its impact on rest of the community. Such type of infections is largely seen in different regions consisting of various groups like religion, caste, class etc., and at the end of the result mistrust is seen among them. One of the major priorities of any developing country is to maintain a unity of its people. In the history of modern India, such a unity is put to a very severe test by the growing communalization of the Indian people, politics and society. In India, communalism and communal violence have created huge problems since decades. 14.3 Meaning of Communalism The word 'communalism' is derived from the word 'communal', which in itself has been derived from the word 'commune', and 'community', meaning a feeling of oneness or friendliness. To be more specific, 'community' has been defined as "a concept used in sectarian, territorial and functional context about the persons who are in social interaction within a geographical area. In the Indian context, Robert Hardgrave defines the term 'community' as "in India, community usually refers to a racial, caste, linguistic or religious group rather than a locality as in the United States." But in Indian context the word "communal" has been used in worst disparaging sense. The word 'commune' also means mistrust, hatred, rivalry etc. among the people of different religions. It is characterised by tension or conflict between culturally distinct but geographically mixed communities (Ahuja, 1992). Communalism is a negative term, taken as something harmful to the healthy growth of people and the nation. It creates enmity, hatred, violence and revenge, which hamper the growth and development of the society. It affects adversely the property of the community at the cost of human values. It divides India into two parts leaving behind memories and incalculable wounds and loss of property. There are many definitions of communalism. Every thinker defines the concept from his or her political and ideological perspectives. The scholars have amplified the concept from socio economic, cultural, political and historical outlook. Communalism is a multi-faced phenomenon. Each factor has close relations with each other. Bipan Chandra (1984) explores several possible meanings of communalism. The main religious community becomes the root cause of it. According to Chandra, (1984) the communalist assumes that most meaningful distinction among the Indian people, on social, cultural, economic and political issues, is to be made, on the basis of such units, of 'religious communities'. The Indian people can exist and act socially and protect their collective or corporate or non-individual interests, only as members of religion-based communities. They never think, want, feel or act in any other

NSOU ? CC-SO-04 191 manner or category, except as members of such homogeneous communities, whose interest, outlook, way of life etc., are the same. Bipan Chandra (1984) has also mentioned three elements of communalism. First, communalism is strong among the people, who follow the same religion, having common secular interests. Second, the secular interests of different religions are dissimilar or divergent from the followers of other religion. Third, these interests of different communities are not only different, but are also hostile to each other. In the opinion of T.K. Oommen, a famous sociologist, there are many dimensions of communalism and he suggests mainly six dimensions of communalism. These are: Assimilationist (or) Communist Communalism Under this type of communalism, small religious groups are assimilated into big religious group. For instance, Scheduled Tribes, Jains, Sikhs, Buddhists are Hindus and they should be covered by Hindu Marriage Act, 1955. In addition, all of them should be covered with the same personal law. Hence, a Sikh, or a Buddhist or a Jain does not identify himself/ herself too much different from a Hindu and Hindu religious beliefs and sentiments. Welfarist Communalism In this type of communalism, emphasis is placed on the welfare for the particular community. Providing education, scholarship, financial assistance in higher studies, matrimonial assistance, skill development, residential accommodation are examples of different services provided under this type of communalism. These welfarist organizations are involved in different kind of charitable and other social upliftment activities related to their particular community alone. Retreatist Communalism Retreatist communalism is one in which a small religious community keeps itself away from politics; for example, Bahai community, which proscribes its members from participating in political activities Retaliatory Communalism This type of communalism attempts to harm, hurt, injure the members of other religious communities. Separatist Communalism It is one in which one re-ligious or a cultural group wants to maintain its cultural specificity and demands a separate territorial state within the country, for example, the demand of some Mizos and Nagas in Northeast India or Bodos in Assam, or of Jharkhand tribals in Bihar, or of Gorkhas for Gorkhland in West Bengal, or of hill people for Uttarakhand in Uttar Pradesh, or of Vidarbha in Maharashtra.

NSOU ? CC-SO-04 192 Secessionist Communalism It is one in which a religious community wants a separate political identity, and demands an independent state. A very small militant section of Sikh population demanding Khalistan or some Muslim militants demanding independent Kashmir have been engaged in practicing this type of communalism. Of these six types of communalism, the last three types create problems engendering agitations, communal riots, terrorism, and insurgency. The most extreme forms of these are the retaliatory, separatist and secessionist. The practice of each of this type of communalism leads to virulent methods such as terrorism, communal riots and insurgency. According to Zenab Banu (1989) "Communalism in India is neither the reaction to anti communalism nor an outgrowth of religious and cultural differences but it is a triangular power struggle of the elite." Louis Dumont (1964) considers, communalism, as a product of interaction between tradition and modernity. Pradeep Nayak (1993) believes communalism should be perceived as a state of consciousness and a strategy of mobilization of a community for a political purpose, to form a political community out of religious issues. K.N. Panikkar (2000) regards communalism both "as a state of consciousness in society and as an instrument of power, not purely for capturing state power, but for operating in political, social and economic domains and at almost all levels of social organization." Thus, Panikkar highlights the multi-dimensional perspective of communalism and its far reaching impact on the institutional society. Moreover, he illustrates the element of false consciousness for the genesis of communalism. Panikkar was more historical in highlighting the material gains, gathered by different religious groups, behind the inflammable communal pressure strategies. Sociologically, Sabrewal (1996) argues communalism as a concept with the above said connotations emerges due to the fact that the members of a multi-religious society work with different manuals listing divergent codes for life. Where people live by different manuals, one way to anticipate the other's behaviour, attitude and intentions is to reckon with the other's manual and other's religion. Social unease is also obviated by signaling one's own manual through various diacritical marks: clothing, life style, facial marks, one's language and manners. During this process religiously rooted social identities gradually get established and are mutually acknowledged. Awareness of socio-religious identities slowly get established and are mutually acknowledged. This awareness helps one constitute useful social maps in one's mind demarcating the social territory into sacred, friendly neutral and hostile.

NSOU ? CC-SO-04 193 Generally, this may be added that due to the propaganda and other factors such as prejudices, hostilities and negative feelings against one another may be emerged. It is therefore argued that all such type of attitudes depends upon the nature and type of interactive patterns between people of different religion and culture. In case if they do not hurt the religious sentiments and challenge religious identities, then there is no problem. But if they, by chance or choice, develop hostility against other, this leads to outbreak of communal outbursts and communal conflicts.

Communalism is a collective ideological and ideology-centric expression of one's community identity in relation to the other in the process of acquisition of power. Since the expression is in relation to others, it often encourages separatism, hatred, and violence. The political perspective based communalism is created and nurtured by political elites to attain political power. Also, Marx argued that "ideas of ruling classes are in every age the ruling ideas". The ruling classes in the multi-religious country support either one or the other community and spread their cunning ideas of polarizing the religious communities and derive political benefits. The ruling classes as a whole are responsible for encouraging communal identities for political ends thereby aggravating the communal conflict. Communalism as Discrimination on Religious Basis Communalism is also defined as the discrimination or protection of interests on a religious basis and is the outcome of conflicting religious practices. This understanding has the following implications. It implies that religious groups are homogenous in nature and their members have common social, economic and political interests that bind them together. This assumes that there exist separate socio-cultural, economic and political interests of Hindus, Sikhs, Muslims and these are dissimilar and divergent. To accept this implication is to analyze the question of communalism within the communal framework. In fact, it is this assumption, which is the basis of communal propaganda. The repeated assertion regarding the existence of such interests by communalists has even distorted the perception of some of the analyst and policy makers. It is very difficult to accept such an assumption when members of a religious group pursue different occupations and have dissimilar socio-economic background and cultural heritage. These elements of communal propaganda distort real issues and misrepresent real interests. According to Bipan Chandra, communalism is the result of the ideological conditioning of the last 100 years, when the middle classes and the intelligentsia were perceptually surrounded by a communal outlook in politics, in the press, in literature and particularly often has been viewed in the social sciences, as in real life, through conscious or unconscious communal assumptions. For example, NSOU ? CC-SO-04 194 if one's analysis starts by accepting the communal leaders as leaders and representatives of their 'communities' – and if one refers to the Hindu, Muslim or Sikh communalists as Hindu leaders, Muslim leaders, or Sikh leaders – or if one accepts communal political activity is the political activity of their 'communities', one is already accepting the basic communal framework of thought and analysis. On the other hand, if no communal, economic, political and social interests exist, the communalists cannot be representing such interests and are not, therefore, representative of their 'communities'. The use of communal categories to understand and unfold social reality leads to mistaking the symptoms for causes. Remedies are prescribing to eradicate the symptoms. The result is that the problem persists while the symptoms may disappear. To understand and counter communalism it is no doubt necessary to recognize the religious factor as an important component, but will be hazardous to accept the notion of Hindu interest, Muslim interest or Sikh interest and so on. Once if this notion is rejected, there shall be no question about secular needs, aspirations and expectations of different religious groups being divergent and dissimilar. The second implication is that communalism seeks the protection of the interests of one religious group at the cost of another. To accept this is to again reinforce the communal propaganda. Communalism does not and cannot protect the interests of one religious group at the cost of another. Communalists do not benefit the 'community' in whose name they seek concessions. It is only a few individuals who benefit from this and such examples become a tool in the hands of communalists to mobilize support. It arouses expectations for the fulfillment of the secular needs and reinforces the belief that a particular religious group is being discriminated against. The present system is not geared to benefit one or the other 'community'. Hence, demands raised along communal lines which cannot benefit 'communities' as a whole, but may only benefit individuals within them. The third implication is the historical inevitability of the phenomenon of communalism in a society having plurality of religions and castes. The assumption that the very existence of religions would make communalism inevitable is false. Communalism, unlike class-consciousness and the fight against imperialism, has not been caused by contradictions in society. Rather it is based on the perception of common non-religious interests of a particular religious, caste or other group. Present day communalism, which is a modern ideology, uses religion to fulfill their secular interests and will persist even if religious group identities are abolished. Only its form may change and some other retrogressive category may replace religion. Duality in Communalism: Integration and Differentiation The inherent notion of communalism is the inter-group differences and intra-group commonalty of secular interests having their basis in religious, caste or other ascriptive group aggregations. In other words, communalism underplays the homogenous and

NSOU ? CC-SO-04 195 common aspects shared by members of different religious, caste, or ascriptive groups and highlights their differences. For instance, communalists use religion as an instrument to cement communal monoliths. It creates an illusion of the universal content of the secular interest of unequal individual members of a religious group. Further it will be hazardous to accept only the notion of Hindu interests or Muslim interests and so on. Once this notion is rejected there can be no question about secular needs, aspirations and expectations of different religious groups being divergent and dissimilar. Therefore, it will be wrong to categorize communalism as Hindu or Sikh or Muslim. The danger is that such a categorization would further sharpen communal polarization. The right approach is to identify the basis of a particular communal mobilization. It should not be forgotten that communalism uses religious or caste group differences, but is not caused by them.

14.4 Communal Violence In India

In India, communal violence has a long history. In fact, communal violence had started before the arrival of the British rulers in India. The British rulers exploited the feelings of Hindus and Muslims by their policy of 'divide and rule'. The British obviously did not create the Hindu-Muslim communal problem, but they did exploit it for their own purposes from time to time. It will be wrong to believe that the British rulers were responsible for religious or communal feuds. However, the British rulers did play an important role in the promotion, spread and growth of communal problem in India. The medieval rulers did not encourage communal violence but that is what the colonial masters had done. In India, the problem of communal violence did not grow up suddenly. It is rooted in the past. It is not the product of religion but of the politics of elites of a religious community. It is not only confined to Hindus and Muslims but recently violence against the Christian community has also increased. The communal violence has continued even after India became independent. The British sowed such seeds of hatred that today Indians are facing its consequences even after 72 years of independence. The British rulers made religion as a tool of hatred instead of love. It is, therefore, necessary to look into the problem of communalism and communal violence, which can be divided into three periods. 1. Muslim Period. 2. British Period. 3. Post independence Period. The purpose of periodization is only to see the steady growth of communalism and communal violence in different phases of Indian history.

NSOU ? CC-SO-04 196 What is communal violence ? After having dealt with the concept of communalism, the other concept needing discussion is "Communal Violence", a collective manifestation of religious feelings and sentiments against the others. A communal violence, in general refers to a collective violent manifestation of one's identity, ideas and beliefs, etc., in relation to other religious community for the realization of certain interests, openly manifested on sometimes hidden but presented in a mystified way. It is, most often, a consequence of the spread of communal ideology. The problems and characteristics of communal violence are different from student agitation, workers' strikes and peasants' movements. At the national level, we have to differentiate between communal violence and agitation and terrorism and insurgency, through mass mobilization and degree of violence, degree of cohesion, target of attack, flare-ups, leadership and victims, and aftermath experiences (Singh V. V., 1994).

14.5 Communalism: Perspective from Sociological Studies

When we look at and review the sociological literature on communalism and social tension, we find three stages of the analysis by sociologists on communal problems. At one stage, which might be called the classical stage of Indian sociology, the debate on communalism, bears the imprint of the national movement, its ideology and values. We find it in the writings of historians, political scientists and other scholars. At the second stage, sociologists, who constitute the pioneering generation, have dealt with this problem and it would be useful briefly to look at their contributions. One of them is D.P. Mukherjee. He wrote a very interesting book in 1942, which was reprinted in 1946, called *Modern Indian Culture*. In this work he dealt with the problem of Hindu-Muslim relationship and the problems of partition, which in 1942 was looming large on the political horizon of India. He offered some very interesting insights on the problems of communalism in our country. Between Ghurye and Mukherjee, as a matter of fact, we encounter two opposite ideological perspectives on communalism. Mukherjee represents the mainstream thesis of cohesion on communal issue in India through cultural synthesis and integration in the process of nation building, whereas Ghurye takes more or less what one may call the 'communal line', a kind of partisan Hinduistic viewpoint on problems of communalism in India. Mukherjee first emphasizes the role of tradition; that is, to him the issue of communalism cannot be abstracted from the issue of tradition. One has to understand tradition and the structure of tradition in a society in order to understand what is

NSOU ? CC-SO-04 197 called the problem of communalism. Secondly, he points out that even during the Muslim period there was autonomy and religious autonomy between urban areas and rural areas. Even what is known as the Muslim rule in India was largely an urban phenomenon and the rural social structure in India had its own autonomous existence; it had its own internal equilibrium. Thirdly, Mukherjee also mentions that when we look into Hindu-Muslim relationship, there are three levels of interaction at which it should be examined. He calls them the primary level, the secondary level and the tertiary level. He says that one cannot talk of Hindu-Muslim relationship in an undifferentiated fashion, because then the very basic social phenomenon will be lost sight of. I think, here he was a precursor or a forerunner of latter-day sociologists. It is an important insight that he contributed. The primary level is the level of economic interaction. It comprises of the roles of merchants, labourers, farmers and the concomitant economic relationships. It also includes the family structure, the institution of authority and its distribution in the family and kinship relations. It also implies economically related ritual structure, not its ideology but basic rituals. At the primary level of interaction between Islam and Hinduism, according to him there has always existed a measure of partnership and a measure of harmony, so that the Muslim-Hindu relationships in the structure of their consciousness do not involve much disjuncture. The relationship is functioned in a very harmonious manner. It is a very important structural perspective. The secondary level is the level of polity – political ideology and leadership. At this level, there exists a differentiation; there is a dual role; one may even come across some degree of contradiction between the outlook of the representatives of the two traditions-the Hindu tradition and the Muslim tradition. Finally, at the tertiary level, which is the level of ideology, there exists between the two traditions a sharper contradiction in the perception of social reality and in the nature of their interaction. One point he makes is about the extent to which these different levels, as enunciated, could be taken as truly representing the nature of the cultural and social division between the two traditions. Here the insight that we get from his observations is that the relationship should not be dichotomized as a Hindu- Muslim question, because then we would round-off a number of very important similarities in the relationship in the process of the abstract treatment of divide between the two ideologies. In Dumont's view (1964) the relationship between religion and communalism, or the notion of communalism cannot be explained from a purely economic perspective. Dumont would like to make a distinction between the concepts 'communal' and 'communalism'. He says one cannot understand communalism unless one has understood the notion of the communal and its meaning. It signifies a sacred and hierarchical principle. The communal principle is a basic characteristic of the Indian tradition and its social structure. The Indian social structure is communal in the sense NSOU ? CC-SO-04 198 that it is community conducted; in other words, it is hierarchical. The notion of hierarchy is basic to its understanding. What is hierarchy? As Dumont defines it, hierarchy is the encompassing of the utilitarian and individualistic principles of society by one that is sacred and communitarian. It has the supremacy of the transcendental principles in the value system and role definition in society. In a hierarchical society the transcendental principle defines the utilitarian. In an equalitarian society, it is the other way round. In India, according to Dumont, it is the transcendental principle, such as God, religion or whatever one might call it, which defines the utilitarian principle; that is, economy, polity, etc. Functional perspective views that communal riots persist because they are functionally useful to the individual, group, parties and the state authorities. The analysis of communal riots reveals that the functional utility of riots is in the form of political benefits they derive from such incidents. The Marxist approach demands, from everyone endeavoring to understand social reality, a clear understanding of the nature of

95%

MATCHING BLOCK 126/133

SA SYBA SOC PAPER - II.pdf (D111235031)

means of production, the techno- economic division of labour involved in operating the instruments of production and social relations of production, or what are more precisely characterized as property relations.

The Marxist approach considers property to be checked carefully about

69%

MATCHING BLOCK 125/133

SA SYBA SOC PAPER - II.pdf (D111235031)

the spelling relations as crucial because they shape the purpose, nature, control, direction and objectives underlying the production.

And further property relations determine the norms governing who shall get how much and on what grounds. Viewed thus, from a Marxist perspective, different parts or problems of Indian society with all their conflicts and contradictions relating to religion or politics, caste, language or region, ethnicity or nationality, ideology or culture, women's oppression or national integration, etc., do not exist totally apart from each other or from society- the social whole. These often do have a historically specific autonomous reality of their own; their dynamics is decisively conditioned by the economically structural logic of the continental social formation that is India today. And this is the logic of a development, which is essentially capitalist in nature, though it has a historically specific character of its own which scholars variously refer to when they speak of a state or government- supported capitalism, weak or retarded or backward capitalism, underdeveloped capitalism or capitalist underdevelopment or even 'peripheral' capitalism, etc. It is in this sense alone that the problems or conflicts mentioned above, including those relating to religion or communalism, are economy or class dependent. A class perspective today has to accommodate the rich diversity of contemporary Indian social reality even as it lays emphasis on the crucial importance of the economic base and its structural logic that conditions the dynamics of this diversity. Needless to add, without such emphasis Marxism would be theoretically indistinguishable from any other 'sociology'. And it is not without reason that today, especially in the absence of class-based people's politics, all the identities, all the divides and fissures of Indian society are simultaneously becoming significant and explosive. This is equally true of the explosive emergence of communalism in recent years.

NSOU ? CC-SO-04 199 The structural-functional approach is a perspective in sociology that sees society as a complex system whose parts work together to promote solidarity and stability. It asserts that our lives are guided by social structures, which are relatively stable patterns of social behavior. Social structures give shape to our lives - for example, in families, the community, and through religious organizations. Structural Functionalism explains why society functions the way it does by emphasizing on the relationships between the various social institutions that make up society (e.g., government, law, education, religion, etc.). R.K. Merton (1949) argues that the units of society not only perform functions but dysfunctions as well. When it performs functions, it organizes and when it performs dysfunctions it disorganizes the structure as well. Looking otherwise, the structure of a multi-religious society is composed of different religious groups. If these groups live with harmony, there is no problem but if at times there is conflict between them, it leads to communal conflict and poses a threat to the social fabric and social structure of the society and a state of anomie occurs in a society. 14.6 Conclusion The way fundamentalism (Hindu, Sikh and Muslim) has raised its head in India, threatening the unity and integrity of the nation puts a question mark regarding the continuation of our secular polity. Our political leaders, in their own interest, during elections deliver hate communal speeches which have the tremendous impact on the masses, recurring communal violence in various parts of the country taking hundreds of rupees demonstrate the strength of communal forces and relative weakness of secularism. 14.7 Summary The recent controversy on Ram Jonmohumi and Babri Masjid dispute has shown clearly how in spite of a secular Constitution the communal elements in majority and minority communities can set the whole country ablaze on smallest excuse. This shows that the something has gone wrong with the secularism that we are supposed to practice in India. 14.8 Questions 1. Write a note on Communalism. 2. What is Communal Violence? 3. According to Oommen, what are the dimensions of communalism? 4. Explain the problem of communalism from the sociological perspective.

Unit 15 Communalism : Control Measures Structure 15.1 Objectives 15.2 Introduction 15.3 Discuss Communalism 15.4 Describe Communal Violence 15.5 Communal Politics 15.6 Measures to Control Communalism 15.6.1 Short Term Remedial Measures 15.6.2 Long Term Remedial Measures 15.7 Summary 15.8 Questions 15.9 Suggested Readings 15.1 Objectives ? To know communalism. ? To understand communal violence. ? To know communal politics. ? To adopt various measures to tackle communalism. This unit explains the concept of communalism, nature of communal violence and communal politics in brief. Then it tries to discuss elaborately the measures to tackle communalism. 15.2 Introduction Communalism threatens Constitutional values which actively promotes secularism and religious tolerance. Communalism dividing the society on communal lines is a threat to maintain the unity and integrity of the country. Communal feeling engages the state authorities like the police, the army and the intelligence agencies to view minorities with distrust and unpleasant way. This leads to the harassment of members belonging NSOU ? CC-SO-04 202 to the minority communities. Communal violence makes the country open to the outside world. It becomes a real barrier to the all-round development of the country. 15.3 Discuss Communalism The trauma of growing communalism haunts India today. The myth of 'secularism' is crumbling. In 1947, India accepted democracy and secularism as a value enshrined in the Constitution despite the fact that the communalization of both the Hindus and Muslims in the colonial period resulted into the division of the subcontinent (Chandra, 2007; Sarkar & Butalia, 1995). Three salient features articulated in the Indian Constitution are—religious freedom, celebratory neutrality and reformative justice. As European antecedents influence the Constitution, the conceptualization of secularism focuses on the relationship between state and religion (Panikkar, 1991). Mahatma Gandhi looked at the Indian nation as, ideally, a consistent collection of all religious communities placed on an equal footing. Communalism in a religiously plural society (like India) is a highly complex phenomenon, which is dangerous to try to restrict within a single definition. But it is among other things, a process of involving competitive de-secularization which along with non-religious factors helps to harden divisions and create or increase tensions between different religious communities. Here greater importance is granted to religious forces, religious identity, religious competition and religious ideologies; as the development of a strong collective religious identity among the Hindus, Sikhs, Muslims and Christians is a necessary but insufficient condition for the growth of communalism. Non-religious factors are not excluded as important causal factors, but are often misperceived in religious terms. If we are to comprehend communalism properly, we must undertake a comprehensive examination of both the religious and secular practices in Indian society. The idea of secularism was emerged in early modern Europe as an ethics of behavior and a prescription for political organization. It promised to replace the violence and irrationality that seemed inherent in the collective forms of religious utterance. It prescribed a separation between the institution of church and the state and between religion and politics and signified 'toleration' for societies that had been torn by religious conflict. Secularism in India was a complex part of the nationalist self conception at independence and had been persisting for a long time following the debates about citizenship belonging in the post-colonial state. The Indian Constitution enshrined freedom of religion as one of its central principles. The definition of communalism is secularism and is seen as the antithesis of Indian nationhood. NSOU ? CC-SO-04 203 Communalism is not all that appears to be, a 'minor scuffle between two neighbors belonging to different communities.' Historians, sociologist and political leaders are arguing that beneath such event lies a power game. In its widest sense, Zenab Banu (1980) defines, "Communalism in which a minority receives unequal treatment from the majority, on the basis of religion, culture and ethnic characteristics." 15.4 Describe Communal Violence In India, communal violence has a long history. In fact, communal violence had started before the arrival of the British rulers in India. The British rulers exploited the feelings of the Hindus and Muslims by their policy of 'divide and rule'. The British obviously did not create the Hindu-Muslim communal problem, but they did exploit it for their own purposes from time to time. It will be wrong to believe that the British rulers were responsible for religious or communal feuds. However, the British rulers did play an important role in the promotion, spread and growth of communal problem in India. The medieval rulers did not encourage communal violence what the colonial masters had done. In India, the problem of communal violence did not grow up suddenly. It is rooted in the past. It is not the product of religion but of the politics of elites of a religious community. It is not only confined to the Hindus and Muslims but recently violence against the Christian community has also increased. The communal violence has continued even after India became independent. The British has sowed such seeds of hatred that today Indians are facing its consequences even after 72 years of independence. The British rulers have made religion a tool of hatred instead of love. It is, therefore, necessary to look into the problem of communalism and communal violence, which can be divided into three periods. 1. Muslim Period. 2. British Period. 3. Post-Independence Period. The purpose of periodization is only to see the steady growth of communalism and communal violence in different phases of Indian history. What is communal violence? After having dealt with the concept of communalism, the other concept needing discussion is "Communal Violence", a collective manifestation of religious feelings and sentiments against the others. A communal violence, in general refers to a collective violent manifestation of one's identity, ideas and beliefs,

NSOU ? CC-SO-04 204 etc., in relation to other religious community for the realization of certain interests, openly manifested or sometimes hidden but presented in a mystified way. It is, most often, a consequence of the spread of communal ideology. The problems and characteristics of communal violence are different from student agitation, workers' strikes and peasants' movements. At the notional level, we have to differentiate between communal violence and agitation and terrorism and insurgency, through mass mobilization and degree of violence, degree of cohesion, target of attack, flare-ups, leadership and victims, and aftermath experiences (Singh, 1990) The history of communal conflicts in India is generally the history of Hindu-Muslim rivalry. A lot of factors constitute the existence of communal conflict. If the problem is to be solved and communal harmony is to be ensured, the causes of communal problems should be dealt in depth. Although it appears that the reason behind a communal trouble is religious in nature, the detailed analyzing of incidents uncovers other reasons and causes. Apart from religious factors, there exist numerous other causes for the occurrence of a communal problem. Historical distortions and false interpretation of history, the majority-minority problem, economic disparities, and imbalanced economic growth, role of political parties to gain political ends, lack of communication and misconceptions, efforts for conversion, social factors widening the gap are all the major causes which trigger a communal conflict. The term 'communal' was first used by British colonialists simply to describe 'communities of interest', including religious groups. It was in the context of the 1906–09 debates around Constitutional reform in India and the issue of separate electorates for Muslims that the term 'communal' was given a negative connotation of bigotry, divisiveness and parochialism as such separate representation was deemed antinational and anti-modern.

14.5 Communal Politics

Focusing on the specific problem of communal politics, we are immediately confronted with an important question. What lies behind the appeal of communalism? Though the identity crisis of an urban middle class undergoing modernization and partial westernization has made it receptive to such appeals, their origin has usually been elitist, and disseminated for achieving and promoting secular purposes and goals. There is considerable authority in the instrumentalist argument that religion, whether in the form of faith or ideology, has little to do with the formation of such an appeal – beyond the obvious point that some of its symbols, myths and devotional themes are selectively misappropriated.

NSOU ? CC-SO-04 205 Here a 'materialist' analysis of the sources of communalism would reveal the role of the colonial state in deliberately exacerbating the communal divide. Competition for jobs created tensions between the Hindu and Muslim urban middle classes and elites. In post-independence India, attention would no doubt be focused on the socio-economic changes that have taken place in many Indian towns possessing a sizeable Muslim population, as a result of Gulf remittances, the growing export demand for handicrafts and artisanal products, and other expressions of uneven development that have clearly disturbed traditional patterns of dependence between Hindu traders and Muslim artisans. Similarly, the effects of the Green Revolution in Punjab are not without communal resonance for the Sikh Land Lords and Hindu trader.

Major Incidents of Communal Violence in India

Communal violence is a phenomenon where people belonging to two different religious communities attacks each other with feelings of hatred and enmity. ? The partition of India witnessed mass bloodshed and violence that continued up to 1949. ? No major communal disturbances took place until 1961 when the Jabalpur riots shook the country due to economic competition between a Hindu and a Muslim bidi manufacturer than any electoral competition. ? In 1960s – A series of riots broke out particularly in the eastern part of India - Rourkela, Jamshedpur and Ranchi - in 1964, 1965 and 1967, in places where Hindu refugees from the then East Pakistan were being settled. ? In September, 1969, riots in Ahmedabad shook the conscience of the nation. The apparent cause was the Jan Sangh passing a resolution on Indianisation of Muslims to show its intense opposition to Indira Gandhi's leftward thrust. ? In April, 1974, violence occurred in the chawl or tenement, in the Worli neighborhood of Mumbai after the police attempted to disperse a rally of the Dalit Panthers that had turned violent, angered by clashes with the Shiv Sena. ? In February, 1983, the violence took place in Nellie as fallout of the decision to hold the controversial state elections in 1983 in the midst of the Assam Agitation, after Indira Gandhi's decision to give 4 million immigrants from Bangladesh the right to vote. It has been described as one of the worst pogroms since World War II.

NSOU ? CC-SO-04 206 ? In October, 1984, the anti-Sikh riots broke out after the assassination of Indira Gandhi, where more than 4000 Sikhs were killed in Delhi, Uttar Pradesh and other parts of India. ? Meanwhile, the Bombay-Bhiwandi riots were instigated by the Shiv Sena when it jumped on the Hindutva bandwagon to revive the political fortunes of the Shiv Sena which had lost its appeal. ? The Shah Bano controversy in 1985 and the Babri Masjid-Ram Janmabhoomi controversy became powerful tools for intensifying communalism in the eighties. ? The communal violence touched its apogee in December 1992 when the Babri Masjid was demolished by right wing parties. ? This was followed by the worst riots of post-independence India - in Mumbai, Surat, Ahmadabad, Kanpur, Delhi and other places. ? In 2002, Gujarat witnessed communal riots when violence was triggered by burning of a train in Godhra. ? In May, 2006 riots occurred in Vadodara due to the municipal council's decision to remove the dargah (shrine) of Syed Chishti Rashiduddin, a medieval Sufi saint. ? In September, 2013, Uttar Pradesh witnessed the worst violence in recent history with clashes between the Hindu and Muslim communities in Muzaffarnagar district. ? The 2014 Saharanpur Riots occurred on 25 July of that year in the city of Saharanpur in the state of Uttar Pradesh in India. The root of clashes is a land dispute between former MLA Moharram Ali aka Pappu Ali and Gurudwara Singh Sabha in Kutubsher area. ? Since 2015, mob lynching is quite prevalent in India as near 90 people have been killed. ? Nadia riots was a large scale communal riot that occurred in Kaliganj block, Nadia district of West Bengal during 5 May 2015. 4 people were killed and 8 injured. Mainstream media and local politicians didn't condemn the incidents as the victims were from Scheduled Caste Hindus and accused are Muslims. Nadia had seen communal tensions in the past. ? Riots broke out in Kaliachak, Malda district in West Bengal, India on 3 January 2016.

NSOU ? CC-SO-04 207 ? In Dhulagarh, a town 25 kilometres west of Kolkata, the tension erupted on 12 December, when two groups clashed as a procession was brought out in the area. ? Saharanpur, Uttar Pradesh, May 5, 2017. ? Baduria, West Bengal, July 4, 2017. ? Muzaffarnagar, Uttar Pradesh, September 7, 2017. ? Bhima Koregaon, Pune, Maharashtra, January 1, 2018. ? Kasganj, Uttar Pradesh, January 26, 2018. 15.6 Measures to Control Communalism All the causes of communal tensions provide us with the means of their solution. Hence the following suggestions may be given for the eradication of communalism. For academic purpose, the steps to be taken to tackle communalism can be divided into two categories like short term measure and long-term measure. Do you know? Communal Violence (Prevention, Control and Rehabilitation of Victims) Bill, 2005: Till 2002, the successive governments did not take any notable legislative actions but to check the sporadic events of communal violence, the UPA government had in 2005 brought forward the "Communal Violence (Prevention, Control and Rehabilitation of Victims) Bill, 2005". This bill provided measures for prevention and control of communal violence and speedy investigation and trials as well as rehabilitation of victims. This bill could never see the light of the day and the parliamentary standing committee tagged this bill as something, which violates the basic federal principle of the Indian Constitution. After that, the National Advisory committee drafted and brought forward the Prevention of Communal and Targeted Violence (Access to Justice and Reparations) Bill. In February 2014, the UPA-II government faced a major embarrassment on the first day of extended winter session of parliament as united opposition forced the government to defer the communal violence bill in the Rajya Sabha. As the opposition parties, including BJP (Bharatiya Janata Party), Samajwadi Party, CPI(M), AIADMK (All India Anna Dravida Munnetra Kazhagam) and DMK (Dravida Munnetra Kazhagam), stepped up their attack on the

NSOU ? CC-SO-04 208 government, accusing it of going against the spirit of federalism and encroaching upon states' rights, Deputy Chairman P.J.Kurien deferred the Prevention of Communal Violence (Access to Justice and Reparations) Bill, 2014 in view of the "mood of the House." The Bill was to replace the Communal Violence (control and Rehabilitation of Victims) Bill, 2005, withdrawn by Home Minister. 15.6.1. Short Term Remedial Measures a. Established Peace Committees and Their Role Communal violence has been a major peace-breaking aspect in India. India is a country with a lot of diversity in terms of religion, language and culture. Very good co-ordination is needed to maintain the unity in the diversity and to keep the peace in the society. But this has not been the case. Often, we hear the communal violence in the society. Actually, it starts for insignificant reasons, but when it takes the color of communities, the people blindly divide themselves into the parties and they quarrel with each other. The government should immediately constitute a peace committee in the riot – hit areas comprising of the respected people belonging to different communities. These leaders can help in persuading the leaders of the fighting communities and help in restoring peace. In communally sensitive towns and areas, Peace Committees comprising of prominent citizens, community leaders and representatives of political parties, respectable organizations, etc., should be set up, and periodic contacts with them should be maintained by the concerned officers at the police station, sub- divisional and district levels. Prominent persons/ members of Peace/National Integration Committees, and voluntary organizations in the area, could make a significant contribution towards the maintenance of communal harmony, and prevention of communal discord, if they are involved in overseeing the situation in areas over which they are influenced. Women, who constitute a very vulnerable group in the context of communal tensions /riots, play an effective role in helping to defuse communal tensions and to prevent riots. Their fair representation in Peace Committees could help in containing riot situation b. Media's Role In democratic societies, when there is a wide heterogeneity among the citizens, this often results in conflicts and violence, sometimes leading to largescale communal violence and loss of life and properties. India also had a long history of communal violence among the various communities. In this situation, media NSOU ? CC-SO-04 209 occasionally play harmful roles in fomenting communal violence. We find many biases in media reporting. Since communalism is rapidly increasing, threatening our pluralist society, media is also affected by this virus. People are influenced by what they read and what they see on screen. In the context of communal violence, media play a strong pull on mass awareness. Instruments of media play very important roles for communal propaganda and persuasion-messages. Newspapers in India are most directly and repeatedly implicated in the entire process of aggravating communal violence If any communal incident occurs, channels of contact with media persons should be established at a responsible level. The objective is to provide the media with the facts to avoid speculative reporting leading, inter alia, to fueling rumours and community sentiments. Frequently, the electronic media continuously show images of specific incidents, which could lead to exaggerated perceptions about the incidents and lead to provoking sentiments and passions. Regular monitoring and briefing of the media in this context should be ensured. Similarly, the government should also keep a vigil over the social media platforms like Facebook, WhatsApp etc., which tend to spread rumors and trouble people. c. Law Enforcement The role of the police in communal riots has always been a highly controversial issue. Riot victims generally complained that: (1) the police did not come to their rescue; (2) police forces were themselves instrumental in the killing; (3) they led the mob in looting and burning; (4) they arrested innocent persons and tortured them inside the lock-up and put false charges against the arrested persons, and (5) encouraged the culprits to act according to their will, preventing the members of one community to come out during the curfew and allowing members of another community to do so with impunity. These and some other grave charges are made against the police after every communal riot. The role of law enforcement agencies remains sensitive on the spot in preventing the communal violence. For our purposes, the enforcement agencies include all those who are involved in restoring peace while dealing in communal violence. All organs of law enforcement agencies play different role either at the same time or in different phases while dealing with communal situations. Peace can be established by the law enforcement agencies through expertise activities. Expertise activities insist on good behavior, kindness and a tendency to help the people. In democracy, people of India are the supreme. In this regard Supreme Court (SC) of India says that "the highest office in our democracy is the office of citizens; this is not only a platitude, it must translate into reality."

NSOU ? CC-SO-04 210 In communally sensitive areas, secular minded law enforcement officers must be appointed. Similarly, Special Courts may be set up, whenever the situation demands, for the expeditious trial and disposal of communal riot cases. When a communal riot takes place and an Enquiry Committee/Commission is set up, it should be given a time specific mandate for completion of its inquiry. The state governments should give priority to providing all manner of logistic support required by the Committee/Commission to enable it to submit its report on time. Its recommendations should be expeditiously implemented, say within 3 months and the central government should be informed. Also, immediate legal action should be taken against those who instigate communal violence.

15.6.2 Long Term Remedial Measures

a. Encouraging Pluralistic Settlements Pluralism refers to a basic quality of modern societies, where a wide (but not all encompassing) range of religious and political beliefs with diversity is accepted and where the ideal societies envisaged by different political parties may be incompatible with each other. Every generation must understand this complex set of challenges in pluralist societies and how they may be met in a democratic community. Human Rights Education can support students to develop the understanding, attitudes and skills that they need in order to participate as citizens. Through experience of the processes of democratic discussion, students will also learn the open and fair debates demanding certain basic procedures be followed, including:

- ? all participants with something to contribute should be enabled to do so;
- ? everyone's contributions should be listened to with respect;
- ? participants should attack arguments not people;
- ? participants should enter a debate accepting the possibility that their own views could be modified;
- ? adversarial debates, where participants argue from closed positions, are often less helpful than exploratory debates, where the aim is not to "win the argument" but to "understand the problem better".

? Communal riots are only an indicator of a 'boiling point' being reached and a multi-pronged strategy is needed to address the factors that contribute to communalization. Ghettoisation is one of them as religious segregation strengthens communal identities and reinforces negative stereotypes of the 'other'. Ghettos form because of the prejudices inherent in society and therefore governmental action is required to correct this.

NSOU ? CC-SO-04 211 ? The government should have a policy that encourages pluralistic settlements where members of different communities live together. This can be done in two ways. First, existing barriers should be removed. There are regular instances of intolerance where Muslims, Christians, Dalits, non-Brahmins, North-Eastern citizens, meat-eaters etc. are denied housing owing to their identities. This should be cracked down upon and landlords should be penalised. The Sachar Committee Report on the status of Indian Muslims recommended the creation of an Equal Opportunities Commission that would deal with such complaints. Second, pluralistic settlements should be incentivised. The Government can provide rewards to settlements that are diverse whether they are public housing projects, private settlements, colonies, etc. These can take the form of tax breaks, rebates, cheaper loans for future projects, cash prizes, etc.

b. De-communalising History Education Ultimately communalism is an ideology and can be neutralized through education. Two main areas that need attention in this regard are i) the way history is taught ii) equipping children to deal with diversity. The current controversy over the nature of history textbooks to be prescribed in schools reflect two completely divergent views of the Indian nation. One of the most important achievements of the Indian national movement, perhaps the greatest mass movement in world history, was the creation of the vision of an open, democratic, secular and civil libertarian state which was to promote a modern scientific outlook in civil society in independent India. They have, for example, in books published by Saraswati Shishu Mandir Prakashan for classes four and five, portrayed all communities other than the Hindus as foreigners in India, wrongly described the medieval period as the Muslim period and, following the footsteps of the British, portrayed the period as one of great oppression and decline. These books, in the name of instilling patriotism and valour among Indians, spread falsehoods, treat mythological religious figures like actual historical figures and make absurd claims such as that the Qutab Minar was built by Samudragupta. They claim that Ashoka's advocating of Ahimsa (non-violence) spread "cowardice" and that the struggle for India's freedom became a "religious war" against Muslims, and so on. The present categorisation of Indian history into Ancient, Medieval and Modern has significantly contributed to communal thinking in the country. It has effectively divided history into the Hindu period, Muslim period and Christian period.

NSOU ? CC-SO-04 212 Medieval India begins in about 1000 CE/AD with the establishment of the Delhi Sultanate which is widely seen as the 'Muslim invasion'. Modern India begins in about 1757 CE with the establishment of the British Raj after their victory in the Battle of Plassey. This categorisation was tremendously flawed and was a real source of danger. The notion that Hindus in the medieval period were suffering under Muslim tyranny was also a colonial construct, as the British rule could then be projected as having freed the Hindus from this tyranny. Further, depicting the Hindus and Muslims as warring communities created the justification for the British presence in India, and also prevented them from uniting against the British. Therefore, it is abundantly clear that the way history is taught needs to be drastically changed. A much better framework is one based on class. The great historian Romila Thapar in her masterly work 'The Penguin History of Early India' (p 31) which periodises history based on major changes in society such as changes in the economic structure (e.g., from hunter-gatherer to agrarian), in the political system (e.g., from tribal oligarchies to monarchies), in technology (e.g., from stone to iron tools), and so on, offers a far more realistic view of the development of history. The re-categorisation of history is a highly complex topic and needs to be explored in more detail.

c. Rethinking and Use of New Strategies It is necessary for the government to rethink its strategies to counter communalism. It is generally perceived that economic development brings down instances of communalism. But this is not true. It is found that economic development alone cannot suppress communalism. In fact, communal riots have registered in more numbers from developed states like Maharashtra and Gujarat, and developed cities like Mumbai, Amhedabad, Jamshedpur and Kanpur. So, there is a need for the use of new strategies and well-planned efforts to suppress communalism.

d. Teaching Our Children to Deal with Diversity Living with diversity is one of the greatest challenges facing the societies in which our children are growing up. In a world where cultures increasingly touch and intermingle with teaching the values and skills of 'learning to live together' have become a priority issue for education. We all want children to grow up in a world free from bias and discrimination, to reach for their dreams and feel that whatever they want to accomplish in life is possible. We want from them never to experience the pain of rejection or exclusion. But the reality is that we do live in a world in which racism and other forms of bias continue to affect us.

NSOU ? CC-SO-04 213 This must be in the form of practical exercises that instill the habits and skills required to do so such that these remain with them throughout their lives. Some examples include role-playing (promotes empathy for different groups), exercising in critical thinking (to guard against prejudice), exposure visits, conflict resolution through dialogue and so on. A peaceful future depends on our everyday acts and gestures. Let us educate for tolerance in our schools and communities, in our homes and workplaces and, most of all, in our hearts and minds. These were some steps that can be taken by the government in neutralizing communalism. However, in the long run social reform is essential. Therefore, the main thrust of the effort towards neutralizing communalism is in the sphere of social and political reform and in bringing about a change in the values and mindsets of the people at large.

15.7 Summary Communalism is a pervasive phenomenon in Indian public life and communal violence is a particularly ugly expression of it. Secularism in the subcontinent is an inextricable part of the nationalist self-conception since independence, and has remained central to subsequent debates about citizenship belonging in the post colonial state. It signifies all that have been enlightened and integrative within a modern society. The Indian Constitution enshrined freedom of religion as one of its core principles but the practice of religion was to be personal and private. The public presence of religion, 'communalism' it was adamantly stated, would not be entertained any further. This force had its devastating consequences for the nation in the past, and had gravely retarded the process of integration in the post-independence period.

15.8 Questions a. Discuss communalism. b. What is communal violence? c. What lies behind the appeal of communalism? d. What can we do to end communalism?

Unit 16 Secularism : Concepts / Definition Structure 16.1 Objectives 16.2 Introduction 16.2.1 Meaning of Secularism 16.3 Secular, Secularization and Secularism 16.4 Secularism in India 16.4.1 Jawaharlal Nehru on Secularism 16.4.2 Mahatma Gandhi on Secularism 16.4.3 Ambedkar's Views on Secularism 16.5 Growth of Indian Secularism 16.6 Conclusion 16.7 Summary 16.8 Questions 16.9 Suggested Readings 16.10 Endnotes 16.11 Glossary

16.1 Objectives ? To learn about the concept and meaning of secularism in modern society. ? To understand the meaning of a secular state especially in the context of India. ? To differentiate between the concepts 'secular', 'secularization' and 'secularism' and understand their implications. ? To learn about the meaning and growth of Indian secularism. 16.2 Introduction Secularism is one of the most contested ideas in today's society. It is a complex term which needs to be perceived under different situations and politics. What is secularism is not easy to answer and neither easily comprehended. This is because there are various nuances to the idea of secularism. Secularism is a modern concept indicating

NSOU ? CC-SO-04 216 the separation of religion from politics in modern society. While religion is viewed in terms of the traditional or the supernatural, secularism is the opposite of it. Secularism is more attuned to science, reason and rationality, the eminent features of modern society. Secularism means condemning any kind of religious regression and standing against any kind of religious intolerance. Secularism is a progressive thought compared to the outmoded ideas of religion. Religion is best kept within the private domain while secularism will be the face of the public world. Scholars across the world have tried to seek answers to the questions on religion and secularism that intrigued them the most. Their quest has been to search for the significance of secularism in modern society and its impact on religion. How religion and secularism are different in their sensibilities and how successful secularism functions to replace religious sentiments by secular practices. But the idea is not as simple as it sounds. Many countries across the world have used secularism differently. For the western countries like United Kingdom and U.S.A. secularism holds a different meaning compared to the Indian concept of secularism. India had adopted and adapted secularism and made it its own. Indian secularism is contextualized in the larger gamut of diversity and social differences that lie at its core. Similarly, the Indian problems with secularism have not dissipated either even after seventy years of independence. In this unit we will try to decode the meaning of secularism and address the issue of a secular state with special reference to India. 16.2.1 Meaning of Secularism Secularism is a term which dissociates itself from religion. It means everything that is 'this- worldly' and is opposed to the sacred or 'other-worldly', supernatural beliefs and practices. Secularism is a political term which maintains to keep religion away from state matters. It also questions or rejects anything that is based upon faith and belief. Donald Eugene Smith in his book 'India as a Secular State' defines "Secular State is a state that guarantees individual or corporate freedom of religion, deals with the individual as a citizen irrespective of his religion, is not constitutionally connected to a particular religion nor does it seek either to promote or interfere with religion" 1 . This famous definition of religion indicates three things-one is the relationship between the religion and the individual, the second is the relationship between the state and the individual and the third is the relationship between the state and religion. Secularism is known as a western concept simply because it was evolved in western society. This happened at a time when societies were undergoing a transformation from traditional societies based upon faith and belief in God or the supernatural to modern societies based upon reason and rationality. This was also a time when societies were changing their authoritarian political structure to a democratic structure. Modern nation-states were also coming up. Societies were freed from the clutches of

NSOU ? CC-SO-04 217 the Church and also freed from religious connections or interventions. While earlier forms of traditional societies were run by religious institutions like the Church and adhered to all kinds of religious doctrines, modern western societies followed and practised secularism where religion had no control over state matters. Religion becomes a private affair and state and politics become free of religion. This also means that all the different parts of society like economy, politics, culture, education all function independently of religion. This also implies that modern men act on the basis of rationality and not on religious beliefs. In some western society secularism ensures complete separation of the state from the Church. The state is free to function from any kinds of religious impositions or influences. The state will not interfere in the affairs of religion while religion will not interfere in the affairs of the state. Religion is strictly pushed to the private realm and will not be considered as a matter of state policy. Such a state which distances itself from religion is a secular state. A secular state is opposed to a theocratic state ruled by religion. Thus, the distinguishing features of a secular democracy as contemplated by the Constitution of India are: 1) That the state will not identify itself with or be controlled by any religion; 2) That while the state guarantees to everyone the right to profess whatever religion one chooses to follow (which includes also the right to be an agnostic or an atheist), it will not accord any preferential treatment to any of them; 3) That no discrimination will be shown by the state against any person on account of his religion or faith, and 4) That the right of every citizen, subject to any general condition, to enter any office under the state will be equal to that of his fellow-citizens 2 . But a secular state is different from a secular society. While secularism is strictly related to politics, it is different from being secular in everyday life or following the practice of secularization. 16.3 Secular, Secularization and Secularism Understanding the 'secular', 'secularism' and 'secularization' can be very confusing and overlapping. Yet there are different meanings to the word secular, secularism and secularization. Secularism is more of a political doctrine. Secular is more cultural. While secularization is a process of being secular, i.e., being outside the reach of religion and religious institutions. Being secular can also mean being 'this-worldly' in one's orientation. Secularization as a trend emerged in the period of early modernity which also indicated a decline in religious practices and its believers. It also indicated the rise of non-religious or secular institutions worldwide. The word 'secularization'

NSOU ? CC-SO-04 218 was first used in 1648 at the end of the thirty years war in Europe, to refer to the transfer of Church properties to the exclusive control of the princes. George Jacob Holyoake coined the term secularism in 1851 and led a rationalist movement of protest in England. Secularization was built into the ideology of progress. Peter Berger had mentioned that secularization was the process by which religious domination removed from sectors of society and culture. T.N Madan has noted that there is a confusion caused by the use of words such as 'secular', 'secularization' and 'secularism'. For Srinivas, the term secularization implies what was previously regarded as religious is now ceasing

71%

MATCHING BLOCK 122/133

W

to be such and it also implies a process of differentiation which results in the various aspects of society, economic, political, legal and moral becoming increasingly discrete in relation to each other 3 .

Secularism on the other hand requires that all religions should have the privilege of free exercise and be even handily treated except when a religion's practices are inconsistent with the ideals that a polity seeks to achieve. Secularism is a doctrine that may be relevant even in societies where there is no religious plurality. Secularization leads to changes in- a) The beliefs and practices of individuals; b) The nature of institutions and their mutual relations. It doesn't imply elimination of religion but to a state of affairs in which some ideas, practices and institutions cease to be regulated by religion. The range and depth of secularization vary from one country to another within the same country from one segment of the population to another. One can also see that nowhere has secularism led to the disappearance of religious beliefs and practices and institutions. Beteille states that 'it is a sociological truism that no modern society can as a whole afford to dispense with either secular ideas and institutions or religious beliefs and practices'. Srinivas said that 'Hindus were more affected by the secularization process than any other religious groups. Further different sections among the Hindus are affected in different degree by it...'. He suggests that there are certain institutional features of Hinduism that make the progress of secularization easier among the Hindus than among other religious groups. Indians irrespective of their religious faith, practice secularization due to the changes in the external and material conditions of existence. Such changes can also provide a new lease of life to certain religious practices. The prospects for the co-existence of religious and secular ways of life will depend in part on how we think of religion. Srinivas for instance traced the course of secularization through the changes in the rites and ceremonies of the Hindus. For example, the most significant ritual among the caste Hindus is that of purity and pollution. However, the notion of purity and pollution have undergone changes in recent years. As he said, "the notion of purity and pollution have become less

NSOU ? CC-SO-04 219 pervasive...". Many ceremonies related to birth, death and marriage are acquiring a different focus which indicates the presence of 'secularization' but it does not mean that it is at odds with religion. Needless to say, that there are new rituals and ceremonies that are incorporated in the Hindu calendar and other religions. Much of these are 'secular' by definition. Religious occasions are redefined as 'social occasions. There is also elimination of magical elements from traditional religious observances. Both are conventionally regarded as aspects of secularization 4 . Beteille also brought a relationship between religion, magic and secularization through several examples. Many elements of Hinduism and Catholicism were more magical than religious. Among the various social rituals of the Hindus, Brahmin women were not allowed to enter the kitchen during their menstrual time just as the untouchables were not allowed to enter major Hindu temples. The weakening of these restrictions and reduction of their magical and superstitious beliefs were linked to the process of secularization. The modern society finds the growth of new institutions and structures. These institutions are universities, laboratories, hospitals, banks etc. The Indian universities of today were designed by and large to be secular institutions from the beginning. The Indian university is a secular institution in the further sense that individuals have equal opportunity to find a place in the faculty irrespective of religion, caste or creed. Institutions like laboratory hospitals and banks are governed by rules of its own specialized practice, scientific practice or financial practice. They are not intrinsic to any particular kind of religion. Although secular ideas and institutions tend to have a bias for modernisation, secularism can be turned into a doctrine as well as an ideology too, it has had its partisans and militants 5 . Therefore, secularization process can be followed in everyday lives of the people even though the state is non-secular. On the other hand, a secular state doesn't mean all its citizens will be secular. 16.4 Secularism in India Secularism although appeared in western societies, it was later adapted by many countries around the world. India as an independent nation-state also chose to adopt the model of a secular state. Although the idea of secularism was gathered from the west, Indian secularism has its own distinctive character which differs from its western counterpart. India is religiously diverse. The Indian subcontinent has been home to different religious groups over the years. While the majority of its population are Hindus, other minority religious communities like Muslims, Christians, Buddhists, Sikhs, Parsis and others co habit or co-exist. Being a culturally diverse country, India also exhibited fair amount of tolerance across the subcontinent. This also meant that India's approach to secularism will be idiosyncratic.

NSOU ? CC-SO-04 220 In India the word 'secularism' is highly ambiguous. The common man finds the term not only difficult to comprehend but also make different meanings out of the same. Due to various historical, political and cultural factors Indian secularism has always been a matter of confusion as far as state policies are concerned and as far as citizens and their rights and obligations are concerned. That is probably the reason why Indian secularism despite being a constitutional term failed to find its place in the heart of Indians at large. Secularism was the chosen word included in the Indian Constitution in its 42 nd Amendment. It was believed that the problems and turmoil that India was going through after the Partition of the country along communal lines in 1947 could be cured by the inclusion of this magical word 'secularism'. Some people believe in secularism and are in support of it while others find it a farce. The concept however helps to shape one's own understanding of religion. As Andre Beteille says, secularism is not only opposed to religious predominance but also indicates freedom to pursue any religion. Jawaharlal Nehru, the first Prime Minister of India wanted India to be a secular state. This one will be the one that protects all religions but favours none at the expense of others. Neither there will be anything called a state religion. The state will ensure equal protection to all religions that lie at the heart of the Indian sub-continent. Nehru was the philosopher, the harbinger of Indian secularism. Secularism for him meant complete opposition to communalism of all kinds. Secularism was a means to achieve national unity and integrity for India. 16.4.1 Jawaharlal Nehru on Secularism Jawaharlal Nehru was the pioneer to develop the notion of Indian secularism. It was he who believed that secularism would help develop an attitude of tolerance and peaceful co-existence of all religious groups within the country. Jawaharlal Nehru's secularism rested on the notion that religion is an erroneous view of the cosmos that will yield to more rational understanding as scientific thinking and economic growth advance 6 . Nehru wanted to develop the ideology of secularism to suppress communal woes in the country. He was a liberal and believed in liberal secularism. He envisioned that by following secularism, India would not only be tolerant towards the religious minority groups but also ensured liberty and equality for all. Nehru's secularism aimed at social welfare. Nehru always projected a modern and liberal India which would grow along the lines of industry and scientific growth. The secularist ideology fitted well into this philosophy which would help to attain justice for all and avoid any forms of discrimination on the part of the minorities. Nehru wanted to curve out the mottoes of secularism, socialism, liberty and equal justice for Independent India. He was the main architect behind secularism. He was aware of India's deep religious

NSOU ? CC-SO-04 221 diversity and the fissures it created within Indian society. He thought secularism would help unite the country shattered by communal forces. Nehru believed that communal problem which was at the root of the history of Indian independence was not a religious problem. Rather it was more about exploitation of religious differences existing in Indian society by a group of calculating politicians. The quest for achieving secular ends had produced communal divide. For Nehru secularism was about separation of religion from political, economic, social and cultural lives. Secularism was also about separation of the state from religion. Secularism also would not allow discrimination of any kinds on religious grounds and develop more religious tolerance. Religion was simply a private matter that would bring about inner development of one's personality. Nehru was aware of the enormous impact of religion on the lives of the people especially in an old civilization like India which had been the home to large number of religions. But for Nehru, the new India would be built on the premise of secularism, socialism and democracy. New India was a modern India that was scientific and industrialized. He believed that modern scientific education would help people realize the spirit of secularism. He preached about liberty and equal rights of all the citizens of the country.

16.4.2 Mahatma Gandhi on Secularism

Gandhi was a religious devout man. Even though he supported the policy of secularism for India. He always believed religion to be the spirit of India and it was not possible to separate the religion from the secular. Gandhi's secularism rested on the notion that all religions were true, getting the meaning to the moral life and that Indian society could be built on a community based on religious communities. Religion could not be separated from politics either. Gandhi perceived that one could not keep religion away from the parameters of life but one could practice what he called good religion compared to bad religion. Gandhi was against sectarianism, communalism and religious fanaticism. Gandhi believed in spiritual politics. He had always supported Hindu revivalist cult and was a follower of Vivekananda and Aurobindo. The Mahatma Gandhi always believed that every religion should be revered and respected because the ultimate truth can be perceived through different religions. However, he also said that communalism was not a religious problem but a political one. This view showed the secular side of his. He never supported state religion even if a country possessed one religion. After independence he always envisioned a free India and not a Hindu state to come into being. Gandhiji claimed that in independent India issues of religious majority and minority should no longer prevail. He never saw Hinduism as an organized religion and neither were the Hindus a homogeneous group. Gandhi was aware of the growing

NSOU ? CC-SO-04 222 communal forces in the country among the Hindus and Muslims since the nationalist movement. But he had no intentions of fighting for religious nationalism. Gandhi emphasized on the inseparability of religion and politics and the superiority of the former over the latter. For Gandhi religion was the source of absolute value and hence constitutive of social life, politics were the arena of public interest. The inseparability of religion and politics in the Indian context was for Gandhi fundamentally a different issue from the separation of the state from the Church in Christendom.

16.4.3 Ambedkar's Views on Secularism

B.R Ambedkar was the architect of the Indian Constitution. He was also known as the Father of Indian Constitution. Ambedkar was a vehement protester of the Indian caste system and the Hindu religion which he condemned this altogether due to its divisive nature. His aim in life was to bring about social equality of the Dalits or the untouchables and stop any forms of social discrimination within Hindu society. Ambedkar was against Hinduism due to its exploitative and discriminatory character. Through the various laws within the Constitution, Ambedkar wanted to achieve equal protection of rights of all individuals under law. Ambedkar had full faith in the principles of secularism which was included in the Constitution in its forty second amendment. He trusted secularism to give equal respect and protection to all religion. Hence secularism was conceptualized by Ambedkar to give freedom of religion to every citizen. Along with religious equality Ambedkar also wanted to stop practices of untouchability, economic exploitation and caste type of social differences. This widened the scope of secularism. Ambedkar wanted to change the Hindu Code Bill but he managed to obtain the provision of Article 44 which states that every citizen will be secured a uniform civil code by the Indian state within its territory.

16.5 Growth of Indian Secularism

Indian secularism arose in the context of deep religious diversity that predated the advent of western modern ideas and nationalism. It was a political phenomenon than a philosophical one and was adopted with a purpose of defying communal tensions in the country. The Congress under Nehru was committed to secularism but there were differences in the true nature of a secular state in India even among the Congress. The R.S.S or the Hindu Right wing never supported secularism and denounced it as a western concept. It was thinkers like Gandhi, Nehru, Maulana Abul Kalam Azad and B.R Ambedkar who supported secularism in India. India is a secular state because there is no particular religion which is adopted as the state religion. The Constitution doesn't provide any preferential treatment to any

NSOU ? CC-SO-04 223 religion and the people of any particular religion has the right to worship or any religion may be of one's choice is a fundamental right. Secularism in India also brings with it equality of all citizens in the eyes of law. According to the Indian Constitution no discrimination will be made on the basis of caste, creed, gender and class. All citizens irrespective of one's religion, caste or gender have the right to vote. According to Article 14 to 21 all enjoy same rights without discrimination. Person professing any religion will be considered equal before the law. Article 15 also prohibits discrimination of any persons on religious grounds. Article 25 states that all who reside in India are free to confess, practice or propagate the religion of one's choice subject to social health, law and order. All these provisions make us believe that India is a secular state. Indian secularism is unique in its own way. This is because India has always been a multi religious, plural society. In India we find a domination of four major religions Hinduism, Islam, Christianity and Sikhism. Indian society is built upon communal harmony and integrity. Right after independence the Indian Constitution has adopted the democratic form of government. Directive principles and fundamental rights are also incorporated in the Constitution. Among them Articles 25 to 30 ensure freedom of religion to individuals, as well as religious denominations and institutions. However, there are restrictions over certain public sectors while the state has full right to intervene in religious matters if it thinks fit. It was in 1976 that the word 'secular' was included in the Indian Constitution. Indian secularism is more an attitude of "good will towards all religions", "sarvadharmā sadbhava"; in a narrower formulation it has been a negative or defensive policy of religious neutrality on the part of the state. Secularism has multiple meanings. It is being applicable through the process of modernization. It is also thought as the anti-thesis of religion and consistent with rationality, individuality, materialism, economic development and social change. Secularization also implies a break away from the traditional structures of society. Secularism is the pathway to a new modern society. A secular state is one that has no connection with any matters - religious or spiritual-, and that the state shall not intervene in it nor sponsor it. The Indian state follows a neutral path to secularism. According to Article 15 of the Indian Constitution,

64%

MATCHING BLOCK 128/133

SA Final Copy.docx (D142174335)

the state shall not discriminate on the ground of religion, race, caste, sex, or place of birth.

According to Article 44, there should be a Uniform Civil Code which means one rule for all. But secularism in India met with many challenges and was not accepted by all. T. N Madan has argued that where religion persists as a powerful element in personal identity, secular policy cannot build on a rationalist avoidance of religious community but must take it into account. Secularism is simply perceived in the light of the political but it has been insufficient in countering religious fundamentalism and

NSOU ? CC-SO-04 224 fanaticism. Madan notes therefore that the search for secular elements in the cultural traditions of this region is a futile exercise for it is not these but an ideology of secularism that is absent and is resisted. Secularism is often viewed as a dream of the minority which wants to shape the image of the majority. For many, secularism is nothing but a social myth. It is a tool in the hands of political parties to cover the failure of the minority to separate politics from religion and secure vote banks. Majority of the Indians are dependent on religion to establish their place in society and bestows meaning on their life, more than any other social and cultural factors. Despite all the forces of secularization it is found that secularism is unable to make its headway in India. The biggest example of this is the rising and persisting communal riots and tensions in the country, secessionist movements, dissent over personal laws and uniform civil code, unresolved Kashmir issue, prevalence of the Hindu Rights, domination of the anti-secular BJP. Many of the arguments against secularism are vociferous. People believe that it is the failure of the society and the state to bring communal forces under control and secularism is not an answer to it. Indians are largely religious and would continue to be so. Even the Congress party couldn't be fairly secular. This became more evident in its inability to positively deal with the ever-contentious uniform civil code and banning of the Muslim personal law in the Shah Bano Case (1985-86). This had further created seething anger among the Hindu majority in particular which saw secularism to be instrumental in shaping minority politics. 16.6 Conclusion This chapter takes an attempt to comprehend the meaning of secularism in the world politics as well as the political life of India. The principle of secularism is a controversial issue for Indian politics. Under the current social and political situation, the concept is facing redundancy. Indian politics is far from being secular. Secularism only finds its place in the Preamble and the Constitution but fails to shape the lives of Indians. People are still religiously divided. 16.7 Summary The majority and minority issue still revolves around Hindu and Muslim religious identities. Communal tensions, religious riots, mobs and fanaticism never cease to exist. Political parties seek votes along communal lines and the position of every religious minority are under threat. Under such circumstances one is forced to think why is India a secular nation-state and whether it is time to reinvent or redefine secularism in India.

NSOU ? CC-SO-04 225 16.8 Questions I . Answer in detail: a. What is secularism? How is Indian secularism different from its western counterpart? b. Differentiate between the concepts secularization and secularism with examples. c. Explain the growth of secularism in India. II Answer briefly: a. Why is Indian secularism ambiguous? b. What was Nehru's vision of secularism for India? c. Explain Ambedkar's views on secularism. III Answer very briefly: a. How does the Uniform Civil Code contribute to secularism in India? b. What is the Shah Bano case and its implications on secularism? 16.9 Suggested Readings 1. Beteille, Andre. 2000. Antinomies of Society: Essays on Ideologies and Institutions. New Delhi. NSOU ? CC-SO-04 228 17.2 Introduction Secularism was introduced to Indian citizens as a principle policy of the state. It was largely a political practice whereby Indian government wanted to secure the rights and interests of every religious community in the country. This secularism was different from being secular in the social and cultural lives. However, secularism is met with serious challenges and obstacles. Already there have been started so many debates and discourses that state secularism must be a promotional interest of the government for securing the sympathy and support of the minority groups. Yet few also feel that secularism is a major step towards a healthy democracy with its objectives of securing equality and justice for all its citizens. The debate over secularism in India is an ongoing process where scholars, politicians, academicians and the people share dissenting their voices. Secularism in India is still popularly perceived as a western imposition for the purpose of fulfilling vote bank politics. Communalism and religious fanaticism are seen as major impediments to secularism. In this unit, the attempt is taken to decipher the meaning of secularism, its importance in Indian democracy and the challenges that secularism face in India. 17.2.1 What is Secularism? Secularism means that an independent nation-state will not discriminate against any religion or community or any person professing a particular religion. Even though a pluralistic society, no particular religion will be considered as a state religion. The state will refrain itself from bestowing any preferential right on person of any particular religion. In other way the state will maintain its distance from religious favouritism. "The goal of secularism, defined most generally, is to ensure that the social and political order is free from institutionalized religious domination so that there is religious freedom, freedom to exit from religion, inter-religious equality and equality between believers and non-believers. In other words, religion defines the scope of secularism" 1. Indian secularism also aims at bringing about religious equality in the country which takes place in the aftermath of the Partition. However, unlike its western counterpart, the Indian states have always been anything far from anti-religious. For India secularism doesn't imply a complete separation of the state and religion but it is a matter of state policy. On the contrary, by adopting the principles of secularism the state aims to protect the diverse religious groups and their identities that exist in the subcontinent since the ancient times. So, religion definitely holds an important place in Indian polity.

NSOU ? CC-SO-04 229 Secularism was one of the ideals of the new democratic government in India that was to come into being after the British rule. However, it was included formally much later in the Indian Constitution. The Indian state was expected to uphold the principles of secularism. Nevertheless, secularism is one of the most contested and challenged ideals of democracy. Secularism is challenged by the various social, political and economic developments. Many scholars like Amartya Sen held the doctrine of the Hindutva ideology and thought that BJP might be responsible for damaging secularist principles in the country². They were seen as the main critiques of secularism and represented the ideology of Hindu nationalists in the political arena. However, one cannot only blame the Hindutva movement for the crisis faced by secularism in India. There are a series of factors that added to its collateral damage. The secular state of India is under constant threat today and with it the ideals of democracy seem to break down. People were and still are divided on the basis of religion. The major question is to trace the challenges and crisis of secularism in Indian society and polity. Before coming to the crisis of Indian secularism, it is important to understand the difference between secularism in the west and in India.

17.2.2 Secularism in the West

In the west secularism emerged as a new modern idea that was to mark the end of the old feudal order and develop the emergence of a new modern nation-state. Secularism was the need of the hour in the west which tried to undermine the powers of the Catholic Church over the lives of the people. Modern western secularism was a search for a way out of religious wars and keep the Church out of all matters of state interest. Another major function of secularism was that it helped people identify themselves as citizens of the state and not in terms of other primordial loyalties like religion, ethnicity, race and class. The word secularism was coined by George Jacob Holyoake in the middle of the nineteenth century. The word was Latin in origin and also indicated freedom. The origin of the idea of secularism might be traced to the period of Enlightenment in Europe. This was a time when religion or belief in God started giving way to reason and rationality. The word 'secular' started being associated with 'this worldly' while religion was concerned with the 'other worldly'. Although religion is seen to be a feature of backward or traditional society, secularism is a feature of the new age of modernity. It is also associated with the words like 'progress' and 'development'. While religion is seen to divide the society, secularism aims to establish an egalitarian and just society.

NSOU ? CC-SO-04 230

17.3 The Need for Secularism in India

In India secularism was viewed to be the harbinger of a just and equal society which could cordon off religion-based inequalities and differences among groups and communities. Secularism was adopted in order to build a united India amidst plurality and multiculturalism with religious differences and discriminations. According to Rajeev Bhargava, the makers of the Indian Constitution adopted secularism as one of the principles of state policy as an aftermath of the Partition and deterioration of Hindu-Muslim unity in the country. "Bhargava (1998) defined what he called political secularism, a minimalist secularism in which the state keeps a principled distance from religious communities in order to ensure minimal standards of living to ordinary citizens and prevent the degradation of life. Ethical secularism is more demanding in that it necessitates not merely living together in a political association, but living together well. Both ideas of secularism insist upon the separation of religion from politics"³

Bhargava believed that secularism is necessary not only to avoid or stop religious fanaticism but also to avoid religious conflicts. While religion was excluded from state institutions it was not excluded from the lives of the people. The declaration of the Indian state to provide special rights to minorities gave secularism a distinctive character in India. It was believed that absolute uniformity was not required for national integration. Secularism was an attempt to promote communal harmony by not disrupting the religious sentiments of the people. The idea behind secularism was that the state would maintain distance from religion but it possessed every right to intervene in matters of religion that was necessary. Actually, it was thought that India was the home of different religious communities and Indian state had every right to cater to the needs of all. After independence, India wanted to build a democracy that would treat all its citizens equally. As the Partition took place India vowed that it would not discriminate its citizens along religious lines, neither it would have a state religion. Secularism became the gradual call of the hour. Besides secularism being a major state policy, the Congress government had to wait till the Forty Second Amendment of the Constitution to include the term secularism officially. Secular ideologies are mentioned in Article 25 and Article 28 in the chapter of Fundamental Rights. Article 25 propagates the freedom of conscience and the right to freely profess and practice any religion. Similarly, Article 27 and Article 28 ban taxes for the purpose of supporting a particular religion and by banning religious instruction in the institutions recognized or aided by the state. Article 325 and 326

NSOU ? CC-SO-04 231 provide for the principle of non-discrimination among citizens in the area of voting and representation on the basis of religion, race and sex. The ideology and practice of secularism are under much debate and controversy across Indian society. Popularly there is a belief that secularism is a borrowed concept which has been forcefully imposed upon the country. Its alien construction makes it inept for solving the problem of communalism in the country. The seeds of communal disharmony were sowed since the British rule which outgrew into the most violent form of communal tension in the history of India in the form of the Partition. But in no way could secularism bridge the gap between diverse religious groups, neither had it been able to avoid communal issues. Many believe that the crisis is faced by India today are due to secularism. As T.N Madan says, "In either formulation, Indian secularism achieves the opposite of its stated intention; it trivializes religious differences as well as the notion of unity of religions... He calls secularism as 'impossible', 'impracticable' and 'impotent' 4 The makers of secularism have failed to recognize the supremacy of religion in the social and cultural lives of Indians. People of the dominant Hindu majority groups are even unhappy about the protection of the rights of the social religious groups in society. Besides all Constitutional principles, laws and Acts, Indian democracy has failed to uphold the values of secularism. Numerous communal tensions and violence are indicative of the failure of secularism in India today. 17.3.1 The Crisis of Secularism T.N Madan, Ashish Nandy, Partha Chatterjee all criticized secularism as a symptom of deep internal crisis 5 . This was because secularism never complied to the normative structure of Indian society. They all linked secularism to a flawed- modernity in India. Secularism could never eliminate religion from the public life of the people because religion formed the foundation of Indian society and culture. Rajeev Bhargava placed his argument against this view. Bhargava believed that those who criticized secularism failed to view India as a modern society and secularism was a new variant feature. He stated that Indian secularism never promoted privatization of religion and never created a wall of separation among different religious groups or communities rather secularism proposed a distanced relationship between the state and religion. While intending to understanding the failure behind secularism in India, Bhargava noted that secularism as a concept faced some internal threat. This threat originated from the failure to understand the distinctive characters of secularism. Bhargava also believes that secularism is a doctrine that can change over a period of time. Secularism also has multiple interpretations. Secularism is a value that has been inherited from the west but has been made its own by the non-western societies. Even

NSOU ? CC-SO-04 232 in western societies the traditional meaning of secularism is again being reexplored and reinterpreted. This is essentially due to the rising multiculturalism in western societies along with large scale migration and development of Diaspora communities. In case of India, Bhargava notes, that the critics of secularism have linked it to other concepts inherent in modern society i.e., the concept of nation-state, instrumental rationality, hegemony of science and probably industrialization. Secularism is also related to individualism and concepts like liberty and equality which is not well accepted by the Indian society. The Indian critics of secularism for instance have failed to understand the substantive value behind secularism of protecting its citizens against all kinds of religious oppression. However, separation of religion and the state does not mean exclusion of religion and state. The critics of secularism also fail to look into its positive implications like eradication of untouchability, bringing about social and religious reforms and promoting or expanding secular institutions like schools, colleges, hospitals and so on. Hence one major criticism against secularism is that it is highly unsuitable for the Indian context and there should be some alternative to it. 17.4 The Problem of Communalism Secularism is challenged by the communal forces that operate within the country. The frequency with which communal holocausts have been taking place in this country show that there is something fundamentally wrong with our political system as well as our secular governance 6 . Secularism was a dream of the then Indian National Congress leaders like Gandhi, Nehru and Maulana Abul Kalam Azad. But this dream got backfired under the elite driven communalism in the country. Communalism means a kind of collective outburst of one community against the other or strong allegiance to one's own ethnic group than to a society. It is associated with a religious community and implies exclusive loyalty to one's own religion. There are several popular notions about communalism. One of them is that it is seen as a product of religion but it is not. Rather it is the product of the politics of elites of religious communities. It is the competitive politics between the elites of two or more communities which give rise to communalism 7 . Communalism can be traced back to the Nationalist movement which started as a Freedom struggle from British rule. But even after independence the country got its first major communal blow through the Partition. The Hindu-Muslim unity was lost forever. Even after independence series of communal revolts and backlashes were found in different regions of Uttar Pradesh, Gujrat and other states of North India. The

NSOU ? CC-SO-04 233 Gujrat riots, Godhra riots, Bombay riots, riots in Punjab all proved about the failure of secularism in Indian society. 17.4.1 Communalism and the Nationalist Movement One major obstacle to the principles of secularism is communal politics which was embedded within the Nationalist movement itself. If one questions the reason behind the defeat of secularism in India, one has to dig deep into the Nationalist movement for an answer. The Nationalist movement was also known as the Swadeshi movement whose primary aim was to free the country from British rule and create an independent nation-state. Drawing inspiration from the western world and other newly emerging nation-states after the setback of World War II, the Nationalists like Nehru, Gandhi, Jinnah and others envisioned a new India with a new identity of nationhood. The Nationalist movement therefore brought with it new modern ideals of nationhood, patriotism, equality, liberal thinking and secularism. As a nation divided along caste and religious lines and victimized by the 'divide and rule' policy of the British, secularism was believed to be the prerequisite for an equal society. After independence, the ideology of secularism became the ideology of the state but couldn't touch the popular sentiments of the people. Rather people were not just alien to the concept but many vehemently opposed it. This was because the nationalist movement itself was not secular in nature. Rather it brought with its fears of communal disharmony. The Movement itself recognized the dominance of two major religions in the country, the Hindus and the Muslims that further culminated into the Partition of the country along communal lines. Many scholars like Akeel Bilgrami⁸ believed that the way secularism was imposed upon India did not go down well with its popular sentiments. Rather preaching of secularism should have been a gradual and negotiated process between the Congress party and the other religious groups and communities. Communalism emerged as a mere reaction to secularist principles in the state. Even most of the Indian politicians and bourgeoisie failed to accept secularism even though it was formally included in the Constitution. It was never easy to translate the Constitutional ideals into practise in a complex country like India. The Congress party was not really as secular as it stated to be. Few members of the Congress also allegedly practised communal politics. Nehru believed as education, science and technology spread, Indian society would become more secular and rational. However, the picture of India was very different from what Nehru envisaged. The masses lacked education at the primary level and science and technology was also limited to the elite sections or the upper caste groups in society. There was inequality everywhere. Even the education system was trapped under the influence of communalism. For instance, the text books were a source of communal

NSOU ? CC-SO-04 234 divide. The ruling classes wanted to mobilize votes on the basis of their own respective communities and they also started practising the old British policy of 'divide and rule'. The Indian democracy never could oust communalism, rather it was supported by communal forces. 17.4.2 Communalism and Vote Bank Politics In India the Hindus constitute the majority while the Muslims are the largest minority groups. Tensions between these two religious communities have grown since the British rule. It was the British who tapped the cultural differences between these two communities as an instrument for the 'divide and rule' policy. The age-old dispute between these two religious groups further accelerated to the Partition of the country. Even the nationalist leaders during the freedom struggle couldn't bridge the gap between the Hindus and Muslims under the one nation theory. One major reason for this has been the fight for power and electoral policies in the country. The Indian National Congress and the Muslim League were for ever divided in their battle for electorate power after independence. Communal disharmony started ever since the partition of the country and India's independence. Religion was used as an instrument to mobilize the people to fulfil the wish of a selective few, the powerful or the elites. The ruling elites are always in a power battle and the politics of the country is nothing but divisive politics. The major political parties like the Congress and the Janata Dal had always exploited the communal sentiments of the people for their own political motives. The Congress party from the very beginning tried to maintain a pluralistic nature which gradually reduced to nothing but vote bank politics. Secularism therefore became a medium for encouraging vote bank politics. Among the Hindu fundamentalists, secularism is seen as a means to appease the Muslim minority groups. Many feel that it is pseudo secularism that operates within the country. Secularism promotes further communal disharmony and anti-nationalist feelings among the people. Many yet feel that after the Partition just as Pakistan adopted Islam as the state religion, India could have been declared a Hindu state. Jawaharlal Nehru believed that the spread of education, science and technology would eventually help establish secularism and secular ideology in Indian society. But this never happened. Not all members of the Congress were secular in their mind or in practice. Education took a backseat and illiteracy became a major social problem. Education never seeped into the lower rungs of society. Caste, class, religion and linguistic inequalities never withered away, rather heightened. Even the text books taught in schools were sources of communal divide. The ruling classes,

NSOU ? CC-SO-04 235 the political and economic elites were always trying to secure votes on the basis of compartmentalization of society. There was a strong propaganda against Nehruvian secularism which was shown as a sham and meant for creating Muslim vote bank. Protests were flared against the separate Muslim personal law which allowed the Muslims to marry more than once while the Hindus had to strictly adhere to monogamy. All this developed in the light of the famous Shah Bano case of 1985 that further went against the preaching of secularism. In the Shah Bano case the Supreme Court gave its decision in favour of a divorced Muslim woman Shah Bano who moved the court seeking maintenance from her divorced Husband. This was against the Muslim personal law. The decision of the Supreme Court was given in her favour under section 125 of the CrPC. This was seen as an interference in the Shariah Law. In 1986, the Congress under Rajiv Gandhi as the Prime Minister was forced to change the law for the Muslims. Soon an Act was passed called the Muslim Women (Protection on Divorce) Act which made section 125 of CrPC inapplicable to Muslims. This was met with severe criticism and a blow to the Congress's secularist policies. The BJP as the opposition demanded implementation of the Uniform Civil Code. The Congress made yet another blunder. In order to appease the Right wing Hindu fundamentalists, after the passing of the Muslim Bill, Rajiv Gandhi opened the doors of the Babri Masjid for the Hindus to worship Ram. The location of the Babri Mosque was believed to be Ayodhya, the birth place of Ram. This led to the Ramjanmabhoomi and Babri Masjid controversy followed by communal riots and violence in the country. Large number of communal riots broke out in the 1980s. The Anti-Sikh riots started after the assassination of Mrs Indira Gandhi by her Sikh body guards. More than four thousand Sikhs were killed in the massacre. Hence the belief that strengthened was that secularism doesn't fit into the country.

17.4.3 The Issues of the Majority and Minority The issue of majority versus minority holds a lot of significance to one's cultural, social and political identity in the country. India has two major religious groups, the Hindus who are the majority and considered to be the early inhabitants of the land and the Muslims who are the largest minority group within the country. Apart from that there are other religious groups like Christians, Sikhs, Zoroastrians, Buddhists, Jains and Persis who form insignificant minorities. These groups are insignificant due to their numbers. The Indian state is found to patronize some religious groups by giving them minority status, which is again a distinctive character of Indian secularism. The Constitution has always tried to preserve the rights of religious minority groups and safeguarded their own religious and educational institutions yet

NSOU ? CC-SO-04 236 the Indian state is often accused of its incapability to promote tolerance and harmony among different religious groups. Secularism is a means of uniting the vast differences that exist in Indian society in terms of primordial loyalties. Religion, caste, ethnic groups, linguistic communities are myriad and divided within the country. There is a vast difference between the majority groups who are also the dominant cultural groups of society and the minority sections of society. A major threat or attack on secular values comes from its support of the minority groups or the weaker sections of society like the Muslims, Dalits, women and even the adivasis. Such groups also face social exclusion from the mainstream communities. Today there is a new period of crisis where the issue of majority is not just socially or politically ascendant in India, but it holds secularism where the protection of religious minorities is getting shattered. Religion and politics seem intertwined in South Asian countries including India and hence western concept of democracy in India shows that political instabilities and ethnic tensions are part of the process of nation-building. However apart from religion, other forms of discrimination and marginalization on the basis of language, caste and gender also curtail secular thinking. Rowena Robinson mentions that failure of secularism must be traced to several factors and their amalgamation including the weakness of states and their unwillingness to stand by secularist principles. She writes that prejudices and social exclusion and their complexities are often injected into society. Terms like secularism and affirmative action means that the majority are threatened by the loss of their power and privilege and tends to indulge in violent reactions.

17.5 Conclusion The limitations of secularism could be felt with the growing religious and cultural discontents in the 1980s and 1990s. At this time there was also the rise of Hindu Nationalism which further challenged the existence of secularism over religious fundamentalism. Hindu nationalists are of the opinion that India is the land of Hindus and it is the land of their ancestors. The Muslims and Christians were considered outsiders and hence 'the other'. Starting from the 1970s, to the 1980s and 1990s India seethed with anger along communal lines. Communal violence and mass killings of minority groups backed by political parties collaborated to the rise of a powerful Hindu Nationalism. Along with this and rising ethnic conflicts debates started centering around the concept of secularism. Scholars were divided in their views on secularism. On the one hand T.N Madan and Ashis Nandy criticized secularism for being ill-fitted and out of place. They believed that in South Asia religion could be pushed into

NSOU ? CC-SO-04 237 the private domain. On the other hand there were scholars like Rajiv Bhargava Bharucha and Vanaik for whom secularism should be a fundamental principle of state policy if unity and integrity has to be achieved 10 . There were several questions on the rights of minorities and also multiculturalism. Secularism started being studied in the light of religious fundamentalism. The Hindutva ideology started moulding the people by institutionalizing them in their everyday lives. In schools, homes, public sphere, Hindutva was gaining prominence. People were made to believe in hatred for the other religious groups and took the other religious communities as outsiders. Co- habitation of different religions together all of a sudden became unacceptable. The Hindus were made to believe that Muslims were encroaching in their every life, drawing benefits from the government. Religious festivals, celebrations, Godmen, religious books, pilgrimage became instrumental in creating religious divide within the country. The Godhra riots are the biggest instance of the growing Hindutva power. The Hindutva movement gradually leads to the emergence of new cults, organizations and movements. There is a growing relationship between Hindu religiosity and Hindu nationalism. Those who stand against this new found Hindu nationalism are termed as Anti Nationalists. The notion of secularism is under much threat along with the ideals of democracy. The recent abolition of Article 370 stripped Kashmir of its special status is an example of anti-secular forces in the country. Kashmir had always been a major controversial communal subject ever since independence. The move of the BJP government to abolish the famous Article 370 from Kashmir was another biggest anti-secular change. It was supported by the Hindu masses at large. The Kashmiris lost their own identity due to curbing of fundamental rights, speeches and expressions. 17.6 Summary There is a growing curtailment of fundamental rights, speeches and expressions. Kashmiris are forced under curfew and politicians are forcefully driven under house arrest. The media have been blacked out. All these are questioning the role of secular democracy in India today. Recent times have also seen a new trend of Hindu Nationalism where it is equated with the Bharat Mata concept 11 . The Hindus are the real sons of Bharat. There have been lynching of minorities over beef eating, worship of Ram and Gau Mata are almost forced upon all sections of a heterogeneous Hindu community. The secular academic institutions are also under constant threat and challenge. The Intelligentsia, people with communist ideologies,

NSOU ? CC-SO-04 238 the media's independent form are all being shattered. On the whole anti-secularism is on the rise and its basis lies in tramping the freedom and liberty of the citizens. Secularism still remains one of the most contested and disapproved ideas of Indian democracy. Indian secularism on the one hand means withdrawal of the state from any religion while on the other hand the state never refrains from interfering in religious issues. This has not gone down well with the nation and is believed to be anti-sectarian. As a reaction, the recent political system shows a serious crisis to secularist principles that have been laid in the Constitution. Anti-secularism also implies anti-democratic forces in the country and a challenge to national freedom of the citizens. Hence secularism has become a biggest challenge for Indian democracy as well as for the people in their everyday lives. 17.7 Questions I. Answer in detail: a. What do you understand by secularism and what is the significance of secularism in India? b. Explain the crisis faced by secularism in India. c. What is the problem of communalism? How is it relevant in the context of Indian secularism? II. Answer briefly: a. Write a note on communalism in India. b. What is the issue of majority and minority in the context of secularism in India? c. What do you understand by anti-secularism? III. Answer very briefly: a. Define secularism. b. What is meant by Hindu nationalism? c. Explain vote-bank politics. 17.8 Suggested Readings 1. Bhargava Rajeev. 2008. Secularism in Rajeev

Society and Culture in South Asia. 3(2)vii-xx 17.10 Glossary Secularism - It is a political concept whereby the state policies are kept away from religion. Hindutva - It is an ideology that sought to define Hindu culture as a way of life popularized by the RSS and the BJP. Nation-State - It is an independent state which consists of people who share common identity and culture. Religious Fanaticism - It is a state of extreme devotion or enthusiasm towards ones own religion. Communalism - It is a system whereby people of one religious community holds strong allegiance towards ones own religion. Hindu Nationalism - It is an ideology based on the belief that India belongs to the Hindus and is the land of their ancestors where all other religious groups like the Muslims and Christians are considered 'outsiders'.

To learn about the various features that describe the concept of nationalism. ? To understand nationalism through various academic debates and discourses. ? To learn about the growth of nationalism in India. ? To understand the various challenges of Indian nationalism that act as impediments to the concept. ? To critically reflect upon the concept of nationalism in India.

NSOU ? CC-SO-04 242 18.2 Introduction Nationalism is a term associated with nation building or nationhood. The term is used as a popular usage with the coming of modernity starting from western Europe and spreading to other parts of the globe. Nationalism is a term full of multiple connotations. It is based upon one nation theory backed by concepts like state, citizenship, democracy, civil society etc. It is also a medium uniting the masses under one absolute state.

Nationalism has many dimensions. The concept has emerged with the course of modern society and soon became widespread worldwide. However, nationalism has multiple meanings. On the one hand nationalism tries to evoke nationalist or patriotic sentiments towards one imaginary body, the nation, while on the other hand, nationalism becomes responsible in triggering other social issues like fragmented nationalism, multiculturalism, pluralism etc. This unit tries to understand the meaning of nationalism and to trace the historical development of the concept, its origin in western Europe and its meaning in the history of Indian nation building. The unit also attempts to find out the challenges to the growth of nationalism in India. 18.2.1 Meaning of Nationalism Nationalism is one of the most intriguing features of modern society. Nationalism emerges out of the feeling of oneness with the nation-state to which one belongs. It implies that people with a distinct language, religion, race or ethnicity, traditions and customs are united under one demarcated geographical territory. This demarcated territory provides a unique identity to its inhabitants - the national identity. This sovereign territory is also a political community and is called a nation. Several historians, political scientists, sociologists and anthropologists have tried to understand the concept of nationalism from their own perspectives. According to political scientists, nationalism reflects a political sentiment of the people. In this case, a nation becomes a political community whereby its citizens or inhabitants are all closely bound together within the state, abiding common laws and government and its citizens are believed to be culturally, ethnically and linguistically one homogeneous population. Nationalism is an ideology which is attached to the idea of nation or nationhood. A nation can be defined as people who live in a specific defined territory where people have some unity, shared political interests, aspirations and a shared history. This means that nations should be built out of individual states and each state should represent a nationality. People within a nation are ruled by one political organization

NSOU ? CC-SO-04 243 and they hold allegiance to the same. The citizens should enjoy equal rights and be looked after by the nation-state. No nation should be subjugated by other nation- states. People of one nation often want to glorify their nation through one common national language, national emblem, national anthem. Arnold Toynbee understands nationalism as something which is subjective and creates psychological feeling in people. For Alfred D. Garcia nationalism is more about feeling for one's own country and developing suspicious feelings for outsiders. For Hans Kohn, it is a state of mind for the people who are united under one nation state seen as an ideal political organization. According to historians like Romila Thapar, nationalism did not emerge in the ancient times. A nation is different from a state and government. A state can be ruled by different forms of government. Nationalism arises from the concept of nation. It is related to the different aspects of the state like democracy, territoriality and power. It represents the values and culture of the people residing within the sovereign territory of the state. A nation is never ruled by the rulers. A nation is a representation of the democratic process. In order to understand the concept of nationalism one should look at the historical premise to recognize the development of the concept.

18.2.2 Historical Development of Nationalism

Nationalism originated in western Europe in the late 18 th and early 19 th century. Prior to that in the ancient and medieval era, people were unknown about the sentiment of the nation. The loyalties of the people were solely restricted to their own territories, the village or the city. Even during the time of the Roman Empire in Europe the nation-state concept failed to emerge. Feudalism was detrimental to the rise of nationalism. Under feudalism the serfs or the subordinate groups in society were ruled by the feudal lords or the vassals. The feudal system developed over land as the primary economic asset. The feudal system was also a vertical power structure starting from the monarchy. All this prevented the formation of a centralized political community in medieval Europe. There were no rules of residence or citizenship in those days. Politics, administration, law and culture were all decentralized. There were differences in language or dialects spoken across Europe along with social practices, local customs and traditions. All these factors prevented the growth of a large homogeneous culture which was crucial for the development of modern nationalism. The demise of the Roman Empire and the Hundred years of war between the English and the French paved the way for the rise of the first nations in Europe around the 14 th century. The feudal system further collapsed or weakened with the rise of Absolute monarchies like the Tudor dynasty in England and the Bourbon dynasty in France.

NSOU ? CC-SO-04 244 Religious domination also subsided. This was a time when the new mercantile classes engaged in trade and commerce were growing in strength. With the rise of merchant capitalism and trade, there was the emergence of capitalism in modern Europe. The religious reformation also started in the 15 th century. The monarchy started losing their control over the people. They remained confined within their own territories exercising their rule over a standardized set of people. They maintained strict rules, observed religion, education and language and maintained standing armies. Their aim was to have absolute power over their subjects. This had a far-reaching impact in the early periods of modernity in Europe. This gave rise to the absolute state which possessed sovereignty, centralized government and fixed territorial boundaries. Nationalism grew out of the emergence of a centralized modern state in the 16 th and 17 th century Europe. The Renaissance and reformation had their own roles to play in cultivating feelings of national identity. One cannot forget the ideals of French Revolution and the slogans of liberty, equality and fraternity, all of which got associated with the modern nation-state. The modern state is structurally and functionally very different from the pre- modern states. This is because the modern states are not only centralized but also have undivided political power unlike the medieval period where political power was fragmented and divided among different rulers. The modern state possesses the characteristic of sovereignty which means complete undivided power over one's demarcated territory and also nationalist feelings and sentiments. These historical events help us understand the notion of nationalism. The concept of nation graduated from such absolute rule by the monarchy. A nation meant sharing of one culture, one language and a homogeneous ethnic community united within a state. The newly emerging elites or the bourgeoisie soon started cultivating the feeling of nationalism. This was a time when the bourgeoisie rose to power dominating the representative assemblies and parliament in western Europe. The idea of the 'nation' became very significant as a sense of identity for the bourgeoisie. The Industrial Revolution of the 18 th century started uniting the bourgeoisie under nationalism. They started looking for greater political power under the modern states. The French Revolution of 1789 was an example of the mass revolts that started taking place against the despotic rule of the absolute monarchies. All these revolts that became widespread across western Europe took place along nationalistic lines and the elites controlled the leadership of the national movements. Soon the absolutist states started transforming themselves into the new democratic states. Both nationalism and liberalism emerged simultaneously. Soon from a political philosophy, nationalism started concentrating on the economy. The Industrial

NSOU ? CC-SO-04 245 Revolution that began in western Europe provoked the European states to engage in lucrative trade and look for market across the globe. Soon trade was followed by colonialism in other parts of the world include Asia, Africa and Latin American countries. Under the new system of colonialism, the focus and identity of the respective European nations shifted to forming colonies in other parts of the world which will help them grow as a nation economically as well as politically. The mission was also to civilize the other so called uncivilized parts of the world. These countries were then colonized by the capitalist countries of western Europe and consequentially got through their own struggle for freedom and nationalism. As Benedict Anderson said, the doctrine of nationalism was inadvertently 'exported' to Latin America, Asia and Africa by European colonial powers. The national liberation movements in the colonies were also started by the elites, the foreign educated middle classes who became the new leaders of the colonized nation and stood opposite to imperialism. The colonized countries soon started mass movements for independence. These movements in the colonies rapidly created a wave of decolonization across the world after the World War II. Shortly they emerged as newly independent nation-states.

18.3 Features of Nationalism

There are several features of nationalism. Every nation should have an identity of its own. This identity is built out of individuality and the ability to take one's own decision for its citizens. A nation should have the right of governance. Every nation wants to be independent and sovereign, it should have full right over its people and the territory which it abounds. A nation would always protect its citizens from outside attacks physically, economically and politically. Nationalism is like an inspiration for the people. People love to glorify their nation. It is like worshiping God. Nationalism can give rise to heroism or altruism towards the nation. Nationalists would sacrifice their lives for the nation and their fellow countrymen. Nationalism also encourages people to preserve their own culture and heritage. People are proud of their national culture which is yet another source of one's identity. Nationalism with its origin also develops two concepts like liberty and equality along with democracy. People of one nation feel united and equal under their national territory. They are integrated through nationalistic feelings and patriotism. Heightened nationalism can curb feelings of exclusion, separation and social differences with a nation-state. Feelings of nationalism always grow out of a common geographical territory. Territoriality is another major feature of nationalism. Even a heterogeneous population residing in one territory will share mutual feelings and cooperation through exchange of culture. So geographical proximity or closeness always promotes nationalism. People of same nationality often share a common historical background. A common history with a common religion, race or ethnic background can help to cultivate feelings of nationalism easily. People within the same nation are often bounded by some common interests. Nationalism can be boosted with a strong common government and political interests of the people. Over all nationalism is a subjective phenomenon. While there are several positive features of nationalism, the concept is often used in the negative light. There are humanists like Rabindranath Tagore and others who have laid the criticisms of nationalism. For Tagore nationalism is nothing but an organized self-interest of some people. Nationalism can also be called fictitious where some promote their own interests at the expense of the masses. Nationalism is utilized by the privileged and the powerful people for their own gains. Too much nationalism can lead to intolerance towards other nations or even within the nation. People often discriminate among themselves in terms of race, caste, class, religion under the garb of nationalism and anti-nationalism. There is often exploitation and social exclusion of the minorities by the majorities within the nation. All these are against the basic ideology of nationalism.

18.3.1 Nationalism in Debates and Discourses

Nationalism is an abstract concept. There have been various debates and discourses on what constitutes nationalism- Eric Hobsbaum in his book 'Nations and Nationalism since 1780' (1990) spoke about a correlation between history and nationalism. Several historical phenomena played important role in creation of nationalism which not only included the elite communities but also the less privileged sections of society. Nationalism unites the dominant classes or the bourgeoisie and creates a false sense of community between them and masses in the face of exploitation of the latter by capitalist forces. British social anthropologist Ernest Gellner in his book 'Nations and Nationalism' (1983) had related nationalism to a new kind of society which was born out of the womb of an old society. In this kind of society, every individual shared a common culture, history and education and a common law and order. Gellner in his work discussed about the cultural factors that helped shape nationalism. Nationalism for Gellner was a congruence between culture and power. For Gellner, nationalism had gained political legitimacy because of the cultural factors of nationalism. Gellner observed that it was not the nations that created nationalism but nationalism created nations. Nationalism developed to fulfil the needs of the modern industrial society and was not conducive for the social organization of agrarian society. The modern

NSOU ? CC-SO-04 247 industrial economies were in need of a workforce that was beyond the scope of an agrarian society ruled by family and kinship ties. According to Gellner the nation- state concept emerged to suit the needs of the capitalist economy by providing a common education system integrated by one language and within a centralized political and economic system. Education therefore played an important role in imbuing nationalist feelings among the people in modern society. Nationalism can be spread through widespread universal literacy among the people. A shared high culture can communicate feeling of nationalism in industrial societies. For Gellner the cultural homogeneity is useful for industrial societies in many ways. Unlike the tribal societies, which were stateless, industrial societies need to educate the masses in a culture that is free from familial or corporate ties. Nationalism is therefore the only means of social cohesion. Echoing Gellner's notion Aijaz Ahmad argues how nationalism is a stage of transition from traditional societies to modern societies. Benedict Anderson in his 'Imagined Communities: Reflections on the origin and spread of nationalism' (1983) has stated that nationalism is 'imaginary'. It is a shared experience by the people of a nation-state. According to Anderson, nations are imagined because they are not the products of shared language, race or religion. Rather they are created out of imagination and with the help of the technology of print media. "

(D54536612)

The members of even the smallest nation will never know most of their fellow members, meet them, or even hear of them, yet in the minds of each lives the image of their communion...regardless of the actual inequality and exploitation that may prevail in each, the nation is always conceived

of as a deep, horizontal comradeship. Ultimately it is the fraternity that makes it possible, over the past two centuries, for so many millions of people...". This is how nationalism in Europe and America have provided a model for the rest of the world. Rabindranath Tagore on the contrary has never supported the ideal of nationalism. He has also been criticized as an anti-nationalist during his time. For Tagore, the concept of nation is associated with the 'nation-state' and is an instance of the western societies. A nation or as per Tagore can be defined in terms of the political and economic need fulfilment of the people. People of a nation are not bounded by ethnicity, language, religion or the like but through the politics and commerce. A nation in this sense exhibits instrumental rationality to achieve its purpose. Tagore's ideas are a contrast to the existing ideas of nation and nationalism in the 20 th century. Western modernity is able to give rise to the nation-state whereby the state has full regulatory power along with science and technology. Tagore do not support nationalism, as he has taught that the nation would be greater than its people. Tagore observes that NSOU ? CC-SO-04 248 the nation state is selfish, and it is opposed to self-sacrifice. Tagore believes that the nation-state can divide mankind. What is important is to sustain a free spirit, be self- sacrificial and encourage development of the moral and spiritual man. 18.4 Nationalism in India Partha Chatterjee pointed out how nationalist forces started in India since 1885 with the formation of the Indian National Congress. Like other newly independent nation- states of Asia, Africa and Latin America, India too got its gift of nationalism from the western world, i.e., British colonialism. India is a country divided along language, religion, caste and ethnicity. Colonialism had played a major role in cultivating nationalist feelings in India. For Indians, nationalism came into force through the anti-colonial movement. However right after independence, the newly found nation was doomed under the ills of society like poverty, unemployment, illiteracy, corruption and a large population to deal with. Instead of uniting under one nation, the country was divided along language, religion, region and the caste system. Indian Nationalism has always been the narrative of the elites in society and the colonial rulers. It fails to capture the perspectives of the lesser-known subalterns, the peasants, the middle class and others. It also fails to uphold the regional variations and their stories of nationalism. Nationalism has been seen as the power politics of state formation. Nationalism and nation-state are perceived as modern phenomena and creation of modern politics. This nationalism is a problematic concept. Earlier writings of sociology seldom concentrated on nationalism or nation building. However, in between the emergent crisis of communalism and liberalism there have been rising ethnic resurgences in every part of the world which have altered the meaning of nationalism. The ambiguity of nationalism can be gauged from the fact that "nationalism may refer to the doctrine or ideology of an aspiring class or to the political orientation of a state, or to a praiseworthy sentiment of attachment to one's own nation or state...Both as ideology and movement the concept could be used either in speaking of a state or group or ethnic communities or a single ethnic community". Indian nationalism from its very inception was divided along sectarian lines. For instance, the country saw several protests and rebellions by the lower caste groups against the upper castes. The British rule fostered national feelings among the upper caste groups, the Brahmins and the other dwija or twice born castes. On the one hand, the Brahmins and upper castes dominated the nationalist movement and on the

NSOU ? CC-SO-04 249 other hand they were in support of the British Raj for their own personal gains. The dominant cultural groups, namely the upper castes helped create political consciousness. The English educated middle class gradually led to the emergence of the Nationalist movement. Side by side, there were other rebellions, movements and uprisings mostly by the lower caste groups taking shape. With the Indian National Congress taking the charge, the national movement had emerged while all other movements, rebellions and uprisings were merely communal movements. There was also an attempt of homogenizing culture. However, the process of homogenization of culture had a toiling effect on Indian nationalism. Indian nationalism was also a false consciousness so far as the masses were concerned. This was because the Hindu and Muslim dominant groups were battling for their own distinct ideas on nation and claimed exclusivity of their own respective communities. Nationalism at one point had also become nothing but Hindu nationalism. All this started with the revival or reforming Brahmanism through the Brahmo Samaj, Arya Samaj and the Theosophical societies. This too became a part of the national renaissance. The emergence of Hinduism was at once Brahmanical and national because this new avatar of Hinduism also dominated Indian nationalism by developing a pan-Indian character. But acquiring a pan-Indian nationalism was difficult for India because people had to accept that India was composed of several nations, nationalities in terms of cultural groups, castes, communities, tribes and linguistic groups. However, this was unacceptable to the British as well as the upper caste elite nationalists. Effort was made to bring India under one uniform administration. Once India secured independence, the problems of nationalism became more complicated. Communalism had penetrated the subcontinent since the British policy of Divide and Rule. This was further exaggerated by the Nationalist leaders for their own interests. India got divided into India and Pakistan while Kashmir got a special status through the Article 370. Communal violence neither ceased to exist. All this further led to several challenges to Indian nationalism.

18.4.1 Indian Nationalism and its Challenges

The major challenge to Indian nationalism comes from the problems of culture, ethnicity and identity. Indian nationalism faces threat from regionalism, communalism, anti-secularism, fragmented nationalism in terms of ethnic nationalism, tribal nationalism and Hindu nationalism.

18.4.1.1 Regionalism

Regionalism in India is rooted in its rich diversity of linguistic, caste, ethnic and religious groups. Regionalism rises from the feeling of integration with one's own region often fueled out of regional deprivation. Regionalism also comes with strong

NSOU ? CC-SO-04 250 shared collective identities with a particular region. Regionalism has become a major impediment to nationalism in India. It can be seen as a contradiction to nationalism or nationalist feelings. India is culturally diverse. Each region is fragmented in terms of language, religion, ethnicity and culture. The government's futile effort to impose a particular ideology, language or cultural pattern over the people at large comes as a threat to their own regional identity. Ever since independence, ethnic mass mobilisations have been common in the country revolving around the creation of states. In the minority areas, economic, social and political deprivation over accentuates feelings of regionalism against the nationalist feeling. Political parties for their own gains at times concentrate on one particular region. Regional disparities are common among states which undergo uneven pattern of development specially, the BIMARU states of Bihar, Madhya Pradesh, Rajasthan and Uttar Pradesh are the common examples of this case. Of late, India has gone through the worst forms of regional disturbances. Several disparity issues in terms of language and ethnicity have led to separation of states or the demand for separate state. The Khalistan movement has emerged in Punjab as a separatist movement with the demand for a separate autonomous state. There has also been the creation of three new states- Chattisgarh, Jharkhand and Uttaranchal after regional battles. There is also the dispute over Bodoland in the Darjeeling district of West Bengal. Regionalism is anti-national. At times it can give rise to militants and terrorists. Regionalism is therefore a very big threat and challenge to national unity of the nation. Regionalism can lead to separatism or even secessionist movements. Regionalism leads to confrontation with the state whereby a particular region often seeks autonomy from state control at times leading to secession. This happens when regional identity takes over national identity. Separatism is common in regions which are economically or politically deprived and exploited. Such regions feel a sense of detachment from the nation. Regional identity is a big threat to national integrity. In India the state of Jammu and Kashmir was a very big example of separatism. The Jammu and Kashmir Liberation Front has been one of the separatist organizations.

18.4.1.2 Communalism

Communalism has a long history in India since the time of the British rule. The Hindus are the majority religious group while the Muslims are the biggest minority in the country. Communalism means when one religious group consider themselves to be superior vis-a-vis other religious groups. They are also engaged in social, economic, political and cultural conflict with other religious groups. Bipan Chandra categorized communalism as national communalism, liberal communalism and extreme

NSOU ? CC-SO-04 251 communalism. All these three forms could be found in India during its freedom struggle. Communalism also leads to communal politics. Communal politics are often sustained by political parties for their own interest. This again goes against the policy of secularism and democracy. In case of India, there is a rising force of Hindu nationalism whereby nationalism is perceived as a Hindu prerogative. Hindu nationalism had started ever since the nationalist movement which also became the source of national identity. Hindus always perceived the Muslim minorities as outsiders. This simultaneously led to communal tensions and violence between these two religious groups since Indian independence. On the other hand, secularism in India is also complicated enough to make the situation complex. Anti secular forces try to create frenzy among the masses against the state. The popular notion is that Indian secularism is a sham which tries to shield the interest of the minorities at the cost of the majority. Various anti-secular forces have paved the way through democratic ideals and nationalism. 18.4.1.3 Fragmented Nationalism Indian nationalism is of a pluralistic nature and hence fragmented. While the anti- colonial nationalists were focusing on one nation and one culture, nationalism was actually fragmented at the local level. Apart from the larger national identity, in the post-colonial societies a kind of sub nationalism is invoked. This is called cultural nationalism 10 . The minority groups are often threatened by the superiority of the majority population. The nationalist movement itself was seen as an elitist movement which involved only the upper caste, educated, Hindu nationalists. The Muslim leaders also faced discrimination in the hands of the majority Hindu nationalists (The formation of the Muslim League called for a different nationalist struggle). The sectarian trend of nationalist movement can be perceived from Partha Chatterjee's work Nation and its Fragments (1999) which noted how the organized political parties of the anti- colonial movement wanted to replace the colonial state with a bourgeois state while the peasant politics that were on the rise at that time "did not fit into the grid of interests and aggregation of interests that constituted the world of bourgeois representative politics" 11 . Even in post-colonial India, the political leaders chose a fragmented politics and nation building whereby majority and minority communities are divided in terms of primordial identities like language, religion, region and tribes 12 . In today's globalized world the meaning of nationalism is also transforming. People are reverting back to their ethnic roots. Large scale migration across transnational borders have increased fear of the existence of one's own culture and ethnicity in the multi-cultural world. This has also resulted in ethnocentrism and xenophobia. Nationalist sentiments of the people also come under threat. People no longer believe

NSOU ? CC-SO-04 252 in one nation one identity theory. There is increased tension between cultures where national policies centre around the one cultural group while the other groups (minorities) are discontented. In India there is the emergence of Hindi Cultural Nationalism promoted by the RSS. There is an effort to homogenize the masses in a different kind of ethnic (in this case Hindi) nationalism by consumption of cultural products. This also shatters the federal democratic structure of the country. The belief is that India is a nation of the Hindus which in term is a religion of tolerance and hence should be an integral part of the national culture. This type of nationalism shuns the minority Muslim, Sikh and Tribal nationalism. 18.5 Conclusion This chapter has tried to discuss the meaning of nationalism in modern society and its meaning and implications in modern India. There is a lot of ambiguity revolving round the concept of nationalism. It is a major feature of the modern democratic state. But in the post industrialized world nationalism as a concept needs to be revisited. In a country like India the fervour of nationalism often feels like a promulgated idea of the state. 18.6 Summary In contemporary times, nationalism emerges as the most contested ideas. The image of nation-state that becomes prevalent at the advent of modernity, uniting and building solidarity among the people of a state, is changing. Nation-states built around ideas of democratic governance is holding less and less significant today. Simultaneously ethnocentric ideas are on the rise across the world. The welfare concept of the modern state with its nationalist ideals are also dwindling. People are losing their trust on the nation. In case of India, the rise of Hindutva movement in modern times and its mass support is a clear example of the crisis faced by nationalistic idealism. At this critical juncture one needs to re examine the whole gamut of nationalism in the new political, social and cultural space.

NSOU ? CC-SO-04 253 18.7 Questions I. Answer in detail a. Explain the historical development of the idea of nationalism. b. What is meant by nationalism? Discuss briefly the features of nationalism c. How will you explain the growth of nationalism in India? d. What according to you are the various challenges to the idea of nationalism in India? II. Answer briefly a. How has regionalism become a challenge to nationalism in India? Give examples. b. What do you understand by fragmented nationalism? III. Answer very briefly a. What is a nation? b. Who gave the concept of the 'Imagined Community'? c. What is meant by Hindu Nationalism? 18.8 Suggested Readings 1. Aloysius, G. 1997. Nationalism without a Nation in India. Chatterjee, P. 1999. The Nation and its Fragments: Colonial and Post colonial Histories

in The Partha Chatterjee Omnibus. New Delhi. Oxford University Press: 159 12. Ibid. 224 18.10 Glossary Civil Society - It is a community of citizens, a collective entity that exists for specific and limited purposes. Civil society is separate and independent of the State. Citizenship - T.H Marshall in Citizenship and Social Class (1950) defined citizenship as 'full and equal membership in a political community'. It holds the promise of equality and integration within the political community. Communalism - Communalism is a political ideology whereby ones own religious and ethnic community is considered superior to all other minority groups in society. It often promotes intolerance and hatred of one religious group against the other. Democracy - It is a form of government where the common people take part in decision making process through their elected representatives. Democracy is based upon consent of individuals who form the political community. Imagined Community - Imagined community is a concept developed by Benedict Anderson in his book "Imagined Communities: Reflections on the Origin and Spread of Nationalism" (1983) which he used to explain the idea of a nation. Anderson noted that the nation is imagined by the people who share a sense of communion even though they have not seen or met each other. People of a nation imagine belonging to the same collectivity with its history, trait, beliefs and attitudes. Liberalism - Liberalism is a broad political ideology that promotes the ability of people to make meaningful choices whereby the individuals are free from external coercion of the State. Nationalism - It is a broad term, an ideology or a movement that seeks to establish the concept of nation-state. Nation - Nation refers to a united political community who's people share that same cultural, linguistic, ethnic and racial history. Regionalism - It is an ideology or political movement that enhances the causes of a particular region within the nation-state. Regionalism especially in India is often seen as against national integration and challenges the legitimacy of the State. State - State is a political organization which has complete authority over its population within a specific territory and a government. Sovereignty - The theory of sovereignty looks upon the State as an absolute structure of power and authority over its land and people.

Unit 19 Regionalism: Issues and Challenges Structure 19.1 Objectives 19.2 Introduction 19.3 Regionalism: The Meaning 19.3.1 Characteristics of Regionalism 19.3.2 Forms of Regionalism 19.3.3 Dimensions of Regionalism 19.3.4 Causes of Regionalism 19.3.5 Elimination of Regionalism 19.4 Historical Lineage 19.5 Regionalism in India 19.5.1 India after Independence 19.5.2 Regionalism as a sub state movement 19.5.3 Regionalism: Issue of Ethnicity and Language 19.6 Contemporary Debates: Region and Regionalism 19.7 Linkages between Women and Regionalism 19.8 Impact of Region on Women 19.9 Regionalism in Indian Politics 19.10 Conclusion 19.11 Summary 19.12 Questions 19.13 Suggested Readings 19.14 Glossary 19.1 Objectives This unit will help you – ? To understand the linkages between gender relations and regionalism.

NSOU ? CC-SO-04 257 19.2 Introduction Regionalism has been an important feature of Indian politics since the dawn of independence. It has posed a serious threat to the unity of India. Regionalism means love of a particular region.

Regionalism refers to sub-nationalism demanding the preference for a region as against the country as a whole. 19.3 Regionalism: The Meaning Regionalism is the extreme loyalty and love shown to a particular region. It expresses itself in such a distorted notion like development of one's own region even at the cost of interests of other regions and people, and unwillingness to allow people from other regions to work and settle in region. Regionalism militates against nationalism and delays the process of national integration. This may be characterized by the commonness of cultural, linguistic or historical and social background. According to Marachell E. Dimock, regionalism is a clustering of environment, economic, social and governmental factors to such an extent that an identity within the whole, a need for autonomous planning, a manifestation of cultural peculiarities and a desire for administrative freedom, are theoretically recognized and actually put into effect. Regionalism can be seen as an ideology that seeks to advance the causes of regions. But it is necessary, at the very outset, to distinguish two quite different meanings of the term regionalism. At the international level, regionalism refers to transnational cooperation to achieve a common goal or resolve a shared problem or it refers to a group of three countries, such as western Europe, the western Balkans, or southeast Asia, that are linked by geography, history or economic features. Used in this sense, regionalism refers to reinforce the links between these countries. Today, the foremost example of such an attempt is the European Union (EU) (Bevir, 2009). To some scholars, regionalism in Indian politics in generally has been regarded as something that is anti-system, anti-federal and against basic interest of a well-integrated polity (Reddy and Sharma, 1979). 19.3.1 Characteristics of Regionalism 1. Regionalism is a psychic phenomenon. 2. It is built around as an expression of group identity, as well as loyalty to the region. 3. It presupposes the concept of development of one's own region without taking into consideration the interest of another region. 4. It prohibits people from other regions to be benefitted by a particular region.

NSOU ? CC-SO-04 258 19.3.2 Forms of Regionalism Regionalism in India has assumed various forms like: (a) Demand for State Autonomy: Regionalism has often led to the demand by states for greater autonomy from the centre. Increasing interference by the centre in the affairs of the states has led to regional feelings. Demand for autonomy has also been raised by regions within some states of the Indian federation. (b) Secession from the Union: This is a dangerous form of regionalism. It emerges when states demand separation from the centre and try to establish an independent identity of their own. Disputes between states over the sharing of river water, primacy given by the states to the language of majority and to people of their own states in job opportunities have also given rise to feelings of regionalism. Migration of people from backward state to a developed state for employment opportunities have often resulted in a hostile attitude against the migrants for example, problems going on in Karnataka and Andhra Pradesh. 19.3.3 Dimensions of Regionalism Regionalism in India may be viewed from two dimensions – positive and negative. In positive terms regionalism embodies a quest for self-identity and self-fulfilment on the part of two domiciles of a region. In negative terms, regionalism reflects a psyche of relative deprivation on the part of people of an area not always viable in terms of national economic analysis. It implies excessive attachment to one's region or the preference for their country or the state. In the positive sense it is a political attribute associated with people's love for their region, culture, language, etc., with a view to maintain their independent identity. While positive regionalism is a welcome thing in so far maintaining as it encourages the people to develop a sense of brotherhood and commonness on the basis of common language, religion or historical background, the negative sense regionalism is a great threat to the unity and integrity of the country. In the Indian context generally the term regionalism has been used in the negative sense. The feelings of regionalism may arise either due to the continuous neglect of a particular area or region by the ruling authorities or it may spring up as a result of increasing political awareness of backward people that have been discriminated against. Quite often some political leaders encourage the feelings of regionalism to maintain their hold over a particular area or group of people.

NSOU ? CC-SO-04 259 19.3.4 Causes of Regionalism There are several causes of regionalism in India. These causes are discussed below. 1. Geographical Cause: Linguistic distribution along geographical boundaries and isolated settlement pattern induce in people the concept of regionalism. Sometimes people live, in such area which appears as a separate region cut off from the rest of the country and thereby may give rise to feelings of separatism among the inhabitants of the region. 2. Historical Causes: Due to historical reasons people believe that they are separate from the rest. A feeling of regionalism may develop among the people of a particular region if they believe that they have been politically dominated by the people of other regions. 3. Economic factors: Uneven economic development in different parts of the country may be considered as the prime reason for regionalism and separatism. There are certain regions which are economically more developed. But there are certain regions which are economically backward even after Independence. No effort has been made for regional balance in matters of industrial, agricultural and above all, economic development. This disparity has caused the feeling of relative deprivation and thereby the demand for separate states, for example, Bodoland and Telangana recently have been formed on this principle. 4. Political and Administrative Factors: Political parties, particularly regional parties and local leaders exploit the regional sentiments to capture power. They give emphasis on regional problems in their election manifesto and promise for regional development. This has resulted in the feeling of regionalism. The regional parties like DMK, AIADMK in Tamil Nadu and Telugu Desam in Andhra Pradesh were formed in this basis of principle. 19.3.5 Elimination of Regionalism Regionalism may be a product of cultural and social differences. Following suggestions may be given for the elimination of regionalism. 1. Development of Transport and Communication Transport and communication network should be improved so that people of a region may find it easier to visit other regions and develop friendly relations with people therein. 2. Removal of Regional Imbalance Uneven economic development with regional imbalance has been the main cause of disgruntlement among the people of a particular region for regionalism. Hence,

NSOU ? CC-SO-04 260 effort should be made to distribute the national resources in a planned manner to mitigate the problem of regionalism. 3. Economic Development of Deprived Regions Top priority is to be given on economic development of those regions where people have developed the feeling of relative deprivation. So that they can be drawn into the national mainstream. 4. Acculturation The cultural distinctiveness of regional groups delimit the interaction between- different groups. Frequent cultural contacts should be promoted to break the regional barriers and to develop the nationalist spirit. 5. Abolition of Regional Parties The regional parties which play a dirty role in exploiting the regional feelings of the people should be banned. 6. Proper Education Education can play an important role for the promotion of national integration. It may be construed as a powerful agent for doing away with the separatist tendencies among the countrymen. 7. Appeal through Mass-Media Mass media, particularly electronic media are powerful agents of social change. Hence, extensive effort should be made to encourage feelings of nationalism among the people through mass media communication. 19.4 Historical Lineage Pre-independent India was a land with fragmented regions that possessed autonomy in different degree. British colonizers re-structured those regions for colonial exploitation. At the same time, privileged sections of the population responded to British colonialism in two ways. On the one hand, they adopted colonial modernity for their upward mobility. On the other hand, they questioned the colonial onslaught on their region. Thus, the notion of region in India during the period of colonialism and post-independent state was a skewed one. Regional culture persisted in a dynamic fashion even after the formation of India. In other words, various strata of people in India associated themselves with their regional cultures. At the same time, they were governed by the nation at large. Thus, the regional cultures shaped the consciousness of plural and unequal masses who were scattered throughout the country.

NSOU ? CC-SO-04 261 19.5 Regionalism in India Regionalism as a phenomenon in the Indian political system is not new. Regionalism has remained perhaps the most potent force in Indian politics ever since 1947, if not before. Regionalism is rooted in India's manifold diversity of languages, cultures, tribes, communities, religions and so on, and encouraged by the regional concentration of those identity markers, and fuelled by a sense of regional deprivation. For many centuries, India remained the land of many lands, regions, cultures and traditions. The basic point that highlights in this respect is that internal self-determination of community, whether linguistic, tribal, religious, regional, or their combinations, has remained the principal form in which regionalism in India has sought to express itself, historically as well as contemporaneously. In the pre-independence period, it was applied by the British imperialist, as they intentionally encouraged the people of various regions to think in terms of their region rather than the nation as a whole, with an aim to maintain their hold over India during the national movement.

19.5.1 India after Independence The following two processes were initiated at the dawn of Independence in India by the national leaders.

1. Integration of the country: All parts of the country were not equally integrated by the Britishers. The national leadership took effective steps to integrate the following in the national mainstream:
 - a) The Princely states were brought under unified constitutional framework. The people of these states were no more subjected to the autocratic excesses and the tyrannies of their rulers.
 - b) Uniform administration was gradually extended throughout the country. This was not so during the British days when a very large area of the country remained either non-administered or partially administered.
2. The entire country was uniformly democratized. This brought a change in the quality of life of the people of the Princely states of this country. (Kumar, 1998).

19.5.2 Regionalism as a Sub- State Movement On the contrary, in its positive sense, regionalism implies an idea of searching the self-identity of the people of that particular area. In other sense, it is rather a separate demand for protecting and preserving racial, linguistic and economic interest of a group of people belonging to a nation. To be precise, regionalism is in fact, a movement of a sub-nationality against a prevailing nationality. It is often distinguished by a particular racial, linguistic or religious group settled in a particular part of the country which demands either separation or sovereignty of special constitutional, administrative,

NSOU ? CC-SO-04 262 economic or political status for themselves to the exclusion of the rights and interest of other communities and takes recourse to necessary political measures with a view to coercing the authorities accede to their demands, then that movement is certainly a regionalist movement. Hence, regionalism is the other name of distinctive and restrictive political movement having no broad based liberal and democratic elements but, in some cases, it also had a clear objective of attaining separate statehood, as in the case of Gorkhaland and Telangana. The regional movement is also considered as the 'diverse trend detrimental to national unity'. Regionalism is thus a movement against social, political and economic deprivations and it is also a movement against the hegemonic groups who are dominant in the mainstream of the country as a whole. It is important to note that regionalism in India, in its present form, has various connotations like 'provincialism' (Pratt and Sullivan, 2009), 'localism' (Salloukh and Brynen, 2004), 'son of the soil theory' (Weiner, 1978), 'disintegration of Indian states' (Wadhawan, 1997), struggle for separate statehood or provincial autonomy (Bhattacharjee, 2018), struggle for more power, especially economic power etc., whatever may be the connotations, the concept of regionalism has now become a separatist movement in different parts of India in various forms. India is now infected with regional upsurge of different kinds like geographical regionalism, linguistic regionalism, cultural regionalism, ethnic regionalism and so on.

19.5.3 Regionalism: Issue of Ethnicity and Language The term 'ethnic' in general can be understood as

80%

MATCHING BLOCK 130/133

W

a group of people who share a common culture and life style but

without any homeland.

65%

MATCHING BLOCK 133/133

SA

SYBA SOC PAPER - II.pdf (D111235031)

An ethnic group is characterized by a multiplicity of attributes like religion, caste, region, descent, race,

language, colour, culture and so on. The focus of interests of an ethnic group is to get some benefits for itself. The group often uses ethnic criteria like religion, language or caste to mobilize itself to give identity which separates it from other group or groups. There are different approaches used by different social scientists to understand the nature of ethnicity as a factor in human life and society. Examples of such approaches are: primordialism, essentialism, perennialism, constructivism, modernism and instrumentalism. According to Lake and Rothschild (1996) ethnic conflict is a sign of a weak state or a state embroiled in ancient loyalties. In this case, states act with bias to favour a particular ethnic group or region. Therefore, in critical or difficult political situations, the effectiveness of governance is dependent on its ability to address social issues and human needs. The continuing demand for separate state in India as argued by T.K Oommen is due to two reasons. First, even though the Indian state is conceived as a multi layered entity- a union/federal, provincial or autonomous regions, Zila parishad panchayat NSOU ? CC-SO-04 263 hardly any authority gives to the lower three level. This prompts a demand for provincial state by regional linguistic communities, ignoring their population, size and financial viability. Second, the cultural specificity of subaltern communities is not only ignored but sought to be destroyed through their attachment to the state dominated major linguistic communities which results in the former's marginalization and alienation. He also points out that the failure of the states in India to link culture and governance systematically provides an important agenda for the society. Moreover, the recognition of language as the basis for politico administrative units has attended to the deprivation of most of the speech communities. (Oommen, 2004) 19.6 Contemporary Debates: Region and Regionalism The existence of relative deprivation is one of the most important aspects in constructing the argument for regionalism. For instance, if the people from any particular region feel that they are more deprived than others in terms of distribution of resources, infrastructures and so on, then it may create regional affiliation. For example, Gorkha Nationalist Liberation Forum (GNLF) started its movement in Darjeeling. In the view of GNLF, Darjeeling was the most underdeveloped region in comparison to the southern part of West Bengal. This sort of sentiment to have a separate region is often manipulated by the community leaders according to their vested interests and ideological inclinations. The second significant factor for the emergence of regionalism is the issue of language and culture. Every individual's identity is based on the categories of language and culture which, once politicized, play an important role in the formation of region. According to Edward Sapir, language plays a vital role in the creation and determination of a region. Thus, the idea of region has to be explored in the context of language debates. Language is defined as the "human and non- instinctive modes of communicating ideas, feelings and desires by a system of voluntarily produced symbols" (Sapir,1921). Consequently, the need for a region is linked to a population who converse in a particular language. Simultaneously, this premise of a particular language excludes those communities that do not deploy that language for communication (Aloysius, 2007). After Independence, the first Prime Minister, Jawaharlal Nehru established the State Reorganization Committee which was amended in 1956. Paul Brass argued that it was done according to the traditional linguistic regions. For instance, current states of Gujarat and Maharashtra were formed after the bifurcation of Bombay in 1960(Brass, 1999). State formation on the basis of language gave rise to some conflicts. For instance, the Tamil revolted against the Hindi belt showed the conflict related to languages. It was argued that language determined the assertions and struggle related to knowledge.

NSOU ? CC-SO-04 264 19.7 Linkages Between Women and Regionalism The issues of region and regionalism have wider linkages with gender and particularly, women. But, the role of women in relationship to region and regionalism remains invisible. In fact, women's participation is seldom recognized by institutions such as state, political parties and so on due to patriarchal modes of operation in several forms. For instance, the formations of separate states such as Maharashtra, Gujarat, Chhattisgarh and Jharkhand have had various political wings of women. In the recent Telangana movement in which women are protesting against the central government for a separate Telangana state from Andhra Pradesh, the participation of women is often ignored. The movement began under the banner of Chhattisgarh Mines Shramik Sangh (CMSS) which was a trade union of manual mine workers. However, this movement was conceived during the emergency period in 1977. Trade unions emerged in Bengal Nagpur Cotton Mills at Rajnandgaon. There were other upsurges of trade unions during the same period i.e., 1984-1987. A family from Rajnandagoan owned the mill and they deployed Goondas to regulate the labourers. Goondas were even part of the core management activities related to the mills, as well as part of the newly introduced scheme for workers. Unrest of workers emerged in the form of the central trade union for Dalli Rajhara mine workers. Thus, they approached this union, known as 'Lal Hara' (Red Green), which came under Rajnandgaon Mazdoor Sangh. After the foundation of Bhilai Steel Plant, Durg and Raipur were transformed into an industrial hub. Industrial units at Jamul (Bhilai), Urala and Siltara (Raipur), Sarkanda (Bilaspur), Tedesara (Rajnandgaon) which were part of Raipur Industrial Development (RIDA) were already appropriated into this region. Consequentially, it became a part of M.P. Industrial Development Corporation or Audyogik Kendra Vikas Nigam (AKVN). This particular region witnessed the formation of different industry. This growth was related to the incentives that were provided to Raipur Industrial Development Area. It was argued that the major part of industrialization happened in privatized fields except public sector Bhilai Steel Plant. It had been contended that a parallel trend was the exploitation of workers through the violation of constitutional and statutory rights. Industrialization accelerated the profit and pauperized the workers and resources. More workers got affiliated to the Lal Hara trade union and it resulted in increase in its membership. Workers who suffered from the inhuman policies and activities of the industries found the aforementioned union as a platform to raise their voices. The Lal Hara trade union had different off shoots such as Pragatisheel Engineering Shramik Sangh (PESS), Chattisgarh Mill Mazdoor Sangh and Chattisgarh Shramik Sangh.

NSOU ? CC-SO-04 265 Chattisgarh Mukti Morcha which were related to rural assertions in its earlier phase. Later, it was merged with diverse unions under Red Green Platform. Industrialists and repressive state apparatus declared their solidarity to crush the assertions of workers. Leader of the movement Shankar Guha Niyogi, was assassinated during this period. Police killed 16 protesting workers in the year 1992. Some of the leaders were subjected to physical attack. Mahila Mukti Morcha was always the main aspect of Chhattisgarh Mine Shramik Sangh. In the Dalli Rajhara, where the CMSS was its origin, women formed half of the workforce. CMSS participated in the united struggle and the first strike of which was held in 1977. Women lived under gruesome conditions in Dalli Rajhara. Women faced sexual harassment from the lumpen elements of that area. Majority of women who were sexually harassed belonged to the working class. However, women resisted such forms of exploitation. Women who were part of CMSS regions and regionalism pursued legal action against CISF jawans who raped a tribal girl. It was argued that Mahila Mukti Morcha emerged during that period (1980-81). It addressed the problems which women faced such as wife-beating, problems related to marriage, sexual harassment of women and so on. These political activities were instrumental in creating political consciousness among women. Thus, women achieved a separate platform to raise different forms of marginalities faced by them. Hence their engagement with Mahila Mukti Morcha created competencies for articulation and leadership for women. Mahila Mukti Morcha operated in the informal living places of the contractual workers and unorganized workers at Dalli Rajhara. Women started antiliquor agitation. They picketed liquor shops and identified drunken revellers from their area. Women also demanded their rights from the administration. They demanded separate toilets for women. They also urged the authorities to take action against the disobedient men who harassed women in the cinema halls. Activists of Mahila Mukti Morcha created consciousness among women at large. Thus, they mobilized many women and empowered them. Women started participating in demonstrations due to constant efforts of those activists. They conducted elections, public programmes which attracted most of the women. Large membership was a salient feature of the Mahila Mukti Morcha.

19.8 Impact of Region on Women The social development of a particular region affects the gender relations of that region. For instance, women are socially mobile in places such as Kerala. Development in Kerala is linked to the history of the social movements. In other words, the

NSOU ? CC-SO-04 266 movements collectively resisted oppression based on caste, gender and class which led to the upward social mobility of women in Kerala. On the other hand, states such as Bihar, Rajasthan, Madhya Pradesh are backward in terms of development. This is reflected in the gender indices of these states. Women still undergo different forms of oppression. 'Secession' also determines the status of women. For instance, the claims for a separate Kashmir are raised by different political groups, and by Kashmiri militants. Muslim women from Kashmir who have demanded a separate Kashmir are mobilized by the sub-regionalist/extremist politics which act as a threat to the Indian nation. Women in Kashmir are caught in the internal patriarchy of their community, bound by religion and external military apparatus. Women have raised their voice against the military apparatus as well as the impact of militancy on their lives. For instance, the rape of women which took place at Shopian showed the brutal oppression which is determined by patriarchal military apparatus, and against which many women have spoken up.

19.9 Regionalism in Indian Politics

Regionalism in Indian politics is a uniquely powerful experience, and to understand it properly we have to recognize the important factors behind it. Geographic isolation is considered as one of the important factors. India is a very large country, but it's also a country where a lot of infrastructure is still in the process of being developed. This means that some states and communities within India are isolated from major political centres. Till transportation and communication technologies have failed to connect these communities with the rest of Indian society, the people here tend to have very strong regional identities. The nation is a pretty vague concept to many of them. India has struggled with unequal development. While some Indian cities and states contain world-class industrial and technological centres, others are still remote, rural, and relying on outdated technologies. People's lives are different and the amount of progress is different, so regional disparities are very common. Regionalism in India is based on the history of cultural segregation. Indian society has a long history of organizing people into castes, and when large numbers of people in the same caste live in the same area, they can develop a regional sense of belonging, especially if they feel excluded from the rest of the nation. This same phenomenon is true of religious, ethnic, and linguistic minority groups in India as well. Finally, India's regionalism likely reflects discontentment and distrust with national politics. For people who feel like their communities or states are marginalized, ignored,

NSOU ? CC-SO-04 267 or developed unequally, they have to trust on national political leaders, national political parties, and national politics in general. In Indian states where regionalism is strongest, state politics are dominated by regional political parties. These political parties are generally found in that state, only deal with issues of that state, and advocate for the state to find its own solutions to political problems rather than dealing with the national government. These regional political parties have existed since Indian independence (and before), but since the 1970s they've grown continually in prominence and influence. Today, some states in India are almost entirely represented by regional political parties both at the state level and within the Indian parliament. This is especially true in the Lok Sabha (the lower house of India's parliament), where regional political parties seem to be gaining more seats every year. Not only are they gaining more seats, but they're often taking those seats from India's preeminent national political party, the Indian National Congress. This is the same party that supported both Gandhi and Nehru, the foundational figures of Indian independence and national identity. So, the rejection of the Indian National Congress by people in states progressing pro-regionalism is significant.

19.10 Conclusion

We can conclude that regionalism is triggered by following factors:

- (a) Low rate of economic growth** The economic growth of India has been fluctuating since independence. But with respect to high population growth, the economic growth has been not enough to catch the development with full speed. In the last decade, the economic growth was progressive, but now they are reeling under the influence of world economic crisis and other bottlenecks at domestic level.
- (b) Socio-economic and political organisation of states** The states have been unable to do the adequate land reforms and the feudal mentality still persists. Bhoodan and Gramdaan movements, after independence, have not enthusiastically carried out and even land under land banks are not efficiently functional. The political activities in the backward states are limited to vote bank politics and scams.
- (c) Lower level of infrastructural facilities in backward states** The level of infrastructural development, such as power distribution, irrigation facilities, roads, modern markets for agricultural production has been at back stage. All these are state list subjects.

NSOU ? CC-SO-04 268 (d) Low level of social expenditure by states on education, health and sanitation The states which have invested heavily on education, health, and sanitation fall under the developed and advanced states. For example Tamil Nadu can be cited for better health care services and their. Primary health centre is bench mark for other states. (e) Political and administration failure Political and administrative failure often creates source of tension and gives birth to sub-regional movements for separate states. Jharkhand, Chattisgarh, Uttrakhand and recently Telangana are under the resultant effects of these failures only. Many such demands are in pipeline such as- Vidarbha, Saurashtra, Darjeeling and Bodoland, etc. These failures also weaken the confidence of private concerns and do not attract the states. 19.11

Summary This unit discusses at length the definitions, conceptual clarifications and scope of regionalism. It also discusses the various dimensions, characteristics and causes of widespread regionalism as well as its historical legacies. The unit has also examined the post- independent situations of regionalism as well as the present debate enveloping it. Feminists' dimensions of regionalism and its impact on the women have also taken into consideration. Emphasis has also been given to see the link between regionalism and the Indian polity as well as the possibilities for regional disparities to subsist in the present world 19.12 Questions Answer briefly: 1. What are the characteristics of regionalism? 2. What are the forms of regionalism? 3. Write short note on regionalism on the basis of ethnicity and language. 4. Why regional disparity still persists? Answer in detail: 1. What are the causes of regionalism? 2. Write a short note on elimination of regionalism. 3. Write a note on contemporary debates related to region and regionalism.

NSOU ? CC-SO-04 269 4. Regionalism as a sub state movement – Explain. Essay Type Question: 1. Write a note on regionalism in India. 2. Explain the historical lineages of region and how you can relate it to women and regionalism. 3. Critically analyse the relationship between region, regionalism and women. 4. Write a note on regionalism in Indian politics. 19.13 Suggested Readings Aloysious, G. (2007). From Regions to Regionalisms. Hyderabad: University of Hyderabad. Bhattacharjee, D. (2018). NSOU ? CC-SO-04 270 19.14 Glossary Acculturation - Acculturation is a process of social, psychological, and cultural change that stems from the balancing of two cultures while adapting to the prevailing culture of the society. Acculturation is a process in which an individual adopts, acquires and adjusts to a new cultural environment as a result of being placed into a new culture, or when another culture is brought to you. Individuals of a differing culture try to incorporate themselves into the new more prevalent culture by participating in aspects of the more prevalent culture, such as their traditions, but still hold onto their original cultural values and traditions. The effects of acculturation can be seen at multiple levels in both the devotee of the prevailing culture and those who are assimilating into the culture. Ethnic Conflict - An ethnic conflict is a conflict between two or more contending ethnic groups. While the source of the conflict may be political, social, economic or religious, the individuals in conflict must expressly fight for their ethnic group's position within society. This final criterion differentiates ethnic conflict from other forms of struggle. Provincialism - Provincialism is a characteristic behaviour arising from narrowness of mind or outlook. It showcases a kind of orientation or attitude characteristic of a provincial. It refers to the excessive attention to the affairs of one's province rather than the whole nation. .

Unit 20 Terrorism : Causes and Consequences Structure 20.1 Objectives 20.2 Introduction 20.3 Terrorism : The Meaning 20.3.1 Characteristics of Terrorism 20.3.2 Forms of Terrorism 20.3.3 Dimensions of Terrorism 20.3.4 Causes of Terrorism 20.3.5 Consequences of Terrorism 20.4 Terrorism and Social Ethics 20.5 Politics and Terrorism 20.6 Sociology of Terrorism 20.7 Conclusion 20.8 Summary 20.9 Questions 20.10 Suggested Readings 20.1 Objectives This unit will help you to explain – ? Concept and characteristics of terrorism. ? History of terrorism. ? Causes, consequences and forms of terrorism. ? The impact of terrorism on human rights. 20.2 Introduction Terrorism is an international problem but India is the most affected country due to terrorism and terrorism related activities such as insurgency, civil war, guerrilla war, intimidation and extremism in various parts of the country.

NSOU ? CC-SO-04 272 Terrorism is a problem faced by India for more than two decades. Earlier, India has been faced with the problems of insurgency in northeast India while dealing with the Naga and the Mizo rebels and the terrorism of the Naxalites in Bengal. Today, terrorism is perceived as a problem capable of destabilizing not only national but also international politics. Terrorism in recent times has affected both the developed and the developing countries.

20.3 Terrorism: The Meaning The Oxford Advanced Dictionary defines terrorism as the use of violent action in order to achieve political aims or to force a government to act. The Encyclopaedia Britannica describes terrorism as the systematic use of terror or unpredictable violence against governments, public or individuals, to attain a political objective. It can be broadly defined as violent behaviour designed to generate fear in the community or a substantial segment of it for political purpose. It is the use of violence on the part of non-governmental groups to achieve political ends. According to the Encyclopaedia of Social Sciences, terrorism is a method whereby an organized group or party seeks to achieve its vowed aims chiefly through the systematic use of violence.

20.3.1 Characteristics of Terrorism Terrorism is characterised by a technique of perpetrating random and brutal intimidation, coercion or destruction of human lives and property, and used intentionally by subnational groups operating under varying degrees of stress, to obtain realistic or illusory goals. The main characteristics of terrorism are: 1. It is against the state or community. 2. It has a political purpose. 3. It is illegal and unlawful. 4. It aims at intimidating and creating impact of fear and panic not only for the victim but also for the people at large, caused for the purpose of coercing or subduing. 5. It is accompanied by a feeling of impotence and helplessness on the part of the masses. 6. It stops rational thinking. 7. It leads to reaction of fight or flight, and 8. It contains arbitrariness in violence as victims' selection is random or indiscriminate (Sharma, 2008).

NSOU ? CC-SO-04 273 20.3.2 Forms of Terrorism According to the National Advisory Committee on Criminal Justice Standards and Goals, there are six distinct types of terrorism. All of them share the common traits of being violent acts that destroy property, invoke fear and attempt to harm the lives of civilians.

1. Civil Disorder It is sometimes a violent form of protest held by a group of individuals, usually in opposition to a political policy or action. They are intended to send a message to a political group that "the people" are unhappy and demand change. The protests are intended to be non-violent, but they do sometimes result in large riots in which private property is destroyed and civilians are injured or killed.
2. Political Terrorism It is used by one political faction to intimidate another. Although government leaders are the ones who are intended to receive the ultimate message, it is the citizens who are targeted with violent attacks.
3. Non-political Terrorism It is a terrorist act perpetrated by a group for any other purpose, most often of a religious nature. The desired goal is something other than a political objective, but the tactics involved are the same.
4. Quasi terrorism It is a violent act that utilizes the same methods terrorists employ, but does not have the same motivating factors. Cases like this usually involve an armed criminal who is trying to escape the law enforcement, utilizing civilians as hostages to help them escape. The law breaker is acting in a similar manner as a terrorist, but terrorism is not the goal.
5. Limited Political Terrorism These are generally one-time only plots to make a political or ideological statement. The goal is not to overthrow the government, but to protest a governmental policy or action.
6. State Terrorism It defines any violent action initiated by an existing government to achieve a particular goal. Most often this goal involves a conflict with another country.

Every type of terrorism utilizes distinct methods of violence to get their message across. They can be anything from weapons or explosive devices to toxic

NSOU ? CC-SO-04 274 chemicals that are released into the air. These attacks may occur at any time or place, which makes them an extremely effective method of instilling terror and uncertainty into the general public.

20.3.3 Dimensions of Terrorism

Terrorism has been perceived by different scholars with different dimensions. We may identify four such dimensions: historical, political, sociological and legal.

Historical Dimension : It focuses on the origin, development and qualitative changes in different phases in terrorism. Baljit Singh is one scholar who has used this approach to analyse terrorism.

Political Dimension : It perceives political terrorism as a political violence movement organised by an organised political group either at a national or at international level.

Legal Dimension : It concentrates on state laws as well as international laws for cooperation among various states in dealing with international terrorism.

Sociological Dimension : In analysing terrorism from the perspective of sociological dimension, Jordan Paust focuses on: i) the types of participants engaged in terrorism as terrorists, targets, victims and so forth, ii) the objectives of the participants, iii) the situations of actual interaction, iv) the type of resources at the disposal of each type of participant, v) the strategies of terror utilised and, vi) the outcome of the terroristic process.

20.3.4 Causes of Terrorism

Terrorism has several causes which can be related to social, historical, cultural, religious, economic, and psychological aspects. The following could be seen as some of the causes of terrorism:

The Reality of Persistent Disputes: Terrorism has its breeding ground in conflicts. Reasons for conflicts, however, can vary widely. Basically, it is the differences in objectives and ideologies that show the way to conflict. Some of the historical examples to this effect are: dominance of territory or resources by various ethnic, linguistic, religious or cultural groups; aspiration for freedom from foreign regimes; imposition of a particular form of government, such as democracy, theocracy, oligarchy, or dictatorship; economic deprivation of a population; and real or perceived instances of injustices.

Dearth of Reasonable Redressal Procedure: The absence of a systematic and proper redressal system can cause continuous terrorist activities. If such a system exists, people will have to take recourse to it in order to solve conflicting situations. When such systems are not available due to their nonexistence, sloth, corruption or NSOU ? CC-SO-04 275 unaffordable cost, the socially and culturally wounded people will get tempted to seek solution by themselves. Terrorist activities thus can arise from a sense of denial of lawful rights of a certain group of people, which they have been demanding determinedly.

Weakness of the Distressed People : When there are violent discords coupled with the absence of a genuine redressal system, there could be attempts to find solutions to the problems by force. This could result in various kinds of organized violence like communal riots and war. However, violence takes an ugly form through terrorism when the distressed people realize their inability to influence the dominator, due to their weakness. In such a situation, they are unable to face the oppressive forces face to face or in a direct manner. Therefore, they go underground and fight for their cause.

Misguidance : When children and youth are not brought up responsibly by their parents or guardians, there is a high risk for them to get involved with violent groups or militancy. There are groups with vested interest who indoctrinate young minds to take up arms to light for their causes which are sometimes fabricated. Often, an ideology of hatred in the name of religion, ethnic loyalty or nationalism is injected into the minds of people. These youngsters are trained to cause destruction and are armed with deadly weapons. Their misguidance becomes complete when they are taught to regard the death and destruction of their enemies as a glorious achievement and their own possible death in the process as a case of heroic martyrdom.

Influence of the Mass Media : Mass media are showing keen interest in terrorism and in the issues related to it. We find radio stations, television channels, newspapers, and Web pages often discussing this subject. These broadcasts reach a large section of people in the world, especially those in the west and intensify the fear that the threat of terrorism generates. The terrorists make use of this effect of the media, thus turning them into an unwilling ally. The wide coverage given in the media motivates a terrorist organization to go ahead with their plans, since they know for sure that their action will be made known to the whole world and thus draw greater attention to the cause. Often, the live coverage of the terrorist activity helps the perpetrators of violence to get away from the site of the violence in an easy manner. In such cases, the mass media can become an unwilling ally of terrorism.

Democratic State : Though it is opined by researchers that democratic nations are generally less vulnerable to terrorism; however, they too are not free from terrorist activities. There is a complex relationship between terrorism and democracy. Though in one sense democracy diminishes the risk of terrorism by undercutting some of its reasons, in another sense it often contributes to its prevalence. The open nature of

NSOU ? CC-SO-04 276 democratic societies makes them vulnerable to terrorism. In such societies, civil liberties are protected, and government control and constant surveillance of the people and their activities are kept to the minimum. Taking advantage of such restraints by the government, terrorists have stepped up their activities. Studies done on the relationship between liberal societies and terrorism suggest that concessions awarded to terrorists have increased the frequency of terrorist attacks. By contrast, repressive societies, where the government closely monitors citizens and restricts their speech and movement, have often provided more difficult environments for terrorists. It should also be noted that in democratic societies, the risk of terrorism is compounded if the law enforcement is slow or inefficient. In such democracies, the aggrieved people, having lost faith in the ability of the legal system of the country to deliver justice, are seen to take law into their own hands, and if they are weak, they do it clandestinely. Globalization : It can be said that globalization, though not a direct cause of terrorism, it can often contribute to the menace of terrorism. The situation brought about by the linkage, even fusion, around the world of communications and financial systems has contributed to the promotion of global terrorism. Again, new communications such as the Internet and satellite phones have made it possible for the extremist terrorist and political organizations to build large organizational networks, exchange information, and combine resources. Psychological Factors : Many psychologists believe that the key to understand terrorism lies in understanding people. According to this perspective, terrorism is purely the result of psychological forces, not a well-thought-out strategy aimed at achieving rational, strategic ends. Therefore, psychologists emphasize the study of the mind of the terrorists. Accordingly, various attempts have been made to gain knowledge of the hidden psychic dynamism which incites a person to perform such acts without any qualm of conscience. There is another psychological view which says that the terrorists are normal individuals, who due to their deep emotional need and a high order of motivation on the grounds of nationalism or religious sentiment forces him to take up the path of violence. Another reason for taking up terrorism could be seen due to the desire to overcome loneliness. They claim that many terrorists are people who have been rejected in some fashion by society and tend to be loners. Since it is in human nature to be part of a group, an alienated loner is naturally drawn towards any group that will accept him, give him a sense of mission, and provide him the ways and means of accomplishing it, along with monetary gains too (Kaippananickal, 2017).

NSOU ? CC-SO-04 277 20.3.5 Consequences of Terrorism The causes of the growing terrorism in a state are many. Mostly the terrorists are motivated by religious and political consideration, but there are also economic factors. Environmental Consequences : Terrorist activities can paralyze the entire cosmos with its vulnerable activities. It can be said that every terrorist attack is a way of demeaning the entire universe. The cosmos, which is the habitat of life, is dishonoured into a place of death and doom. The very fact that a human being is a cosmic reality, he/she is automatically dehumanized in the wake of every terrorist activity. Anything that is done against the cosmic reality is going to affect all the living and non-living beings of the universe. Sowing the seeds of disorder, disharmony and discontent has turned to be the work of a number of psychosomatics. Political Consequences : Terrorism builds up both direct and indirect pressure on the government to weaken it physically and psychologically. The function of terror can also be to discourage the people from cooperating with or giving information to the government. The deepest anxiety amongst ordinary people arises when they fear a collapse of law and order. Terrorism works towards a collapse of the social order and terrorists exploit this situation by trying to project them as a better alternative. In this state of fear and anxiety the essential services may not function properly. Terrorism grows out of political anarchy. Terror incorporates two facets: first, a state of fear or anxiety within an individual or a group and second, the tool that induces the state of fear. Thus, terror involves the threat or use of symbolic violent acts aimed at influencing political behaviour. Following World War II, political terrorism reemerged on the international scene. During the 1960s, political terrorism appeared to have entered into another phase. Perhaps the two most significant qualitative changes were: first, its transnational character and second, its emergence as a self-sufficient strategy, namely, operating independently of the larger political arena. Political terrorism occurs as the result of a conscious decision by ideologically inspired groups to strike back at what their members may perceive as unjust within a given society or polity. The answers to contemporary political terrorism, therefore, would have to be found within this larger social, economic, political, and psychological context. Economic Consequences : Terrorism aims at maximizing economic impact in the world at large. The destruction of the twin-towers on that Tuesday of 11th September, 2001 has caused much confusion and disarray in the global economic scenario. Since each act of terrorism is designed in such a way as to have an impact on the larger audience, its reverberations and after effects are largely seen in the economic area. Nations and government machineries are forced to equip themselves with latest

NSOU ? CC-SO-04 278 technologies to combat the network of terrorism. All those involve the bifurcation of national funds which could be made use of other purposes. Terrorism, in other words, deteriorates the economy of a nation. The economy of a nation does not include its financial conditions alone. It deals with all forms of wealth such as human resource, natural resource, intellectual power, aesthetic power, creative power, money-power and so on. Therefore, economic consequences of terrorism affect all forms of wealth without which human life would be impossible. 20.4 Terrorism and Social Ethics Where appropriate, issues relevant to counter-terrorism will be considered in this section, with a more extensive discussion in the following section. The ethical questions of interest which will be discussed include the following: ? Ethical issues related to the commission of terrorist acts, including whether they are ever ethically permissible and, if so, in what circumstances. ? Ethical issues involved in counter-terrorism activities, including whether it is justified to suspend human rights in the fight against terrorism and if so, in which circumstances and which rights. ? Contextual issues related to the resources and attention given to fighting terrorism and other threats, many of which actually or potentially result in much higher numbers of deaths and injuries. It has been suggested that 'terrorist attacks by the groups victimized by the Nazis, for example, would hardly have deserved any negative evaluations' (Lutz and Lutz, 2004). However, the issue is much wider than terrorism on its own and relates to whether it is ever justified to use violence and, if so, in what circumstances. Moral positions should preferably be coherent and consistent. Therefore, the labelling of particular acts as 'terrorist' rather than, for instance, 'warfare' should not affect ethical judgments about them. Discussions about the circumstances in which the use of violence might be justified are part of the wider argument of the relationship between ends and means or consequentialist and deontological ethics. It has been suggested that the use of political violence cannot be justified unless all channels of non-violent protest have been exhausted. While it is clearly desirable to use nonviolent means if at all possible, this argument is problematic, since it is not always clear what channels of non-violent protest are available and the need for change may be urgent due to the existing state of violence and oppression. In addition, engaging in non-violent protest may itself put participants at risk and could lead to reprisals and repression. However, on the other side of the argument,

NSOU ? CC-SO-04 279 there is no guarantee that political violence will be successful in achieving its aims or even that it has a greater likelihood of success than non-violent means. In addition, non-violent resistance has the potential to involve a much greater proportion of the population and to empower them. There is also sometimes a relationship between the ends achieved and the means used. Thus, the use of peaceful means has the potential to achieve change at a deeper level and which is longer lasting, whereas change achieved by violence may require a further peaceful 'revolution' to remove the violence that has become embedded. Several different authors have suggested conditions under which the use of political violence or terrorism might be justified. These include the use of terrorism by a morally innocent individual (however moral innocence is defined) to defend themselves or other morally innocent people against a significant injustice using terrorist activities which are directed proportionately and only against those guilty of committing acts of significant injustice. Further suggestions include the justification of the use of political violence (Narveson, 1991) to prevent immediate injury or longer-range threats to oneself or others and to prevent or rectify the loss of legitimate liberty by oneself or others. However, it has also been suggested that the use of political violence is probably not justified to obtain conditions of a minimally acceptable life even when there are no other means available to do this and that it is also not justified to promote a better life for oneself, a particular group or people in general. The logical conclusion of not accepting this as a fundamental right is accepting an unequal distribution, with some individuals and groups having significantly reduced and probably inadequate shares of these resources and goods. While the difference in perspective is largely based on a difference in political philosophy or ideology, an unequal division of the world's resources and goods is also counter to many ethical theories (Harsh, 2015), implying that access to equal shares is a fundamental right in ethical terms. In terms of deontological ethics making significant differences in the shares received by different individuals or groups is not innately virtuous and is unlikely to be based on good intentions. With regard to positive utilitarianism the benefits of an unequal distribution are likely to be low and the costs high. In terms of negative utilitarianism there are likely to be significant present and future harms due to many people receiving insufficient for their needs. With regard to virtue ethics an unequal distribution is unlikely to build good character either of those who receive less or those who receive more than an equal share. In terms of normative ethics there is an inherent injustice in an unequal distribution, it is unlikely to promote autonomy and is maleficent rather than beneficent. Since unequal distributions frequently lead to feelings of resentment, the result is unlikely to promote relationships and is therefore counter to the ethics of care. Differences in beliefs about

NSOU ? CC-SO-04 280 the fundamental entitlement to an equal share of the world's resources will affect any analysis of the ethical justification for using terrorism to access basic needs or a fair share of the world's resources, assuming no other means are available to do this. However, acceptance that everyone is entitled to (approximately) equal shares of the world's resources does not imply that the use of terrorism is ethically permissible and this would have to be further evaluated through application of ethical theories. Rights ethics is based on consideration of fundamental moral rights, with actions which violate these rights considered to be wrong. Both terrorism and counter-terrorism raise issues of whether it is morally justified to kill, injure or torture one or a relatively smaller number of people in order to save a larger number of other people. The issues related to counter-terrorism will be discussed in a later section. In the case of terrorism, the existing situation is generally categorized by frequent serious violations of human rights, hostility between different groups, state sponsored violence and other forms of violence. Thus, applying rights ethics to the analysis of terrorism leads to an evaluation of the relative importance of different rights and decisions about which rights and whose rights it is least unjustifiable to violate (Held, 1991). Wherever possible it is clearly preferable to use non-violent methods to ensure respect for human rights. However, situations where this has been tried without success or non-violent approaches seem unlikely to be successful, give rise to the ethical questions of whether any rights violations are permissible in the short term in order to end human rights violations on a long term basis and, if so, what rights. There is also the practical question with ethical consequences of the likelihood of success. Where success is unlikely or its probability is not sufficient high (however that is judged) violation of rights of any type to achieve change should not be considered from either an ethical or practical perspective. Although all rights are important, broad categories of rights of different degrees of importance can be defined. In general, respect for the more important rights should be prioritized and care taken to avoid the violation of important rights in order to achieve respect for less important rights (Held, 1991). This implies that terrorism in support of the right to personal security or sufficient access to resources to meet basic needs is more likely to be justified than terrorism in support of less important goals.

20.5 Politics and Terrorism

A totalitarian state makes use of violence as a system of government. But a democracy resorts to it only selectively during a period of crisis, when they even overlook the international convention that insists on respect for human rights. The gravity of situation is assessed by the government and such situation is prone to possible abuse. The term crisis implies a threat to the regime. In weak democracies also rulers resort

NSOU ? CC-SO-04 281 to direct or indirect violence to continue in power. In order to stay in power, rulers who had reached a point at which their follower is disowned them or because a minority, may overturn democracy. The military may help them behind the scenes. Every democratic constitution has provisions to enable the government to assume special powers. Here again there is danger of abuse of power. Terrorism demoralises the population of a region or state. In some instances, however it serves as an integrating factor. However, terrorism itself always invokes problems of law and order. Yet it is not capable of disrupting the entire social system. Terrorism is not a revolutionary movement and so far, terrorists have not succeeded in fulfilling their aims. Terrorist killings do not change the structure of politics. However, this is not to say that they have no effect on the social and political fabric. They do loosen it somewhat. Mechanisms have to be created to prevent acts of terror.

20.6 Sociology of Terrorism

A holistic sociological perspective of terrorism will be possible only when we discuss large-scale political events not only in aggregate numerical terms but also in impact terms, that is, we focus not only on quantitative macro-politics but also on qualitative micro-politics. Terrorism demoralizes and demobilizes populations and disintegrates societies, though it is also true that terrorism in some instances serves as an integrative mechanism binding people together in a common cause. Terrorism may involve the problem of law and order, that is, of killing or kidnapping of one group by other group because of its religious affiliations or sub-cultural differences, but it does not disrupt the social system. Nor is terrorism a special method for hastening historical change. No terrorist movement has ever succeeded in achieving its goals. Terrorists, therefore, do not shape the course of historical events. For understanding terrorism, it is necessary to measure the amount of violence engaged in by the terrorists of effect their desired ends, the quantum of force utilized by the police and the armed forces to prevent social change, and also to measure the types of violence. Using this perspective to terrorism in India, the number of people killed and kidnapped in Bihar in one year is much more than the killings and kidnappings in Punjab or Kashmir. The social impact of terrorism which may totally affect the society on a long term basis, thus, should be the central focus in any system of analytic measurement. It may, therefore, be concluded by claiming that terrorism disintegrates society or affects the survival of the system will not be very correct. Nevertheless, mechanisms have to be created to prevent acts of terror. Terrorism and political violence have become the bane of Indian society today. Both are leading the

NSOU ? CC-SO-04 282 country towards anarchy and chaos. Terrorists kill in the name of religion and region, in the name of language and culture. It is time that the prevalent frustration and a sense of deprivation amongst people, particularly the youth, are checked. On one hand, the government has to deal with the terrorists with a very firm hand and on the other minorities have to be protected.

20.7 Conclusion In has been faced with the Kashmir problem for the past half a century and has been faced two Indo-Pakistan wars on this issue, but the government has not been able to take hard decisions and evolve a definite coherent policy. Our policy makers have been chasing the mirage of soft options and have been following a weak kneed approach in dealing with the terrorists. Terrorism in Kashmir assumed a new shape 1988 onwards. The militants launched a bloody battle to underline their separate identity. The neighbouring countries, determined to see turmoil continuing in the valley, are providing training and weapons to the militants even today. The people have also been so brain washed that talk of the excesses of the police and the para-military forces. For the militants, the criticism of the government by the people means that people are more than willing to support them. On the other hand, the Hindus have been forced by the militants to leave Kashmir. It is claimed in one report that nearly two lakh Hindus have fled Jammu and Kashmir between 1988 and 1991. The Hindus claimed that the fundamentalists and militants had infiltrated every sphere of the government in the Kashmir valley till the middle of 1996 and that what ruled the roost was not the writ of the government but that of the militants. They maintained that the pro-Pakistan forces had overtaken the valley and in a way, there was a collapse of the administration and the terrorists wanted them to quit the valley. Some sources claimed that till two years ago, Muslims from other countries such as Pakistan, Afghanistan, Sudan, Libya, Bangladesh, Lebanon, Saudi Arabia and Turkey were engaged in terrorist activities in Kashmir (Indian Today: May 15, 1994).

20.8 Summary Thus, It has been seen that there are several opinions regarding the origin of terrorism. According to one theory, the term terrorism comes from the French word terrorism, which is based on the Latin verb *terrere* (to cause to urinate), and which refers to a kind of violence or the threat of imminent violence. It is noted that the terrorism as a concept was first used by the British statesman Edmund Burke. He used it in NSOU ? CC-SO-04 283 the context of the Reign of Terror during the French Revolution. In those days, terror was understood to be a tool of dictatorship and as a symbol of power. We also saw the various characteristics of power and its present nuances in our current society.

PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, discipline specific, generic elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern, which finds efficacy in sync with credit system, credit transfer, comprehensive continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility of choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the University has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U. G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the under graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Materials (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English/Bengali. Eventually, the English version SLMs

will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success. Professor (Dr.) Subha Sankar Sarkar Vice-Chancellor

types the Negrito, the proto-Australoid, the Mongoloid, the Mediterranean, the Western Brachycephals, and the Nordic

had found their way within the Indian population. Hence, it is improper to conclude India a country of unipolar symptoms. For the absence of written documents for the earliest days of 'history' other than literatures deeply connected with religious rituals and sermons it is difficult to draw a near correct picture of those days. 1.3 The History of Indian Civilization The date when the first human being left his footprint in this part of the world is a matter of debate. But it has been widely accepted that the people here became 'civilized' much earlier than others in the globe. India poses a puzzle to many in the outside. When more advanced countries of the present day were nowhere to an orderly social system, the people in some parts of this land were succeeded in raising a well-planned urban life where the inhabitants could establish trading relations with faraway places. Equipments they normally used for cultivation and for domestic use still can be found in use in India. The bullock-carts and the straw huts as depicted in Bharat sculptures of about 130 B.C.E. and the plough used by farmers in Kusana reliefs of 200 C.E. are still common phenomenon in India. Sometimes historians ask themselves how to narrate this story of continuity. The progress made by India during the long course of its existence is undeniable Despite these still saddle quern are relevant in daily life since the days of the Indus people. Even some crop patterns including their sowing time, their consumption and preservation remain more or less same with only some nominal changes and improvements. The Indus Valley civilization is one a very few of its kind in the world. Archaeological excavations reveal a lot about the daily life and community behavior of those who had raised a number of urban settlements scattered in an area covering hundreds of kilometers. Examination of the findings surprised the archaeologists though the seals could not be properly read. No doubt, some conclusions are debatable. Still it is an accepted fact that the people who used to reside there could successfully adopt an advanced life-style. Existence of granary and common bath established the fact of their improved social structure probably with a certain kind of municipal administration. But the most revealing thing is the absence of a deity and place of worship. Existence of a female figure may provide certain clue towards

NSOU • GE-SO-11 11 a 'devi' worship with worship of fertility through pipal tree and such like. If these are so then India of today is yet to find newer modes of worship. 1.4 Advent of Aryans Excavated sites covering urban life are the one side of the entire picture the other being the villages. Without surplus produced in the villages no urban life is possible. But village and villagers were lost since structures are not available. Village got prominence during the days of the Aryans. The Aryans, a nomadic tribe arrived in India and started with a pastoral life which ultimately culminated in a rural one. Hence one can find the hymns in the Vedas are addressed to the Gods in the shape of nature. Worship of nature still prevails in many forms. Indian village is primarily caste- based. With the coming of Islam feelings of community rose its head and character of village changed accordingly. Occupation was one of the principal factors for rural settlements. There were food-gatherers and hunters to whom the British considered aborigines. They were and are forest-dwellers and solely depend on their own customs prevailing from the days not known. These people divided and sub- divided into many tribes maintain their traditional habits and livelihood. Growth of modern living, extension of urban settlements, and use of machines all have affected seriously. These tribes have been taken into established religious communities for which they are losing their identities. Even once the deity of the Sabaras, a tribe in Odhisa, Lord Jagannath is now universally worshipped by the Hindus. This is a unique aspect of Indian social life where a vast majority community adopted a deity of a group of forest-dwellers of a tiny corner in Odhisa. With the spread of modern- day living and unimaginable growth in population forest covers are withering away very fast leaving those dependent on forest with no other option than to abandon their traditional living. This process has been going on for last couple of centuries but without major opposition. During the colonial rule rebellion against the rulers were crushed paving the way for state control over forests. Through their livelihood, occupation and customary offerings to the deities, all of whom are actually totems innumerable numbers of forest-dwelling tribes are the fountainheads of varied cultures of India. Since these people constantly avoided urban culture they became non-entities to the ruling communities. But their usefulness to the 'civilized' population did never diminish. The epics also present such stories. One cannot forget the importance of forest-dwellers in supporting the cause of Rama and also that hunter-family's timely intervention when all the Pandava brothers faced

12 NSOU • GE-SO-11 possibility of extinction by a conspiracy of Duryodhana. In both the anecdotes the composers tell the eternal tale of the victory of truth and justice over evil. The truthfulness of these are not beyond any suspicion, but they still exemplify the values of Indian family life. Often these are accepted as the core of India's traditions. 1.5 The Epics The stories within the Mahabharata have a lot of similarities with historical events. The battle in Kurukshetra is sometimes termed as fictitious. But by singing at least one sacred hymn from the Vedas before recital of any part of the epic it has acquired certain historic relevance. Again, the genealogy of the patron of the performer was also recited. By doing so the people of the day nearly discarded the caste-system propounded by the Aryans. The Brahminical superstructure in the Indian society probably took shape between 200 B.C.E and 200 C.E. when the reading of scriptures became exclusive privilege of the Brahmins. The epics provide no exclusive clue by which superiority of the upper castes can be understood. Most important of the stories is the life and activities of Krishna who came from an intermediary caste and not from the Kshatriyas, the warriors. Still we have learned of his innumerable soldiers who eventually fought along the Kurus. Such stories are absent in any of the Greek epics. Again, the story of Janamejaya's performance of a yajna for the complete annihilation of the Nagas, the cobra demons who could take a form of snake at will and had killed Janamejaya's father Parikshit II surpasses the original story of the epic. This cobra is the totem of many tribes for time immemorial. The sacrifice of Janamejaya remains incomplete without the presence of Astika, the son of a Brahmin father and a Naga mother, giving a different dimension of the social order. Because a son of clean Brahminical parentage was considered a true Brahmin. Again, Somasrwas, the chief priest in that sacrifice was not a clean Brahmin. These stories have been considered as sacred as the other parts of the epic which establishes the fact that classification of the Indian society, primarily based on occupation was of much later date from the date of composition of the Mahabharata. The story of the Nagas who were chiefly in possession of the forests in the Gangetic valley and in the foothill of Punjab. Food gathering was easier here to the initial Aryan nomads. In that context the Nagas had the similar status of that of the Aryans. These forest-dwellers were so strong that they could not be easily vanquished. Here a mixture between the foreigners and the local hunters took place. Since a good

NSOU • GE-SO-11 13 number of poor Brahmins were not provided any livelihood, as the Vedas tell us, they adopted a forest life and married girls from there. Absence of women flock among the invaders is an accepted fact. This position led inter-mixture and creation of a social order which was ultimately absorbed within the Aryan culture. Late D.D. Kosambi, the Marxist historian was sure that during the days of the early settlement of the Aryans the young Brahmins in their early phase of apprenticeship in the Guru's seminary had to devote at least twelve years in memorizing the Vedas and to bear a lot of domestic responsibilities there. They had no time nor scope to plough and to produce food. Hence dependence on the Nagas was a natural course. On the other hand those Nagas were never a warrior tribe. It is believed that remains of ochre-washed pottery of Hastinapura I were the creation on this Naga tribe. Gradually, the Nagas transformed themselves from hunters and food-gatherers into agriculture. Their relation with the Kurus is established in the stories of the Mahabharata. This is one of the principal aspects of the growing Indian society where mixtures of several bloods was usual at least before the reckoning of the Common Era. The Vedas, the epics and the Jain and Buddhist texts render certain help for getting some idea of the earliest period of our reckoning. Travelogues help sometimes but fail to produce pictures in wide canvass. Since the twelfth century the Indian started history writing. In some regions archeological findings strengthen our imaginations and help to construct ideas of habitations there. India's uniqueness in holding numerous sects, tribes and lingual groups in a single canvas deeply rooted in her long historic traditions which started emanating from various sources. As many as 180 language groups with nearly 550 dialects were listed by the celebrated linguistic, G. A. Grierson in his monumental research, the Linguistic Survey of India. It is true that these assertions faced challenge but theories relating divergence in language are universally accepted. Even the framers of the constitution of independent India could not ignore these facts. Initially 11 major languages were recognized and the figure had to be raised first up to 15 in 1967 and again by 18 in 1992. Ignoring such context it has been fanatically tried to project this society a monolithic one by ignoring the realities experienced by the people of India for many generations. The theory of nationhood has more or less been built up with European experiences. The concept of nation-state is a western one and to scan Indian scenario with that instrument leads to a false notion. The sense of nationalism which India has developed is quite different from those rooted in the western thought and practice. Traditions of acceptance and of co-habitation have developed a mosaic where all the colours and patterns have converged successfully. It has been widely believed that

14 NSOU • GE-SO-11 a long-drawn historical process in India beaded socio-cultural diversity into a thread of unity. Cultural pluralism in a way strengthened that unity. How the Indian civilization was first born and then continued after so many turbulence had amazed the western readers. Exploring India and 'Indian-ness' became one of the primary duties of the British colonisers. It started in the late eighteenth century first, with the survey of Major James Rennell and then with the foundation of the Asiatic Society of Bengal. The British probably had no idea about the vast and rich antecedent of their newly-conquered race. Wealth of India and its artisan crafts including fine weaving for long had been street gossip in parts of Europe. But the actual knowledge about this country and its society was gathered by the foreign rulers when they intruded interiors. The pictures made them surprised since all conjectures about this land were shattered. Now the question is, which India they had been expecting? 'In the first perception, i.e., unity and diversity as two ends of a continuum, the two concepts retain both their distinctiveness and interlinkages. In fact, in this sense, a deft management of diversity is a continuous process, or part of a ceaseless effort that goes on in a plural society to achieve a harmonious interdependent co-existence amongst communities insisting on maintaining the distinctiveness of their identity.' (Ajay k. Mehra; 'Unity and Diversity in India : Two Ends of a Continuum or a Converging Horizon?' in Imtiaz Ahmad and others eds. Pluralism and Equity Values in Indian Society and Politics New Delhi, 2000. pp.115-16) Their expectation of nearly a single linguistic group, same food habits and above all a single religion did not match with India. Moreover, religions of different shades had also flourished under royal patronage and seldom had they posed problems in curving out relationship among different kingdoms. India also had never witnessed religious wars in her soil though persecutions were very common. Two things posed as puzzles to the British. How people having so many faiths stay along for many centuries and how the lingua franca was to be detected. William Jones, the founder president of the Asiatic Society of Bengal suggested that all the languages spoken by the people here had monogenesis. He strongly believed that all the languages had their common root. Needless to say that primary proposition was to establish this root in the west. Studies of Sanskrit and its grammar became popular among the early European scholars who championed the cause of the Orientalism. But one premise was forcefully established that the past of the orient was glorious which had by that time evaporated. With the rise of Utilitarianism the British as the ruler resolved to take care of the interest of the people of India.

NSOU • GE-SO-11 15 1.6 Invasion by Foreigners : Cultural Factors One very important aspect of the Indian society is that it could digest a lot of foreign elements. India had the misfortune of having been prey for invaders for centuries. If one takes historical context the value of pluralism would be visible in many facades. That also played pivotal role in state formation too. Pluralistic tenets influenced not only social but also political, economic and above all cultural factors. When fragmented this pluralistic trend pursued a determined role to achieve strong as well as long-lasting political authority. In the process both nation and state came into existence simultaneously. Whatever means were available the forces for unity strenuously endeavour to deploy. In a sense, the tendency of diversity was buried under the alter of unity. An evolutionary process got shape first with a political agendum. Formation of an orderly state was the primary goal. While achieving this tribes and races initiated a further process of assimilation. They helped to emerge a variety of kinship, mode of living, pattern of settlements, systems of production, rules of land tenure and finally community life. In fact, the Aryans whose legacy we are proudly following had their origin in faraway place. These nomadic tribe finally decided to settle here and introduced an agrarian society with a hunter and pastoral past. Their social as well as transcendental way of life are still relevant in some parts and within some communities. Mixture with the indigenous social order was inevitable and the end product has gradually become the social system in India. The Vedic tradition of Rajachakravarty was not only a glorification of a sovereign but also a symbol of assimilation of several local political and administrative systems. In the process a large and divergent patterns were merged into one to project a broader political order. Empires in the ancient period came into being by innumerable assimilations-tribal, cultural and administrative. It is not known whether those people laid out a fixed agendum for creating a political order. The political order was not necessarily a complete indigenous one. Greco- Roman shadow was also too deep. Invasions through the north-west brought a number of novelties. From wearing apparels, ornaments to sculptures foreign elements intruded. This mixture produced one of the finest schools, the school of Gandhara arts. Rise of the Mahayana sects within the Buddhism popularized this school which is one of the identities of India in its ancient past. The long shadow of the Greco-Roman mode of architecture hugely flourished during the Maurya reign and continued in the later days. Contacts with outside by curtsey of traders strengthened the long process of this assimilations.

16 NSOU • GE-SO-11 1.7 Social Factors While spreading the ethos of imperial order the people propounded that hegemony which was able to rule upon people residing in different geographical settings. Those who were ruled readily accepted their rulers and their administration. Language and local traditions including tribal ones did not affect very much. But the society was dominated by the upper castes whose hegemony was often resented by the lower ones. The dissensions did not breed revolts. What India achieved was evolution. Larger kingdoms and then empire flourished chiefly on trade. Trade was the forte of the lower castes. The financial strength of the traders helped them to get some elevation in the prevailing social order. Ultimately they became intermediary caste and was duly honoured. They found salvation within newly emerged faiths like Jainism and Buddhism. These two were totally opposed to the Aryan way of rituals sacrifice and many others. But their surge could not be restricted. Royal patronage started coming and Buddhism spread out by crossing the seas. Asoka's baptism is well known. In one of his rock edicts he declared that all his subjects were his own offspring. This might be a political declaration. But through it he clearly expressed his desire to accommodate all irrespective of their creed. In this way a trend was set for accommodations. As a result, India is the only country where nearly all types of religion are practiced. This is no mean achievement if viewed in larger worldly context. History of Buddhism is nothing but assimilation of several traditions which became a singular one and finally found its place within the settled Aryan, now we may call it Hindu religion. This metamorphosis is revolutionary one which helped people with different as well as conflicting ideologies in merging into one. Rise of Jainism and then Buddhism ushered in the simultaneous rise of the lower strata in the social order. Growth of regional varieties of classical Sanskrit was one of the principal gains. None of the Jain and Buddhist texts are written in the classical language which was in the sole custody of the learned high castes. The rise in the use of Prakrit is the signal for the rise of the people from below. This could happen by not affecting the existing caste pattern. Hence, India did not experience bloody conflicts which 18th century Europe had to. European scholars seldom could assess this phenomenon. Unitary tendency for generations taught the people to remain faithful to it. Though divergent in many ways religion and tradition stitched a lot. Apart from tradition and culture mixture of blood also produced new groups of people. The Rajputs had their origin in the Gujjar-Pratihars who in turn had their

NSOU • GE-SO-11 17 roots in central Asia. A complex and shady origin did not prevent the Rajputs in the medieval ages in fighting the Muslims to protect honour and dignity of the Hindus. Once who had not been considered 'Indian' by any of the Aryan standards, became the sole protector of Hinduism, sometimes synonymous to India itself. Unitary trend of culture expanded its wings manifold and helped to produce a picture of oneness. In the course of hundreds of years such churning continued. But it is wrong to conclude that the Rajputs posed as a single unit. Their tribal character had never been lost which generated animosity among themselves. Then, the tradition of the Rajachakravarty haunted them and a violent fight began to claim that position. By that way these tribes or clans acquired the Indian culture. Thirteen century witnessed another phenomenon. The Muslims invaded India and the rule of Islam started to continue for more than five centuries. All the earlier invaders ultimately lost their identities and gradually merged themselves within Indian social and religious environment of which we have already discussed. The Muslims maintained their identity and never allowed any aberration. Whichever land they occupied, converted the entire lot into their own fold. That process was not practiced here. On the contrary, there was a constant attempt to practice co- habitation. The racial dissensions and warfare were highlighted by the western scholars and the colonial rulers without giving credence to the fact that the invaders in India had lost their foreign connection forever. To them such co-habitation of strongly opposing people was never possible. They perceived social and political interactions on the basis of the two communities, Hindu and Muslim. The history tells that the Muslims converted nearly an entire race over whom they had established their suzerainty. But those marauds people could not succeed in doing so in India. On the contrary, both the people, ruler and ruled decided to stay together without being too much involved in the social structures of each other. Islam brought a loose sense of democratic behavior. They refused to give credence to any caste system. At the same time, the presence of the Sufi saints helped to treat all irrespective of one's caste and creed. The coming of Islam coincided with the growth of the Bhakti cult. It is wrong to conclude that the Bhakti movement had been influenced by the Sufi order. The Bhakti movement with its earlier roots in the south slowly arrived at the north and could acquire a pan-Indian status. Interestingly enough both these orders had a number of similarities. The propagators of the orders, both the Hindus and Muslims usually detested official patronage. The saints used to live in their respective hospices away from locality. Their daily life was the symbol of hardship which

18 NSOU • GE-SO-11 enthused common people. They seldom discriminate among their followers. Religious piety was the sole motto. In the process assimilation of people from various faiths could be possible. This unique religious orders could be embraced by anyone and that too by not discarding his or her own faith. The followers' had only religion i.e.; mutual love and nominal adherence to rituals. Even Gandhi, while leading his famous march towards Dandi only chanted the bhajana of Narsinghdas Mehta, a Vaisanabite saint. Relevancy was such that people took this as a clarion call of Gandhi in Civil Disobedience Movement in 1930. Under the Mughals, who acquired the sole credit of ruling uninterruptedly for so long a period without any major disturbance. Credit goes to Babar, the founder first and then to his grandson, Akbar. Akbar was the first ruler in the medieval India to visualize a pan –Indian empire. In attaining this he pursued a policy of tolerance towards his Hindu subjects. By awarding even-handed justice to all, irrespective of race and religion Akbar brought peace and order which were to stay for long after him. He is also credited for bringing first the Rajputs within the state craft and then extended the net. Family relations established by his was followed by his successors. Aberrations due to the policies of Aurangzeb brought disaster and ultimate withering of the empire. Akbar's intention was to provide a stable as well as orderly administration. He maintained the traditional rural social structures without any interference from above. In doing so he started a process of cultural mixture. Not only did he try to introduce liberal Islam but also advocated self-respect for all. To fulfil this he started paying respect to the Hindu scriptures and customs. Upon advice of Birbal he used to chant thousand names of the sun since the emperor to the Indians represent the sun. For all such 'heathen' behaviours he had to face rebellion from the orthodox elements among his own community Still he remained undaunted. He started a process of translation of the Indian religious scriptures and epics into Persian, the court language so that non-Hindus could understand the eternal values of Indian philosophy.. In course of time, this language was adopted by the learned Hindus. This was not the end. Due to the mixture of two communities a new language Urdu appeared. Ultimately, it became the lingua franca of all in the north and north- west India. The 'functional hierarchy' on which Rajni Kothary has put so much emphasis had emanated from 'manifold frame of identification' as well as their 'inter- dependence'. This inter-dependence often over-lapped with each other facilitating the process for unification. Mixtures in manifold could also be possible due to this inter-dependence. Since all types of rigidity were avoided a society, loosely stitched

NSOU • GE-SO-11 19 could emerge. To achieve this all the groups or units always avoided to discard those shades of identification which might have hurt the sentiments of the others. This is also applicable to the different units of independent India. All the constituent provinces do not have identical interests. Protection and up-keeping of the interests of respective states are the primary political agenda of the states. In many cases these create tension and shabby quarrel among them. Still the flame and heat never reach such a proposition which is impossible to douse. This practice remains all along for which Indian federation works. 1.8 Political Factors Already social and cultural aspects have been dealt with. Other important façade of this unity is political. The British rulers used to claim that fragmented India could be brought under a single rule for the use of the English language and the railways. The role played by the railways cannot be denied. But the English could be understood and spoken by a factional part of the Indian population. During the freedom struggle the leaders from different parts of India could assemble on a single platform to draw a common agenda. The sense of nationalism did not develop among the masses. But they a vast majority of whom were illiterate followed ritualistically their leaders whoever they may be and came from whichever part of India. Nobody should be oblivious of the prevailing schism among the leaders about the means and procedures of the movements. All were overcome without any significant turmoil excepting the divisive final phase. The two-nation theory ultimately divided the country, and the Indian nationhood acquired its ultimate shape. Still the essence of the theory which divided India failed to corrupt nationalism of the Indians. People in the newly emerged nation quickly dumped that ideology and embraced all in providing that sense of unity which had been the guiding principle during the days of struggle. Independent India could draw her constitution by keeping regional differences at a bay. Regional aspirations were honoured in free India. To achieve a state based on language Patti Sriramalu's sacrifice set a new trend. A number of states in later days were formed to honour the aspirations and wishes of the people of the regions. Division of Punjab into two was necessitated for the same reason. But the state of India as a single unit was never challenged. The motive of the leaders of free India was to present a welfare state and that became the principal plank of various political parties. Elections were fought to achieve the same. Democracy and democratically

20 NSOU • GE-SO-11 elected institutions' pivotal role in this field have been immense. People from across the length and breadth of this land participates in the elections without any hesitation to be ruled by a bunch of representatives not necessarily from one's own region. The sense of national unity prevailed over regional identity. 1.9 Summary The Planning Commission envisaged during the freedom struggle was nourished for an over-all growth of the country. To do so resources from one region were shifted to another with a view to provide a uniform development of the country as a whole. But sometimes divisive prospects also haunt the entire process. Those can simply be termed as fissures. The leaders having various shades of opinions from extreme right to extreme left finally understood the value of tradition in the daily life of the people. They embarked with such political agenda which subtly or broadly focused towards caste, creed, and language and so on. 1.10 Questions (i) Discuss in detail the multiple dimensions associated with Indian civilization. (10 marks) (ii) Explain the influence of foreign invasions on Indian culture and civilization. (10 marks) (iii) Briefly discuss the historical background of Indian civilization. (5 marks) (iv) Analyse the role of Indian constitution in shaping the political framework of country. (5 marks) 1.11 Suggested Readings (i) India after Gandhi by Ramachandra Guha. Willman-Grabowska (1996) 1.12 Glossary (i) Culture the ideas, customs, and social behaviour of a particular people or society. (ii) Civilization the stage of human social and cultural development and organization that is considered most advanced. (iii) Brahmacharya the first of the four stages (Ashramas) of life. (iv) Brahmanas a collection of ancient Indian texts with annotations on the hymns of the four Vedas.

22 NSOU • GE-SO-11 Unit - 2 □ Religious, Linguistic and Cultural Plurality : Unity in Diversity Structure 2.1 Objectives 2.2 Introduction 2.3 India – Land of Diversity 2.4 Colonial Influence – Role of Social Reformers 2.5 Summary 2.6 Model Questions 2.7 Suggested Readings 2.8 Glossary 2.1 Objectives • Meaning Of Diversity • Reasons Behind Diversity, Economic and Social differences • Brief introduction about unity in diversity 2.2 Introduction Diverse culture and behaviour could never be placed in an air-tight compartment. So, to rule such a vast country the British policy was to divide the people as efficiently as possible. In a way they succeeded in dividing the country on the basis of faith. Till then India was able to put such a face which could reflect a various universe. No doubt that the indigenous society prior to the arrival of the Muslims was strictly divided along caste line and in majority of cases caste depended on occupations. The Dharmashastras prescribed different rules for the upper and lower caste. Untouchability was practiced and colonies of the castes in very lower strata away from the village were very common. Still the caste rules and their applications 22

NSOU • GE-SO-11 23 varied according to local conditions. The artisan- producer might be untouchable but the produce of his or her were necessarily not so. This custom prevailed for centuries which also put impetus to the production systems. Social orders were such which conducted the production systems and finally established a feudal order. Surprisingly, lands were awarded to the Brahmins who by rule were not allowed to plough. They had to depend on the hired labour who incidentally was in the lower strata. The sense of 'class' as defined in the Marxist doctrine was absent. Caste was the basis and was accepted for centuries together without any major modification. Even the intrusion of foreign elements could hardly change it. How did so many element converge into a unitary one- is a matter to be surprised. "the eclectic rather than proselytizing style of spiritual integration characteristic of India tradition; the absence of either a unifying and continuous secular tradition; and above all, a highly differentiated social system that has brought functional hierarchies, spatial distinctions and ritual distance into a manifold frame of identification and inter-dependence." (Rajani Kothari; State Against Democracy; In Search of Humane Governance. Delhi, 1988. Pp 155-56.)

2.3 India – Land of Diversity

India is the only country where nearly all major religions of the present day are practiced as well as preached. We may find such scenario in some other countries but language spoken is more or less same which not the situation in India is. Here, religious and linguistic diversities are very prominent. Still India is united. Continuity of tradition in nearly original forms is very normal. Indian society has been evolving with some set practices and orders. These are the combination of multiple units and sometimes their factions. Needless to say that the villages are caste-based. But their power to absorb a lot of foreign elements is immense. Outward appearance may vary from one to another but basic tenets of family life remain more or less similar. Though professions of the inhabitants differ from each other, livelihood seldom. Religious ceremonies, rituals during a marriage etc.; were identical though the class of priests differed. This is the strength which helps the Indian social structure remain intact. Juxtaposition of fragments of historical traditions has created a unipolar system by absorbing social, political, economic, and cultural units. The constitution of the free India allows all to practice his or her own faith individually and in assembly. Secularism is the hallmark of Indian polity. This

24 NSOU • GE-SO-11 secularism means that the state allows all and does not remain thoroughly neutral. However, the people here use to stay beside each other for centuries together. It is true that Buddhism and Jainism like Sikhism are treated as the part of broader Hinduism. Similar some smaller faith are also viewed in the same manner. Others, which are opposed to Hinduism include Islam and Christianity. Islam arrived here more than a millennium so does Christianity. Since Islam could occupy state power its roots are sphere extended too deep and too broad. This was not the case with Christianity. After colonizing India the East India Company also tried to promote mass conversion with a hope that similarity in faith between the ruler and the ruled would secure their position permanently. But all of the efforts went into vein. Here lies the success of Islam. What is often not clarified in this mode of classifying the religious traditions is whether their classification under one or the other of these two categories derives from antiquity or if it is a recent invention and what were the specific circumstances in which they came to be so classified.' (Imtiaz Ahmed; 'Basic Conflict of 'We' and 'They' between Religious Traditions, between Hindus, Muslims and Christians in India 'in Imtiaz Ahmad and ors.eds. Pluralism and Equality : Values in Indian Society and Politics. New Delhi, 2000. P.157) The historians have culled huge amount of literature and epigraphic evidences emanating from past and suggest the construction of religious traditions in terms of a sharp divide of either mutual tolerance as supposed to be existed among different groups of people. Customs and behavioural patterns of people for centuries remain more or less similar still today. Even from the names and surnames of a person or individuals one can identify one's religion and caste too. Since the period concept of society emerged four categories of names commonly used were : ethnic names derived from tribal or names of community, names derived from the country of origin, honorific and generic terms already used with reference to outsiders. It is also said that these terms do not follow any evolutionary pattern. It is a common believe that the Muslims did also find place in such terms like 'yavana', 'tajika', 'mlechha' etc. in the ancient Sanskrit texts. But this was not so. All the intruders and not followers of the established faith were identified with such terms. Similarly, inscriptions and literary works of ancient Persian and Arabic sources attest to the relative absence of an essentialised representation of Hindus as a reified religious group or community. (Imtiaz Ahmad. P. 159). Then how the term 'Hindu' came into existence? It has become well-known that this very term denotes

NSOU • GE-SO-11 25 geographical origin i.e. 'the people residing on the banks of the river Sindhu (Sindh or Indus) were called the Hindus by foreigners. Initially by this term some people residing in a place were identified and not that by their own faith. But with the passing of time the terms 'Hindu' as well as 'Hinduism' was related to the adherents of a faith. Subsequently even ethnic, sectarian or caste was determined with such terms which are closely and solely related to religions. In a broader perspective terms like Brahmana, Rajput, Syed, Sheikh etc. though have religious affiliations, commonly understood to have caste or ethnic origins. As and when ethnicity got prominence, it is believed that the Hindus and Muslims, the most populous communities fought among themselves more than between them. During the formative years the Muslims tried to maintain their 'purity' in a conquered land but to extend power and to retain sovereignty this trend lost ground. Though a 'true' Muslim used to believe that as a philosophy Islam stood opposite to Hinduism and as a result never they could meet. Too and often the 'ulema' tried to convince and force rulers at Delhi to order mass conversion or to face death. But none obliged. Since the rulers had their own agenda they normally used to maintain a status quo. No doubt, some overzealous rulers showed bigotry but, they were few in number. Due to such atmosphere the Hindus and Muslims used to stay together. Same stories were repeated if one goes through the history of the Sikhs. Their rise was to save the down-trodden and oppressed. Oppression by state and also by upper caste and privileged people was normal. Fight between the Sikhs and the Mughal state from the reign of Jahangir was too bloody. Even the Guru was tortured and beheaded. Still a bond among people remained. From certain compulsions and social churning Guru Nanak in the late 15th century united some fragmented tribes and some marginal people from the Hindu society and preached a new faith. No worship of deity is the hallmark of his religion. The new faith called Sikhism (Sikh meant disciple) which within a very short span became popular in the north and north-west of India. Similar was the appeal of Sant Ravidas, a messiah of the untouchables. These new faiths opened gateway of salvation to a large section of masses who due to primarily for their low caste could not participate in religious programmes. The Sikhism posed serious problems to the mighty Mughals. Some Gurus laid down their lives. But the unitary force of the religion and the teachings of self-righteousness prevailed for which after so many battles with the Mughals and the East India Company the Sikhism is vibrant with its cultural ethos.

26 NSOU • GE-SO-11 2.4 Colonial Influence – Role of Social Reformers This condition continued for centuries and still prevails. Under the colonial rule aberrations became prominent. It was the policy of the colonial masters, especially from the days when seeds for freedom movement was sown, to divide the people on the basis of creed and caste. But the very term 'Unity in diversity' was coined by Vincent Smith, a civilian cum historian of India in the 1920s. By these words he must have mentioned the unitary nature of the Indian society and not the British state system here. Even this unity was not the creation of the Indian nation post 1947. A deep sense of unity amidst its socio-cultural diversity had been detected by Vincent Smith, the civilian cum historian. The British could only bring such diverse elements within a broad administrative and territorial unit. Presence of innumerable big and small, even miniscule ethnic groups with their language, sometimes not in script; religions again sometimes only in forms of totem did not prevent people in sharing their territories with others. Some of these groups or tribes had fought with the foreigners to protect their own identities and lost. Their defeat in war field failed to dilute their traditions and cultural roots within a bigger world. In free India Jawaharlal Nehru decided to give equal weightage to all the traditions and ethnic values. While describing the position under Nehru for preserving the traditional Indian philosophy in 'new' India Prof. S. Gopal once mentioned that "This will also help us to see what truth is in the oft-repeated charge that India has never been a nation and was always a prey to anarchy and invasion till the British came. But even in the remote past there has always been a fundamental unity of India—a unity of common faith and culture." (S. Gopal ed. Jawaharlal Nehru : An Autobiography. New Delhi. 1983. P. 8). It has been widely admitted that heterogeneity within Indian society and culture had not been a new import. It was the principal thread of unity of this great race. It is the historical evolution of the Indian society and its socio-cultural traditions are eclectic spiritual integration. This integration was made possible mostly by voluntary submission and that too by not a total discard of individualism. Hence, local sub-cultures and an intermittent, unstable and discontinuous political centre continued to stay. Such diverse features went into making a plural 'multi-centre' social tradition, keeping the great variety and heterogeneity in a 'continuous pattern of coexistence'. In India major traditions had their roots in religions, a vast number of which were active for long. Often religion and its practices were subtly inter-woven with

NSOU • GE-SO-11 27 caste. Primarily within the Hindu social order occupational castes have their own and distinct faith. This faith has worked as a primary binder of the community. In the process presence of 'gotra' also had its share of contribution. Innumerable village with people professing identical 'gotra' still exist. The 'gotra' gives a sense of social unity which very rarely could be ignored. Since the day one when indigenous society had been taking shape both family and relations grew simultaneously. Tradition in India was and still is to accommodate all the elements from outside. Though family life was guided strictly by certain rules framed within scriptures those sometimes became corrupt due to inflow of foreign elements. One aspect of Hinduism is the absence of a well-worked out theory or practice. 'The culture of the low castes incorporated forms of worship and practice which differed from that of the high castes, leading to a fundamental dichotomy between notions of Sanskritic Hinduism and popular Hinduism.' (Imtiaz Ahmad; op.cit. p.161). But the Sanskrit sourced do not provide a single model but many model some of which stand opposed to each other. For this the philosophical tenets do not provide a singular mode of practice and worship, but a lot of numbers. Consequently, orthodoxy either within texts or in practice is absent. This is the tradition of India. But irony remains in the other form. Liberal though in religious thought social customs continue to be rigid. Social stratification in some parts of India is still serious as well as severe. Untouchability continues through every Indian enjoys right to vote and to be elected. Acquisition of high ministerial berth even through democratic process has failed to remove the caste stigma. Some reputed temples also refuse entry of the untouchables. Gandhi started a movement of temple entry for every Indian and also promoted depressed communities. He used to call the untouchables, 'Harijan' meaning sons of the god and started publishing a paper in the same nomenclature. But all his efforts failed to improve the situation. Growth in English educated population in the late-19th century brought some radical changes. The process had already been continuing since the days of Rammohan and the Young Bengal movement in the 1830s in Bengal. After 1857 and with the establishment of three universities in three Presidencies urge for western education grew and with its westernized people started leading social life. It is true that their presence was limited within urban areas. But those urban intellectuals sowed the seeds of modern India. Whether it was Rama Krishna Pramhansa, Keshab Chandra Sen, Swami Vivekananda, Swami Dayananda, Madhav Govind Ranade and men like them or Sir Syed Ahmad Khan the goal was to cultivate modern thinking. Religious reform movements stimulated cultural rejuvenation. Previously, in the name of

28 NSOU • GE-SO-11 orientalist learning the hidden policy to establish superiority of the occident had been subtly undertaken. But the second half of the 19th century India started to identify its own strength. In that way the western influence was much deeper primarily the coastal regions and the regions where the Hindus highly outnumbered the Muslims or where as in Bengal the Hindus occupied influential positions (Sumit Sarkar; Modern Times : India 1880s - 1950s.. New Delhi, 2018 p. 311). But it will be wrong to think that the Muslims lagged far behind. Prof. Sumit Sarkar understands that their position in the western United Province (now Uttar Pradesh) was an exception. With a rich Urdu cultural background the Muslim 'asraf' gentry constituted cultured gentry there. Before 1857, the policy of the government was to act in tandem with them for which association of the Urdu-speaking Hindus joined hand with the Muslims and established the Delhi College. There Urdu was the medium of instruction even in the Science faculty which had still been not possible in Calcutta or in Bombay. But the rebellion of 1857 changed the entire environment. The Hindus were now favoured by the government and on account of pressure from the communal elements within the Hindus the Persian was replaced by Hindi in nagri script in the law courts. This official change brought such cultural milieu which ultimately divided the elites first and then the masses in northern India. Some enlightened in India viewed the progress of the west (to them it was primarily Europe and most probably excluding its eastern part with Russia) due to the presence of secular ideas. One contingent feature of European social order after secularism became established as the principle of social and political life was tolerance. Since the late 19th century intellectuals started adorning secular values. These secular ideas had been practiced and that too very radically by some students of the then Hindu College in Calcutta. They were called the 'Young Bengal' or the Derozians (the pupils of the young professor, Henry Louis Vivian Derozio of the College). But these chosen few failed to popularize their ideas. Secular ideas were propagated chiefly by the western educated few who used to stay and preach in the urban areas. With the birth of Indian National Congress Indian could achieve the first goal i.e.; a political platform which could accommodate all views. Still regional divides along with caste division persisted. Both religion and caste could make deep impact in India's social and political life in the initial decades of 20th century. Often people from the down-trodden castes within the Hindus and the minorities looked on going freedom struggle at askance. The debate of majority versus minority, in fact, had its origin in the 1880s with the birth of the Congress. The leading figures of the Congress were chiefly high-caste

NSOU • GE-SO-11 29 educated Hindus though a few like Dadabhai Naoroji or Badriddin Tayebji could be found. Formation of the Indian National Congress in a sense fuelled suspicion in the minds among the minorities. In 1906 some leading Muslims formed their own political platform, the Muslim League to protect their interest. Bengal was partitioned in 1905 in such a manner by which the newly created province of Eastern Bengal and Assam could have a Muslim majority. The demand for annulment of the partition and a vigorous movement for it made some leading Muslim nervous. They chose to have their own political agenda and a party. Formation of the Muslim League was meant for that. In 1909 to place their demand of separate electorate for the proposed Council elections they led by Aga Khan met the Viceroy at Simla and finally succeeded in achieving their goal. This was the beginning of a politics based on faith, hitherto unknown here. When the minority, Muslims could convince the colonial masters the down-trodden among the Hindus followed suit. The Census of 1931 identified and listed the untouchables and other castes in the lowest strata of the Hindu society. Meantime the Congress led by Gandhi had started civil disobedience movement. To tackle the movement and to bring some changes in governance the government called for a round table conference at London. In face of this Dr. B. R. Ambedkar raised the issue of the depressed classes. He demanded for separate electorate for them. The Congress raised strong objection but failed to convince any of the parties. Previously it was religion which divided the Indian 'unity' and now it was the turn of the caste. For such atmosphere social coherence started disappearing. Now religion along with caste raised their heads and with passing of each day the gulf between the majority 'Hindu' and the minority began to widen. Now to the depressed castes started distancing themselves from the upper castes who got a sudden degree of solace in the freedom struggle and projected themselves as sole spokesmen of their entire community. But the depressed people did not subscribe to that position. Hence the gulf could not be narrowed least to fill. Even Gandhi's fast and subsequent Poona Pact somehow brought peace. But the break between 'majority' Hindus representing high and intermediary castes and 'minority' Hindu consisting of down-trodden remained. In the far south, especially present Tamil Nadu a rich literary and cultural tradition laced knittly with religious fervour' emerge on closer look as significantly different in implications from the cult of tamil tai (Mother Tamil)in the '20th century (Sumit Sarkar, op.cit. p. 331) It is well-known that the earlier part of the 19th century the Tamil officials used write an official letter in Persian, land deals etc. in Marathi, study music in Telugu, performed religious

30 NSOU • GE-SO-11 offerings in Sanskrit and correspond among themselves in Tamil. But with the passing of time vernacular was popularized which brought the people closer while enriching the language itself. (Sumit Sarkar, op.cit. p. 331) Growth of some vernaculars like Oriya and Assamese had nearly the same history though both were nourished to oppose Bengali which had been in use in government offices and in law courts. These are some broad features of the growth of regional linguistics and culture in some parts of the country. But in the other way these changes also sowed seeds of division. It has been widely believed that due to the policies of the colonial rulers Indian social fabric got punctured. But the Indian social order which was also closely linked with economy as well as education also had a distinct role. Social reform movements though spearheaded in some parts of the country and religious reforms like the Brahmo and Arya Samaj movements could only brought changes in limited scale. Basic arrangements continued to be unchanged. The leaders of the Congress were aware of the situations but could do nothing to amend. Moreover since the days of the Swadeshi Movement under current of hatred for the Muslims started flowing among the majority community. During those days Bengal had its pre-eminence both in politics and in culture. The divide could not be healed though Bengal was re- united in 1911. This situation ultimately alienated the Muslim minority from the main stream politics. Gandhi's movements enthused large number of people but association with the Muslims is still not beyond question. To mend the fence the Congress leaders jumped into action and that too during 1937-39 consequent to the implementation of the Government of India Act of 1935. Here again, its sphere of action was limited in the then United Provinces, Bihar and Bombay where it formed governments on its own. Then it tried to gain confidence from all, especially of the Muslims. But that was too late. Muhammad Ali Jinnah's rise and his Two-Nation theory finally triumphed. India has a long history of rule of minority communities who came from outside but prior to the invasion of the English all invading mass adopted India as their own land. Oppressions of several kind for generations failed to divide India. But twentieth century witnessed the power of religion and community on the basis of which a new state Pakistan was born. Akbar S. Ahmed while describing the Pakistan movement writes, 'Pakistan meant more than just territory, more than a defined area with boundaries. Pakistan meant a culmination of a Muslim movement rooted in history.' (Jinnah, Pakistan and Islamic Identity : The Search for Saladin. Karachi, 1997. P. xviii) Hence, the sense of separation on the basis of religion had not been a new nor novel phenomenon.

NSOU • GE-SO-11 31 Free India inherited the politics based on religion and caste. It is true that with the creation of Pakistan and partition of the Punjab and Bengal huge number of Muslims went to Pakistan. But the Hindu minority in the newly-created state had to migrate into India as they were not treated there on equal term. This created new problems. As free India adopted secularism and the Westminster model of parliamentary democracy right to vote was given to all. Though Pakistan was created on the basis of religion all the Muslims did not leave India. Now they decided to protect their interest. On the other hand, the Hindu majority was not truly united. The depressed class within it along with the tribes enjoyed reservations both in legislature and in government employments. This was a huge task and the leaders dealt this as efficiently as possible otherwise India could have been Balkanised. With the growth of communication and spread of the Aryans in the deep of the Gangetic Valley two major things happened. First, the Aryan social order was constantly increased with involvements of several tribes and groups whom the Aryans were able to conquer. Secondly, stratification process was initiated. The true and pure Aryans constituted their own society who demanded service and various obligations from those who had been subjugated. This social discrimination was so strict that the vanquished tribes who were the original inhabitants of the land had lost all the social, economic and political power. The Dasa was only to serve the people in the higher echelon and to carry out their dictates. Oppressive rules were inflicted to keep the social order intact. But this failed to survive for eternity. Aspirations of the people in the lower strata and accumulation of resource pursued them to think otherwise. Apart from this marriage among the communities also facilitated a social change. Ownership patterns of land could not be changed but trading activities played havoc. From the Dasas grew the Vaisya, the trading community who could increasingly command the resources available. Expansion in territorial limits of the kingdoms expanded the communication network too. Regions in the farthest areas were gradually accessible. Administrative requirements paved the establishment of markets where mutual connections among various types of people could also be established. Economic expansion ushered in new mode of religious performance by discarding the earlier forms where huge Yagnas with animal sacrifice was a must to the privileged ones. Those for long had been denied to take part in such rituals now demanded their shares. They now adopted a novel mode without any serious tremor. The period around sixth century B. C. E. Mahavira, the Jain monk and Goutama Buddha initiated newer methods of religious performance. Both of them renounced earlier forms and practices. Instead they preached universal tolerance by which social divisions lost importance. The Jainism could not spread itself in major parts of India and it was limited primarily among the trading communities in the western and some portions of the peninsular India. But the message of Buddha got such acceptance in many parts of the continent that ultimately India has been known as the land of Buddha. It used the language of common men in spreading its messages. Prakrit or Pali assumed the position of lingua franc. Hence, Buddhism was not confined in a particular place neither within a particular community. Its appeal broke all the barriers and in one way unified a lot. From the days of imperial Magadha Buddha started gaining relevancy not only in religious or social but also in political lives of people. Under Asoka state patronage took such a turn that diplomacy also revolved around the tenets of Goutama Buddha. This unique feature in the Indian statecraft when education was too limited made this land a place of surprise to the outsiders. The phenomenal growth in the Buddhism made its position vulnerable even within its followers. India in the dawn of the reckoning under Common Era assumed enviable position by absorbing several foreign elements within it. Alexander's invasion in the fourth century B. C. E. and subsequent connections established by a number of tribes far away from India. Regular communications and trading activities reached their height during the rule of the Kushanas who themselves were of foreign origin. In course of time, the Buddhism was adopted a number of countries where Indian culture got easy acceptance. The Buddhism opened huge avenues of learning, painting sculpture and also architecture. "The art and architecture of Burma, (Myanmar), Thailand, Korea, Japan, and China, and hence world art, would be much poorer without Buddhist motifs developed under Indian influence." (Kosambi; *The Culture and Civilisation...*p. 96) Wide influence of India upon the daily life and spiritual world of a number of countries since the days of the Mauryas remains an accepted fact. It is a fact that the statecraft in Tibet till 1959 remained under a strong Buddhist influence. A number of countries in central and South East Asia not only adopted Buddhism but used to believe that Buddhism had been the guiding force of their civilization. Most of the classical Mongol and Tibetan literature were nothing but offshoots of Buddhist literature and philosophy. Not just religion but the way of life was also guided by the same philosophy. A number of temples, monasteries in numbers of countries in the South East Asia still carry traditional rituals with great reverence. Though Buddhism has lost its place in central Asia presence of a huge number of ruined stupas (relic monuments) and recently destroyed gigantic statue of Buddha in the Bamian cave in Afghanistan are the relics of Indian influence in various forms.

NSOU • GE-SO-11 33 In the spiritual world India's presence got acceptance in a far away land and among the races of different source. Buddhism "not only influenced Manichaeism but must earlier have helped in the formation of Christianity. The scholars who wrote the Dead Sea scrolls. Though good Jews, show peculiarities that appear to be of Buddhist origin. Their practice of living in a monastery almost on top of a necropolis would be repulsive to Judaism, though quite agreeable to Buddhists. The 'Teacher of Righteousness' mentioned in the documents of this (probably Essene) Palestinian foundation bears the precise title of the Buddha. It is not, therefore, surprising that the Sermon on the Mount should sound more familiar to Buddhists than to the followers of the Old Testament who first heard it preached." (Kosambi; op.cit. pp. 96-7). Often Buddhist principles got precedence over a Semitic faith. Religious and some traditional practices even in Arabia were emanated from Buddhism. Achievements of Indian thought and practices could be possible due to the strength of adaptability taught in Indian philosophy, and here lies its success. The strong message of Buddhism encompassing all the segments of a social order infused required vitality within it. Ultimately, India's way of life was transported to those lands. In this way Asoka became a name to reckon with in faraway lands when the venerated monarch had lost all his glory within India. More significant is the fact that after a near total eclipse of Buddhism itself in its place of origin it survives still in some of those countries. Through the rise, growth and its decline Buddhism transformed a tribal society into a monarchy with absolute authority and then to feudalism. India was able to maintain a close co-habitation of monarchy with oligarchy and finally with republic in the shapes of sixteen mahajanapadas (principalities or/ and kingdoms) Buddha himself arrived during those days. Rise of Magadhan Empire wiped out small kingdoms and presented an economy under which trade and commerce could flourish. Creation of wealth was started and communication with various regions developed. These acted as conditions for a unified social order covering a number of regional practices. First Jainism and then Buddhism assumed the thread for unifications. Success story of the latter has already been mentioned. But none can deny the role played by Jainism which still being practiced by a good number of people in the western and southern parts of India. Apart from these major two there were others too, most important of whom were the Ajivikas. For the absence of stories of mutual hatred the prevailing peace and respect for each other helped in developing schism in society. It was not a novel one. Since the days of composition of scriptures questions were raised by the Charvakas who sometimes challenged the presence of all-powerful being. Their arguments though

34 NSOU • GE-SO-11 not so popular but were churned in many ways. Finally, majoritarian views had to incorporate some of the core ideas coming out from different sources. Side by side Jainism and Buddhism a school of monotheistic order also got credence. It is not surprising that the Vedic rituals and Brahminical practices as preached through the Brahmins could not overshadow the Upanishadic teachings. Importance of the Upanishads can be judged when one traces the rise of the Brahmo movement in the 19th century Bengal. A learned as well as modern man like Rammohan Ray took refuge under the tenets of the Upanishads while fighting the Christian missionaries working for conversions in India. Rammohan discarded idolatry without having moral and scriptural support from the Christians who were hell-bent in discrediting Hinduism. To the foreign masters, particularly in the 19th century Indians were nothing but fallen children of some glorious clans once who could nurture civilized way of living. Rammohan and then others like Swami Vivekananda, Keshab Chandra Sen, Swami Dayananda to name a few after him took cudgels to establish the vibrant nature of the Indian civilization. Their motive was to establish such an identity of India which was able to adopt everything good and vibrant and to rectify the anomalies as and when required. India also went through the days of Sankaracharya whose primary aim was to clear all the misgivings of Hinduism. In doing so he decided to demolish all the practicing religions prevalent during his time and to present a unified character of his 'India'. In a way Brahminical superiority was established. Along with this position Sanskrit regained its position. In theory the Vedic texts remained immutable, Sanskrit as living language had started adoption of regional variations. Cultural changes predominated by not affecting core points. "High culture was associated with the elites at various courts and focused on the aesthetics expressed in creative literature, sculpture, architecture and philosophy, together with their style of life. Quite apart from the elite, it was also assumed that ordinary people were materially well off, with little to complain about." (Thaper; Early India. p. 280). But complaints were there. Sanskritisation of all phases of life certainly affected the people living in lower strata of society. Starting from the period covering the 5th and 6th century C. E. caste became dominant. The Brahmins could own land but could not plough. Engaging hired labour was essential for food production. Similarly, a variety of occupations gave birth to a number of occupational castes some of whom were clean and the rest unclean. Varied nature of local customs prevailed and for this occupational castes

NSOU • GE-SO-11 35 barring some could be involved in the social structure. Another very important difference made distinct change in their status in the north and in the peninsular India. The Dravid community's adoption of certain Aryan values and above all language for rituals brought them closer to the Aryan core pattern. Though social customs did not match religious ceremonies acquired similarities gradually. Through these a pan-Indian fabric could be weaved. Wealth of India and internal strife, particularly in the north allured foreigners for long. Within a very short period after the death of Mohammad western India was invaded by the rising Muslims from Arabia. Its effect was nothing. But with the beginning of the 8th century India's north-west became an easy prey of the invaders. The onus in protecting the borders was assumed by the Rajputs who became champions in protecting the Brahmins and also cow. Now these became viewed as performance for Dharma which must be the Karma. In this way Hinduism began to be practiced. But the very origin of the Rajputs was not beyond dispute as it was widely believed that their ancestors were first Hunas and then Gurjar-Pratiharas. With this hazy ancestry they were considered the standard-bearers of the Hindus in face of constant threats. In one way divergent culture and way of life became integral part of Indian scenario. Islam after a long and bloody endeavor could succeed in occupying India. Their arrival put Hinduism in a challenge. Plunder and destruction of places of worship and conversion jeopardized the established social order. But in spite of several attempts and those for several centuries basic structure of the Indian society remained more or less the same. Though some Brahminical privileges were threatened orthodoxy practiced as a way of compensation. Traditional Hindu society was now strictly compartmentalised. Caste became synonym of class. The ruling community was by and large warrior and learned cleric. On the other hand, the general administration and particularly, financial one with trade and commerce became monopolized by some communities within the Hindus. These close contacts sometimes opened avenues for co-operation. In face of the Indian traditions the invaders could hardly remain pure. They saw the classification of their society into Asraf elite) and Azlaf (commoner) sections. Hence, social division remained too distinct in both the communities. Dominance of upper caste or ancestry whichever suits shaped the community behavior of both Hindus and Muslims. This continued for generations. Even the more powerful and 'enlightened' foreign rulers in the late 18th and 19th centuries failed to alter. But these divisions could not deter the cultural unification which can be considered the soul of Indian civilization.

36 NSOU • GE-SO-11 Contact with Islam helped to develop some social patterns. The Hindus were too much involved with caste of a person for which India had failed to innovate technological devices. Occupational castes were considered lower for which scope of their mental upliftment was too remote. The Muslims were least concerned with caste. They were interested in production for which slaves were set free for their greater service to the masters. When the growth from below was accepted then liberal attitude towards faith was also encouraged. With the spread of Sunni faith schism also developed since 8th century. Hence, traditional Islam arrived with Sufi saints. These saints were often opposed to the Koran and Hadith and were determined to preach the sermon of universal love. They were greeted in India since the Bhakti cult had already been practiced here. The Bhakti movement was originated in the South revolving Siva. This practice transported to the Gangetic provinces during the Tripartite Struggle in the 10 th -11 th centuries. In the north Bhakti evolved with the worship of Rama and Krishna. Like the Sufis the followers of Bhakti cult tried to demolish caste barriers and made bridge between the two rival communities. Though looked by the leaders of the society at askance appeal of these cults and their saints to the masses cutting all barriers is still vibrant. 2.5 Summary Several religious movements helped regional languages to grow. A huge number of hagiographies along with prayers sometimes in form of songs and music produced huge amount of literary works. Songs like Bhajanas and Qwalies enthused mass participation irrespective of religion, gender and language. In a way traditional as well as classical literary works lost importance to the works composed eulogizing the cult. Islam also brought a new language in India. Initially, it was Arabic. But during the Mughals Persian became the court language and a new one, Urdu emerged for the masses. This became a lingua franc India is a land of any languages derived from opposing cultural entities as we have noted earlier. The languages chiefly spoken on the north of the Vindhya had their origins in the Aryan group of languages either in closer or in distant way. But the languages spoken in the peninsular India are quite different. In a number of surveys, it has been proved that spoken words though vary within a mere 1 to 15 kilometers the scripts are uniform. This script helps people in a wider perspective to remain united for centuries.

With the passing of time the Indians steadfastly tried to absorb all available customs in their daily life. Hence, the Vedic rituals though in modified forms, the Jain and Buddhist customs in different and sometimes in contradictory modes, the Islamic customs and those also in two broad arms are still practiced by the people. Number of non-believers and atheists are microscopic meagre. Since the 39

40 NSOU • GE-SO-11 number of the Hindus is overwhelmingly high in respect of others their dominance in the social and cultural lives are imminent. Here, in India religious customs in too and many occasions are allied with daily life in inseparable ways. Not necessarily the followers of this faith use to follow the religious dictums as the other principal religions ask their respective followers to do. But the vast number of people following the Hinduism have already embraced the rituals as the customs of their daily life. These have been going on since the time immemorial. The traditional Hindu social order was created and then historically maintained to preserve the caste system which is largely based on individual professions. In preserving this pattern the Hindus have failed to honour the merit of individual barring him or her to proceed or ascend the other caste. It is nothing less than a stigma in society. 3.3 Social Revolution Now the question arises whether the social orders could be torn apart to accommodate others who do not belong to that strata of the society. We know that Mahavir, the Tirthankar and Goutam Buddha initiated a social revolution through which mainly the intermediary castes were able to break certain traditions. Their movements assumed such importance that people, irrespective of wealth and social standing embraced those religions. Even some very powerful and authoritarian rulers also converted themselves in those faiths. They acquired the status of 'religion of protests'. The protest was against the traditional customs which had been preventing the enterprising members in the lower strata of society to move forward. No doubt that those movements ushered in a new way of life in the sub-continent. This was not confined only in rituals and customs but could make headway in creating noteworthy cultural and intellectual atmosphere. But rejuvenated traditional forces succeeded in the fourth/ fifth century in dislodging the above two. Since then the social orders were built up in such a way where scripture values started dominating. Interesting enough the scriptures did never acquire a universal acceptance. With the passing of time dominance of the north and central Indian traditions as well as culture gained ground. The land called 'Aryavarta' had and still has strong differences with the land of the 'Dravida's. Not only linguistics and costumes but also food habits along with mode of worship are sharply different. With the arrival of the Muslims a different religion with its culture also available. Hitherto unknown traditions and behavioural patterns could be found. Primarily the Rajputs fought with the invaders and tried to prevent their suzerainty in the north and the central parts

NSOU • GE-SO-11 41 of India. They failed. Their failure was chiefly due to their segregations from each other. The Rajputs were divided into several clans and fought for years to put the opposite clan under one's dominance. These clan divisions had emanated from their age-old belief relating to their respective lineage. Inter-mixture in any form was strongly discouraged. Hence, each one of these clans had developed their own cultural identity. Emergence of different units within the indigenous communities did not confine within the 'Aryavarta' but also spread out in the peninsular India apart from the east and the Deccan. Rapid spread of Islam chiefly in the eastern India with the growth of agriculture and reclamation of un-inhabited parts once full of forests and riverine marshes helped to develop a mixed culture. With the arrival of traditional Islamic order some strong dissenting force within also made their presence felt. The Sufies in various orders (Silsila) were very active particularly in the rural life of India. On the other side, the cult of 'Bhakti' which broke the jinx of established rituals and religious customs within the Hinduism found wide acceptance among the downtrodden and the people of the lower order. All such orders juxtaposed in many forms created a new social dimension which by itself became a new cult. They did not, even do not present uniformity. From region to region and from caste to caste such practices vary. For centuries a large number of tribal communities had been able to protect their identities and customs. In some cases though they were absorbed in the traditional social as well as religious orders they seldom discard their way of life. At least one very common example in their assimilation with the traditional faith can be cited. It is commonly believed that the deity of Lord Jagannath of Puri had its origin in the religious practice of the Sabar community of ancient Odhisa. The Sabars can still be found in limited number. Adoption of the deity or the religious culture of marginalized community far away from the traditional Indian social order proves the power and strength of it in those days. But irony lays elsewhere. Presently, the Sabars don't worship their deity and the Lord Jagannath has become a symbol of ritual for innumerable numbers who follow traditional faith.

3.4 Social Orders

Social orders take shape when response from one of its members is given by his or her fellows living more or less in same environment and condition. In course of

42 NSOU • GE-SO-11 time, social behaviours generate traditions. The sociologists suggest the reading of Indian culture with the help of two different concepts viz.; 'Little tradition' and 'Great tradition'. This very concept strengthen the idea that the civilization and social as well as cultural organisations have their traditions. Initially agrarian economy and society gave birth of some customs and rituals. They took refuge to nature as for the nature they were living and earning livelihood. All their deities were nature's produce. Hence, totem became inseparably allied with their daily life. This pattern is common throughout the world. With evolution of time various novelties were incorporated which act as the founding stone of modern social systems. Orthogenetic evolution indicates changes in those areas where internal or indigenous factors work for some very essential changes. On the other hand, heterogenetic contacts indicate those changes which occur due to external contact or interference of outside civilization. Some suggests existence of two levels where the social structure of these civilizations operate, i.e.; at the level of folks or peasants and at the level of elites of 'reflective few'. This has been a continuous phenomenon and ultimately produces a mosaic in society. Since the agrarian community or the peasants are usually confined in particular pockets of a country they are seldom exposed to outside culture. However, in the course of last one hundred years or so mixture of various cultures and ethnic communities nearly destroyed the rural identities. The folks or the peasants are included under little tradition and great tradition includes the elite groups or 'reflective few'. But it will be wrong the think that they stands strictly on separate alters. Both of these are inter-linked and constantly interact with each other. From such interactions emerge all sorts of changes and growth in cultural structure of traditions. Hence, one may conclude that all civilizations start from a primary or orthogenetic level of cultural organizations. With passing of time both the internal growth and external contacts help to build newer traditions. The society being exposed much to the outside world has been able to modernize itself.

3.5 Role of Eminent Anthropologists

It is known today that Milton Singer and Robert Redfield developed the twin concept of Great Tradition and Little Tradition while studying the orthogenesis of Indian civilization in the then Madras (modern Chennai) city. Tradition means handing down of information, belief and customs by word of mouth in way of

NSOU • GE-SO-11 43 examples from one generation to another. In other words, tradition is the inherited practices or opinion and conventions associated with a social group for a particular period. For constant practice of the usages attitudes of the people take shape. Hence, interactional patterns and socio-cultural institutions emerge for posterity. Like Milton Singer McKim Marriot also have conducted survey at KishanGhari village of Uttar Pradesh. His field of study covered rural area unlike of Singer. Needless to say that urban society is more exposed to foreign elements vis a vis the rural one. Still McKim found that there is constant interaction between Little and Great Traditions. He concludes that Little Tradition consists of local customs, rites, rituals, dialects and Great Tradition contains legitimate form of all these things. Traditions in many forms have thus emerged which stitch the social fabric consisting of innumerable units. McKim has found that when Little tradition and Great tradition interact with each other two types of movements are observed – upward and downward. When the elements of Little tradition move upward, McKim calls it as 'Universalization' and when some elements of Great tradition move downward it is called as 'Parochialisation'. This type of interaction is reflected in different areas like village community, caste system and so on. This creates a common cultural consciousness among Indians. The common cultural consciousness has been formed by certain processes and factors such as sacred books, rituals etc. Constant interaction between Little and Great traditions helps in cultural continuity in the face of modernization which sometimes create havoc in established social structure. As noted earlier India possesses certain degree of uniqueness due to intrusion and assimilation of various foreign elements from time immemorial. Beauty of the Indians is that they had refused to forego their traditional values and beliefs entirely. This could be possible for the constant interaction of Little tradition and Great tradition in various forms. As we have seen for centuries India has been a place of mixed social and cultural traditions. Multi-ethnicity is the major ethos of this country. In fact, geographical texture and natural produce shaped the livelihood of the people of the region. The evolution of culture, mainly in Indian context is the interplay of two factors the physical environment and the metaphysical ideas. As noted earlier new movements of emerging faiths within the broader world of traditional religious order introduced changes which though very effective but never destructive. The complex

44 NSOU • GE-SO-11 formed from these elements is called as national culture. With the diversified landscape the production of crops varied from each other and thus the India's economic life developed on an agricultural pattern and this had a marked influence on the shaping of her culture as a whole. No doubt, that the foundation of Indian civilization is totally based on agriculture. Conflict and co-existence of two traditions and cultures are vivid in the rural life of India. Tribal communities in different parts of India still practice their own religious rituals and cultural traditions. Again the same people willfully attend the religious festivals of the majority community. This co-existence is a marvel in the social fabric of the country. This tradition is sometimes termed as a position on middle ground. To some the relations between little communities and 'civilized' mass "may be likened with some justification either to the primitive or to the modern Western extreme." (Village India p. 172) The primitive communities are viewed as the 'world' within a highly cultured and advanced social order. To the anthropologists this is unique since the little communities have never diluted their cultural and religious moorings while participating in the major events descending from traditions. For such behaviours the traditional Indian village in many cases despite their modernization still conceived as the extension of the primitive pattern of life. As example, one may cite the existence of little communities though influenced by urban way of life long ago in Kerala, Karnatak, Jharkhand and in Odhisa. How these people have been able to do so? This was made possible due to a " high degree of economic self-sufficiency, political solidarity as against the outside world, and a sense of ritual integrity." (Village India, p. 172) One striking view for such a scenario is that prior to India's colonization by the British Indian villages normally existed in "isolation" from the rest of the world. This state of thing actually shaped the destiny of the villages who succeeded in building a self-reliant economy for themselves. From this economic strength emanated a force to keep cultural identity. The colonial masters were only interested in collecting rent and revenues without disturbing the social behaviours. Since intervention from state was nominal the tribes were able to keep their own respective positions as they had been. No doubt, fissures in the shape of rebellion broke out from time to time. Bone of contention was primarily enactment of forest acts by dint of which the government made the forests and forest products including animals state wealth. But the rebellions did never take an all – India shape and the government was able to put those down at different times of outbreak. Hence, the then state only developed a relationship attached with sovereignty. For such an arrangement village life in India continued to exist in its traditional form.

NSOU • GE-SO-11 45 3.6 Integration of Village It can't be denied that India has remained united entity despite of its diversity. It has become possible for the give and take atmosphere prevailing for generations. People in India seldom wish and try to break the social chains. Though inter-caste as well as inter-faith marriages have taken strong roots among the members of the traditional societies this practice is still not so popular among the tribal communities and not among the village-dwellers. The villagers whatever tradition or faith they follow still are averse in adopting newer practices. Hence, traditions among the little communities continue. Though the Indian villages often found to be unified in character but they are actually complex while considered in terms of great traditions of Indian civilization. If considered in details then one can easily find several differences of peasant customs more clearly than a lifelong "poring over the Vedas." As already mentioned that differences in many fields exist from time immemorial between the tribal life and the traditions. Not only the tribal villages but village life in general does not necessarily go along the set customs and traditions derived from the ancient texts and scriptures. Holistic and isolated conceptions of Indian village communities are studied thus far seemed most appropriate to students of social life in faraway areas. Still the customs of marriage and even inheritance differ from village to village. As is well-known that the Indian villages were set and grew following caste lines of Indian social order. Hence, it is presumed that all the villagers belong to a single family tree. This is very common among the villagers to accept the village customs which often do not conform to traditional ones. Interesting to note that most of the villages are still connected with outside world primarily for political as well as administrative reasons while maintaining their age-old customs during social and religious functions. There are supralocal patterns too. To study these some scholars suggest that some structural unit larger than the single village might more appropriately be taken as a microcosm for holistic study. (Village p. 173) From outside, it is difficult to assess the contents of the customs of a single village and to draw a uniform picture. Marian Smith, writing of North Indian villages in Punjab, takes further note of ways in which traditional economic and religious organization run far beyond the village. She suggests that some structural unit larger than the single village might more appropriately be taken as a microcosm for holistic study. (Village. P. 173). Similar picture can be availed from the villages in the South. There too. It is very difficult to interpret the rituals and beliefs of Coorg villagers

46 NSOU • GE-SO-11 without tracing the same rituals and beliefs to literary levels in the much larger units of region and nation. If assimilate all the findings gathered from various parts of India then the individual natures of self-created world of Indian little communities can be assumed. While addressing the problems we cannot say both that the Indian villages are yet to break the shackles of the past and to adopt some systems outside its own ambit. To the sociologists the value of the great traditions of India is as relevant as the peasant lives in various parts of interiors. To understand the both one has to dissect the social fabric at various levels. Value of land and also its possession are very important. Similarities attached with this question among the villages dominated by the Hindus and by the Muslims are seldom common. The same is true when one ventures to study a tribal one. In the 21st. century and under a democratically elected government a sea-change has occurred especially, in administrative and in economic lives. Those changes sometimes affect daily life. Holding pattern of arable lands and in some cases homesteads have also changed. Though the law forbids purchase of lands by non-tribal in tribal villages in recent past the state has come in the scene. For development works and for industrialization the land-holding patterns have changed sharply. In majority of cases tension brew when the state decided to act. These have been causing concerns to the people. It is false to presume that all along the people in the villages used to live peacefully. There are certain internal divisions of economic interest among groups of landholders and the other below to them. Pattern of agriculture is such that tillers are divided into many sections. Traditionally, the Indian villages had khudkast's (i.e.; tillers of the land belonging to the village and in majority of cases belonging to dominant caste) and "pahikast"s (i.e.; tillers brought from outside). Hence, tensions in terms of caste and holdings of land were very common. Incorporation of foreign elements in the social order are not unnatural. With the association of others in the village the economic activities also acquired some degree of novelty. Those who came from outside brought their own customs and rituals. Moreover, for economic needs a single village could not remain strictly isolated in the broader economic arena. The villagers have to establish contacts with outside for their own needs. They are to sell their produce and to buy other articles which cannot be produced by themselves within the village. In this process, a small unit like a particular village gets into direct contact with a greater one. Another very important source of contact was regular visits of agricultural

NSOU • GE-SO-11 47 labours from outside during harvesting. This may happen twice in a year. The people thus coming also bring their respective social behaviours and cultures. They usually do not permanently stay and their character may vary from one year to another. These migratory labours seldom intermix with the local people. But they leave the signs of their social behaviours. Sometimes the apparels they wear and language they speak also have a certain degree of influence over the local population. Immigration thus facilitate inter-mixture in various levels. While people coming from outside has some value similarly migration also occur. Primary reason is economic. But the people going outside and that not necessarily to a particular place also carry their own culture and language to those places. The ultimate result is the mixture between great and little traditions in several forms. In face of the situations in most of the villages internal divisions are quite normal within each of the villages. Daughters of the village move out and wives move in in many such cases. Any survey to ascertain actual picture can reveal the true character of a village. With the spread of basic education villagers now become well acquainted with the affairs of outside world. Education helps to build some very common sense which in consequence act as the bridge between great and little traditions, faiths and customs. Besides, such environment, the gap between rural and urban societies are daily being minimized. Fast and cosmopolitan urban life invade the village for which the villagers are now more attracted by the outside world. Each Indian village has normally its own deity to worship. Often the presence of a big temple or a mosque is not certain. Even presence of crematorium is not certain. The villagers use to worship a sacred tree or a place in case of a Hindu village and a burial of a saint in case of a Muslim village. In the tribal villages tree- worship is much popular. Often the priests or preachers as the case may be are brought from outside. It is a common view that the forte of identity is the religion and the way of its performance. But people also join spontaneously in the bigger and traditional festivals like Dasserah, Holi, Diwali, Eid, Muharram etc. During such celebrations local identities become lost in the bigger or universal ones. Some villagers have also converted into Christianity. In some parts of India conversions are not so old. In such villages the people use to offer some cocks or hens as sacrifice at the altar of their church. In doing so they wish to carry out their age-old customs though not in conformity with the Christian rituals. These are ample examples of mixtures of rituals. Hence, the religious and social fabrics of a village present a mosaic in daily life.

48 NSOU • GE-SO-11 While adopting great traditional orders the villagers as little communities have no close coherence or well-bounded physical locus. It has been an accepted fact that as parts of the little community reach beyond the physical village, while many parts of other communities and of the great community reach inside the village. (Village p 175) Sometimes a village is a nexus of much informal activity among nonkinsmen and noncastemen. Assimilation of people takes place since they use to reside side by side and take parts in all social and economic activities in conjunction with each other. For so many ins and outs in the rural society it may acquire a newer type of civilization as 'secondary'. It is said that urban communities and urban culture in such secondary civilizations are necessarily different from the society and culture of the indigenous folk. It is an accepted fact that such secondary civilizations have acquired heterogenetic in origin and their respective growths. Commonly the villages lose their set identities and make themselves transformed into a newer cultural paradigm. One may ask a question. Whether a secondary civilization is continuation of the civilization or not. Primarily the rural life is termed as the primary civilization and its transformation though sometimes an upliftment is nothing more than secondary one. The 'great tradition' which is characteristically developed by such a primary civilization is a carrying-forward of cultural materials," etc.; "already contained in local little traditions." (Village. P.181) While following this pattern the little communities would almost seem to cease to exist. Singer and Redfield prefer to believe that development of an urban community in a primary civilization as one in the series of nucleations within a common field (Village. P. 181). Some conditions may befall before the little communities when placed in a primary civilization. 3.7 Influence of State With passage of time and with simultaneous progress influence and control of state increase. The state usually exercise its authority in two ways. One through its bureaucracy and secondly, through certain interest groups who enjoy some privileges and work on behalf of state. The latter-named group is the principal landholders in the village and sometimes enjoys quasi-judicial power too. During the colonial rule this group was in many occasions tools of the state in one way or other in quelling dissensions. Again there are other types of disunity in the village population which are still rooted into traditional Indian caste system. Great traditions champion Indian

NSOU • GE-SO-11 49 social divisions which have been in place for centuries. People belonging to upper echelon of this order still believe that it is their right to humiliate the people belong to the lower strata. Interesting enough the persons suffering from this environment are also wilfully accept their position. Certainly fissures occur but those are only of temporary nature. Given such situation nature of the state is very difficult to dissect. The state in one hand tries to keep complete harmony in the social order and in the other allows powerful interest groups to oppress on the weaker ones. After independence India's economic, social and political systems are broadly based on equality, justice, liberty, rationality and secularism. Though India does not have its national language wide use and currently much wider use of English helps people from different region and language group to mix and exchange views with others. In doing so a person seldom forget his identity. In this way Little tradition still exist. The Great traditional elements, on the other hand, are continuously getting mixed with Little traditional elements since contacts among people coming from various ethnic groups have been increasing. Current relationship between a village and state has brought a certain degree of suspicion in relation to older 'orthogenetic' land administration particularly in north India. That might have descended from top 'as much as it was a result of indigenous growth upward from little communities.' Presence of some administrative manuals drawn during the colonial rule as guide to its officials crystalize an orthogenetic policy towards village societies. (Village p. 183) Primary aim of the British was to ensure assessed revenue collection and those by following a perfect routine. Some- times they used to collect revenue directly from the tillers and sometimes from highest bidders at auction. In majority of cases the latter ones were not cultivators. As the rate of revenue was in most cases, was very high land-holders of ancient origins had to leave their right for the new comers. As a result, holding pattern changed drastically meaning little communities gave in to the great. 3.8 Summary During the colonial rule and more specifically during the late 19 th century some erudite people in India envisioned a unified India from the Hindu Kush and Himalayas to the seas and oceans in the east, west and south. After the failure of the Rebellion of 1857 people in general started accepting the foreign rule as a fate

50 NSOU • GE-SO-11 accompli. But spread of western education, larger use of the English language and introduction of modern communication systems in the shape of railway, telecommu- nication and faster postal network created an environment conducive to modern living. People receiving western education also learned about the western democ- racy, sense of liberty and equality which they had not been experiencing here. But the very idea of 'nation' as emerged and gradually developed in the west was not available in India. It was accepted by some in the late 19 th century that India would never be a nation since its social fabric as they viewed, was fragmented due to caste division. Hence, India would never be conceived as a nation with a composite social and cultural mooring. Even the Indian National Congress in its formative days could not gather support from the vast rural India and also from a good number of communities. By the turn of the century this phenomenon of nationhood started gaining some ground. Struggle for independence brought people nearer though still the participation of all was lacking. For the freedom movement Indians started reviving their glorious past. Discovery of the original script of Arthasastra by Kautilya and excavation of the Indus valley civilization made Indians proud. They were then sure of the superiority over their then rulers in the past. Now the concept of Indianness started taking shape. Still such feelings were confined to a handful few. Like India Egypt, Iraq, Greece, Knossos and China had also their respective glorious past. But unfortunately, except China all had lost their identity in face of several challenges coming from various quarters. Nowhere else has there been, except China and India a real continuity in civilization. In spite of innumerable invasions and mixing of different cultures India has been able to keep and protect her identity for centuries. Now the question is, from where India has been gathering strength? Once Jawaharlal Nehru claimed that respect to its own past helped India to keep its identity and traditions intact. (Glimpses of World History. P. 13). He also claimed that the Indian are the heirs of those who entered in this land from the north west and came down to what was then called Brahmavarta and Aryavarta and Bharatvarsha and ultimately to Hindustan. Intrusion of marauder hordes many times and defeat of the indigenous people at their hands failed to rob this country of its values emanated for centuries. India witnessed constant warfare and massacre of uncountable men and women many times. But all such horrors normally took place in the urban centres.

NSOU • GE-SO-11 51 Since India's artisan craft achieved a world-wide publicity wealth was confined chiefly there. As a result, vast rural population was spared from such destructions. These people without and guidance and directive continued with the ancient faith, traditions and way of life. 3.9 Questions (i) Critically examine the concepts of little and Great Traditions for understanding the Indian Villages. (10 marks) (ii) Discuss the interaction between 'Little tradition' and 'Great tradition' (10 marks) (iii) How does interaction between little and Great tradition bring about social change? 54 NSOU • GE-SO-11 4.2 Introduction How should we define the term 'nation'? It is a very tough as well as complicated exercise. Whenever we talk about 'nation' we visualize a geographic, linguistic and above all a cultural entity. Etymologically this term has its origin in the Latin word of 'nation' meaning descent or birth. Prof. Eric Hobsbawm once noted that 'nation' is not very ancient concept. To him this concept could have been developed in the 18th century. From the days of modern reckoning people in various parts of the globe tried to remain in a group sharing roughly a common lineage. They decided to share a common language and religion. This in turn had been rooted in common race. In this way the very concept of race emerged. This is roughly the history of the western world where the people though sometimes claiming to propagate same religion and had come out from a common root decided to create their own state. It is a fact that the concept of modern state is not so old but behaviour and economic activities supported by distinct vocabulary called language acted as aspirations to people residing in a particular place to create their own state and thereby formed a nation. But the term 'nation' has its political meaning which is totally different and distinct from a nationality. Nationality becomes relevant when the nation is able to hold on some land and form its own state with the required instruments. So, formation of a state is the final achievement of nationality. It is very different concept from the concept of kingdom and an empire. A person with his personal might and intelligence can carve out a kingdom by defeating some ones or by inheritance. When a king expands his sphere of influence and occupies vast mass of land with people from different sects, he creates an empire. These seldom can be called state least a 'nation state'. The concept of 'nation state' has its origin mainly in Europe. Formation of the United States of America can also be seen in this line though people gathered there from different parts of the globe even in the late 18th century. Still the people there could build up a notion which helped to develop it into a 'nation state'. Cessation of Portugal from Spain and formation of a number of 'nation states' after 1919 in Europe are the perfect examples of it. This pattern became popular in the second half of the 20th century when innumerable colonies were freed from their bondage. After the conclusion of the Second World War India's emancipation was followed by formation of a number of states after their liberation. But all of those

NSOU • GE-SO-11 55 were and are not 'nation states'. Most of these countries are multi-national in nature. Ethnic and linguistic divisions are so strong that in some cases the smaller groups have various symptoms of nationhood or near nationhood. If one surveys the present positions of the states of the world, he or she will be bewildered in finding the nature of nationalism. Since in very rare cases the theory of 'one nation one state' can be found in practice presence of nation state becomes absurd. It is very common to find several nations in a particular territorial boundary. But it is also not a conjecture that one nation is spread out in several states. India, Russian Federation, the United Kingdom and also the United States of America are the example of those states which accommodate several races and nations within them. While the Kurds, the Hazaras and the Tamils can be termed as trans-state nations since they are spread out in many states. Hence, no one can correctly identify 'nation' in one go. But the primary criteria as accepted by all is the identity on the basis of ethnicity and language may be a logical one. Language has a very powerful appeal as we have seen the formation of Bangladesh on the basis of language only. In this case religion lost the match though it had played havoc only 25 years prior to the formation of Bangladesh. So, one cannot conclude and arrive at a solution in perfectly defining the term 'nation.'

4.3 Concept of Nation

Once sociologist, T. K. Oommen has called certain 'tentative definitional proposals of a nation/nationality, state/citizenship and ethnic/ethnicity.' To him a nation is nothing more than a territorial entity to which the national had an emotional attachment and in which they invest a moral meaning. That is the homeland either inherited or adopted. But a state is not entirely so. It 'is a legally constituted institution, which provides its residents with protection from internal insecurity and external aggression.' Prof. Oommen also makes certain distinction between the state and nation. He says that while territory is common to both, 'there is crucial difference between national territory and the state territory; the former is a moral, and the latter a legal entity... If the state and the nation are coterminous, we have a nation-state. But most states today are multinational, poly-ethnic, or a combination of the two.' (ibid) If one goes by the assertions of Prof. Oommen than he is to agree with the theory of fusion of a common homeland with a common language. He again says that

56 NSOU • GE-SO-11 nationality 'as the collective identity that the people of a nation acquire by identifying with the nation. This proves that citizenship has been equated with nationality. But in majority of cases nationality is used as term, synonymous to ethnicity. If so, then various cultural groups constituting a nation are described as nationalities.

4.4 Other Views of Nation

We have some other views too. To Anthony D. Smith a nation can emerge with a group of people sharing an historic territory, common myths, and historical memories, a mass public culture, a common economy and a common legal rights and duties for all members. But his version has been challenged since he did not distinguish a nation from an ethnic group. Needless to say, that the idea of a territory is central to all definitions of nation and is the distinguishing feature between nation and other social categories such as an ethnic group. Elaborating on this point Lowell W. Barrington notes that nations are groups of people linked by unifying traits such as myths, values and symbols etc., and also a desire to control a territory that is thought of as group's national homeland. He also says that it is not necessary that they actually control any such territory. Prof. Barrington is sure that the words 'nation' is often mistakenly used as synonyms with 'ethnic group'. No doubt that the very idea of 'nation' chiefly emanates from the existence of ethnicity but ethnic groups are not entirely responsible for creation of a nation. Another inseparable ingredient is the presence of a territory. As an example, one may cite the 'nationhood' of the United States of America where the people do not share a common lineage or ancestry. But they own a territory, share a common language and cultural identity. Then, how a 'nation' can be defined? None can ascend nor descend while defining a nation. Conceptual ambiguity is there as various structures are available. In elaborating this theory Benedict Anderson suggests that nationality, nation-ness and nationalism, are cultural artifacts of a particular kind. (Imagined Communities: Reflections on the Origin and Spread of Nationalism. P. 13) To him a nation is an act of imagination. Since no cultural or sociological factor is a sole contributory factor in building up a nation it is better to take refuge to imagination. It is commonly suggested that existence of the major institutional forms through which this imagined community comes to acquire a concrete shape. The states and /or nation-states in the 20th century have acquired a profoundly modular character. This view has come out from the experience of the states formed in the last century when

NSOU • GE-SO-11 57 nationalisms with a set of modular forms from which nationalist elites in Asia and Africa had chosen the ones they liked. On the other hand, Etienne Balibar and Immanuel Wallerstein think that 'nation' has a historical construct through which current institutions and antagonisms can be projected into the past to assign a relative stability on the communities on which the sense of individualism depends. To them a nation or a nation-state does not have an ethnocentric perspective excepting a sense that is the product of a fictive ethnicity. If one tries to define the concept otherwise then their ancestry and a history of community culture will vanish.' But they have to institute in real (and therefore historical) time their imaginary unity against other possible unities. '(ibid. p. 49) They further argue that 'No nation possesses an ethnic base naturally, but as social formations are nationalized, the populations included within them, divided up among them or dominated by them are ethnicized – that is represented in the past or in the future as if they formed a natural community, possessing of itself an identity of origins, culture and interests which transcends individuals and social conditions (ibid. p. 96). In his book, 'Ethnicity and Nationalism Prof. Paul Brass states that 'ethnicity' and nationalism are not 'givens', but are social and political constructions' (p. 8) Who formulates this? His answer is, they are created by elites of ethnic groups with the object of 'protecting their well-being or existence or to gain political and economic advantage for their groups as well as themselves.' (ibid) Hence, to him ethnicity and nationalism are modern phenomena inseparably connected with the activities of the modern centralizing state arising out of specific types of interactions between the leadership of centralizing states and elites from non-dominant ethnic groups, especially but not exclusively on the peripheries of those states (ibid. pp. 8- 9).

4.5 Nation-State Meaning The concept of 'nation-state' was put into practical experiments especially in the modern west in 20 th century. In the process many of the constituent groups within the nation –states lost their individual as well as distinct identities. In some cases, they remained dormant. In such states the idea and concept of 'nation' occupies central position. Naturally, here state and nation become synonymous. So, the minority elements within these nations were expected to lose their individual

58 NSOU • GE-SO-11 identities and to get assimilated within that state. By the way the marginal communities are to lose their culture and language if not religion in the first place. Nationalism in such cases can be viewed as a strong and powerful concept by which unity of the state can be kept intact. Given the situation the dominant group within the nation -state took up the reins in assimilating the smaller constituents with a plea to build the nation itself. Undoubtedly, in some cases the exercise could achieve a certain degree of success depending on the 'effectiveness of their projects of cultural standardization. But the success rate of the project in most of the cases is nominal. Because, the dominant group always tried to enforce its own agenda and also tried to influence economic and social activities in its favour. In such exercise the aspirations of people and their very identity are bulldozed. One can go by the historic experiments undertaken by Hitler before 1940 in his neighbouring countries such as, Austria and Czechoslovakia and ultimately in parts of Poland. Similarly, the Communist rulers of the then Soviet Union also tried to enforce the said model. But dominance of the superior units in both the cases brought only disasters. Hence, the theory of the nation-state is not easy to implement in the ground. Why such experiments failed? To the sociologists, subjugation of minor or marginal communities always does not yield results. This attempt in general, reinforces a sense of separate identity among the latter vis a vis the dominant community or communities as we have already noted. Hegemony of the dominant unit, primarily in the cultural front usually breeds nationalism or sub-nationalism of the subjugated units. Led by their elites, these movements mobilize the marginal people/peoples for getting their due shares in the society as well as in the state itself. On the other hand, the ruling groups intention is to suppress these and to maintain status quo. In these situations, the possibilities to build the nation become illusive and may end in fiasco.

4.6 Nation Building in India We already know that India is a land of composite culture with a huge number of ethnic as well as religious groups. That is not the end of the story. Presence of caste and then sub-castes in many forms also has their individual roles to play. Its varied religion, ethnicity, way of living, language etc. are severe challenge towards the process of nation- building. Separate landmass and environment are also contributory factors in that process. The colonial masters used to utter that they had

NSOU • GE-SO-11 59 united India which had been divided and sub-divided into several units. They also used to get solace from the idea that India would be shattered into innumerable units as and when they leave. So, the work was too tough to complete after India's liberation. It is claimed that post-colonial nation-building approach was such by which it was attempted to provide a unitary façade involving several composite units within it. 4.7 Hurdles of National Integration Indian society has for more than a millennium been divided and again sub-divided into several castes irrespective of creed. The majority community started its shape during 4th-5th centuries the legacy of which is still being carried. Rise of Mahavira and Gautama Buddha in 6th century B. C. E though affected the traditional Indian society for some period those were ultimately evaporated. Ultimately Indians are living within a caste-ridden society. This caste pattern also has regional bearings. As results entire country does not follow standard set of rules and practices. Coming of Islam in the 12th-13th centuries caused a certain degree of social havoc in some parts of India. But the Muslim society was also affected with social divisions. Hence, the people of India do not present a composite order. Another major problem in India is that the people's social status generally depends on individual's occupations. Within the Hindu society it has been a settled fact for centuries that those who undertake manual work should stay at the bottom of the order. For such practice there exist untouchables who are not allowed to mingle within the higher echelons. On the other hand, the Muslims though don't advocate caste system strictly on the line practiced by the Hindus their society is also broadly divided into 'ashraf's (aristocrats) and 'ajlaf's (common). Moreover, they are also divided between the Shias and Sunnis. Apart from these two major communities there exist a good number of other religious sects and innumerable tribes preaching their individual religious faiths. Given this position U. Phadnis and R. Ganguly (Ethnicity and Nation-building in South Asia) argue, post-colonial nation-building approaches focused almost exclusively on creating a unified 'national identity' based around either common political values or citizenship or a putative majoritarian 'ethnic' identity. The aim of both approaches, on the whole, has been to produce a pulverized and uniform sense of national identity to coincide with the state boundaries that seldom reflect ethnic divisions on the ground. This type of outlook towards nation-building, as promoted

60 NSOU • GE-SO-11 vigorously by the modernization school of thought, refused to accept the notion that states incorporating more than one 'ethnic nation' could be both stable and harmonious."(p.13) But the process of nation-building is not smooth one. As noted, Indian social structures were never composite. Moreover, for preceding two centuries the colonial masters' endeavour was to divide and rule India. For their policies unification was not possible neither those were ever envisaged. Process of modernization from within was affected in very limited sphere. Recourse to western education gave birth to a modern elite group who chiefly decided to borrow from the west and to implant those here. They were confined primarily in some towns and selected parts of the country. Even Bengal the breeding ground of the 19th century modernization failed to provide the same atmosphere throughout the province least the entire eastern India. Lack of education was the major contributory factor for most of the hindrance towards the achievement of a unitary façade. 4.8 Emergence of Nationalism Colonial rule gave birth to a sense of nationalism though Rabindra Nath Tagore was averse to the term 'nation' itself. To him this term was suited to Europe where nationhood emerged either from a common ancestry or from a common language. But Gandhi had a different observation. He envisaged a nation which has its root in the ancient past. Foreign rule though subjugated the people in India but could not vanquish the feelings of the people. Gandhi succeeded in uniting entire India to oppose the foreign rule. Whether India could be claimed as a unified 'nation' or not is a point of high debate. S. N. Banerjee prior to emergence of Gandhi could think about a growing nation. Like Gandhi he also ascribed the oppression of the foreign rule and aspiration of those oppressed helped 'nationalism to grow and flourish. Observing the situation in India Prof. Hobsbawm once described India as a polity that grew out of anti-colonial movement. The leaders of those movements were able in assembling people from various regions with various ethnicity with them. It was the finest achievement of the leaders spearheading freedom struggle. The British left with a fanciful dream that very soon India would be dismembered. Still India remained united. The leaders in the free India also could bring more than six hundred big and small near independent states within the fold of the newly-born republic. This was more or less handiwork of the elites, the theory as propagated by some. The British left the power with a selected few whom some prefer to call 'elite'.

NSOU • GE-SO-11 61 This group was miniscule minority but was able to carry the entire country with them. They had to combat a host of internal and external pressures to reduce as well as to eliminate if needed, the incongruence between state and society. Society had a strong influence upon the masses who were eventually divided into a large number of groups. Nation-building process in all the countries confronted challenge from the social groups. Threats of separatism were also very strong. Each case of separatism constitutes a unique specimen of state-society contradiction. To overcome such difficulties towards nation-building exercise in the post-independent the state adopted a policy to construct a pan-Indian identity. In doing so the state formulated its economic and cultural policies. Its aim was to honour the aspirations of the people spread put in the vast landmass. But that undertaking opened the flood-gates of dissensions, tribal, regional as well as linguistics. The state's attempts were roughly viewed as a majoritarian one. This brought violent protests threatening to cessations also. A type of ethno-nationalist movement emerged. Ethnicity could not be overshadowed by majoritarian agenda. India's political atmosphere too often was designed by those people who do not necessarily represent the entire country. For this smaller elements within the society feel themselves neglected. Hence, the future and also survival of India as a nation depends on acceptance of the plurality of nationalities. A strong state tries to decimate group identities in the name of national integration. India is not an exception. This attempt by the state has long been a force for brewing trouble in many parts of the country. During freedom struggle the Indian National Congress endeavoured strenuously to put the question of nationalism above everything. No doubt, it had roughly a urban character in its initial days. Even the Muslims kept themselves out from it by following advice of Sir Syed Ahmad Khan of Aligarh. Its leaders like Dadabhai Naoroji, Surendra Nath Banerjee, R. C. Dutt and men like them could envisage a united India which would be able to accommodate all shades of opinions by overcoming local or regional issues. Hence, a sense of nationalism developed. But the avowed votaries of it were all guided by the western model. During the Swadeshi Movement (1905- 11) sense of nationalism (Swadeshi) got a boost. Twentieth century opened with nationalist movements which gathered momentum and ultimately with arrival of Gandhi the Congress could achieve national unity. 'The pre-eminent view of Indian nationalism has been that of an inclusionary, accommodative, consensual and popular anti-colonial struggle. This has entailed degenerating the exclusive affinities of religion as 'communal' in an imagined hierarchy of collectivities crowned by the

62 NSOU • GE-SO-11 ideal of a 'nation' unsullied by narrow-minded bigotry." (Ayesha Jalal; 'Nation, Reason and Religion : Punjab's Role in the Partition of India' in Economic and Political Weekly. Vol.33 No. 32 8 August 1998. p. 2183) 4.9 Challenges Faced The groups challenging the procedures of national integration are not always homogenous in character. They are often constituted by a number of other smaller ethnic configurations living in geo-social proximity. By incorporating smaller groups within a leading one and finally to form an ethnic identity is still working. This can be found in the north-eastern part of India. One can equate the present position of that region with the colonial and pre-colonial days. As we have noted the presence of a number of ethnic groups during those days, most of whom were not brought within mainstream. So, economic seclusion helped to keep cultural identity intact. Lack of communications was also responsible. The authority always calculated profits for any of the investments it made. As investments towards improvement of social fabric was never within its agenda development had been a far cry. As a result, people in such region felt themselves oppressed by the 'foreigners'. After 1947, participation in the political affairs of the country at the centre again alienated them. They used to believe that the rulers had only changed their colour. The colonial rulers to some extent, succeeded in transforming India into a politico-territorial entity. They also created new regional politico-territorial units incorporating willy-nilly more than one, in most cases several, such nationalities. But the so-called integration process was marred by imperialist agenda as already noted. The rulers though elected by the people in free India failed to assess the aspirations and grievances of all spread out in the entire land. When development progressed in several fronts newer issues emerged. Since winning the elections became increasingly more vital chunk of resources were deployed in such regions from where majority of seats in the legislature come. Now such conditions fuelled more dissensions in the regions deprived of their dues. To them not only lack of development is issue but cultural hegemony running down from above is also another vital one. Regional aspirations increasingly become very high which penetrates too deep into the socio-political life of the people living on the margins. This sub-nationalism has strong appeal. In majority of the cases the people demanding recognition of their aspirations started claiming a rich heredity and some claim themselves parts of warrior clans. Since free India inherited such a territorial mass from erstwhile

NSOU • GE-SO-11 63 colonial masters which had been acquired by them with sinister and/or imperial designs. Explaining this Sudipta Kaviraj noted that 'sub-colonial advantages for some linguistic groups, simply because those were the first to receive colonial education and formed the natural reservoir for personnel' (m Politics in India. P. 224) for colonial administration advocated nationalism in such a way which excludes a large number of groups and tribes. This left out groups rose with their demands after 1947. In this way first a new state, Andhra Pradesh was created for Telugu speaking people by bifurcating the then Tamil-dominated Madras Presidency. To keep India untied the British used to employ force. In free India that was a far cry. Hence the leaders embraced parliamentary democracy on the Westminster model as they all along had cherished that. Universal adult franchise was given to those vast majority of whom could not even write their names in their vernacular. Elected representatives went to the legislative assemblies in the centre and in the states and started taking policy decisions covering various issues. Small states had smaller representation resulting to non-fulfilment of their aspirations. Sometimes the marginal group of people had to suffer as they had experienced in the earlier days. However, reservations in employments and in people's representation were allowed. But the quantum of loss seldom match to their gains. Nehru, the first prime minister opposed statehood demand on the basis on language. He was afraid that if this were allowed then consolidation of the nation would not be possible. In this context, SudiptaKaviraj explained that Nehru's fear was emanated from such a situation when cessation would be inevitable.(Ibid. p. 225) But eventualities could not be averted. We have already talked about the formation of Andhra Pradesh. It was followed by creation of States Re-organization Commission. A number of states were to be formed and all on linguistic basis. This trend did not end. In 1967 Punjab was divided into two Haryana and Punjab since the Sikhs demanded legitimacy of their Gurmukhi language. Assam was divided and some states like Nagaland, Mizoram, Meghalaya were born simply on the basis of ethnicity. Bifurcation of Uttar Pradesh was needed to help the hilly region to flourish. On the other hand, Madhya Pradesh and Bihar were divided to create tribal-majority states. Recently Andhra Pradesh had to cede erstwhile Nizam's kingdom for the formation of Telengana. 4.10 Summary Whenever a new state is formed aspiration in the other regions with similar perspective gets fuelled. In some cases, this has legitimate claims. Statehood 64 NSOU • GE-SO-11 demands for Vidarbha (from Maharashtra), Bundelkhand (from Uttar Pradesh and Madhya Pradesh) have been continuing for quite long. Further division of Uttar Pradesh and statehood demands for separate Gokhaland (bifurcating West Bengal), Bodoland (from Assam) are very loud. Previously demands were made for linguistic states but in the recent past regional imbalance and neglect became focal points. The question is-why there are dissensions among the people of a nation which is so young ? One very important reason for these is the over centralization of the state affairs. The government at centre is too powerful and amendments in the constitution also strengthened its position. Moreover, majority of the acts and rules were drawn during the colonial rule. The colonial masters had no interest in satisfying regional needs. Administration to maintain law and order under colonial set up was transformed overnight into an administration to carry out welfare measures. Similarly, bureaucracy also remained same. The strength and devotion of the leaders in free India were never questioned. But the legal systems prevented them to revolutionize. While preventing imposition of Hindi in Tamilnadu in the 1960s demand for more power to the states was initiated. In 1973 the Shiromoni Akali Dal in Punjab adopted a resolution at Anandpur Sahib on the similar line. To suggest constitutional amendments through which states' power and authority could be enhanced Sarkaria Commission was constituted. But its recommendations were shelved. With the growth in population and bigger use of technology increasingly minimizes scope of employments. Now the demand of the Siv Sena in Maharashtra for opportunities to the sons of the soil has been gaining ground. This very demand is opposed to social integration. Immigration and migration within the country will be ultimately stopped. Hence hindrance towards nation-building has been increasing regularly. Whatever difficulty befalls India still a united country. This has been possible due to the tradition prevailing in Indian social system. For centuries together the Indians have embraced and adopted multiple numbers of foreign elements. In this way adaptability here is very vibrant. In the same fashion adoption of the Westminster model and a constitution which enshrines roughly a model of separation of power, individual rights in all spheres of life and above all secular ideals could be possible and smooth. No doubt, that the state is yet to fulfil all the commitments. But the policy since independence in promoting betterments in economic, cultural and social fields has brought progress. Now people is in habit in scaling the progress of self and also of the region of his/her place of residence primarily in economy. This is the

NSOU • GE-SO-11 65 success of Indian state which has been able to engage the people in material world. The competition for better living also acts as unitary force since people from one region to another has constantly been moving for better opportunities. These immigrants try to be associated with the local people and with their language, food- habit as well as culture. This is a very binding which ultimately put down fissiparous trends. 4.11 Questions (i) What was the huge obstacle in nation building at the time of India's independence? 70 NSOU • GE-SO-11 5.2 Introduction Rural society means society that lives in village and is dependent on natural environment. Rural economy rests predominantly on agriculture and allied activities. These societies have a low density of population, intimate group relationships and have oral traditions. Rural societies are rich in culture and tradition. However, from the contemporary point of view, they are considered to be socio-economically less developed. Therefore, several developmental activities have been undertaken in our country to improve their socio-economic conditions. On the other hand, urban society includes towns, cities and metros with a specific way of life. An urban society can be defined as an area having higher density of population, people engaging mostly in occupations other than agriculture and domestication of animals, having a distinct ecology and culture different from that of the large society's culture. India is predominantly a rural country with two third populations and 70% workforce residing in rural areas. Rural economy constitutes 46 per cent of national income. In India on the basis of human settlements rural and urban are two different types of social formation. So, in this cognizance traditionalism and modernism are interwoven in globalized India. Over the past two decades rapid economic growth, counter urbanization, larger capitalistic market set up and gradual changing political scenario have also resulting rural power structure and occupational pattern indeed. Despite the rise of urbanization more than half of India's population is projected to be rural by 2050. Rural transformation and changing pattern of agrarian relation are focal theme of concurrent research in social sciences. 5.3 Traditional Structure of the Indian Village Studies of the Indian village began in the early stages of the establishment of British colonial rule, and arose out of the necessities of fiscal administration. It was inevitable that in these studies the Indian village with its traditional social? order should appear to the eyes of the British writers as a "completely self-sufficient, isolated republic". Their studies of "the village community" were concerned with the self-sufficient socio-economic structure of the village, with systems of communal land-ownership and collective responsibility in the payment of taxes, and with the organs of village self-government which supervised these social mechanisms. The conception of the Indian village which was built up from the study of these aspects of rural society was that of an occluded communal social organism.

NSOU • GE-SO-11 71 The Indian village may certainly be regarded as having maintained a traditional order of society and as having constituted a little isolated universe of its own in the period before the establishment of British rule. We may say with M. N. Srinivas that this isolation was a product of such factors as the absence of roads, the prevalence of widespread political instability and the fact that very little money circulated in the rural areas. Of necessity, this state of society underwent some change under British rule. However, the essential nature of British colonial rule was such that it delayed the modernization of India, barred the way to industrialization and did not lead to the breakup of the self-sufficient economy of the village. Of course, the idea that the Indian village was completely self-sufficient and isolated is a mixture of myth and reality. M. N. Srinivas and many other writers have pointed out that, although it is true that little currency was in circulation, there were a certain number of itinerant merchants, and weekly markets were long established institutions. The self-sufficient division of labour in the village was indeed supported by the caste system, but it was not the case that members of all the castes whose occupations were necessary for the life of the people were present in every village. This was especially so in North India, where caste endogamy and village exogamy combined to draw the villagers into social relations established by marriage which transcended the individual village. We need not add that caste panchayats were organized which united members of the different castes living in neighboring villages. Further, although it is the practice to speak of the village community, it is not the case that the village was a communistic community in which all the villagers shared equally in the ownership of the land. No community of the kind which is characteristic of the idyllic classless society of the period of primitive communism has been found in the caste society of the Indian village. The communal ownership of land did not exist in all Indian villages and even in those areas where the communal ownership of land was found, the institution of communal ownership was in practice much complicated by the caste hierarchy and distinctions were made between individuals in regard to their enjoyment of communal rights.

5.4 Characteristics of the Indian Village

Nevertheless, the Indian village does possess certain characteristics in the understanding of which we can well employ the concept of the village community.

72 NSOU • GE-SO-11 Further, these characteristics still survive in the modern village community, even although the traditional structure of the village is now in process of dissolution. (i) Internal Organization of the Village Among the Indian villages of this period there were some which were inhabited by members of only one caste, but by far the greater part of them were "multi-caste" villages in some degree. The village community was composed of these castes, arranged one above the other in a hierarchy whose rankings were most clearly apparent in the practices observed in regard to commensality. It was the general rule for the members of the different castes to live in different sections of the village. The first thing which one notices about Indian villages is that the better houses are usually located in the center of the village, while the ill-kept and roughly constructed houses are built round them or are located at points on the circumference of the agglomeration or at a slight distance away from it. Since this is so, one can always distinguish two residential areas at least at first glance – the group of houses occupied by the dominant caste and the group of houses occupied by members of the scheduled castes. These residential areas are denoted by the word 'thola', to which the name of the caste living in the area is prefixed. The castes which are represented by only a small number of persons live in a residential area occupied by a larger caste of approximately the same social standing. For example, it is usual for the Brahmins to live in the residential area occupied by the dominant caste. At present there is some irregularity in the geographical distribution of the castes within the village, and the castes are mixed together in a greater degree than formerly, but we may suppose that in the traditional village these distinctions in regard to residential areas were carefully observed. The castes living in the different residential areas were arranged in a hierarchy which was self-evidently legitimate in the eyes of the villagers and was accepted by them as axiomatic. This ritual ranking, however, was at the same time related to the economic stratification which characterized the village. That is to say, the dominant caste was also the landowning caste, while the Scheduled Castes in the lowest stratum of the village community comprised the poorest section of the landless inhabitants of the village. If we divide the Indian castes into three main strata – the upper stratum containing the Brahmins and the land-owning dominant castes, middle stratum containing the merchant and artisan castes, and the lower stratum containing the aboriginal people and untouchables – we may say that the representatives of the upper stratum in the Indian village were landlords and rich peasants, while the lower

NSOU • GE-SO-11 73 stratum was composed of landless labourers and tenant peasants. The artisan castes in the middle stratum may be regarded as having lived in a state of dependence (economic as well as social) on the castes in the upper stratum. (ii) The Jajmani System as the Traditional Economic System As we have stated above, the castes in the Indian village live in separate residential areas and the villagers' consciousness of belonging to a particular caste is strengthened by the social and geographical implications of the contacts which they make in the course of everyday life. As a consequence of this, it would appear that the village was split up into a number of caste groups, but in fact the castes were bound together by the Jajmani system, the traditional occupational organization. In the period during which the Indian village was based on the communal ownership of land to a greater or lesser degree, certain social relations were established under which the dominant castes, who possessed considerable rights over the communally-owned land, assumed a sovereign role in food production and mobilized the labour of members of the lowest stratum of society for this purpose, causing the artisan castes to manufacture and deliver to them goods required for consumption by these agriculturalists as well as agricultural implements to be used by them in production, and paying these artisans in kind with food grains. This was the Jajmani system. This form of economic organization was not operated according to the principle of an exchange of equal values, but took the form of services performed by the members of the artisan castes and the untouchables for the benefit of the dominant castes (who were the sovereign power in agricultural production and the owners of the land used for agriculture), in return for which the dominant castes gave them an assured livelihood by means of payments in kind. For this reason, the payments in kind made to artisans by the land owners, that is, by the sovereign power in agricultural production, remained at a fixed level, but the quantity of the goods manufactured by the artisans – for example, the number of pots which a potter had to produce for his patron – was not fixed but was dependent on the requirements of the patron. In the case of the blacksmiths, too, there was no limit to the number of occasions on which a peasant patron could command the services of the blacksmith for the repair of his agricultural implements. When there were two or more households of potters in the village the agricultural producers who made payments in kind to the potters as patrons were divided into two groups. The amount of the annual payment in kind was not arrived at by negotiation between individual patrons and clients (client being used in the Roman sense), but was laid down in the first instance by the caste Panchayats of the persons in question, these decisions later receiving the approval of the village. Similar arrangements were made in the case of the exchange of services between the artisan castes. Among the castes of the lower stratum of society, too, certain persons were granted an assured livelihood by the village. The sweepers, who were allowed to beg the leavings of food from the members of the castes of the upper stratum of village society, are an example of such a case. Their services at marriage ceremonies and funerals were rewarded by fixed payments. The same arrangement was made in remunerating the Brahmins for their officiation at religious ceremonies. The caste system, associated in these ways with certain traditional hereditary occupations, was maintained by the economic power of the landowners, that is, by the agricultural producers. Agriculture, it need hardly be said, was not an occupation confined to any particular caste, but in general it was main occupation of the dominant castes. These dominant castes were the sovereign power in the economy of the villages. In these circumstances, agricultural production was never organized as a means of acquiring profit by re-investment in the expansion of the scale of reproduction, but had the function of maintaining the traditional mode of living in the village. (iii) Hereditary Structure of Village Self-Government The institutions of village self-government which operated under this economic system were run by the dominant castes. The traditional power structure in village government was headed by a hereditary headman who was a member of one of the dominant castes. In many cases, members of certain families in the dominant castes were recognized as being eligible for the office of headman, and this eligibility was hereditary. This headman, as need hardly be said, had to assume responsibility for tax collection and the maintenance of order on behalf of the ruling power. In this way the headman received recognition as the headman of the village from the external political power. He undertook the collection of the Land Revenue with the co- operation of the Patwari, who compiled the land register and calculated the taxes, and the Chaukidars, who served tax notifications and demands. The Patwari may be described as the village accountant, and most of those who fulfilled this function were members of the Brahmin caste. In contrast, the Chaukidars, who may be regarded as village policemen, were usually recruited from the Scheduled Castes in the lower stratum of society. Again, leaving aside serious offences, the headman had the power to inflict punishments on the villagers in the cause of maintaining law and

NSOU • GE-SO-11 75 order in the village. He was also, of course, the principal mediator in disputes among the villagers. Disputes within a single caste were settled by the caste Panchayats, but disputes which the caste Panchayats found them unable to settle, as well as disputes between castes, were submitted to the mediation of the headman. The headman also presided at many of the religious festivals celebrated in the village. It goes without saying that the headman's rule over the village was not a dictatorship. His position was strengthened by the support of the dominant castes, and in the background of his administrative power lay influential members of the village community who, like himself, were members of the dominant castes. Between the headman and the villagers lay the leaders of the castes, that is to say, the leaders in the different residential areas of the village. We may be justified in supposing that at this period the actual operation of village self-government was in the hands of an informal assembly of elders composed of these leaders and dominated by influential belonging to the dominant castes. In concrete terms, the situation in regard to this traditional power structure differed in the Zamindari type villages and the Ryotwari type villages. There were also differences between villages in the areas which came under direct British rule and those in the areas in which the princely states retained their independence. In spite of these differences, however, we may accept the view that, up to the beginning of the present century, the village was allowed a comparatively high degree of autonomy under this system of self-government, and that the economy of the village was self-sufficient to a fairly high degree.

5.5 Socio-Economic Changes in the Agricultural Village

The traditional socio-economic structure of the Indian village which we have briefly described above underwent gradual changes during the period of British rule. In particular, since the beginning of the 20 th century the handicrafts which were maintained by the Jajmani system have shown a tendency to disappear under the influence of modern industry. These changes became all the more marked after Indian Independence. Further, the institutional changes in political administration which occurred after Independence had a strong impact on the traditional power-structure of the village. No more than any other social organism could the Indian village – so typical of stagnant Oriental society – be spared the trials of modernization.

76 NSOU • GE-SO-11 (i) Economic Change and Traditional Occupations These social changes in the village were brought about, first and foremost, by economic factors. Although it is true that imperialist colonial rule barred the way to industrialization, it was impossible for the economy of the Indian village to remain completely unchanged as the times advanced. Economic development led to the penetration of a money economy into the village, and the villagers came to regard a certain level of monetary income as a necessity to be used in purchasing some at least of the manufactured products of modern industry. Further, modern industrial production could not but have some effect on the traditional occupational structure in the village. Certain of the hereditary occupations associated with the caste system became incapable of maintaining themselves, and even where the traditional occupational system was not brought to complete dissolution, many of the traditional occupations came to require fewer workers than in former times. As an example, we may cite the case of the carpenters who had made ox carts in the past, but who found themselves unable to stand up to the competition from vehicle-building works in the towns. When the carpenters living in a village are employed only in repair work, one carpenter can do the work formerly done by three. The same situation obtained in the case of the blacksmiths. When textile mills were established the village weavers found that there was no work for them to do, and they were obliged to abandon their traditional occupation. Economic development also led to the appearance of new occupations. As the economy developed, even members of the castes whose principal occupation was agriculture were led to open little shops in the villages and to act as dealers in various commodities. In particular, in areas near the cities an increase took place in the numbers of factory workers and transport workers who commuted from their village. In such villages as these the members of all the castes began to live in closer relations with the cities, and changes were liable to occur in the socio-economic structure. Even in villages situated at some distance from the cities, the Chamars, in the lowest stratum of village society found that they could no longer make a living by preparing hides, and the weavers, having lost their traditional occupation, were forced to find some livelihood outside the village and took up the transportation of milk by bicycle or left the village to go to temporary work in brick factories. On the other side, these changes have resulted in persons who have been deprived of their traditional occupations employing their labour in agricultural production. The monopoly of land held by the dominant castes (the landowners and

NSOU • GE-SO-11 77 organizers of agricultural production in the past) have been broken and increasing numbers of persons in the artisan castes and even in the Scheduled Castes in the lowest stratum of society have come to own land of greater or lesser area and to carry on agriculture as their principal occupation. A discrepancy has appeared between the traditional hereditary occupations of the members of the various castes and their actual occupations, and where this discrepancy has reached great proportions the Jajmani system itself has broken down. When this happens, the annual payments in kind which were intended to assure the livelihood of the workers under the Jajmani system change their nature and assume the form of remuneration paid in exchange for labour. Fixed payments in kind are then to be found only among a certain section of the richer peasantry, and cash payments become general. These developments have wrought great changes in the Indian village, which hitherto has been a cosmos of its own in which the castes lived in a state of interdependence by means of a self-sufficient economy in which payments were made in kind. (ii) Influence of the New Panchayat System The second kind of change which has taken place in the Indian village is the change in the realm of political administration. The British colonial administration made some impact on the village through the tax collection system, but provided that the taxes were paid the colonial authorities did not interfere to any great extent in the running of self-government in the village. About the year 1920 attempts were made to establish the Panchayat System, but this institution was not of such a character as to negate the existing traditional power structure in the village. However, the New Panchayat System which was introduced after Independence was put into force by the Government with great expectations, since it was associated with the Community Development Programmes. The New Panchayat System was of a character which was incompatible with the existing form of village self-government. The electoral constituencies and the number of members in the New Panchayats were laid down on a population basis. The Panchayats were chosen by election, and seats were usually reserved for members representing women and the Scheduled Castes. We may describe this change in local self-government in a few words as being a change from the rule of tradition in the direction of the rule of legitimacy. We may draw attention to the following important points in connection with the new institution. Firstly, the hereditary principle has been negated, and the principle of deciding the choice of leaders by election has been adopted. It is not possible for us to equate this change with the change from "ascribed status" to "achieved status" as

78 NSOU • GE-SO-11 S. C. Dube says, but the use of the electoral method in deciding the choice of leaders implies a change in the type of leader which is regarded as ideal. The new institution has at least opened the way to the overthrow of the state of affairs in which the dominant castes monopolized the office of the head-man. Secondly, the decisions taken in connection with the administration of the village must now be taken on a majority vote and not as a result of unanimity among the members. Formerly decisions had been taken by the leaders of the dominant castes, and a compromise agreement was regarded as the unanimous decision of the whole meeting. It was difficult for any of the members to resist such decisions but now that the voting procedure has been adopted it has become possible for members to express their opposition. Thirdly, the connections between the panchayats and the external political power have been strengthened under the new system, and the questions discussed in the village include an increasing number of matters which could not be dealt with within the administrative institutions of the village itself. Even under the old system of local self-government it was not the case that the village was completely closed and isolated, but in former times the village was more independent than it is now, and it was easy to maintain the social order of the village unchanged. However, matters are different now. We may say with D.G. Mandelbaum, "the old councils were arbitrary, conserving agencies whose prime function was to smooth over or settle village friction. The new panchayats are supposed to be innovating, organizing bodies working for changes rather than conserving solidarity". The Panchayat's business brings it into contact with their higher administrative organs of the Government in connection with such matters as the Community Development Programmes, extension work and the organizing of agricultural co-operative associations. When such activities are undertaken at the initiative of the superior organs of government, there are more chances of changes of leadership to occur at village level and for changes to occur in the form of decision-making. (iii) Urbanization and Weakening of Social Unity The progress in urbanization which has taken place recently is connected with changes in the structure of the economy and has led to changes in the social attitudes and value systems of the inhabitants of the villages. The deeply-rooted Hindu religious faith is still to be found in the villages in the form of religious celebrations or the rituals associated with them and practices are maintained in the traditional manner. However, the religious celebrations no longer play so important a part in the life of the village as they did in former years. Again, with the progress of

NSOU • GE-SO-11 79 urbanization, the caste system, deeply imbued as it is with the Hindu view of the world, has become less strict in the social distinctions which it makes. The Government has negated caste discrimination in the Constitution, and it does not allow the traditional commensality rules to be observed at public functions in the village or in schools. Over a long period, this will probably have a considerable effect. The changes in the times have also inspired the members of the hitherto oppressed castes in the middle and lower strata of society with a desire to improve their social position. This desire may be augmented by an increase in the gap between the socio-economic stratification and the ritual rankings of the castes. As M. N. Srinivas says, even today "it is considered proper to follow one's traditional occupation," but "this view does not obtain among many of the younger people who have been to school and who are urban in their outlook". We may thus say that in the modern Indian village both the vertical ties centered chiefly on the dominant castes, that is, village loyalty, and the horizontal links transcending the village which join members of a caste, that is, caste loyalty, have been weakened. M. N. Srinivas, who regards the latter as being more important than the former, takes the village to be the social unit which commands the loyalty of all the villagers, regardless of caste, but we may consider that the village has been losing its unity. D. Pocock and L. Dumont think that caste is fundamental, but that the cohesion of the castes is now generally weaker than before. In recent studies of the Indian village, attention has been paid not only to the village itself but also to problems in the surrounding region, and it would appear that some emphasis is being attached to the fact that the castes have wide horizontal connections. In fact, however, this is not necessarily the case, and the most important point to be noted in this connection is the fact that the village is no longer a small self-sufficient cosmos of its own. That is to say, the social changes which have taken place in the village are of such a character that they require some extension of the scope of village surveys and an examination of the question of the weakening of unity in the village community and in the castes must be carried out in a wider context.

5.6 Towards the Modernization of Village Society

The Indian village's road to modernization is beset by many difficulties. In opening up this difficult road, India, like many of the underdeveloped and developing countries, has sought a solution in industrialization. However, whether this has been successful is by no means indisputable. The reason for this is that modern industry

80 NSOU • GE-SO-11 does not absorb a large amount of surplus population from the villages. At the same time, efforts are being made to encourage cottage industry as well as modern industry, but there is no sign that cottage industry will be able to bring about modernization in the Indian village. In conclusion it can be said that the Indian village will not be modernized unless some strong measures are taken in regard to agriculture itself. Further, Indian industrialization will not be able to proceed along the road of expansion and development unless there is a rise in the productivity of agriculture which will make possible an accumulation of capital and a rise in the purchasing power of the peasants.

5.7 The Rise of the City

An important concomitant of urbanization in India is that villages located outside the boundaries of a city get included in it over time. This phenomenon has been intensifying since the 1950s and is sure to intensify further. India is on the path of rapid urbanization, and the urban development authorities of all cities are planning to draw more and more villages into their nets. The causes and consequences of the phenomenon, therefore, require careful analysis. How a village gets included within a city is usually a long drawn process. It is necessary to recall that in most parts of India a village is made up of, first, a residential settlement (gaon-than or abadi area) where houses and huts are huddled together, and second, agricultural fields, pasture (gauchar) land, water tanks and ponds, cart tracks, wasteland, and other open territory all around it. The two together constitute a territorial unit called the "revenue village" (mauza in most parts of India) with fixed boundaries recognized for local administration. Often it includes, besides the main settlement, one or more small subsidiary settlements, or "satellite villages", as M. N. Srinivas called them. On the other hand, a mauza may not have any residential settlement, in which case it is called a "deserted village". In the case of a village located on the periphery of a city, one piece of land after another gets sold to individuals, business firms, property agents, institutions, government establishments, and others in the city. Why the urban buyers buy this land is more or less known. But why a villager should sell his land is a matter of investigation. What are the motivations? What are the compulsions? What does a villager do with the money he gets by selling land? Is he wise or stupid in selling land?

NSOU • GE-SO-11 81 When most of the agricultural fields in a village are acquired by the urban people, they demand urban facilities : paved roads, underground drainage, piped water, regular electricity supply, security, etc. Pressures build up on the municipal corporation and on the state's politicians and bureaucrats to include the village within the city. Often the government, anticipating this development, works out a town planning scheme. The net result is inclusion of the entire mauza in the city.

5.8 Transformation of Villages into Towns • Just as the village gets included within the city, the city people and their culture also migrate to the village and transform it into a town. This is a very complex process. It is well known that a settlement considered as a village at one census might become a town at a subsequent census. Since the 1961 Census, a settlement is normally considered a town if it satisfies three criteria : (i) a population of 5,000 or more, (ii) a population density of at least 400 per sq. km, and (iii) at least 75% of the male workers should be engaged in non-agricultural work. If it receives the state government's recognition it becomes a "statutory town"; otherwise the census of India may recognize it as a "census town". It has been discussed at length how these criteria have been applied differently in different states and at different censuses in the same state, making comparisons over space and time difficult. Recognition of a village as a statutory town is, moreover, a complex bureaucratic decision, often influenced by local political forces. Of the three criteria, that of a minimum population is the easiest to apply, if the satellite villages are not ignored. The criterion of population density should not also pose much of a problem because in any case most village settlements have high density and would have more or less the same density when they become towns, although this requires calculation of density only for the residential settlement of the village, main as well as subsidiary, and not for the mauza's entire territory.

5.9 Nature of Influence of Towns Before entering into some special cases of Indian towns and their regions, it is worthwhile to make clear the related concepts of city region. Urban influence is of varying nature. It may have its influence on agriculture, on industry, on administration and also on certain services like medical, cultural including educational, recreational, etc.

5.10 Towns and Agriculture Much has already been discussed about town's influence over surrounding countryside. Everywhere and in every age towns people have owned rural properties. In India, 'zamindari' system has been in vogue for a long time. Formerly, in princely states of India there were landowners owning rural properties and used to live in the state capital town. In modern times also rich people have lands and properties in the villages of their forefathers, but they themselves live in the neighboring town. People possess farm-houses in the mid of their agricultural farms to look after and supervise their farm operations and visit intermittently. It has become almost a status symbol of a few well-to-do urbanites to have properties and land in nearby villages. It is not an exaggeration, therefore, to state that "the country is very often the property of the town". Town also depends on agricultural production. Dickinson while describing agricultural regions of Europe identified roughly concentric zones of various crops in relation to the town. There would be floriculture, market-gardening, rearing of dairy-cattle for milk, etc., and then cultivation of sugar beet and cereals. Often some of the industries located in a town such as based on wool, sugarcane and sugar beet for wine, wood products, mats, baskets, 'bidi' (in India), flax (in Europe) for linen industry, products for dyeing obtained from plants, mulberry for silk industry and so many other products are rural based. A town actually acts as a market for the rural products based on local raw materials. Thus, a town, through middlemen, offers required supplies and the facilities for products meant for export. In this way a town exerts a very real control over the surrounding country.

5.11 Town is a Shopping Centre for Country People Villagers come to town to do their shopping. They purchase goods of their choice. Large cities have goods collected from different parts of the world. Importance of extent of market lies in a region not by its large or small size. But it is the sale which determines the significance. The evaluation of sales to the inhabitants of the town, and also to those outside the time, determines the strength of the area of influence. Among towns there is found a hierarchy for performing central administrative functions within its regional limit. It has been seen in places like southern Germany where hierarchy is present in ascending order as market town, township, country town, district city, state capital, provincial capital and regional capital. The structure of the hierarchy varies from country to country. The town, however, serves as the regional center is equally significant of all administration, business, and legal affairs, medical and educational services. People from the countryside rely on their regional capital.

5.12 Summary Urban settlements everywhere have grown to form clusters around a large city. Often these are constituted by country towns and villages and are attracted to fall within the ambit of a major city by virtue of mutually associated functions. Thus, a 'city region' is formed around a city and metropolis. The city region is linked socially and economically to its urban center. Actually, the city region is an area influenced by an urban center two dimensionally. Town acts both as centripetally as well as centrifugally. Goods and services flow both into and out of a city, and thus the region of city is economically interdependent. It is neither a sphere of influence, nor does it necessarily form a continuous zone. A city cannot sustain by itself, but it is linked by its surrounding countryside interdependently.

5.13 Questions G-A (5 Marks each) (i) What is a village ? (ii) What is a town ? (iii) What is the structure of the Indian village ? (iv) What is the process that leads to the rise of the city ? (v) State the role of town as a business center.

84 NSOU • GE-SO-11 (vi) How do towns benefit agriculture ? G-B (10 Marks each) (vii) Discuss the characteristics of a village society. (viii) What are the socio-economic changes that took place in the village society ? (ix) State the causes that lead to the transformation of the village to towns. (x) State one difference between village, town, and city. 5.14 Suggested Readings (i) Fukutake, T. (1964). 86 NSOU • GE-SO-11 6.11 Questions 6.12 Suggested Readings 6.1 Objectives • To define religion • To understand the relation of religion with the primitive people • To understand the elements of Religion • To understand the role of religion as an institution • To understand the functions of religion • To understand the dysfunctions of religion 6.2 Introduction Religion has always been with us. Throughout history, it has expressed the deepest questions human beings can ask, and it has taken a central place in the lives of virtually all civilizations and cultures. As we think all the way back to the dawn of human consciousness, we find religion everywhere we turn. In our day and age, rumors of religion's demise seem very premature – and perhaps there's no grain of truth in them at all. Religion persists and is often on the rise, even as scientific and non – religious perspectives have become prominent. We still find religion everywhere, on television, in film, in popular music, in our towns and neighbourhoods. We discover religion at the center of global issues and cultural conflict. We see religion in the lives of the people we know and love, and in ourselves, as we live out and wrestle with our own religious faith. Why does religion continue to thrive? There are many reasons, but one thing is certain: religious traditions are adaptable in important ways. For many, contemporary religion even has room for skepticism, science, and the secular, which allows it to keep going strong in our rapidly changing world. From antiquity man has sought answers to questions concerning the mysteries of nature, such as why it rains, why volcanoes erupt, why accidents and incidents happens and questions about his own creation, his relationship to the supernatural, a satisfying philosophy of life, and life after death. In his quests, man has developed

NSOU • GE-SO-11 87 certain beliefs about the supernatural and also rituals and ceremonies for appeasement and propitiation of the supernatural. These rituals based on beliefs, convictions, and the ceremonies and symbols accompanying prescribed roles and prescribed roles and prescribed patterns of behavior, together constitute religion. The religious beliefs, forms of worship, objects of worship, rituals, ceremonies of the people of the world are varies and most numerous, but most of them are basic in the profound influence that they exercise on the behaviour of individuals, groups and society as a whole in almost every aspect of life. It is found throughout the world because it offers answers to such ultimate questions as why we exist, why we succeed or fail and why we die. People have believed in supernatural powers throughout history. Belief in supernatural powers or beings is, thus, the main basis of the phenomena of religion. The most widespread manifestation of this belief we find in the form of rituals. Rituals are the observations, in a prescribed manner, of certain actions that help to establish liaison between the performer and the supernatural power. All religions – primitive or modern – have this base of belief and rituals. 6.3 Why Sociologists Study Religion ? As said above, religion is considered as a belief in some supernatural power. Sociologists are not interested in knowing what this supernatural power is or how it works. They are also not concerned with the truth or falsity of any given religion. Sociologists take an objective look at religion – its functions, social foundations and social consequences. Sociologists also regard religion as a non-natural knowledge or an explanatory system which believes in a unique truth and which believes itself to be in possession of it. Sociologists study religion as a system of ideas that have a great impact in directing human behaviour. He does not study religion per se, but the effects of religious beliefs and practices on the social and cultural systems, socialization process and personality development. For a sociologist, religion is a non-rational, collective and symbolic action which acts as a response to the human need for meaning. Sociologists have no access to divinity revealed truth but they themselves try to seek to reveal their own truth. More specifically, the sociologist is concerned with the myriad ways in which society and religion interact, with profound consequences for the individual. Religious beliefs have social consequences and it is these that sociology studies under the name sociology of religion.

88 NSOU • GE-SO-11 6.4 Religion Defined How to define or even explain religion is a very difficult task as it is so diverse in historical development so culturally varied, that all definitions developed so far often failed to encompass is adequately. In its simplest and purest form, religion is an emotional attitude towards the unknown and the uncontrolled. It is a universal phenomenon that exists in some form or the other everywhere but varies in character. At the one extreme, it is concerned exclusively with the demon world. At the other, it is social and personal and related with supernatural constructs – transmigration existence of God and soul and the origin of universe. Pioneer sociologist Emile Durkheim defined religion as "...a unified system of beliefs and practices relative to sacred things, uniting into a single moral community all those who adhere to beliefs and practices". Anything that people in a society consider to be sacred and celebrate in recognized rites become religion. Religion thus rest on beliefs, sacred things, prescribed rites and officially consecrated individuals – priest – to celebrate those rites. Durkheim believed that everything can be sacred. Sacredness is not a property that is inherent in an object. It exists in the mind of the beholder. Thus, a tree, an animal, a pebble or a piece of wood may be considered sacred. In Durkheim's view the world is divided into two distinct categories : (i) the sacred, supernatural, divine and spiritual and (ii) the profane, natural, human and material. For early anthropologist E. B. Tylor, the belief in supernatural power is religion. Functionalists like Kingsley Davis believes that religion is an attempt to transcend the tedium of everyday life; that is it, involves the belief in and response to some kind of beyond. It is any set of coherent answers to existential dilemma like birth, sickness, ageing and death. It is human response to those things which concern us ultimately. It is a collective way of dealing with the unknown and unknowable aspects of human life – with the mysteries of life. It is also concerned with making of moral decisions. Paul Tillich says that religion is that which concerns man ultimately. In sociological terms, religion is simply a system of beliefs, practices, rituals and symbols that somehow related to our community's orientation to the supernatural or the life beyond. Religion entails a system of beliefs, practices, rituals, a form of worship and symbols, obedience to divine commandments and a concern with transcendental realms that are beyond the rational and the empirical. Thus, religion can take many forms such as bathing in the Holy Ganges (Hindus), offering prayers in the temple, church or mosque or performing some sacrificial rituals, participating in Holy Communion (Christians), or performing the Mitzvah ceremony (Jews).

6.5 Religion among the Primitive People In the process of evolution, man came to believe that there are some powers outside him that control the forces of nature as well as his own well-being. He believed that these powers can be propitiated with gifts and other actions. Rituals and ceremonies developed to take care of the interests of these supernatural powers. Shamans, medicine men, and priests emerged to mediate between man and those powers he held in awe. Objects that represented or were associated with these powers were treated as sacred. Gradually, these beliefs, practices and their practitioners tended to become part of the tribal social structure. Primitive religions have taken at least three major forms: animism, naturism and totemism. Animism is the belief that all things, animate and inanimate, are endowed with personal indwelling souls or spirits. This involves belief in spiritual beings such as ghosts, spirits and souls. For example, the Native Americans believed in the Great Spirit that exists in all objects and beings and spoke to them through animals and trees. Naturism is the belief in the personified forces of nature which control human destiny. Throughout history humans believed that gods or other supernatural beings controlled the forces of nature and once again, they sought to appease them for blessings. Not only thunder and lightning, wind, fire and mighty ocean but also dreadful diseases such as small pox are believed to be controlled by certain gods or goddesses. Finally, most tribal societies have a totem, an animal, plant or natural object that is set apart as sacred and towards which members of the community feel a special relationship. Totemism is a form of social organization and religious practice typically involving an intimate association between sibs and their totems, which are regarded as ancestors or as supernaturally connected with an ancestor, which are tabooed as food and which give the sibs their names. Animism, naturism and totemism have several elements in common. People believe that they can communicate with these powers or spirits and influence them to enhance the community's well-being. Attitude of the community involves veneration of ghosts, spirits and other supernatural beings. Rituals and ceremonies often involve magic and sacrifices. There are sacred objects, places and people that are taboo. Very often celebrations of the spirit involve magic, dance and ritual sacrifices.

90 NSOU • GE-SO-11 James Frazer, British social anthropologist and classical scholar, analyzed primitive religions and a vast range of exotic beliefs and customs in terms of man's search for true knowledge and effective control of his environment and his conditions. He delineated the evolution of human psyche in three phases: magical, religious and scientific thought. Magical thought assumed that the universe is regulated by impersonal and unchanging laws and the magician like the modern day scientist used his knowledge in a quasi-technical manner to accomplish things. As the failures of magic became apparent, it was gradually discredited and people turned to religious thought. In this phase, supernatural beings were supposed to control the world and they began to venerate and propitiate them. Finally, recognizing the limits of his own powers and gradually applying logico-experimental methods, man arrived at the scientific stage.

6.6 Elements of Religion All religions have certain elements in common, yet they differ in expression and manner. Most religions of the world have the following elements. (i) A set of beliefs and values regarding the ultimate power in the universe, life after death, in supernatural beings. (ii) A set of ceremonial ways, (rituals and behaviour) of expressing this belief including festivals, ceremonies, prayers, religious services, feasts, sacrifices, fasts, offerings and pilgrimages. (iii) Things considered sacred such as Gods, spirits, special persons or any object or symbol or thought defined as sacred, supernatural divine or ultimate. (iv) A group of community of believers, a congregation, who make religion a social existence as well as a personal experience, which includes meetings, discourses and devotional gatherings. (v) A form of organization that reinforces the sacred, unites the community of believers and carries the rituals. (vi) An expressive culture – particularly visual and performing arts – including dancing, singing, chanting, processions, mythical ecstasy, trance, alteration of psychological states through drugs and deprivation.

NSOU • GE-SO-11 91 (vii) Holy texts believed to be based on revelation and containing the tenets of faith and rules of conduct. (viii) A moral philosophy which unites the mundane and the supernatural in a mystical blend. Each of the above of elements will vary in form, in observed, in the response they evoke from individuals and in influence according to the culture concerned – altogether these prescribed specific lines of action, attitudes and values desirable under varying conditions according to which man is exact to behave. Religion developed slowly with evolution of human society in its more primitive forms. In its evolutionary development, the earliest people are said to be the pre- religious people – possessed no organization or special roles (no temple, church or priest or clergy), only a communal sharing in rituals and gave expression to religious symbols. As religion and society evolved, a sense of sacredness takes concrete form in objects and images that becomes sacred, whether these are persons, animals or natural objects, human artifacts or symbolic expressions. The sacred also becomes conveyed and expressed for the living in ritual, where behaviour gives objective form to mood and feeling. A division among the sacred and the profane eventually marks of religious activity.

6.7

Religion as an Institution In viewing religion as an institution, sociologists evaluate its impact on human societies. As an institution, religion has operated to standardize the religious emotions, beliefs and practices and to spread and perpetuate them. It is a powerful instrument of social control and social integration. It is a strong bond of social unity through promoting of a community of thought. It deals with divine sanctions at well as with present and future rewards and punishments. Through this, it exercises a profound influence on one's behaviour. In viewing religion as a social institution, sociologist, have also evaluated its impact on individual and society as a whole. As an institution, religion is characterized by its universality, its rituals, its sacredness and its persistence. Religion can be viewed from both individual and societal points of view. The functions of social cohesion and social control are oriented towards the larger society while providing emotional and social support and other psychological explanations which are more oriented towards the individual.

92

NSOU • GE-SO-11

Although religion, like other institutions, has changed, it continues to be a potent force, rather with more vigour in our lives throughout the modern neo-liberal risky world. The assertion that God is dead is not true for a large part of the world's population. Despite the incredible growth in the importance of science and empiricism since 19th century, which has caused many people to regard religion as a superstition, an irrational belief and religiosity and spirituality among people are increasing in some way or the other. At many times, religion persists in the face of scientific evidence. Even, the men who call themselves as scientists are not fully devoid of religious beliefs and take part in many religious rituals in the home as well as at the workplace. We often hear a doctor saying that he or she will do his/her best to save the life of the patient but it is ultimately the

God who saves. This proves that religion has always been present and has also been a prominent institution. In traditional societies the religious and non-religious spheres of life are not sharply differentiated. But in modern industrial societies, religion and society are not the same. The emergence of different modes of life experience leads to different meanings about life, producing a religious differentiation. Religion

thus may still provide cohesion but that may be only for certain sub-groups of society. 6.8

Functions of Religion Religion is a cultural universal because it fulfills several basic functions within human societies. It is a basic requirement of group life. In sociological terms, these include both manifest and latent functions. Among the manifest (open and stated) functions of religion are included defining the spiritual world and giving meaning to the divine. Religion provides an explanation for events that seem difficult to understand. By contrast, latent functions of religion are those which

are unintended, covert or hidden. Functionalists suggest that religion is a requirement for society and individual both because it serves both manifest and latent functions.

These functions are briefly discussed below. 6.8.1

Religion as an Integrative Force Durkheim believed that the primary function of religion was to preserve and solidify society. Its functions to reinforce the collective unity or social solidarity of a group. Sharing the same religion or religious interpretation of the meaning of life

NSOU • GE-SO-11 93

unites people in a cohesive and building moral order. The social cohesion is developed through rituals such as reciting prayer in the honor of God, institutions of worship (church, temple, and mosque) and multitudes of observances and ceremonies practiced by different groups. The unifying rituals of different faiths are also observed by individuals on the most significant occasions such as birth, marriage and death. This integrative function of religion was particularly apparent in traditional, pre-industrial societies. Durkheim was particularly concerned with a perplexing question, 'how can human societies be held together when they are generally composed of individuals and social groups with diverse interests and aspirations'. In his view, religious bonds often transcend these personal and diverse forces. It gives people certain ultimate values and ends to hold in common.

Although the integrative impact of religion has been emphasized here, it should be noted that religion is not the only integrative force – the feelings of nationalism or patriotism may also serve the same end. In contemporary industrialism societies, people are also bound together by patterns of consumption, ways of life, laws and other forces. 6.8.2

Creating a Moral Community Religion provides a system of beliefs around which people may gather to belong to something greater than them in order to have their personal beliefs reinforced by the group and its rituals. Those who share a common ideology develop a collective identity and a sense of fellowship. Members of moral community also share a common life. This moral community gives rise to social community through the symbolism of the sacred that supports the more ordinary aspects of social life. Religion then legitimizes society. It provides sacred sanction for the social order and for its basic values and meanings. 6.8.3 Religion as Social Control Frank E. Manual (1959) had said that 'religion was a mechanism which inspired terror, but terror for the preservation of society'. While conservatives have valued religion for its protective function, radicals have also often recognized that religion can be a support of the established order and have consequently been critical of religion. Friedrich Engels, a life-long close associate of Karl Marx, once noted that

94 NSOU • GE-SO-11 religion could make the masses 'submissive to the behest of the masters it has pleased God to place over them'. Durkheim also emphasized that besides acting as an integrating force, religion also reinforces social control in oppressive society. Religious beliefs can influence the conduct of those who believe in them. It keeps people 'in line' through folkways and mores. It provides a foundation for mores of society. Religious sanctions are sought for certain desirable patterns of behaviour to persist in society in the forms of mores. Thus, many taboos in various cultures have religious sanctions, e.g. the taboo against eating of pork in Jewish and Muslims and cow meat in Hindus. 6.8.4

Provides Rites of Passage Religion helps us in performing ceremonies and rituals related to rites of passage – birth, marriage, death and other momentous events – which give meaning and a social significance to our life. 6.8.5 Religion as Emotional Support Religion is a sense of comfort and solace to the individuals during times of personal and social crisis such as death of loved ones, serious injury. This is especially true when something senseless happens. It gives them emotional support and provides consolation, reconciliation and moral strength during trials, and defeats, personal losses, and unjust treatments. It provides a means whereby man can face the crisis and vicissitudes of life with strength and fortitude. The concepts of karma and transmigration among Hindus and Jesus Christ as son of God, and prayer among Christians seek to provide such fortitude, and strength. Thomas O'Dea (1970) writes, 'Men need emotional support in the face of uncertainty, consolation when confronted with disappointments, and anxiety'. It is often said that visiting places of worship and holy premises serves for outlets for releasing tension and stress. Religion offers consolation to oppressed people also by giving them hope that they can achieve salvation and eternal happiness in the afterlife. Religion increases the 'God will provide' attitude. 6.8.6 Religion serves a means to provide answers to Ultimate Questions

All religions have certain notions and beliefs that provide answers to questions like why are we on earth, is there a supreme being, what happens to life after death.

These beliefs are based on the faith that life has a purpose and there is someone or

NSOU • GE-SO-11 95 something that controls the universe. It defines the spiritual world and gives meaning to the divine. Because of its beliefs concerning people's relationships to a beyond, religion provides an explanation for events that seem difficult to understand. 6.8.7 Religion as a Source of Identity Religion gives individuals a sense of identity – a profound and positive self-identity. It enables them to cope effectively with the many doubts and indignation of everyday life. Religion may suggest people that they are not worthless or meaningless creatures and thus, helps them alleviating the frustrating experiences of life which sometimes force a person to commit suicide. According to Thomas Luckman (1983), 'the prime function of religion is to give personal meaning to life.' In industrial societies, religion helps to integrate newcomers by providing a source of identity. For example, Bangladeshi immigrants in India, after settling in their new social environment, came to be identified as Indian Muslims. In a rapidly changing world, religious faith often provides an important sense of belonging. 6.8.8 Legitimizing Function of Religion According to Max Weber (1930), religion may be used to explain, justify or rationalize the exercise of power. It reinforces the interests of those in power. Even in societies not as visibly ruled by religious dogma, religion legitimates the political sector. For example, India's traditional caste system defined the social structure of society. According to one theory, caste system is creation of the priesthood (Brahmins) – the uppermost stratum of this system, but it also served the interests of political rulers by granting legitimacy to social inequality. Marx has acknowledged that religion plays an important role in legitimizing the existing social structure. The values of religion reinforce other social institutions and the social order as a whole and as a consequence it perpetuates social inequality in society. 6.8.9 Psychologizing Religion The notion of positive thinking serves as an example of psychologizing religion. It provides peace of mind, promises prosperity and success in life, as well as effective and happy human relations. It is thus a source of security and confidence, and also of happiness, and success in this world. But at times religion can be debilitating and personally destructive. Persons

96

NSOU • GE-SO-11

convinced of their own essential wickedness can suffer extreme personal difficulties. As Kingsley Davis (1949) noted, 'like other medicines, it (religion) can sometimes make worse the very thing it seeks to remedy. Innumerable are the psychoses and neuroses that have religious content.' But, in this role, religion is not always harmful. Many times, it serves as a liberating and integrating force for individuals. For instance, it helps in bringing change (sobriety) to seemingly hopeless alcoholics. 6.8.10 Religion acts as Psychotherapy In modern world, religion has also become a supporting psychology – a form of psychotherapy. Now, God is conceived of as a humane and considerate God. Such a hopeful perception helps the sufferer in alleviating his/her personal and social crisis. A new vocation of religious practitioner has recently come up in the mental health field as a helping professional. It already existed in village India and other places in the form of shamans, priests and magicians. 6.8.11

Religion as an Agent of Social Change While religion supports the status quo in its priestly function, it inspires great change in its prophetic function. It can enable individuals to transcend social forces; to act in ways other than those prescribed by the social order. Mahatma Gandhi, Jesus, Thomas More all died upholding spiritual beliefs that were not those of the social order in which they lived. Religion, in its prophetic function, provides individuals with an unshakable foundation of social criticism which later on become the basis for change. Many religious groups of the world protested against Vietnam, and Iraq, and an age-old Buddha statue in Afghanistan. Generally, religion is regarded as an impediment in the path of social change but many religious groups, by criticizing existing rules of social morality and social injustice, and community or government actions, help in bringing about social change. In this regard, Max Weber's pioneering work on the relationship between economy and religion, *The Protestant Ethic, and Spirit of Capitalism* (1930) can be cited that how Protestant ethic had helped in the development of spirit of capitalism in certain European nations. Weber's major theoretical point to be noted here is that ideas can change history and in doing so can contribute to changes in the material context of life. Despite establishing relationship between religious ethic and economy, Weber

NSOU • GE-SO-11 97 argued that the effects of religion on society are unpredictable and varied. Sometimes it might have conservative effect, whereas in other cases it might contribute to social change. Thus, Buddhism militated against the development of capitalism in China, whereas in Northern Europe, Calvinism had the opposite effect. Contrary to Weber, Marx has put forth a quite opposite thesis. He opined that religion impedes social change by encouraging oppressed people to focus on other worldly concerns rather than on their immediate poverty or exploitation. He said, 'Religion is the sigh of the oppressed creature, the feelings of heartless world....It is the opiate of the people'.

Whereas Marx had seen religion as a consequence of the economy, Weber believed that religion helped to shape a new economic system. It should be noted that many religious leaders have acted in the forefront of many social and political movements. For example, Martin Luther King fought for civil rights of Blacks in America. Swami Dayanand worked aggressively for women education and widow remarriage

in India. 6.8.12 Religion as an Agent of De-politicization According to Bryan Wilson (1976), religion functions as an agent of de-politicization. Marxists suggest that by inducing a false consciousness among the disadvantages, religion lessens the possibility of

a

collective political action. In simpler terms, religion keeps people away from seeing their lives and societal conditions in political terms. 6.8.13 Religion controls Sexuality According to B. Turner (1992), religion has the function of controlling the sexuality of the body, in order to secure the regular transmission of property via the family. In feudalism and now capitalism, religious control of sexuality is an important vehicle for the production of legitimate offspring. In the end, it may be said that in spite of being regarded as superstition, religion is persisting for such a long time as a social institution because of its varied functions cited above that it performs for the welfare of both the individual and the society. At many times, even the so called educated people regard religious laws as superior to the man-made laws. In primitive and traditional societies, and even some sections of modern societies, despite all-round attack over it, religion is a pervasive matter, and religious beliefs, and rites play an important part in the activities of various kinds of

98

NSOU • GE-SO-11

groups – from family to occupational groups. Though inhabitants and citizens of a modern society, many remain traditional in their religious and moral outlook. For some, this means that religious authority and principles override that of secular law. 6.9 Dysfunctions of Religion

In common parlance the functions of religion are more highlighted. Its dysfunctions or negative functions, which may be covert, are not much talked about but in some instances religious loyalties are seen as dysfunctional. They contribute to tension or even conflict between groups or nations. Millions of European Jews were either exterminated or killed by Nazis during Second World War. Besides this, history is replete with the examples of wars which were fought on the issues of religion. Even in modern times, nation such as Lebanon (Muslims versus Christians), Israel (Palestinians versus Jews), India (Hindus versus Muslims) and many others have been greatly affected by religion. Generally, it is held that religion makes a unique and indispensable contribution to social integration. This proposition is based on the studies of religion in non-literate societies. How far this proposition is true in complex and changing societies is of question today. What are the unintended consequences of religion? What are the functional alternatives to religion in meeting social needs – the need of social integration? It is difficult to defend the proposition that religion alone supported social integration or social control in modern societies like America or Britain or even Indian society. It is often seen as a disintegrating force in some quarters. A small incident of the destruction of old structure of Babri Mosque has deepened the gulf between Muslims and Hindus in India. Religion is not necessarily a beneficial or admirable force or social control. For instance, Hindu religion reinforces traditional patterns of behaviour that call for the subordination of the powerless. Subservient position of women in Hindu and many other religions is the outcome of this feeling. Religion is a potent impediment to social change and progress. It supports the existing social order and encourages both the privileged and dispossessed to accept the status quo. The caste system and to some extent joint family system in Hindus are reinforced by the Hindu philosophy of religion. These two pillars of Hindu society have put many hindrances in the developmental process of the country.

NSOU • GE-SO-11 99 6.10 Summary Marx has strongly criticized religion. For Marx all that was fundamental in the science of society proceeded from the material and especially the economic sphere. For him therefore religion is, to be sure, superstition, but to stop at this point is to limit religion to merely abstract belief. It leaves the impression that religion may be dislodged simply by new, rational belief. Marx's sense of the matter is more profound. Merely changing beliefs is not enough. The transformation of an entire social order is required, for belief is deeply rooted in the social relations of men. Religion, writes Marx, is the self-consciousness and self-feeling of man who either has not yet found himself or has already lost himself. But man is no abstract being, squatting outside the world. Man is the world of man, the state, and society. This state, this society produces religion, a perverted world consciousness because they are a perverted world. Religion is the compendium of that world, its encyclopedic, its enthusiasm, its moral sanction, its solemn completion, its universal ground for consolation and justification. It is the fantastic realization of the human essence because the human essence has no true reality. Marx believed, like Ludwig Feuerbach that what man gives to God in the form of worship he takes from himself. That is, man is persuaded through suffering or through false teaching to project what is his to a supernatural being. But he was convinced, unlike Feuerbach, that what is fundamental is not religious forms – against which Feuerbach had urged revolt-but the economic forms of existence.

The abolition of religion as the "illusory happiness" of the people is required for their real happiness,

declared Marx. But before religion can be abolished the conditions which nurture it must be done away with. "The demand to give up the illusions about its condition is the demand to give up a condition which needs illusion". Marx's criticism of religion is thus deeply connected with the criticism of right and the criticism of politics. As Marx put it... "The criticism of heaven transforms itself into the criticism of earth, the criticism of religion into the criticism of law and the criticism of theology into the criticism of politics". Marx was an atheist as well as a great humanist. He had profound sympathy for all who look up to religion for salvation. This is amply clear from his following observation : "The criticism of religion ends with the teaching that man is the highest essence of man, hence with the categorical imperative to overthrow all relations in whom man is debased, enslaved abandoned..."]

102 NSOU • GE-SO-11 7.2 Introduction Family is one of the most important social institutions. Most of the world's population lives in family units; it is an important primary group in the society. Family is the most pervasive and universal social institution. It plays a vital role in the socialization of individuals. Family is regarded as the first society of human beings. It is known as the first school of citizenship. One is born in family, grows in it, works for it and dies in it. One develops emotional attachment to it. The parental care imparts to the child the first lesson in social responsibility and acceptance of self-discipline. Family is the backbone of social structure. The difference between a living and a dead social system – of whatever size, be it the largest or the smallest – is the presence, or disappearance (due to death or migration), of its members. A social system lives through its membership. Individuals who belong to it may die or withdraw; their replacement is a must if a system is to survive. Since a social system is a plurality of interacting individuals, the first functional pre-requisite is the presence of individuals in interaction. Since individuals have a limited life span compared to a social system – particularly a society or a community – the system must ensure their replacement when they die or move out. Every social system has to attend to the question of recruitment of its membership, of ensuring continuing membership. For societies as a whole, this recruitment pre-requisite is fulfilled through the institution of marriage – persons of opposite genders are united for the purpose of sexual congress, necessary for the process of reproduction. The continual living together of mating partners and their progeny creates conditions for the small primary group called the family. 7.3 Family : Concept Anthropologist George Murdock (1949) has observed that there are only two truly units of human organization – the family and the community. Philosophers and social analysts have also noted that society is a structure made of families and these have been observable throughout man's history. It is unlikely that any society has ever existed without some social arrangements that could be termed family. Even in most primitive societies, it existed in some or the other form. It has remained present in all cultures, despite variations in its composition, descent, and residence and authority patterns.

NSOU • GE-SO-11 103 The family is the basic social institution from which the other institutions – political, economic, religious and educational – have grown as increasing cultural complexity made them necessary. It is the institution which links the individual to the large social structure and thus performs the mediating function in the large society. It is through the family that the society is able to elicit from the individual his/her necessary contribution. It grows out of biological needs such as procreation, protection of the expectant mother and the infant child and old and the sick that cannot support and live by themselves. Not only this, it also helps in the socialization of the young, the production and distribution of food and the exploitation of environment which is essential to permit the satisfaction of the more intimate biological needs which cannot take place without organized cooperative efforts. Recruitment by birth as the principal mode of enlisting membership is common to all societies. It is this aspect of recruitment that has given prominence to the institution of the family. Apart from religion, family is the only institution that is universally found in all societies. It is the family towards which every individual seems to be oriented. The individual carries out assigned tasks as a member of the family. While most individuals marry, it is not compulsory for them to do so. People can choose to remain bachelors/spinsters. Widowers and widows of marriageable age and without children can also prefer widowhood to remarriage. Unmarried people still belong to the family to which they are born; only they will not have a family of their own. In many societies, ascetics who decide to remain celibate are treated with respect for their sacrifice; while some persons may become their disciples, they do not preach celibacy to all their followers. Those who renounce the world for higher religious goals also depend on the families in society for their sustenance. They return from their hermitages to the towns and villages to beg for alms. It is in this sense that: family is the fundamental instrumental foundation of the larger social structure, in that all other institutions depend on its contributions. It is the family that performs the functions of reproduction of the young, physical maintenance of family members, social placement of the child, socialization and social control. The family is regarded as universal in three different aspects : • An arrangement to meet a universally defined biological need or drive; • Understood as the smallest group consisting of people related through blood or marriage, who takes care of the children; this is found in all societies; and

104 NSOU • GE-SO-11 • The family fulfills some universally applicable functions of society, such as replacement of members, socialization and social control. It will be seen that in the first meaning, the emphasis is on the biological need for sex; in the second, the focus is on the group; while in the third, it is the functions that the family performs for the wider society that are regarded as crucial. In other words, family is universal because it provides a group setting where both the biological needs of the individuals and the functional requirements of society are fulfilled. Family, understood as a group of people of both sexes, of different age groups, with some sexual relationships within the group permitted while others are tabooed, is universally present. But its uniqueness ends there. Each society has a distinctive family culture that is defined not by biology, but by the sociology of the society in question.

7.4 Family : Definition What is meant by the term family? The term family has been defined in various ways in a both narrow and broad sense. In a narrow sense, Elliot and Merrill (1961) defined the family as 'a biological social unit composed of husband, wife and children.' Almost, in similar terms, Ogburn and Nimcoff (1950) stated, 'the family is more or less a durable association of husband and wife with or without children or of a man and woman alone with children.' However, in modern times, one of the most notable features of the Western society has been the increase in the single- parent family, i.e. a family where one parent, usually the mother resides with and takes responsibility for parenting her children. Not only this, there are instances of pairing in which unmarried people are living together or homosexual couple rearing children. Such people call their pairing as families. In a broader sense, family has been defined by Burgess and Locke (1963) as '.... a group of persons united by the ties of marriage, blood or adoption, constituting a single household, interacting and intercommunicating with each other in their respective social role of husband and wife, mother and father, son and daughter, brother and sister, creating and maintaining a common culture.' Similarly, Oxford Dictionary of Sociology (1994) defined family as an intimate domestic group of people related to one another by bonds of blood, sexual mating or legal ties. According to Maclver and Page (1959), 'the family is a group defined by a sex

NSOU • GE-SO-11 105 relationship sufficiently precise and enduring to provide for the procreation and upbringing of children.' In the two definitions cited above, the roles, functions and relationships between different members have also been taken into account besides the associational aspect of the family. Looking to the possibility of its polygamous character as found in many primitive and even modern societies, anthropologist Edward Westermarck defined family

95%

MATCHING BLOCK 3/115

W

as 'a relation of one or more men to one or more women which is recognized by custom or law and involves certain rights and duties both in the case of parties entering the union and in the case of the children born of it'.

This definition seems to be most exhaustive as it includes both its associational and institutional aspects. Recently, Anderson and Sabatelli (1999) have defined family as 'an interdependent group of individuals who have a shared sense of history, experience, some degree of emotional bondage and devise strategies for meeting needs of individual members and the groups as a whole.' This definition locates the crucial roles and responsibilities of the family members as a linked entity. Family can be studied as a group, a social system and a social institution. As a social group, it consists of spouses and their children with or without other nearest blood relatives. It is the primary social group in which early childhood socialization takes place. As a social system, it is composed of interdependent parts, it has a characteristic organization and pattern of functioning and it has sub-systems that are part of larger system. The family is also considered as a social institution because it is an area of human social life that is organized in discernible patterns. It helps in meeting our crucial societal goals and needs. As an institution, it places emphasis on household, marital, and kinship relationships, along with norms and values that govern inter, and intra-familial relationships.

7.5 Family : Characteristics Every family is known to possess the following characteristics : (i) Family is a universal group, it is found in some form or the other in all types of societies, whether primitive or modern. (ii) A family is based on marriage, which results in a mating relationship between two adults of the opposite sex. (iii) Every family provides an individual with a name and hence it is a source of nomenclature.

106 NSOU • GE-SO-11 (iv) Family is the group through which descent or ancestry can be traced. (v) Family is the most important group in any individual's life. (vi) Family is the most basic and important group in the primary socialization of an individual. (vii) A family is generally limited in size, even large joint and extended families. (viii) The family is the most important group in a society; it is the nucleus of all institutions, groups and organizations. (ix) Family is based on emotions and sentiments. Mating, procreation, maternal and fraternal devotion, love and affection are the basis of family ties. (x) The family is a unit of emotional and economic cooperation. (xi) Each member of the family shares duties and responsibilities. (xii) Every family is made up of husband and wife, and/or one or more children, both natural and adopted. (xiii) Each family is made up of different social roles, like those of husband, wife, mother, father, children, brothers or sisters.

7.6 Family : Forms Families throughout the world vary in many different ways. There are tremendous variations in family structures around the world. Variations in family structures include variations in accepted modes of mate selection (endogamy and exogamy), forms of marriage (monogamy and polygamy), rules of authority (patriarchal or matriarchal), rules of descent and inheritance (patrilineal or matrilineal and sometimes bilateral), rules of residence (patrilocal, matrilocal or neolocal) as we find in modern society. We here explain the important forms of family based on structure and marriage.

7.6.1 Nuclear Family It is a unit generally composed of married couple (in the statuses of husband and wife) in the role of mother and father or parent and their unmarried dependent children, either natural or adopted, living together. It is called nuclear as it serves as the core or nucleus upon which larger family groups are built. It is also sometimes referred to as conjugal family. Such a type of family is relatively independent of the wider kinship network because the social emphasis is placed primarily on the marital relationships. William Goode (1959) observed that spouses in the nuclear family have to rely heavily on each other for the companionship and support that might be provided by other relatives in an extended (joint) family system. The term nuclear family is sometimes used for such families also which may and may not include husband and wife. They consist of any two or more persons related to one another by blood, marriage or adoption who share a common residence. Thus, a brother and sister or a single parent and child would be nuclear families but not strictly speaking conjugal families. In conjugal family the emphasis is primarily on conjugal bond, i.e. marital relationship. In virtually all societies we can identify this type of family. In most traditional societies, including India, the nuclear family was part of a larger kinship network of some type. Anthropologist G. P. Murdock (1949) asserts that it is a universal human grouping.

However, there are several categories of evidence against this position. Family units comprising step parents as a consequence of divorce or remarriage is known as reconstituted family. It is a form of nuclear family in which one or both parents have had children from a previous relationship. **7.6.2 Extended Family** When nucleus of the conjugal family is extended by the addition of other closely related kin (grandparents, aunts, uncles, nephews, brothers and their wives, cousin sisters, etc.) it is called an extended family. Giddens (1997) writes: 'when close relatives other than a married couple and their children live in the same household or in close and continuous relationship with one another, we speak of extended family.' As stated above, an extended family may include grandparents, brothers and their wives and children, sisters and their husbands, aunt and nephews.

86%

MATCHING BLOCK 4/115

W

The term refers to a family system in which several generations live in one household.

It consists of several individual families related by blood or marital ties. In most traditional societies, the extended family is the norms which go beyond the nuclear family unit. But, the old structure of extended family is crumbling and fast changing everywhere and in its place a modified extended family is gradually coming up. The form of extended family differs from society to society. Indian joint family is also one of the forms of extended family. It is an extended form of consanguine family in which many blood relatives together with their mates and children reside. It is different from conjugal family which has a married couple as its core surrounded by a fringe of blood relatives, whereas the consanguine family has the group of

108 NSOU • GE-SO-11 brothers and sisters at its core surrounded by a fringe of husband and wives. Generally, it is defined as, when two or more lineal or collateral nuclear families live together in one household, it is called joint family (in reality, joint families are an amalgam of what have been otherwise several families of orientation and procreation) (Majumdar 1956). Families formed on the basis of marriage are of two types: monogamous family, in which one man marries one woman at one time, while polygamous family is formed by the concurrent marriage of one sex to two or more members of the opposite sex. Polygamous family is of two types: polygynous family, in which a man may be married to more than one woman at the time and polyandrous family, in which a woman may have two or more husbands simultaneously. This type of family is much less common. 7.6.3 Families Based on Descent, Inheritance and Residence Norms of descent, inheritance, authority patterns and residence also decide the forms of family. The most common form of descent is patrilineal. In this type of descent, lineage is traced through father's kin: offspring owe a special allegiance and loyalty to father and his kin. It indicates that only the father's relatives are important in matter of property, inheritance and the establishment of emotional ties. Conversely, in societies which favour matrilineal descent, the mother's relatives assume the important role among offspring. This pattern of descent is not common, but they do exist as we find in Khasi and Garo tribes of North East India. When both sides of a person's family are regarded important, this system is referred to as bilateral descent. In this system, kinship lines are traced equally through the biological relatives of both the mother and the father and inheritance is passed on in equal proportions to children regardless of sex. Now the question arises: who rules? Who has the power to make a decision? Societies vary the way the power within the family is distributed. Most societies are patriarchal, i.e. the men have the power and authority and are dominant. They dominate in all family decision making. Women hold low status in such societies. By contrast, in matriarchal societies, the authority rests with the females, especially wives and mothers. This system is rare and even in such society male members is seen exercising power through female members. The least common pattern of authority is the egalitarian model in which spouses are regarded as equals and decisions are equally taken by husband and wife. In modern times, the egalitarian family has begun to replace the patriarchal family as a social norm.

NSOU • GE-SO-11 109 Norms of residence are very much different. When a married couple chooses its own place of residence or decides to establish a separate household, it is known as neolocal family. This type of residence pattern seems to be linked most closely with norms of monogamy and individualism. In many societies, the bride and groom live with groom's parents (the patrilocal family) or with wife's parents (matrilocal family). In such cultures it is felt that the new couples need emotional support and economic support of kinsfolk. Usually it is seen that the young couple begin their married life not as an independent household (neolocal residence) but with parents of either spouse and later on after sometime they end up an independent household of their own. Sociologists also distinguish families of orientation and families of procreation. The family (usually nuclear) in which one is born and reared is termed as family of orientation. This is the family in which the most basic early childhood socialization occurs. Contrary to this, when a person marries, a new nuclear (or conjugal) family is formed and it is known as family of procreation. It is a family in which the person procreates after being married. This family consists of oneself and one's spouse, and children. Thus, a person becomes member of two different but overlapping nuclear families. Marriage is a dividing line between family of orientation and family of procreation in terms of the nature of roles one performs in two families. 7.7 Indian Joint Family There are certain technical differences between the joint and the extended family. In Western society what is called joint family meant one uniting both father's and mother's lines. In this sense, Indian joint family is different from Western joint family. It is not only the extended form of nuclear family as is generally supposed, but it has other ingredients of jointness also. Co-residentiality, i.e. living together of nearest kin relatives with the conjugal family, is only one characteristic of Indian joint family and that too has lost much importance these days. What is meant by jointness that makes a family joint in Indian context, we start with much quoted definition of Irawati Karve (1953). She define the

83%

MATCHING BLOCK 5/115

W

joint family as 'a group of people who generally live under one roof, who eat food cook at one hearth, who hold property in common, who participate in common family worship and

who

are related to each other as some particular type of kindred.' Karve has defined the family in

historical context : the family that seems to have existed in Vedic and Epic period or in mediaeval times. This definition emphasizes on five characteristics of the joint

110 NSOU • GE-SO-11 family; (i) common residence, (ii) common kitchen, (iii) common property and income, (iv) common worship, (v) some kind of kinship relations. If we apply these characteristics to the present Indian families, it would be very difficult to call a handful of families to be joint in the above sense. According to I.P. Desai (1956), it is the relationship between the members of a household that determines the type of family. What distinguishes nuclear family from the joint family is the difference in the role, relations and the normative patterns of behaviour among different members. He defined it as under: '

95%

MATCHING BLOCK 7/115

W

we call that household joint family which has greater generation depth (

i.e. three or more generations) than the nuclear

family and the members of which are related to one another by property, income, mutual rights and obligations.'

Desai thinks that when two nuclear families having kinship relations are living separately but function under one authority, it will be a joint family. For him, generational depth, rights and obligations and property relations are the main criteria for explaining joint family. Some sociologists have given importance to commensality and fulfillment of obligations as the criteria of joint family, irrespective of common residence and common kitchen. It is the authority of the elder in matters of family and religion, joint investment of capital, joint enjoyment of profits, and of including birth, marriage and death expenses out of joint funds that determines a family to be joint. Thus, the main basis of joint family is the subordination of narrow individual interests to the larger interest of the family as a whole. It is the co-operative spirit among the members to help each other at the time of any calamity and their attendance at family functions and the observation of obligations or responsibilities towards are the members of the family rather than the facts of co-residence, commensality and the size of the group that keep the family joint. Due to the exigencies of modern times, it is not possible to place undue emphasis on common residence and common kitchen as dimensions of jointness. In its modern form, the nuclear families as the units of a joint family retain considerable autonomy and yet maintain connections with the other nuclear families of brothers and their parents to exchange gifts, goods and services. This type of family differs from a traditional joint family in that its members may live separately in the same household or in different parts of the city or in different cities in India or outside India and choose their occupations independently rather than following the traditional parental occupation. Yet it may be joint family if its members contribute their bit to the feelings of jointness by rendering financial and other kinds of help, performing various reciprocal obligations and following joint family norms. Physical jointness (common property,

NSOU • GE-SO-11 111 purse, common land or business) has more or less weakened, but sentimental jointness still exists. This we can see at the observance of any family ritual – birth, marriage and death – when all members gather. When a joint family grows so large as to be intended to split apart, brothers start new joint families of their own. The Indian joint family has probably always gone through such cycles of formation and fission. To conclude, it may be said that it is set of relationships and rights and obligations that make a family to be joint rather than its mere structure. Instead of large joint families, we will have only locally functioning effective small joint families of two generations and so. At the same time, even the majority of those nuclear families in which a man, his wife and unmarried children live separately, will continue to be joint with their primary kin like father or brother in terms of functioning (Ahuja, 1993). At the level of interaction, if the actions are oriented towards the husband, wife and children, it should be understood as nuclear family, but if they are oriented towards to a wider group of relatives (brothers, sisters, uncles, aunt and grandparents), then, it should be understood as a joint family. The basic elements of the traditional joint family may be summarized in the following points : (i) Responsibilities of members – duties and rights. (ii) Authority structure based on status. (iii) Affectional pattern – intimacy. (iv) Sentiments – mutuality of interest and mutual assistance. (v) Primary group controls. The family has been one of the most important institutional pillars of Indian society. 'If there is an "ism" that governs Indian society and its institutions, it is familyism' (Kakar and Kakar, 2007). 7.8 Family : Functions From the fact that family is a universal social institution, it is clear that it has very important social functions. (i) Procreation Every society needs to replace its members. Although reproduction can take

112 NSOU • GE-SO-11 place outside the marital union, it is only the family that can effectively nurture and socialize the human young to meet the needs of society. (ii) Sexual Regulation No society can allow unrestricted promiscuity. First, every society has to ensure that statuses and roles are defined so that individuals can function effectively in assigned positions. Second, by specifying that individuals marry within or outside certain social groups, society is establishing networks of relationships and forging useful alliances. (iii) Economic Support In the pre-industrial society, the family was the unit of production and consumption. Today as individuals pursue independent economic activities outside the home, the family may no longer be a significant unit of production. But the family is still responsible for maintenance of the human young, education, training and material support. In India, the family's support for children does not end when they turn eighteen; in the absence of productive employment many adults continue to depend on their parents. (iv) Social Placement Every individual is recognized as the member of a family and thus has an inherited status. Children inherit not only the family name and material assets but also a social standing. In fact, birth into a family determines a person's caste, class, religion, language and clan. (v) Socialization The family is the most important and effective agent of socialization. The human young is dependent on his or her parents for a long time. The child also spends the most formative years of his or her life in the family. The institution of family is responsible for initiating the child into the social circles, religious groups, language and caste. Thus the child gets socialized into the group's values, beliefs, standards and practices. (vi) Emotional Security This is one of the most important functions of the family. Food and shelter can be provided by other institutions such as the orphanage. Studies have shown that children who grew up in loving families tend to become mentally and physically healthier than those brought up in other institutions.

NSOU • GE-SO-11 113 Many of these functions continue to be performed in large measure by the Indian family. But some of the functions such as education, apprenticeship for economic activities, training, recreation and religion have been taken over by schools, religious institutions and other community clubs.

7.9 Future of the Institution of Family

The existence of the twin institutions of marriage and family, which used to be pivot of all community life, seems to be in peril because of the changes in the attitude and norms of associational living. There have been loud claims that families are in decline and there have even been those who welcome the so-called demise of the family, because it is viewed as oppressive and bankrupt institutions. Scholars of Marxian leanings advocate that there is no need of marriage and stable traditional family. They regard these institutions as the outcome of patriarchal structures, which represent capitalism. Critics of modern family life suggest that a woman's inferior place in the home compound, female inequity in society at large and virtues of intimacy and emotional attachment, in fact, unveils a system of exploitation of wives by husbands and children by parents. Commenting on the modern family, Edmund Leach (1967) wrote, "The parents and children huddled together in their loveliness take too much out of each other. The parents fight; the children rebel." Leach further argues that the 'isolation and close-knit nature of contemporary family life inculcates hate which finds expression in conflict in the wider community.' Since industrialization and its attendant harmful consequences and the disorganization of family life (breaking of family ties, open attitude about sex, increasing divorce rate, a general tendency for seeking personal happiness, mental and emotional disturbances, delinquent behaviour and illegitimate children) and the increasing tendency of living together without marriage after the advent of IT revolution in the mid-20th century, it had become much common to forecast pessimistic future of marriage and family. Whether the family is breaking up or adapting to the modern needs? Traditionalists affirm the idea of breaking up or declining or to use David Cooper's word 'dying'. Feminists and other critics of the conventional family have an interest in derogating it in some way or the other. Some experts are concerned about the ultimate outcome of the profound changes that occurred after industrialization and IT revolution of the 20th century and are afraid that there will be a complete breakdown of the family. It is rather premature to tell the demise of the family and not to expect that the family will adapt itself to the new situation. Nonetheless, it is but definite that the family is fast changing, and its format is crumbling and is being replaced by a new one. In spite of the constant prediction of its demise, the family remains a significant institution. It is the only refuge in a brutal society. The family has become the sphere of personal life at a time when people are increasingly looking to themselves, outside of productive work, for meaning and purpose. Resilience and elasticity are the most potent characteristics of the institution of family which are keeping it alive. It is certain that there are changes underway, and possibly more to come, which will not only change the structure and functions of the family but also its meaning. The loss of the traditional functions was the basis for defining the family which used to be the source of emotions and sentiments. These are not found in an impersonal, competitive world of today, for making it a haven in a heartless world. All societies develop myths about their present family systems, as well as about the past ones. It is a well-established tendency to glorify the past. How can we assume that the modern family system and the morals attached to it are really worse than the golden past, if we go deeply in the details of individual lives of 18th and 19th centuries? The traditional family as it was usually thought of in its purest form never existed. There are too many oppressive facets to families in the past to make them a model for today. The theme of bemoaning the rapid pace of modern change, as against the harmonious unaltered family behaviour of the past, is an old one. We cannot, however, prove that life was much more harmonious a century ago, or people were more contented in it. There is no doubt that the structure of the family and the norms of associational living are changing. The traditional expectation that the marriage will last for a lifetime has become an ideal in the past. In this regard, Anthony Giddens has suggested that terms like broken marriages and broken homes embody the traditional ideal and have unfortunate negative connotations, especially regarding children whose parents are separated or divorced. Thus, the changes in the family as discussed may be viewed from the point of reorganization of the family.

7.10 Summary

To conclude, it may be said that the future of the family and marriage is not bleak. Both institutions, which are rooted in the basic in emotions of love and

NSOU • GE-SO-11 115 affection, will survive in some form or the other. Their structure may differ from place to place but the content (functions) shall keep the trinity of father, mother, and child together. The form of the new emerging family may be the neo-conventional family - a family with suits to the needs of the modern man. The social changes that have transformed earlier forms of marriage and family are mostly irreversible such as the modern woman would not like to return to the old domestic situation, confined to the four walls of the house. This was quite painful for them. The norms of family living, and sexual partnership have also undergone a sea change. Emotional communication between members of a conjugal family is becoming more and more central both in the personal and family domains. Because also undergone a sea change. Emotional communication between members of a conjugal family is becoming more and more central both in the personal and family domains. Because of the emphasis on the modern values of individual freedom, personal happiness, satisfaction and self- fulfillment both partners now do not want to live in a miserable marriage and thus there is every possibility of the steep increase in divorces in near future. This may be the cause of concern for those people who advocate for the old values of family stability. In reality, the family is not collapsing or dying as is generally said by the traditionalists; it is merely diversifying in its form and functions. Transitional families (neo-local, functionally joint, based on equality of sexes) are increasing and may become the order of the day. 7.11 Questions G-A (5 marks each) (i) Define Family. 118 NSOU • GE-SO-11 form you are often asked to provide your name, address, phone number, birth date, and sex or gender. But have you ever been asked to provide your sex and your gender ? As with most people, it may not have occurred to you that sex and gender are not the same. However, sociologists and most other social scientists view sex and gender as conceptually distinct. Sex refers to physical or physiological differences between males and females, including both primary sex characteristics (the reproductive system) and secondary characteristics such as height and muscularity. Gender is a term that refers to social or cultural distinctions associated with being male or female. Gender identity is the extent to which one identifies as being either masculine or feminine. Concepts are terms used by social scientist as analytical categories to study society and social behaviour. Through the use of concepts social scientists develop categories that act as aids in the scientific investigation of behaviour in the society. In gender studies there are several such concepts that provide the framework in the study of behaviour. The concept of gender gives recognition to the fact that every known society distinguishes between women and men. Therefore, the concept of gender is a systematic way of understanding men and women socially and the patterning of relationships between them. The concept of patriarchy helps in the study of the male dominance in the society. The concept of gender helps to study the differences in behaviour between men and women and to analyze the basis of these differences as basically biological or as social constructions by the society. In feminist writings and in discourses on Gender Studies, these concepts are basic to our understanding of social differences between men and women in the society. A study of these concepts is useful as analytical categories. 8.3 Sex and Gender The term "sex" and "gender" are concepts used by academicians, researchers and feminist writers to make a distinction between the biologically different "male" and "female" and between the socially different "man" and "woman". Feminist sociologists suggest that there is a need to understand and distinguish between the two terms "sex" and "gender" in academic discourses and writings. 8.3.1 Sex In a very broad way, "sex" refers to the biological and physiological differences between male and female sex. The term sex is a physical differentiation between the biological male and the biological female. Thus, when an infant is born, the infant

NSOU • GE-SO-11 119 comes to be labeled "boy" or "girl" depending on their sex. The genital difference between male and female is the basis of such characterization. There is a biological difference between the sexes and most people are born (except for a few ambiguous cases) as one sex or another. However, it has been argued that having been born into one sex or another, individuals are then socialized according to specific gender expectations and roles. Biological males learn to take on masculine roles. They are socialized to think and act in masculine ways. Biological females learn to take on feminine roles. They are socialized to think and behave in feminine ways. As the feminist writer Simone de Beauvoir puts it "one is not born a man but becomes one", "one is not born a woman but becomes one". At birth, besides the basic biological differences in the genitals and reproductive organs, there is not much difference between the male child and the female child. Society makes the differences between boy and girl through gender constructions. The biological difference between the sexes does to some extent explain certain psychological and socially constructed differences. This view is criticized by some feminist writers like Judith Butler. Judith Butler argues that sex is natural and comes first. Gender is perceived as a secondary construct which is imposed over the top of this natural distinction. Viewed thus, Butler argues "sex" itself becomes a social category. This means that the distinction between "male" and "female" is a social distinction made by the society, that is, it is a social construction. It is a particular way of perceiving and dividing the differences between "male" and "female". Butler explains that "sex" though seen as biological, is as much a product of society as is gender. So the term sex is also socially constructed. The scientific, biological meaning and definition of sex is an important source of explanation to point out the basic differences in sex. Butler's concern is that "biology" itself, as a scientific discipline, is a social system of representation and more important there are a number of differences between human beings, but only some become a basis for dividing human beings into distinct types. In other words, even if we accept that there are basic differences between the "sexes" there is no logical or rational reason for use. This is the basis for dividing human beings into two groups or sexes. Judith Butler further explains "sex" is not just an analytical category. It is a normative category as well. It stipulates what men and women are. It also stipulates what men and women ought to be. It formulates rules to regulate the behaviour of men and women. Butler concludes that sex is also a social category. There are some feminist writers who do not agree with Butler and regard "sex" as basically biological in nature.

120 NSOU • GE-SO-11 Much research in sociology assumes that each person has one sex, one sexuality and one gender. Sometimes sex and gender are used interchangeably. Sometimes sex means sexuality; it may refer to biology or physiology. A woman is assumed to be feminine female, a man a masculine male. Research variables polarize sex as males and females; sexuality is polarized as homosexual and heterosexuals; gender is homosexual as and women these reflect conventionalize bodies that do not take into account transvestites, transsexuals, bisexuals and so on. In gender studies or women studies the four of concern is on the biological sex – man, woman, male female and the way in which biological differences have been socially gendered in different ways by the patriarchal society. When infants are categorized as a particular sex, they are subject to a range of gendered behaviour through gendered socialization. This brings us to the question what is gender?

8.3.2 Gender

The concept of gender in feminist writings and other sociological discourses became popular in the early 1970. In simple terms, gender explain the differences between men and women in social terms as men, and as what a man can do; as "woman", and as what a woman can or cannot do. Therefore, gender is an analytical category that is socially constructed to differentiate the biological difference between men and women. The term gender is also used to describe the differences in behaviour between men and women which are described as "masculine" and "feminine". Feminist writings focus on this aspect and claim that these differences are not biological but are social constructions of patriarchal society. Some theorists suggest that the biological differences between men and women also result in their mental and physical differences. They argue that biologically, men are physically and mentally superior to women. Other theorists suggest that the biological difference between men and women are exaggerated. The differences are socially constructed by the patriarchal system of society by which men are described as superior to women. Therefore, women become subordinate to men in the society. Ann Oakley in her book, "Sex, Gender and Society" (1972) explores the term gender. Oakley says that in the Western culture women play the roles of the "housewife" and "mother". This is because women are made to play these roles because of their biology. The western culture also believes that any effort to change the traditional roles of men and women in the society can cause damage to the social fabric of the society. Oakley concludes that this view regarding the roles of men and women helps to support and maintain the patriarchal society. Simone de Beauvoir in her book "The Second Sex" (1949) says that "one is not born, but rather becomes a woman". She explains that gender differences in the

NSOU • GE-SO-11 121 society make the man superior through his role as the bread winner. It gives him a position of power in the society and family. Gender differences are set in hierarchal opposition such that men are superior and women are subordinate. Women's position is that of the "other" and women are the continual outsiders. Civilization was masculine to its very depth. Shulamith Firestone in her book, "The Dialectics of Sex" (1970) suggests that patriarchy exploits women's biological capacity to reproduce as their essential weakness. She explains that the only way for women to break away from this oppression is to use technological advances of free themselves from the burden of childbirth. She advocated breaking down the biological bond between mothers and children by establishing communes where monogamy and nuclear family do not exist. Few feminists accept Firestone's views mainly because both technology and its uses are still firmly in the hands of men. While cultural feminists question whether all the key differences between men and women are solely cultural and whether also biological, these feminists prefer to value and celebrate the mothering role as evidence of women's natural disposition towards nurturance and would not like to relinquish even if they could. Ann Oakley says that there is a constant slippage between sex and gender; for example people are generally asked to declare their "gender" instead of sex on an application form. In feminist writings there are references to the close association of gender with the biological or natural as inevitable. Recent writings on sex and gender suggest that feminism has relied too much on the polarization of sex and gender distinctions, showing that the meanings attached to sex differences are themselves socially constructed and changeable. It is dependent on the way we understand them and attach different consequences to these biological facts within our own cultural historical context. At the same time there is an argument that biology does contribute to some behavioral characteristics. Moira Gatens states that evidence points "that the male body and the female body have quite different social value and significance and cannot but help have a marked effect on male and female consciousness". Certain bodily events have huge significance especially if they occur only in one sex. She cites the example of menstruation. She points that masculinity is not valued, unless it is performed by biological male; hence the male body itself is imbued in our culture with the mythology of supremacy of being the human norm. Judith Butler's theorization about gender introduces the notion of performativity,

122 NSOU • GE-SO-11 an idea that gender is involuntarily performed within the dominant discourses of hetero-reality. Butler's conception is perhaps most radical as she asserts that all identity concepts are in fact that effects of institution practices, discourses with multiple and diffuse points of origin. She further states that sex/gender distinction suggests a radical discontinuity between sexed bodies and culturally constructed gender. This approach questions the way we make the construction of gender identity. Individual do tend to challenge the way discourses establish and reinforce certain meanings and institutions such as that of compulsory heterosexuality. It is difficult to accept a rigid distinction between sex and gender as either wholly biological or singularly cultural. There is a constant shift between conceptualizations of human beings as controlled by either predominantly biological or social forces. The debates on sex and gender will continue as some will argue in favour of biological differences while other feminist writers will favour the differences as socially constructed, supported by social institutions like religion, caste, family marriage and so on. The substantial shift in women's lives and expectations since the 1960s clearly explains that the category of feminine has been rather elastic. Women's roles and performances have changed drastically over the past few decades which have added new dimensions to the debates by feminists and other on sex / gender distinctions. 8.4 Deconstructing Sex and Gender In rethinking gender categories it is necessary to look at sex and gender as conceptually distinct. Each is socially constructed in different ways. Gender is an overarching category – a major social status that organizes almost all areas of social life. Therefore, bodies are gendered and are built into major social institutions of the society such as economy, ideology, polity, family and so on. For an individual, the components of gender are the sex category assigned at birth on the basis of the appearance of the genitalia. Each category provides a gender identity, gendered sexual orientation, marital and procreative status, a gendered personality structure, gender beliefs and attitudes, gender at work and family roles. All these social components of are supposed to be consistent and congruent with one's biology. The actual combination may or may not be congruent with each other and with the components of gender and sex, moreover, the components may not line up neatly on one side of the binary divide.

NSOU • GE-SO-11 123 The need for official categorization in societies of infants into neat legal label “boy” or “girl” soon after birth are at the sometime subject to rather arbitrary sex assignment. Sex change surgery is not uncommon for infants with anomalous genitalia Sociologists are aware of the varieties of biological and physiological sexes. The rationale given for categorization of the ambiguous as either female or male throws light on the practices that maintain the illusion of clear sex differences. Without such critical exploration, sex differences can easily be considered as natural of what actually is socially constructed. 8.5 Gender Roles Gender roles are based on the different expectations that individuals, groups, and societies have of individuals based on their sex and based on each society’s values and beliefs about gender. Gender roles are the product of the interactions between individuals and their environments, and they give individuals cues about what sort of behavior is believed to be appropriate for what sex. Appropriate gender roles are defined according to a society’s beliefs about differences between the sexes. Gender roles are the roles that men and women are expected to occupy based on their sex. Traditionally, many Western societies have believed that women are more nurturing than men. Therefore, the traditional view of the feminine gender role prescribes that women should behave in ways that are nurturing. One way that a woman might engage in the traditional feminine gender role would be to nurture her family by working full-time within the home rather than taking employment outside of the home. Men, on the other hand, are presumed by traditional views of gender roles to be leaders. The traditional view of the masculine gender role, therefore, suggests that men should be the heads of their households by providing financially for the family and making important family decisions. While these views remain dominant in many spheres of society, alternative perspectives on traditional beliefs about gender roles have gained increasing support in the twenty-first century. Different disciplines offer a range of perspectives on gender roles. An ecological perspective on gender roles suggests that gender roles are created by the interactions between individuals, communities, and their environments. That is, while individual people play a role in constructing gender roles, so too do the physical and social environments within which people operate. A biological perspective on gender roles suggests that women have a natural affinity toward the feminine gender role and that men have a natural affinity toward the masculine gender role. The biological

124 NSOU • GE-SO-11 perspective does not, however, suggest that one role holds any inherently greater value than another role. A sociological perspective toward gender roles suggests that masculine and feminine roles are learned and that masculine and feminine gender roles are not necessarily connected to males’ and females’ biological traits. Sociologists study the different meanings and values that masculine and feminine gender roles hold in society. Related to the sociological perspective, a feminist perspective on gender roles might assert that because gender roles are learned, they can also be unlearned, and that new and different roles can be created. The feminist perspective points out that gender roles are not simply ideas about appropriate behavior for males and females but are also linked to the different levels of power that males and females hold in society. For example, maintaining economic control over themselves and their families is one way that men experience greater power in society than women. Because men are expected to be the primary breadwinners for their families, women often find themselves to be in poverty if their marriages dissolve. In this example, a feminist perspective would assert that men tend to hold more power in their marriages than women since men are less likely to lose power or social status if their marriages dissolve. Gender roles can be linked to expectations of males and females in realms outside of the family as well, such as work. In the workplace, men and women are often expected to perform different tasks and occupy different roles based on their sex. Even in the early 21st century, many corporations operate from a perspective that favors traditional beliefs about gender roles by, for example, offering parental leave benefits only to mothers and denying such benefits to fathers. In addition, because the traditional perspective toward gender roles remains predominant in many corporations, the positions that women and men hold within corporations are often segregated by sex. Women are more likely to be expected to work as secretaries, and men are more likely to be expected to work as managers and executives. Also, men are presumed to be more ambitious and task-oriented in their work, while women are presumed to be more interested in and concerned about their relationships with others at work. As these examples demonstrate, gender roles are sometimes created on the basis of stereotypes about gender. Gender stereotypes are oversimplified understandings of males and females and the differences between them. Individuals sometimes base their perceptions about appropriate gender roles upon gender stereotypes. Gender stereotypes tend to include exaggerated or erroneous assertions about the nature of

NSOU • GE-SO-11 125 males and females. For example, a common gender stereotype about males is that they are not emotional. Females, on the other hand, are commonly stereotyped as being irrational or overly emotional. Political movements such as the feminist movement continue to work to deconstruct gender stereotypes and offer alternative visions of gender roles that emphasize equality between women and men. Finally, gender roles are often discussed in terms of an individual's gender role orientation, which is typically described as either traditional or nontraditional. A traditional gender role orientation emphasizes differences between men and women and assumes that each sex has a natural affinity to particular behaviors. Those who maintain a traditional gender role orientation are likely to be influenced by the rules and rituals of the generations that came before them, by their parents and grandparents. Individuals with nontraditional gender role orientations are more likely to believe that an individual's behavior is not or should not be determined solely by her sex. Individuals with nontraditional gender role orientations are more likely to believe in the value of egalitarian relationships between men and women and in the power of individual human beings to determine what roles they wish to occupy and the extent to which those roles are or should be associated with their sex. 8.6 Gender Stereotypes Gender relates to a set of cultural expectations according to which men and women behave. Each culture assigns certain roles and standardized patterns of behavior to its members that allow them to organize their lives in a consistent and predictable way. In normative order, cultures and societies prescribe normative role behavior and ease-down interaction of individuals. Normative role behavior is collectivistic that delimits individual freedom and tie them to predetermined rights and duties as well as expectations. The socially constructed and culturally defined realities are closely associated with the development of stereotypes that are predetermined notions or images, which define various spheres of activities including gender. 8.6.1 Stereotyping Stereotyping is the act of judging someone on the basis of one's perception of the group to which that person belongs. In other words, it is "the unconscious or conscious application of (accurate or inaccurate) knowledge of a group in judging a member of the group". A stereotype is a view that is held by one or more individuals

126 NSOU • GE-SO-11 about a group to make overgeneralization of the characteristics of that group. Through stereotyping, people are categorized according to the characteristics they have in common, including gender, age, race, ethnicity, language, religion, and so on. In sociological discourse, stereotyping is closely associated with prejudicial judgment characterized by rigid and irrational generalization about an entire community of people. More specifically, gender stereotypes are deep-rooted perceptions of the characteristics of male and female, which support the continuity of specific gender roles. Based on gendered division of labor and social roles, men and women are often represented stereotypically according to the traits they are assumed to possess by virtue of their biological make up. Several studies point to stereotyping on the basis of their sex-related characteristics. It is viewed that gender stereotypes are formed during the process of learning and communication in which sociocultural and interactional factors play the role of key socializing agents. The factors and agents also include family as a basic and primary source of gender socialization where social roles are assigned based on gender. Family as a foremost socializing agency transmits simplistic labels and deep-rooted messages considered specific for a feminine woman and a masculine man. In family, different role models are assigned to women and men according to what is traditionally attributed to each sex. Similarly, on the basis of a set of physical qualities and psychological characteristics defined by family, society labels tasks which are known as gender stereotypes. 8.6.2 Kinds of Gender Stereotypes There are four basic kinds of gender stereotypes : • Personality traits — For example, women are often expected to be accommodating and emotional, while men are usually expected to be self-confident and aggressive. • Domestic behaviors — For example, some people expect that women will take care of the children, cook, and clean the home, while men take care of finances, work on the car, and do the home repairs. • Occupations — Some people are quick to assume that teachers and nurses are women, and that pilots, doctors, and engineers are men. • Physical appearance — For example, women are expected to be thin and graceful, while men are expected to be tall and muscular. Men and women are also expected to dress and groom in ways that are stereotypical

NSOU • GE-SO-11 127 to their gender (men wearing pants and short hairstyles, women wearing dresses and make-up). In many societies, masculine stereotypes is identified with competitiveness, aggressiveness, and independence, whereas feminine stereotypes revolve around a set of beliefs that define women as caring, altruistic, affective in interpersonal relationships, child friendly, emotionally expressive, sensitive and empathetic, and above all submissive and passive. 8.6.3 How gender stereotypes affect people ? A gender stereotype is harmful when it limits women's and men's capacity to develop their personal abilities, pursue their professional careers and make choices about their lives. Harmful stereotypes can be both hostile/negative (e.g., women are irrational) or seemingly benign (e.g., women are nurturing). For example, the fact that child care responsibilities often fall exclusively on women is based on the latter stereotype. Gender stereotyping is wrongful when it results in a violation or violations of human rights and fundamental freedoms. Example of wrongful gender stereotyping are the failure to criminalize marital rape based on societal perception of women as the sexual property of men, and the failure to effectively investigate, prosecute and sentence sexual violence against women based on, e.g., the stereotype that women should protect themselves from sexual violence by dressing and behaving modestly. Gender stereotypes compounded and intersecting with other stereotypes have a disproportionate negative impact on certain groups of women, such as women from minority or indigenous groups, women with disabilities, women from lower caste groups or with lower economic status, migrant women, etc. Wrongful gender stereotyping is a frequent cause of discrimination against women and a contributing factor in violations of a vast array of rights such as the right to health, adequate standard of living, education, marriage and family relations, work, freedom of expression, freedom of movement, political participation and representation, effective remedy, and freedom from gender-based violence. Gender stereotypes can affect people in the following ways : • Hyper-femininity is the exaggeration of stereotyped behavior that's believed to be feminine. Hyper-feminine folks exaggerate the qualities they believe to be feminine. This may include being passive, naive, sexually inexperienced, soft, flirtatious, graceful, nurturing, and accepting.

128 NSOU • GE-SO-11 • Hyper-masculinity is the exaggeration of stereotyped behavior that's believed to be masculine. Hyper-masculine folks exaggerate the qualities they believe to be masculine. They believe they're supposed to compete with other men and dominate feminine folks by being aggressive, worldly, sexually experienced, insensitive, physically imposing, ambitious, and demanding. • These exaggerated gender stereotypes can make relationships between people difficult. Hyper-feminine folks are more likely to endure physical and emotional abuse from their partners. Hyper-masculine folks are more likely to be physically and emotionally abusive to their partners. 8.6.4 How to fight gender stereotypes ? There are ways to challenge these stereotypes to help everyone — no matter their gender or gender identity — feel equal and valued as people. • Point it out — Magazines, TV, film, and the Internet are full of negative gender stereotypes. Sometimes these stereotypes are hard for people to see unless they're pointed out. Be that person! Talk with friends and family members about the stereotypes you see and help others understand how sexism and gender stereotypes can be hurtful. • Be a living example — Be a role model for your friends and family. Respect people regardless of their gender identity. Create a safe space for people to express themselves and their true qualities regardless of what society's gender stereotypes and expectations are. • Speak up — If someone is making sexist jokes and comments, whether online or in person, challenge them. • Give it a try — If you want to do something that's not normally associated with your gender, think about whether you'll be safe doing it. If you think you will, give it a try. People will learn from your example. The International Human Rights law framework prohibits gender stereotypes and stereotyping which undermine the enjoyment of human rights and fundamental freedoms. States have obligation to eliminate discrimination against women and men in all areas of their lives. This obligation requires States to take measures to address gender stereotypes both in public and private life as well as to refrain from stereotyping.

NSOU • GE-SO-11 129 8.7 Summary The sex / gender difference raises the issues of male – female; masculine and feminine, male associated with masculinity and female with femininity. With each construction the biological differences between men and women get translated into social terms and descriptions. Feminist writers argue that biological differences get heightened through social descriptions of masculinity and femininity. Patterns of differences by gender is seen when the character is either masculine or feminine. For example, pink and blue are gendered colors, former regarded as “feminine” and the latter as “masculine”. Further to be “strong” and “tough” is masculine. Being “weak” and “soft” are associated with feminine character. There are several other traits that are categorized as masculine and feminine. Masculinity and femininity are concepts which signify the social outcomes of being male or female the traits and characteristics which describe men and women give men advantage over women. Masculinity is not valued unless performed by biological male. Hence the male body is imbued in our culture with certain traits that characterize maleness or masculinity; hence the human norm of male supremacy. Similarly femininity is performed by the biological female. The female body in our culture is imbued with certain traits that characterize female or femininity. According to Judith Butler any theorization about gender introduces the notion or idea of performance of gender in terms of masculinity and femininity. Thus, performance of gender becomes involuntary as gender gets internalized through the socialization process within the dominant discourses of patriarchy gender is performed at different levels within the family and in the society. We socially enter into our gendered categories of masculine and feminine right from birth. The concepts of masculinity and femininity are needed in feminist discourses and writings to explain the differences between men and women. Some argue that these differences are based in their biology while others reject this argument and emphasize that the differences are socially constructed. Therefore, the construction of men and masculinity will accrue exclusively to the bodies of males. The construction of women and femininity will accrue exclusively to the bodies of females. In contemporary writings there is a recognition that this social categorization of masculinity and femininity are blurring. There is a constant shift in the conceptualization of human beings as controlled by wholly biological or social forces. Women’s expectations have changed; women live and roles have broadened.

This can be reflected in language, religion, material culture such as clothing and 131

132 NSOU • GE-SO-11 cuisine, and cultural products such as music and art. Ethnicity is often a major source of social cohesion as well as social conflict. Ethnicity, unlike race, is not based on biological traits, except in the case of ethnic groups that recognize certain traits as requirements for membership. In other words, the cultural elements that define a particular ethnic group are taught, not inherited. This means that the boundaries between ethnic groups are, to some degree, fluid, allowing for individuals to move between groups. Because ethnic groups are self-defined, it is important to remember that no single aspect of group identity (language, religion, etc.) can be used to sort people into one group or another. Ethnic diversity is one of the social complexities found in most contemporary societies. Historically it is the legacy of conquests that brought diverse peoples under the rule of a dominant group. Ethnicity refers to the differentiation of groups of people who have shared cultural meanings, memories, and descent produced through social interaction. Ethnicity is considered to be shared characteristics such as culture, language, religion, and traditions, which contribute to a person or group's identity. An ethnic group is a group of people united on the basis of some shared experience or some common physical or socio-cultural attributes. For e.g. race, culture, language, religion, region, nationality, heritage. Ethnic group is defined as a segment of a larger society which is seen by others to be different in some combination of the following characteristics – language, religion, race and ancestral homeland with its related culture; the members of the ethnic group also perceive themselves in that way and they participate in shared activities built around their (real or mythical) common origin or culture. Weber (1997) defines ethnic groups as those groups

89%

MATCHING BLOCK 10/115

SA

which entertain a subjective belief in their common descent because of similarities of physical types or customs or both.

This subjective belief is important for the propagation of group formation. Furthermore, it does not matter whether or not an objective blood relation exists.

W

Ethnicity involves a feeling of consciousness among the members of an ethnic group of the existence of such shared characteristics. It also involves the process of mobilization of people along some common point of reference for presenting a united front to articulate their socio-economic or political interests. Ethnicity, thus, involves the process of interaction between two or more groups. Barthes (1969) says that the issue of the identification of social boundary is intrinsic to the concept of ethnicity. Each ethnic group draws a boundary to identify its own members and to distinguish the "we" group from other ethnic groups.

NSOU • GE-SO-11 133 9.3 Etymology of Ethnicity It is widely known, 'ethnicity' and 'ethnic' are derived from Greek. At the time of Homer (between 750 and 650 BC) the term *ethnos* was applied to various large, undifferentiated groups (warriors as well as bees and birds) and meant something like 'throng' or 'swarm'. Aristotle (384–322 BC) used the term to denote alien or 'barbarous' groups as distinct from Hellenic civilization. In the Greek text of the New Testament ethnicity refers to non-Christian or non-Jewish populations. The adjective 'ethnikos' accordingly meant 'pagan', 'heathen', or 'barbarian'. The modern academic usage of the term 'ethnic' began in the early 19th century. In the 1830s and 1840s, scientific 'ethnological' societies devoted to the study of the origin, characteristics and progress of the world's different 'peoples' were founded in Europe and the USA. The term ethnic was applied to indicate differences in religion, behaviour, life-style or phenotype. The word 'race' first entered Western languages between the 13th and 15th centuries and had a variety of meanings. Before the Enlightenment it was sometimes used to refer to a family line or lineage, particularly of noble families. Later it meant a class of people or the people of a land, but it was not until the late 18th century that 'race' began to acquire the meaning of one of the great subdivisions of mankind. During the 18th and 19th centuries, however, the ideas of people, race, nation, and class were still merged and the terms frequently used interchangeably. Well into the twentieth century, 'ethnic group' was mostly employed for populations in the 'developed' parts of the world (Europe and the USA) and differentiated by the aforementioned criteria, while the majority populations in each country were considered 'nations'. The indigenous inhabitants of Africa, the Americas, Asia and Australia were, in contrast, generally referred to as 'tribes'. From the 19th-century evolutionist perspective, their forms of social organization were considered relics of earlier stages of development. A similar view was represented by the modernization theory that dominated the debates on development up to the 1960s. 'Tribal' loyalties in the developing countries were held to be hindrances to societal integration and nation building. As a response to the mounting critique of the 19th-century evolutionary concepts, the term tribe has largely fallen into disuse in the social sciences and been replaced by 'ethnic group' or 'ethnie'. This complex history of usage is still reflected in recent academic discourse. Many authors employ 'ethnic group' merely to describe forms of socio-cultural

134 NSOU • GE-SO-11 differentiation within existing states. Others consider the 'ethnie' or ethnic group to be a forerunner of the nation or the nation as a special variant of the 'ethnie', with nation characterized by its ideological reference to a bygone, existing or desired state. 'Ethnie' or 'ethnic group', then, would refer to any grouping that distinguishes itself from others by cultural criteria and symbols (such as language, beliefs, norms or history). Authors like Francis (1947), Rothschild (1981), Connor (1984) or Brass (1991) do not make a systematic distinction between 'ethnie' and 'nation', but instead consider them as largely synonymous. Francis (1947), for example, employs 'ethnic group' to denote a minority within a state, e.g. French Canadians in Canada, as well as to refer to the French in France or the Irish in Ireland. Modern genetics tend not to speak of 'races' because there 'has always been so much interbreeding between human populations that it would be meaningless to talk of fixed boundaries between races' and 'the distribution of hereditary physical traits does not follow clear boundaries'. However, in a number of cases people's actions are informed by the belief that systematic differences in the personality of members of different 'races' are linked to hereditary characteristics, and that phenotypic features play a crucial role in differentiating between social groups.

9.4 Defining Ethnicity The conceptual differences sketched above notwithstanding, most scholars would probably agree that the term ethnicity should be employed for a sub-class of us / them distinctions people make. Thus, the question arises as to what features make distinctions 'ethnic'. Frederic Barth's classic definition states ethnicity as: "A categorical ascription is an ethnic ascription when it classifies a person in terms of his basic, most general identity, presumptively determined by his origin and background". Barth sees ethnicity as a special form of social categorization, and links it – as Max Weber long before him – to the idea of common descent.

100%

MATCHING BLOCK 11/115

SA SYBA SOC PAPER - II.pdf (D111235031)

Max Weber used the term ethnic group to connote those human collectivities which 'entertain a subjective belief in their common descent because of similarities of physical type or of customs or both, or because of memories of colonization or migration' (Weber, 1968).

Thus, Weber states that ethnic groupings are aggregations of people who share a 'subjective belief in their community of descent'. Weber also points out that this belief normally rests on the idea of cultural and/or phenotypic similarity. However, Barth's 'basic, most general identity' is too vague to be of much help. Beyond this, his definition implies that each human being has only one 'primary' group identity.

NSOU • GE-SO-11 135 Likewise, much more recent commentators such as Horowitz (1985), who deployed the term in an ascriptive sense, saw the core features of ethnicity as common origin, skin colour, appearance, religion and/or language. Schermerhorn, in his seminal work *Comparative Ethnic Relations*, defined the term ethnic group as 'a collectivity within a larger society [who] have real or putative common ancestry, memories of a shared historical past, and a cultural focus on one or more symbolic elements defined as the epitome of their peoplehood' (Schermerhorn, 1970). Clarifying the term 'symbolic elements', he says that these can include 'kinship patterns, physical contiguity (as in localism or sectionalism), religious affiliation, language or dialect forms, tribal affiliation, nationality, phenotypical features, or any combination of these'. Geertz (1996) avers that ethnicity is based on the primordial ties of blood, race, language, religion or tradition and such "attachments seem to flow from a sense of natural affinity than from social interaction". However, many sociologists do not agree with Geertz's views on ethnicity that it is based on primordial loyalty and is immutable. Writing on ethnicity in South Asia, Phadnis and Ganguly (2001) posit that ethnicity is a dynamic and fluid concept. Its basis is not pre-determined but keeps on changing depending on the circumstances existing at a particular time. A person's identity is multi-faced and keeps on flitting from one to another depending on the circumstances. For instance, ethnicity based on religion at one time may give way to another like region or language whenever there is a change of interest or circumstances. Another important concept is that of ethno-nationalism. Ethno-nationalism is on rise in recent years due to large-scale trans-national migrations in the current era of unprecedented globalization. According to Anthony Smith (1993) "ethnic nationalism...unlike the territorial or civic versions of nationalism...conceives of the nation as a genealogical and vernacular cultural community. Whereas civic or territorial conceptions of the nation regard it as a community of shared culture, common laws and territorial citizenship, ethnic concepts of the nation focus on the genealogy of its members, however fictive; on popular mobilization of the "folk"; on native history and customs; and on the vernacular culture...".

9.5 Racial classification of Indian People by different Anthropologists

India's present-day population is a conglomeration of people belonging to

136 NSOU • GE-SO-11 different racial groups with different ethnic backgrounds. The people entered India from different parts of the world at different time periods adopting themselves. India has been a meeting point of different races and tribes from times immemorial. Almost all the major races of the world are found in India. As a result, India has a varied population and diversified ethnic composition. Different Anthropologists classify racial composition of Indian people based on their works. Some of the notable classifications are Sir Herbert Hope Risley (1915) and B.S. Guha (1937).

9.5.1 Classification of Sir Herbert Hope Risley (1915)

Sir Herbert Hope Risley tried to classify the Indian population on the basis of anthropometric measurements. He had developed a clear-cut idea about the racial elements of India when he directed the operation of Census for India in 1901. Later, he took the help of anthropometry to affirm his assumptions and published the results in 1915 under the title 'The People of India'. He identified three principal racial types in India i.e. The Dravidian, the Indo-Aryan and the Mongoloid. On the whole, Risley distinguished seven different 'physical types' in the Indian population in the following way :

(i) The Dravidian The stature of these people is short or below medium. The complexion is dark, approaching to black. The hair is similarly dark and plentiful with an occasional tendency to curl. The eye colour is also dark. The head is long and the nose is very broad, sometimes depressed at the root. The people of Dravidian type are distributed in the region from Ceylon to the valley of the Ganges covering the southern part of India, which especially includes the Western Bengal, Tamil Nadu, Andhra Pradesh (Hyderabad), Central India, and Chotonagpur. The best example of this type is the Paniyans of Malabar (South India) and the Santals of the Chottanagpur. Risley believed these people as original inhabitants of India who are found to be modified at present by the infiltration of the Aryans, the Scythians and the Mongoloids.

(ii) The Indo-Aryan This type is the most close to the traditional Aryans who colonized India. The people are tall statured with fair complexion, dark eyes, and plentiful hair on face and body. They also possess predominant longhead (dolichocephalic), narrow and long (leptorrhine) nose. The type is confined to Punjab, Rajasthan, and Kashmir where the members are known as the Kashmiri Brahmins, Rajputs, Jats, and the Khattris.

NSOU • GE-SO-11 137 (iii) The Mongoloid The most important characteristic features of this type are broad-head, dark complexion with yellowish eyes and scanty hair on face and body. The stature is usually short or below medium. The nose shows a wide range of variation, from fine to broad. The face is typically flat where the eyes are oblique with epicanthic fold. The people of this type are found along the Himalayan region, especially in the regions namely North East Frontier, Nepal and Burma. The best examples are the Kanets of Lahul and Kulu Valleys, Lepchas of Darjeeling and Sikkim, the Limbus, the Murmis and the Gurungs of Nepal, and the Bodo of Assam. (iv) The Aryo-Dravidian This type is known as the Hindustani type. Generally the heads of the people are long with a tendency towards medium. The complexion varies from light brown to black. The nose is usually medium, although the broad nose is not uncommon. But in this case, the broad nose is always broader than the nose of Indo-Aryans. In stature, the people are shorter than the Indo-Aryans who usually show a below average height; i.e. the height ranges from 159cm to 166cm. Thus, the Aryo-Dravidians is differentiated from the Indo-Aryans. The type is considered as an intermixture of the Aryans and the Dravidians in varying proportions. The people of this type are found in Uttar Pradesh, in some parts of Rajasthan and in Bihar. (v) The Mongolo-Dravidian This type is known as the Bengalian type characterized by broad and round heads with a tendency towards medium dark complexion and plentiful hair on face. The nose is usually medium with a tendency towards flatness. The stature is also medium but sometimes short. Such people are found in Bengal and Orissa. The notable representatives of this type are the Bengali Brahmins and Bengali Kayasthas. According to Risley this type is not only an admixture of the Mongolians and the Dravidians, some blood strains of Indo-Aryan type are also mixed with it. (vi) The Scytho-Dravidian The people of this type possess medium to broad head, low to medium stature, fair complexion, and a moderately fine nose, which is not conspicuously long. The hair is scanty on face and body. It is held that the type has been evolved by the intermixture of two distinct racial strains—the Scythians and the Dravidians. Typical example of this type is found in Western India comprising the Maratha Brahmins, the Kunbis and the Coorgs, who are distributed in the tracts of Madhya Pradesh,

138 NSOU • GE-SO-11 Maharashtra-Gujrat border region upto the Coorg. The Scythian element is more prominent in higher social groups of these regions while the Dravidian features predominate among the lower social groups in the region. (vii) The Turko-Iranian This type is characterized by broad heads and fine to medium nose, which is long and prominent. The stature is fairly tall and the average height of the males varies from 162cm to 172cm. Although the eyes are dark in colour, grey eyes are not uncommon. Complexion of the people is generally fair; plentiful hair is found on face and body. The type includes the inhabitants of Afghanistan, Baluchistan and Northwest Frontier Provinces (now in Pakistan) who are represented by the Balochis, Brahai, Afghans and some other people of NWFP. In the view of Risley, this type has been formed probably by the fusion of Turki and Persian elements in which the former's features predominate. Risley's classification faced a considerable criticism from different authorities, especially in respect of the Dravidians, the Scytho-Dravidians and the Mongolo- Dravidians. Besides, the Indo-Aryans is distributed only in Punjab, Rajputana and the Kashmir Valley according to Risley. But the speakers of Aryan languages actually occupy a vast area in Indian subcontinent, which has not been reflected in his classification. If he had measured the people of Kashmir alone, then he should have placed them in a separate group as they possessed absolutely different physical features. Further, Risley had given much importance in Scythian elements when he discussed about broad-headed people as the Scytho-Dravidian type. In fact, the Scythian invaders stayed so short that they hardly get any opportunity to spread any remarkable influence among ethnic elements of Bombay Presidency where Risley conducted his study. Risley also stated that the broad-headed elements in Bengal have been influenced by the Mongolian people. But it is difficult to confirm that the brachycephalic elements in Bengal and Gujrat have been derived from the Mongolian element. Although all Mongolian people are brachycephals but the epicanthic fold as a typical Mongolian feature is found only among some people living in Darjeeling and neighbouring districts. This feature is totally absent among the people of other parts of Bengal. 9.5.2 Classification of B.S. Guha (1937) The racial classification of Dr. B. S. Guha's is based on anthropometric measurements, which were collected during his investigations from 1930 to 1933.

NSOU • GE-SO-11 139 Guha traced six major racial strains and nine sub-types among the modern Indian population. (i) The Negrito These people are considered as the first comers and the true autochthones of India. They are characterized by dark skin colour, short stature, and frizzly hair with long or short spirals. The head is small, medium, long or broad with bulbous forehead. The nose is flat and broad. The lips are everted and thick. The best representatives of this type are the Kadars, the Irulas, the Puniyans, etc. of South India. Such type of characters is also visible among the tribes living in the Rajmahal Hills. In respect of the head form and hair form, the Indian Negrito strain resembles more to the Melanesian Pygmies than to the Andamanese or African Pygmies. (ii) The Proto-Australoid This group is considered as the second oldest racial group in India characterized by dolichocephalic head, broad and flat nose (platyrrhine nose) which is depressed at the root. They are further short in height, dark brown to nearly black in skin colour. The hair is wavy or curly. Supraorbital ridges are prominent. These features are found among almost all the tribes of the Central and Southern India. The best examples are the Oraons, the Santals, and the Mundas of Chottanagpur region; the Chenchus, the Kurumbas, the Yeruvas and the Badagas of Southern India; and the Bhils, Kols of Central and Western India. (iii) The Mongoloid This type of people is distinguished by scanty growth of hair on face and body. The eyes are obliquely set and show the presence of epicanthic fold. The face is flat with prominent cheekbones and hair is straight. This group can be divided into two sub-groups, such as Palaeo-Mongoloid and the Tibeto-Mongoloid. The former one is further sub-divided as long headed and broad-headed. In Palaeo-Mongoloid group, especially the longheaded type possesses long head, medium stature, and medium nose. Their cheekbones are prominent and skin colour varies from dark to light brown. The face is short and flat. They are the inhabitants of the sub-Himalayan region; the concentration is most remarkable in Assam and Burma Frontier. The SemaNagags of Assam and the Limbus of Nepal are the best examples. The other sub-division of palaeo-Mongoloid is the broad-headed type who possesses broad head with round face, dark skin colour and medium nose. The eyes are obliquely set and epicanthic fold is more prominent than that of the long-headed type. This type has

140 NSOU • GE-SO-11 been identified among the hill tribes of Chittagung, e.g. the chakmas, the Maghs, etc. Second sub-division of Mongoloid is the Tibeto-Mongoloids who show no further divisions. Their physical features are characterized by broad and massive head, tall stature, long and flat face, and medium to long nose. The eyes are oblique with marked epicanthic fold. Hair on body and face is almost absent. The skin colour is light brown. The best examples are the Tibetans of Bhutan and Sikkim. (iv) The Mediterranean This group is divided into three distinct racial types, these are : (a) Palaeo-Mediterranean The people are characterized by long head with bulbous forehead, projected with high vault. They also show medium stature, small and broad nose, narrow face and pointed chin. The hair on face and body is scanty. The skin colour is dark. These people probably introduced megalithic culture to India. The Dravidian speaking people of South India exhibit the main concentration of this type. The Tamil Brahmins of Madura, Nairs of Cochin, and Telugu Brahmins are the examples. (b) The Mediterranean The features include long head with arched forehead, narrow nose, medium to tall stature and light skin colour. Their chin is well developed, hair colour is dark, eye colour is brownish to dark and the hair on face and body is plentiful. These people live in the regions like Uttar Pradesh, Bombay, Bengal, Malabar, etc. The true types are the Numbudiri Brahmins of Cochin, Brahmins of Allahabad and Bengali Brahmins. It may be assumed that probably this type was responsible for the building up of Indus Valley civilization. (c) The Oriental These people resemble the Mediterranean in almost all physical features except the nose, which is long and convex in this case. The best examples are the Punjabi Chattris, the Benia of Rajputana, and the Pathans. (v) The Western Brachycephals This racial group is divided into three types, which are : (a) The Alpenoid This type shows broad head, medium stature, prominent nose and rounded face.

NSOU • GE-SO-11 141 The hair on face and body is abundant and the skin colour is light. This type is found among the Bania of Gujarat, the Kathi of Kathiawar and the Kayasthas of Bengal. (b) The Dinaric : This type is characterized by broad head. The nose is very long and often convex. The face is long and stature in general is very tall. The skin colour is dark; eye and hair colours are also dark. The representative populations are found in Bengal, Orissa and Coorg. The Brahmins of Bengal and Mysore are the best examples. Both the Alpino and the Dinaric people entered into India through Baluchistan, Sind, Gujarat, and Maharashtra. They penetrated Ceylon from Kannada. The presence of this type has been noted in the Indus Valley site, Tinnevalley and Hyderabad. (c) The Armenoid This type shows a resemblance with the Dinarics in physical characters. Only difference is that, among the Dinarics the shape of occiput is much developed and the nose is very prominent. The Parsis of Bombay exhibit typical Armenoid characteristics. The Bengali Vaidyas and Kayasthas sometimes show the features of this type. (vi) The Nordics The people are characterized by long head, arched forehead. The nose is straight and high bridged. All are tall statured with strong jaw and robust body built. The eye colour is blue or grey. The body colour is fair which reddish. This element is scattered in different parts of Northern India, especially in the Punjab and Rajputana. The Kho of chitral, the Red Kaffirs, and the Khatash are some other representatives of this type. The Nordics came from the north, probably from Southeast Russia and Southwest Siberia, thereafter penetrated into India through Central Asia. 9.6 Manifestations of Ethnic Identity in India

100%

MATCHING BLOCK 12/115

SA SYBA SOC PAPER - II.pdf (D111235031)

Ethnicity is a social-psychological process which gives an individual a sense of belonging and identity.

It is, of course, one of a number of social phenomena which produce a sense of identity. Ethnic identity can be defined as a manner in which persons, on account of their ethnic origin, locate themselves psychologically in relation to one or more social systems, and in which they perceive others as locating them in relation to those systems. By ethnic origin is meant either that a person has

142 NSOU • GE-SO-11 been socialized in an ethnic group or that his or her ancestors, real or symbolic, have been members of the group. The social systems may be one's ethnic community or society at large, or other ethnic communities and other societies or groups, or a combination of all these. The articulation of ethnic identity and assertion in India primarily takes the following forms : (i) Linguistic Ethnicity Language has always formed the basis of asserting ethnic identity in India. This was well evident during the

the adoption of Hindi as the national language by the government of India. The movement gave the call for the secession of Tamil Nadu from the union of India on the basis of identity centered on Tamil language. Because of intense linguistic feelings, many states were carved out based on languages by the State Reorganization Act of 1956.

Recently, linguistic identity was again on display in the state of Maharashtra in Central India, where in the name of Marathi pride, there were concerted attacks on the helpless and poor Hindi-speaking North Indian immigrants from the states of Bihar and Uttar Pradesh. (ii) Religious Assertions and Communalism : This is probably the most difficult and intricate socio-political issue that the Indian state has to grapple with when it comes to nation-building, especially the communal tension between the Hindus and the Muslims. Mutual distrust between the two communities is very high. The recent surge in Hindu nationalism has further intensified the feeling of cultural assertiveness on both sides. Post-independent India is replete with gory incidents of Hindu-Muslim riots. (iii) Tribal Movements This is not unique to post-independent India. The British period was full of incidents when tribes rose in revolt against the officials, the landlords and the money-lenders when they were forcibly evicted from their traditional land. Even in independent India, the tribes constitute the most neglected lot. Their lack of development and displacement from forests and traditional lands has caused huge disaffection among them. This has led to the resurgence of tribal identity movements in different parts of the country. An important dimension of this is what is called the "ethno-ecological" movement in which the tribes are not only fighting against their displacement but also against the ecological destruction of their natural habitats. The growing menace of Maoist violence in India in the tribal dominated regions of the

for autonomous governance or even secession as sovereign nation states. The secessionist movement in Kashmir, the Khalistan movement by Sikhs in Punjab in 1970s and 1980s for a separate homeland and the Naga movement in North-East India

are examples of feelings of

83%**MATCHING BLOCK 19/115****SA** SYBA SOC PAPER - II.pdf (D111235031)

ethno-nationalism. (v) Regionalism Regionalism centers around three main factors: i) fear of being assimilated into the dominant culture and, hence, to preserve one's language and culture by demanding an autonomous state, ii) the skewed economic development of India where certain groups feel that they have been left behind despite being rich in resources in their regions and iii) nativistic tendencies – "sons of the soil" concept in which regional identity becomes the source of ethnic strife. Examples include the erstwhile Jharkhand movement in the state of

100%**MATCHING BLOCK 20/115****SA** SYBA SOC PAPER - II.pdf (D111235031)

Bihar and Telangana movement in the state of Andhra Pradesh, the attack on South Indians in Mumbai in 1960s

and the simmering movement in the north-eastern state of Assam to expel the immigrants especially from the states of Bihar and Uttar Pradesh, which often taken the ugly turn of sanguinary strife between the natives and the immigrants. (vi) Casteism A rather inconclusive debate rages as to whether caste can be considered an ethnic group. A large chunk of that debate centers on the relation between caste and race. Scholars such as Berreman (1963) contend that caste is quite akin to race in its attributes and have highlighted the striking parallels between the two; others such as Dumont (1961) hold that the caste system, indigenous to India, has several unique features of its own which prevent it from being subsumed within the larger rubric of race. Beteille (1992) says that many American social anthropologists while working on racial segregation in the southern states of the United States in 1930s found it useful to speak of a caste system in representing the cleavages between blacks and whites in rural and urban communities there. They found strong similarities between caste system and stratification based on race. In fact, Myrdal (1944) employed similar terms and categories in his classic study of the American Negro.

144 NSOU • GE-SO-11 9.7 Types of Ethnic Groups What follows is not a complete classification of types of ethnic groups. It uses as criteria of classification locus of group organization, degree and nature of self-awareness in ethnic organization, structural location in interethnic relations and the generational factor. According to these criteria we can distinguish the following types of ethnic groups: primary and secondary ethnic groups, folk-community and nationality-community ethnic groups, dominant majority and subordinate minority ethnic groups, immigrant or young and established or old ethnic groups. (i) Primary and Secondary Ethnic Groups This distinction refers to the place of origin where the group's culture emerged as a distinct entity.

82%**MATCHING BLOCK 23/115****SA** SYBA SOC PAPER - II.pdf (D111235031)

Primary ethnic groups are those which exist in the same place in which historically they have been formed. They are indigenous groups. Examples are the French in France, Germans in Germany, etc., and also Native Indians in the Americas, Andalusians in Spain, etc. Secondary ethnic groups are those which have their origin in society different from the one in which they currently exist, as for example, the Italians, Germans, etc. in Canada or the United States.

They are, as it were, transplanted groups which share their cultural and historical background with the society from which they emigrated, but which do not depend any more on the original society for their existence. (ii) Folk-community and Nationality-community Ethnic Groups The distinction between the folk community and nationality as types of ethnic groups was originally drawn by IhorZielyk (1975). The basic principle of distinction here is cultural self-awareness. Nationality groups are those which are culturally highly self-aware. That is, their members share an image of themselves as a collectivity united by a distinct culture rather than by their kin or clan. An essential part of this image is a conception of history of the group as legacy. Organizational life of the ethnic community articulates this image in its normative systems. An ethnic group which is a folk community is one whose members are predominantly of peasant background. The community is little differentiated in social status. The character of social relationships among the members of the community is determined by kinship and close family friendships. The center of social organization is the religious institution, the church, around which develop other organizations and which exerts a pervasive influence on the whole community.

NSOU • GE-SO-11 145 (iii) Majority and Minority Ethnic Groups Sociologically, the concepts of majority and minority refer not to numbers but to power. Simply stated, the distinction is between those groups which have or have not power in society. Often the concept of ethnicity is confused with that of minority and all ethnic groups are seen as minorities. By this, the majority groups become ethnicity less and it becomes difficult to understand what culture of the general society is all about. Majority ethnic groups are those who determine the character of the society's basic institutions, especially the main political, economic, and cultural institutions. They determine the character of the norms of society as a whole, including the legal system. Their culture becomes the culture of the total society into which the minority ethnic groups assimilate. The minority groups may preserve their institutions and culture in larger or smaller degree or they may influence the character of the dominant institutions in larger or smaller degrees, but usually, the framework for intergroup processes is provided by the institutions deriving from the culture of the majority groups. The majority groups, because of their position of power, usually are at the top of the ethnic stratification system, and the status of other ethnic groups is assessed in relation to them. Much of the dynamics of interethnic relations derives from the structure of dominance and subordination involved in the majority-minority ethnic group relations. (iv) "Young" and "Old" Ethnic Groups A common confusion in the discourse on ethnicity is that of ethnicity and immigration. Ethnicity often is erroneously identified with immigrants, but immigrants make up only one type of ethnic groups. We can distinguish between 'young' groups, i.e., those made up predominantly of the first - the immigrant - generation, and whose second generation is either small in size or young in age. The 'old' groups are those already established in the larger society, i.e. they have at least a high proportion of adult second and adult third or consecutive generations. By this distinction, it is incorrect and misleading to speak of all ethnic groups as if they were immigrants. Members of the old, established ethnic groups usually do not like to be confused with immigrants. The issues which these two types of ethnic groups pose are different. The concerns of the young groups can be characterized as essentially the problems of adjustment to society at large, whereas those of the old groups, as interests of persistence. Among the old ethnic groups in Canada one can include the British, French, German, Scandinavian groups, Dutch, Ukrainian, Russian, Polish, Jewish, Doukhobors, Mennonites, Indians, the Inuit, Blacks, except for those from the West Indies, Chinese, Japanese and others. Among the relatively young groups,

146 NSOU • GE-SO-11 one can include the Greeks, Portuguese, various Latin American groups, East Indians, except for the Sikhs, and others. 9.8 Ethnic Unrest in India

Kothari (1988) asserts that ethnic upsurges and "assertions of cultures" in India are the consequences of excesses of modernization and the homogenizing trend of modern states and of their technological/educational imperatives. In his words, ethnicity "is a response-including reaction – to the excesses

of the modern project of shaping the whole humanity (and its natural resource base)...” Such views are also echoed by scholars like Pandey (1990) and Oberoi (1994) who consider recent surge in ethnic assertions a consequence of modernity and that traditional India was free from such fixed identities. However, the noted scholar and Dalit activist Gail Omvedt (1990) criticizes such a romanticized view of traditional India. She holds that traditional India was not characterized by multiculturalism but by hierarchy which pervaded every aspect of social life. Some of the critical factors responsible for inflamed ethnicity in India are : • India is a plural society.

98%

MATCHING BLOCK 24/115

W

It is characterized by a large diversity in its population with multitudes of castes and several religious, linguistic, cultural and racial groups living here. Because of intense competition for scarce economic resources and the heightened consciousness among people of different groups to preserve their age-old cultures, India has always been vulnerable to assertions of ethnic identities. • Lopsided economic development of the country because of which some groups feel that they have been marginalized and completely left behind in the process of development. This makes them highly susceptible to the politics of ethnicity. • Representative parliamentary democracy in India where different ethnic groups (castes, religious groups, linguistic groups etc.) compete for political power by stressing on horizontal solidarity and consolidation of shared interests.

Ethnic groups that use ethnicity to make demands in the political arena for alteration in their status, in their economic well-being are engaged very often in a form of interest group politics.

The system is highly segmented and heterogeneous. However,

76%**MATCHING BLOCK 30/115****W**

emergence of ethnicity all around primarily on cultural grounds has put the boundary of nation state under severe stress. Usually the quest for larger identity is emphasized as it also serves some political purposes. But at the same time, this emphasis on a large identity like nation ignores the reality of plural identities and their possible interplay and thus reverts back to the nation where religion, language become static categories of ethnic attributes. 9.10

152 NSOU • GE-SO-11 10.2 Introduction Kinship system represents one of the basic social institutions. Kinship is universal in nature and in most societies it plays a significant role in the process of socialization of individuals and the maintenance of group solidarity. It is supremely important in the primitive societies and extends its influence on almost all their activities- social, economic, political, and religious, etc. In the "pre-writing" societies that anthropologists have traditionally focused on, the status of individuals, the place in which they must live, such as, in some cases, their trade, are determined by membership in a kinship group. In other words, all social relations are conceived in the mode of kinship relations. In industrial societies, on the other hand, family relationships do not occupy such a predominant place. But eventually, it now appears that they continue to play an essential role in the lives of individuals.

10.3 Definition of Kinship

The conception of 'kinship' is very much important in cultural anthropology. In simple societies, the kinship relations are so extensive, fundamental and influential that in effect they in themselves constitute the 'social system'. But in more complex societies kinship normally forms a fairly small part of the totality of the social relation which makes up the social system. Sociologist does not attach much importance for it except in their study of the sociology of kinship. Anthropologists, on the contrary, give more importance to this concept because kinship and family constitute the focal points in anthropological investigations. Kinship is basically culturally defined relationships between individuals who are commonly thought of as having family ties. Although usually thought of in terms of biology, much of kinship is actually culturally constructed. Kinship is the relationship by the bond of blood, marriage and includes kindred ones. It represents one of the basic social institutions. Kinship is universal and in most societies plays a significant role in the socialization of individuals and the maintenance of group solidarity. It is very important in primitive societies and extends its influence on almost all their activities. According to Robin Fox, in his book 'Kinship and Marriage', "Kinship is simply the relations between 'kin' that is persons related by real, putative or fictive consanguinity". Abercrombie and others in 'The Penguin Dictionary of Sociology' mentioned that "The social relationships deriving from blood ties (real and supposed) and marriage are collectively referred to as kinship".

NSOU • GE-SO-11 153

In simple words, the bond of blood or marriage which binds people together in group is called kinship. Michel Verdon in his paper "Kinship, Marriage, and the Family: An Operational Approach" (1981,) regard these "anthropological" concepts (residence, descent, kinship, and so on) as "secondary" or "derivative" concepts. As, he reasoned, that they are derived from a more implicit, more fundamental notion of group. This is not to deny that, prior to their utilization for anthropological analysis, these notions were rooted in empirical and cultural experience. Certainly, "kinship" and "marriage" refer to something "out there" which has received diverse interpretation on different cultural surroundings. But the manner in which these commonsense notions, borrowed from the everyday language, have been redefined as "scientific concepts" for the comparative analysis of socio-cultural systems has been, he believe, directly determined by the analysts' representation of what groups are. A.R. Radcliffe Brown defines kinship as a system of dynamic relations between person and person in a community, the behaviour of any two persons in any of these relations being regulated in some way and to a greater or less extent by social usage. He assumed that, by definition, individuals are unique, idiosyncratic, and autonomous, and that their relations, or the very existence of sociability, were problematic, for a group or a society to exist, these unique and independent individuals must interact, and their interaction presupposes some standardization or patterning of behaviour (Radcliffe-Brown 1957). Like most functionalists, Radcliffe-Brown postulated that individual behaviour must be somewhat constrained or regulated (i.e., share a common element by reducing its idiosyncratic nature) for interpersonal relationships to take place and that this regulation is achieved through the action of "binding" or coercive mental representations- namely, norms, values, rights, duties, beliefs, and soon. Against this undifferentiated background of interpersonal ties, Radcliffe-Brown also sought a formula to conceptualise the discreteness of the corporate grouping which constitute society's internal subdivisions. Individual within a group interact, but they also formed groups with diverging loyalties which unites subsets of individuals but divide them from other subsets. In order to reconcile these two levels of interpersonal and group ties, he resorted to the Durkheimian distinction between solidarity and its jural expression. The standardization of behaviour found in interpersonal relationships is concretely expressed in specific rights and duties (Radcliffe-Brown [1935] 1952), and the rights and duties pertaining to the reciprocal

154 NSOU • GE-SO-11 relations in a given relationship from identifiable "roles" a group may therefore be represented as a 'bounded' and interconnected set of social relations, which are crystallized in terms of roles. Against this general notion of group, kinship is presented as a fact of nature, a physiological fact, that is the fact of consanguinity, selectively emphasized by society and endowed by the latter with a set of norms or jural sanctions which make it binding on individuals. Once made binding or normative through "social recognition" or "institutional arrangement," kinship then operates to constrain and regulate behaviour in interpersonal relationships. By the same token, it also serves to define statuses, thereby functioning to give "kinship statuses"-bearers membership in the group. For Brown, kinship came to be represented both a) as a rule of group membership (often known as "descent" in this instance), and b) as a regulator of behaviour. The main challenge to the structural-functionalist model came from Levi-Strauss, who elaborated his model from the initial intuition that kinship statuses ought to be treated like symbols, not to be defined "substantively" with reference to themselves, but only through their relation to other statuses (Levi- Strauss 1945). A man, for instance, is not a "father" when studied with reference to himself, but only in relation to his child(ren). This notion was later extended to groups and Levi-Strauss postulated that groups gain their identity and reality only in relations to other groups, through exchange. Such an idea ran counter to all the established dogmas, if only because it appeared to do away with the elements of behaviour and their jural expression so crucial to the structural-functionalist credo. It provided a new concept of group which strove to be operational, in that a knowledge of the rules specifying the relation between groups should allow the analyst to infer the type of social structure. This innovation reverberated throughout his conceptualization of kinship, marriage and the family. Marriage, to Levi-Strauss, came to represent the main expression of the principle of exchange upon which social life rests because of alliance that it creates between exchanging units, an alliance which actually defines the very identity of these units or groups. Kinship is therefore a simply by-product of alliance and is geared at the outset to the maintenance and furtherance of alliance. As a result, the structural-functionalist "elementary family" lost its unique status of irreducible kinship group, to be replaced by the structuralist "atom of kinship", which included the mother's brother as a necessary representation of the principle of exchange. However, Levi-Strauss's model has not completely served its links with the behavioural and normative dimensions. Whereas Radcliffe-Brown located his mechanism in society at large, Levi-Strauss placed it in man's mind. Like Radcliffe-Brown, Levi-Strauss need the mind and rules shared by the group because he is addressing himself to the same fundamental problem, namely, the regulation of interpersonal behaviour.

NSOU • GE-SO-11 155 10.4 Types of Kinship The phenomenon of kinship can be classified as : • Consanguineous kinship • Affinal kinship and • Fictive kinship. 10.4.1 Consanguineous Kinship Relation by the bond blood is called consanguineous kinship such as parents and their children and between children of same parents. The son, daughter, brother, sister, paternal uncle etc. are consanguineous kin. Each of these is related through blood. 10.4.2 Affinal Kinship Kinship due to marriage is called affinal kinship, as opposed to consanguinity. New relations are created when marriage takes place. Not only man establishes relationship with the girl and the members of her but also family members of both the man and the woman get bound among themselves. Kinship includes Agnates (sapindas, sagotras); cognates (from mother's side) and bandhus (atamabandhus, pitrubandhus, and matrubandhus). 10.4.3 Fictive Kinship Fictive kinships are belonged to those patterned on kin-like relations that are neither purely based upon blood nor marriage ties, in contrast to true kinship ties. The term fictive kinship has in the past been used to refer to those kinship ties that are fictive, in the sense of non-real. It is used to refer as chosen kin, fictive kin or voluntary kin. It includes god parents, informally adopted children, and close family friends etc. This emphasise the basic biological fact on which kinship system depends. Men and women indulge in sexual interaction and as a result bear children. This lead to blood ties between the individuals and the special terms are used to recognize this relationship, mother, father, and child. The relationship based on blood ties is called "consanguineous kinship", and the relatives of this kind are called "consanguineous

156 NSOU • GE-SO-11 kin". On the contrary, the desire for reproduction gives rise to another kind of binding relationship. "This kind of bon, which arises out of a socially or legally defined marital relationship, is called affinal relationship", and the relatives relates themselves as "affinal kin". The affinal kins, husband and wife, are not related to one another through the bond of blood ties but through the marital ties. Additionally, kinship has got various ramifications. On the basis of nearness or distance, kins are classified into : (a) primary kins, (b) secondary kins, and (c) tertiary kins. Primary Kins. Every individual who belongs to a nuclear family finds his primary kins within the family.

50%

MATCHING BLOCK 34/115

W

There are eight primary kins : husband-wife, father- son, mother-son, father-daughter, mother-daughter, younger brother-elder brother, younger sister-elder sister, and brother-sister. (b) Secondary Kins.

Outside the nuclear family the individual can have more or less thirty three types of secondary kins relatives, for example: Mother's brother, brother's wife, sister's husband, father's brother etc. (c) Tertiary Kins. Tertiary kins refer to the secondary kins of our primary kins, such as wife's brother's son, sister's husband's brother, and so on. Anthropologists have spoken almost of 151 tertiary kins. Descent. When a man died, he leaves something behind: a status or position in society, certain goods, lands, money, or something else. All these assets must pass to someone else, and all societies have developed specific rules about such transmission. Descent is the principle that governing the transmission of kinship: inheritance, that is transfer of property, and succession, that is transfer of functions, tends to follow the principle of descent. In other words,

descent refers to the social recognition of the biological relationship that exists between the individuals. The rules of descent refer to

the set of principles by which an individual traces his descent. There are three basic rules of descent : (a) patrilineal descent, (b) matrilineal descent, and (c) bilateral descent. (

a) Patrilineal Descent. According to this rule, descent is traced through the father's or male line. Here the descent criterion is restricted to males, and only descendants of a common ancestor

in

the male line will be recognised as kin. these are known as agnatic or patrilineal kin. (b) Matrilineal Descent. Here the descent of the individual is traced through the mother or female line exclusively. The descendants are called here uterine or matrilineal kin. These two modes of tracing the descent are called unilineal, that, they select one line only either the male or the female. These principles or rules are not necessarily mutually exclusive within

a society.

NSOU • GE-SO-11 157 (c) Bilateral Descent. This is a rule in which the descent is traced through both of these lines, the female line and also the male line for certain or other purposes. What is important here is that almost all kinship systems recognise 'bilateral' relationships, that is, relationships to both maternal and paternal kins. For example, some societies like the 'Yako' of Nigeria utilise matrilineal descent for some purposes and patrilineal descent for others. There exists a system of 'double unilineal descent' which is also known as 'double descent'. Lineage. "A lineage is a unilineal descent group in which membership may rest on patrilineal descent [patrilineage] or on matrilineal descent [matrilineage]". A lineage, thus, consists of descendants in only one line, either the father's or the mother's. These descendants knew their exact genealogical relationships and who recognise obligations to one another. A lineage is thus relatively smaller and more localised than the broad category of kinship groupings. Clan or Sib. "A clan is a unilineal descent group, the members of which may claim either patrilineal descent [patrician] or matrilineal descent [matrician] from a founder, but do not know the genealogicalities with the ancestor or ancestress" (Abercrombie and others : 66). 'A clan is a named unilineal descent group: that is, a body of persons claiming common descent from an ancestor (often mythical) and recruiting the children of either male or female members, but not both (Duncan Mitchell : 30). The ancestor or mythical ancestor, through whom the descent is claimed, may be human or non human like, animal, plant or even inanimate object. The "Gotra" group of Hindus represents a clan these clans are larger groups and are geographically more dispersed. The clans may have a common totemic name and common ritual taboos against eating or performing such things. Phratry. "A Phratry is a grouping of clans which are related by traditions of common descent" (Abercrombie and others : 219). Mythical ancestors are common in clans and phratries. The Phratry is larger than the clan and includes people scattered over relatively large areas among whom it not possible to trace relationship without bringing in a mythical common ancestor. Moieties. "Where the descent groups of a society are organized into two main divisions, these are known as moieties [halves]" (Abercrombie and others : 66). The term 'moieties' refers to the bisection of a tribe into two complementary social groups. Some scholars would restrict the term 'moiety' to 'exogamous' social divisions, while others use the term to mean any dual organization.

158 NSOU • GE-SO-11 10.5 Kinship Network Human societies are not, however, simply groups of nuclear families with tenuous links to each other. The incest taboo forces each person to create links outside his/her family of origin, and because of this, a network of strong links is created in every society. There is an expansion of elementary kinship links. Thus, every individual belongs at least to two nuclear families : • Family of orientation and • Family of procreation Family of orientation is the one in which person was born and family of procreation, which he founded when he married. Kinship system arises from this universal reality of each individual belonging to two nuclear families. If people married within their nuclear family, there would be no kinship system. The principal of nuclear family and the incest taboo indicates that each person has a precise and particular relationship on the one hand and, on the other hand, that he must extend his relationships beyond this limited circle. The phenomenon of expansion gives rise to an increasingly complex network of relationships. Several "levels" of kinship can therefore be distinguished that combine in a virtual network of relationships that are called "kinship system" according to which individuals are attached to one another by a highly complex network of links with numerous branches. According to Murdock, there are several levels of kinship. The nuclear family that is almost universal in character, gives rise to a set of eight characteristic relationships : (i) The husband-wife relationship (ii) The father-son relationship (iii) The mother-daughter relationship (iv) The mother-son relationship (v) The father-daughter relationship (vi) The relationship between elder and younger brother (vii) The relationship between elder and younger sister (viii) The brother sister relationship.

NSOU • GE-SO-11 159 All these relationships are encountered in families with children in any society. But as any individual is not restricted to that family and must establish a second nuclear family, the family of procreation, that individual serves as a link between the family of origin and this new family. 10.6 Marriage The term kinship, in the broad sense, includes relatives on the one hand and affinity on the other. Two individuals are related when one is descended from another (e.g., a father and daughter) or when both are descended from a common ancestor (e.g., brothers and sisters, cousins). In the latter case, the relationship may be real, fictional or mythical (as for members of a tribe). This extended meaning of kinship does not distinguish between relation and affinity. Marriage is a fundamental social institution studied by anthropologists because it is usually through the marital union that alliances are for forged between groups and social solidarity is built up. Unlike an animal, a human child depends on adults for an extremely long period. This prolonged dependency explains the need for family organization. In all human societies, marriage is an institution of vital importance. Put simply, we can say that marriage is the union between a man and a woman to give children born of this woman a legitimate status. Depending on the society, a marriage may be monogamous or polygamous; in the latter case there is polygynous marriage and, much more rarely, polyandrous marriage. These concepts are not always adequate: in many societies, for example, polygyny is tolerated, even promoted, but it is nevertheless uncommon and it therefore becomes difficult to consider them polygamous societies. Marriage is one of the universal social institutions. It is established by the human society to control and regulate the sex life of man. It is closely connected with the institution of family. In fact, family and marriage are complementary to each other. As Gillin& Gillin have said, "Marriage is a socially approved way of establishing a family of procreation". As Westermarck has remarked, "Marriage is rooted in the family rather than the family in the marriage". Marriage is an institution of society which can have very different implications in different cultures. Its purposes, functions, and forms may differ from society to society, but it is present everywhere as an institution.

160 NSOU • GE-SO-11 10.7 Definition of Marriage In almost all societies, marriage is understood as a legally and socially recognized sexual relationship. Depending on the society, marriage may religious or civil sanction. Westermarck (1891)

98%

MATCHING BLOCK 35/115

W

defines marriage 'as a relation of one or more men to one or more women, which is recognized by custom or law, and involves rights and duties both in the case of the parties entering the union and in the case of children born of it'.

The Concise Oxford Dictionary of Sociology (1994) defines it as, 'Marriage is traditionally conceived to be legally recognized relationship, between an adult male and female, that carries certain rights and obligations.' According to Anthony Giddens (1997) states, 'marriage can be defined as a socially recognized relationship and approved sexual union between an adult male and female that carries certain rights and obligations.' 1. Michel Verdon in his paper "Kinship, Marriage, and the Family: An Operational Approach" (1981,) defines "...marriage must be defined with reference to group formation, a task which requires first the identification of the activities in which 'married groups' are involved. The activity which has been almost universally acknowledged is the sexual one." Radcliffe-Brown (1935, 1952), structural-functional, conceptualized groups in terms of corporations which are differentiated from others and also internally organized in so far as the interaction of members is regulated, kinship came to be represented both (a) as a rule for group membership, and (b) as a regulator of behaviour. The family operated to generate kinship, to manufacture the glue which organizes these simple societies where on the basis of kinship ties, the family came to take a dominant position in structural-functional thinking; as a result, marriage was given a derivative importance, being completely subsumed under the family. For the structural-functionalists, marriage derives its significance from the unique position of the family, and it is defined in a teleological manner, with the family as its purpose. Since the latter institution serves for social placement, marriage appears as a means of legitimizing children. To Levi-Strauss (1945, 1949), again notwithstanding Radcliffe-Brown, marriage came to represent the main expression of the principle of exchange upon which social life rests because of the alliance that it creates between exchanging units, an alliance which actually defines the very identity of these units or groups. From this equation, Levi-Strauss inverted the common assumption that the purpose of marriage is to found

NSOU • GE-SO-11 161 a family through the procreation of children, contending instead that the creation of families or the production of children is only accomplished for the purpose of marriage! If groups derive their reality and identity through exchange, they must keep the exchange going, and the only solution is to procreate. Consequently, groups reproduce themselves physically only with a mind to break even in the eternal game of exchange, which requires a bilateral gifts. Kinship is therefore a simple by-product of alliance and is geared at the outset to the maintenance and furtherance of the alliance. However, Levi-Strauss's model has not completely served its links with the behavioural and normative dimensions. Whereas Radcliffe-Brown located his mechanism in society at large, Levi-Strauss placed it in man's mind. Like Radcliffe-Brown, Levi-Strauss need the mind and rules shared by the group because he is addressing himself to the same fundamental problem, namely, the regulation of interpersonal behaviour. 10.8 Characteristics of Marriage (i) Universality Marriage is more or less a universal institution. It is found among the preliterate as well as literate peoples. It is enforced as a social rule in certain societies. Examples: In Japan, celibacy is publicly condemned. In Kerala, unmarried individuals are called 'half' persons. Among the Hindus, marriage is a sacrament which is regarded roughly as obligatory. (ii) Relationship between Man and Woman. Marriage is a union of a man and woman. It indicates relationship between one or more men to one or more women. Who should marry to whom? Why should one marry? - are the questions which represent social rules regarding marriage which differ significantly from place and time. (iii) Marriage as enduring bond. Marriage indicates a long lasting bond between the husband and wife. Hence it is not coextensive with sex life. It sanctioned the sexual intercourse within a society or it help to exclude any other sexual relationships which are son sanctioned by the society or custom. Marital relationship does not obtained solely on the basis of sexual satisfaction of the partners or the marital bond may endure without practicing sexual activities.

162 NSOU • GE-SO-11 (iv) Marriage as social approval. A union of man and woman becomes a marital bond only when the society gives its approval. When marriage is given the hallmark of social sanction, it becomes a legal contact. (v) Marriage as a civil or religious ceremony. Marriage gets its social recognition through some ceremony. This ceremony may have its own rites, rituals, customs, standardization etc. it means marriage has to be concluded in a public and solemn manner. Sometimes it receives as a sacrament the blessings of religion. Marriage among the Hindus regarded as both a civil performance and a ritual performance. (vi) Marriage as mutual obligation. Marriage imposes certain amount of rights and duties on both the partners. And both of these partners are required to support each other to upbringing their children and to survive the family. 10.9 Forms of Marriage Every society has certain forms of pairing arrangements to which we call marriage but remaining single or pairing without marriage (living together) is fast emerging as an acceptable form of lifestyle in the modern world. The trend towards maintaining an unmarried lifestyle is related to the growing economic independence of young people. The main forms of marriage are : (i) Monogamy It is a form marriage in which one man is married to one woman at a time. It allows one wife to have one husband till death and only divorce separates them apart. This form of marriage is the universally recognized form and is the predominant event in societies where other forms exist. This is the most widespread form of marriage found among the primitives as well as the civilized societies. It is practices among the tribes such as kadars, Santals, the Khasis, the Canella, the Hopi, the Iroquois, the Andaman Islanders etc. Monogamy seems to be relatively superior to other forms of marriage in reference to its universal practicability. Since there is one- to-one ratio in almost all the societies, only monogamy can provide marital opportunity and satisfaction to all the individuals. This form is more economically

NSOU • GE-SO-11 163 better suited as hypothetically, no one with ordinary income can think of practicing marriage other than monogamy. This type of marriage promotes comparatively better understanding of the actual conditions between the husband and wife. Because no form of marriage other than monogamy fail to produces the highest type of emotion and affectional relation between the partners. This form relatively more able to contribute to stable family and sexual life as there is no scope for sexual jealousy and sexual competitiveness. Moreover, since the husband and wife have better understanding, they can give greater attention to the upbringing and proper socialization of their children and there is a vital possibility of enjoying prestigious status of women. (ii) Polygamy Some cultures allow an individual to have more than one spouse at the same time. Having more than one marriage partner at a time is known as polygamy. It was practiced in most of the societies of the world but now the trend is towards monogamy. However, as anthropologist George Murdock (1959) found, 80% of societies had some type of polygamy. There are three basic forms of polygamy : (a) Polygyny It refers to plurality of wives or having more than one wife at the same time. In many societies, having several wives is a mark of prestige, distinction and status. It is very common among Muslims in Africa and in Middle East and Asia, the Eskimo tribes, Crow Indians, African Negroes, the Nagas, Gonds etc. Polygyny

70%

MATCHING BLOCK 36/115

W

is of two types: First, Sororal Polygyny. It is a type of marriage in which

the wives are invariably the sisters. It is often calls as 'sororate'. The Latin word 'soror' stands for sister. When several sisters are simultaneously, or potentially the spouses of the same man, the practice is calls sororate. It is usually observed among the tribes which pay a high bride price. The death of the wife or her childlessness is compensated by supplying a new spouse who is generally the younger sister of the deceased woman. Second, Non-Sororal Polygyny as the term indicates is a type of marriage in which the wives are not related as sister. For social, economic, political and other reasons, both the types of marriage practiced by certain group of people. (b) Polyandry It is a type of marriage in which a woman can have several husbands (plurality of husband) or two or more husbands simultaneously. It is very rare form of 164 NSOU • GE-SO-11 marriage. Wherever it is practiced, the co-husbands are usually brothers, either blood brothers or clan brothers and are of the same generation. The Todas (South India) and Khasa (North India) are the famous examples of polyandry. The polyandry is of two types: First, Fraternal Polyandry. When several brothers share the same wife, the practice can be called 'aliphic' or 'fraternal' polyandry. This practice of being mate, actual or potential, to one's husband's brother is called 'levirate'. It is prevalent among the Todas. Second, Non-Fraternal Polyandry. In this type of marriage the husbands need not have any close relationship prior to the marriage. The wife goes to spend some times with each husband. So long as a woman lives with one of her husbands, the others have no claim over her. Nair polyandry was of this type. No universal generalization can be made with regards to the causes of polyandry. However factors like scarcity of women or property, the desire to keep the property intact, heavy bride price, poverty and the sterility of men, etc. are favourable to propagate polyandry. (iii) Group Marriage It is one more type of polygamy, in which several or many men marry to several or many women. It is practiced in some indigenous societies. Theoretically group marriage means the marriage of two or more women with two or more men. But this arrangement is practically rare. Here the husbands are common husbands and wives are common wives. Children are regarded as children of the entire group as a whole. Children call men of such a group their fathers and all the women are their mothers. Some of the tribals in Australia, in India, Tibet etc. are believed to have practiced group marriage. Rules of Marriage. No society gives absolute freedom for its members to select their life partners. Even in societies where 'free marital choice' is allowed, the selection is not absolute but relative. Rules regarding who should marry to whom- always govern such a selection. Endogamy and exogamy are the two prime rules that condition marital choice. Endogamy is a rule of marriage in which the life partners are to be selected within the group. It is marriage that performed within the group. And the group may be caste, class, tribe, race, village, religious group etc. Thus, in this way we have respectively caste endogamy, sub-caste endogamy, class endogamy, tribe endogamy, race endogamy, village endogamy, religious endogamy and so on. For example, in caste endogamy, marriage has to take place within the caste group. Brahmin has to marry a Brahmin. Endogamy prohibits marriage outside the group. Even today intercaste marriage is not encouraged. Endogamy as a rule of marriage has its own advantages. It contributes to the group unity and solidarity. It keeps women happier

NSOU • GE-SO-11 165 within their group. It helps to preserve the property within the group. It also safeguards the purity of the nature of group. Finally, it helps to keep under secret the strength and weakness of the group. It has its disadvantages also such as by limiting the choice of life partners, it often gives scope for certain evil practices like Polygyny, dowry system, bride price etc. it may also make its followers to develop hatred and contempt for other groups. The modern civilized people are more in favoured of exogamy than endogamy. Exogamy is almost the opposite of endogamy. It is a rule of marriage in which an individual has to marry outside his own groups. It actually prohibits marrying within the same group. The rule insists that the so-called blood relatives shall neither have marital connection nor sexual contact among themselves. Near relatives are not supposed to marry among themselves. But the degree of nearness may differ from community to community. Like marriage of cousins is allowed among Muslims. Exogamy assumes various forms in India such as Gotra Exogamy, where the Hindu practices of one-marrying outside one's own Gotra. Pravara Exogamy, where those who belongs to the same pravara (uttering the name of a common saint at religious functions) cannot marry among themselves. Village Exogamy, where many Indian tribes (Naga, Garo, Munda etc.) have the practice of marrying outside their village Pinda Exogamy, those who belong to the same 'pinda' or 'sapinda' cannot marry within themselves. 10.10 Summary Kinship ties are connections between individuals, established either through marriage or through the lines of descent that connect blood relatives (mothers, fathers, siblings, offspring, etc.). Marriage may be defined as a socially acknowledged and approved sexual union between two adult individuals. 10.11 Questions Model Questions (5 Marks each) (i) What do you mean by kinship ? Discuss the conceptual meaning of kinship. (ii) Explain in brief the various types of kinship. (iii) What is marriage ? Discuss the various forms of marriage. (iv) What are the basic types of marriage found in society ?

166 NSOU • GE-SO-11 (v) What is the basis of kinship network ? (vi) What is monogamy ? G-A (10 Marks each) (vii) Explain in brief about your understanding of marriage. (viii) Briefly elucidate the key characteristics of kinship. (ix) Briefly discuss about kinship network. (x) Explain in brief the salient features of marriage. 10.12 Suggested Readings (i) Al-Haj, Majid. NSOU • GE-SO-11 169 11.2 Introduction The process of change in the social structure is an inevitable universal social reality. The changes in the last few decades are so rapid and far reaching that many thinkers look upon this as a new era in human history. The very processes of industrialisation, urbanisation, and secularisation have brought about many socio- psychological changes in the attitudes and values of the people. The most striking one is the emancipation of women from their relatively traditional bound ethos challenging the institution of kinship, family and marriage. 11.3 Changes in Kinship System The distinction between sociology and anthropology in the West and their convergence and unification in Indian academia is reflected in the way family and kinship are taught and researched. In the history of the field in Euro-American academia, family and kinship were studied within separate disciplines. Family was a staple of sociology and kinship was a core constituent of social/cultural anthropology. Developing as it did in the wake of social transformations following the Industrial Revolution, sociology was not only seized of the unfolding changes in family structure and function, but the dominant Parsonian framework placed the nuclear family of the West as the best adapted model for the emerging new society. Kinship, on the other hand, was an important focus for anthropologists, because in the kind of societies they studied, kinship was a central organising principle, often encompassing and expressing the entire gamut of social relations. Sociology of family, considered a soft option (Barnes 1980 : 297), was a popular subject where common sense, public discourse, and sociology blended into a continuum. They shared common assumptions of the harmonious and consensual nuclear family, with a functional division of labour, which was a cushion for the individual against the harsh external world (see, for instance, Dube 1997, Ganesh and Risseuw 1998 : 11-12). In contrast, anthropology of kinship was seen to be a hard sub discipline - kinship algebra the famous words of Bronislaw Malinowski (1930:19), referring to the pre-occupation with kinship terminology. The work of Claude Lévi- Strauss was particularly influential in raising empirically grounded technical discussions to a sophisticated level of abstraction, where kinship was considered to code eternal principles fundamental to human survival. It became a highly specialised field with its own esoteric jargon, supping at the table of high theory.

170 NSOU • GE-SO-11 The 1970s and early 1980s saw a crisis in kinship studies, mainly over the issue of whether there can at all exist a cross-culturally applicable definition of kinship based on marriage and procreation. The supposed universality of biology in determining kinship was questioned. The widely discussed demise of kinship was followed by a renewal (Varto 2010 : 83-84), but within the canvas of anthropology. While the other three components of the anthropological quadrivium - economics, politics, and religion - have, through the 1970s, seen considerable convergences between sociology and anthropology (Barnes 1980 : 297), what Michael G. Peletz termed the anthropological romance of kinship (1995 : 344), continued. Anthropology did not let go of kinship. A review of the field till the late 20th century (ibid. : 366- 67) shows how kinship in the sense of terminology and as a symbolic system has waned as a staple theme, but anthropological studies of kinship in terms of social relations among variably situated actors, within broader economic and political contexts, and in terms of historical transformations, have got strengthened. In contrast, in India, most scholars have written on family and kinship as a composite field. In Indian universities, wherever they have been taught as a separate course, they have been merged into a unity (Patel 2005 : 22). More commonly though, they are condensed into one or two topics and incorporated within courses like Sociology of Indian Society, Sociology of Gender, Sociology of Ageing and other appropriate courses. This reflects the dominant approach in Indian academia of keeping sociology and social and cultural anthropology together as one discipline, or at least as siblings in a joint family. G.S. Ghurye's own inclinations to fuse the two - given that he was sent to England by the University of Bombay to study sociology but chose to shift to anthropology under W. H. R. Rivers - no doubt played a role. But subsequent generations of influential scholars have also written extensively endorsing this position, which has widespread acceptance in India. Kinship is a structural system of relationship in which individuals are bound to one another by complex interlocking and ramifying ties. Radcliffe Brown insisted on the study of a kinship system as a field of rights and obligations and saw it as a part of the social structure. Man

does not live alone in society. From birth till death he is surrounded by a number of people. Some of these people are his relatives, some are friends and some are neighbours while all others are strangers and unknown to him. He is bound to all those people who are related to him either on the basis of blood or marriage. The relations based on blood or marriage may be closed or NSOU • GE-SO-11 171 distant. The bond of blood or marriage which binds people together in

a group is called kinship. 11.4 Nature of Changes in Kinship System One of the most important areas of social science is the study of the family as the basic social unit for reproduction, residence and economic life in nearly all societies. But family structures and family relationships (kinship system) do have different forms in different parts of the world. The phenomenon of kinship system is so dynamic in nature especially in reference to its nature of changes. Kinship system is changing all the time. The changes in important structural parts such as the forms of marriage, the rule of residence, the rule of descent and the types and composition of kin groups are usually slow i.e. they usually emerge clearly in the course of generations rather than days. According to Johnson, the forces behind such changes are of many inter-related kind- discovery, development or depletion of resources and the development and the spread of new methods of production, the growth of new patterns in the relationship of men in their productive activities, changes in the internal ordering of societies is so far as the use of force concerned and in the relation of one society to another in this respect, changes in the size, age and sex composition of population. These various factors do not necessarily move kinship structure in the same direction, some factors reinforce others, and some neutralized others. Any changes that take place in kinship structure are, therefore, the resultant of many other social changes. Changes in the kinship system : In earlier times, says Bruner (1955 : p. 849) in his recent study of kinship system among the Mandan-Hidatsa, both the Mandan-Hidatsa and the South-eastern tribes had a pure Crow type lineage system. After acculturative influence an American generational type kinship system is found among the two groups. In the Southeast the orderly and progressive shift in kinship type was characterized as a process of slow modification of the existing system due to adaptive responses to changing conditions. In Lone Hill, the lack of intermediate variations in kinship patterns suggests a rapid process of change caused by early socialization in those families in which there has been white intermarriage. Drawing upon the work of Spoehr (1947), the Schmitts (nd), Gough (1952), and Eggan (1941, 1950), as well as upon an analysis of his own material, Bruner (p. 845) concludes that there are two distinct processes involved in kinship change. The first process consists of the slow modification of a kinship system as evidenced by an orderly and

172 NSOU • GE-SO-11 progressive shift in type. The second process is a more radical change evidenced by an abrupt jump from one type of kinship system to another. The second process he illustrates with material from Lone Hill. One gathers from the context of the article that Bruner equates his material with that of Spoehr, etc., in that he sees both cases as involving a change in kinship system. This equation is not precisely correct. Spoehr's Southeast material illustrates an orderly and progressive change in kinship system due to the adaptive responses of the system to changing conditions. Bruner & # 39; s material, however, illustrates some individuals using an American type kinship system rather than a Crow type system due to early socialization in those families in which there has been white intermarriage. It is clear from the Mandan- Hidatsa material that there are two systems present and that individuals adjust to alternate kinship systems (p. 847). In cases such as the Southeast, where progressive changes in systems are involved, there need not be two systems present at any given point in time. Gough (p. 86) says, for example, that; analysis of the processes of change in a kinship system over a period of time fails to reveal discontinuity. The Nayar system has, over a period of two hundred years, changed from a very extreme form of matriliney into a system with only a weak tendency to matriliney; but the later system developed imperceptibly out of the earlier; Both individual and system change or adaptation may take place within the same society (Spoehr p. 198; Bruner p. 845), but the two types should be kept conceptually separate. In terms of a structural model of a changing system, an explanation of process within the scope of present research methodology means the description of changing social usages (and associated terminology) through time and the relation of this description to the particular adaptation of a society to its natural and social environments.

11.5 Factors of Changes in Kinship System Changes are taking place in kinship patterns due to the phenomenon of mobility under vocational or professional pressure and movements of groups due to expediency of commerce. Kinship patterns are changing and so is the case with affinity. In the past kinship was confined to caste, and the phenomenon of inter-caste marriage were discouraged. But at present time, inter-caste marriages are taking place. The number of inter-caste marriages is also increasing day to day. Due to the inter-caste marriages changes have taken place in affinal kinship. Thus the belong kins to different castes. In traditional societies, the concept of residence was very crucial. Considerably,

NSOU • GE-SO-11 173 there were no marriages at too far distant places. But, comparatively, today the concept of distance has no meaning. Thus, one can have kinship at various places and in any castes. Thus, the phenomenon of kinship network is increasing not only in individual level but in terms of area also. As far as matrilineal society concern, the kinship relation is also undergoing change. If we consider the institution of Nayar families, it stands today radically altered. It retains only some of the superficial aspects of the matrilineal type of family system. The situation in rural Malabar is that in majority of Veedas (the dwelling place of small family) the practices of visiting husbands are still prevalent. Husbands do not only visit for a night as they used to, but stay for a longer period, at times, extending two or three days. Many husbands have been assigned important roles in the management of their wives' Vedas. The wives also go periodically to their husband's Vedas, either in the village or in the urban areas where the husbands gone for employment. Then they come in contact with the husband's lineage kin in their Tarwads. The standardisation of behavioural pattern towards the husband's close maternal kins is unknown in old Tarwad organization, is in the process of evolution on the lines of the one prevalent in the Tarwad. The changes that have taken place in matrilocality and matriliney are, however, not uniform in different regions. M. S. A. Rao has observed, as a whole the changes that have come about are neither uniform nor wholesale. They exhibit different shades of intentionalities in different regions. They are rapid in Travancore and slow in Malabar. Cochin occupies the middle position. We can conclude the discussion by mentioning the words of H.M. Johnson, "Kinship systems are changing all the times. The changes in important structural parts such as the form of marriage, the rule of residence, the rule of descent and the types and composition of kin groups are usually slow; that is, they usually emerge clearly in the course of generations rather than days or even years". As far as matrilineal society concern, the kinship relation is also undergoing change. If we consider the institution of Nayar families, it stands today radically altered. It retains only some of the superficial aspects of the matrilineal type of family system. The situation in rural Malabar is that in majority of Veedas (the dwelling place of small family) the practices of visiting husbands are still prevalent. The changes in important structural parts such as the form of marriage, the rule of residence, the rule of descent and the types and composition of kin groups are usually slow; that is, they usually emerge clearly in the course of generations rather than days or even years". 11.5.1 Modernization and Kinship System Majid Al-Haj, in his study Kinship and Modernization in Developing Societies: The Emergence of Instrumentalized Kinship (1955) stated that the effect of modernization on kinship structure and the extended family in developing societies is a controversial issue. For a long time this field of research was dominated by the convergence approach which postulates that countries are industrialized, they increasingly resemble highly developed societies in their family, kinship ties and other basic institutional arrangements (Bernard, Mogney and Smith 1986 : 151). The social forces of modernization affect every known society, thus creating a remarkable phenomenon in the development of similar patterns of family behavior and values among much of the world's population, even if the family systems in different areas of the world move from very different starting points (Goode 1970 : 1). This argument is based on the conception that in the wake of a conspicuous modernization process, family-oriented traditional values are confronted with different Western hierarchies of values, which stress achieved rather than ascriptive elements, universalist rather than particularistic orientation and individualism rather than familism (see Madigan and Almonte 1977 : 797). Modernization and kinship systems are inimical to each other in many respects. Therefore, kinship structure is either a victim or a barrier of modernization (Inkeles and Smith 1974), since extended kinship relationships cannot be adapted to modern industrialized society. The need for social and geographical mobility necessitates the creation of a conjugal family independent of

NSOU • GE-SO-11 175 kinship ties (Levy 1965). One of the main characteristics of this nuclear-conjugal family is the remoteness from affinal and blood relatives, including the extraction of mutual economic aid (Goode 1970 : 8). Therefore, all the relatively modern nations are non-kinship oriented (Levy 1965).

11.5.2 Changes in the study of kinship Terminology Thomas R. Trautmann, in his study *India and the Study of Kinship Terminologies* (2000) mentioned that Kinship as an anthropological object, and anthropology as the observing subject of kinship, was mutually constituted in the middle of the nineteenth century. The constituting of kinship was not a creation from nothing, like divine creation; rather, in the manner of human creations, it came about as a gathering together into a new configuration of elements that had previously existed in a dispersed state. From the law, from ethnographies of missionaries, explorers and philosophical travellers, from the Classics and the Bible were drawn a variety of existing concepts - of patriarchy and matriarchy, forbidden degrees of marriage, rules of inheritance, and so forth - as material for the making of the new thing, kinship. The inventors of kinship - Lewis H. Morgan, J. F. McLennan, Henry Maine, Johann J. Bachofen, Numa D. Fustel de Coulanges - were thrown together through the making of this new object, collaborating in its production without really intending to, or even being aware that they were doing so (Trautmann 1987). In many ways the decisive contribution was that of L. H. Morgan, in his master work, the *Systems of Consanguinity and Affinity of the Human Family* (Morgan 1871), which conceptualized kinship as existing in the form of a limited number of systems that, as such, could be rigorously compared ; for by doing so he conceived an object for anthropology that was complex and required extensive study, creating at the same time an important part of the *raison* for a special discipline devoted to its study. Kinship terminologies were central to this conception of kinship, and thus to the creation of anthropology itself. Constituting kinship terminologies as objects of comparative study involved giving fully conscious recognition and formal expression to the terms we have learned as young children and which we use readily and without reflection. Because, the kinship terminology, like language itself, is both lodged in unconscious knowledge and yet fully available to consciousness for articulation in speech, because it is at once quotidian and occult, it takes a special effort to call into consciousness the relations of reciprocity among the terms that bind them together into a logically organized set. The formal recognition of kinship terminology as a

176 NSOU • GE-SO-11 self-contained system did not come about by way of first lessons in ones own kinship terminology during childhood, nor through adult self- reflection, but by comparison with other terminologies and the apprehension of their difference. Let us briefly trace this moment of emergence. Morgan held that kinship terminologies are aspects of language that, because they are logically-ordered and hence more resistant to change, are more conservative than both the vocabulary and the grammar of a language, constituting for this reason 'a new instrument for ethnology', more powerful than the comparison of vocabularies and grammars in uncovering historic relations among peoples. Thus, in a paper called 'System of Consanguinity of the Red Race' delivered before the American Association for the Advancement of Science in 1859, he wrote: "Language changes its vocabulary, not only, but also modifies its grammatical structure in the progress of ages ; thus eluding the inquiries which philologists have pressed it to answer ; but a system of relationships once matured, and brought into operation, is, in the nature of things, more unchangeable than language - not in the names employed as a vocabulary of relationships, for these are mutable, but in the ideas which underlie the system itself." Morgan found the new anthropological object, which we call kinship terminology, deep in the heart of language. To understand the conditions under which it rose to consciousness we have to consider the role kinship terms had within the project of what we should like to call linguistic ethnology. In the eighteenth century, the European preoccupation with the intersection of languages and nations issued in a project of linguistic ethnology whereby the relations among nations were to be uncovered by determining the relations among languages, arranging them in a tree resembling an anthropological diagram of segmentary lineages. The method employed a simple-seeming tool: the vocabulary list, juxtaposing columns of words from various peoples whose historical relations would be revealed by the similarities of words across the rows. This device seems simple but in fact rested upon a rather complex theory about history and language, to the effect that there are certain words every language must have at the moment of its creation, and that these are the most durable and conservative core of the lexicon of a language. Kinship terms regularly feature in the list of words that make up the core vocabulary. Thus Leibniz, believing that nothing would throw greater light on the origins of nations than the collation of languages, called for the collection of Pater Nosters and glossaries, and drew up a vocabulary list for the purpose which seems to have served as a model for subsequent lists of this kind, the *Desiderata circalinguas populorum* (Leibniz 1768). Leibniz's list includes the

NSOU • GE-SO-11 177 propinquitates, aetatesy, among whom we find the kinship terms pater mater, avus, filius, filia, frater, soror, patruus, maritus and uxor; other sub-lists are words for numbers, parts of the body, necessities, naturalia, and actions. Here the words of the kinship vocabulary remain a series within a series, having no special virtue of their own and being interchangeable with others of the series; so that the conceptualization and use of them is part and parcel of the more general program of linguistic ethnology. So long as kinship terms constituted items in a vocabulary list, however (and they remain so in Campbell), they were captives of an epistemology according to which words are the names of things, in a world of discrete object-types having comparable names in all languages. But once it was grasped that the things of kinship might be categorized under the names of kinship in very different ways from one society to another, one reached the threshold of the anthropological conception of kinship terminology as a system having a logic of its own, comparable to but different from other such terminologies and their logics; so that now the words of kinship were no longer in series with words for feet, nose and teeth, but constituted a bounded set to be compared with other such sets. This breakthrough understanding came about when Morgan confronted the strangeness of the Iroquois terminology, in which 'the father's brother is equally a father', and the mother's sister a mother, implicitly comparing his own kinship terminology - in which the father's brother is an uncle, and the mother's sister an aunt - with that of the Iroquois. An essential step in achieving this new sense of kinship consisting of systems that can be closely compared was to abandon the comparison of vocabulary items, i.e. the lexicon of kinship, in favor of examining the semantic patterning of the kinship set. Morgan tended to believe that similarity of semantic patterning indicated historical relationship even where the vocabulary of kinship is completely different, i.e. across language families. In this way, he believed, kinship could show historical relationships between languages whose vocabularies had so changed over time that they were no longer recognizably alike. Thus, kinship terminology was central to the consolidation of kinship as anthropological object. Because this object was a system or structure, all analysis of this anthropological object necessarily has an incipiently structural, if not a fully-blown structuralist, character; and it is to structural analysis that we owe most of the great advances in our knowledge of kinship. Lewis H. Morgan him-self, though the overall shape of his interpretation is evolutionist, clearly delimited the structure of

178 NSOU • GE-SO-11 terminologies we call Iroquois, Crow, Omaha and Eskimo, providing in fact most of the tools of kinship analysis in use ever since. It is not an accident that the two golden ages of the study of kinship, and especially of the study of kinship terminology, had this structural or structuralist aspect – the first following W. H. R. Rivers's revival of Morgan (1914), and the second following the publication of Lévi- Strauss' great masterwork, *Les structures élémentaires de la parenté* (1949), fittingly dedicated to Morgan, and of Murdock's *Social Structure* (1949). Critiques of kinship as anthropological object have often had the analysis of kinship terminology in mind, as when Malinowski complained of 'kinship algebra' or (so as not to malign algebra, presumably) 'the bastard algebra of kinship'. Kinship terminology is no longer automatically included in what anthropologists call kinship, even tacitly. Nevertheless, it remains part of the invaluable ethnographic record which anthropology has made of worlds that have vanished. And some recent works, including the publication of the 1993 Maison Suger conference on kinship terminologies organized by Maurice Godelier (Godelier, Trautmann & Tjon Sie Fat 1998), and Francis Zimmerman's book (1-993) that appeared the same year, *Enquete sur la parenté*, suggest that a revival of the study of kinship terminologies is in progress.

11.6 Changes in Marriage

In recent times marriage has seemingly become less popular, more fragile and less of an exclusive setting for having children. We will discuss recent changes in marriage and marriage related issues such as cohabitation, divorce and re-marriage patterns. Robert Parke, JR. and Paul C. Glick in their study *Prospective Changes in Marriage and the Family* (1967) stated that there (in recent trends in marriage and family statistics) is a "...continued decline in the rate of teen-age marriage and rise in the average age of women at first marriage; reductions in the relative frequency of widowhood due to increasing similarity in the age of husbands and wives, as well as to improvements in survival rates; reductions in the relative frequency of divorce and separation due to rising incomes; and some continued decline in; the average size of households and families and major increases in the proportions of unmarried individuals who maintain their own households." They reviewed that in reference to recent trends in marriage and family statistics provides a basis for the following expectations, if one keeps in mind the foregoing qualifications :

NSOU • GE-SO-11 179 (i) Persons now in their late twenties and their early thirties are more likely to marry at some time in their lives than any other group on record. (ii) The rate of teen-age marriage, which is now on the decline, will continue to go down for a while, and then level off. (iii) The relative oversupply of young women will tend to produce a further rise in the next ten years in the age at which women marry for the first time. (iv) The compression of marriages into a narrow age range will cause marriage and household formation to be somewhat more responsive than before to changes in the number of past births from which the marrying population comes. (v) Over and above any general decline in mortality, the declines in the difference between the ages of the husband and wife will reduce the frequency of widowhood and increase the proportion of couples who survive jointly to retirement age. (vi) Declines in the relative frequency of divorce and separation should result to the extent that there are reductions in poverty and general improvements in the socio economic status of the population. (vii) The small average size of modern families (in terms of related persons sharing the same living quarters) will not change very much, but the average number of adult members may come very close to a minimum size. Greater changes are likely to develop only if there are major changes in the average number of children in the home. (viii) Nearly all married couples now maintain their own households. In addition, there is a good prospect that within the next 20 years five out of every six aged individuals not in institutions will keep house on their own, and more than half the adult individuals of other ages will do so. In closing, it is acknowledged that here and there the observations presented have gone a step or two beyond the projections. Furthermore, the future patterns could actually veer off in new directions not anticipated in the projections. However, there is reason to expect that further development of the program for preparing marriage and family projections, and improvements in the data available, will make it possible to reduce the area of uncertainty and to provide prompt corrections of future readings so as to bring them in line with current developments.

180 NSOU • GE-SO-11 11.7 Nature of Changes in Marriage The central theme of our understanding towards the nature of changes in marriage is one of diversity. We try to document varieties of diversity in men's, women's and children's experiences of family and marriage- over time, across cultures and especially today. We describe a variety of perspectives that provide different lenses on the question of why people marry and the consequences of those choices for parents, the children, and the society at large. We also present evidence suggestive of continuing and potentially increasing diversity of those experiences and consequences into the future. The changes in the marriage system may be analysed in following areas. (i) Changes in the Aims of Marriage The main objective of Hindu marriage was Dharma. Although Karma or sex was one of the aims of Hindu Marriage, it was the least desirable aim. In recent times, the order of aims of marriage has undergone change as, sex has become primary and Dharma has become least important aim to marriage. (ii) Change in the Process of Mate Selection As far as the selection of the bride and bridegroom concerned it was the prerogative of the parents or the guardians. This tradition of selecting the marriage partner for son or daughter continued till the end of 19th century. In the post- independent India, the tendency of selecting one's own partner has remarkably increased. At present, the younger generation is not very much in favour of parental choice in matter of selection of marriage partners. (iii) Changes in the Rules of Endogamy and Exogamy There have been considerable visible evidences of change in the matter of rules of endogamy and exogamy. The rules of Varna, caste, and sub-caste are endogamy while Gotra and Pravara are categorised as exogamy have been banned by legislations. Now one do not find any sort of restriction in cross-cousin marriages and the number of incidences are gradually increasing under such circumstances such as the Hindu Marriage Disabilities Removal Act (1964), the Special Marriage Act (1954), the Hindu Marriage Act (1955) etc. (iv) The Age at Marriage In course of time, the child marriage became the taboo of marriage in India. In NSOU • GE-SO-11 181 the 20 th century, the Child Marriage Restraint Act, popularly known as Sharada Act

89%

MATCHING BLOCK 38/115

W

prescribed the minimum age of marriage at 14 years for girls and 18 years for boys.

Thereafter, the Indian Parliament raised the age of marriage 18 for the girls and 21 for the boys and any case that come below the prescribed age has been made a cognisable offence. (v) Changes in the Rites of Marriage Conventionally, Hindu marriage is a religious sacrament and the Hindu marriage can take place only through the performance of certain rights and rituals. But now the situation is being changed as marriage is monitored and performed strictly by the civil courts. As a result, the sacred nature of rites and rituals has been gradually diminished to a considerable extent. (vi) Change in the Stability of Marriage In the orthodox Hindu society, the concept of divorce is less considerable phenomenon. The hindrance on divorce made the institution of family and marriage stable and enduring. But due to the enactment of marriage and family legislations and many other inter-related factors the divorce rate in India has been steadily increasing.

11.8 Factors of Changes in Marriage

Factors that are supposed to be responsible for the changes in marriage are as following:

- (i) Second Demographic Transition Family forms are becoming increasingly diverse. Some demographers have characterised the dramatic changes in family structure and behaviour over the past forty years as the "second demographic transition" (Lesthaeghe 1995). These changes includes delays in marriage and increases in divorce, non-marital childbearing, and cohabitation. These changes have not occurred equally for all groups, however. The retreat from marriage and increases in non-marital childbearing are concentrated among racial and ethnic minorities and the less educated, and these differences in marriage outcomes have contributed to the increase in inequality over the last thirty years (McLanahan 2004)
- (ii) Spending Less of Being Married There has been considerable debate about whether individuals are tending forgo 182 NSOU • GE-SO-11 marriage altogether, or whether due to increase in the age of marriage and in the likelihood of divorce they are just spending less of their life cycle being married. Data clearly shows that both men and women remain single for a longer period of time. In the 2005 the median age of marriage in the United State was 27 for men and 25 for women. The age at marriage has increase substantially since the 1950s, when half of women married during their teen years. At the end of 19th century, the age of marriage was closer to what is today; in 1890 the median age of marriage was 22 for women and 26 for men.
- (iii) Marriage Delayed/Avoided The continuing debate sheds some light on the question of whether marriage is delayed or avoided. The figure shows that the proportion of white and black women who were ever married by age 45-50 by educational level over time. The top panel shows that marriage propensities have increased for white women. Since 1950s, the likelihood of ever marring remain almost constant for those with less than a high school education, but this likelihood increased for white women with more education (by about 6% for women with some college.) In contrast the lower panel shows that marriage propensities decreased substantially over time for black women of all educational level. The decline was largest for black women less than a college education (from 96% to 62%), but there were still a 10-point decline in marriage probabilities for black women with some college. As several studies on this issue trying to emphasize that over and time the phenomenon of marriage has become increasingly selective of those with higher socio-economical status.
- (iv) Increasing Divorce Rates The increase in divorce rate is another factor contributing to the decline in marriage. The substantial increase began in the late 1960s, but aggregate divorce rates have been fairly flat since 1980, with a small decline in recent years. Divorce propensities also reflect the divide between high and low socio-economic groups. The likelihood of divorce has fallen slightly for non-Hispanic whites but has continued to rise for black (Bramlett and Mosher 2002). It also shows that remarriage rates have fallen over time. Again remarriage rates have fallen faster for black than for whites (Bramlett and Mosher 2002).
- (v) Non-marital Childbirth The delay in marriage has not been matched by a similar delay in fertility,

NSOU • GE-SO-11 183 especially for black women and those with lower education. Essentially marriage and childbearing are less closely connected now than in the past, resulting in an increasing number of births outside of marriage. This behaviour has been the focus of much debate by policy makers and pundits alike. In 2005, almost 7 in 10 black children and about 1 in 4 white non-Hispanic children were born to non-married parents. The reason rise in non-marital childbearing began in 1960s, and the percentage of births that are non-marital has almost quadrupled since 1970. (vi) Non-marital Cohabitation Another change in family structure has been the rise of non-marital cohabitation. Estimates based on the 2000 U.S. census show that there are nearly 5.5 million cohabiting couples in the U.S. today, which represents a more than 1000 percent increase since 1970. It is estimated that about 40% of cohabiting households including children (Fields and Casper 2001; Simmons and O'Connell 2003). Indeed, evidence from the National Survey of Family Growth estimates that 40% of non-marital births to unmarried cohabiting couples (Chandra et al. 2005). (vii) Diverse Life Course Individuals are experiences diversity across the life course. Today many men and women spent their life course in various family structures, moving back and forth between being single, cohabiting, married, remarriage, divorced and widowed. (viii) Impact of Social Change Overall the trends and changes described to highlight the considerable diversities in experiences of marriage and indicate that there remain many unanswered questions about contemporary marriage and family life. This mix of reviews and of theory and the literature, and empirical data gives our readers both breadth and depth into the multitude of issues and perspectives that mark contemporary research on marriage and family. Thorton also describes social changes in the western world, including industrialization, increasing wages for women, and the development of the birth control pill, that have contributed to the decline in marriage. (ix) Single-Parent Family Over the past forty years the parent of all children living in single-parent households has increased gradually. Although there is considerable diversity in the prevalence and experiences of single-parent families across different social, ethnic and educational groups, and there is also diversity in the route through which the current phenomenon occurs. The studies shows that children who live in single-

184 NSOU • GE-SO-11 parent household have worse outcomes than those who living with two biological married parents, though there is less consensus about the mechanisms that lead to these outcomes. (x) Single-Mother Family This further leads to the phenomenon of single-mother family household. Comparatively there is a considerable different and diverse outcome for children living in two family types that have never had a structure transition: stable married-biological parent and stable single-mother families. (xi) Step-Parent Family Now considerably the next question comes of step-parent families, especially with the view of comparative outcomes for adolescents in step-parent families with those in single-parent families. Here the major emphasis goes on whether the step-parent family is formed through cohabitation or through marriage and whether step-parent family is preceded by a divorce or by a non-marital birth.

11.9 Summary We can conclude that the future of marriage, both in terms of the ontological meaning that marriage has and the practical knowledge that could have in people's lives, become dynamic. Steven Nock accounts that as marriage has become less universal, it has also become more selective of individuals with higher education and other socially valued characteristics. According to him, as marriage rates decline, "the symbolic importance of marriage increases".

11.10 Questions G-A (5 Marks each) (i) What is divorce ? (ii) What is cohabitation ? (iii) What are rites of marriage ? (iv) When did Hindu Marriage Act passed ? (v) Mention some functional changes of kinship system.

NSOU • GE-SO-11 185 (vi) Point out some structural changes in present kinship system. (vii) Evaluate the contemporary status of marriage system. G-B (10 Marks each) (viii) Discuss the major factors of changes in kinship system. (ix) Explain in detail the nature of changes that taken place in kinship system. (x) Explain the factors that solely responsible for changes in marriage system. (xi) What are the factors of changes in marriage system ? (xii) What are the changes occurred in the nature of marriage system ?

NSOU • GE-SO-11 187 Unit - 12 □ Relevance of Marriage Family and Kinship Today Structure 12.1 Objectives 12.2 Introduction 12.3 Importance of Family in Modern Society 12.4 Importance of Kinship in Contemporary Society 12.5 Relevance of Kinship in Modernizing Societies 12.6 Structure and Function of Kinship 12.7 Relevance of Marriage in Recent time 12.8 Summary 12.9 Questions 12.10 Suggested Readings 12.1 Objectives • To learn about the role of family in our society • To learn about the necessity of kinship ties in our changing scenario • To learn about the present condition of marriage in contemporary society • To develop a worldview about the present necessity and importance of social institutions in human society in general. 12.2 Introduction Life has changed so much for most of us in the modern world. With the advancement of technology, changing cultural norms, new priorities and forms of communication fuelled by the internet, it's natural to wonder what the importance of 187

188 NSOU • GE-SO-11 family is. Is it a dying institution that has no place in modern life? Well, of course not. Family just as relevant as it ever was if not more. No matter how much life changes in the future, it will probably continue to be need in one form or another. 12.3 Importance of Family in Modern Society The traditional definition of "family" entitled one man and one woman who were married, and their children. A grand-parent might live with and be a part of the family, too. In the 1950s, the ideal family was a father, a mother, and two offspring. The current definition is somewhat open and inclusive. A family might be two parents of any gender, married or not. Some people even have a family with more than three parents. The child may have been born to one of the parents, both parents, or adopted. As modern family puts pressure on all of us, the benefits of living in a family are more important than ever such as : (i) Family Meet Basic Needs The basic social unit called the family is tasked with meeting the basic needs of those family members who can't provide for themselves. This includes minors, the elderly and disabled, or simply those who can't afford to live by themselves. Basic needs such as food, water, shelter, and clean air are accessible when one or more members can provide things for the whole family. (ii) Financial Security A well-functioning family provide financial security for everyone living in the household. First, members who can work contribute at least a part of their earnings to help the family meet everyone's needs and wants. On the other hand, the family combines resources to pay bills and manage their money to ensure that financial necessities are always taken care of. (iii) Built-in Support System When family members are under stress, someone close to them is most likely to see the symptoms that they are struggling with. People may hide their problems with others, but their family most often already understand. In such a situation, all close members may not support economically but can physiologically and psychologically.

NSOU • GE-SO-11 189 (iv) Provides Support when one is Ill Family potentially helps solve all these problems and can make sure that food, water, rest, and medical care is provided. Society may not have physiologically to do anything to take care of a person's basic needs because a family already has that covered. (v) Community Benefits The community benefits when the family relieves it of the burden of supporting members of that family. Healthy family produce people who make positive contributions to the community too. It is basically the process of socialization of that family of their members that solely responsible for a better or worst society as a whole. Significance of Family in Globalizing World: The idea of globalization is a central paradigm of our time, informing the work of a wide range of groups and interests, from scholars to economic development workers to human rights activists. In a much-cited passage, social theorist Anthony Giddens (1990) defines globalization as intensification of worldwide social relations which link distant localities in such a way that local happenings are shaped by events occurring many miles away and vice-versa. For some, the primary feature of globalization is, deterritorialization; (Scholte :2000). On the one hand, as exemplified by the McDonaldization thesis, globalization is associated with cultural homogenization, and the dominance of a commodity-driven, Western-imposed world culture. In reviewing theories of globalization, Kibria, in her study. *Globalization and the Family* (2006), was struck by the fact that the family is relatively invisible and very much a secondary focus of concern in these discussions. For the most part, the family is understood as a recipient of globalization—a sphere that is acted on by globalizing forces. To put it in positivist terms, globalization in this scheme is the independent variable and the family is the dependent variable. She discussed globalization and family as separate and distinct rather than as deeply intertwined features of the social world. For her the family is quite often the shock absorber of globalization. Whether it through a strategy of labor migration by mothers or the redefinition of household boundaries, families respond to the economic and other dislocations of globalization in a variety of ways, striving to ensure the survival of members. These strategies are not simply

190 NSOU • GE-SO-11 responses to globalization but also constitute it, shaping its emerging scope and character. As a critical mediating structure of globalization, she mentioned, the family is also the site of sense making; a place where family members, through their interactions with each other, give meaning to the changes taking shape around them. The family is, thus, an integral part of the cultural dynamics of globalization. Andrews notes the critical role played by children in how families cope with the dislocations of war and conflict. Children serve as cultural nodes for these families, serving to maintain a sense of cultural continuity and tradition for them. Srinivas, on the other hand give emphasis on packaged food consumption among middle class Indian families in Bangalore, India and in Boston, United States and describes how food consumption in these families is grounded in a larger project of asserting and maintaining authentic Indian-ness in the face of the cultural challenges of globalization. Menjivar, Thai and territorialization in Eckstein all offer the opportunity to reflect on the dynamics of de- relation to the family. Menjivar describes the complex diversity of family forms that emerge among Guatemalan and Salvadoran immigrants in response to U.S. immigration laws and the environment created by them. In a study of Vietnamese immigrant men, Thai explores the question of what motivates these men to remit money to family members in Vietnam. All these scholars are nothing but trying to affirm the value and importance of a renewed focus on family in globalization studies.

12.4 Importance of Kinship in Contemporary Society

Why kinship is so important? Because, in all human societies, biological relationships are basic categories that allow humans to identify and order their social relations. Everywhere, indeed, individuals are sired by their fathers and are born of their mothers. Therefore, these basic biological relationships offer us ready-made categories to differentiate ourselves from each other. While all animals, too, result from a male and a female, the key point here is that human societies consciously recognize and explicitly use these categories to define their biological relationships. As a result of this uniqueness, some contrast biological relationships with social relationships and affirm that only the latter concern the ethnologist. For example, Southwold explain that if a term in a native language means "biological father", it NSOU • GE-SO-11 191 is applied very often, and simultaneously, to a number of other individuals, such as the father's brothers (Southwold 1977). According to these authors, it is as if these social relations had nothing to do with biological relationships. Gellner corrected this view by showing that social relationships studied under the level of kinship relationships derived directly from biological relationships (Gellner, 1988). It is biological relationships that provide the material basis upon which human societies have built their system kinship. People consider such relationships in different ways. For Americans, kinship is primarily a relationship of blood and this consanguinity cannot be altered: it creates a certain consubstantiality, a mystical identity that cannot be terminated (Schneider). When purely fictitious kinship ties are established, they do not contradict the biological relationships but take it as a model. In the Peruvian Altiplano, each individual is assigned a number of godfathers and godmothers. These are often ritually connected people who can bring one prestige or simply expand one's network of social relations. A relationship of comradeship (*compadrazgo*) develops between the godparents and the parents of the child. Such a relationship does not in any way eliminate the existing social distance. Yet, a marriage relationship is impossible between a person and the child of his/her godparents. It is considered "the greatest insult that one can offer to God" (Christinat, 1989).

12.5 Relevance of Kinship in Modernizing Societies

Majid Al-Haj, in his study *Kinship and Modernization in Developing Societies: The Emergence of Instrumentalized Kinship* (1955) stated that recent evidence from developing societies in the Third World suggests the need for a serious reconsideration of the aforementioned convergence approach. Studies conducted in these societies indicate that despite the modernization process they experienced in different fields, some of the so-called traditional systems have continued to exist. In several societies the kinship system has been reconstructed and has adapted to the changing environment (Ekong 1986; Al-Haj 1989). Furthermore, radical modernization has strengthened, rather than weakened, the traditional system. In many cases kinship groups have become vitally important for social and political recruitment (see Talmon-Gerber 1966; Ramu 1986). The study of kinship in rural India indicates that the kinship system has been

192 NSOU • GE-SO-11 well integrated in the modern system (Ishwaran 1965). The introduction of a modern political system in Indian villages, based on elections rather than inheritance, opened the way for groups that hitherto had been placed at the periphery to compete for control of the power system (Ishwaran, 1965). The vitality of the kinship structure is also evident in Indian urban areas (see Ramu 1986). Based on a study conducted on entrepreneurship in an Indian city, Ramu indicated that the most successful entrepreneurs were those who were able to restructure their family and kinship networks effectively and use them as a resource for economic success (Ramu 1986 : 176). The kinship group is reported to have a significant role in Bengali society in terms of social and religious activities (Aziz 1979). The effect of the kinship group even extends beyond the village, whether through marriages with other lineages or with kinsmen distantly related. With a wider circle of kinsmen, a family can enhance its social and economic power (Aziz 1979 : 127). Evidence from Jamaica and Guyana also indicates a strong kinship continuity. In these societies kinship has constituted the major bond for sustaining human relations between the different classes and racial groups (Smith 1988 : 184). The integration of the kinship structure in the development process is noticeable in Middle Eastern societies. Based on a wide review of several studies conducted on parallel cousin marriages (FBD), Holy (1989) indicates that this type of marriage still exists and manifests the continuity of kinship ties. A study conducted on adolescence in a Moroccan town points out that Moroccan families are closely tied in large networks. The penetration of technology in many developing societies has ultimately increased, rather than weakened, the kinship effect. An interesting example is given by Moge and Bachmann (1986), who examined the effect of introducing a modern irrigation system on the kinship structure in Senegal. They concluded that exchanges between children and parents, on the one hand, and between parents or children and in-laws and uncles, on the other, have increased as a result of the innovation (Moge and Bachmann 1986 : 240). The urbanization process experienced by many developing countries, which was usually coupled with a rapid process of geographic movement from rural areas to urban centers, has not resulted in the disappearance of kinship ties. On the contrary, in many cases the kinship system was reconstructed and kin relationships were reshaped in order to meet the new needs that arose from the

NSOU • GE-SO-11 193 processes of movement, settlement and adjustment to the new setting (Abu-Lughod 1961; Goldscheider 1987 : 683). Despite the disruption of the kinship structure as a result of internal and international migration, there is salient evidence that in many cases the kinship system was eventually revived in the place of destination (see, for example, Lomnitz and Peretz-Lizaur 1984; Schuster 1987). This occurred either by the recreation of the kinship group in the place of destination or through close contacts with distant relatives, including the continuity of economic and social exchange. Based on a study of a shanty town and upper-class households in Mexico City, Lomnitz and Peretz-Lizaur (1984) reported that the kinship group was recreated in the shanty town right after migration by a chain movement of relatives who sought to join their families. The upper class in Mexico City has established even stronger relationships and norms of cooperation and developed an intense social, ritual and economic exchange (Lomnitz& Peretz-Lizaur 1984 : 191). Kinship networks have proved to be vitally important in the absorption of traditional Jewish immigrants in Israel (Talmon- Gerber 1966 : 97). The reconstruction of the kinship group helped the new immigrants to adapt to the new environment, socially as well as economically (Talmon-Gerber 1966). The reconstruction of the original community and the kinship group was indicated by Abu-Lughod (1961) as an important feature of the settlement and adjustment of rural migrants to Cairo. Migrants from particular villages concentrated within small subsections of the city, forming social networks and sharing not only a common past but also a similar and often simultaneous history of adaptation to the city (Abu-Lughod 1961 : 25). The recreation of the kinship structure is also obvious among immigrants moving from developing to Western countries, whether through voluntary or involuntary migration. A study conducted by Sweet (1980) to trace Druze immigrants from a Lebanese village to a Canadian city indicated considerable continuity. The Lebanese village continued to flourish in a Western Canadian city in both ideology and practice. By recreating the previous structure of kinship and community, immigrants enhanced their economic and social security (Sweet 1980 : 50). Several studies have shown a considerable continuity of the kinship network among the Vietnamese refugees in the U.S., despite the disruption of the kinship system as a result of the war and the exodus (Haines 1988; Dunning and Greenbaum

194 NSOU • GE-SO-11 1982). The intrinsic structure of the Vietnamese kinship provided useful strategic resources for dealing with the new needs and for facilitating the resettlement and the adjustment of the refugees (Haines 1988 : 11). After the process of resettlement, the kinship group was redefined the Vietnamese refugees to include family members and other members of the community bound by actual or even fictive relationships (Haines et al. 1981). A similar phenomenon can be found among the Palestinian refugees in Arab countries. Kinship and original community were preserved in many cases by camp and non-camp refugees, who continued to be community oriented and family oriented, despite the displacement and movement they had experienced. Outside this life style, Palestinian refugees may feel isolated and without a frame of reference which may give meaning to their existence (Barakat 1973 : 151). In his study of the Palestinian community in Kuwait, Ghabra (1987) indicated that networks based on kinship and hometown have been created among the Palestinians and have become vital to diaspora survival. Through reciprocal relationships and intensive contact, these networks play important social, political and economic tasks (Ghabra 1987). The reformation of the kinship structure among the Palestinian internal refugees in Israel is of special interest : a new relationship began to emerge between the community of origin and the kinship group. Kinship affiliation was replaced by affiliation with the community of origin (for example, refugees who came from the village of Mear are called Meari, attached to the community of origin rather than the kinship name). Thus the relationship among persons who belonged to the same original village became similar to the kinship group solidarity. The redefinition of the kinship group in a broader way was aimed at creating a wider social group, which has been used by the refugees for competition over the local political and economic resources. In addition, it has become a major unit in the marriage market and expanded the pool of mate selection (Al-Haj 1986, 1988b). Apart from voluntary factors, the continuity of the kinship structure in developing societies may be interpreted in the light of socio-economic constraints imposed by the wider society, or the failure of the formal systems to deal with rising needs that accompany the development process (Schuster 1987; Goode 1970:130). It may also be the result of explicit or implicit encouragement by the state or the ambiguity of the criteria used for the allocation of resources and promotion in the socio-economic ladder (see, for NSOU • GE-SO-11 195 example, Pena 1984; Schaefer and Davis 1989; Khuri 1976). Pena (1984) indicated in his study of a region in southern Mexico that & quot; the political process- the distribution of power, the upholding of order- is not carried out exclusively by impersonal state apparatuses. Instead the state resorts to personal links to manifest itself. Thus kinship becomes overwhelmingly important : Property and citizenship rights are transmitted by kinship (Pena 1984 : 205). In this sense, kinship is used for tactical means for the mobilization of power and the promotion of personal interests (Pena 1984; Bloch 1971). Similar examples can be found elsewhere in other developing societies. In Moroccan society, for example, informal connections still play a major role in the allocation of resources and in competition in the labor market. In this case relatives are the best means to achieve the desired connections (Schaefer and Davis 1989). Family relationships are sometimes enhanced legally by the state, which provides a solid basis for kinship solidarity. For example, the Indian inheritance law and income tax structure clearly favor family partnerships and therefore allow the joint family to maintain economic cooperation and social solidarity, despite the political and socio- economic changes (Ramu 1986 : 181). In some cases, even if no formal policy exists regarding kinship and other informal systems, the failure of the state apparatus to meet the rising needs of its citizens paves the way for large networks to fill the gap. Therefore, kinship groups are used to solve problems that go beyond the capacity of the single family (see Goode 1970). A good example can be derived from Zambian society, where the absence of an adequate state welfare system increased the importance of the kinship group as a source of services and social security (Schuster 1987 : 365, 382). It should be mentioned that along with the continuity of the structure and functioning of the kinship system in developing societies, there have been significant changes in its characteristics and the basis of its organization. Many students of kinship in contemporary developing societies have suggested a pragmatic approach for an understanding of the complexity of change and continuity in the kinship structure (see ??? 1986; Bernard et al. 1986). Some referred to kinship as a pragmatic association rather than a traditional group (Cohen 1970). Others spoke about modified kinship to indicate the adaptability of kinship to changing circumstances (Chekki 1974).

196 NSOU • GE-SO-11 12.6 Structure and Function of Kinship There is an internal logic to kinship terminologies. The kin terms tend to be semantic categories first of all; from a limited vocabulary, they can identify dozens, even hundreds of subjects. Some of these categories are very broad; for example, the maternal uncle, the most significant ally, is named by a term that can apply to many individuals, that is, all men of one's mother's generation who belongs to one's group. They thus rely on rules of extension that ultimately stem from the principal of structural unity of siblings. All members of a group fall into the same category: thus, all the brothers of an uncle are my uncle. The terms are, therefore, united in a relationship of interdependence and this is why we speak of the "internal structure" of a terminology. Often, traditional societies cannot conceive of social relationships outside the family; everyone around them must therefore be classified in one way or another. Thus, anthropologists themselves are assigned a kinship term, often "brother" or "sister" by members of their generation, or "uncle" or "aunt" by the children. A kinship terminology thus shapes the world of a population. It reflects the world, but it also organizes it because, as Jamous puts it, kinship terms are not just a manner of speaking they are also a manner of behaviour. Additionally, all terminologies are not necessarily meaningful and their peculiarities do not necessarily reveal the basic elements of social structure. In some cases, two individuals are can be designated by the same term and the same term can covers extremely diverse persons.

12.7 Relevance of Marriage in Recent time The current trends indicate that marriage in the future will be less central as the defining event in the life than course of adults than it is in the present. Marriage will increasingly compete with cohabitation as an alternative form of intimate family life, and increasing number of adults will live alone. The overall number of fraction of adults who are currently married will decline. Here we will explain, in view of the account, how these trends may elevate the importance of marriage, family and kinship in present day.

NSOU • GE-SO-11 197 (i) Marriage as Social Institution Marriage is a socially recognized institution because conventional expectations are associated with it, such as customary ways to be a good husband or wife. Society expects husbands and wives to do thing differently from when they were not married. A kind of informally formal responsibilities and obligations in voluntarily are fall upon both of these partners. By getting married, partners announce to each other's that they are ready to accept the obligations and responsibilities to be faithful. It is comparatively more difficult for a married than for an unmarried person to break such promises because they are parts of our laws, religion, rituals, and definitions of morality. Marriage should look like :

- Marriage is a free choice that builds on love.
- Marriage presumes individual maturity and in dependence.
- Marriage generally presumes hetero-sexuality, even in a regime permitting same-sex marriage.
- Men must provide support; working is not optional for husband, even if it is for wives.
- Married partners are sexually faithful to each other.
- Parenthood – married spouses are presumed to be become parents. Society itself enforces these ideals both formally and informally. The core of any social institution is agreement among members of society about the norms that govern people in acting that role. In marriage, this means that the institution consists of various beliefs and norms about what a married man or woman should and should not do.

(ii) Symbolic Importance of Marriage Steven L. Nock notes that to the extent that fewer individuals are married at any point in time, the symbolic importance of marriage increases. The symbol of marriage has potentially important significance in the labour market. If marriage implies valuable traits about individuals, then these who are married may enjoy benefits that their unmarried counterparts do not.

198 NSOU • GE-SO-11 (iii) Marriage serves as Kind of Sorting As long as the alternatives to marriage (e.g., cohabitation, singleness etc.) grow in popularity, then marriage increasingly serves to sorting individuals based on the personal attributes associated with various living arrangements. We may conclude that men and women who marry each other likely to benefit by this. (iv) Marriage as kind of Signal Through the eyes of economic signalling theory, marriage can distinguishes the married from the other. By considering marriage as a sign of otherwise unknowable personal traits, we learn how it becomes matter to employers, the state, and others. If we consider, marriage as a social institution, offers a framework to identify the content of marital signal. This content, when perceived by others, is the value of marriage. The outcome is that, that is why the married people are treated differently than their unmarried counterparts. (v) Marriage as Distinctive Status Marriage rates have been declining for several decades and for many reasons such as later age of marriage, high unwed birth rates, increasing events of cohabitation, high divorce rates etc. Regardless of the reasons marriage is delayed, disrupted or foregone, the result is that being marries is an increasingly distinctive status because a growing fraction of people are not. (vi) Marriage as Beneficial Factor Marriage has been argued to produce benefits for individuals in at least three basic ways (Becker 1981; Becker, Landes, and Michael 1977). First, there are wholly external factors that influence the value of marriage regardless of the particular individuals involved. These have their source completely outside the particular relationship of two people. Every married couple enjoys such benefits like, state assign different obligations on the basis of marital status. Secondly, there are marriage-specific benefits and possible costs that develop in a relationship over time. One obvious example is the division of tasks that arises in most married households. To the extent that marriage contributes to the development of such specialization, efficiencies arise. Finally, there are partner-specific benefits that depend on the particular individual and her/his spouse for their value. For

NSOU • GE-SO-11 199 example, sensitivities, tastes, habits, and hobbies are developed over the course of time in a marriage. These unique partner specific features of the relationship depend on the particular combination of personalities involved. (vii) Marriage as Distinct Relationship Marriage generates benefits in various ways that cohabitation cannot. While often similar in terms of the ongoing relationship, the crucial distinctiveness is in its methodological ways of how people enter and exit into a relationship. Importantly, the two differ in reference to whether entry and exit are governed by rituals, rules, and social recognition or not. (viii) Marriage as Public Act Virtually all marriages are formed through a public act involving the mutual exchange of promises before an official authorized to conduct marriages. Entry into a marriage requires a license and some form of procedures. At present, marriages begin with a public ceremony of some type. The costly marriage ceremony has been shown to be an indicator of conformity to conventional marriage and social norms (Kalmijn 2004). The ceremony itself is very crucial as after the wedding, there will be little question about the new status of the couple: they are husband and wife. To all, the practicing of this ritual is significant in making a social and legal recognition of change of status. (ix) Marriage as kind of Identity Beyond its public significance, rituals contribute to the creation of an identity or a sense of presence with something larger than the individual (Durkheim 1915; Gluckman & Gluckman 1977). Wedding ceremonies, anniversaries, or other ceremonies teach individuals that "this is the way our family is" (Wolin & Bennett 1984). To the extent the collective sense of identity is important to individuals, an incentive to maintain it is created. (x) Divorce as Legal Domestic Regulation Nevertheless, the rate of divorce is too high at present, divorce is the most obvious legal distinction between marriage and cohabitation. It is also the most important differences by itself. In law, divorce is the most crucial component of regulation of domestic relations. Divorce laws are a legal form of insurance that

200 NSOU • GE-SO-11 safeguards the interests of children and the adults involved (Scott 2000). By getting married, each partner consents to important limits on their future behaviours and claims on some sort of property. There are rules about property distribution, claims on retirement benefits and the value of less tangible property such as professional degrees. There are also rules about future support requiring the valuation of compensatory payments, 'spouse support' etc. This cannot be said about the cohabitational events. 12.8 Summary We can conclude that if comparable social norms emerge, then cohabitation would be indistinguishable from marriage. In that case marriage would become less important. The current evident shows that the legal changes are happening much slower than the behavioural changes. A tendency to cohabiting is growing more popular, while legal effort to regulate it is developing much slower. And there is little to suggest that social norms are developing about cohabiting relationships. For the foreseeable future, therefore, we should expect to see marriage grow in importance of the increase in cohabitation. 12.9 Questions G-A (5 Marks each) (i) What is family of procreation ? (ii) What is family of orientation ? (iii) What are community benefits of family ? (iv) What is socialization ? (v) Do you think there is any justification of getting conventional marriage in modern times ? (vi) Point out the interconnectedness of family and marriage. (vii) Explain your opinion about the validity of family importance in such ever- changing human society.

NSOU • GE-SO-11 201 G-B (10 Marks each) (viii) Evaluate your conceptual clarity about the necessity of maintaining kinship ties in such a diverse life course. (ix) Why marriage is still important to maintain social solidarity ? (x) Explain briefly about the importance of kinship ties in modern society. (xi) What is the relationship between marriage and kinship system ? 12.10 Suggested Readings (i) Al-Haj, Majid. Unit - 13 □ Varna, Caste and Jati : Changing Dimensions Structure 13.1 Objectives 13.2 Introduction 13.3 Essential Features of Varna 13.4 Varna and Social Organisation 13.5 Essential Features of Caste 13.6 Theories of the origin of Caste 13.7 Merits and Demerits of Castes 13.8 Caste Relations and Village unity 13.9 Dominant Caste 13.10 Caste and Varna 13.11 Caste system and its changing dimension 13.12 Summary 13.13 Questions 13.14 Suggested Readings 13.1 Objectives

- To understand the caste system, its meaning and characteristics
- To identify the difference between jati and varna and caste and class
- To explain the jajmani system and the dominant caste

13.2 Introduction Varna and Caste, both are the foundation of ancient Hindu social structure as well as the major forms of social stratification in ancient Indian society. As Dube 205

206 NSOU • GE-SO-11 (2001: 5 – 6) has observed that Indian history has experienced a long encounter between Aryans and non-Aryans (earlier inhabitants of the land). Aryans were basically racist as they regarded themselves superior and maintained distance from the earlier inhabitants of India.

100%**MATCHING BLOCK 39/115****W**

Aryans were divided into three groups – the Rajanya (Warriors and the aristocracy), the Brahman (priests) and the Vaishya (Cultivators).

Shudras were the fourth varna who were outside the Aryan group. The word 'Caste' is of the Spanish and Portuguese origin. The Spanish word 'Caste' means lineage or race. The word 'Caste' is derived from the Latin word 'Castus' which means pure. The term caste was not used in Indian situation till the 17th century. It was first used by the Portuguese to denote Indian situation of endogamous groups which in Sanskrit were called 'Jatis' (Rao 2004 : 190 ; Bhattacharyya 2014 : 338). Ghurye (2000 : 176) has mentioned that, "Later on the word Jati is specialized to denote caste, which in a group, the membership of which is acquired by birth. The word Jati etymologically means 'something into which one is born'. It is occasionally used by good ancient authorities as equivalent to Varna." The villagers throughout India, maintain their primary identity as the members of a particular group to which their parents and other relatives belong. Each person is a member of this group by virtue of his birth into it and he will marry within it. The people of each endogenous group follow certain types of behaviour and they have a specialized occupation. According to their occupation the group is ranked in the local hierarchy. Members of one group keep distance from those of other group especially lower groups. The term 'Jati' is used for the endogenous group. This word is very common in several languages of northern India. By definition, Jati is an endogenous, hereditary social group. Each member of a Jati is expected to act according as his Jati attributes and enjoys the Status of his Jati in the social hierarchy of a village locality in India. Everyone is a member of his village and of his Jati (Mandelbaum 1989 : 13–15).

13.3 Essential Features of Varna An Indian carries several identities such as religion, place of residence, family name, jati, gotra, kula, varna and so on. According to Dube (2001 : 48), "In the Hindu social system, Varna is only a reference category : it is not a functioning unit of social structure, and only refers broadly to the ascribed status of different Jatis. It is also a classificatory device. Several Jatis with similar ascribed ritual status are clustered together in four groups namely Brahman, Kshatriya, Vaishya, Sudra and NSOU • GE-SO-11 207 hierarchically ranked. These four groups are four Varnas. Varna categories have limited uses in social system. They provide a rough and ready indicator of ascribed status, specialized functions in some areas of social life and expectations of standards of behaviour and conduct. Hindu mythological stories narrate that the Brahman has

85%**MATCHING BLOCK 41/115****W**

been born from the mouth of the creator, the Kshatriya from the arms, the Vaishya from the thighs and the Sudra from the feet.

This is a symbolic representation of the rank and functions of the four Varnas. The head, the arms, the thighs and the feet are ranked as descending order in a human body. The Brahmins enjoy highest position and the functions of acquiring and disseminating knowledge and performing sacrifices are associated with them. The Kshatriyas are in second position in Varna hierarchy and their assigned functions are military, administration and government. The Vaishyas are in third position in Varna - ladder and are involved in agriculture, trade and commerce. Finally the Sudras, ranked the lowest, serve all the dwijas or higher three castes through their crafts and labour (ibid : 50 – 51). Another point of view believes that the word 'Varna' denotes the Aryans and the Non-Aryans referring to their fair and dark complexion respectively as the word 'Varna' means colour. Later these two classes have come to be regularly described as Varnas. Four different colours are assigned to the four classes by which their members are distinguished. The colour associated with the Brahmins is white, with the Kshatriyas is red, with the Vaishyas is yellow and black is with the Sudras. Some sociologists believe that colour distinction is associated with race while others opined that the colour has a ritual significance not racial. In vedic period Varna was not in hierarchical order. It was the division of labour in society. In Brahmanic period (230 B.C to 700 A.D.), the four Varnas were arranged hierarchically with the Brahmins are at the top and the Sudras are at the bottom. It is to be mentioned here that only two Varnas are mentioned in the Rigveda – Aryavarna and Dasavarna. In Rigveda, the description of the division of society is found into three orders namely Brahma (priests), Kshatra (warriors) and Vis (common people). There is no mention of fourth group or Sudras (Ahuja 2006 : 232 – 233). 13.4 Varna and Social Organisation The first three categories of Varna system namely Brahman, Kshatriya and Vaishya belong to upper three levels in varna hierarchy and are considered as 'Dwijia' or 'twice-born' group. In addition to biological birth they are believed to have been

208 NSOU • GE-SO-11 born second time after initiation ceremony or Upanayan which permits them to wear the sacred thread. They are now entitled to go through the sacred books. But the fourth groups, the Sudras, are neither entitled to the initiation rites, nor twice-born status (ibid : 6; Kuppuswamy 1984 : 173). The philosophic doctrine of ancient India identified three 'gunas' or inherent qualities of human beings. These 'gunas' were 'satta', 'rajas' and 'tamas'. 'Satta' was characterized by noble thoughts and deeds, goodness and virtue, truth and wisdom while 'rajas' was characterized by high-living and luxury, passion, and some indulgence, pride, and Valour. The last 'guna', 'tamas' was characterized by coarseness and dullness, over-indulgence without taste, the capacity to carryout heavy work without much imagination. 'Satta' qualities were attached with brahmans, 'rajas' were attached with Kshatriyas and vaishyas, and the last quality 'tamas' were attached with sudras (Dube 2001 : 51). Kuppuswamy (1984 : 171-172) has mentioned that the entire Hindu social organization is based on two fundamental concept – one is natural endowment of man and the other is nurture and upbringing of man. Natural endowment fixes the position of man in society namely Varna dharma. Dharma indicates duties. Each varna has its separate duties and distinctive ways of life. The dharma of men of high birth is not same for the men of low birth. The dharma of the student is not same for the old man (Kar 2009 : 132). Men have to perform 'Ashrama Dharma' during their phase of upbringing 'Ashrama Dharma' refers to four stages of life – 'Brahmacharya' or student stage – men acquire knowledge and prepare themselves for future duties; 'Gruhastha Ashrama' or householder stage – men fulfil their economic obligations towards their families and enjoy married life; 'Vanprastha Ashram' - by giving up their household duties men enjoy retired life into a forest hermitage; 'Sanyasa Ashrama' - is the last stage of life when men devote themselves fully to achieve ultimate aim of 'moksha' or liberation. In second stage of ashrama dharma, people take occupation according to their jati within Varna structure. Varna dharma and Ashram dharma are jointly mentioned as 'Varna Ashrama Vyavastha' which is recognised as the foundation of Indian social organization (Kuppuswamy 1984 : 172). In short, it can be said that upper three varnas – Brahman, Kshatriyas and Vaishyas – are the elites of society. Brahmins devote themselves to study, teaching and the performance of sacrificial rites and constitute the intellectual elite. The rulers and warriors of olden days, the Kshatriyas, are statesmen the and politician modern of times. These groups may be called as political elite. Vaishyas

NSOU • GE-SO-11 209 may be recognized as economic elite. The fourth group or Sudras comprises the working class (Kuppuswamy 1984 : 172). But the fourth group are not involved in non-polluting occupations. Society needs various functions from priesthood to scavenging. Outside the four-fold vertical varna structure, a group of people live in society who are known as 'Antyaja'. Their ethnic status is very low and their occupations are so degraded and polluting that any physical contact with them is prohibited for the twice-born and the Shudra. These 'Antyajas' are also known as 'Avarna' and 'Pancham' as they do not belong to four-fold varna structure (Dube 2001 : 6, 49; Kuppuswamy 1984 : 175). The untouchables comprise a number of distinct groups who form the strata of Hindu society and are mentioned as untouchables by the higher caste lowest Hindus throughout centuries. They are called differently in different parts of the country – such as outcastes, untouchables, pariahs, panchamas, avarnas, antyajas, atishudras, namashudras etc. Their social disabilities are specific, severe and numerous. Their touch, shadow and

87%**MATCHING BLOCK 42/115****W**

even voice are considered by the caste Hindus to be polluting. They

are forbidden to keep certain animals, to use certain metals for ornaments, are obliged

60%**MATCHING BLOCK 43/115****W**

to wear a particular type of dress and are forced to live dirty and unhygienic in the outskirts of

villages and towns. They are prohibited to enter any public places like schools, temples etc. and to use any sources of drinking water. As they are illiterate, all public services including police and military forces are closed to them. Naturally they are born as untouchables, live as untouchables and also die as untouchables. This situation has been continued till 1950. The Indian constitution adopted in 1950 has totally abolished untouchability (Keer 2005 : 1–2). The caste system is one of the basic pillars of Indian social structure. Castes are also found in some other parts of the world such as Ancient Egypt, Rome, Japan, Burma, Persia. At present, some countries Burma, Somali, have such systems resembling caste system. But caste system in India has some specific characteristics which are not common in other parts of the world (Rao 2004 : 189). 13.5 Essential Features of Caste Main characteristics of caste system are as follows – (i) Segmental Division of Society The caste group is not a homogeneous group. The membership of any caste 210 NSOU • GE-SO-11 group is determined by birth and the status of any person depends on his luck of being born in that particular caste group. In other words, in a caste-based society, a person enjoys ascribed status. A caste group has its own council i.e. 'Caste Panchayat' which controls the conducts and guides the morals of its members. According to Ghurye (ibid : 3) it is not clear as to how does the caste-panchayat manage their affairs but in the case of Brahmins of Southern India, an epigraphic record shows that if any occasion arises then a special meeting of the members of the

53%**MATCHING BLOCK 44/115****W**

caste is convened. Some of the offences dealt with are : (a) eating, drinking or having similar dealings with those persons where such social intercourse is forbid- den; (b) keeping a woman of another caste

as concubine; (c) adultery with a married woman; (d) fornication ; (e)

71%**MATCHING BLOCK 45/115****W**

refusing to maintain a wife ; (f) non-payment of debt ; (g) petty assault ; (h) breaches of the customs of the trade peculiar to the caste ; (i) encroaching on another's clientele, and raising or lowering prices ; (j) killing cow or other forbidden animals ; (k) insulting a Brahmin ; (l) defying the customs of the caste regarding feasts, etc. during marriage and other ceremonies. It

is to be noted here that some of the offences in the above list are usually dealt by the state in its Judicial capacity. Hence, caste is such a group with separate arrangement which tries to show justice to its members. The punishments which are decided in caste-council are as follows: (a) out- casting (either temporary or permanent); (b) fines ; (c) feasts to be given to the caste men; (d) Corporal punishment (e) sometimes religious expiation. In caste-bound society, caste-feeling supersedes community-feeling and people owe moral alle- giances to their castes first. Further, each caste has its own way of life, customs, traditions, practices and rituals, informal rules, regulations and procedures. Many of the castes have their special deities. The customs related to marriage and death vary widely among different castes. Caste-feelings and cultural differences among the castes bring out the segmental division of society (ibid : 4–5 ; Rao 2004 : 191). (ii) Hierarchy One of the principal characteristics of the caste-group is a hierarchical order in social scale, Normally Brahmin varna group stands in upper positions than the castes of other varna categories. But there is no uniformity regarding the hierarchical position amongst the caste groups. It varies from region to region and even from locality to locality. In Bisipara village, the washer men are ranked among the clean caste groups, but in a neighbouring territory, in the same district of Orissa, they are regarded as untouchable (Ghurye 2000 : 6 ; Mandelbaum 1989 : 330).

NSOU • GE-SO-11 211 (iii) Restrictions on Feeding and Social Intercourse There are minute rules regarding the acceptance of food and drink from other castes. But there are great diversity in this matter all over India. In Hindustan proper, castes are divided into five groups; first, the twice-born castes; second, those castes who are allowed to provide 'Pakka' food to twice-born castes; third, those castes who are not allowed to provide any kind of food except water; fourth, castes of this group are not untouchable but twice-born castes do not accept water from this group; fifth, all untouchable castes belong to this group (Ghurye 2000 : 7). The position of untouchable caste is varied from one place to another. The rules are more rigid in South India than North India. "In the Maratha country, the shadow of an untouchable is sufficient, if it falls on a member of a higher caste to pollute him" (Ghurye 2000 : 9). In Madras, especially in Malabar, certain castes always maintain a stated distance between themselves and the other higher castes. Similarly in Kerala, a Tiyan maintains a distance of thirty-six steps between himself and a Brahmin while a Pulyan has to maintain a distance of ninety-six paces. Rules are also varied in respect of caste hierarchy.

W

bodies cast too long a shadow, which falling on a member of the higher castes- especially Brahmin – defiles him. ”

Further he has mentioned (ibid : 11 – 15) lots of examples, all over India, where untouchables are debarred from their natural rights. On the other hand, there are some instances where lower castes also protest the entry of higher castes especially Brahmins in their quarters. For example, Paraiyant, who are not allowed to enter the Brahmin quarters, will not allow Brahmins to pass through their street. Similarly, Brahmins in Mysore cannot pass through the Holeya (Untouchables) quarters of a village. (v) Lack of Unrestricted Choice of Occupation Occupations are heredity in caste-ridden society. Some occupations are regarded superior and sacred and some occupations are considered as degrading and inferior. Each caste has its own specific occupations and caste members are expected to continue the same occupations. Priesthood, teaching etc. are prestigious professions and the Brahmins involve themselves in these occupations. No non-Brahmin is allowed to be a priest. No caste allows its members to be a priest. No caste allows its members to accept any degrading or impure tasks. Ghurye (ibid : 16) has opined that “

94%

MATCHING BLOCK 53/115

W

It was not only the moral restraint and the social check of one’s caste-fellows that acted as a restraint on the choice of one’s occupations, but also the restrictions put by other castes, which did not allow members other than those of their own castes to follow their callings.”

Some occupations are considered degrading such as washing clothes, barbering, pottery etc. Some occupations are considered as impure such as shoe-making, curing hides, scavenging etc. Some occupations are open to all caste such as agriculture, trade, labouring in the field, doing military service etc. (vi) Restrictions on Marriage Caste groups are divided into different sub-caste groups and each of these sub- caste groups is an endogamous group. Endogamy is such a rule of marriage when a man has to marry a woman within his own group. Some sociologists believe that endogamy is the essence of the caste system. Exception of this rule of endogamy is seen in some places of India. In some parts of Punjab (Specially in hills) Hyper gamy is practised; i.e. a boy from upper caste can marry a girl from lower caste. Inter-caste marriage is allowed in some of the artisan castes of Malabar. But there are lots of examples where endogamy is strictly maintained specially amongst the Brahmins (ibid : 18).

NSOU • GE-SO-11 213 13.6 Theories of the Origin of Caste Sociologists are not in consensus regarding the question of the origin of caste. Scholars have established their theories regarding it. One of these theories is occupational theory. According to this theory, the castes have originated in different occupations. Where any particular group follows hereditary occupation then it evolves into a caste in course of time. Further, this theory is connected with the idea of purity and impurity. People who perform pure or better and respectable tasks are regarded as superior. People who are engaged in impure or low grade occupations are considered inferior (Rao 2004 : 195–196). Several sociologists have criticised occupational theory. This theory on the one hand cannot explain the differences in social status of various castes who follow some occupation and also ignores the racial and religious factors in the formation of caste system, on the other. Further, some sociologists believe that, the status of castes depends on the degree of purity of blood and the extent of isolation maintained by the groups, not on the superiority or the inferiority of occupations. In fact, it is wrong to consider occupation as the only factor of the birth of caste system (ibid : 196). Another theory of the origin of caste system is racial theory. The main argument of this theory is that racial differences are the main cause of the emergence of caste system. This theory has been presented by eminent anthropologists. Ghurye (2000 : 172) has mentioned that the Aryans, who have come to India from outside, are fair complexioned with prominent noses. They have defeated the original inhabitants of India or natives. These natives are dark in complexion with snub nose. The Aryans do not allow non-Aryans to participate in their religious activities and also keep distance from any type of social communication. As a result, caste system has gradually been emerged. The racial theory has also been criticized. This theory cannot explain the practice of untouchability. According to racial theory, Brahminical influence plays a vital role in the emergence of caste system. But the Brahminical influence is not uniformly found in all the places. Further it is very much dominant in few areas while it is virtually absent in a few other areas. Racial theory highlights on racial factor only and ignores other important factors (Rao : 2004 : 197). The functional theory of social stratification states that any form of stratification has its own function in society. As a form of social stratification caste fulfils certain functions. British ethnographer Hutton (1961, cited in Ahuja 2006 : 283-284) has

214 NSOU • GE-SO-11 mentioned the functions of caste from three points view : (i) from the point of view of an individual, (ii)

61%

MATCHING BLOCK 54/115

W

from the point of view of caste as a unit, (iii) from the point of view of

society at large. Caste provides an individual a fixed social status in society. One's choice in marriage, selection of friends, food-habits, family-customs, rituals, practices are determined by caste. Caste also provides occupational and social security. In the time of crisis and difficulties, members of a caste always support their fellows. Each caste has its own culture i.e. its own norms, values, beliefs, practices, way of life etc. which it wants to preserve and to transmit to the next generation. Caste also transmits the specialized skills, knowledge, those are closely associated with the hereditary occupations of the caste. Caste is the basis of Hindu social organisation. The main functions of the caste towards the society are – (a) Caste provides the basis of social order. In traditional Indian society, members always try to identify themselves with caste system. Caste system has provided a mutual support. Further caste system is also an established system of division of labour. Different tasks of society are assigned to different castes. Max Weber (1968, cited in Ritzer 2000 : 231) has focused on property, power and prestige as three bases of social stratification. Prestige differences generate status group in society. Society ascribe honour on some people, either propertied or property less, and these people form status group. The caste group in India is an example of status group. 13.7 Merits and Demerits of Castes Several sociologists have mentioned that Indian caste-system has its own merits and demerits, Rao (2004 : 210 – 213) has pointed out following merits and demerits of caste system – On the basis of division of occupation, caste represents the harmonious division of society. As occupations are hereditary in caste-based society, each caste provides necessary training and guidance for its members to continue caste-based occupation. Occupational skills and knowledge are imparted to younger generation in an informal manner. People get occupational security in caste-based society. Members of a caste support each-other in times of crises. Castes have specific ways of lives. The new born babies of the castes are socialized in accordance with caste rules, practices and customs. The customs, practices, rituals, ceremonies, festivals in Hindu society varied and are preserved through the practices of different castes. Caste

NSOU • GE-SO-11 215 regulates its members' socio-economic as well as moral life. Some noble qualities such as mutual co-operation, sacrifice service etc. are encouraged by caste group. Along with these merits, caste system also has some demerits. Perhaps the most disgusting demerit of caste is untouchability. It is unjust and inhuman. Caste system encourages caste members to be more loyal to their caste than nation. Thus it prevents to develop national consciousness among the people. Sometimes members of different castes are involved in conflict with the members of other castes. Caste- conflict may hamper social unity and progress. Castes put limitations on occupational choice. Talents of low-caste people are suppressed by caste system. Development of individual personality is curbed by caste system. Finally, domination of the upper castes encourages lower caste people to get converted into other religions like Islam or Christianity. 13.8 Caste Relations and Village Unity Indian villages all through the periods in history have maintained unity and it is believed that the fabric of village life consists of caste and kin groups (Doshi and Jain 2004 : 79). In traditional Indian villages caste system has always played an important role in village social system and in economic system as well. Village economic system is regulated through jajmani system which is based on caste relations. It is also an inter-familial relationship. In traditional India, each caste has a specific occupation. Members of a village exchange services between themselves. Originally the term jajmani refers to the client for whom a Brahmin priest performs rituals but later this term has been used to refer a patron or a recipient of specialized services or goods. Generally, a high caste, land owing family receives goods / services from various castes like carpenters blacksmiths, washer men, barbers, sweepers etc. Servicing castes are paid in cash or kind (grain fodder, milk or milk products clothes etc.). Servicing castes receive extra payment or gift in any ceremonial occasions of jajman's house and time of harvest or receive loan or donation from jajmans if they are in needs (Ahuja 2006: 322 – 324; Mandelbaum 1989: 161 – 169) 13.9 Dominant Caste M. N. Srinivas, a renowned sociologist, has studied Rampura Village which is not far away from the city Mysore in the state of Karnataka. Another concept of caste that is 'dominant caste' has emerged from his study. Srinivas (1976, cited in Doshi

216 NSOU • GE-SO-11 and Jain 2004 : 72) has defined the concept of dominant caste in 1955 as – a caste that occupies a high position in caste hierarchy and also wields economic and political power. According to him, even in the traditional society, the caste which has acquired economic and political power is also able to improve its ritual status. He (ibid :73) has revised his definition in 1966 and has stated that, to be a dominant caste, it should own a sizeable amount of the arable land locally available, must have strength

in numbers and should occupy a high place in the local hierarchy. On the basis of the above definition, some characteristics of the dominant caste are found. Firstly, size of land indicates class position. Larger amount of land and adequate irrigation facilities increase agricultural income. Larger land owning caste provides jobs to landless or marginal peasants. Like Srinivas, Y. Singh (1994, cited in Doshi and Jain 2004 : 74) has mentioned that superior economic status is the basic determinant of dominant caste. Brahmins and Okkaliga are dominant castes in the South Indian villages. Rajputs in Uttar Pradesh and Gujrat control major portion of the land and the degree of dominance of those castes in respective villages are high. It has been found that Lingayat and Okkaliga in Mysore villages; Reddy and Kamma in Andhra Pradesh; Gounder, Padayachi and Mudaliar in Tamilnadu; Nayar in Kerala; Maratha in Maharashtra; Patidar in Gujratl Rajput, Jat, Giyar, Ahir are dominant castes in North India. These castes have also acquired the benefits of modern education and hold different jobs in urban areas. With strong economic position they have also captured political power in Panchayati Raj system. Second, high rank in caste hierarchy is a mark of dominance. Traditionally, it has been found that land-owing castes belong to higher position in caste-ladder and they capture political power too. But the situation has been changing as the reservations in favour of scheduled castes, scheduled tribes, woman have put new attribute to the concept of dominance (Doshi and Jain 2004 : 75). Third, the numerical strength of a caste becomes an important factor of dominance because number of votes select a candidate in election. Sometimes dominance of one caste extends to other villages (ibid : 75). A number of criticisms are linked with the idea of dominant caste at least as posed by Srinivas. Land reforms, such as land ceiling and abolition of Jamindari and Jagirdari, have ceased the 'land-holding' to be a determinant factor of dominant- caste. Now-a-days political power is more important determinant factor than land-holding. Thus, numerical support becomes more important than land-holding and numerical strength of a caste takes place in size of land-holding. But some sociologists hold that some castes (like Lodha or Pasi) are numerically largest caste

NSOU • GE-SO-11 217 in a village but not a dominant caste. Authority and importance are attached with some upper castes in Indian social system. However, after a long period of independence and due to several changes in society, some politically dominant groups have started to exercise influence on the villagers (ibid : 76 – 79). 13.10 Caste and Varna Varna and Caste – both are important systems in traditional Hindu social structure. But very often one is used interchangeably to mean the other. Though there are some similarities between Varna and Caste, such as both the systems are hierarchical in nature and consist of social division of labour, the distinction between the two is also very important in sociology. The main differences between the two are noted below : (a) The hierarchical base of Varna model is same in all over India. There is no variation between one region and another. But caste-hierarchy is not same in all parts of India. One clean occupation may be unclean in another part of India. In fact caste position varies from one region to another (Srinivas 1998 : 3). (b) There are only four varnas viz. Brahman, Khastriya, Vaishya and Sudra. Untouchables are excluded from Varna model. They are regarded as 'Pancham' (or Fifth) in varna model. But castes are innumerable. It is difficult to say the exact number of castes in existing India. It is estimated that there are more than 4,000 castes and sub-castes in India. Untouchables are an integral part of the caste system.

84%

MATCHING BLOCK 55/115

W

They perform certain essential tasks in village. They are village servants, messengers, sweepers and beat drum at village festivals (

ibid : 3 – 4; Rao 2004 : 216). (c) Caste system is based on birth i.e.; membership of caste is determined on the basis of the birth of a person. Varna system is based on occupations. Membership in the varna system is based on one's "guna" which indicates profession. So varna system is open system while caste system is closed system. In other words, varnasystem is less rigid and caste-system is more rigid. In the RigVeda, only two varnas have been mentioned – Aryavarna and Dasavarna and there is a description of the division of society into three orders – Brahma, Kshatra and vis. There are no restrictions regarding matrimonial alliances or commensal or any type of social relations. Society

218 NSOU • GE-SO-11 has passed from the Vedic age to the Brahminial age and varnas are arranged hierarchically (Rao 2004 : 217 ; Ahuja 2006 : 233). (d) According to Karve (1961, cited in Pramanick 1994 : 30 – 31), there are two basic groups in Hindu social structure – Varna and Jati. Jati organisation did exist in India before the advent of the Aryans while varna organisation was associated with the Aryans. Later, varna and caste were interwoven together and formed a elaborate ranking system. Each varna has a number of castes hierarchically arranged. As caste structure differs in regard to internal rank differentiation from one region to another, then it exists micro-structure of Indian society. On the other hand, the varna model has the appearance of a macro-structural phenomenon (Singh 1996 : 162). Further Varna system has the sanction of the religion. Lord Krishna says in Bhagavadgita (Chapter XIV, Sloka 13, cited in Rao 2004 : 217) that He himself had created the four varnas. On the contrary, caste system does not have the sanction of religion (Rao 2004 : 217) (e) Kothari (1995 : 11-12) has opined that varna has a neat and logical structure. In contrast, jati is characteristically ambiguous and has several meanings those indicates various aspects – doctrinal, territorial, economic and occupational, ritual and associational – federal (political). It is difficult to describe caste by any single set of attributes. 13.11 Caste System and its Changing Dimension The caste system, as it exists in India, has been developed through centuries.

Scholars have divided Indian history into four periods. These four periods are – ancient period, medieval period, British period and post-independence period (Ahuja 2006 : 269). Ancient period of Indian history includes Vedic period, Brahminical period, Maurya period, post Maurya period, period of Harsh Vardhana. In Rig-Vedic period varna group was prominent and it was not hereditary but flexible. There are some scholars who believe that caste system was developed in Rig-Vedic period and was not flexible. The end of Rig-Vedic period is popularly known as Brahminical period. The hierarchical system of four varnas was firmly established and caste distinctions become prominent in this stage. In Maurya period, caste system was not allowed to develop as a rigid institution. In post-Maurya period and in Gupta period, Brahminism as well as caste rigidity got its strength (ibid : 269-273).

NSOU • GE-SO-11 219 Medieval period consists of Rajput period (700 – 1200 AD) and Islamic period (1200 – 1757 AD). In Rajput period Indian social system remained unchanged with its rigid caste system. In Islamic period, caste rigidity was continued. Muslim rulers tried to convert people to Islam. Some saints like Kabir, Nanak, Chaitanyadev preached Bhakti cult which denounced caste system. A good number of people accepted them but caste system itself remained rigid (ibid : 273–275). In India, British era was started from 1774 A.D. when Warren Hastings was appointed the first Governor General of India. Some legislative measures were taken by the British Government. They transferred the judicial powers of the caste councils to the civil and the criminal courts. Further some acts like caste Disabilities Removal Act of 1850, Widow Remarriage Act of 1856, the Child Marriage Restraint Act of 1860, the special Marriage Act of 1872 attacked the caste system. Some social reformers in British period also attacked caste-system. The Brahmo Samaj Movement founded by Raja Ram Mohan Roy in 1820 and developed by Devendranath Tagore and Keshav Chandra Sen advocated universal brotherhood of men. They were against caste divisions. Likewise, Prarthana Sabha movement in 1849 in Maharashtra raised voice against caste barriers. The Arya Samaj founded by Swami Dayananda Saraswati in 1875 protested caste restrictions. The Ramakrishna Mission, synthesizer of all religions, believed in the abolition of caste system (Rao 2004 : 201 ; Ahuja 2006 : 276). With the advent of British rule, new industries, occupations, employment opportunities salary-based service system have been established in India. As a result, traditional caste-based occupation came to be changed. New industries destroyed the old crafts and household industries. New communication system helped trade and commerce. Jajmani system i.e., interdependence of different castes started to be declined. Industrialization led to urbanization which released the commensal taboos. In post – independence period, besides industrialization and urbanization, some important factors such as modern education, new laws, growth of market economy, socio-religious reform movements played vital role for relaxation of caste rigidity (Rao 2004: 203 205; Ahuja 2006: 279 – 282). 13.12 Summary Caste is a special form of social stratification found in India. It is characterized by its segmental division, hierarchy, endogamy, fixity on occupation, cultural difference, concept of purity and pollution, ascribed status and absence of vertical

220 NSOU • GE-SO-11 mobility. Caste is religious in nature while class is economic. The dependence among the castes have been given the name of ‘ Jajmani System’, under which each group within a village is expected to give certain standardised services to the other castes.

222 NSOU • GE-SO-11 Unit - 14 □ Bourgeoisie, Working Class and Middle Classes Structure 14.1 Objectives 14.2 Introduction 14.3 The Concept of Class 14.4 Class : Marxian Concept 14.5 Class : Weber's analysis 14.6 Emergence of Indian Bourgeoisie 14.7 Working class in India 14.8 Condition of the Workers 14.9 Middle Class 14.10 Summary 14.11 Questions 14.12 Suggested Readings 14.1 Objectives • To understand concepts like Bourgeoisie, Working class and Middle class • To understand class structure that is prevalent today • To assess the implications of class structure in everyday life 14.2 Introduction For Marx, the analysis of social class, class structures and changes in those structures are key to understanding capitalism and other social systems or modes of production. In the Communist Manifesto Marx and Engels comment that the history of all hitherto existing society is the history of class struggles. (Bottomore, p. 75) 222

NSOU • GE-SO-11 223 Analysis of class divisions and struggles is especially important in developing an understanding of the nature of capitalism. For Marx, classes are defined and structured by the relations concerning (i) work and labour and (ii) ownership or possession of property and the means of production. These economic factors more fully govern social relationships in capitalism than they did in earlier societies. While earlier societies contained various strata or groupings which might be considered classes, these may have been strata or elites that were not based solely on economic factors – e.g., priesthood, knights, or military elite. 2.1 14.3 The Concept of Class Societies are divided into various hierarchical groups. One of these hierarchical groups is class which is different from caste. Bourgeoisie, working class and middle class are such categories which belong to social class. Social class is a category or group of persons having a definite status in society. The relative position of the class in social scale arises from the degree of prestige attached to the status. Thus the prestige of ruling class is superior to that of non-ruling class. Power, wealth etc. are important criteria for the enjoyment of higher prestige in society. More specifically, an individual's class is not given at birth; it is some part achieved. Class depends on economic differences between groups or individuals that is inequalities in the possession of material resources. In other words, wealth denotes class position. It is not established by religious provisions unlike castes in Indian society. In class-based society, mobility is more flexible than other types of stratification system. There are no formal restrictions on intermarriage between people of different classes (Gisbert 2004 : 367; Giddens 2001 : 282-283). Generally it is believed that caste and class are polar opposite to each other. Caste is considered a feature of a traditional society like India which is a system based on ascription. In contrast, class is considered a feature of industrially advanced achievement-based western society. In class-based society, an individual has freedom to move up in the social hierarchy (Sharma 2002 : 55). Caste and class – are two phenomena of social stratification which offer many features common in respect of origin, development and function. Some scholars like Maclver and Page (2006 : 348 – 349) do not define class strictly in the economic sense. They have included 'status' with class and call it social class. According to them a portion of a community differs from the rest on the basis of social status. Social intercourse is limited by the distinctions between higher and lower. Occupational distinctions, income level,

224 NSOU • GE-SO-11 distinctions of birth, race and education are associated with social status. They have also mentioned that the identification of social class with economic division is sociologically inadequate. Sharma (2002 : 80) has opined that caste and class are not polar opposites. In fact both are inseparable parts of India's social formation. Beteille's (cited in Kuppuswamy1984 : 348) study has revealed that class hierarchy is positively correlated with caste hierarchy. Landowners are largely Brahmins. The tenants are the middle caste non-Brahmins and the agricultural labourers are the lower castes, the Harijans. As village economy is based on agriculture, the ownership of land gives rise to an agrarian class structure. Landowners mainly belong to upper class; middle class consists of the tenants who take the land on lease for cultivation from the landlords; lower class comprises of landless labourers who are employed on a daily wage basis by the landlords or the tenants. Besides, there are artisans and service castes in the traditional villages. They have formed middle class or lower middle class. After independence the class structure in villages has been greatly modified by legislation and market forces. The land tenure legislation has provided security to the tenant. As a result non-Brahmin tenants have become powerful. Further the land- ceilings in1961 is a severe blow to the landowners (Kuppuswamy1984 : 348 – 349). Modern formation of agrarian class structure was a result of British rule in India. Pre-British India did not experience the private ownership on arable land (Desai 1982 : 9). The British introduced a different type of economic and administrative system in India. Land came under private ownership. New social classes namely 'Zamindars', 'tenants', 'intermediaries' were grew. New land revenue system gradually led to the commercialization of agriculture (ibid : 38-43). New social classes as industrialists and proletariats were also emerged during British rule (ibid: 175). Focused on Europe, during Middle Ages feudal lords or landed gentry were at the top of class-structure and serfs were at the bottom level. Between these two classes, there were soldiers, artisans and so on. Artisans plied their trade for the others. The artisans and the small tradesmen became powerful in towns during eleventh century. These towns were not controlled by the land lords. These townsmen organised themselves under guilds. There were also lawyers, doctors, financiers (mostly Jews) who constituted high class in towns. The bourgeoisie of the 18th and the 19th centuries were the direct successor of the town's workers and artisans. These bourgeoisie fought for political rights and succeeded in the French Revolution (1789). In England, the bourgeoisie gained similar position of respectability through a series of parliamentary reforms. But simultaneously a powerful change took place in England and Europe which caused the emergence of two distinct classes in

NSOU • GE-SO-11 225 society. That powerful change was 'Industrial Revolution' and the two distinct classes were the 'Bourgeoisie' and the 'Proletariat' (Gisbert2004 : 370). 14.4 Class : Marxian Concept The words 'Bourgeoisie' and 'Proletariat' are frequently used by the German thinkers Marx and Engels (cited in McLellan1980 : 44-45). Marx's famous work The Communist Manifesto is divided into four sections. The first section depicts a history of class-based society where the victory of proletariats over the bourgeoisie is inevitable. The second section describes the position of communists among the proletariats, rejects the objections of bourgeoisie against communists and then characterises the communist revolution, the measures to be taken by the victorious proletariats and the nature of future communist society. The third section contains the criticisms against other types of socialism, reactionaries, petty-bourgeois and utopian socialists. The fourth section describes the communist tactics towards oppositions and finishes with an appeal to unite proletariats. The entire book has described the struggle of oppressed against their oppressors. Marx and Engels (cited in ibid) have opined that the class antagonism has been simplified in present age. Two hostile camps are now facing each other – bourgeoisie and proletariat. The bourgeoisie is originated in feudal society; is helped by the market economy and modern industry; imposes its domination on society. Bourgeoisie needs continuous improvement of technologies of means of production for its survival. Marx and Engels (cited in ibid : 46) have described the revolutionary nature of the proletariat. They have to go through several stages. Their first aim is to restore the vanished status of workmen in the middle ages. They will begin to form trade unions as they grow in number and finally their class struggle will become political struggle. The lower strata of the middle class – the small trades' people, shopkeepers, retired tradesmen, handicraftsmen, peasants – all these sink gradually into proletariat. Proletariats are organised themselves as a class for the fight against bourgeoisie. Class of proletariat becomes a means of revolution. Like proletariats bourgeoisie also form class by force of circumstances. Their class is an organised power to oppress others. In capitalist society, bourgeoisie are the owners of means of production, employers of proletariats or wage labourers. In contrast proletariats have no means of production and they live by selling their labour (ibid : 48). Marx (cited in ibid : 179-181) has also used the term 'class' to refer petty- bourgeoisie and

226 NSOU • GE-SO-11 peasants. He has also noticed the advent of new middle class who are constantly growing in number for increased use of machinery and the multiplication of service industries. There are some other groups in society such as farm-labourers, intelligentsia and so on. Marx has applied the term proletariat to the industrial workers in capitalist society, but sometimes he says that proletariat comprises the vast majority of people in capitalist society. Another intermediate group is found in society. This group is intelligentsia. Marx (cited in ibid) has referred them as the 'ideological representatives and spokesmen' of the bourgeoisie. These intelligentsia are also the paid wage- labourers of the bourgeoisie though they are different from that of the proletariats. Thus class-structure is a complex system. Lower middle-class, middle-class, upper- middle-class are separate class. Similarly, industrial capitalists, finance capitalists, business capitalists form different classes. There is also a group of people in society who have actually no historical role to play. They have no definite trade, no home. All types of criminals, vagabonds are included in this group. This group is called lumpen proletariats. 14.5 Class : Weber's Analysis Like Marx, Weber (cited in Haralambos 2005 : 44-45) defines class in terms of economic criterion. According to him class refers to a group of individuals who share similar position in a market economy i.e. they receive similar economic rewards. In other words, similar class situation shares similar life chances. It means one's economic position creates chances of obtaining desirable goods from market such as good quality housing and other things. Weber also argues that the major class division is between those who own the forces of production and those who do not. Thus, those have enough property, are able to enjoy better life-chances. Various skills and services in a given society have different market values. In capitalist society, managers, administrators and professionals are paid relatively high salaries due to the demand of their services. Weber distinguishes class groupings in capitalist society in following ways : (i) The propertied upper class, (ii) The property less white-collar workers, (iii) The petty bourgeoisie, (iv) The manual working class. Weber (ibid) differs from Marxian concept of class in following ways : - firstly,

NSOU • GE-SO-11 227 he has added skill of the property less people in the formation of class. Thus ownership of property and skill of the people are significant in the formation of class. Secondly, he does not support the polarization of class. According to him white collar 'middle-class' expands rather than contracts. Rational bureaucratic administration includes large numbers of administrators and clerical staff. Thirdly he rejects the Marxian view of proletarian revolution. Finally, Weber does not believe that political power is derived from economic power. He argues that class forms one possible basis of power and the distribution of power in society is not necessarily linked to the distribution of class inequalities.

14.6 Emergence of Indian Bourgeoisie Emergence of Indian Bourgeoisie was not alike with the emergence of European Bourgeoisie. When Industrial Revolution took place in England and other countries in Europe, India served to quicken the process of Industrial Revolution to its master country. At the same time the traditional economic pattern of India was disintegrating. Industrial Revolution had two aspects – technical and social. The technical aspects indicated the introduction of machinery and social aspects indicated the emergence of capitalism that is the emergence of bourgeoisie and proletariat. But the development of capitalism in India was a belated process (Sen 1997 : 1–3). The establishment of railways in India during the middle of 19th century, created a condition for the growth of modern industries in India. Cotton mills, a few jute mills and coal mines were the main industries between the years of 1850 and 1855. During 1880, it was estimated that there were 56 cotton mills and 56 coal mines in India. The number of cotton mills increased to 144 in 1894 – 95. The number of coal mines were 123 and jute mills were 29 in the same year. The 'Swadeshi' movement in 1905 gave an impetus to the expansion of Indian industries. In 1913-14, the number of cotton mills rose to 264 and jute mills to 64. Some new industries were established during the years between 1890 and 1914. Those new industries were petroleum, manganese, mica and saltpetre, rice mills, timber mills, engineering and railway workshops, iron and brass industries and so on. Import of foreign goods declined during the war of 1914-18. Indian Industries developed during this phase to meet the demands of war requirements. But above all the rate of growth of Indian industries was insufficient in spite of above development. But that industrialization played a significant role in the life of the Indians. Industrialization made the Indian economy more unified and organized. It gave an impetus for the development of new social classes including bourgeoisie and proletariat (Desai 1982 : 103–124).

228 NSOU • GE-SO-11 The rise and development of the Indian bourgeoisie were related with the expansion of trade, commerce, industry and banking in India. It is to be noted here that the Europeans were also engaged in trade, industry and banking in India. They formed their own organisations either separately or with the Indians according to the nature of economic enterprise. The first European Chamber of Commerce was established at Calcutta in 1834 and at Bombay and Madras in 1836. The first Indian Chamber of Commerce, 'The Bengal National Chamber of Commerce' was started in 1887. The Indian Merchants' Chamber was founded in Bombay in 1907. The Marwari Chamber of Commerce was started at Calcutta in 1900 and the South Indian Chamber of Commerce at Madras in 1909. All these organisations aimed to protect the interests of Indian businessmen. The conflict of interests between the Indian and the European commercial classes was the main cause for the formation of separate organisations of the Indian Commercial classes. The Europeans got favour of the British government in the sphere of trade while the Indian businessmen faced undue restrictions on them. For instance, the British businessmen occupied favourable position in coasted shipping in the country. With the establishment of modern industries, a group of Indian industrialists emerged in society. Like the British businessmen, the British industrialists also got favour of the British government. After 1880, a good number of modern industries developed in India and the industrial bourgeoisie grew in strength. They were conscious regarding their position. They founded a number of organizations to protect their interests and put their demands. The Bombay Mill owners' Association was founded in 1875 and was followed by the Indian Tea Association in 1881; the Indian Jute Mills Association in 1884; the Ahmedabad Mill owners' Association in 1891; the Federation of Indian Chambers of Commerce and Industry in 1927; the Employers Federation of Southern India in 1920; the All-India Organization of Industrial Employers in 1933; the Employers' Federation of India in 1933 and so on. Thus during the period of British rule, a new class that was the class of modern commercial, industrial and financial bourgeoisie was developed in India (ibid : 200-206).

14.7 Working class in India In Europe, capitalism developed over the ruins of feudalism; but India had different experience. The British established modern industries in India and introduction of railways was an important event in the process of formation of modern capitalist state. Modern working class in India emerged with the introduction

NSOU • GE-SO-11 229 of railways. Hundreds of workers were engaged in railway building. Along with railways, coal mining industry was quickly expanded. Railways and shipping lines were the effective means of communication. A number of mercantile enterprises grew to import manufactured goods and to export raw materials. As some new materials needed initial processing before export, enterprises like packing houses, cotton pressing and ginning establishment, rice mills, flour mills etc. were developed. All these industries helped to bring up Indian working class. Meanwhile plantation farming also developed intensively. Contact labourers were engaged in these plantation forms. Their condition was slightly better than slaves. But they were also a part of Indian work-force. Jute industries in Bengal and cotton industries in Maharashtra (Bombay) flourished. Thousands of workers were employed in those industries who increased the numerical strength of Indian work-force. Gradually, Calcutta, Bombay and Madras became the main areas of British investments and these cities also became the centres where Indian labourers developed as an organized class (Sen 1997 : 21-24). In Europe, the artisans and craftsmen were dispossessed of their profession when large scale industries were established, because they could not compete with large manufacturing enterprises. Those artisans and craftsmen were absorbed as labourers in those modern industries. But in India, traditional handicrafts and cottage industries were destroyed in colonial interest. But unlike Europe, modern industries did not grow up in India. Dispossessed artisans and craftsmen were compelled to depend on agriculture as agricultural labourers. A small number of them entered into railways and other industries as industrial workers. But there was a gap of two or three generations that separated destruction of traditional cottage industries and partial replacement by modern industries. Those dispossessed artisans and handicraftsmen lost their age-old technical skill when they entered in the modern industries. They were unskilled and tied with various superstitious habits and customs of agricultural life. They were the subjects of caste-group, racialism and religious superstition of Indian social life. All these factors caused a positive hindrance to develop modern outlook and political consciousness among the Indian workers (ibid : 25 – 27). According to Sen (ibid : 27) not only among Indian workers, these characteristics were common among the workers of colonies and semi-colonies. Further they were severely exploited by the British and Indian bourgeoisie. British recruited workers from among the ruined craftsmen and the poorest strata in the villages. They fixed wages in rural standards which were much below the cost of labour. Indian bourgeoisie exploited their religious beliefs. Indian bourgeoisie

230 NSOU • GE-SO-11 preached reformist ideology, propagated superstitious ideas in the name of Indian tradition and tried to keep Indian working class off the revolutionary struggle. India is a country of diversity. Industrial workers have come from various background of language, culture, religious beliefs, social customs and so on. Mass migration among workers and their settlement in different environment have arisen certain peculiar problems in the formation of the Indian working class and its movement. Migration of workers is a reflection of the growth of capitalism in the country. This migration is an indicator of the process of forming a stable labour market. Some middlemen become active in labour recruitment process in India. They are called by varieties of names in different parts of the country such as jobber, sirdar, mistri, mukaddam, choudhri and so on. The role of these middlemen are very important regarding the context of labour supply in industries. The managerial functions in majority of the industries are performed by the Europeans. Under these circumstances, some sort of communication gap arises between the employers and the labourers. European employers have to depend on these jobbers or middlemen. Sometimes these jobbers manipulate the situation by creating artificial scarcity. On the other hand, the labourers are also exploited by these jobbers. They can hardly avoid the 'dasturi' (commissions) of the jobbers. Workers are often indebted to the jobbers to avoid starvation. It is another source for the jobbers to squeeze workers in terms of interest. Further religions and caste heterogeneity is typical among the Indian proletariats. Uneven development of capitalism in India causes concentration of workers in certain places. Calcutta, Bombay, Ahmedabad, Kanpur, Madras and a few other places are the centres where proletariats are concentrated (Sen 1997: 28- 31; Basu 1993: 44-67).

14.8 Condition of the Workers

Workers maintain their livelihoods by selling their labour. The Capitalists increase their profits by exploiting the workers. To achieve their goals, capitalists depend on certain devices. At first they lengthen the working day. Secondly, they reduce the wages at subsistence level. Further the machines reduce the demand of skilled labourer and hence its price. Thirdly, capitalists make profit by recruiting women, teenagers and children in cheap rate. These groups are more obedient and less capable of resistance. These are the general trends which are applicable to all countries wherever the factory system exists. Naturally India is also included in these trends. Unlike Europe, the first generation of Indian factory workers appear from the

NSOU • GE-SO-11 231 distressed and dispossessed section of the village people. It can be said that probably the hungriest sections of the people have come in industry. It is also found that majority of the workers belong to the lower castes. Obviously, a good number of them are Tanti or weavers who are totally robbed of their hereditary means of livelihood. Considerable number of workers are also distressed Muslims. Some female workers are included among the industrial workers. Majority of them are widow (Basu 1993: 37-39). In Bengal coal mines, Bauris (very low social rank), Santhals (a tribe) and other people of lower caste rank joined in labour force. It was also true in case of immigrant labourers in the coalfields. Another interesting feature of jute mill in Bengal was that Bengali workers were gradually replaced by the workers of Bihar, Uttar Pradesh and Orissa. Bilaspuri and Madrasi were also found among workers in Bengal. Not only the cases of jute-mills, other industries of Bengal like cotton mills, paper-mills, docks, pottery-works were dominated by the immigrant workers. Different views came out to explain this situation. One view said that Bengal demanded more agricultural labourers due to its high fertility. Agricultural wages were relatively attractive and such Bengalis were reluctant to undergo the hardship of factory work. Another view opined that Bengalis were not able to work long hours in the factories as they were physically weak. Some scholars explained that mill-owners preferred non-Bengali workers as non-Bengali workers were more submissive than the Bengalis. Bengali workers, coming from peasant stock, had a tradition of protest like Indigo rebellion (1860), Pabna rising (1873) and so. They were conscious and prone to protest against injustice and exploitation (ibid : 40-43). 2. Generally, it is assumed that Indian working class is primarily agriculturist. Majority of them work as agricultural labourers; they do not have own land. Sometimes they leave mill for a period of time, go back to village and live on their savings which they have earned in mills. Indian factory workers are simply village people. It is found difficult for them to adjust strict discipline of factory works. Workers have to adjust with long hours of strenuous works. They find for escape from factory environment and enjoy by occasional visits to their village home. It is a general trend among Indian factory workers that they are pushed from the villages not are pulled from the towns. Further they are irregular of their attendance, take frequent intervals of leave. This attitude may be explained as a reaction to the extreme hardship and monotony of their working condition (ibid 43-46). Fifteen to sixteen hours working at a stretch is very common practice during the early phase of industrialization in India.

232 NSOU • GE-SO-11 Official report of the Indian Factory Labour Commission (which was appointed in 1908) has revealed the above picture. Condition was worse in the ginning factories. Workers had to work seventeen and eighteen hours a day. Sometimes workers have to work twenty to twenty-two hours in a day in rice mills and flour mills. In printing presses men work twenty-two hours a day for seven consecutive days (Sen 1997: 35-36). Wage statistics reveal a great disparity in wages of different categories of the workers even belonging to the same industry. Children and women are exploited much more than the male workers. Several studies have revealed that the workers are very poorly paid. Majority of the mill-authorities pay weekly or fortnightly. Monthly payment is also made by some mills. Long interval between payments often causes them immense hardship. Workers hardly enjoy their full earnings of the period they worked for. It is a common practice that a portion of the wages are withheld; that as they are paid on the pay day not the wages earned upto that day but upto some previous date. As a result, Indian factory workers have to bear a huge burden of debt. Workers have to borrow money to meet any extra expenditure like marriage, funeral or the time of prolonged illness. Further the housing condition of the workers are very poor. The workers who have come from the villages are compelled to live in slums near by the mills which are not fit for human habitation. These overcrowded dwellings are very harmful for the workers' health. Many of the workers suffer from various diseases. In course of time, some mill owners (obviously large mill owners) have realised building coolie lines will be profitable in the sense that they will demand best labour. But colie lines are insufficient to meet the demand and workers have to pay for these coolie lines. To the mill owners, workers are just means of production. Mill owners ignore the measures for the safety of the workers. Workers of different factories including mines face horrible accidents which cause the loss of their body-parts even lives (Basu 1993: 64-77). It is found that in all sorts of terms (wages, working hours, housing and other conditions of service). Indian workers have reached in extreme point of terrible condition (Sen 1997: 43). Inhuman condition of the workers needed legal safeguard in favour of themselves. But the Factory Acts which were implemented in first phase were helpful to the employers. For example, The Employers' and Workers' (Disputes) Act was passed in 1860. It was implemented first in Bombay and then rest of the country. This Act empowered the employers to fine or imprison the workers on charges of insubordination. Colonial interests were important for the enactment of Indian Factories Acts (ibid : 43-46). The hard condition of life led the workers towards working class movement though class consciousness among the workers developed

NSOU • GE-SO-11 233 much later than the intelligentsia, educated middle class and the bourgeoisie (Desai 1982 : 208). According to Sen (1977 : 66) the Indian working class movement might be divided into four phases. The first phase (1850 – 1900) was the commencement of the working class movement; the second phase (1901-1914) was the formative process of the trade unions; the third phase (1915-1947) was the phase of developing consciousness, organized trade union and political movement of the working class. During this phase workers along with economic struggles, marched forward with the political perspectives of national liberation. Fourth phase began after independence. Independent India accepted socialist orientation for the common good of all. Some legal safeguards were taken for the benefit of the labourers. Some of these legal safe guards were prohibition of child labour, the fixing and implementation of a minimum wage, equal pay for equal work, provisions for sanitation, health and safety at work and so on (Bremen,1999 : 29-30).

14.9 Middle Class Historically, the bourgeoisie comprises the middle-class because they stand in middle that is between the land-owning class and the working class. With the industrial revolution, the bourgeoisie becomes the industrialist and the ruling class of great financiers. A new class emerges between the bourgeoisie and working class. This new class is known as middle-class who are identified by Marx as petty bourgeoisie. The small traders, independent small businessman, the self-employed professional, independent artisan – all these groups are known as middle-class. Within the enterprise, a new group emerges between the employers and workers. They are socially marked as salaried employees and establish their social character in their own consciousness. Some scholars have identified this group as 'new middle class'. Nineteenth and twentieth century have experienced the tremendous growth of salaried employees. Rapid growth of capitalism, expansion of big business, continuous economic development, expansion of bureaucratic activities, rise of modern 'service state' cause the rapid growth of salaried employees that is middle-class. This middle-class has become a topic of scholarly discussion. German left-wing writers have regarded these salaried employees as simply a "white-collar proletariat" whose tendency is towards the adoption of working-class attitudes. Some sociologists conceive this middle-class as a factor of social solidarity who act as a balancing group between the employers and workers. Some scholars believe that these middle- class people will be crushed between the capitalist class and the industrial proletariat.

234 NSOU • GE-SO-11 Another group of scholars has assumed that the future world will be a world of bureaucracy as the number of salaried employees increases rapidly (Bell 1974: 69- 72). A group of persons appeared in Indian society with the introduction of English There was a basic difference between the emergence of new middle class in Western Europe and the emergence of new middle class in India (Kuppuswamy 1984: 362). During 17th century a group of persons emerged as a commercial middle-class. They served Europeans. Some of them were petty clerks, some of them were interpreters while others were Cashiers. Another group of persons namely contractors travelled one

new generation of middle-class professional groups and groups of social reformers emerged. Western education contributed to the growth of this class.

A group of people were involved in writing poems, novels, drama and so on. They followed models and ideologies of the English literature. All these people belonged to middle class (Singh 2004 : 88- 90). education. They were known as intelligentsia.

87%**MATCHING BLOCK 60/115****W**

Raja Ram Mohan Roy and his group were the first group of

Indian intelligentsias. They followed modern as well as western rationalism, democratic doctrines and spirit. In the first decades of 19th Century, the number of educated Indians was small. The British government established many schools, colleges, universities and also private schools were established. As a result, a big class of educated Indians emerged in the second half of 19th century. They joined in various clerical and teaching posts. Simultaneously, they increased the body of Indian intelligentsia. Further, English education caused the emergence of some other persons like lawyers, doctors, technicians, professors, journalists, state servants, clerks and so on. All these persons constituted middle- class. These middle-class as well as intelligentsia played important role to form

a modern nation. They organised various progressive social and religious reform movements in the country.

A group of political elites emerged among these middle- class. They brought ideas of nationalism and freedom. They were the pioneers to spread the ideas of nationalism among the wider sections of Indians. Further great NSOU • GE-SO-11 235 scientists, poets, historians, philosophers, economists, sociologists emerged among these middle-class. They were the makers of modern

65%**MATCHING BLOCK 62/115****W**

India. Outstanding members of Indian intelligentsia founded the first national political organization of the Indian people

in 1885. These groups of Indian intelligentsias were backed up by the Indian bourgeoisie. Thus, the important political organization "Indian National Congress" was formed and the elites of the intelligentsia became its first leaders (Desai 1982: 196-199; Singh 2004: 81). The intelligentsia organized and led the all types of progressive movements in India. They studied the history of peasant movements and the movements of trade unions in other countries. Then they organized and led the peasants and workers of India. It should be mentioned here that the Indian national movement (in all its phases) was led by the intelligentsia though ideology, methodology and programme were different. During the liberal phase, the nationalist movement was led by liberal intellectuals like Gopal Krishna Gokhale, S. Banerjee and others. During its militant phase, the movement was guided by Bal Gangadhar Tilak, Aurobindo Ghose and others. Even the terrorist activities were initiated and led by educated middle-class youths. When nationalist movement turned into mass movement in 20th century, then its credit also went to these English educated Indian intelligentsia (Desai 1982: 197-198). The democratic liberalism and rationalism transformed the cultural pattern of individuals in India. But there were regional variations. The middle class emerged in Bengal, Bombay and Madras provinces at first during British period. There were also communal variations. The Hindu and Christian converts accepted new education and become the members of new middle class at first. Muslims were late in taking up to modern education and stood behind which was one of the chief sources of communal trouble in India. Similarly, among the Hindus, upper castes were the first group of English educated persons. As a result, lower castes failed to raise their status as middle-class. The non-Brahmin leaders realised that by virtue of their education Brahmins monopolized administrative services. So, they claimed reservation of admissions to schools and colleges and also for employment in the administrative services (Kuppuswamy1984: 362). After independence India has accepted reservation for some backward groups. The significant feature is that after more than a century since the emergence of the middle-class in India, middle-class is largely composed of administrative, professional and the clerical people. Finally, a large number of women have entered into the middle-class occupations such as teachers, nurses, telephone operators, sales assistants and others (ibid: 363-364).

236 NSOU • GE-SO-11 14.10 Summary The working class, which is the product of capitalist relations of production, came into being with the industrial revolution and subsequent industrialisation in England in particular and Europe in general. In this relation of production, unlike other epochs, they did not own anything except the labour, which they sold for survival. At the other spectrum, there were capitalists who not only owned all the means of production but also appropriated all the surplus generated out of these relations of production. The working class at the conceptual level seems to be fairly simple, but if one tries to define it, the problem magnifies. The reason is that this is not a homogeneous entity. Rather it is a complex, contradictory and constantly changing entity. Another reason is that the concept of 'class-consciousness', is very slippery with regard to the working class. The consequence of this is that it is often proclaimed that either the working class is shrinking in size or everybody except a few at the top are working class. However, the fact is that working class is a distinct entity, with characteristics of its own. In India, the situation is much more complex because of several reasons like (a) the forced intrusion of British capital in India (b) simultaneous existence of multiple relations of production and (c) never ending identification of working mass with primordial features such as caste, religion and other ethnic divisions of the society. The coming into being and consolidation of the working class in the world as well as in India, has been affected by local and international events of both economic and political nature. So, for carrying out further studies on the working class, these peculiarities have to be taken into account.

14.11 Questions G-A (5 Marks each) (i) What do you mean by bourgeoisie? (ii) Who are proletariats? (iii) Define middle-class. (iv) What do you mean by 'new middle-class'? (v) Discuss the roll of 'jobbers' in Indian industries.

NSOU • GE-SO-11 237 (vi) Write a note on exploitation of Indian workers. (vii) Describe the Weber's view on class. (viii) Describe the role of intelligentsia in Indian society. (ix) 'Indian workers are primarily agriculturist' – explain the view. G-B (10 Marks each) (x) Write a note on the emergence of bourgeoisie and proletariat. (xi) How do Marx and Engels explain bourgeoisie, proletariat, and middle class? (xii) Write a note on Indian bourgeoisie. (xiii) Write a note on Indian middle class. (xiv) Write a note on Indian working class.

240 NSOU • GE-SO-11 15.1 Objectives • To understand the concepts of Scheduled Castes, Tribes and Other Backward Classes • To examine their present day condition and status in society • To learn about the reservation policies initiated by Government of India • To assess the implications and challenges faced by them in everyday life 15.2 Introduction

Scheduled castes are those castes/races in the country that suffer from extreme social, educational and economic backwardness arising out of age-old practice of untouchability and certain others on account of lack of infrastructure facilities and geographical isolation, and who need special consideration for safeguarding their interests and for their accelerated socio-economic development. These communities were notified as Scheduled Castes as per provisions contained in Clause 1 of Article 341 of the Constitution. 15.3 Scheduled Castes : Concept The term 'Scheduled Castes' denotes some castes who belong to the lowest rung in caste ladder. Caste group is the most basic form of Hindu social structure. It is closely connected with the Hindu Philosophy. Caste membership is acquired through birth. One's food habit, dress, occupation, education, family, marriage, morals, manners – everything is regulated by caste rules. Notion of purity and pollution pervades over all aspects of Hindu social life including food, dress, occupation and so on. Each caste occupies a particular rank in the hierarchy of castes. Some castes are superior in terms of their occupations and life-style while others are inferior. There are untouchable castes at the bottom in caste ladder. These groups are associated with unclean occupations such as scavenging and so on and are believed to be polluting. Further, the Hindu society is divided on the basis of 'varna' category. Varna group is divided into four on the basis of division of labour in society. These untouchables are outside of four fold varna group as their occupations are so lower

NSOU • GE-SO-11 241 graded that they are not included in varna group. They are also untouchable by higher caste-Hindus. Mahatma Gandhi, through his weekly 'The Harijan' and his 'Harijan Sevak Sangh' and other organisations has tried to designate these untouchable groups as 'Harijan', meaning 'Children of God'. Men belonging to these groups are often described as 'Dalit'. Some scholars have mentioned that these untouchables are also known as 'broken men' or 'outcastes.' Untouchables are described by the British as 'depressed classes.' Census of 1931 has classified them as exterior caste.' The term 'Scheduled Caste' is coined by the Simon Commission in 1935. This commission has prescribed thirteen tests for including a caste in the scheduled list. Some main tests are : • Whether the caste pollutes high castes by its touch or proximity. • Whether the caste is denied entry into temples. • Whether the caste is denied use of public places like schools, wells etc. • Whether the caste is prohibited priestly service by the Brahmins. • Whether the caste is refused by the servicing castes like barbers, washermen, tailors etc. • Whether the caste is refused by the caste Hindus to accept water. • Whether a well-educated member of the caste gets equal treatment from the high caste-men in ordinary social intercourse. The constitution of the Republic of India has accepted the term 'Scheduled Castes' to denote these people of the lowest strata in society. Some important castes are included in Scheduled Caste list. Some of these Scheduled Castes are – Chuhra, Bhangi, Chamar, Dom, Pasi, Raigar, Mochi, Rajbanshi, Shanani, Thiyan, Paraiyan, Dosadh, Kori and so on. (Sharma 2008: 185 – 187; Dube 2001: 49; Ghurye 2000: 306 – 307; Ahuja 2006 : 364–365). 'Dharma' and 'Karma' – these two notions are invariably associated with the Hindu-Caste organisation. Here 'dharma' refers to duty. It is obligatory for each caste, higher or lower, to perform his hereditary occupation and to follow the norms associated with his caste in relation to other castes. The theory of 'Karma' makes a man to believe that his caste position (that is birth in higher or lower strata) depends on his good or bad deeds of his previous birth. Therefore, he cannot go against his

242 NSOU • GE-SO-11 ascribed position. He can improve his future by performing his 'dharma' i.e. his assigned duties under the caste system. These two notions have made the caste system stagnant. The Brahmins, who belong to top rank in caste-hierarchy, are the rule-makers and prescribers of norms. The prescribed rules and norms for untouchable groups are generally very cruel and humiliating. They have to live on the outskirts of towns and villages (Sharma 2008 : 185–186). Restrictions are imposed on lowest groups of people since the later Vedic age though types of restrictions are varied from time to time and place to place. In some parts of South India, untouchables are not allowed to enter cities when their shadows become long as their shadows may pollute the upper caste people. They are forbidden to use public wells, to enter temples. There are separate drinking water wells for them in the villages. Some exterior castes like Adi-Dravidas are not allowed to wear ornaments of gold and silver; not allowed to cover upper portion of the bodies; not allowed to use umbrellas and sandals; not allowed to have their hair cropped; not allowed to use other than earthen ware vessels in their houses. Further, women are not allowed to use flowers or saffron paste. Violation of these prohibition has led to violent reaction of upper castes against Harijan. Huts, granaries, property of the Harijans have been destroyed. Further the position of depressed castes is not same in all states. In Madhya Pradesh, the same caste has different social rights and disabilities in different districts. Discrimination against depressed castes becomes strong when depressed castes are numerically small. When they are numerically strong then they face comparatively less restrictions. (Ahuja 2006 : 366–367; Srinivas 1998 : 15–16).

15.4 Problems of Scheduled Castes For centuries scheduled castes have been suffering from various social, religious, economic, political and other disabilities. They are socially deprived in many ways: (i) In caste hierarchy scheduled castes have occupied lowest status. They are considered as 'low' and untouchable. Probably two reasons have made them untouchable. First, they are engaged in lowest kinds of occupations such as scavenging, leather work, removal of the carrion etc. Second, they are beef-eater which is a crime to caste-Hindus. Hence, their touch is considered to be polluting for the caste-Hindus. (ii) From the ancient times, people of exterior castes are forbidden from education. Sanskrit education is denied to them. Public schools and other NSOU • GE-SO-11 243 educational institutions were closed for them for a long time. Even today majority of them are not literate. (iii) For a long time, the untouchable castes are not allowed to use public places such as temples, hostels, hotels, schools, hospitals, lecture halls and so on. They are denied to avail civic facilities like village wells and ponds. They are forced to live on outskirts of the towns and villages. In South India, restrictions are imposed on building pattern of houses, types of dress and patterns of their ornament (Rao 2003: 640). Harijans have suffered religiously - (i) they are forbidden to listen or chant the Vedic mantras which are considered to be purer. They are permitted to use the Upanishadic mantras (ii) The Brahmins refuse to perform their priestly services in favour of Harijans. Harijans are not allowed to enter temples in many places (ibid: 605). Harijans are economically exploited by the caste Hindus - (i) For a long time they are the low-paid workers and some of them continue to suffer as bonded labourers (ii) For centuries Harijans have no right of property ownership. It means they are not allowed to have land and business of their own. Recently, Harijans have got property rights. But propertied people are less among them. Majority of them are land-less labourer. (iii) Harijans have limited choice of occupation. Traditionally are they forced to engage in inferior occupations such as curing hides, removing the human wastes, sweeping, scavenging, oil grinding, tanning, shoe-making, leather-works, carrying the dead animals and so on (ibid). Harijans have political disabilities too. In traditional India, they are prohibited to hold public posts. Normally they do not participate in any political matters in traditional India. During the British period they have acquired voting rights for the first time. After independence they have got equal political opportunities with caste Hindus (ibid).

15.5 Abolition of Untouchability and Welfare Measures For centuries, people of depressed classes have faced a great problem i.e. untouchability. Though religious leaders of different ages have tried to remove untouchability still it continues to date. In ancient times Mahavira and Lord Buddha preached against untouchability. Later many thinkers as well as social reformers like Kabirdas, Sant Tukaram, Ramdas, Tulsidas, Guru Nanak, Sri Chaitanya have advocated for removal of caste distinctions and untouchability. During the British rule in the 19th and 20th centuries, a number of social reformers like Iswara Chandra Vidya

244 NSOU • GE-SO-11 Sagar, Jyoti Rao Phule, political leaders like Mahatma Gandhi, B.R. Ambedkar, religious leaders like Swami Vivekananda have played important roles for the removal of untouchability. Finally, after independence, the Constitution of India has abolished untouchability. Article 17 of the Constitution of India states that "

86%

MATCHING BLOCK 74/115

SA

chapter three-origin and development of caste ... (D40662830)

untouchability is abolished and its practice in any form is forbidden. The enforcement of any disability arising out of untouchability shall be an offence punishable in accordance with law" (Rao 2003: 606). Further the constitution of

India has prescribed protection and safeguards for the Scheduled Castes along with Scheduled Tribes and other backward classes. Some important measures in favour of people of backward sections are: religious institutions of public character are open to all sections of people; all Indian citizens including Scheduled Castes can move freely; removal of restrictions on access to shops, restaurants, wells, tanks, roads etc.; Scheduled Castes are given rights of property, rights of admission to educational institutions. The constitution has also permitted the state to make 15 percent reservation for Scheduled Castes in services and educational institutions; to set-up separate departments and advisory councils to promote their welfare and safeguard their interests; to arrange special representation in the Lok Sabha and the VidhanSabhas. Special attention has been given in the Five- year plans for the welfare of the Scheduled Castes. Some centrally sponsored schemes are launched for the welfare of the people of backward sections. These are : (i) coaching and training for various competitive examinations in order to improve the representation of them in various services; (ii) post-matric scholarship for providing financial assistance for higher education; (iii) construction of hostels for providing residential facilities to Schedule Caste boys and girls studying in schools, colleges and universities; (iv) financial assistance to reputed social science research institutions for research in development and problems of the Scheduled Castes and Scheduled tribes; (v) providing text books to the Scheduled Castes and Scheduled tribes, students of medical and engineering courses; and (vi) scholarships and passage grants for higher education in abroad (Ahuja 2006 : 369-371). During the sixth Five-year plan (1980 – 1985), a comprehensive three-pronged strategy has been evolved for the development of the Scheduled Castes. This is a combination of three scheme : (i) Special Component Plans (SCPs) of the central ministries and state governments; (ii) Special Central Assistance (SCA) for Scheduled Castes of the states and (iii) Scheduled Caste Development Corporations (SCDCs) in the states (ibid: 373).

NSOU • GE-SO-11 245 Untouchability is so deep-rooted in Indian society that it is still continuing. Several studies have revealed that scheduled caste students are segregated from the caste Hindus. They have separate benches in class rooms, separate rooms in hostels (Ahuja 2006 : 368). Further the reports of the National Commission on Scheduled Castes and Scheduled Tribes show that the number of crimes against scheduled castes have increased in every year. Women are the victims of rape by upper caste men. Men are exploited by upper castes by usurping their lands, giving them low wages, using them as bonded labour and so on. Governments (both Central and States) have taken several measures to protect the people of weaker sections such as helping the scheduled castes in getting possession of lands belonging to them or allotted to them; the police have been instructed to take quick action for the cases against scheduled castes; Special Scheduled Caste cells have been set-up for the welfare of scheduled castes and so on (Ahuja 2009 : 170-171). Article 46 of the constitution of India has provided special care for the scheduled castes and scheduled tribes. But several studies have revealed that there is a well-recognised hierarchy among the scheduled castes based on degrees of defilement and pollution. They are aware of their separate identity, and at the same time they are conscious regarding their common status of scheduled castes. They have elites within their ranks. These elites are educated, economically better-off and become the members of the parliament, state assemblies, panchayets. They are aware of the welfare measures taken by the governments and enjoy those facilities. These elite groups are not the victims of ill-treatment and atrocities by the upper castes. Several states in India like Bihar, Maharashtra have experienced caste-riots. Scholars have opined that these caste contradictions are due to inherent class contradictions in the caste system (Sharma 2008 : 190-192). 15.6 Scheduled Tribes 15.6.1 Tribes : Definition Tribes are very important social category in Indian society. But the term 'tribe' is not defined in the constitution of India. In fact, no satisfactory definition is found anywhere. A number of groups are still in primitive stage in social development and are referred as primitives, adivasis, aboriginals, jungle people, original inhabitants of India and so on. The term 'tribe' is used by the colonial administrators and is

246 NSOU • GE-SO-11 accepted by all which denotes early settlers of our country. They are also identified as Asura, Rakhasa, Non-Aryans and so on. Dictionary defines 'Tribe is a group of people in primitive stage of development acknowledging the authority of a chief and usually regarding them as having a common ancestor. "Tribes are a simple homogeneous group with their distinctive cultural traits. They do not belong to the Varna or Caste model. Indian constitution has mentioned some groups of people as 'Weaker Section' because in various ways those people are unable to compete with stronger sections of the Indians. Some of these groups of 'weaker section' are tribes (Rao 2004 : 342 – 343); Manna et al 2018: 57 – 65; Rao 2003 : 616). 15.6.2 Tribes : Racial Connotation Some anthropologists have opined that six major racial elements are found in Indian – population. These are

73%

MATCHING BLOCK 65/115

W

Negrito, Proto-Australoid, Mongoloid, Mediterranean, Western Brachycephals, and Nordic. The first three are the older

residents in India and are confined to small pockets. Kadar, Irula, Paniyan of South-India, Onge and Andamanese of Andaman Islands belong to the Negrito characteristics. Some people of Negrito traits are found in western coast of India. Perhaps they have come with the Arab traders. Majority of the tribes in middle of Indian belong to the group of Proto-Australoid. They are described by the Indo-Aryans as Anas, Dasa, Dasyee and Nishad – all are derogatory terms. Tribes in the Himalayan region and north-east of India are of Mongoloid stock. Mongoloid features are also found in the non-tribal population of the eastern states of Assam, West-Bengal, Manipur and Tripura. Other three races have arrived later. The Nordics (Indo-Aryans) make profound impact in Indian society. They are 'racists' in the sense that they regard themselves superior. Though Indian society has become diverse with the assimilation of different ethnic culture, some earlier inhabitants of India refuse to be absorbed in the main stream and have chosen to move to inaccessible forests and hills. Their isolation continues for centuries (Dube 2001 : 2–7).

15.6.3 Distribution of Tribes The tribes of India are spread all over the country. From the point of view of geographical distribution of tribes, India is divided into four major zones – namely, the Himalayan Region, Middle India, Western India and Southern India. Details are given below.

NSOU • GE-SO-11 247 Name of the Zones Name of the States Name of the major tribes

1. The Himalayan Region Jammu and Kashmir, Bhot, Gujjar, Gaddi, Himachal Pradesh, Tharus, Mizo, Garo, Terai of Uttar Pradesh, Khasi, Nagas, Assam, Meghalaya, Mao, Tripuri Nagaland, Manipur, Tripura

2. Middle India Region West Bengal, Bihar, Santhal, Munda, Oraon, Orissa Ho, Khand, Gond

3. Western India Region Rajasthan, Madhya Meena, Garasia, Bhil, Pradesh, Gujrat, Dubla, Dhodia, Koli, Maharashtra Mahadeo, Kokna

4. Southern India Region Andhra Pradesh, Gond, Koya, Konda, Karnataka, Tamilnadu, Dova, Naikada, Marati, Kerala, Andaman and Irula, Toda, Pulayan, Nicobar Islands Paniyan [Source : Ahuja 1999 : 275]

15.6.4 Tribe : Broad Characteristics Pramanick (1994 : 55) and Ahuja (1999 : 276) have mentioned some broad characteristics of the tribal communities : (i) they live in relatively isolated areas; (ii) they maintain a separate identity in terms of their cultural ethos such as language, institutions, beliefs, customs etc.; (iii) they have their own social as well as political organization; (iv) their social organization is non-hierarchic and undifferentiated; (v) they have a low-level of techno-economic development; and (vi) they practice endogamy. Further they are economically backward. The main source of their livelihood are agriculture and gathering of forest products. They do not cultivate for profit. Main portion of their earnings are spent in social or religious ceremonies. They are exploited by forest contractors and money lenders.

15.6.5 Tribe and Caste Several scholars have discussed the relationship between tribe and caste on the basis of different criteria. On the basis of religion, it is said that tribes are basically animists. The main characteristics of animism is the belief in spirit. All objects, animate or inanimate, are inhabited by spirits. Men can be possessed or influenced by spirits and magic. On the other hand, the religion of caste group is Hinduism. The main characteristics of Hinduism are – dharma, bhakti, karma and rebirth. But the Hindus especially the lower caste Hindus believe in spirits, ghosts, magic and so on. Similarly tribal groups also worship Hindu gods and goddesses, celebrate Hindu festivals and fairs, practice Hindu customs and rituals. Though tribes live in isolated regions, some of them live in plains. Caste Hindus live in plains but some lower caste people live in fringe areas and are isolated from higher caste Hindus. It is said that the tribes are less civilized than caste groups. But economic backwardness is also found among caste groups. Thus, the difference between tribe and caste is not very clear (Ahuja 1999: 277–278). Bose (1996 : 180) has opined that "Culture, Flows from a politically and economically dominant group to a subservient one. In social matters too, the former occupies a higher status in contrast to the latter. "For ages, tribes remain undisturbed in their own habitations i.e, in forests and hills. Situation has changed during British rule. Tribes are uprooted from their natural habitations and have become the part of one political union. Tribe-Caste interaction and acculturation have changed their original culture. A good number of tribes have accepted Hindu religion. But all of them are not fully incorporated in the Hindu social structure. Some tribes like Bhils and Bhumij have been incorporated in the Hindu social order and have accepted caste structure. Some tribal groups like Santhals, Oraon, Munda, Gonds have adopted the ethos, symbols and world-view of Hindus but not included themselves in the caste frame. Some tribes (tribes of Arunachal Pradesh) are indifferent towards Hindu social order while some tribes (Miozo, Naga) have negative views regarding Hindu social structure. Bulk of the tribal population have connected themselves with Hindus, a sizeable portion of them have accepted Christianity, a few of them are attached with Buddhism and Muslims (Ahuja 1999 : 275).

NSOU • GE-SO-11 249 15.6.6 Scheduled Tribe In post-independent India, Government has taken certain special measures for the upliftment of the people of backward section. Obviously, tribes are included in this back ward section. Dr. B.R. Ambedkar,

100%

MATCHING BLOCK 66/115

W

the chairman of the drafting committee of the Indian constitution,

prefers the term of 'Scheduled Tribe'. Though the constitution has not defined tribe, but the Article 366(25) of the Constitution says that "Scheduled Tribes are the tribes or tribal communities or parts of or groups within such tribes or tribal communities which the Indian President may specify by public notification under Article 342 (1)" (Rao 2004 : 373). According to Pramanick (1994 : 68) 'backwardness' is the only criteria in scheduling the names of some tribes in the constitution. He has mentioned three reasons to support his view: (a) the words "parts of or groups within tribes" indicate that not only the tribes are regarded as units, even parts of them may be included or excluded from the schedule; (b) some communities who are traditionally regarded as tribe may be left out of the schedule; and (c) some communities who are not regarded as tribe may be included in the schedule. For example, the Muslim inhabitants of Lakshadweep and all the native inhabitants of the Kinnaur of Himachal Pradesh have been classified as scheduled tribes.

15.7 Problems of Scheduled Tribes Rao (2004 : 356–358) has specified some problems which are faced by the tribes or scheduled tribes of India. One of these problems is geographic isolation. They live in unapproachable physical areas such as hills, deep valleys, dense forests. Developmental projects undertaken by the Government remain out of reach of the tribes. Tribes have their own culture which is an obstacle of assimilation into mainstream. Some tribes such as Kondhs in Orissa maintain their traditional language, dress and housing pattern even after adopting Hinduism (Pramanick 1994 : 75). Botia women (in Uttar Pradesh) had high status and enjoyed considerable freedom in their own tribal culture. But after adoption of Hinduism (or process of sanskritization) their (Botia women) position has declined (Rao 2004 : 357). Tribes are economically poorest people in India. Majority of them belong to below poverty line. They are exploited by the Zamindars, landlords, money lenders forest contractors, 250 NSOU • GE-SO-11 police and so on. They are emotionally attached to the forests. But their natural rights of use of forest have been restricted. A sizeable portion of land of tribal areas has been legally transferred to non-tribals. Tribal literacy rate is very low. Due to illiteracy and ignorance, tribals are not aware of modern concept of health and sanitation. They are often reluctant to avail modern medicine. As a result, good number of them become victims of diseases. In short tribals have faced several problems such as indebtedness, bondage, unemployment, poverty, exploitation and so on. Several uprisings of the tribals have also taken place in different periods of time. Scholars have classified these movements into four groups – (i) Reactionary, (ii) conservative, (iii) revisionary, (iv) Revolutionary. After independence tribal movements may be classified into three groups. These are : (a) movements due to exploitation of outsiders; (b) movements due to economic deprivation; (c) movements due to separatist tendencies. Scholars believe, among these movements, separatist movements in North-East India (e.g. Naga revolution from 1948 to 1972) are a threat in national integration (Ahuja 1999 : 282–284; Pramanick 1994 : 80).

15.8 Welfare Programme It has been found that scheduled tribes are backward in every sphere of life. After independence several measures are taken to improve the condition of the scheduled tribes. 'Panchseel' or five principles are initiated in the interests of the tribes. These are – (i) encouraging tribal's own traditional arts and culture, (ii) respecting tribals rights on land and forest, (iii) avoiding over administering of the tribal areas, (iv) training for tribal leaders for administrative and developmental activities and (v) Judging results on the basis of the quality of human character evolved not on the basis of money spent (Ahuja 1999 : 289). The constitution of India prescribes protection and safeguards for scheduled tribes along with other weaker sections. The main safeguards are abolition of untouchability, protection from social injustice and various forms of exploitation, removal of restrictions on access to public like roads, public tanks etc., giving them rights to enter religious places, rights to take admission in educational institutions and so on. Further, constitution has assured their representation in the parliament and state legislative assembly; set up separate departments and advisory councils; promoted their welfare

NSOU • GE-SO-11 251 and safeguard their interests; permitted reservation for them in service. A commission for Scheduled Castes and Scheduled Tribes has been set up for the interests of Scheduled Castes and Scheduled Tribes. This commission has been renamed as National Commission for Scheduled Castes and Scheduled Tribes. This commission consists of a chairman and eleven members (Ahuja 2009 : 158) State governments have separate departments to look after the welfare measures for tribes. Welfare for tribes has been given special attention in five-year plans. In five-years plans, some special programme has been taken for the tribes. The aim of those programmes are : (1) to increase the productivity in agriculture, animal husbandry, forestry, cottage and small-scale industries, (2) rehabilitation of the bonded labour, (3) education and training programmes and special developmental programmes for women and children (Ahuja 1999: 289). Some important schemes for scheduled tribes are : (a) coaching and training for various competitive examinations like IAS, IPS etc. ; (b) launching vocational training and education facilities in tribal areas; (c) Construction of hotels for providing residential facilities to scheduled tribe girls who are studying in schools, colleges and universities; (d) financial assistance to reputed social science research institutions for research in development and problems of scheduled tribes; (e) providing post-matric scholarship to scheduled tribe students for their higher education; (f) providing text-books to scheduled tribe students of medical or engineering courses; (g) scholarships and passage grants for higher education abroad and so on. Further 7.5% seats are reserved for scheduled tribes in service and educational institutions. This limit has been exceeded in some states in North-Eastern region. In government services, some facilities are given to scheduled tribes such as relaxation of age limit, relaxation in standards of suitability, relaxation of the qualification and experience in promotion along with special quotas (ibid : 159–160) 15.9 Approaches Scholars have used several approaches to study tribal communities. The anthropological approach believes the ultimate integration of the tribes into the mainstream of Indian life as a desirable goal but it insists on ease and caution in planning for the tribes though, Verrier Elwin has advocated keeping tribals in isolation. Social service approach and religious approach indicate the views of social

252 NSOU • GE-SO-11 workers and missionaries respectively. These approaches try to bring integration by a spirit of service and religious faith respectively. The political approach refers to the emergence of various complicating factors such as new consciousness and solidarity among the tribes spread of national political parties and their cumulative impact on the behaviour pattern of the tribes etc. After independence, tribal problems have become politicized and political elites have become very active regarding tribal problems (Pramanick 1994 : 74; Ahuja 1999 : 282–292). Referring on MLA's public speech Pramanick (1994 : 63) has opined that the government of India has provided various welfare programmes and the financial assistance schemes to the tribes. These programmes have created a vested interest among the tribes to retain their tribal identity. 15.10 Other Backward Classes 15.10.1 Other Backward Classes : Basic Concept The term 'Backward Classes' is used to refer the weaker sections of society, especially scheduled castes (SCs), scheduled tribes (STs) and other backward classes (OBCs). There are some groups of people who are above the untouchables and below the twice-born castes ritually, socially, culturally and economically. Some social thinkers believe that these groups belong to the 'Shudra' varna in four-fold varna division in society. They are also a lower rung in caste hierarchy and comprises the 'Other Backward Classes'. They form the intermediate agricultural and functionary (clean) castes. In India, the higher castes have traditionally large landholdings, the lower castes work as land-less agricultural labourers. In terms of actual cultivation, the intermediate castes are the principal agricultural castes. They cultivate land as tenants. On the basis of caste rank and economic status, this group of people are highly differentiated. The well-off OBCs are known as 'upper backward and the poor OBCs are known as 'lower or most backward'. They need special protection and help for their upliftment. Generally, it is perceived that the backward classes are backward in terms of education, government services, professions, business and so on but there is no all-India index of backwardness. Both central government and state government can appoint commissions to investigate the conditions of the backward classes (Sharma 2008 : 212-213).

NSOU • GE-SO-11 253 15.10.2 Kaka Kalelkar Commission The President of India has appointed a Backward Classes Commission in January, 1953, under the chairmanship of Kaka Kalelkar. The commission has taken two years to complete its work and has prepared a list of 2,399 castes and communities. The commission has determined the backwardness on the basis of (i) low social position in the caste hierarchy, (ii) lack of educational progress, (iii) inadequate representation in government service and (iv)

100%

MATCHING BLOCK 67/115

W

inadequate representation in the field of trade, commerce and industry.

It is to be noted here the caste is taken as the key factor in making a list of backward classes. But the government of India has rejected the recommendation of the commission and the state governments are asked to conduct surveys to identify the members of the backward classes and then to provide them with reasonable facilities. The states are further advised to determine backward classes by using economic scale rather than going by castes. A number of states have classified backward groups on the basis of occupation and income. In 1966, the government of Andhra Pradesh has decided to use 'family' for classifying backward groups. As states are left free to decide their own backward groups, several castes and groups in different states even belonging to economically and socially upper strata have become active for their inclusion in the category of backward classes. Dominant castes are also able to strike a political bargain for being classified as backward classes (ibid: 215-218). 15.10.3 Mandal Commission In 1977, the Government of India have appointed a Backward Classes Commission under the chairmanship of B. P. Mandal, a Member of Parliament. The terms of reference of the Mandal Commission are : • to determine the criteria for backward classes; • to recommend steps to be taken for the advancement of the backward classes; • to examine the desirability or

92%

MATCHING BLOCK 68/115

W

making provision for the reservation of appointments or posts in favour of backward

classes; and • to present a report and recommendations of their investigation of backwardness. The Mandal Commission has used three indicators for identifying a specific caste or class as backward. These indicators are social, educational and economic.

254 NSOU • GE-SO-11 The commission has observed that in India, the caste group is also an indicator of class. According to the Mandal Commission report, the backward classes, including the non-Hindu castes and excluding the SCs and STs, constitute 52 percent of India's population. The commission has recommended reservation of 27 percent of jobs and educational facilities for these 52 percent people. The commission has suggested following steps – "(1) The reservation of 27 per cent jobs be made

82%

MATCHING BLOCK 69/115

the central and state governments, universities and colleges, (7) The government should make the necessary legal provisions for implementing these recommendations." (

Sharma 2008; 221-222). In August, 1990, the Government of India have declared the acceptance of the recommendation of Mandal Commission and have invited country-wide agitation and criticism. Being afraid of unemployed, several numbers of youths have protested the government's decision through self-immolations. Several scholars have criticized the recommendations of Mandal Commission. The main arguments against the report of Mandal Commission are given below : (i) 'Backwardness' is defined on the basis of caste only. Special provisions should be made for all poor irrespective of castes. Mandal commission has ignored class. (ii) The criteria used by Mandal Commission to determine social, educational and economic backwardness are whimsical and politically motivated, not scientific. (iii) Commission has used the data of 1931 census as the listing of castes in census are discontinued after 1931. But industrialization, urbanization, educational growth, land reform (after independence) has altered the social, educational and economic status of various castes. (iv) Further, there is also a methodological fallacy. Sampling procedure used for field survey was defective. (Sharma 2008 : 221-222; Ahuja 2009 : 173-180).

NSOU • GE-SO-11 255 The report of Mandal Commission has been referred to the Supreme Court. The court has accepted the 27 percent reservation, though it has given certain directions for change in this policy. Some of these directions are – creamy layer of backward classes should be excluded, armed forces and sensitive higher civilian posts should not be included in reservation, reservation is made only for original appointments not for promotion, reservation quota should not go beyond 50 percent and so on. Further the Supreme Court has given same additional directions to the central government regarding inclusion and exclusion of the backward classes. Finally, it is to be stated that the reservation policy is abused in many ways. As a result, social scientists are divided regarding the question of reservation. Reservation policy has led to the emergence of the elite class among the backward sections of people. These elites are more concerned regarding the benefits of reservation (Ahuja 2009 : 182-183). 15.11 Summary India is the hub of tribal population in the world. The tribal world in India remained comparatively placid till the advent of the British. The colonial system bore harshly on the tribal communities who were formed out of isolation and relatively intact social mechanism of control, they revolted more often than not and much more brutally than to the rest of the community counting Indian peasants. Colonial rule differs basically from pre-modern forms of administration in one important respect. Before the attainment of Independence, the great debate about the future of Indian tribes centred round the dual concepts of isolation and assimilation. The British government broadly followed the model of indirect rule in its colonies, dependencies and protectorates. Since Independence several plans and programmes have been implemented for overall upliftment of the Scheduled Tribes but the achievements so far made by them in the field of economy are not encouraging. In order to understand their present wretched condition, we should look back to the historical past and follow it up in a sequential order. After Independence, the Government realized that the backwardness of the tribal group would have an adverse effect on Indian society. Developmental strategies were therefore formulated intending to bring the tribals closer to the mainstream of society, so that they eventually became a part of it. In addition, a closer look into the geographical and cultural matrix of West Bengal shows that the colonial parameters

256 NSOU • GE-SO-11 for categorization and definition of tribes based on characteristics for instance primitive traits, distinct culture, backwardness, geographical isolation, etc., have in most cases either served their purposes or have become redundant with the passage of time. During the pre-independence period tribals subsiding in forests, hills and even on the plains were secluded from the mainstream of national life. Their status was unsatisfactory due to the policy of ignorance and exploitation followed by the administration. The architects of the Indian constitution gave special emphasis regarding the tribal problems, keeping in view the nation's commitment to equality and social justice as cherished in the Preamble of the Constitution. The Indian Government took various extensive welfare schemes for securing the comforts of the tribal people and their socio-economic upliftment. Embedded in the Indian Constitution are several articles that have the object of promoting and safeguarding the comforts of the Scheduled Tribes. As the problems of the tribals are unique, it is essential that they are actively involved in both the planning and implementation of welfare programmes which the government undertakes for their benefit. Both total and sectoral evaluation should be undertaken in this respect. We must always remember that though the Government policies and programmes have helped to advance the standard of living of STs, one third of the tribals are still backward. Tribal communities linger to be vulnerable till date, not only for the reason that they are poor, and illiterate in comparison to the general inhabitants but also because they are to convey and deal with the residual society. A little step in bureaucratic programmes can do little to offset the pauperisation, exploitation and crumbling of tribal communities. As a result of this, the tribals continue to suffer from a number of problems and issues which require immediate attention of the Government. Violation of civil and political rights, land estrangement, dislodgment and false hearing for repossessing minor forest produce are only some of these. As India's flourishing economy necessitates more resources, the indigenous peoples are continued to be seized, ensuing a robust sagacity of isolation amid them and further exacerbating social skirmishes. The laws meant at shielding indigenous peoples from frequent inadequacies but their execution is far-flung from pleasing. India has an elongated past of indigenous people fighting their rights.

NSOU • GE-SO-11 257 15.12 Questions G-A (5 Marks each) (i) What is meant by 'Harijan'? (ii) Define tribes. (iii) What do you mean by Scheduled Tribes? (iv) Who are other backward classes? (v) What do you mean by scheduled caste? (vi) Mention the geographical location of tribes in India. (vii) Discuss the relationship between tribe and caste. 260 NSOU • GE-SO-11 • Define a minority group (subordinate group) • To understand other Religions and Ethnic Groups • To learn about the welfare measures for the Minorities

16.2 Introduction India—like many other countries in the world—is home to a diverse set of religious and ethnic groups. On most days and in most places, members of these diverse groups enjoy their basic civil and political rights, and freedom to pursue their beliefs. But unfortunately, that is not always the case. Tensions do exist, and for varying reasons, sometimes these tensions devolve into violence. Tensions may be aggravated by struggles over access to limited resources, particularly land, or by political rivalries. Sometimes localized incidents—street fights, local crime—can escalate.

16.3 Definition The people of a given society are categorized on the basis of several factors such as race, religion, language, cultural traits and so on. Indian society is also composed of different types of people. Different types of racial, religious, ethnic groups have brought diversity in India. Religion is a system of beliefs, practices, rituals and symbols which entails some forms of worship or obedience to divine power. Religion unites those people who share common beliefs, rituals and practices. There are eleven world religions. Eight major religions are found in India – Hinduism, Islam, Christianity, Buddhism, Jainism, Sikhism, Zoroastrianism and Judaism. Among these, Hinduism is the dominant religion in India and all other religions are considered as minority groups in India. Tribes have close affinity with the Hindus. A sizeable portion of the tribes have converted into Christianity and some of them have accepted Islam. Majority of them preferred to retain their tribal identity. Each major religion is further divided into several sub-groups. The census of 1961 has listed seven religious categories in India. These are – Hindus, Muslims, Christians, Buddhists, Jains, Sikhs and other religions. The census of 2011 has followed the same pattern. Details are given below :

NSOU • GE-SO-11 261 Sl. No. Religion Population in percentage

1. Hinduism	79.80
2. Islam	14.23
3. Christianity	2.30
4. Sikhism	1.72
5. Buddhism	0.70
6. Jainism	0.37
7. Zoroastrianism	Not counted
8. Religion not specified	0.9

The above list shows that the majority of Indian population belong to the Hinduism. Five religions (Islam, Christianity, Sikhism, Buddhism, Jainism) together constitute only 19.32% people. In other words, a group of people numerically large is dominating while others are small in number. The constitution of India has used the term minority in articles – 29 to 30 and 350A – 350B. Article 30 has mentioned two categories of minority – religious and linguistic. But no definition is given in constitution. Dictionary meaning of the word is smaller number or a part. Generally, it means a small group of people who differ from majority others in terms of race, religion, language and so on. (Abraham 2009: 135; Dube 2001 : 1; Sharma 2008 : 13; www.wikipedia.org 16.07.19, 13: 30; www.google.com, 26.07.19; 11:30). The term 'minority group' is widely used in social world. But the term is frequently used in a non-literal way-which indicates group's subordinate position within society. They may be numerically majority or minority. In the United States, blacks are minority in numerically and sociologically. But in South Africa, blacks are majority but they are being suffered by discrimination and unequal treatment by a small group of whites. Minority groups have a feeling of inequality because of their distinct physical or cultural characteristics. In India, the government have distinguished between 'minorities' and 'weaker sections.' Muslims, Christians, Buddhists, Sikhs, Jains and Zoroastrians are religious minorities. Dalits, tribes, backward classes are weaker sections. Traditional rules of caste system maintain distance between castes. For centuries lower castes are forced to do menial and unclean works. They are

262 NSOU • GE-SO-11 denied civil rights. Thus, minority groups experience disadvantage. Their culture, language, religious beliefs are separate from dominant groups. The National Commission for Minorities Act 1992 describes minorities as a community notified by Central Government. – Section 2(7). In October 1993, the government of India have declared Muslims, Christians, Sikhs, Buddhists and Parsis (Zoroastrian) as minorities. Jains have appealed to the Supreme Court for similar recognition. But Supreme Court has not issued any direction. In a later ruling, another bench of Supreme Court has declared Jains as minority (Bal Vidya case 2006) (Abraham 2009: 136; Giddens 2001, 248; www.google.com, 26.07.19; 11:30).

16.4 Features Scholars have mentioned some features of minority groups. These are :

- Minority groups are suffering from discrimination and they remain subordinate;
- The physical and cultural traits of minority groups keep them apart from dominant groups;
- They share a collective identity and common burden;
- Generally, they are eager to marry within their own group;
- They share social rules which are imposed on them

(www.wikipedia.org, 16.07.19, 13 : 30).

16.5 Ethnic Group Ethnic group is also a category of people who are identified with a distinct cultural tradition, Ethnic groups are distinguished from each other on the basis of religion, language, history of ancestry (real or imagined). In India, Punjabis, Muslims, Christians and Andamanese tribes are separate groups. Simultaneously they are also religious group, lingual group, caste, tribe and so on. But ethnicity emphasises on culture. Here is to be mentioned that Muslims are the largest religious minority in India (Abraham 2009 : 135, Giddens 2001 : 246; www.wikipedia.org. 16.07.19, 13 : 30). The term ethnocentrism is related with ethnicity. Ethnocentrism

NSOU • GE-SO-11 263 is a tendency of man to consider his culture superior to all others. The man judges other cultures in terms of his own culture or values. Ethnocentrism is found everywhere though it varies in degree of intensity. A man becomes ethnocentric because of his habits. A man has specific way of living in respect of food consumption, forms of recreation, pattern of worship, economic activities and so on. The habits of others may seem odd, inferior or undesirable to him. An individual becomes ethnocentric because of lack of understanding of situation of others. A custom which is common to the Indians may be seen with curiosity, surprise and even horror in United States. Similarly, rituals of one regions group may be curious to another religious group. One may become ethnocentric due to his personal inadequacies. He may use ethnocentrism as a defence against his inadequacies. Some individuals may have feelings of either superiority or inferiority which make them ethnocentric and less tolerant of others. Ethnocentrism has some effects – (i) it promotes loyalty to the group though sometimes it becomes blind loyalty to the members of the group; (ii) it makes greater conformity within the group; (iii) it causes resistance to change and strengthens the status quo; (iv) it resists assimilation of groups or individuals and (v) also resists to develop inter-cultural relationships (Chitambar 2002 : 101-102).

16.6 Muslims In the second decade of the eighth century, Muslims came to India and settled here. They practised their religion freely. A large number of local Hindu population were converted to Islam. The Islamic message of equality attracted a large number of Hindus of oppressed castes. The earliest Muslim preachers were close to Hindu masses. They maintained simple style of living and had attitude of tolerance towards Hindus. The converts of new faith could not give up their ancestral beliefs and practices, their occupational hierarchy and their caste consciousness (Dube 2001: 21 – 22; Momin 1977 : 242 – 243). After the death of Prophet Muhammad, the Muslims are divided into two groups – Shias and Sunnis. The cause of this division is a dispute of searching spiritual head of Islam. There are no racial or occupational factors as found in Hindu caste-based society. Caste system among Hindus is characterized by certain basic features such as endogamy, occupational specialization,

264 NSOU • GE-SO-11 status hierarchy, belief in purity and pollution and so on. Indian Muslims are also affected by the features of caste. They have some distinctive characteristics. They bear the traits of both Islamic great tradition and the local or little traditions of the places where they live in. The concept of society in Islam is based on equality. The Quran does not allow any kind of inequality in its social order. But Hindu social structure is based on caste system which is absolutely a hierarchical division of society. As most of the Indian Muslims are converted, they have accepted caste in their new social structure. In most parts of India, the Muslim society is characterized on the basis of some occupation specific endogamous jatis. Beside the division of Shia and Sunni, Indian Muslims are also divided into three other groups – Ashraf, Azlab and Arzal. Saiyeds, Sheikhs, Pathans and a few others belong to the Ashraf group who are regarded as noble-born. Momins (weavers), Mansooris (cotton cleaners), Ibrahims (barbers) etc. belong to the Azlab groups who are considered as low-born. Arzals are regarded the lowest of all. They are like untouchables among Hindus. They are not allowed to enter mosques, to use public graveyards. All these groups prefer endogamy (Ahuja 2006 : 147; Momin: 1977 : 243; Chatterjee 2019 : 139). According to Mandelbaum (1989 : 550), the Muslims of the bottom level are engaged in scavenging, sweeping and other menial tasks. They are generally Hindu converts who maintain their former occupations, poverty and disabilities. They are treated same way as their untouchable Hindu counterparts. The socio-political scenario of India had been changed after a century of immigration of Arab traders. India came under Muslim rule for centuries. Some Muslim rulers like Akbar tried to build bridges between the various communities of India while some of them did discriminatory practices by imposing additional taxes like Jijyah (poll tax), Kharaj (tax on land and property) and so on. Above all, considerable interchanges were found between the Hindus and the Muslims in the fields of art, architecture, philosophy and religion. In India, Islam got some distinctive characteristics that might be called 'Indo-Islamic' tradition. The impression of syncretism was present in the style of art, music, literature, and architecture. (Dube 2001 : 25; Momin 1977 : 244). But this view was criticized by some sociologists. According to these sociologists, Hindu and Islam – both cultures are opposite to each other and syncretism was not possible. Muslims were always eager to maintain their separate identities. They were primarily Muslims and then Indians. Thus, they were

NSOU • GE-SO-11 265 'Muslim Indians' not Indian Muslims. India came under British rule in the middle of eighteenth century. Muslims lost their centuries-old political domination and became frustrated. The relationship between Hindus and Muslims came under strain when the British adopted the policy of 'divide and rule' after the 'first war of Independence' in 1857. As a result, India experienced a number of communal riots before and after independence (Ahuja 2009 : 122; Pramanick 1994 : 195-197). In 1947, India was divided into two parts - India and Pakistan. This situation was simultaneously a victory and defeat for the Muslims. The Muslims who remained in India were stigmatized as disloyal to this country. A psychological gap between the Muslims and the other communities was created in India. A feeling of insecurity among the Indian Muslims had emerged which was reflected in their political posture (Kothari 1995 : 234). Partition of the country has brought distrust between the Hindus and the Muslims. Communal violence has created a feeling of insecurity among the religious minorities and ethnic groups. Several events after independence have created tension among the minority groups. All religious minority groups are protected by the Constitution of India which provides justice, tolerance, equality and freedom. But sometimes religious fundamentalism becomes strong and brings intolerance among different religious groups and also causes communalism. Communalism is an ideology which states that society is divided into religious communities whose interests differ and are opposed to each other. The antagonism practised by the people of one community against the people of other community is called communalism. Communalism may be practised several ways such as political communalism, religious communalism, economic communalism (Ahuja 2009 : 119- 120). Oommen (cited in Ahuja 2009 : 121) has suggested six dimension of communalism namely assimilationist, welfarist, retreatist, retaliatory, separatist and secessionist. The last one is that communalism when a religious community wants a separate political identity on the basis of their religion and demands separate state. A militant section of muslims demand independent Kashmir, a section of Sikhs demand independent Khalistan. Separatist group wants separate territorial state within country to maintain their own cultural specifically. Retaliatory communalism attempts to harm, hurt or injure the members of other religious communities. These three categories of communalism create social as well as political problems. They are also harmful to national unity.

266 NSOU • GE-SO-11 Muslims have emerged as the largest religious minority group in India. Census 2011 shows that 172 million Muslims live in India. It is 14.23% of total Indian population. They are majority in the state of Jammu and Kashmir and Lakshadweep. There are some states like Uttar Pradesh, Bihar, West Bengal, Assam and Kerala where Muslims live in high concentration (www.wikipedia.org 16.07.19 : 13 : 39). In the early 1980s, a committee under the chairmanship of Dr. Gopal Singh was set up by the Ministry of Home Affairs to enquire into social and economic conditions of the Indian minorities. The committee found Muslims as backward. After two decades, again a committee was set up under the chairmanship of Justice Rajinder Sachar to enquire into the socio-economic conditions of Muslims. According to Sachar Committee Report Muslims in Uttar Pradesh, Bihar, Assam and West Bengal were the poorest sections of the population along with Scheduled Caste and Scheduled Tribes. Muslims lag behind the national average poverty ratio. They are identified as backward in terms of education, health, income, physical quality of life and low representation in public services. According to census of 2011, West Bengal has 27.01% Muslim population. It has high share of population in the district of Murshidabad (66.26%). Muslims of West Bengal are divided into two constitutional categories – General Muslims and OBC Muslims. OBC Muslims are categorized into two groups – 'Category – A' and 'Category – B'. 'Category – A' indicates 'More Backward' sections and 'Category – B' recommends those people who are relatively backward. As per the notification No. 6309 – BCW/MR – 84 / 10 dated on 24-09- 2010, total 116 groups of Muslim communities have been declared as OBCs. Among these groups 74 are declared as 'More Backward' (Chatterjee 2019: 134-136).

16.7 Christians in India Indian society is very old and has been enriched by different cultures and religions. Both Christianity and Islam have great impact on the texture of Indian society and are considered as organic parts of it not as alien elements. Christianity is the third largest religion in India. According to the census of 2011 2.3% people of India are Christians. They are majority in three states of north-east India namely Nagaland, Mizoram and Meghalaya. There are a good number of Christians in Kerala and Goa. It is believed that St Thomas (A. D. 50) and St. Barthomomew (the same period) have brought Christianity in India. A sizeable number of people in

NSOU • GE-SO-11 267 Kerala, Malabar, Kalyan (near Bombay), Punjab have accepted Christianity. In sixteenth century, with the arrival of Portuguese, Christianity has got an impetus of its success (Dube 2001 : 17-18; www.wikipedia.org. 16.07.19, 13 : 30). The Portuguese were very conscious regarding their position. To protect their nobility, they avoided inferior castes. They attempted to convert kings and upper caste Hindus. Goa had become a Christian settlement with many churches and clergymen. De Menzes, Archbishop of Goa, tried to remove Hindu influence on the early Christians of Malabar. But Roberto de Nobili, the Italian Jesuit, landed in Goa in 1605 lived like a Hindu ascetic. He dressed in saffron robes and maintained the rules of ritual purity in his food and social contacts. He communicated with the people of remote areas in regional dialects. He was a master in the language of Sanskrit and discussed with the Brahmins in that language. To facilitate the rapid spread of Christianity, Nobili was keen to convert from the top of Hindus. Further he avoided the Christians of lower caste origins. By the end of seventeenth century a good number of Christian people were found in India. Thus, India experienced with Christianity long before the arrival of the British. The later development of Christianity in India was found with the association of the Church with foreign powers – the Portuguese, the Dutch, the British and the French (ibid: 19 – 20). Srinivas (1998: 50) has mentioned that though India was known to European Christian missionaries long before the advent of the British in India, the entry of the European missionaries during the early period of the rule of the East India Company was not allowed. This was changed in 1813 when the British parliament permitted them to enter the country under a new system of licensing. As a result, the entire sub-continent became open to missionary activities without any hindrance. During British rule mass conversion to Christianity took place in several pockets in India. Major portions of the tribes of the north-eastern states of India converted to Christianity. A sizeable portion of tribes in Chotanagpur accepted Christianity. Christianity flourished in Kerala and TamilNadu. They were the saviours to the members of depressed castes (Dube 2001 : 20; Ahuja 2009 : 163; Sharma 2008 : 13). But the deep-rooted beliefs could not be eradicated merely through the act of conversions. New converts had to continue their jati-occupations for the maintenance of their livelihood. They had to keep contact with their neighbours. As a result, new converts were the victims of the Hindu caste rigidity. Even in late twentieth century

268 NSOU • GE-SO-11 the Bishops of TamilNadu admitted in their annual meeting that “the Scheduled Caste Christians, even after conversion, continue to suffer from extreme social, educational and economic backwardness arising out of the traditional practice of untouchability.” (Dube 2001 : 60). In South India, Christians from untouchable castes were segregated both in their settlements and in the Church. Their colonies were situated at distance from main settlement and no civic amenities were provided. Any procession (marriage or funeral) of low caste Christians was not allowed to pass through the main settlement. They had to receive holy sacraments during baptism, confirmation and marriage at last. High castes converts identified themselves as Brahman Christians or Nayar Christians. The sufferings of Scheduled Caste Christians continued. A sizeable portion of Indian Christians were socially discriminated. Nadars of TamilNadu were untouchable and suffered for centuries. European missionaries extended their humanitarian activities among these Nadars and the first Nadar conversions were made in the early 19th century. A good number of Nadars were converted into Christianity. As a defiled caste, Nadars suffered from severe social disabilities. They saw Christian missionaries as their protectors. With the help of missionaries Nadars were able to improve their economic condition. Gradually after a long struggle they were also able to improve their social condition (Kothari 1995: 101). Thus, converts have acquired higher socio-economic status than non- converts (Sharma 2002 : 178). Though missionaries were the protectors of exterior castes yet a distance emerged between the mainstream of Indian population and European missionaries. Perhaps the association of missionaries with European rulers caused that distance from the mainstream of Indian society (Dube 2001: 20). Further converts were also unable to mingle with mainstream. After independence, the government of India launched several measures for minorities and weaker sections. These were an impetus for the tribes including converts to retain their own ethnic identities (Sharma 2002: 178). 16.8 Anglo – Indians A new ethnic group namely Anglo-Indian has emerged out of the bond of Europeans and Indians. Anglo-Indians are racially mixed community, born out of the relationships between European fathers and Indian mothers. It is estimated that this community has taken shape with the Portuguese invasion in India i.e., from 1493

NSOU • GE-SO-11 269 A.D. and followed by Dutch and English invasion in India. In the middle of nineteenth century, Anglo-Indians have been formed as a community of mixed blood; in other words, Anglo-Indians are Eurasians. They live in different parts of India and a good number of people belonging to this group live in Kolkata (Sen 2017: 160). The Anglo-Indian community always supported British during colonial period but the British considered them as indigenous people. When the leaders of this community realized that the British would not accept them as members of their own folk, then they started to demand for a home land. Migration was common among this group. After independence, mass exodus took place in different times and 1970s was that decade of last mass exodus from India to other countries specially Australia, Canada and United Kingdom (ibid : 159–160). Anglo-Indians have emerged as an ethnic minority in India during the last three decades of Indian freedom struggle against the British and the first three decades after independence. Sen (ibid) has mentioned them as a docile community. From the very beginning Anglo-Indians are willing to connect themselves with the British. India is a multi-cultural society. Anglo-Indians have been living with the other communities (majority or minority) in India for a long time, but they seem to be ignorant of cultural practices of their neighbours. There are lots of evidence which show that they follow British social and cultural life-style. They are not eager to follow non-Anglo-Indians cultural pattern. Further, throughout their existence in India, they are also indifferent towards Indian culture, history, politics and so on. They put little efforts to understand the religious and philosophical traditions of India. All these factors are again significant markers to maintain them marginal – ethnic identity.

16.9 Sikhism
Sikhism has developed in North India as a distinct religion in fifteenth century. Sikhism has taken elements both from Hinduism and Islam. Guru Nanak (1469 – 1539), the preacher of Sikhism, advocates some disciplines for each individual to reach the final goal. Nanak has discarded the external practices and observances of traditional forms of religion. He strongly rejects fasting (Vrata), superstitions, idol worship and so on. According to census of 2011, 20.8 million Sikhs live in India. They are majority in the state of Punjab which is believed their spiritual home. There are also significant number of Sikhs in neighbouring states of Chandigarh, Delhi and Haryana. Sikhism is a synthesizing religion which emphasizes equalitarianism. But casteism is present in Sikhism. Lower-caste members who have adopted

100%

MATCHING BLOCK 76/115

W

Sikhism are known as Mazhabis. They live in separate hamlets.

They are not addressed with the common honorific title 'Sardar'. But they can join in prayer in Gurudwaras (Sikh temple) and the Langar (serving of food to all in the temple precinct). Their touch is not considered polluting. But majority of them are still endogamous group. The Jat, the Kshatriya, the Brahman and the artisan castes practice endogamy and maintain their separate identity. Here is to be noted that girls of lower jatis may be accepted by the higher jatis but they are not eager to marry their own girls to the males of lower jatis. Perhaps gender imbalance is the main cause of such practice. (Dube 2001 : 17-32; Bhattacharyya 1989 : 17; www.wikipedia.org. 16.07.19: 13: 30).

16.10 Buddhism
Buddhism was preached by Gautama Buddha during 6th – 5th century B.C. (Thapar 1996: 39). Buddha taught for 45 years through conversions, lectures and parables. His method of teaching was unique. Accompanied by his disciples he moved around cities and villages and preached his doctrines. He taught four noble truths. These truths are – (i) existence of sorrow; (ii) cause of sorrow; (iii) sorrow can be ceased (iv) there is way to attain bliss and desires. Further he advised five moral code of conduct – "(i) to abstain from killing; (ii) to abstain from stealing; (iii) to abstain from sensual misconduct; (iv) to abstain from lying and (v) to abstain from intoxication." He was against the institution of caste. He was frequently asked regarding the purity of castes and always replied that all castes were equally pure. Social distinctions were based on types of work in society but position could not be an indicator of purity or impurity. Buddha was in favour of the equality of all before the law and he showed greater liberty towards women than the Hindu tradition. He permitted women to become nuns. He preached his doctrine in simple language. It was economic. No money is required to be spent to be honest and virtuous. Above all the personality of Buddha was also responsible for the spread of Buddhism. Buddhist Sanghas were helpful to spread Buddhism. In the early days of Buddhism, Buddhist

NSOU • GE-SO-11 271 monks led a holy life. The Buddhist monasteries were the centres of education. Further Buddhism received royal patronage under Asoka, Kanishka, and Harsha. These kings played important role in the spread of Buddhism. As a result, not only in India, Buddhism became popular in countries outside India. These countries were Ceylon, Burma, Tibet, Java, Sumatra, Borneo, Champa, China, Japan, Siam and some other states in central Asia. In India the people who were tired of the complicated rituals of Hinduism, welcomed Buddhism. Specially Vaishyas and the Sudras faced pride of the Brahmins. The practice of Hinduism became costly. People had to spend lots of money to perform several rituals in Hinduism. To perform this religion (Buddhism) no priest or any intermediary is required. Their division of Buddhism were based on doctrinal differences, not on the gradation of society. Here is to be noted that Buddhism was divided into two parts – Mahayana and Hinayana (Mahajan 2017 : 140-147; Dube 2001 : 32; Thapar 1996 25; www.wikipedia.org. 16.07.19: 13 : 30). In course of time Buddhism gradually declined in India though a large number of Buddhists live in other Asian countries. One important cause of the decline of Buddhism was the decline of Buddhist monasteries or Sanghas. Monks and nuns became corrupted and lost respect from common people. Buddhism also lost royal patronage. The Gupta rulers were the patrons of Brahminic Hinduism. The new Brahminism also incorporated the good points of Buddhism. During the time from eighth century to twelfth century Buddhism could not achieve royal patronage. Muslim invasion also began to take place. Buddhism further lost its foothold during Muslim period (Mahajan 2017 : 149-150). Buddhism flourished in India when the Hindu society had lost its former glory. But with the revival of Vedic Hinduism, spread of Islam and Christianity, Buddhism lost its hold in India and confined only to a few pockets. It was revived by Dr. B.R. Ambedkar. Dr. Ambedkar was a member of Mahars of Maharashtra. The Mahars were untouchables due to their defiled works and faced severe discrimination. Ambedkar was highly educated. His education enabled him to talk in modern political terms and also won him the respect and administration of his caste. He fought against social discrimination through political channel. He found in 'Buddhism' ways which offered release from Hindu concepts and a high moral standard but had no political overtones. With his thousands of followers, he accepted Buddhism. They were popularly known as neo-Buddhist.

272 NSOU • GE-SO-11 Now-a-days around 8.5 million Buddhist live in India. A significant number of Buddhists live in Maharashtra. They are neo-Buddhist (Kothari : 37-48). 16.11 Jainism Another important religion in India is Jainism which is contemporary of Buddhism. Its followers are now numerically small. There are two main sects among Jains – Digamber and (Unclothed) and Shwetamber (white robed). Untouchability is not practised among them and inter-dining is allowed but they have a good number of endogamous jatis. The founder of Jainism is Rishabha who is succeeded by twenty-three 'Tirthankars' or Prophet of Jainism. Parsvanath is the twenty-third Tirthankara. He has criticized the Vedas, Vedic gods and castes. His main teachings are – truth, non-violence, non-stealing and non-accumulation. Mahavira is the last Tirthankara. He does not believe in the existence of God. He has advocated for right faith, right knowledge and right actions. Jainism puts stress on non-violence. At present Jains are mainly concentrated in Gujrat, Karnatak, Maharashtra and Rajasthan (Mahajan 2017 : 132-134; Dube 2001 : 32-33; www.wikipedia.org. 16.07.19 : 13 : 30). The preachers of both religions were prince. They had no connection with priestly families. Both the religions put stress on right conduct and right knowledge, not on religious ceremonies. They opposed castes, animal sacrifice and emphasized on 'Karma' i.e., the cumulative effect of one's actions in former life. They taught in the language of common people. People of lower strata in terms of castes attracted and adopted Buddhism and Jainism. Both of the religion opposed Brahmanical orthodoxy. In early stages Buddhism became popular among the emergent commercial classes. Jainism was also popular among them. Non-violence was the central focus of Buddhist and Jaina religions. Finally both religions found their earliest supporters amongst the republican tribes (Mahajan 2017: 151; Thapar 1996 : 25, 48). 16.12 Other Religions and Ethnic Groups There is another small community in India namely 'Parsi' who

100%

MATCHING BLOCK 77/115

W

have played an important role in India's industrial development. They

have arrived in western coast of India in eighth century from Persia. They have adopted the life style of the

NSOU • GE-SO-11 273 mercantile communities for their religious rites. Hereditary priests marry among themselves. According to census 2001, Parsis comprises 0.006% population in India. They have high concentration near Mumbai. Jewish faith is also present in India. They are very small in number and have concentrated only in two settlements – Cochin (in Kerala) and Maharashtra. Cochin Jews are divided into two groups – white Jews and black Jews. Their relationship is like caste relationship among the Hindus. White Jews do not marry or dine with black Jews. They enjoy some – privileges. Another settlement of the Jews is in Maharashtra. These groups are known as 'Bene Israel' (Hebrew term) which means sons of Israel. For centuries in the Konkan villages, they are called 'Shanwar Telis' for oil-pressing is their main occupation. They are treated like Hindu Telis but they observe some Jewish dietary regulations and festivals. They have white and black divisions; prohibition on inter-marriage and inter-dinning. But all of them worship in same synagogues. Many of them have migrated to Bombay as jati-like restrictions are less there (Dube 2001 : 33-34; Kar 2009 : 153).

16.13 Welfare Measures for the Minorities For centuries India is a multi-religious country. After independence, the government of India have decided to protect the interests of minorities and recognize their rights to conserve their religions and cultures. Article 14 of the constitution of India ensures equality of all citizens of India. Article 15 says that, "

100%

MATCHING BLOCK 79/115

SA

chapter three-origin and development of caste ...
(D40662830)

The state shall not discriminate against any citizen on grounds only of religion, race, caste, sex

and place of birth or any of them." Further, Article 29 and 30 of the constitution of India protects the rights of minorities. The National Commission for Minorities has been set-up under the act in 1993. The main functions of the commission are : (i) to evaluate the progress of minorities; (ii) monitoring the usefulness of safeguards provided by "constitution and laws enacted by the Parliament and other states legislatures; (iii) to recommend for the implementation of safeguards provided by the constitution and laws; (iv) to look into the complaints of minorities regarding deprivation of rights and 274 NSOU • GE-SO-11 safeguards and take up such matters to the appropriate authorities; (v) to conduct studies for the evaluation of the condition of the minorities; (vi) to suggest appropriate measures for the safe-guard of minorities; (vii) to prepare on any matter related to the minorities and so on.

16.14 Summary Independent India has accepted socialist ideology i.e. the view of common good for all. People of all categories such as religious, racial, lingual, ethnic groups are accepted in India with their usual specialities. Further Indian Constitution has made special provisions for weaker sections of the people namely scheduled castes, scheduled tribes and other Backward Classes. Religious minorities also enjoy the right to their beliefs and practices in India.

16.15 Questions G-A (5 Marks each) (i) What do you mean by minority group? (ii) Is there any similarity between Jainism and Buddhism? (iii) Write a note on Anglo-Indians as an ethnic minority group. (iv) What is communalism? (v) What do you know about Jews? (vi) Write a note on Parsis? (vii) Write a note on Indian Christians. (viii) Write a note on Buddhists as a religious minority group. (ix) What do you know about Jains as a religious minority group? G-B (10 Marks each) (x) Mention the features of minority group. (xi) Write a note on Sikhs as a religious minority group.

NSOU • GE-SO-11 275 (xii) Differentiate between religious minority group and Ethnic minority group? (xiii) How does untouchability enter into minority groups? (xiv) Write a note on largest religious minority group in India. (xv) Mention the welfare measures for minority groups.

280 NSOU • GE-SO-11 • To understand the impact of social Mobility on Women • To understand the idea of caste mobility 17.2 Introduction Mobility stands for shift, change and movement. The change may be of a place or from one position to another. Further, change is value free i.e. it cannot be said that change is for good or bad. When we prefix 'social' along with mobility it would imply that people or individual occupying a social position, move to another position or status. In the social ladder this movement may be upward or downward or it may be inter-generational or intra-generational. In short, social mobility stands for change in the position of an individual or a group of individuals from one status to another. 17.3 Social Mobility : Meaning and Definition The study of mobility is an indispensable part of the study of social stratification. Social stratification indicates the inequalities between men in terms of property, power and prestige. In other words, society is divided into different strata on the basis of property, power and prestige. People of upper strata enjoy much honour in society. Mobility tells us the movement of people from one stratum to another. Thus, social mobility is the upward or downward movement of a person or a group of persons from one social position to another. As a result, an individual or a group may gain or lose wealth, power and prestige. For example, a poor man may become rich, a peon may become officer, a petty business man may become business tycoon and so on (Tumin 2003 : 132; Rao 2004 : 233; Abraham 2009 : 132). Thus, social mobility indicates a change in socio-economic position. A person's class status is determined originally by the class status of his parents. If that person gets different amount of education from that of his parents or moves into a different occupational group, or maintains a different style of life then he will be socially mobile. Mobility may occur collectively by a group of persons. Several sociologists, anthropologists have mentioned that some backward sections of people (castes and tribes) acquire mobility by imitating the customs, rituals and symbols of higher castes. This process is popularly known as 'sanskritization' which is an upward cultural mobility by a group of persons. (Bhattacharyya 2014 : 317). Further, mobility may take place without changing one's status or prestige. It is a movement within same level. In

NSOU • GE-SO-11 281 short, social mobility is a movement of a man or a group of men within same level of social strata or different levels of social strata (Kar 2009 : 144). 17.4 Social Mobility and Social Types Based on the ease or difficulty of upward movement, society is divided into two parts – open society and closed society. There are some societies where the chance of mobility is very little, status is hereditary i.e., ascribed on the basis of birth. These types of societies are closed societies. For example, feudal societies are rigidly divided into three estates – peasants, clergy and aristocracy. In the Hindu caste system, caste membership is hereditary and in caste-based society, it is virtually impossible for a man to succeed by his own efforts. Here, in closed system, one's position is inherited and permanent. Closed systems are organized to perpetuate privilege and inequality. Structural barriers are created by customs or law, enforced by coercion to ensure the access to the higher classes or castes. In India, educational system in caste-based society, is segregated along caste lines which prohibits lower- level children from general education. Their (lower-level children) skills are curbed which in turn perpetuates their disadvantageous position. This barrier is legitimized by prevailing socio-cultural ideas and beliefs. Theories of genetic inferiority claim the existence of biological differences among the people. Members of certain groups acquire certain qualities at birth. Aristocracies usually claim the right to rule on the basis of a combination of biological (acquired by birth) and social (acquired through training) disparities. In medieval estate system, rulers sometimes declare divine support for their power. All these ideologies support the continuation of stable patterns of inequality. Closed systems are generally found in stable agricultural societies and tend to be threatened by the process of industrialization (Abraham 2009 : 132; Rothman 2011 : 222 – 223). In contrast, class-based society permits movement of people from one strata to another strata easily. This type of society is called open society. It is ideally admitted that in completely open society, there is no formal or ideological barriers in social mobility. On the basis of his or her own ability and efforts one can change his or her position in society. In other words, there is no necessary link between the class level occupied by parent and the ultimate class position of child. In all types of industrial societies, more openness is found than agricultural societies. Urbanization, industrialization, information technology increase opportunities for social mobility. In the early stages of industrialization, the most profound transformation is the shift from agriculture to manufacturing. Rural people are able to move to urban areas.

282 NSOU • GE-SO-11 Many property less rural farm workers have got a chance to improve their economic as well as social conditions by joining in relatively better-paid factories. Industrial systems tend towards openness. Formal education is an important factor for achieving occupational success (Rothman 2011 : 223). Sociologists are interested to study open societies. High moral and political values are attached to open societies. Majority of the western societies are open societies where the opportunity to succeed depends on one's talent. It is also a mark of good society. A society is deemed to be fair when achievement is based on merit, not on advantage of one's origin, skin-colour, religion, sex or any other such characteristics. All western societies officially approve equality of opportunity for all. But it does not mean the equality of situation or outcome. The equality of situation refers to the condition in which everyone receives equal amounts of the good things of life, irrespective of their talent, fitness and performance. It is possible that equal opportunity may lead to in equal situation in the same society at the same time. Natural talent and ability may cause inequality of situation or outcome even by receiving equal opportunity. Equal situation can be achieved by altering the reward structure through socialist ideology "

100%

MATCHING BLOCK 80/115

W

from each according to his ability, to each according to his needs."

In modern welfare states, inequality is reduced by securing funds through taxation which are redistributed to the poor people (Tumin 2003 : 133). It is to be noted here that no society is absolutely closed system or open system. Compared to the estate and caste system, class system is relatively open. Social mobility is desirable, approved and possible easily in class-based society. Mobility is neither approved, nor desirable and also impossible for a person in caste- based society. If it occurs (though occurs rarely) then the unit of mobility is whole caste or sub-caste. But in case of open society, an individual or a family is able to acquire new status (Rothman 2011 : 223; Tumin 2003 : 47; Kar 2009 : 144). Sociologists are interested to study social mobility because the amount of mobility in a society is connected to a number of other social features such as the degree of political freedom; the level of economic productivity; the amount of violence in social relations; the rates of various kinds of criminal acts; the changes in the role of the school system; the quality of the networks of personal associations including friendship, community groups and even marriage patterns and so on. All these features in a society vary in accordance with the amount of mobility in the social system. Further some groups experience rapid social mobility while others do not. As a result, former groups are more beneficial than latter groups. And due to relative deprivation latter groups may show high rates of personality disorder

NSOU • GE-SO-11 283 and other pathologies. This situation may bring serious and costly disorders in society. Because of these possible influences of mobility, sociologists are keen to study social mobility (Tumin 2003 : 133-134).

17.5 Features and Types of Social Mobility

17.5.1 Horizontal Mobility, Vertical Mobility and Lateral Mobility

The movement can occur in any of three following directions – from lower to higher, from higher to lower or between two positions at the same level. The first two types of movement are known as vertical mobility while the third one is horizontal mobility. The opposite of vertical mobility is horizontal mobility. When a person moves from one occupation to another occupation but his status or income or prestige remains same then it is a horizontal mobility. In other words, it is an occupational change within same strata. For example, a person quits his job as an electrician and becomes a machinist. Both of these occupations need same amount of training, pay-level about the same, carry the same amount of prestige in connectivity. This type of occupational movement does not lead to the change in status or income. It is a horizontal mobility within a stratum. Sometimes individual or a group of persons move from one social group to another social group in some rank then it is a horizontal mobility. For example, movement of an individual or a group from the Baptist to the Methodist religion group; from citizenship of one country to another country; from one family to another family (through marriage) in same income level or same social strata or from one family to another family (through divorce or remarriage) in same economic level or social prestige and so on. In contrast first two types of movement are the example of vertical social mobility. But in first case, it is upward vertical social mobility and in second case, it is downward vertical social mobility. Lateral mobility as mentioned by Giddens (2009: 463) is often combined with vertical mobility. Lateral mobility is a geographical movement between towns or regions. For example, a person who is working in a company in Kolkata, is transferred to its another branch of Mumbai. Lateral mobility takes place here. If he is transferred on promotion to a higher position in the Mumbai branch then lateral mobility is associated with upward vertical mobility (Bhattacharyya 2014: 317).

17.5.2 Inter-generational Mobility and Intra-generational Mobility

Vertical mobility is further divided into inter-generational vertical mobility and

284 NSOU • GE-SO-11 intra-generational vertical mobility. Intergenerational vertical mobility involves a comparison between a parent's class position and his child's class position. If child's class position is higher than his parent's class position then it is inter-generational upward vertical mobility. For example, if the son of a blacksmith becomes an engineer. If child's class position is lower than his parent's class position then it is an intergenerational downward vertical mobility. If the son of a professional man involves in any lower graded job, then it will be intergenerational downward vertical mobility. In contrast, intra-generational vertical mobility refers to an individual's occupational changes or position in the course of his own life time. An individual may change his status through his own talent. If his status increases then it will be intra-generational upward vertical mobility. If a man fails to maintain his career which he has begun first and loses his position then it will be intra-generational downward vertical mobility (Abraham 2009 : 133; Tumin 2003 : 41). Bhattacharyya (2014 : 318) has opined that industrial societies are marked with rapid changes in occupational structure. Intergenerational upward movement is more prevalent than intergenerational downward movement in both developed and developing societies. But the studies of social mobility in the United States, Great Britain and other western countries have revealed that social mobility has occurred in limited range. Though there are fairly high levels of intergenerational mobility, majority of them are short-range mobility. It means mobility is between occupational positions quite close to one another. 'Long-range' mobility is not common. Downward mobility is less common than upward mobility, but it occurs both intra generationally and inter generationally. Like upward mobility downward mobility is also a widespread phenomenon. This type of mobility is often associated with psychological problems and anxieties when individuals become unable to sustain their previous life-style. When middle- aged persons lose their jobs, then it is different for them to find jobs in some level. They obtain work at lower level of income than before. During economic crisis (inflation), a general downturn in the average real earnings of people in middle level white collar jobs may occur. In such condition, people may not support the life-style aspirations they once did. Sometimes companies trim their work-forces. Further downward mobility is common in divorced or separated women with children (Giddens 2009 : 466). Rothman (2011 : 224) has opined that intergenerational mobility focuses on formal education and divides the process into three stages. The first stage indicates a connection between social class origins and educational attainments. There are some factors which influence educational success. The second stage is a link

NSOU • GE-SO-11 285 between social origins, educational attainments and first job in labour market. The third stage indicates social origins in educational qualification, first job and their involvement in later job. This process is known as 'status attainment model' which has begun in 1960s and establishes the impact of parental class location on their children's accomplishment. First group researchers regarding this issue have established empirical relationships among the basic variables in the process. Next generation researchers have added cognitive (ability measures) and social psychological factors (mobility aspirations) to the process. Contemporary researchers have focussed on the institution arrangements that influence progress through educational systems and careers. Rothman (ibid) has admitted that 'status attainment model' is an oversimplification but, he opines, it is a useful starting point for understanding intergenerational continuity and mobility. Rothman (ibid) has presented 'status attainment model' through a diagram. "The model shows that in the first stage of the process, parental social class origins directly influence children's aspirations, academic ability, and level of educational attainment. Academic ability and aspirations have an independent impact on educational progress. In the second stage, social origins and years of education are directly correlated with the level of the first job. The third stage focuses on the second generation's later jobs, which are correlated with social origins, levels of education, and the level of the earlier job."

17.5.3 Causes of Vertical Mobility It has been found that vertical mobility is present in all types of societies in different forms. Kar (2009 : 145) has opined that vertical mobility is an inherent trait of all stratified societies. Different types of causes are associated with vertical mobility. Some of these causes are explained here. (i) There are some societies where upper positions are filled for a definite period. After the expiry of the term, new persons are recruited in those posts. If those posts are open to people of all strata, then there is a chance of vertical mobility. (ii) People belonging to different social strata carry specific criteria. Some people of lower strata have a tendency to emulate the ways of life of those people who belong to upper strata. After certain period of time, the people of lower strata can manage the membership of upper strata. One of such examples is the process of sanskritization in the Hindu caste-based society. (iii) Low birth rate among people of upper strata is generally found. In such a situation, a 'social vacuum' may be created. People of lower strata can get chance for upward movement because vacant posts are filled with those people. (iv) Sometimes people are unable to perform the functions of their social stratum. This may be caused by the dissimilarity between parents and children in terms of capacity. As a result, down-ward movement is found. Sometimes persons undergo profound changes in course of their lives owing to physical or mental sickness, some accidents and so on. Such people may lose their ability to perform according to their family status. (v) Another cause of vertical mobility is continuous change in the environment especially socio-cultural environment. Changes in socio-cultural environment may create favourable conditions for some people or can create unfavourable conditions for some people. A popular singer may be rejected. Changes in attitude or awareness or public tastes may flourish certain types of businesses or may cause opposite result. In such cases one businessman may get opportunity for upward movement or one may skid from his position. So, it can be said that dynamism in socio-cultural life is sufficient to produce vertical mobility within any group (Kar 2009 : 145).

17.5.4 Structural Mobility and Circulation Mobility Another point of view has divided social mobility into two parts – structural mobility and circulation mobility. These types of mobility arise due to changes in the division of labour and labour supply. These changes bring new opportunities to some people who did not have such opportunities before. Structural mobility is referred as forced mobility. This type of mobility has occurred by forcefully. The structural changes in the economic system of production and distribution. Shifts in the economic system may close opportunities for some and may open it to others. Structural mobility also takes place when changes occur in the number of people in particular categories; for example, the changed ratio of blue to white collar jobs. Such changes may come from a number of sources including economic expansion and growth that make manual labour obsolete; differences in birth rates between levels of workers (for example the professional group may not have enough children to replace itself); changes in death rates and rates of immigration affect the number of people seeking jobs and available for jobs. Further expansion of high-skilled technical based upper middle-class occupations create new opportunities for upward mobility for the better-educated children of lower middle-class or working-class people. This type of mobility is also referred to as structural mobility. On the other

NSOU • GE-SO-11 287 hand, circulation mobility is also referred as true mobility. Some kinds of opportunities are opened to some kinds of people who did not have such opportunities before, in a particular social system. Major factors here are laws which reduce discrimination against members of racial, religious and sex groups. New educational opportunities and skills, new attitudes make some people able to take such jobs which were barred to their ancestors because of prejudice or lack of opportunities. Circulation mobility encourages people to acquire the higher position and to enjoy the higher prestige and pay (Tumin 2003 : 138 – 139; Rothman 2011 : 226).

17.5.5 Sponsored Mobility and Contest Mobility

Social mobility is further divided into sponsored mobility and contested mobility. Sponsored mobility is a form of mobility where the positions of elites are filled by the persons of established elites' groups or their agents. In other words, these elite posts are not open to all. Individual ability or efforts are not considered here. One's family background is more vital here. In contrast, in the case of contest mobility, elite positions are open to all and can be achieved by individual's ability and efforts. In case of sponsored mobility, schools and higher educational institutions play important role in selection process. Certain types of schools have limited seats with high fees. Sons and daughters of former pupils are preferred for admission. Students of these schools get greater opportunities when they try to get job. Along with their qualifications three other factors are very crucial here. These factors are – (I) Schools or other higher educational institutions perhaps have a common background among those who are selected and those who select; (II) family background and (III) personal contacts. In case of contest mobility, these three factors do not work. (Bhattacharyya 2014 : 319-320). Sponsored mobility and contest mobility – both systems are found in western industrial societies. According to Bhattacharyya (ibid: 320) these two forms of mobility are very important because they indicate the restrictions in mobility in open societies. Professional and high administrative posts are filled by the people of upper strata. Majority of the businessmen in Britain and in the United States are the sons of businessmen. Thus, levels of mobility are low compared to ideals of opportunity. In all societies, people remain close to the level of their own families. Some people experience vertical mobility but this is due to the result of changes in the occupational structure, not because of high level of equality of opportunity. It has also been found that intra-generational mobility is generally achieved through promotion at work and this increasingly depends on educational qualifications. Intergenerational mobility is mainly achieved through educational qualification. Thus, education becomes the main route of upward social Mobility.

288 NSOU • GE-SO-11 Further, marriage may become a route of mobility. People may achieve upward mobility through marrying a partner from a higher social class. It is mainly women who achieve upward vertical mobility through marriage. But this type of marriages is not common. Generally, people like to marry within their own social class. A small number of people find sports or other entertainment as a route for upward mobility (ibid: 321).

17.6 Obstacles and Effects of Social Mobility

A number of obstacles to social mobility in industrial societies are also present. Some of these obstacles are discussed below – (i) The socio-economic system is shaped like a pyramid; i.e., the number of posts at top rank is very few. So only a few persons can hold the posts of higher rank. (ii) Studies have revealed that class membership of an individual is established through heredity. Persons who belong to the top ranks, have come from professional or affluent family backgrounds. Wealthy people hardly begin with nothing. (iii) Studies in America has also revealed that white-collar parents are more affluent than blue-collar parents. They can provide their children with better education and other needs. As a result, children of upper strata are able to achieve similar level jobs. On the other hand lower graded manual workers are less able to facilitate the mobility of their children (Rothman 2011 : 226). This situation is true in case of many countries including India. Children coming from lower strata face a number of obstacles to success in education. It means that they do not do as well as their ability. The chances of upward mobility are thus restricted. Wealthy people can provide their children best available education and this leads them towards good jobs. (iv) Upper middle-class elite jobs are another obstacle. Judges and top civil servants are recruited almost from people who have gone through very expensive schooling and then elite Universities. Children of poor families cannot afford such schooling and are denied the chance of getting these elite jobs. (v) Women face much obstacle in achieving upward mobility because of several factors which make hindrance to compete in the labour market on equal terms with men (Bhattacharyya 2014 : 321).

Effects of Social Mobility

– Finally it is to be stated that vertical mobility heightens the consciousness of the differences. There are some people who belong to the lower strata have a strong desire to improve their condition while the people belonging to the upper strata, bear a feeling of sinking the social hierarchy. Intensive vertical mobility facilitates an increase of the intellectual progress, open mindedness, versatility of behaviour and so on. On the other hand, it also facilitates an increase

NSOU • GE-SO-11 289 in mental strain, superficially, scepticism and so on. Vertical mobility may diminish intimacy in relationships, may increase social isolation, loneliness and restlessness, spirit of individualism antagonism and so on (Bhattacharyya 2014 : 324).

17.7 Studies on Social Mobility The amount of vertical mobility in a society is an indicator of the degree of its 'open-ness' where talented individuals of lower strata can move up the socio- economic ladder. In this respect social mobility is an important political issue, especially for those states who have accepted liberal vision of equality of opportunity for all citizens. A good number of studies on social mobility have been carried on in several countries. An important study of America has revealed that majority of the subjects of upward mobility are men. So, lack of gender balance is found in this field. Upward occupational mobility is common though downward movement is also present both within the careers of individuals and intergenerational. Downward mobility is much less common than upward mobility. It has been found that white- collar and professional jobs have grown much more rapidly than blue-collar jobs. The sons of blue-collar workers have got a chance to move into white-collar positions. Education and training are two important factors for upward social mobility in industrial societies. As a whole, upward social mobility maintains social stability as well as integration (Giddens 2009 : 463-464). Another study of social mobility has analysed data from nine industrialized societies – Britain, France, West Germany, Sweden, Switzerland, Japan, Denmark, Italy, and the United States. This study has focused on mobility of men from blue- collar to white-collar jobs. It has been found that total vertical mobility across the blue-collar or white-collar line is thirty percent in the United States while in other countries, it varies between twenty-seven and thirty one percent. The conclusion of this study is that all the industrialized countries experience similar changes in respect of the expansion of white-collar jobs. Some social scientists argue regarding this study that significant differences between the countries may come out if more attention is given to downward social mobility (ibid : 465). Most studies of social mobility have focussed on objective dimensions of mobility – that is how much mobility exists in which directions and for what parts of the population. Another study has focussed on different approach – that is subjective feelings about changing class positions. Both the positive and negative views have come out from this study. Some people have opined that social mobility produces a sense of disequilibrium and isolation while others have expressed an

290 NSOU • GE-SO-11 optimistic view regarding graded process of adaption to a new class (ibid : 465-466). A number of studies regarding social mobility have also been done in Britain. Britain is not an open society. Studies have shown that majority of the mobility are upward mobility and are concentrated at the middle levels of the class structure. Mobility among men is higher than that of women. Further, mobility among men is higher than the mobility in the previous period. The main reason for this is that the occupational system had become more egalitarian. It has also been found from the studies that two- thirds of the sons of unskilled or semi-skilled manual workers keep themselves in manual occupations. Despite higher rates of absolute social mobility, relative chances for mobility among different segments of the population in Britain remain highly unequal. The occupational structure in Britain has been changed. Number of blue- collar occupations are decreased. Later studies (studies in 1980s) have shown that about a third of people in higher white-collar or professional jobs are from blue- collar backgrounds. Both intragenerational and intergenerational mobility are found here. Again, the sale is still biased against women (Giddens 2009 : 466-467).

17.8 Social Mobility and Women Sociologists are also interested to study mobility among women. In higher education, females are outnumbering males. Naturally some questions may arise here – Are long-standing gender-inequalities in society relaxed? Are the chances of mobility of women guided by the family and social background? It has been found that both for male and female family background and class of origin play important role. Individuals from disadvantaged backgrounds have a greater tendency to remain there. As a whole, women are experiencing much greater opportunity than their counterparts in the previous generation. Middle class women, as like as their male peers, go to universities and absorb in jobs after graduation. This trend indicates greater equality and heightens women's self-esteem. Though women's chances of entering good careers are improving some obstacles are still prevalent. Male managers and employers have a belief that 'women are not really interested in careers'. After marriage, women may leave work force. Domestic works and child- care activities are great obstacles in women's career. Men are less interested to share domestic works and child-care (ibid : 468-469). Tumin (2003: 146) has mentioned that in majority of the family's wives earn less than their husbands. Three factors play important role here – (a) direct discrimination against women, (b) lack of equal opportunity for married women, (c) norms force women to take account of non-income aspects of their jobs. These

NSOU • GE-SO-11 291 inferences are supported by the fact that the earnings of single women are greater than married women. But number of children have no influence on the occupational status of women. There is a popular belief that the physical attractiveness of women helps them to secure high standing job. But studies have shown that this is not true in the marriages of women of higher social rank. Educational level is more influential than physical attractiveness or social origin. It has also been found that education and first job become important in determining final job. If women have achieved educational parity with men, they still remain in lower occupational and income levels. Further sometimes women may achieve upward mobility through marriage but women experience downward mobility resulting from breakdown of families through death of husband, divorce or abandonment (Rothman 2011: 227). Bhattacharyya (2014: 319) has remarked that "As compared with men, women have far poorer chances of upward mobility but greater chances of downward mobility." 17.9 Caste Mobility In India, caste system is a social reality. A caste system is such a system where individual's rank, right obligation are ascribed on the basis of birth into a particular group. Generally, it is believed that caste-system is a closed system where vertical mobility is strictly restricted. But it is not so rigid as is generally assumed. Vertical mobility is also found in caste-based societies. Generally, it is believed that traditional caste-based Indian society is relatively static which is excluded from social mobility. But in reality, mobility is found in different ways. One of these ways is mobility through warfare. It is an age-old practice (Bhattacharyya 2014 : 322; Ahuja 1999 : 58). In ancient India, rulers were Kshatriyas. But there were some rulers of peasants who after capturing territory established a kingdom. These peasant conquerors claimed Kshatriya status and rose from their caste-rank into Kshatriya-rank. Kolenda (1997, cited in Ahuja 1999 : 58) has opined that before the British rule, the most effective way to rise in

87%

MATCHING BLOCK 81/115

W

the caste-system was by the acquisition of territory either through conquest

of land or through capturing of empty land. Shivaji's caste rank (Maratha) was considered as Sudra. But he established his own empire and went through a religious rite of transition into Kshatriyahood. Along with Shivaji's rise in Varna status, his caste members (Marathas) also claimed Kshatriya rank (Ahuja 1999: 58). Caste-groups also raise their caste-rank by serving Hindu or non-Hindu rulers. For example, Patidars of Gujrat, a peasant group of Sudra varna, supported the Maratha descendants of Shivaji, the Gaekwads, who ruled Central Gujrat.

292 NSOU • GE-SO-11 Gradually they established their small regimes by claiming as Kshatriyas. Another example of rise in caste through service to rulers is that of Kayasthas. Kayasthas were a low caste group in the twelfth century. They were professional letter writers before the invention of printing, copied the writings and kept records. They made themselves useful to the Moghuls and then to the British rulers. In nineteenth century, the Kayasthas in Northern India are considered as twice-born categories though they still remain in Sudra category in East Bengal. Here, the unit of mobility is not caste or Jati but the family, or a group of families. This type of upward mobility may lead to the formation of a new Jati or caste (Ahuja 1999 : 58-59). During British rule, Jati identity was recorded in census (from 1891 to 1931). Many caste-groups tried to improve their caste-rank by registering themselves as members of the twice-born varnas. Claimant groups offered evidence from myths and history. District committees were set-up to evaluate the claims. Some of those claims were sustained while majority of those claims were rejected (ibid:59). Singh (2004 : 54) mentioned that, some castes continuously attempted to claim higher caste position in censuses between 1911 and 1931. If in one census, a caste group claimed the status of Vaishya, in next census, its claim would be the status of Kshatriya and in next it would be Brahmin. These claims were so irksome to the administration that at the 1941 census and there after the column of caste was eliminated from the census schedule. Caste mobility also occurred through the process of sanskritization and westernization. A low caste was able to improve its caste rank through the process of sanskritization. Low caste members adopted the customs, rituals, rites and beliefs of and higher caste in locality and after a generation or two they claimed the status of that higher caste. Thus, it was obviously an upward vertical mobility as well as cultured mobility. During British rule in India, some factors such as industrialization, occupational mobility, developed means of communication, western technology, modern education, giving up evil customs and social practices played important role to make sanskritization possible. Along with sanskritization the process of westernization also made social mobility possible. Westernization helped to change One's ideology, values, cultures and so on (Ahuja 1999 : 60-61). Sometimes several castes like Mahars of Maharashtra, Nadars of Tamilnadu have used politics for ameliorating their social condition (Ahuja 1999 : 61). 17.10 Summary Thus, social mobility is the movement of individuals, families, households, or

NSOU • GE-SO-11 293 other categories of people within or between social strata in a society. It is a change in social status relative to one's current social location within a given society. This movement occurs between layers or tiers in an open system of social stratification. Open stratification systems are those in which at least some value is given to achieve status characteristics in a society. The movement can be in a downward or upward direction. Markers for social mobility, such as education and class, are used to predict, discuss, and learn more about an individual or a group's mobility in society. 17.11 Questions G-A (5 Marks each) (i) Define Social Mobility. (ii) What do you mean by horizontal mobility? (iii) What is vertical mobility? (iv) How do you explain 'status attainment model'? (v) What is structural mobility? (vi) Mention different types of social mobility. (vii) Write a note on Gender Mobility. (viii) Explain inter-generational mobility and intra-generational mobility. (ix) Write an essay on caste mobility. G-B (10 Marks each) (x) Explain closed society and open society. (xi) Mention the causes of vertical mobility? (xii) Differentiate between horizontal mobility and vertical mobility? (xiii) How does mobility bring changes in society? (xiv) Write a note on studies of social mobility. 17.12 Suggested Readings (i) Abraham, M Francis. 296 NSOU • GE-SO-11 in the caste hierarchy seek upward mobility by emulating the rituals and practices of the dominant or upper castes. It is a process similar to “passing” in sociological terms. This term was made popular by Indian sociologist M. N. Srinivas in the 1950s. In a broader sense, also called Brahmanization, it is a historical process in which various local Indian religious traditions become aligned to and absorbed within the Brahmanical tradition, creating the pan-Indian tradition of Hinduism.

18.3 Sanskritization – The Concept Caste system, in theory, is a closed system; that means no one can change his caste identity which he has acquired by birth. But in practice some movement has been found within caste-system. ‘Sanskritization’ helps to explain the changes within caste-system in the traditional social structure of India. The term ‘Sanskritization’ has been conceived by M.N Srinivas when he studied religion and society among Coorgs in Mysore in the state of Karnataka in south India. People of lower castes, in order to raise their position in the caste hierarchy, adopt some customs, rituals, ideologies, life-style of the Brahmins and give-up some of their own habits such as meat eating, consumption of liquor etc. which are considered impure by the higher castes. After a period of time, a generation or two, people who imitate Brahmins claim higher positions in caste-hierarchy. It is an upward group mobility not individual. Initially this process was defined as ‘Brahminization’. Later on, the term ‘Sanskritization’ has come to denote this process of mobility. (Doshi and Jain 2004 : 81-82; Singh 2004 : 5; Srinivas 1998: 6-7).

18.4 Brahminization and Sanskritization Srinivas (1998: 7) has admitted that, he has emphasized on Brahminical model of Sanskritization specially derived from Kannada, Tamil and Telegu Brahmins and has ignored the other models, viz. Kshatriya, Vaishya, Sudra and even Brahmin castes of other regions. In addition to Brahminical model, Pocock (1955, cited in ibid) has pointed to the existence of Kshatriya model. According to Pocock (ibid), Kings (or Kshatriyas) along with the Brahmins, are also superior group to the Vaishya and Shudra varna. Sometimes they become dominant political power in some areas and also become local dominant non-Brahmin caste of that area. Kshatriya model of sanskritization is followed in those areas. Srinivas (1998 : 7-8) has mentioned that not only the kingly model but the other models (locally dominant NSOU • GE-SO-11 297 castes) of varna group are also followed. It has been found that the relative prestige and rank of different varnas vary with time and place. In many areas life-style of any non-Brahmin group is either equal or higher than that of the Brahmin groups; in those areas, people who wish to improve their position may follow the patterns of life-style of those dominant non-Brahmin castes. Even the life-style of the merchant and peasant are considered as models in localities where these groups are dominant. Sanskritization is a broader concept than Brahminization. It is a general tendency among the lower castes to imitate the cultural ways of higher castes. These higher castes may be non-Brahmins; they may be Kshatriyas, Jats, Vaisyas, Rajputs etc. Hence, the term ‘Brahminization’ does not explain all these processes and different terms in different cases have to be used. Further there are no uniform characteristics among the Brahmins. Though, by and large, Brahmins are vegetarians, some of them like Kashmiris, Bengalees, Saraswath Brahmins are non-vegetarians. Some Brahmin groups are more sanskritized in their style of life than others. Brahmins in some areas such as Punjab, parts of western Uttar Pradesh and Rajasthan have a low secular status. Some Brahmin groups in Gujrat (e.g., Tapodhan) Bengal and Mysore are considered as ritually low. (Srinivas 1998 : 8). If the term ‘Brahminization’ is to be used then it should be specified which particular Brahmin group is meant. Further, the reference groups of sanskritization are not always Brahmins. Srinivas (1998 : 6) has mentioned that,

90%

MATCHING BLOCK 84/115

SA Social Change in Modern India.pdf (D67117255)

Harijan castes in Mysore do not accept cooked food and drinking water from the Smiths.

Smiths claim themselves as ‘Vishwakarma Brahmins’. Though their claim is not accepted by others and even untouchables, they

100%

MATCHING BLOCK 85/115

SA Social Change in Modern India.pdf (D67117255)

are certainly one of the touchable castes and therefore superior to Harijan.

Similarly, Maraka Brahmins, who are certainly Brahmins, are not accepted by Okkaligas (peasants), Kurupas (Shepherds) and others. However, the ways of life of Lingayats, who are not Brahmins but claim as equal to Brahmins, are adopted by some low castes. So, the term Brahminization is not enough for explaining the process of cultural and social mobility (Ahuja 2006 : 354; Rao 2003 : 310).

18.5 Sanskritization : Caste Position and Rituals The Brahmins constitute the top of the Varna hierarchy and enjoy a respectable position in the caste system. They are also expected to conform to ideal norms of Hinduism. The castes who belong to lower level in caste-ladder especially untouchables are tolerated some kind of deviation. Thus, the higher position in caste-structure is

298 NSOU • GE-SO-11 associated with high expectations of conformity to ideal Hindu norms. But the ideal code of conduct in Hindu religion varies from time to time. For example, in Vedic period, the Brahmins took Soma (liquor), offered animal sacrifice to gods, ate beef. All these have become prohibited for Brahmins in later period. Thus, what was culturally accepted (Sanskritic) in Vedic period, became taboo in later period (Singh 2004 : 6). Through the process of sanskritization Hindu low-caste groups

chapter three-origin and development of caste ... (D40662830)

or tribes or other groups change their customs, rituals, ideology and way of life in direction of a high twice-born caste. The

first three groups of varna model i.e. Brahmin, Kshatriya, Vaishya are considered as 'twice-born' caste or dwija as they are entitled to put sacred thread at the ceremony of 'upanayana' which is interpreted as second birth. Only the members of these three varnas are entitled to perform Vedic rituals. Among these twice-born varnas, the Brahmins are regarded as better models of Sanskritization than the others. The cultural content of each varna varies from one area to another and also from one period of time to another. The diversity is generally greater at lower levels of the varna hierarchy than the highest group (Srinivas 1998 : 6-8). Further, Srinivas (1998 : 9) has mentioned that there are some castes belonging to the category of Shudra maintain highly sanskritized style of life whereas others are minimally sanskritized. But the dominant peasant castes, may be highly sanskritized or not, provide local models for imitation.

Social Change in Modern India.pdf (D67117255)

A feature of rural life in different parts of India is the existence of dominant

caste. In traditional society, a

67%

MATCHING BLOCK 86/115

W

dominant caste should own a large amount of arable land locally available, must occupy a high place in the local

caste hierarchy and should have strength of numbers. Dominance of one caste may be changed in time and sometimes there may be more than one dominant castes in a village. In British India, western education, job in administration and urban based income have become the important factors for dominance. In independent India, introduction of adult franchise and Panchayati raj (local self – government at village level) have given a new sense of self-respect and power to low castes who enjoy reservation of seats in all elected bodies from the village to the Union Parliament. The long-term implications of these changes are important in this respect that a particular caste group with its numerical strength can sway the local balance of power. In traditional society, a small number of people belonging to a high caste and having a large quantity of arable land can enjoy authority over the entire village. Later, in many parts of rural India power has been transferred to the hands of numerically large, land owning peasant castes (Srinivas 1998 : 10).

NSOU • GE-SO-11 299 In rural India, dominance is not purely a local matter. Sometimes a caste group enjoys dominance regionally. In such a situation dominant caste group in a village finds that it has to reckon with the lesser caste group in the village which is a dominant caste group in the region. Further, vast improvement in communication has contributed to the decline in prestige of purely local styles of living. It is now a general trend to borrow urban style of living. The long-term effect of this process is a decrease in cultural diversity and an increase in uniformity. It is to be noted here that land ownership is a crucial factor in establishing dominance. In traditional India, the bulk of the arable land is concentrated in the hands of a relatively small number of big owners and a large number of people either own very little land or no land at all. Landowner generally come from higher castes and enjoy power over bulk of the poor villagers. Along with power land ownership confers prestige and it is found in traditional India that all walks of life tend to invest in land (Srinivas 1998: 11- 12). There are ample examples in rural areas that land owning castes enjoy power over other castes even over ritually superior castes. In some places of Punjab, land owning Jats look down upon the Brahmins as their servants. In Madhopur village in the eastern Uttar Pradesh, the dominant castes Thakurs do not accept cooked food from the Brahmins except their gurus or religious teachers. In Rampura village in Mysore, a Brahmin priest needs to be accompanied by someone from dominant pleasant caste to perform his ritual duties. So, there are some areas in rural India where ritual rank is less power than economic rank. In contrary, the Brahmins of some areas refuse cooked food from other castes even if they are economically powerful. An economically powerful Gujrati Bania does not enter the kitchen where his Brahmin cook works (ibid :13). Various models of Sanskritization are found in rural India. Local dominant castes become the model for this cultural transmission. If a Brahmin or Lingayat becomes locally dominant then Brahminical model of Sanskritization is followed. If Rajput or Bania becomes dominant then Kshatriya or Vaishya model is followed.

100%

MATCHING BLOCK 88/115

W

Each locally dominant caste has its own conception of Brahmin, Kshatriya or Vaishya models.

According to Srinivas (1998 : 13-14), two distinct tendencies are associated with caste groups. Each caste group is dominated by local moral and religious norm. Multiple cultures are associated with castes. Some beliefs, ideas, practices are followed by one caste group while other groups do not follow the same. Generally, it is determined by hereditary occupations which they follow. A peasant group talks about agricultural skill, its importance and difficulty and patience 300 NSOU • GE-SO-11 required and so on. Similarly, artisans or any other serving castes show some attitude towards their hereditary occupations. The second tendency inherent within caste system is the imitation of the life-style of higher castes. Elaborately speaking, one local section of a caste imitates another local section of caste. It is to be noted here that imitation is not of any particular caste or higher caste. Model of imitation is from any higher caste. Local village system is independent of wider Indian system. Ideal behaviour may be derived from the sources of great Traditions like pilgrimages or religious doctrines. The process of Sanskritization is neither smooth nor automatic. The leaders of dominant caste watch the value system of the village. They ignore minor changes in the ritual and style of life of low castes, but when the members of low caste refuse to perform their caste-bound service then they (leaders of dominant caste) take action against them. If the process of Sanskritization hampers the economic interest of any caste, then the elders of dominant caste interfere in that process. But this does not hold good in the case of agriculture and trading in some goods which are deemed to be open occupations. 18.6 Sanskritization : Some Barriers When any low caste group follows any important symbols or rituals then they face strong opposition even punishment from dominant high caste group. The members of dominant castes are also concerned regarding the imitation of customs of upper castes by the lower castes. They ignore the minor changes in style of life of lower castes. But if occupational changes disturb the village solidarity as well as social system then they look into the matter. If lower castes refuse to perform their traditional duties or imitate any important symbols of higher castes then they are punished severely by the higher castes. Some incidents may be described here for instance. Once a low caste man in a village of Gujrat dressed like a Patidar (high caste) and carried his hookah like a Patidar. He was caught, beaten and ordered "never to try to look like a Patidar again." In 1936, the Noniyas (low caste of salt makers) of Senapur village in eastern Uttar Pradesh wore sacred threads. They were also beaten by their Kshatriya landlords and their sacred threads were torn off. A collective fine was imposed on them. Their attempt was direct and it was a public challenge. Later, the Noniyas wore sacred thread quietly and on an individual basis. Similarly, Ahirs (cowherds) of North India donned the sacred thread and claimed Kshatriya status.

W

In North Bihar, the high caste Rajputs and Bhumihar Brahmins

NSOU • GE-SO-11 301 prevented them which in turn led to violence and resort to the law courts. In 1930 the Kallar (a dominant caste) in the district of Ramnad (in the extreme south of India) imposed eight prohibitions on Harijans. When Harijans disregarded the order of Kallars then their huts were fired, granaries and property were destroyed (Srinivas 1998: 14-16). Similarly, in the first half of the twentieth century the Mahars of Maharashtra (Kothari 1995: 35) faced strong opposition when they claimed equal rights with caste Hindus and attempted to enter in three temples. Nadars (low caste) of Tamilnadu suffered severe social disabilities as a defiled caste. During the first of nineteenth century Nadar women were motivated by Christian missionaries and dressed like Nair (high caste) women which caused a wide spread riot in Christian areas in South India (ibid : 101-102). 18.7 Features of Sanskritization The concept of sanskritization has emerged in 1952. Sociologists and social anthropologists have shown their interest regarding this issue. It is agreed that the concept of sanskritization is useful to analyse changes among villagers, especially in respect of cultural changes. Some basic features of Sanskritization are given below : (i) Sanskritization is a cultural paradigm – Culture consists of ideas, beliefs, traditions, rituals, practices and so on. When lower castes or non-caste groups change their own ways of life and imitate upper castes then it is a change of their cultural life. (ii) Sanskritization is generally an

62%

MATCHING BLOCK 98/115

SA

Ideologies and the Thoughts of Anthropologists ... (D131354075)

upward mobility for the caste. But mobility may take place without sanskritization. However, the mobility associated within sanskritization directs only in positional changes in the system. It does not lead to any structural changes in

society. (iii) Unit of mobility is group, not individual or family. (iv) Sanskritization is a change directed to twice-born castes. There are more than one models for sanskritization. A particular group may imitate Brahmins as their model of change while in another village, they may follow Kshatriya or Vaishya model. Sanskritization is thus an endogenous source of social change during those periods of relatively closed Hindu social system. (v) From social-psychological point of view, sanskritization is a motivation toward 'anticipatory socialization' to

73%

MATCHING BLOCK 91/115

W

the culture of a higher group in the hope of gaining its status in future. 302

NSOU • GE-SO-11 (vi) Sanskritization has two connotations – 'historical specific' and contextual specific'. In 'historical specific' sense, sanskritization indicates social mobility in different periods of history of caste-based Indian society. In contextual specific sense, the process of sanskritization varies from region to region, time to time depending on factors internal as well as external to the context. In many places lower castes imitate Kshatriyas; at other places, tribes imitate caste-Hindus; in a few exceptional cases, caste Hindus even higher castes imitate tribal ways of life (tribalization). In a few villages where Muslims are dominant group, Muslim culture is followed. (vii) The local dominant caste or group become the model for sanskritization. The concept of sanskritization is thus integrated with economic and political domination. But there is a gap between ritual rank of one caste and its political-economic position. The domination of political and economic field does not mean the highest ritual rank in locality. Further,

100%

MATCHING BLOCK 92/115

W

each locally dominant caste has its own conception of Brahmin, Kshatriya or Vaishya models.

Thus, the context of sanskritization differs not only in each model but also within the same model from region to region. (viii) Impurity or the gap between pure and impure can be removed or reduced through the process of sanskritization. (ix) The values of Sanskrit literature like 'karma', 'dharma', 'moksha', etc. are also adopted through the process of sanskritization. (x) Both sacred and secular elements of culture are associated with sanskritization. Lower castes imitate rituals and sacred customs of upper castes. Further they imitate consumption patterns also

92%

MATCHING BLOCK 93/115

W

such as betel-chewing, wearing gold ornaments, shoes and other forms of dresses. (

xi) Lower castes have a tendency to improve their status in caste hierarchy by adopting vegetarianism and teetotalism. (xii) Sanskritization is not an 'one-way' process. The lower castes take the rituals from higher castes and the higher castes even Brahmins also worship their deities (or local deities) along with the gods of all India Hinduism. (xiii) Some factors like occupational mobility, developed communication. Modern education and modern technology are conducive to Sanskritization. The British rule in India has provided a favourable condition for Sanskritization. (xiv) Sanskritization is a corporate activity which attacks hierarchy. It is therefore a process towards 'general levelling of culture.'

NSOU • GE-SO-11 303 (xv) Dominant castes are also aware of the movements of sanskritizing castes. They take defensive mechanisms and maintain or create more status- distinctions than before which are generally beyond the reach of sanskritizing caste. 18.8 Sanskritization among Tribes and Scheduled Castes According to Pramanick (1994 : 61-62) the process of caste formation among the tribes has been reported by scholars in different ways such as Hinduization, Aryanization, Sanskritization, Tribe-Caste continuum and so on. Ghurye (1963, cited in Pramanick1994 : 57-58) considers tribals as 'backward Hindus.' To support his view Ghurye has presented ample data from the tribal communities of central India. According to GhuryeKatauris, Bhuiyas, Oraons, Khonds, Gonds, Korkus, Baigas, Kols, Bhils, Halbas, Bhuiyas etc. have substantially adopted Hinduism as their religion. In Bastar region, the main tribes participate in the Dussahara festival which is marked as a festival of Hindus. Srinivas (1998 : 7) has mentioned that the process of sanskritization is also found among tribes. Ghurye (1963, cited in Pramanick 1994 : 58) believes that the economic motivation plays an important impetus for the adoption of Hinduism. After adoption of Hindu religion, tribes can join in specialized types of caste-occupations which are in demand in society. Here is to be mentioned that Ghurye (ibid : 71) is also aware of the fact that the tribes of eastern region are culturally so different that his general conclusions regarding tribe-caste relationship are not applied to them. Similarly, Bose (1996 : 170) has opined "fact of economic affiliation to Hindu society may explain why the Juangs look upon Hindu culture as superior to their own." Here is to be mentioned that the process, which is widely described as 'sanskritization', is discussed by Bose (1996 : 168-181) as "The Hindu Method of Tribal Absorption". Bose has studied three

100%

MATCHING BLOCK 94/115

W

tribes of Orissa – the Juangs, the Savaras and the Pauri Bhuiyas.

The Juangs are originally hunters, food gatherers and jhum cultivators. The state has restricted hunting and that type of cultivation for the preservation of forests. The Juangs have been forced to adopt wet cultivation in the valleys between the hills. They work with bamboo and sell baskets, wicker-boxes etc. and start to earn money. Thus, they have been tagged to the larger body of Hindu society. In the matter of manufacture of bamboo articles, the Juangs enjoy monopoly because no other caste joins in that occupation from a fear of losing its own social position. Further, Bose (ibid : 33 – 35) has noticed that the Juangs have some specific patterns of rituals which are clear indicators of brahminical culture such as the bath, the fast, the use of turmeric and sun-dried rice etc. On the other hand, some practices

304 NSOU • GE-SO-11 such as the sacrifice of cocks, worship of their own deities Burambura and Buramburi, absence of a separate category of priest bear the marks of their autonomous folk culture or tribal culture. The Oraons and Mundas of Chotanagpur have a strong inclination towards Hindu religion and ideas (ibid : 170). Ahuja (1999 : 290-291) has mentioned that the process of acculturation is found among many tribes in different states. One of the examples of acculturation is Sabaras (tribe) in Ghorabar village in Orissa. The sabaras have discarded egalitarianism and accepted caste system. They are hierarchically divided into four segments on the basis of occupational distribution. Four divisions are like four 'varnas' in Hindu religion. These four segments are – hunting and fighting, worshipping, cultivation and dancing and singing respectively. In varna system, worshipping occupies first position but among the Sabaras, it occupies second place. Further, purity and pollution are absent among the Sabaras unlike caste system. They are divided into sub-groups like Hindu sub-caste groups. Each sabara sub-group has its own panchayat. Each sub-division of the Sabaras claims descent from three Sabaras who figure in Ramayana and Mahabharat. Hindu culture is prominent in the marriage customs of Sabaras. They have been accepted as 'caste' in the village not as tribe and have been assigned the occupation of wood-cutting. The model followed by the Sabaras for mobility is Vaishya not Brahminic. Ahuja (ibid) prefers the term acculturation to sanskritization. Pramanick (1994 : 59) has mentioned that, "The conferences of Social Workers and Anthropologists held in Calcutta in 1948 estimated that of the total 25 million tribes living in India, 20 million live in the plains and are assimilated with the rest of the people." This process of assimilation is not continued. The British rulers do not like the process of assimilation and have tried to check it. This is obviously helpful to their colonial interest. The colonial rulers, by separating tribals from non-tribals, have fulfilled their commercial and business interests. The British rulers have exploited the natural resources with the help of cheap labour provided by the tribes. They have tried to keep separate tribal areas so that tribes can act as human reservoir to meet the demands of European commercial interest. But this separation between tribals and non-tribals is detrimental to national integration (Pramanick 1994 : 64-66). Shasmal (Pramanick and Manna 2006 : 172-179) has noticed the Bauris, one of the large scheduled castes of West Bengal. In West Bengal, Bauris are mainly agricultural labourers while in lower Orissa, they are a basket-making caste. The caste-rank of the Bauris is so low that they do not have fixed barber or Brahmin to perform their socio-religious ceremonies. The religious beliefs and practices of the Bauris do not differ much from the upper caste Hindus. They worship the goddess NSOU • GE-SO-11 305 Durga, Saraswati; celebrate festivals of colours, Rathjatra (Sacred Chariot) drawing ceremony) etc. Along with the upper caste Hindus. According to Shasmal (ibid : 179) though Bauris bear some traits of aboriginals, the process of sanskritization have upgraded their position. Mahars are the original inhabitants of Maharashtra and are found almost in every village of Maharashtra. Mahars' hereditary duties are village watchman, sweeping the village roads, carrying death notices and messages to other villages, bringing fuel to the burning ground, removing the carcasses of dead cattle of the village. They have fixed duties in religious matters. They belong to the untouchable category. Public places like temples, schools etc. are closed to them. Some restrictions on clothing and ornaments are imposed on them. Their role in village festival is specified. Everything is the indicator of their low status. British rule has brought several socio-economic changes in India. Mahars, like many other castes, have got a chance to improve their condition. Here is to be noted that, Mahars have a record from the time of Shivaji as guards in the hill forts and soldiers in the artillery. Thus, Mahars have an old record of military connection which help them to put a claim of Kshatriya status. Joining in military is surely an outlet to the Mahars from their hereditary occupations. Their service in military continues in British period also. Zelliot (Kothari 1995 : 34-35) has mentioned that throughout the first period of the 20th century, numerous efforts including the practices of higher caste rituals (sanskritization) are made by Mahars for improving their caste status. Ultimately, they have become a strong united group under the leadership of Dr. B. R. Ambedkar (ibid : 37). The Nadars of Tamilnadu suffered socially and economically for a long time. As a ritually impure caste Nadars were forbidden to enter into Hindu temples, to use wells for caste-Hindus, to carry an umbrella, to wear shoes and golden ornaments, to milk cows, to walk in certain streets, to approach a Brahmin within twenty-four paces and so on. Women were imposed more restrictions. In early 19th century, European missionary's activities helped Nadars and a good number of Nadars were able to improve their economic conditions. Nadars gradually disassociated themselves from community's traditional occupation. During the latter part of the 19th century, the Nadars began to sanskritise their ways of life. Many of the Nadars men cropped their hair like the Brahmins, put on sacred threads, became vegetarians, named their children after the new sanskritic gods. Some Brahmin priests were found to provide their services to the wealthy Nadar temples and caste-ceremonies. Newly advanced Nadar claimed high Kshatriya status (ibid : 99-104).

306 NSOU • GE-SO-11 18.9 Sanskritization and its Negative Aspects The people of lower castes accept the customs and habits of higher castes (though the process of sanskritization). Some practices and habits of higher castes are considered good and functional in respect of present rational standard and are imitated by lower caste groups. But there are also some practices among higher castes which are not good; even those are degrading and dysfunctional according to modern rational standard. In the process of sanskritization, lower caste groups also accept those degrading customs and habits. For example, generally people of lower castes are more liberal in the spheres of marriage, sex and attitude towards women. They permit divorce and widow remarriage. On the other hand, Brahmins regard marriage indissoluble, prevent widows from remarriage and expect that widows shall maintain restrained ways of life. When a low caste group achieves higher rank in the process of sanskritization or its ways become more sanskritised, it adopts the marriage code of Brahmins. Further, a high caste Hindu wife is expected to treat her husband as deity. She is expected to perform a number of vratas (religious fasts) for the welfare of her husband and other members of her family. Lower caste groups also accept these practices. Sanskritization thus brings harshness towards women. It is a blind and irrational imitation of the customs, practices, habits and values of higher castes, especially Brahmins (Ahuja 1999 : 470-471). Theoretically, sanskritization represents the cultural changes of the little as well as the great tradition. But majority of the empirical observations indicate that the process of sanskritization is mainly confined to little tradition only. So sanskritization though wider in scope remains restricted to a few castes in a specific region as castes vary from region to region. Any movement of sanskritization among the potters in any particular region does not mean that the movement will spread among the potters at national level. The concept of Sanskritization is limited within ritual-cultural sphere. In terms of social stratification, Sanskritization considers only caste hierarchy that is a ritual-cultural hierarchy. It does not explain other types of hierarchies in society. Further, Sanskritization is only an analytical tool in the context of group mobility and particularly with reference to dominant castes. It cannot help to understand mobility at the level of individual or the level of family. Srivastava (cited in Sharma 2002 : 203-204) has opined that the progressive family becomes a strong reference group for mobility. He has mentioned that the koiris of Barigaon do not imitate the behaviour patterns of the dominant caste chhatris but imitate the behaviour patterns of their own caste from a nearby village. There is no dominant NSOU • GE-SO-11 307 caste in the village Asalpur and the Raigars imitate the Raigars who live in Ahmedabad. Here 'city-culture' becomes prominent instead of religious adaptations (Doshi and Jain 2004 : 87; Sharma 2002 : 200-203) It is to be stated that Sanskritization explains only socio-cultural mobility in a very limited way. The lower caste people adopt the cultural practices of upper caste groups and these practices no longer remain the symbols of status for the upper castes. Sanskritization is the positional changes within the caste system and not of the system. In the present situation, on the one hand dominant castes change their strategies for the perpetuation of their dominance (Sharma 2008: 327-328), and on the other hand, some castes like Jatavas of Agra find Sanskritization no longer attractive and have decided to politicise themselves to extract greater dividends (ibid: 218). In modern India, the concept of dominant caste becomes gradually irrelevant. The concept of ritual hierarchy is replaced by professional status and party association. In developed villages, dominant caste is no longer considered as reference model for Sanskritization. Some American scholars have applied reference group theory to analyse social change in India. Doshi and Jain (2004 : 88-89) have opined that reference group theory is more comprehensive than dominant caste theory. The process of Sanskritization, at least as depicted by Srinivas (1998 : 1-48), explains social mobility as well as social change only in Indian context where caste system exists. It is not applicable to other societies. Sanskritization does not explain the adoption of non-sanskritic tradition. (Ahuja 1999 : 61). Urge of Sanskritization sometimes produces psychological strains. If any group, especially very small community, does not succeed to raise its status after a long period of attempt, then their status necessarily creates an insecure and unsettled position in society. This is really a frustrating and painful situation for that group. In spite of this psychological cost, the process of Sanskritization always present in Hindu Society (Kothari 1995 : 12-13). As the process of Sanskritization is neither smooth nor automatic, it creates tensions, contradictions and inter-class hostility in society, manifestly or latently. It does not reduce economic inequalities nor it challenges caste hierarchy and dominant castes. Sanskritization does not fit for political analysis of the village community (Sharma 2002 : 58). In contemporary India, democratisation has become a new political as well as social value. So, the hierarchical transformation of lower castes through the process of Sanskritization is becoming weak. Youths belonging to lower castes have started to believe that they have their own dignity, they have legitimate rights-nobody can deny that. So they do not need to follow higher castes (Doshi and Jain 2004 : 89).

308 NSOU • GE-SO-11 18.10 De-Sanskritization and Re-Sanskritization It has been observed that new social situation and value system have changed the model of sanskritization. In Gujrat, Kolis and Patidars imitated Rajputs (Kshatriya). But now they prefer to imitate business model (Vaishya). Some years ago, a man of Baria (lower caste) was victimized as he tried to imitate the style of Patidar castes. But now-a-days such emulation is ignored. Another pattern of sanskritization is found now-a-days. In Uttar Pradesh Koris refuse to accept water from others even from the Brahmins. They consider Brahmins less pure than themselves. Many other lower castes reject some models of the great tradition in their process of Sanskritization; such process of deliberate reaction against Sanskritization is called De-Sanskritization. De-Sanskritization may be a reflection of anti-Brahmin movements in South India and an expression of politicization (Singh 2004 : 55-57). Last process of Sanskritization may be called re-Sanskritization. A westernized or modernized group discards many of the cultural symbols of modernization such as dress, spoken language, food habits, style of living and accepts traditional sanskritic symbols and beliefs. Before independence, the Rajputs of eastern Uttar Pradesh were identified with the western culture and ideologies. But after independence they deliberately accept orthodox Hindu culture (ibid : 56). 18.11 Summary The social aspect of Sanskritization is much more important from the view point of change. The low caste individuals are inclined towards Sanskritization because in

100%

MATCHING BLOCK 95/115

W

that way they can elevate their social status and get higher

status in caste hierarchy. Economic betterment and Sanskritization is another related issue. The lower caste people have given up un-cleaned occupation to raise their economic status because clean trades are a symbol of social light. Sanskritization also can be observed in the religious field. Like Brahmins many of the lower castes people

NSOU • GE-SO-11 311 Unit - 19 □ Urbanization Structure 19.1 Objectives 19.2 Introduction 19.3 Urbanization: Definition 19.4 Prerequisites of Urbanization 19.5 Difference between Rural and Urban areas 19.6 Characteristics of Urban Community 19.7 Urbanization in India 19.8 Urban Evolution 19.9 Urbanization and Theories 19.10 Urbanization and Social Change 19.11 Summary 19.12 Questions 19.13 Suggested Readings 19.1 Objectives • To introduce various socio-economic theories which explain process of urbanization and its outcomes. • To create an understanding about the organization of space in terms of land uses at the city level • To understand the hierarchical arrangements of urban settlement 19.2 Introduction Urbanization (or urbanisation) refers to the population shift from rural to urban areas, the corresponding decrease in the proportion of people living in rural areas, and the ways in which societies adapt to this change. It is predominantly the process 311

312 NSOU • GE-SO-11 by which towns and cities are formed and become larger as more people begin living and working in central areas. Although the two concepts are sometimes used interchangeably, urbanization should be distinguished from urban growth. Whereas urbanization refers to the proportion of the total national population living in areas classified as urban, urban growth strictly refers to the absolute number of people living in those areas. It is predicted that by 2050 about 64% of the developing world and 86% of the developed world will be urbanized. That is equivalent to approximately 3 billion urbanites by 2050, much of which will occur in Africa and Asia. Notably, the United Nations has also recently projected that nearly all global population growth from 2017 to 2030 will be by cities, with about 1.1 billion new urbanites over the next 10 years. 19.3 Urbanization : Definition Urbanization denotes excessive growth of cities. It is a part of developmental process though it varies from society to society. In backward societies, process of urbanization is slow but in developing countries, the process of urbanization becomes gradually faster. Newly established industries and other commercial developments create various types of jobs. As a result, a large section of population concentrates in urban areas. A number of terms such as city, community or urban- community, urbanism, urban areas, urbanisation are used by the urban sociologists. Urbanization is a continuous and universal process in all types of developed and developing countries. Men create city – it is a product of men and their achievement. It is a centre of any civilised society. "Civilization means the city and the city means civilization." By becoming a member of a city, a man becomes citizen. A city is regarded as an epitome of culture. As a manufactured environment culture surrounds the city man. A city is described as an environment of bricks, steel, mortar and cement. Bridges, tunnels, streets, subway platforms, monuments and buildings have detached a city from a village (Rao 2004 : 440-441). The term 'urban' is popularly used but it is defined in various ways by the urban sociologists. They have used different criteria to define the concept urban and also a community as urban. Urban community life represents the city-life. City is not only a collection of individuals. City is a state of mind, a body of customs, an organised attitudes and sentiments. It is a geographic area inhabited by closely settled population whose occupations are non-agriculture. Some urban sociologists have

NSOU • GE-SO-11 313 defined city as a place with a minimum of ten thousand population. The 1991 census has defined a city or urban place on the basis of following criteria. (i) An urban area must have minimum five thousand people. (ii) At least 75% male workers remain engaged in non-agricultural occupation. (iii) Density of population must be minimum one thousand per square mile. (iv)

All places with a municipality, corporation, cantonment board or notified town area are also regarded as urban area. The definition of urban area is varied from countries to countries. For example, in Japan, Urban areas are considered as a place having minimum 30,000 inhabitants. In U.S.A., this number is 3,500; in Netherlands and Holland, this number is 20,000 and the number is just 2000 in Austria, Germany and France. So the size of population is not important for a definition of urban area. The important aspects of urban area are the characteristics of its inhabitants. Urban area is marked by heterogeneous population, complex division of labour, impersonal secondary relations, dependence on formal social control, predominance of non-agricultural occupations, formalised system of local government and so on (ibid : 441-445). Kar (2009: 86) has mentioned that the definitions of urbanization have indicated three dimensions of urbanization. These are - (i) the process of urbanization gradually includes its country sides. In other words, country sides are acquiring physical characteristics of urban areas. (ii) Urbanization is a process of population concentration. (iii) Urbanization is a process of changing of behaviour patterns. To define urban areas, the United Nations have applied five main criteria. These are (i) Population size; (ii) Local self-government; (iii) Certain urban characteristics such as public water supply, electricity, sewerage, police station, hospital, market, educational institutions, courts of law, local means of transport and so on; (iv) certain administrative functions; and (v) Predominant economic activity that is majority of the people in urban area must be engaged in non-agricultural occupations (Kuppuswamy1984 : 338).

19.4 Prerequisites of Urbanization Urbanization is a process of creating and developing urban communities. Urban community is characterized by a dominance of commercial, industrial and service occupations. Extensive division of labour and its corresponding social complexity;

314 NSOU • GE-SO-11 high density of population; development of coordination etc. are some basic features of urban community. Dasgupta (2011: 197-198) has mentioned that urban communities are originated from rural communities and some strategic features of rural communities become the important prerequisites of the growth of urban communities as well as urbanization. (i) Agriculture and Domestication of Animals The most important and fundamental rural contribution for the growth of towns is to provide food. In details, increasing efficiency in food production, favourable geographic condition and a developed technical competence in raising crops are the essential pre-conditions of urban communities. Surplus of food allows extension of trade and commerce. (ii) Improvements in tools, weapons and technical methods Surplus food production leads to the development of other occupations to meet the demand of other practical purposes such as pottery making, weaving, melting of metals and their fabrication into other instruments and so on. Perfection of military weapons is particularly important because defence of the community was an important concern of early urban experience. (iii) Complex social Organization The two main features of rural community are – (a) primary, personal relationships and (b) powerful kinship organization. But urbanization inherently involves larger social aggregations, cultural differences within populations, problems of coordinating a variety of activities, resolving inevitable disputes and controversies etc. The kin or familial organization of rural society is succeeded by civil organization in urban society. Civil organization provides a clear-cut public, community wide form of coordination and control. A central, universally applicable and legitimate control system is developed. Gradually city becomes prominent and visible.

19.5 Difference between Rural and Urban Areas For centuries, rural and urban areas have been recognised for human habitation. The two are dependent on each other, especially in the field of economy. There are also a lot of difference between them in terms of occupation, style of life, social relations and cultural ethos. But the distinction is very prominent in case of social environment. In urban areas, many aspects of natural environment are modified or

NSOU • GE-SO-11 315 eliminated for the purpose of community living. But the distinction between rural and urban communities is always changing. In fact rural community stands in one end and the big metropolis at the other end. There are many types of cities between two ends. Generally, city is relatively dense. Major portions of these population maintain their livelihood from non-agricultural activities and depend on the rural communities for food and agro-products (Bhattacharyya 2014 : 236). Following are the important criteria for distinguishing the urban social world from the rural social world (Desai 1997 : 10-12; Rao 2004 : 456-457; Sharma 2002 : 114-116). (i) Occupational Differences Majority of the urban community are involved in non-agricultural occupation while in rural society, majority of the rural community are involved in agriculture. People of urban area engaged in manufacturing, mechanical pursuits, trade, commerce various professional job like lawyer, doctor, teaching and so on. (ii) Environmental Differences Urban community is isolated from nature. Man-made environment dominates over nature. Rural community has direct and close relation with nature. (iii) Difference in the Size of Community Urbanity and size of community are positively correlated. In the same country and at the same time, the size of urban community is much larger than the rural community. (iv) Differences in the Density of the Population In comparison with rural area, the density of population is higher in urban area in same country and at the same period. (v) Differences in Social Stratification Pattern Distinct patterns of life-style are found in urban and rural areas. Rural areas are dominated by agrarian relations while urban areas are dominated by industrial relations. So urban-industrial social stratification is characterized by industrialists, working class and various professional groups. As a result urban-industrial social stratification consists of the following classes : (i) upper class; (ii) upper middle class; (iii) lower middle class and (iv) working class. These classes are formed on the basis of occupation and income.

316 NSOU • GE-SO-11 (vi) Differences in the Social Mobility and in the Direction of Migration Occupation and other forms of social mobility are comparatively more intensive in urban areas. More people are migrated from rural to urban areas. Only at the time of social catastrophe (like war etc.), the migration from the city to country is greater than from the country to the city. (vii) Characteristics of the Population Compared to the rural populations, urban communities are more heterogeneous in the same country and at the same time rural communities are homogeneous in character. (viii) Differences in the System of Social Interaction Compared to rural people, urban community has wider area of interaction system. Secondary, impersonal, casual and short-lived relations; standardized formality in relationship; greater complexity and superficiality dominate interactional pattern in urban areas. Personal and relatively durable relations; primary contacts, simplicity get importance in rural interactional pattern. (ix) Means of Social Control Generally, it is perceived that informal means of social control such as norms, customs, folkways and mores are sufficient to regulate rural people. But formal means of social control such as law, legislation, police and court are also needed with the informal means of social control to regulate urban people. (x) Nature of Families Families in rural areas are very influential and dominant institution. People are bound by the family-traditions. In urban areas, families are said to be unstable. In rural areas average size of household is larger than urban areas. Rural people are more conservative than urban people. They are less class-conscious. On the other hand, there is more class-conscious and class-conflict among urban people. In short, rural society is a simple in-group society while urban society is a complex multi- group society. (xi) Ideas of Career Finally, it is to be stated that women in rural areas are mostly tradition bound. They are not career-conscious. They are submissive and obedient. On the other hand, women in urban areas are career-conscious.

NSOU • GE-SO-11 317 19.6 Characteristics of Urban Community (i) Urban community is characterized by secondary relations that is face-to-face, friendly, intimate relations are not present among urban communities. People rarely take personal interests in others' concerns. Even the neighbours are unknown to each other. Urban people are motivated by personal interests. Formal relationships dominate over informal relationships (ii) Informal means of social control such as norms, customs, traditions, religion are not effective in cities. Formal means of social control such as law, police and court play greater role to control human behaviours. People are more individualistic in their attitude. (iii) Urban society is heterogeneous in character. Urban people differ significantly from each other. Their ways of thinking, behaving, acting habits, morals, occupations, religious beliefs and practices, food and dress-habits are different from each other (iv) Large-scale division of labour and specialization are found in cities . As a result, occupational divisions are greater in urban areas which cause different kinds of workers and occupational groups such as skilled, unskilled, semiskilled workers; technicians; white-collar workers of different levels; different types of businessmen, administrators and politicians; artists and so on. Work is divided among people on the basis of talents, efficiency, opportunities, age, sex, interests etc. (v) In urban areas, an individual's position is determined by his or her achievements, not on birth. Intense social mobility, that is the movement of people from one social status to another, is found in urban areas. (vi) Varieties in types of urban population have provided a solid ground for the emergence of voluntary associations. People become the members of a number of associations, which are called secondary groups, in order to fulfil their interests. (vii) Heterogeneous characteristics of a city make the inhabitants of city to develop a spirit of tolerance. Urban dwellers have to adjust different types of cultures which cause greater degree of tolerance. The spirit of tolerance gives the strength of unity in diversity to the life in a city. Distinction between private and public is sharp in the lives of city. City regulates public behaviour and ignores private aspects (Rao 2004 : 442–444). Some scholars have mentioned some other characteristics of a city which are actually negative aspects of urban community. Cities are places of heterogeneous communities unlike villages. Diversity in cultures, religions and professions are common in cities. Feeling of 'one-ness' is not found among city dwellers. This feeling is also absent among the members of family. Members of same family may become the members of separate clubs and association. Impact of western cultures

318 NSOU • GE-SO-11 is greater in urban areas. As a result, incidence of pre-marital and extra-marital sexual relationships are more prevalent in urban areas. Different types of crimes such as smuggling, fraudulence, kidnapping, sexual abuse, murder, rape etc. are much noticed in urban areas. Social dis-organisation, marital problems, are very common in almost all cities. Ahuja (2009 : 296 – 305) has mentioned that some problems such as housing and slums; crowding; water supply and drainage; transportation and traffic; power shortage; sanitation and pollution; different types of crime are associated with urbanization. Some factors like migration, industrial growth, defective town planning are responsible for urban-problems. These problems may be overcome through proper planning and systematic development of urban centres. 19.7 Urbanization in India It is a very popular statement that India is a land of villages but India has a long tradition of urban living since ancient times. Archaeological discoveries have shown that India is equated with the world's oldest urban civilizations that is the Indus Valley civilization. Nearly 5000 years back, Indian people have built a city civilization which extends from Ropar in Haryana in the north to Rangpur in Kathiawar in the South and up to Baluchistan in the West. The two main cities of this civilization are Harappa and Mohanjodaro which are now in Sindh (Pakistan). The other important sites of this civilization are Kot Diji (Sindh, Pakistan), Kalibangan (Rajasthan), Ropar (Punjab, India), Lothal (Gujrat). Lothal is also important as port-town. Cities of indus-valley civilization were well-planned with drainage and sewerage. There were wide streets with large brick-built houses. Each house consisted of a number of rooms, courtyard, bathroom (Dube 2001 : 4; Kuppuswamy 1984 : 335-336). It is estimated that for a thousand of years after the Aryan invasion, India has not developed any city. Except it, the urban tradition of India is continued. There are several types of urban centres in ancient India-political capitals; military towns; manufacturing and trading towns of various sizes (large one is known as nagar, commercial parts by rivers or the sea is known as pattan, small size trading centres called kheta); educational and intellectual centres like Nalanda, Taxila, and many others; major temple towns and centres of pilgrimage like Mathura, Brindaban, Dwarika, Puri, Rameshwaram, Haridwar, Prayag, Varanasi, Gaya, Tirupathi and so on. Different ruling dynasties have developed the capitals of their kingdoms. They have built new forts and also renovated old forts. Followers of all major religions of India such as Hinduism, Jainism, Buddhism, Christianity, Islam, and Sikhism have

NSOU • GE-SO-11 319 built their temples mosque or church for worship and pilgrimage. Several scholars like Kautilya, Vatsyana and travellers like Magasthanese have described cities and the life-style of the men of cities. Muslim rulers have built the great cities of Agra, Delhi, Lahore in the North and Golkonda, Bijapur, Hyderabad, Srirangapatnam in the South. Further, in medieval period, a number of small or big towns have become famous for their handicrafts and trade; for example, Dacca for fine muslins, Murshidabad for silk, Krishnanagar for clay modelling, Golkonda for diamond and jewellery, Agra for perfumes and marble works. During British regime, some cities like Calcutta, Bombay, Madras, and New-Delhi have become important for administration and also for centres of learning and socio-political activities. After independence, some old cities have been extended and some new cities have been established. Some cities such as Rourkela, Durgapur, Bhilai, Chittaranjan, Sindri, Vishakapatnam etc. have come to be known as industrial cities. Some cities like Haldia, Paradeep, Tuticorin have been developed as port cities. Cities like Faridabad, Rajpur, Nilokheri, Kalyani, and others have been developed to rehabilitate the refugees who came from Pakistan during partition. Some cities have been developed as capital of different states such as Chandigarh, Bhopal, Bhuvaneshwar, Hyderabad and so on. Some cities have become centres of attraction due to the vast employment opportunities such as Mumbai, Chennai, Kolkata, Kanpur, Pune, Dhanbad, Bangalore, Ahmedabad and so on (Dube 2001 : 96; Kuppuswamy 1984 : 336; Rao 2004 : 446- 447). According to census figures 10.5 percent people lived in urban areas in 1901 and 1911. It went up to 12 percent in 1931. Since then, there was a steady growth in urban population. It went up to 14 percent in 1941, 17 percent in 1951, 18 percent in 1961, 20 percent in 1971 and 23.3 percent in 1981. Industrial development and changing attitude of middle-class people were the causes of rapid growth of urban population. Though the size of urban population has increased the number of towns has decreased in 1961. It is due to the new attempt of definition. In India, after 1961, cities are divided into four parts on the basis of population size. These are – Class I. Metropolitan Cities : Urban areas with 10 lakh and above population. Class II. Big Cities : Urban areas with population between 50,000 and 1 lakh. Class III. Large Towns : Urban areas with population between 20,000 and 50,000. Class IV. Small Towns : Urban areas with population between 5,000 and 20,000.

320 NSOU • GE-SO-11 Because of this new definition of town, many towns have lost their status of town. Now the total number of towns in India is 7935. (Kuppuswamy 1984 : 337; Dube 2001 : 97; Rao 2004 : 445, Google.Com, 22.06.2019, 21:15). 19.8 Urban Evolution The theory of urban sociology has experienced a rough, discontinuous evolution of urban development. This evolution is not inevitable but a reflection of increasing social complexity. This complexity emerges from a specific socio-cultural conditions of given historical periods and from particular geographic factors. The evolution of urban development is divided into three parts – the first urban wave : 4500 B.C. – 500 A.D. The Second urban wave : 1000 A.D. - 1800 A.D. And the third urban wave: 1800 A.D. onwards (Dasgupta 2011 : 199-203) (i) The First Urban Wave : 4500 B.C. – 500 A.D Gordon Childe (cited in Dasgupta 2011: 200-201) believes that the first urban society was developed in Neolithic period on the Afro-Eurasian land. The earliest urban centres appeared in the favourable environments of semitropical river valleys of Tigris, Euphrates, Nile, Ganges and Yangtze. Surplus agricultural production was the prime factor of transformation of rural society into urban society. The most striking features of cities during this phase were - defence, worship and commerce. Merchants became prominent and some industries like textile, pottery, metal working and the production of alloys such as copper, the crafts of jewel working, furniture making, construction (public buildings and temples) were developed. The final contribution of first urban wave was the emergence of complex diversified arts - those are sculpture, architecture, painting and decoration, music, drama, dance and literary forms like dialogue, comedy, tragedy, verse and so on. In India, this phase was witnessed during the period of Indus-valley civilization. It was estimated that this civilization originated around 2500 B.C., flourished by 2300 B.C. and declined around 1700 B.C. Extensive excavations proved that this civilization was enriched by different ethnic streams such as Proto-Australoid, Mediterranean, Alpine, Mongoloid and so on. Several animals like the humped bull, the buffalo, the camel, the elephant had evidently been domesticated. Hinterlands of this urban areas grew cotton and vast quantities of cereals which were stored in the spacious granaries built in the cities. Many people were engaged in profitable commercial activities within the country and also outside of the country. Many of

NSOU • GE-SO-11 321 them were rich and used ornaments of gold, silver, precious stones etc. Arts and crafts were also flourished during that time. People worshipped lord Shiva and Mother Goddess. Historians opined that the foundations of Indian civilization were laid during this phase (Dube 2001 : 4-5). (ii) The Second Urban Wave : 1000 – 1800 A.D. With the emergence of new political and economic consciousness, the second urban wave started in the latter part of tenth century. The new city which was primarily a European phenomenon was principally organized in terms of six criteria – economic features, rise of the bourgeois, the urban legal innovations, the University, ecological structure and the stratification of art. The three significant economic development during this phase were (a) improvement in agricultural methods; (b) expanded trade in manufactured goods (cloth in particular) and promoted development of basic handicraft industries; (c) wide-ranging trade transformed barter economics into money economics. Merchants started to demand political safeguards and by the twelfth and thirteenth centuries they became a respected and powerful middle class. Gradually, cities became independent from feudal regulations and restrictions. Legal system became strong. Institutions (Universities) for higher and specialized education were established. Universities met the increasing demand of civil professional services. During this phase, population started to increase. Congestion led to emergence of urban slum problems. The arts of first urban wave were in general a public enterprise in which most of the citizens could participate. The arts were the expressions of dominant religious activities. In latter part of second urban wave arts came under the control of private enterprises (Dasgupta 2011: 201-202). (iii) Third and Current Urban Wave : 1800 AD to the Present The economic and political success of urban communities in the sixteenth through eighteenth centuries led to further social changes that indicated the emergence of the modern urban region. Four important features of third as well as current urban waves are – expansion and separation of industrial units, Cooperative capitals, the urban-national axis and ecological complexities. Large scale heavy industries were established in this phase and workplace was separated from home. Joint stock companies, Banks, Corporations etc. played an important role for the development of urban-economy. It was found that with the rise of modern urban features, city became the centre of wealth. Gradually city became an arena of competitive power groups and the new locus of politics. New modern class structure developed with the consequence of technological and economic developments with the expansion of

322 NSOU • GE-SO-11 urban region, differentiated central commercial administrative area, residential districts and numerous retail areas were established. Further, arts, recreation, education developed and different types of deviant behaviours like crime, gambling, drug addiction, prostitution etc. arose within urban set up (Dasgupta 2011 : 202 – 203).

19.9 Urbanization and Theories Theory means a set of propositions about relationships between facts. Urban theories consist of essential features of the urban environment. Some urban theories such as theories of contrast focus on comparisons between rural nature and urban nature. Redfield (cited in Dasgupta 2011 : 204-207) has focused on folk culture and urban culture. His study on four different areas in Yucatan peninsula of Mexico has revealed the significant contrasts between a folk and an urban culture. He has studied a tribal village (Tusik), a peasant village (Chankom), a town (Dizitas) and a large city (Merida). It has been found that the peasant village as compared with the tribal village; the town as compared with the peasant village; the city compared as with town are less isolated; more heterogeneous, characterized by a more complex division of labour, have a more complete developed money economy have professional specialists who are more secular and less sacred, have less organized kinship system and less effective in social control, less religious, allow greater degree of freedom. Three main features are prominent in urban society – cultural diversity, increase in secularization and greater degree of individualization. The homogenous nature of folk society that is “the same kind of people are doing the same kind of thing” creates an unambiguous, monolithic social structure. With the growth of urban society, this homogeneous character of people is replaced by heterogeneous character. As a result, conflict and disorganization are the inevitable marks of urban culture. Urban culture is also dominated by secular values. Secularism is such a factor which causes to lessen the importance of religion in society. Rational and practical judgements get importance in urban society. Further urbanization and individualization have positive correlation. Urban people enjoy more individuality than rural people. The extended families of rural areas become small and nuclear in urban areas. Finally, it is to be stated that this theory is not only the theory of contrast but also an indication of evolutionary changes. Later, some scholars have criticised Redfield from different perspective but Redfield has pointed out some important features of urban areas (ibid). Emile Durkheim (cited in Ritzer 2000 : 186), a French sociologist, has developed a model of contrasting types – mechanical solidarity and organic

NSOU • GE-SO-11 323 solidarity. Mechanical solidarity, found in typical primitive society, refers to social bonds which are constructed on the basis of resemblances. Common beliefs, customs, rituals, symbols are the basic criteria of these resemblances. Such solidarity is mechanical because the people who participate in it (living in traditional society) are almost identical in major respects and are united almost automatically. In contrast, organic solidarity, a feature of heterogeneous society, describes a social order that is based on differences among people. Like the organs of a body, people depend more on one another to fulfil their needs. This type of solidarity depends on complex division of labour in which people engage in different types of occupations and depend on others to meet their basic demands. In other words, people of different categories perform varieties of tasks to fulfil society's needs and they are interdependent upon one another. Tonnies (cited in Kar 2009 : 80-81) has talked about two kinds of group- Gemeinschaft (found in village) and Gesellschaft (found in town). Tonnies has used the term Gemeinschaft to describe the rural areas and its habitants. Social life is characterized by intimate, private relationships. Members are bound by common language and tradition. They recognize common goods – common evils; common friends – common enemies; carry a sense of 'we-ness' and 'our-ness'. In contrast Gesellschaft indicates a totally different style of life. By its very nature Gesellschaft allows people to become more self-centered. Sense of 'we-ness' is declined, people become more rational and more calculating. In Gesellschaft, the natural social institutions of kinship, neighbourhood and friendship are predominant; in Gesellschaft, all these forms of associations tend to decline. In Gesellschaft, each person is known in terms of a particular role and service provided such as teacher, butcher and so on. Along with theories of contrast, theories of deduction are frequently used to explain urban society. Louis Wirth, George Simmel are the main proposers of this theory. Wirth's (cited in Dasgupta 2011 : 208) remarkable proposition 'urbanism as a way of life' has emphasized on three assumptions from which other propositions are deduced: size, density and heterogeneity. Urban characteristics are based on these three basic criteria. The first two are mainly ecological characteristics and the third one is sociological. Size, the principal ecological characteristic of the city, is the indicator of large number of populations which includes a wide range of individual variation in status and ethnic heritage. Urban social situations weaken the kinship bond and neighbourhood bond. The limitation in personal interaction leads to segmentation of social contacts and less intimacy. In term, urbanity increases superficiality, anonymity and the transitory characteristics. Density, another

324 NSOU • GE-SO-11 characteristic of city, intensifies the need of specialization and differentiation of occupations. Heterogeneity destroys the narrow divisions of groups and introduces a more complex pattern of social stratification. The contact between people of different backgrounds leads to sophistication and cosmopolitanism which are considered the typical of urbanity. Heterogeneity also leads to greater mobility both geographical and social. Heterogeneity also produces a certain amount of social levelling. This levelling is accomplished by means of the standardization of consumer goods, beliefs, social intercourse and so on. Another proposer of deductive theory is George Simmel (1964, cited in Macionis and Parrillo 2011 : 125-126). According to him, compared with rural society, urban society demands greater punctuality and exactness from urban residents. If an individual wants to survive in city, he or she needs to be more rational and precise and less impulsive. Urban people are sophisticated and intellectual. Rationality is associated with advanced economic division of labour which requires a universal means of exchange. Money performs that vital task. He believes that money is the base of development of metropolis. 19.10 Urbanization and Social Change Rao's (1992 : 487-509) study has revealed that the process of urbanisation leads to certain changes in society. These changes depend on several factors such as attitude of people who live at near-by villages, relationship between town and its surrounding villages, the location of the city, type of the city and so on. There are some villages in which a good number of people work in far-off cities even in overseas cities. They live there and visit natal villages occasionally. But they send money regularly to their families and invest their earnings in building houses within the village. In such villages, urban employment itself becomes a symbol of higher social prestige. Further, the city where an emigrant is employed and the nature of his job become additional criteria of status-differentiation. Rao (1992 : 488) has mentioned that a good number of people from the villages of Gujrat are engaged in jobs in different cities of Africa and Britain. They have built fashionable houses in their natal villages; invested money on land and industry; donated money for library, establishment of educational institutions and trusts. Villagers feel urban impact though villages are not physically situated near the cities. The second type of urban impact is seen in those villages which are close to an industrial town. If any industrial town, like Bhilai, comes up in the midst of villages

NSOU • GE-SO-11 325 then some villages are totally uprooted while the lands of others are

83%

MATCHING BLOCK 99/115

W

partially acquired. Influx of immigrant workers stimulates a demand for houses and market inside the

villages and create some problems regarding relationships between the native residents and the immigrants. The growth of metropolitan cities accounts for the third type of urban impact on the surrounding villages. During the time of expansion, metropolitan city includes its surrounding villages. In general, these villagers seek urban employment. Some of them may involve dairy-farming, poultry keeping and so on. They may seek employment in the city and start commenting. They participate directly in the economic, political and social activities, and cultural life of the city (ibid : 488-490).

19.11 Summary Urbanization may improve environmental quality as a result of numerous reasons. For instance, urbanization upsurges income levels which instigates the eco- friendly services sector and increases demand for green and environmentally compliant products. Furthermore, urbanization improves environmental eminence through superior facilities and better-quality living standards in urban areas as compared to rural areas. Lastly, urbanization curbs pollution emissions by increasing R&D and innovations. In his book *Whole Earth Discipline*, Stewart Brand argues that the effects of urbanization are primarily positive for the environment. First, the birth rate of new urban dwellers falls immediately to replacement rate and keeps falling, reducing environmental stresses caused by population growth. Secondly, emigration from rural areas reduces destructive subsistence farming techniques, such as improperly implemented slash and burn agriculture. Alex Steffen also speaks of the environmental benefits of increasing the urbanization level in "Carbon Zero: Imagining Cities that can save the planet". However, existing infrastructure and city planning practices are not sustainable. In July 2013 a report issued by the United Nations Department of Economic and Social Affairs warned that with 2.4 billion more people by 2050, the amount of food produced will have to increase by 70%, straining food resources, especially in countries already facing food insecurity due to changing environmental conditions. The mix of changing environmental conditions and the growing population of urban regions, according to UN experts, will strain basic sanitation systems and health care, and potentially cause a humanitarian and environmental disaster.

326 NSOU • GE-SO-11 19.12 Questions G-A (5 Marks each) (i) What do you mean by urbanization ? (ii) What is urban evolution ? (iii) Define *Gemeinschaft* and *Gesellschaft*. (iv) What do you mean by current urban wave ? (v) Describe first urban wave ? (vi) What do you mean by current urban wave ? (vii) Describe the different types of urban centres in India. (viii) What is mechanical solidarity and organic solidarity ? (ix) Write a note on second urban wave. (x) Write a note on theory of deduction. G-B (10 Marks each) (xi) Describe the Indus Valley Civilization ? (xii) Describe the features of urban community. (xiii) Discuss the pre-requisites of urbanization. (xiv) Write a note on urban waves. (xv) Differentiate between rural and urban areas. (xvi) Discuss the theories of contrast. (xvii) Discuss the impact of urbanization on social change ?

produced some radical and lasting changes in Indian social set up. The Britishers brought with them new technology, knowledge, beliefs, values

and institutions. For example, the introduction of Printing Press by them are produced many changes in the life of the Indians. The concept 'Westernization' is easy to understand but difficult to "Explain. We can define. Westernization is a process or changing life style of the Indians towards the west. 20.3 Westernization : Origin and Concept The concept of Westernization is applied to indicate the certain changes in Indian society. M. N. Srinivas (1998 : 49) has

79%

MATCHING BLOCK 101/115

Social Change in Modern India.pdf (D67117255)

that, "British rule produced radical and lasting changes in Indian society and culture.

It was unlike any previous period in Indian history as

100%

MATCHING BLOCK 104/115

W

the British brought with them new technology, institutions, knowledge, beliefs and values." The

British have laid the foundation of modern state in the nineteenth century. In other words, modernization has taken place in India during British rule through the process of survey of land, settlement of revenue, establishment of schools, colleges, police, army, law-courts, new bureaucracy, development of communication like railways, post, and telegraph and so on. Newspapers have made people of different parts of India to realise that they have common bond. In fact, the colonial rule has integrated the different segments of Indian society (Srinivas 1998 : 49; Doshi and Jain 2004: 90). Some traditional customs such as suttee, female infanticide, human sacrifice, slavery have also been abolished during the first half of nineteenth century. All these changes are the result of British rule and Srinivas (ibid : 50) has used the term 'Westernization' to indicate the changes in a non-western country as a result of contact with a western one. Further, he (ibid : 51) has stated that westernization has brought fundamental changes in old institutions. In traditional India, only upper caste pupils can enter into schools and they are taught mostly traditional knowledge. Civil service and law courts are also similarly affected in traditional India. Westernization results the introduction of new schools and other institutions which are secular in character. In short, through the process of westernization a non-western country comes with the contact of western society and changes its technology, institutions, ideology and values. In India westernization is primarily meant the impact of British (Ahuja 2006 : 356-357).

330 NSOU • GE-SO-11 20.4 Phases of Westernization in India The impact of west in India has been discussed in five phases. The first phase has experienced a hostile contact with the conquest of Alexander, though successive centuries experience a peaceful interchange in the field of trade and Commerce. The second phase has begun by the end of the fifteenth century when Vasco de Gama arrives in 1498 A.D. Within a few years the Portuguese have occupied Goa. But the effects of west during these phases are relatively restricted. The third phase begins with the arrival of the East India Company in the eighteenth century. The phase of British rule is very important for the expansion of western cultures in India. The fourth phase begins in the nineteenth century. The British has exploited India economically and has become active to expand western cultures in social field. The fifth and last phase had begun after independence (Ahuja 1999 : 476 – 477). Western culture has brought four types of changes in Indian society. These are eliminative changes, addictive changes, supportive changes and synthetic changes. The eliminative changes indicate those changes which have been abolished from Indian culture, such as abolition of 'suttee system' (widow burning). India has adopted certain cultural traits from the British such as introduction of divorce in the Hindu marriage system, giving share to the daughters of their fathers' property and so on. These changes are called addictive changes. Some changes have strengthened the values, beliefs or behaviour patterns which are still present in society. These values and beliefs are continued from pre-western era. These types of changes are supportive changes. The synthetic changes are created from existing culture and adopted culture. Some examples of these synthetic changes are emergence of residentially nuclear family but functionally joint family which continues to fulfil the social obligations towards parents and siblings. It is to be noted here some changes simultaneously may become supportive changes and eliminative changes. For example, introduction of textile industry. It contains supportive elements as it facilitates the production of cloth. But at the same time, it has eliminative character as it pushes back the traditional handloom and weaving industries. Finally, it is to be mentioned here that westernization has brought both positive (giving up evil social practices) and negative (communal disharmony) changes in Indian society (ibid : 478–479).

20.5 Modernization It is found that westernization has brought a good number of modern changes

NSOU • GE-SO-11 331 and then it can be called modernization. Some sociologists like Singh (2004 : 12), Lerner (cited in Srinivas 1998 : 53) prefer to use the term modernization to westernization. Modernization may start in various aspects of social structure. The process of modernization is commonly approached in terms of economic development. It brings certain changes in traditional societies. For example, education is viewed as essential for all. Without mass education democracy cannot be successful or 'good for all' cannot be achieved. Land reform is sought as a matter of social justice. It is a system of income re-distribution rather than an increase in total income. Establishment of modern civil service is an important characteristic of modernization. A kind of administrative ethic can be established through civil service by choosing full-time personnel on the basis of merit. Further, modernization must be considered in terms of economic growth. The process of industrialization is closely related with modernization. "Industrialization means an extensive use of inanimate sources of power for economic production and all that entails by way of organization, transportation, communication and so on." Many underdeveloped areas, which are mainly based on agricultural production, consider industrialization as factory production of non-agricultural products. Later, industrialization includes mechanization of agriculture and of the ancillary services of transportation and communication. (Moore 1978 : 95-97). It is clear that modernization is that process of social change in which economic development is the principal component. Along with economic development modernization brings some changes such as secularisation of ideas, increase in geographical and social mobility, spread of scientific and technical education, transition from ascribed to achieved status, increase in material standards of living, high proportion of working face employed in secondary and tertiary level rather than primary level, high degree of urbanisation, high level of literacy, improvement in mass media, high expectancy rate of life and so on. In short, modernization brings certain changes in economic, political and cultural sphere. In economic field, modernization indicates the development of very high level of technology and systematic application of knowledge. In political sphere, modernization means democratization. In cultural sphere, modernization brings new values in respect of education, religion, personal outlook and so on (Ahuja 1999 : 481-482). Daniel Lerner (cited in Srinivas 1998 : 53) has considered the term modernization as appropriate. The term westernization is unsuitable for several reasons. It is a term of local label. He has found that educated people in the Middle East, which is Lerner's area of interest, reject U.S.A and accept

332 NSOU • GE-SO-11 USSR. The model which is imitated by the countries of Middle East may not be a Western country but Russia, Turkey, Japan or India. They have a strong anti-colonial feeling. The hostile attitude towards west may be expressed in several areas of culture and social life. Srinivas (1998 : 53) has opined that "The allergy to westernization is the result of Middle Eastern ethnocentrism, expressed politically in extreme nationalism, psychologically in passionate xenophobia." According to him (ibid: 54) the term westernization is ethically neutral. It does not carry the implication of 'good' or 'bad' whereas modernization is normally used in the sense of good. But Singh (2004 : 12) believes that the term westernization is more value-loaded than modernization because it has a pejorative connotation. The term westernization is an indicator of former colonial domination on the countries of the East.

20.6 Process of Westernization in India

It was found that, at the initial stage the process of westernization was localised and peripheral. It was confined to middle class people in the cities of Calcutta, Bombay and Madras which are now known as Kolkata, Mumbai and Chennai respectively. Educational institutions were concentrated around those cities and education

100%

MATCHING BLOCK 105/115

W

was confined to the upper and middle-class urban people.

English education acquainted the Indians with western ideologies and values. Further, English education gave an impetus to the rise of social and cultural reformation movements. Westernization was not equally spread among all sections of people. The twice-born castes were the first among all to realise the trend of change and also took advantage of those new opportunities. In India, the process of westernization took place through three levels – primary, secondary and tertiary. At the primary level, a small group of people came into contact with western cultures and they were the first group of beneficiaries. At the secondary level, some group of people came into direct contact with the primary beneficiaries. The third level or tertiary level of westernization indicated to those people who were benefitted by the process of westernization indirectly. Weaker sections of India also came to contact with westernization through missionary activities. During British rule, Christian missionaries worked in different parts of India including backward and tribal areas. As a result, weaker sections of people got a sense of westernization (Sharma 2008 : 43; Doshi and Jain 2004 : 91; Abraham 2009 : 255). Westernization is closely related with urbanization and industrialization. In India, urbanization has brought certain changes in family structure (breakdown of the NSOU • GE-SO-11 333 joint families) and also in family relationships. Caste ties have been slackened. Certain changes have come in the fields of morality and religion. Though westernization also accelerates the above changes, urbanization and westernization are not same processes. It is to be mentioned here that the cities of pre-industrial era and the cities of post-industrial era are characteristically different. This is also true in case of western societies. But after the industrial revolution, number of cities has been increased. Simultaneously it is also found that urbanization and industrialization are positively correlated. Highly westernized groups are generally found in the big cities. Again, it is cautioned that urbanization and westernization are not same process. It may be possible that groups inhabiting in rural areas are westernized. Even in India, in some rural areas where commercial crops are grown, westernized groups are found. Westernized groups are also found in those villages which have a tradition of providing soldiers for the Indian army. (Rao 1992: 20-21; Srinivas 1998: 50) Rao(1992: 94) has remarked that "urbanization during British rule was characterized by features of westernization". Kuppuswamy (1984: 61-62) has mentioned the process of westernization in two areas of Bangalore – Cantonment area and City area. In Cantonment area people frequently come across British civil and military personnel. Indians of this area speak in English (with or without education), wear clothes of western style, consume alcohol and smoke. Another significant influence in this area is existence of a fairly large Anglo-Indian population. In contrast, Brahmins of the city area have learnt western education at the high school and college level. They have accepted western literature and science, but do not change their style in dress nor they adopt the habits of the British. Brahmins speak English more grammatically while the cantonment people speak English with the British accent and use their diction. The picture houses in cantonment area show only British films while Indian films are popular in city area. Restaurants of cantonment area serve bread, butter, cakes, biscuits and so on. They are more westernized in style while the restaurants of city area serve idli, dosa, vada etc. in Karnatak style. There are bars in cantonment areas. Middle-class people of cantonment areas visit these bars to consume bear whisky etc. In city areas, only toddy and arrack shops are found in slum areas. Workers of city area visit those shops. In general, it is to be said that cantonment people are more westernized externally. Singer (cited in Ahuja 1999: 474) has studied the leading industries in Madras and has found a different process of change in the style of life and religious belief of lower and upper castes. There is a change in the practice of ritual pollution both

334 NSOU • GE-SO-11 in the office and factory. Home and workplace – both are separated in terms of practising of ritual pollution and daily habits. In workplaces, different castes mix with each-other freely. They eat same hotels and restaurants, travel in same cars, participate same meeting and so on. Many upper caste Hindus even Brahmins are engaged in highly polluting works as per Hindu religion. They use western dress, speak English and follow western customs in the factories. At home, they use Indian clothes, speak in their local languages and practise Hindu rituals. This is what Singer recommends as 'compartmentalisation.' Another study in a village of eastern Uttar Pradesh has revealed that Sanskritization and westernization have taken place simultaneously. There are two main castes – a dominant caste of Thakurs and a large number of untouchable caste of Chamars. The Chamars attend local schools and have managed to raise their income. They have a trend to imitate their landlord's (Thakur's) ritual in the ceremonies of marriage and birth. On the other hand, a good number of Thakurs have migrated to the cities and have become industrial workers, clerks and teachers. They are westernized in respect of their dress, habits, manners and also in religious outlook (ibid: 473 - 474).

20.7 Westernization : Some Features Scholars have mentioned certain characteristics of westernization. Some of these important characteristics are given below.

- In Indian society, westernization is the result of British rule.
- Westernization is accelerated by the British as well as Christian Missionaries.
- Westernization is associated with certain values such as humanitarianism, equalitarianism, rationalism and so on.
- The term humanitarianism has a broad connotation which includes certain other values. One of these values is welfare of all human beings irrespective of caste, sex, age, religion, economic status etc.
- Another value which is associated with westernization is equalitarianism which stands for minimising inequality, (removal of poverty), liberty to all and so on. It is also a democratic value.
- Indians have accepted the scientific innovations of west. As a result, Indians are eager to improve their standard of living in terms of material welfare.
- The idea of secularization is associated with westernization.

NSOU • GE-SO-11 335

- Westernization causes a number of social reforms in India.
- Westernization is a process of changes of exogenous form in Indian society.
- Westernization has brought a number of socio-economic changes such as establishment of scientific-technological institutions, establishment of modern schools and colleges, rise of new political culture, development in communication system and so on.
- Western institutions such as banking system, public administration, military organisation, modern medicine, law etc. are introduced in India.
- Modern means of communication such as railways, bus, postal service, press, radio, television have affected the lives of Indians in various ways.
- Westernization becomes an important factor of upward social mobility.
- The term westernization has close association with some other terms such as modernization, urbanization, industrialization and so on.
- To some extent the process of westernization is accelerated by Sanskritization. In fact, these two processes are linked with each other.
- The nature of westernization in India is varied from region to region.
- Westernization is attached to macroscopic level at least as depicted by Srinivas. In other words, westernization brings cultural changes in macro- level.
- Westernization reduces rigidity of caste system.
- Westernization has brought a new 'great tradition of modernization.'
- Western educated people become conscious regarding their rights and freedom. In other words, western education has broadened the outlook of Indian people.
- The impact of westernization on traditional Indian institutions such as marriage, family, caste, religion is great. Westernization has affected the inter-personal and the inter-familial relationships of the Indians.
- A vibrant middle-class has emerged.
- Westernization causes to establish a strong feeling of nationalism. (Ahuja 1999 : 473-479; Beteille 1971 : 220; Doshi and Jain 2004 : 91-93; Kothari 1995 : 69; Sharma 2008 : 43-46; Singh 2004 : 9-27).

336 NSOU • GE-SO-11 20.8 Impact of Westernization on India during British Rule In India, westernization is equated with British rule. A number of socio- economic changes have taken place in the fields of food habit, dress, education, technology, and patterns of behaviour and so on. Westernization is a multi-layered process of diffusion of western ideas, philosophy, system of laws, western ways of life and culture in Indian society. Western education and communication have accelerated the process of westernization. Western ideas have eroded the concept of purity and pollution in caste system – eating is no longer an act of ritual; vegetarianism is not necessarily a virtue. Traditional dresses are replaced by western fashions. Though caste system has been survived in India, ideas of equality, humanity, social justice, individual-dignity have been strengthened (Abraham 2009 : 255). As an ongoing process, westernization has a great impact on rural India. After independence, the government of India have given special attention for the development of villages. The people of rural areas are also accustomed with different types of modern means and come closer to westernization. Western values have a great impact in Indian society. India has experienced a number of social reforms. Age old social evils and practices such as sati, untouchability have become punishable offence by new laws. With the introduction of uniform law, science and technology Indian society has started to become modernized. Industrialization and urbanization have changed the traditional patterns of lives and have introduced modern economic system. These processes are also helpful to lessen age-old social evils like purity and pollution of caste-system. Westernization has also introduced bureaucratic administrative structure in India. Westernization has brought the value of secularism. This value is essential for India as India is a multi-religious country. Later it has been accepted in the Indian constitution. A synthesis especially between the elites of India and the elites of the west has occurred. Finally, westernization accelerates national and social awakening. Indian elites have borrowed several humanistic elements from the British and use those to create national feelings and political consciousness. (Doshi and Jain 2004 : 91-92; Sharma 2008 : 43-44). Beteille (1971: 191, 220) has conducted a village study in Sripuram of Tanjore District in South India. He has noticed that westernization has brought a certain number of changes within caste-structure. A general trend towards the contraction of structural distance between proximate segments of caste group is found. For example, marriages take place between two subdivisions of the Brihacharanam

NSOU • GE-SO-11 337 segment; commensal relations are common between Smarthas and Shri Vaishnavas. In general westernization has also brought certain changes among Brahmins in their style of life in comparison with the past. Westernized Indians are

68%

MATCHING BLOCK 106/115

W

varied from region to region; from one section of population to another. Some people may become westernized in their dress, diet, manners, speech and

by using of gadgets (specially electronics). On the other hand, some people acquire western science, knowledge and literature. Latter group are free from external features of westernization. Many Brahmins have accepted the dress and hair-style (tuff is replaced by cropped hair); send their children to westernized schools, use western gadgets but they do not accept the western diet or recreation patterns (Ahuja 2006 : 357). Westernization has created new status group in Indian society. It also accelerates the distinction between westernized and non-westernized group in Indian society. Structural changes are found in the fields of agriculture, industry and polity. 20.9 Impact of Westernization in Indian Culture Westernization has brought a new cultural tradition in India. India has got a taste of modern culture with the advent of the West. The impact of the Dutch and the French Culture is minimal but the British has emerged as a dominant power in India. The western impact on the Indian culture is therefore of British culture. With the advent of British rule, India has experienced some modern characteristics such as formal rationality, experimentation, codification, verification, rational-utilitarian orientation in behaviour and thought and so on. Westernization has encouraged the values of equality and universalism. Western cultures have provided new basis of social stratification which emphasise on achievement, not on ascription. Individual performances are encouraged in place of hereditary ascriptions. Gradually, the westernization has brought innovatory changes in the cultural pattern of India. Primarily a group of Indian intellectuals and scholars have accepted western cultures which in turn leads to emergence of a sub-cultural pattern. They also support its rapid expansion. Westernization is also spread in the area of dress, food, style of life and habits. This process is diffused both among the laymen and scholars, among the villagers and urban dwellers. Further, some forms of westernization have crossed local or regional boundaries, such as education, law, science and technology, new forms of politicization, urbanization, industrialization, new media for

95%**MATCHING BLOCK 107/115****W**

cultural transmission through press, printing and facilities of transport and communication (

Singh 2004 : 85 – 87).

338 NSOU • GE-SO-11 The sub-cultural pattern of westernization has grown in stages. At first, a commercial middle-class emerges in the 18th century. Its social composition is

40%**MATCHING BLOCK 108/115****W**

different from region to region. In Calcutta, a most important centre of British influence in terms of politics and commerce, new middle-class has emerged mostly from the Banyan (merchant) caste. In Madras,

middle-class emerges from Brahmins and in Bombay from Parsis. The members of this class serve as middle men for the European traders. These commercial groups are partly westernized. They emulate some of the European customs and ways of living. One European has observed these middlemen flocking aboard the ship at Madras Presidency and has differentiated them from boatmen by describing them as "... they were clad in a more stylish garb, with a head dress of calico-coiled turban, light vest and loose trousers. They all spoke English, offered their services for small wages, and waited on the passengers to execute their business" (ibid: 88-89). This type of middlemen who are also interpreters, are also present in Bengal. According to Singh (ibid: 89), this group is not westernized but quasi-westernized. Their jobs require specialized training and education, new professional skill in trade and commerce, ability of rational managerial administration for modern trade and commerce. Soon they transform into a new commercial middle class. They are very small in number but they play significant role in the process of westernization. They are the fore runners of westernization. A sub-culture of westernization is gradually established in India through them. In the early part of 19th

60%**MATCHING BLOCK 109/115****W**

century, new sub-cultures of westernization have begun to emerge. These are represented by the new generation of middle-class professional groups and social reformers.

A good number of western educational institutions are established by the government and missionaries. Though these educational institutions are concentrated in Calcutta, Madras and Bombay regions. Western values and ideologies are inculcated among the Indians. Along with this, expansion of Christianity accelerates the process of westernization. New educated groups have also adopted the habits and customs of Europeans. They have well-furnished houses. They like to consume wines. The impact of westernization is also found in literature. In Bengal, poets and novelists follow western style and ideologies. Similar influence is found among Tamil, Telegu and Marathi literatures. These literary works also play an important role to inculcate western values among Indian people. Role of social reformers also helps to change stagnant Indian society. They oppose age-old social evils of India (ibid: 89-92). Reform movements of Indians and the British legal system cause the abolition of Indian customs which are considered as a part of religion such as 'suttee' (widow burning). Further,

NSOU • GE-SO-11 339 rationality and humanity have got importance with the expansion of westernization. British administration has introduced

67%**MATCHING BLOCK 110/115****W**

civil, penal and procedural laws which put an end to unequal laws of Hindu and Islamic jurisprudence.

According to the Hindu law in pre-British era, punishment varies on the basis of persons' cast. In Islamic law the evidence of non-Muslims is not admissible. Both Hindus and Muslims regard their codes as divine. On the other hand, British administration and Christian missionaries have fought against all types of inequalities like untouchability, institution of caste, low position of women, child marriage, polygamy and so on (Srinivas 1998 : 51-52). Srinivas (ibid : 52) has remarked that, "no alien government would have dared to declare the practice of untouchability in any form an offense or to enforce the right of Harijans to enter Hindu temples and draw water from upper caste wells in villages." British administration has controlled banditry, lawlessness, private armies and thuggee (an institutionalized form of deception and killing). Thus, India has experienced a qualitative change through the process of westernization (Singh 2004 : 93). 20.10 Westernization and Sanskritization Westernization and sanskritization, both are the processes of cultural and social change in India.

92%

MATCHING BLOCK 111/115

Social Change in Modern India.pdf (D67117255)

have occurred throughout Indian history and still continues to occur. On the other hand, westernization has been introduced in Indian history during British rule and

is still continuing. After independence, the process of westernization has been quickened. Westernization is not confined within any particular section of the people. The impact of westernization, both in the number of people it affects and the ways in which it affects them, is steadily increasing. Sanskritization and westernization – both concepts are used by Srinivas (1998 : 1-94) to understand and to analyse the changes of Indian society. Both of them have become the part of cultural approach to study society. Sanskritization is found within the caste structure while westernization is observed beyond the caste structure. Through the process of Sanskritization, lower castes get the chances to be absorbed in the mainstream. Westernization offers modern way of life to all people. It is secular in character but Sanskritization takes place within Hindu religion. The gap between castes becomes narrowed through the process of Sanskritization while westernization may narrow the gap between castes or widen the gap or leave it as before. It depends on impact of westernization on upper and lower castes. Along with

340 NSOU • GE-SO-11 Sanskritization westernization is also an important factor of upward social mobility (Srinivas 1998 : 1; Kothari 1995 : 23, 91; Doshi and Jain 2004 : 91; Ahuja 2006 : 400). Compared with Sanskritization, westernization is a simpler concept. The social changes take place during British period is known as westernization. Westernization and Sanskritization – both can go simultaneously. Sometimes westernization accelerates the process of Sanskritization. Modern means of communication such as postal facilities, railways, newspapers, media, and telecommunication are developed in British period. These modern means help people to communicate with each other. Caste members also can contact with each other easily. Religious pilgrimages, caste- meetings are more possible now than in the past. Westernization and Sanskritization have focused to analyse the cultural changes in society not structural changes. But a question may arise here – do they (Sanskritization and westernization) explain all types of major cultural changes in India ? Two concepts 'logical' and 'contextual' are used here to answer this question. In logical sense, Sanskritization and westernization – both are '

W

truth asserting' concepts which oscillate between the logics of ideal- typical and nominal definitions of phenomena.

Their connotation is after all vague, especially when the discussion is shifted from one level of cultural reality to another; that is from historical specific to contextual specific. Sanskritization is not a single concept; it is a bundle of concepts. But it is to be remembered here that Sanskritization denotes a widespread cultural process (Singh 2004 : 9 – 10). Singh (ibid : 10-26) has also mentioned that Sanskritization and westernization – both are founded upon empirical observations and highlights some aspects of cultural changes. But both have failed to develop any theory of cultural change. Both the concepts are devoid of hypotheses and do not indicate true or false. It is to be said that both the processes may be clumsy or elegant, appropriate or inappropriate, effective or ineffective but not true or false. So as truth-asserting concepts they have appropriateness but theoretically they are loose terms. Now-a-days, some castes and some religious groups prefer to emphasize their own in-group identity through isolation and nativistic revivalism. Some of these movements are Dravidian identity in south, tribal identity in the eastern border of India, Muslim identity in Kashmir and so on. Both the term, westernization and Sanskritization are unable to explain these processes. Both the processes, Sanskritization and westernization, are connected with macroscopic level though Sanskritization also has some connection in micro level. Sanskritization

NSOU • GE-SO-11 341 means a process of endogenous changes while westernization is a process of changes from an exogenous form. The basic changes in micro and macro structure of Indian society are taking place with the contact of west. The scientific and technological innovations bring changes in Indian social structures. Westernized group specially who live in urban areas follow western cultures. Brahmins who are westernized approve alcoholic drinks, non-vegetarian diets, widow re-marriage. These processes are acts of De-Sanskritization. People of lower castes consume alcohol and eat meat. In this sense, westernization is connected with De-Sanskritization (Rao 1992 : 386). 20.11 Criticism The process of westernization has been criticised on the following grounds. • Westernization has an external character which fails to explain all types of Indian cultural changes. • The term westernization has also complexity like Sanskritization Srinivas (1998 : 49) has equated the term westernization with the British impact in India. But after independence models of other countries specially Russia and America are followed. • The term westernization has a pejorative connotation to the Indians and also to the people of some other states of Asia. This term indicates the former colonial domination on these Asian countries by the west. So, it is more value-loaded term than modernization. • Westernization fails to build theory. • Though some scholars have mentioned that humanitarianism is associated with westernization; there are some scholars who believe that westernization is a process of cultural and cognitive colonialism. • Westernization accelerates conflict between the indigenous tradition and the western tradition. • Now-a-days India is a part of globalization and India becomes the centre of global market and professional activities. • Western values and ideals are based on the spirit of equality. The people who are inspired by the western values may demand a fair treatment. As the

342 NSOU • GE-SO-11 benefits of westernization are mainly reached to the upper castes then it has also increased a feeling of deprivation among the lower castes. (Singh 2004 : 12; Sharma 2008 : 43-44; Pramanick 1944 : 41). 20.12 Summary Westernization has been a growing influence across the world in the last few centuries, with some thinkers assuming Westernization to be the equivalent of modernization, a way of thought that is often debated. The overall process of Westernization is often two-sided in that Western influences and interests themselves are joined with parts of the affected society, at minimum, to change towards a more Westernized society, with the putative goal of attaining a Western life or some aspects of it, while Western societies are themselves affected by this process and interaction with non-Western groups. Westernization can also be compared to acculturation and enculturation. Acculturation is “the process of cultural and psychological change that takes place as a result of contact between cultural groups and their individual members.” After contact, changes in cultural patterns are evident within one or both cultures. Specific to Westernization and the non-Western culture, foreign societies tend to adopt changes in their own social systems relative to Western ideology, lifestyle, and physical appearance, along with numerous other aspects, and shifts in culture patterns can be seen to take root as a community becomes acculturated to Western customs and characteristics – in other words, Westernized. Westernization can include Christianization, Americanization and Europeanization, with historical versions including Romanization, Hellenization, Francization, Russification and Germanization. The phenomenon of Westernization does not follow any one specific pattern across societies as the degree of adaption and fusion with Western customs will occur at varying magnitudes within different communities. Specifically, the extent to which domination, destruction, resistance, survival, adaptation or modification affect a native culture may differ following inter-ethnic contact. 20.13 Questions G-A (5 Marks each) (i) What do you mean by westernization?

NSOU • GE-SO-11 343 (ii) What is modernization? (iii) Why does Srinivas prefer the term westernization? (iv) Why does Lerner prefer the term modernization? (v) What does Singer mean by compartmentalization? (vi) Mention the different phases of the process of westernization in India. (vii) Discuss the impact of westernization in Indian culture. (viii) Discuss the impact of westernization in Indian society. (ix) Mention the negative aspects of westernization. G-B (10 Marks each) (x) Mention the features of westernization. (xi) Write a note on modernization. (xii) Discuss the relationship between westernization and sanskritization. (xiii) Write a note on process of westernization in India. (xiv) Write a critical note on westernization. 20.14 Suggested Readings (i) Abraham, M. Francis. PREFACE In a bid to standardize higher education in the country, the University Grants Commission (UGC) has introduced Choice Based Credit System (CBCS) based on five types of courses viz. core, generic, discipline specific elective, ability and skill enhancement for graduate students of all programmes at Honours level. This brings in the semester pattern which finds efficacy in sync with credit system, credit transfer, comprehensive continuous assessments and a graded pattern of evaluation. The objective is to offer learners ample flexibility to choose from a wide gamut of courses, as also to provide them lateral mobility between various educational institutions in the country where they can carry their acquired credits. I am happy to note that the university has been recently accredited by National Assessment and Accreditation Council of India (NAAC) with grade "A". UGC (Open and Distance Learning Programmes and Online Programmes) Regulations, 2020 have mandated compliance with CBCS for U.G. programmes for all the HEIs in this mode. Welcoming this paradigm shift in higher education, Netaji Subhas Open University (NSOU) has resolved to adopt CBCS from the academic session 2021-22 at the Under Graduate Degree Programme level. The present syllabus, framed in the spirit of syllabi recommended by UGC, lays due stress on all aspects envisaged in the curricular framework of the apex body on higher education. It will be imparted to learners over the six semesters of the Programme. Self Learning Material (SLMs) are the mainstay of Student Support Services (SSS) of an Open University. From a logistic point of view, NSOU has embarked upon CBCS presently with SLMs in English / Bengali. Eventually, the English version SLMs will be translated into Bengali too, for the benefit of learners. As always, all of our teaching faculties contributed in this process. In addition to this we have also requisitioned the services of best academics in each domain in preparation of the new SLMs. I am sure they will be of commendable academic support. We look forward to proactive feedback from all stakeholders who will participate in the teaching-learning based on these study materials. It has been a very challenging task well executed, and I congratulate all concerned in the preparation of these SLMs. I wish the venture a grand success.

NSOU ? GE-SO-21 8 1.8 Conclusion 1.9 Summary 1.10 Questions 1.11 Suggested Readings 1.1 Objectives This course provides a comprehensive survey of the field of social demography the scientific study of population. The course begins by focusing on understanding the core social demographic variables (e.g., fertility, mortality, morbidity, migration), and how these variables influence population growth, composition, and structure. Population will be examined in relation to its sociological determinants and consequences. Upon successful completion of this module students will: ? Understand basic demographic measures ? Know how to choose among alternative demographic measures to describe a population ? Be able to identify alternative sources of demographic data In the latter part of the course, we will shift our attention to the relationship between population and issues such as urbanization, family change, population aging and health, economic growth, and the environment. 1.2 Introduction

91%

MATCHING BLOCK 3/164

SA Demography_Final.docx (D110581594)

Demography is the statistical and mathematical study of the size, composition, and spatial distribution of human populations and

how these features change over time. Data are obtained from a census of the population and from registries: records of events like birth, deaths, migrations, marriages, divorces, diseases, and employment. To do this, there needs to be an understanding of how they are calculated and the questions they answer which are included in these four concepts: population change, standardization of population numbers, the demographic bookkeeping equation, and population composition. Demographic analysis can be applied to whole societies or to groups defined by is usually considered a field of sociology, though there are a criterion such as NSOU ? GE-SO-21 9

85%

MATCHING BLOCK 4/164

SA Demographic changes in Kashmir (1991-2011).pdf (D34797651)

education, nationality, religion and ethnicity. Institutionally, demography is usually considered a field of sociology, though there are a number of independent demography departments. Formal demography limits its object of study to the measurement of population's processes, while the broader field of social demography population studies also analyze the relationships between economic, social, cultural, and biological processes influencing a population. 1.3

Meaning of Demography The word Demography is a combination of two Greek words, 'Demos' meaning people and 'Graphy' meaning science. Thus, demography is the science of people. In the middle of the 19th century in 1855, the word first used by French writer Achille Guillard. Even though, the term "population studies "is more popular, the word 'Demography' is under wider use these days. It is considered and important subject capable throwing light on the nature of population education. Since antiquity a number of thinkers have expressed their views on the level of economic development and the size of population. During the time of Confucius, many Chinese and Greek writers, and following them Aristotle, Plato and Kautilya have expressed their thoughts on the subject, population education is as old as human civilization.

54%

MATCHING BLOCK 5/164

W

Writers like William Peterson, Hauser and Duncan consider "population studies" and "demography" to be different, according to them, "Demography" encompasses limited is spheres and it studies only the decisive factors of population growth,

whereas in Population Studies" besides the social, economic, geographical, political and biological aspects of population, their ensuing relationships are also studied. 1.4 Definition of Demography The term demography has been defined both in a narrow and broad sense. The Oxford Dictionary of Economics defines demography as "the study of the characteristics of human population". According to

88%

MATCHING BLOCK 8/164

SA CHAPTER.docx (D129895265)

the United Nation multilingual demographic dictionary, "Demography is the scientific study of human populations primarily with respect to their size, their structure and their development".

According to Thomson and Lewis, "The population student is interested in population size NSOU ? GE-SO-21 10

100%

MATCHING BLOCK 9/164

W

composition and distribution and in changes in these aspects through time and causes of these changes". According to

Frank Larimer, "In broad sense demography includes demographic analysis and population studies, A broad study of demography studies both qualitative and quantitative aspect of population". According to Donald. J. Brogue, "Demography is a statistical

73%

MATCHING BLOCK 6/164

W

and mathematical study of the size composition spatial distribution of human population and of changes over time in this aspect through the operation of the five processes of fertility, mortality, marriage, migration and social mobility. Although it maintains continuous descriptive and comparative analysis of trends, in each of these processes and in its net result its long run goal is to develop

100%

MATCHING BLOCK 7/164

W

a body of theory to explain the events that it charts and

compeers". Broad definitions take into view not only the size composition and distribution of population and changes in them in the long run but also imply human migration and change in the status of population through education, employment, social status, etc. 1.5 Nature of Social Demography When the study of population was emerging as a discipline, Warren. S.Thompson in his book "Entitled Population Problems" described population studies as being concerned with the following questions related to three areas of study: i. What are the changes that are taking place in the size of population and how are these changes brought about? What is the significance of these changes from the standpoint of human welfare? ii. Where people and what are the changes taking place in their distribution in communities and in areas? iii. What kind of people are found in any given population group

95%

MATCHING BLOCK 10/164

SA

Demography_Final.docx (D110581594)

and how do those in one group differ from those in the

other? These questions clearly indicate that the study of population is concerned with its size on numbers, its structure and characteristics, its distribution and the changes taking place in it over a pert time

100%

MATCHING BLOCK 11/164

W

is also implied in this description that the subject matter of population studies includes the study of fertility mortality migration and social mobility that is the components of change in the size, structure, characteristics, and distribution of population.

NSOU ? GE-SO-21 11 Before delving any further into the details of the nature of population studies it is important at this juncture to have a broad understanding of the various concepts used in the description of the scope of population studies. One important area of study covers the components of population change for the factors responsible for change population. It must be understood that the population of any place at a specific time is a function of three types of events: births, deaths and migration. There are four ways in which the number of if in any area can under go change: i. Children may be born in that area ii. The inhabitants of that area may die iii. People from other areas move into that area iv. Inhabitants of that area may move out. These components of population change namely births, deaths and migration are identified as fertility, mortality, and migration respectively and known as demographic population variables because the size, growth, structure, and distribution of any population are determined by them. A study of any population is made through a study of these demography variables. It is important to understand at this stage the meaning of population structure and population characteristics. Population structure implies that age and sex structure of the population and population characteristics include such characteristics as marital status, literacy and educational status, labor force status, etc. Population characteristics, however, can and do change through "social mobility", that is true movements of individuals from one status to another, for example from "single" to "married" status, and also through fertility mortality and migration. The scope of population studies is quite wide.

88%

MATCHING BLOCK 18/164

W

On the one hand, this subject is concerned with a quantitative study of the size, structure, characteristics and territorial distribution of human population and the changes occurring in them in the other hand; it is concerned with the study of the underlying causes of population phenomena. This student of population is engaged is describing and comparing the size, structure, characteristics and territorial distribution of population, and the changes occurring in it through the study of fertility, mortality, migration, and social mobility. He also attends to explain population phenomena and situations and the changes in them in the context of the biological, social, economic, and other setting. For instance, NSOU ? GE-SO-21 12 population phenomena take place in a social setting and cannot be studied in isolation. Hence, while describing comparing for explaining the determinants and consequences of population phenomena, social phenomena have to be taken into consideration. It can be seen that the study of population is multidisciplinary in nature, involving

and

100%

MATCHING BLOCK 12/164

W

understanding of Biology, genetics, mathematics, statistics, economics, sociology, cultural anthropology, psychology, politics, geography, medicine, public health, ecology etc.

The multidisciplinary nature of population studies and its relationship with other science will be discussed later in this chapter, after this discussion the difference between "population studies" and "demography" and interesting the origin and development

75%

MATCHING BLOCK 13/164

W

of population studies. The discipline of the study of human population is known by two terms: i. Population studies ii. Demography Population studies

can be understood easily as studies concerned with population, where demography can be explained by pointing out that it is derived from the Greek word demos meaning people and hence is the science of population. Though these terms are often used interchangeably,

100%

MATCHING BLOCK 14/164

W

some scholars have tried to distinguish between "demographic analysis" and "population studies".

It is considered that, "demographic analysis is confined to

75%

MATCHING BLOCK 15/164

W

study of the components of population variation and change", whereas population studies are concerned

not only with population variables but also with the relationships between population changes and other variables, social, economic, political, biological, genetic, geographical and the like. The term "demography" may be used in a narrow sense, as synonyms with "

86%

MATCHING BLOCK 16/164

W

demographic analysis" or "formal demography", which is primarily concerned with quantitative relations among demographic phenomena in obstruction from their association with other phenomena. Democracy may also be concept in a broad sense to include,

in addition to the quantitative study of population

100%

MATCHING BLOCK 17/164

W

the study of interrelationship between population and socio economic, cultural, and other variables.

Mini population scholars do not approve of creating search and artificial distinction between democracy and population studies. According to Larimer, "demography and limited to the nearly formal treatment of changes in fertility mortality and mobility would be in a position like that of a formal chemist observing the compression of Mercury with no information about associated changes in temperature of the NSOU ? GE-SO-21 13 Constitution of the liquid. The concept of pure demography except as the skeleton of science is therefore and illusion. Any meaningful study of population, therefore, has to be interdisciplinary. 1.6 Scope of Social Demography The scope of demography is very wide. Includes the subject matter of demography is it a micro or macro study? Weather it is a science or art? These are vexed questions about the scope of demography about which there is no unanimity among writers on demography. The scope of social demography may be discussed under the following points. i. Size of population ii. Composition of population iii. Distribution of population iv. Fertility, mortality, and migration v. Labor force vi. Social demography vii. Population policy The discussion is as follows. 1.6.1 Size of Population Population studies are fundamentally study and the form of its size. The student of population study is interested in studying the size of population. The want to know the changes that are taking place in the size of population. Three important components should bear mind: a. Place: The population studies explain the population phenomena that take place situation and the changes in the contents of biological, social, economic setting. b. Size: May be affected because of higher or lower birth and death rates and migration factors. These components affect the size of the population. c. Time: The size and time do not remain the same the population changes from time to time and it depends on the socio-economic conditions.

NSOU ? GE-SO-21 14 1.6.2 Composition of Population Composition of population includes the measurable characteristic of population of community in a country during the particular period. The characteristic of population age, sex, marital status, educational level, religion, caste, race, and health etc. Population study tries to find out the changes in the characteristic which influences on size and distribution of population because this characteristic generally changing. The population study not only studies the changing factors but also the variables responsible for the changes. 1.6.3 Distribution of Population The distribution of population generally studied according to geographical area. It includes percentage and density of population the factors affecting population distribution is geographical, social, and economic etc. It was studied by classification of residence includes rural and urban rural population, locality of residence inhabitation etc. Population study conducted the concerning levels and trends of population distribution. It tries to study density and the percentage causes and factors affecting the population. 1.6.4 Fertility, Mortality, and Migration The important field of birth rate, birth order, family size, sterility, and conception etc. Population studies influence of biological limits social norms upon fertility. It also studies the reproductive stand in addition to those physiological, social, and cultural factors affecting fertility, the interval between the successive work reproductive wastage etc. Another important field of studies is mortality it includes studies of sex, age pattern, causes of death level and trends of mortality and difference in mortality such as rural urban occupation etc. Migration it studies the general trends of migration movement place of origin and destination migration intervals and streams it was a studies differential migration as age sex, marital status and educational attainment and also national and international migration. 1.6.5 Labor Force Study is made of economically active population both employed and unemployed that is not economic league active such as homemakers' students and income recipients the basic measure of economic activity or labor force analysis include the NSOU ? GE-SO-21 15 labor force the age six specific labor force participation the standardized labor force participation rate etc. Besides and international employment and unemployment are undertaken. 1.6.6 Social Demography Social demography includes study of demographic aspect of social institution particularly family and marriage. The study of marriage includes marital status, age at marriage, time and trends, marriage frequency, marriage by religious group education level etc. It was a studies extent of window hood age by religion, duration of reunion, method of computation. 1.6.7 Population Policy The development of country today very much depends upon population policies, population policies include features of guiding principle of organizational structure and service and supplies educational motivation family planning target and family planning progress and achievement etc. The above discussion the nature and scope of demography include only the major and established areas. The scope of democracy has been constantly increasing; therefore, the new area of research and study is between explored. Thus, the scope is constantly widened. 1.7 Development of Population Studies in India The current rapid growth of population in India is due to a marked decline in mortality, even before significant economic and social development. The future growth of India's population will depend largely upon the future prospects of the fertility decline.

100%

MATCHING BLOCK 19/164

W

The birth rate in India has been lower in the urban areas compared to the rural areas. However, prior to 1965, it was essentially due to the age, sex, and marital status composition of the urban population. The lower marital fertility of urban women is a recent phenomenon, observed after 1965. The available evidence is clearly indicative of an inverse relationship between women's education and fertility. Development, which promotes urbanization and education, will have the effect of reducing marital fertility in India.

Through an overview of the various periods in India, the development of population studies in India may be traced. NSOU ? GE-SO-21 16 1.7.1 Pre-Independence Period In the ancient history of India, a few references are found to the collection of population data. Detailed description of how to conduct a population, economic and agricultural census is available in the

Demographic changes in Kashmir (1991-2011).pdf (D34797651)

Arthashastra, a treatise on policy attributed to Kautilya, the prime minister of Chandragupta

Maury, The Ain-I-Akbari, compiled by Abul Fazal during the reign of Akbar, contains comprehensive data of population industry, wealth, and characteristics of the population such attempts to collect data were, however, few and far between and are today of purely historical interest. 1.7.2 Census in British India

Data on Population became available on a regular basis in India only after the establishment of the system of decennial census in 1872. The beginning of census

taking may therefore be considered as the starting point of population studies in India. Many of the earliest census reports have a heavy anthropological slant, for they were written by British administrators who were interested in getting a broad understanding of the unknown strange land they had colonized and the equally unknown strange people whose culture was totally different from their own. These administrators and scholars made a tremendous contribution to the development of population studies in India the British census actuaries contributed much studying the Indian age data and by constructing life tables based on the census data. This is a contribution not only to the development of population studies but also to the discipline of mathematics. Based on census report from 1872 to 1941, Kingsley Davis, the well-known demographic, produced his monumental work the population of India and Pakistan, which is valued even today for its contribution to the progress of population studies in India. 1.7.3 The Imperial Gazetteers While tracing the development of population studies in India; it will not be out of place to mention the Imperial Gazetteers, which content through an exhaustive account of India and her people. The Imperial Gazetteers where first published in 9 volumes appeared in 1882 and was entitled the Indian Empires. The first volume of the Imperial Gazetteers, intersection on public health and vital statistics, contents a discussion on such matters as nutrition, early marriages, birth rates, the relationship between marriage customs and birth dates, rural-urban

NSOU ? GE-SO-21 17 birth and death rates, differential in mortality, by sex, religion, rural-urban residence, infant mortality, causes of death, health conditions in the European and the native army, etc. It is interesting to note, as one looks back that these are precisely the topics who is sir today included in population studies. 1.7.4 The Role of the Intelligentsia While voluminous scholarly census reports and imperial Gazetteers were being prepared by foreign administrators, even if only for their own use, the Indian intelligence did not show any interest in the study of population till the late 1930s. One reason for this lack of interest was that the rate of population growth was not very high at that time and did not cause any serious concern. The other reason was the Nations preoccupation with the struggle for independence. P.K. Wattal may be considered as the pioneer in trying to focus the attention of Indian leaders and thinkers on the population problem in India, when he wrote about it in 1916. His pleas, however, went unheeded, for Indian leaders and thinkers where more concerned about political, social and educational problems than about the population problem. Both the press and public ware inclined to treat it more or less as a joke. In 1933, Wattle brought out new edition office work, Population Problem in India, incorporating the result of the 1931 census of India. In the late 1930s some interest in the study of the population of India was generated in the first Indian population conference was held in 1936 under the auspices of the University of Luck now, at which paper on the Future Growth of India's Population was presented and the need for birth control was discussed. The second world India conference on population and the First Family Hygiene Conference were jointly held in Bombay in 1938. Apart from discussing the social and medical aspect of birth control and human sexuality several other subjects related to population studies were covered. These included differential fertility, maternity and child welfare, infant mortality, housing and health, nutrition, morbidity, vital statistics, logistic law of growth of the Indian population, economic problems associated with population size and growth, such as population and unemployment poverty and population, optimum theory of population, sociology analysis and forecast population growth. This long list indicates the interest of Indian scholars in various aspect of the study of population and highlights their multidisciplinary approach to this study. Prior to Independence, however, the outstanding students of

NSOU ? GE-SO-21 18 population by the economists, and discussions of Indian population center Mile around the question of whether or not India was overpopulated moreover, authors during this period largely concentrated on relating India's population to the Nation's economic condition. The forecast that the Indian population would reach the 400 million mark by 1941 provoked Dr. Radha Kamal Mukherjee to write on Food Planning for Four Hundred million (1938). While emphasizing the need for agricultural development, Dr. Mukherjee also took many other relevant points into account. Face book followed by the publication of India's Teeming Millions (1939) by Professor Gyan Chand, in which the population problem was viewed from the economic point of view. A significant development in the population field took place in 1938 when the Indian national Congress set up subcommittee of the national planning committee under the chairmanship of Pandit Jawaharlal Nehru to study the problem from the point of view of food supply nutrition social reform and employment and social welfare.

1.7.5 Government's Concern The Government of India, realizing the importance of population data, setup population data committee in 1944 under the chairmanship of W.M.Yeats with Sir Theodore Gregory, Professor P.C. Mahalanobis, Professor K.B. Madhava and Dr. K.C.K.E. Raja is its members. This comity adds special attention to the statistical problems arising out of the tabulation of the 1941 census data and recommended the use of sampling methods for the estimation of vital In 1946, the government of India appointed the Health Survey and Development Committee to study health conditions in India and to make recommendations for their improvement. This committee made shoes study of the activities in the field of population and recommended the appointment of a Registrar-General of Vital and Population Statistics. One of the important recommendations of this committee was that "the population problem should be the subject of continuous study".

1.7.6 Field Enquiries Professor P.C. Mahalanobis and the Indian statistical institute had by this time started taking a keen interest in population research. As early as 1937, Indian statistical institute collected data on fertility through field Enquiries. About 1945, The NSOU ? GE-SO-21 19 All-India Institute of Hygiene and Public Health, Calcutta, initiated several studies under the guidance of Dr. C. Chandra Sekhar an important field study undertaken by this Institute was the study of the productive patterns of 8000 women selected from the city of Calcutta and the surrounding rural areas. This is study attempted to analyze the effect of socio-economic conditions or reproductive patterns. The Gokhale Institute of Politics and Economics, Pune, was another Institute which took interest in population studies. In 1942, Professor N.V.Sovani of this Institute published a study entitled The Population Problem in India: A Regional Approach.

1.7.7 Post-Independence Developments After independence, interest in population studies has been tremendous. Each decade is SIM to surface the previous on when the progress in the field of population studies is considered. The 1951 Census: the report of the first post-independence census taken in 1951 prepared by R.A. Gopaldaswamy, the census commissioner departed considerably from the previous census reports in respect of the treatment of data. The report covered changes in the size and structure of the Indian population and underscored their implications for the level of living of the population. Foreseeing the dangers population growth, Gopaldaswamy declared, "it is extremely important that the attention of the people should be focused on this factor of improvident maternity..."The occurrence of improvement maternity should evoke social disapproval as any other form of social indulgence". An important contribution of Gopaldaswamy was the introduction of the rural-urban dichotomy in census tabulations. She was also responsible for emphasizing the economic aspect of population analysis. As the result of the 1951 census brought the population question into focus, political leaders, planets, and policymakers were alarmed by the high rate of growth of the population. The first five-year plan, therefore, considered the emerging population problem of India and its social and economic consequences and, in 1952, the National Family Planning Programme was launched. India thus achieved the distinction of being the first country in the world with a national family planning programmed. The adoption of this program gave fresh impetus to population studies and its various aspects. In addition to the 1951 Census of India, another study which focused attention on the implications of population growth in India, mall in the economic sphere, was the study of population growth and economic development in

NSOU ? GE-SO-21 20 India by Anstey J. Coaler and Edgar M. Hoover, two American demographers. This was the first systematic authoritative study to bring out the economic implications of different states of population growth in India.

1.7.8 The National Sample Survey The dearth of data on various social, economic and population aspect was keenly felt when the five years plans while being drafted. Reliable estimates of birth and death rates and rates of natural increase in the population why are not available because of the inheritance of the vital registration system. The Nationwide National Sample Survey System was, therefore, established in 1949 to meet this need and produce data for the evaluation up development plans. The National Sample Survey (NSS) started collecting data on birth and death rates and on the rates of population growth from its 14th round taken in 1958-59. It also collects data on differential fertility, family planning knowledge, attitude and practice for rural and urban areas, internal migration, and employment.

1.7.9 Early Field Survey An important population study successful carried out during 1952-53 Mysore population study, jointly sponsored by the United Nations and the government of India. This is study brought about various social and cultural factors affecting fertility in India. Equally important is the fact that this study has contributed to the development of population research in many ways and has served as a model for the many other fertility survey which followed. The field survey on fertility and mortality conducted by Professor V.M. Dandekar and Professor Kumudini Dandekar in Nasik, Satara and Kolaba districts also contributed to a better understanding of fertility behavior in India.

1.7.10 Demographic Centers The Central Family Planning Board, set up in 1956, appointed is subcommittee on demographic studies under the chairmanship of Dr.V.K.R.V. Rao. This subcommittee recommended the establishment of four demographic research center in different parts of the country where is studies might be conducted in fertility mortality and associated factors. As a result, the Demographic Training and Research Centre was established in Bombay in 1956, the demographic research center in Calcutta, Delhi, NSOU ? GE-SO-21 21 and Trivandrum in 1957; and the owner at David was established in 1960. At present there are in addition to the IIPS, fifteen Population Research Centers in different part of the country and four more centers have recently been sanctioned.

1.7.11 Demographic Research In 1959, the demographic Advisory Committee was appointed by the Ministry of Health, mainly to co-ordinate research on population. The Family Planning Communication Action Research Committeeman set up in 1960 to co-ordinate and promotes research in family planning communication and motivation. The two Committees were merged in 1967 to form the Demographic and Communication Action Research Committee which became defunct when its term expired on November 3, 1971. This committee was constituted on December 6, 1972, as the committee on socio economic studies on family planning to cover economic, sociological, educational, psychological, communicational, and demographic aspects of population growth and family planning. The 1961 Census of India provided wealth of data to students of demography, and a large number of reports and monographs, based on this data were published. In 1963, India hosted the first Asian Population Conference in New Delhi-an important event in the history of demographic research in India. The sample registration scheme initiated by the Registrar-General of India in 1964-65, was a step forward in solving the problem of obtaining reliable estimates of birth and death rates and rates of natural growth. The progress made by the system in obtaining reliable estimate has been quite promising. Indian demographics have also made important contribution to the methodology and technique of population analysis. Sum of these contributions may be listed as this stage. The formula developed by Chandrasekhar and deeming to estimate the missing event of birth from vital registration and retrospective survey are now widely used. Jain developed new techniques for evaluating and adjusting Indian is data. Zither 1961 Census of India provided wealth of data to students of demography, and a large number of reports and monographs, based on this data were published. In 1963, India hosted the first Asian Population Conference in New Delhi-an important event in the history of demographic research in India. The sample registration scheme initiated by the Registrar-General of India in 1964-65, was a step forward in solving the problem of obtaining reliable estimates of birth and death rates and rates of natural growth. The progress made by the system

NSOU ? GE-SO-21 22 in obtaining reliable estimate has been quite promising. Indian demographics have also made important contribution to the methodology and technique of population analysis. Sum of these contributions may be listed as this stage. The formula developed by Chandrasekhar and deeming to estimate the missing event of birth from vital registration and retrospective survey are now widely used. Jain developed new techniques for evaluating and adjusting Indian is data. Zachariah's contribution to the technique of analysis migration data collected through a Census well recognizes. Reel's method of estimating birth and death rates and rates of natural increase from the senses data has wide applicability. 1.8 Conclusion The word 'demography' is often used to refer to the study of population statistics. It not only studies population statistics but also the causes and consequences of population changes, dependent on birth and death rates which are influenced by social factors like age at marriage. These social factors form the subject matter of sociology. Demographers also study geographical variations and historical trends in their effort to develop population forecasts. Thus, demography is the scientific study of population in order to understand the social consequences of population. Pointing out the importance of demography, Kingsley Davis (1949) said, 'demography' is the essential basis for understanding the human society. He has demarcated the following functions of demography: to know the population of a particular area; to ascertain as to which factors are influencing the population of that particular area; to explain the factors relating to changes in population; and to study the population trends on the basis of the above three factors. 1.9 Summary Demography

100%

NSOU ? GE-SO-21 25 Unit 2 ? Approaches to Study of Demography Structure 2.1 Objectives 2.2 Introduction 2.3 Uses of Demography 2.4 Demographic Perspective 2.5 Conclusion 2.6 Summary 2.7 Questions 2.8 Suggested Readings 2.1 Objectives In this unit, the learner will get an idea more of demography and how demographers treat the discipline of demography. The unit will further elaborate the uses of demography as well as the various perspectives of demography. 2.2 Introduction Demographers study population change across time and place, a strong emphasis on long range view population change. While tracing the development of population studies it has been appointed about that the founding father of this discipline, John Graunt, termed is empirical observations on mortality as "natural and political" observations. Does the mathematical biological and social character of demography was employed from the very beginning of the study of population. Graunt dedicated his observations to two persons: i. The President Royal Society of Philosophers as it relates to natural history and as it depends on Mathematics of my shop Arithmetic and ii. A member of the Privy Council as it relates to "Government and Trade". William Petty named the newly founded discipline, as "Political Arithmetic".

NSOU ? GE-SO-21 26 The historical development of population studies also suggests that scholars from different disciplines have contributed towards its development. Though its origins were in the natural and social sciences, it soon except maturity and emerged as separate a discipline it is therefore necessary to understand and appreciate relationship of population studies to other sciences and to appreciate its interdisciplinary character. Quantification is an important element in population studies, as population data available in discrete quantifiable form. The relationship of population studies with mathematics therefore resumes great importance. Study of population size, growth, structure, and components is entirely done with the help of mathematics. Population experts have attempted to build various mathematical models regarding population growth. Mathematics is thus and important tool in the study and understanding of population phenomena. Population studies also depend on statistics as a tool. It may be recalled that the development of statistics fostered the development of demography in the 19th and 20th centuries. The theory of probability has been extremely useful for and analysis of mortality. The actuarial science was useful in the preparation of life tables with a high degree of precision and sophistication mainly because of it use of the probability theory. Population studies and biology also closely related it must be remembered that population phenomena take place within the framework of physiology and that there are certain biological limits within which the variables of population change operate the study of fertility provides a good illustration of the relationship between population and biology. It is a biological determined fact that only females can give birth two children and that too only during a certain age span. Similarly, in the study of mortality, it is known that the age and six differentials are biologically determined. Population genetics have been an important area of specialization. The knowledge of reproduction, so necessary for the study of fertility is gained mainly from reproductive physiology. Effective regulation of fertility through improvement in contraceptive techniques has been the contribution of applied research workers in the field of reproductive physiology. It is also well known that advances in the medical sciences and the adoption of widespread public health measures have been responsible for declining mortality rates even in developing countries, irrespective of the level of development in this country.

NSOU ? GE-SO-21 27 Till recently, population studies were generally regarded as a branch of sociology or economics, or 11, geography. Most of the variables and the theories which explain demographic phenomena originate in the social sciences the theory of demographic transition is based on an understanding of such other discipline as economics, sociology, political science, psychology, Anthropology, and geography. Many of the fertility theories are based on biology, sociology, and economics. The changes in the birthdates cannot be explained as independent phenomena. Rather, their explanations have to be shot in the changing economic, social, cultural, psychological, and political situation in which they occur. Similarly, the levels and trends in mortality related to social economic factors in recent times, another dimension has been added to the study of population demographic questions such as those related to fertility regulation, are examined with reference to humanistic issues such as human right and the status of women. Though it is possible to speak broadly of the interrelationship between population studies and the social science and the behavioral sciences considered together it would be useful to consider each of the social and behavioral sciences separately to understand their inter-relationships. Davis referred to the following areas of study which required a combination of demographic and sociological skills. i. Patil sees collection with attitudes and social institutions. ii. Population changes in relation to social and economic change. iii. The labor force with respect to population structure and social organization. iv. The family with regard to demographic behavior. International and internal migrations are to other areas of study mentioned by Davis where in knowledge of sociology and demography need to be combined. Even in the study of mortality, age and sex differentials, though biological in determined. Broom Selznick treats population as one of the nine principal elements of sociological analysis for the discussion of six special topics that is family, city, minorities, industrial sociology, political sociology, and criminal behavior. It, therefore, appears that along with social organizations, culture, socialization, primary groups, social stratification, associations, collective behavior and ecology, populations are important element in sociology analysis.

NSOU ? GE-SO-21 28 Several questions connected with family planning and fertility regulation can be answered only when the reproductive behavior an individual is understood in the context of the social standards are cultural norms which influence and governed such behavior. For instance, some questions, which are often, asked what the family size norm in a community is. How is it determined? It is possible to modify this norm by stimulating plant change. Tiffin in the field of mortality utilization patterns of the health care services can be understood only when individual behavior is explore, and the relevant social norms are studied. Movement from rural to urban areas can also be studied only by understanding the motivation behind such migrations. The study of population is an important area of investigation in the field of economics specially since problems of economic development and development planning have come to the forefront in most developing countries in order to gain better understanding of the relationship between population trends and economic growth the following topics have emerged over the years and continue to occupy and important place, both in economics and population studies: population and development, manpower studies, the economics of fertility and comprehensive economic demographic models. It has been even claimed that the number and quality the population that can exist on the earth in the future will depend on among other factors, economic opportunities and economic organization. Population growth, size and distribution cannot be discussed rationally except in the context of economic growth or change. Population studies are usually interested in the geographical distribution of the population and its movement between rural and urban areas. Those geographers, who are interested in geography not only as an academic discipline but as a geography point of view to understand the world, point out that it is useful to know how the various issues facing the world—for instance, rapid growth of population , urbanization, race relations, etc. —assume different forms in different regions or contents. The interrelationship between population and law becomes clear when atoms is made to study what the present and the future laws of any country can do to solve the problem of overpopulation. Chandrasekhar has pointed out that, population laws may be defined as that body of law which relates directly or indirectly to the three basic demographic variables of fertility, mortality and migration and their various

NSOU ? GE-SO-21 29 components which in terms affect the more general problems of the size growth and distribution of the population. Population laws could therefore, related to public health and sanitation food preparation distribution and sale drugs and pharmaceuticals, clinics, hospitals and medical personnel, migration, marriage, fertility, child-care and all aspect of education and the role and status of women. The Indian medical termination of pregnancy act of 1972, which has made induced abortion fairly easy, is the illustration of how the law of the land can affect and important demographic variable, that is, fertility.

2.3 Uses of Demography Demographic analysis is used to address a wide variety of scientific and policy questions. Any field in which the number of people and their characteristics relate to utilization of a service, such as healthcare or public transport, use the result of demographic analysis. Demography is important for estimating Future school enrollment and for projecting demand for utilities and services, surcharge electricity and ridership on public transportation. In addition, in trying to understand the Dynamics causes of phenomena educational attainment there is variation in the outcomes of introduced by characteristics such as age, sex, education and racer ethnicity, demographic considerations and demographic analysis are important? Often, as a first step to understanding the causes and consequences of demographic phenomenon, it is important to actual on the magnitude of the phenomenon is the magnitude of change and characteristics age changes the view of the situation. Young males are more likely to commit violent crimes than women or older men. In order to understand whether the tendency to commit violent crimes has changed, it is necessary to adjust for changes in the age composition of the population. If the population has grown older, the violent crime rate will usually fall, even if the rates of criminal activity by age have not changed.

2.4 Demographic Perspective In this section first we discuss two different ways to think about population change. They are used to answer different kinds of questions.

NSOU ? GE-SO-21 30 i. An Aggregate Approach: what are the components of population change (e.g. what are the roles of births, deaths, and migration in changes in population size)? This perspective deals with macro social demographic processes. It looks at how the levels of childbearing, mortality, and population movement result in the growth of decline of a population. This perspective is important for understanding when and where the population is increasing and declining. This perspective alerted the world to the future implications of high rates of population growth in the less developed region of the world in the 1960s and 1970s. Ravenous death high fertility (many more births than deaths) was the main reason for high population growth motivated the development of family planning programmed in the less developed region of the world. However, devising effective policies and programs to influence behavior than would lead to lower fertility depended micro behavioral approach that understood the reasons why women and couples wanted to limit the number of children they had in different circumstances.

ii. A Causal or Micro-Behavioral Approach: what are the causal factors of behavioral mechanism that lead to the decisions that people make? What behavior do individuals added to implement their discussions? People make decision related to fertility and migration. Individual choice and behavior also affect the chance that a person will die. Researchers and policymakers need to understand why people have children in are there to motivate people in countries with a high rate of population growth to have fewer children. In some areas, the provision of effective essay to use contraceptives resulted in a rapid decline in the number of births. In other regions, the process of convincing women and couples to reduce their fertility was more complicated and required and in-depth understanding of their views of children and concerns about weather uh reductions in mortality in the past might be reversed in the future. Recently, several more developed countries have become very worried as their fertility rate has become so low that it can lead to population decline. Concerned with population decline has led to a theoretical and policy debate about why people have children that is somewhat different from the debate

NSOU ? GE-SO-21 31 when the concerned was a high rate of population growth. Is having a child a necessary part of being and adult women for an adult man? Are increased employment opportunities for women providing an alternative path to self- fulfillment that racing children provide in the past? Sociological and economic explanations often disagree about that policy would be most effective in maintaining or raising fertility in very low fertility settings. Behavior also influences mortality. Although people would prefer to live a longer rather than shorter life, increasingly behaviors, such as smoking, alcoholic consumption, and poor diet, affects the chances that people will die early. What motivates people to change from this unhealthy behavior to more healthy behavior? Discipline other than economics and sociology have not had as purposive an influence on Population thinking, although their influence has been substantial. Next, we discuss the perspective and influence of history, anthropology, political science, psychology, and statistics. a. Demographic Approach related to History Historical and anthropological perspective address the need to have sufficient cultural and historical understanding to know what things mean in a specific context. In terms of data analysis, cultural and historical understanding relates to the question of validity. When you have a particular indicator for measure, it is intended that it presents some underlying concept the major is valid if in fact it does represent the underlying concept. Lack of cultural and historical understanding can lead to the choice of an invalid indicator, which means that the interpretation of the result can be wrong. For example, Buckley in a discussion of service conduct in Russia involving for any scholars refers to difficulties of translating concepts from one language in which is there will understood to another language in which the concept is not present or is uncommon. She noted that on survey studying depression translated "Do you sometimes feel blue?" Literally into Russian, the in Russian the word "blue "does not necessarily mean depressed and can refer to gay sexual notes that it has often been observed that people in Southeast Asia tends to be extremely eager to please interviewers and to give the desired answered. She argues

NSOU ? GE-SO-21 32 that this tendency is real, but that it can be overcome by the interviewer establishing a good rapport with the respondent and by careful instruction of survey questions so that there does not seem to be any preferred or "right" answer. There is a long tradition in historical demography of attempting to understand the life of ordinary people. History has been limited because ordinary common people were not listed and did not leave letters or diaries. In the 1960s, their emergence and interest of what was sometimes called studying history from the bottom up which focused on the lives of common people. Application of demography methods to religious and activity reports collected for other purposes, open using charts where is registers village listings, has a lot a great deal to be discovered about mortality and fertility conditions, as well as the household and family structure of people in the past. b. Demographic Approach related to Anthropology Population typically studied by anthropologist have sometimes been studied by demographers intending to make inferences about the demographic conditions experienced by populations that lived long in the past, such as hunters and book in this vein published in a series in historical demography. However, increasingly anthropologists have applied demographic approaches to studying mainstream anthropological questions. Since the 1970's, there has been increasing awareness of the importance of anthropological and cultural perspective among demographers. Some of this was motivated by research in the Princeton European Fertility Project, which test the theory of Demographic Transition. And its assessment of historical fertility declines across Europe, there was substantial evidence that the geographical spread of the international imitation childbearing was more strongly related to the diffusion of various cultural you and practices than it was to the extent to which a local had become industrialized. These observations led demographers who wearer usually economists, sociologist to take consideration of the role of culture more seriously than had generally pinto previously. This

NSOU ? GE-SO-21 33 new awareness also leads to an increase in research that combined quantitative and qualitative methods, as demographers become aware that qualitative research is often necessary to understand demographic decision-making behavior.

c. Demographic Approach related to Political Perspectives Much of demography is concerned with likely implications of alternative policies, something that immediately involves political considerations and political positions. Some political issues directly involved demographic considerations, including the US constitutional requirement that seats in House of Representatives be reallocated across States after is decennial census proportionate to the distribution of the US population across States. Political considerations can also lead to demography data not being collected. For example, Lebanon has not had a census since 1932, mainly because the Lebanese Parliament is allocated 50/50 between Christian and Muslims. It is clear that census would show that a substantial majority of the Lebanese population is Muslim. This result would almost certainly lead to calls for change in the composition of the Lebanese legislature, which would lead to political unrest. Sometimes, there are intense disagreements about the wisdom or efficacy of popular program or policies. These disagreements often reduced to different use of which groups are most deserving of government social programs support, which is a political or policy judgment. For example, Ben-Shalom and his colleagues concluded that social welfare programs in the United States have had only a modest effect on reduction of poverty because they favor the employed disabled and elderly, groups that are viewed as deserving. These programs less focus on the poorest segment of the population, even though the poorest segment has the worst health and the highest mortality. Politics also influences fertility related policies and program. For example, there has been a heated policy debate in the United States about sex education program for adolescents, which is focused on whether abstinence should be the only pregnancy prevention method discussed in schools or contraception.

NSOU ? GE-SO-21 34 should also be included. These debates concern whether sex education that includes more than abstinence education promotes sexual activity and also include disagreements about the effectiveness of abstinence only programs. An area of demography that directly involves political considerations is international migration. Although most countries do little to limit immigration many countries, especially more developed countries, have strict rules about legal immigration. Illegal immigration has become an increasingly important issue of policy concern in many countries. There are also policy choices about what the penalties and enforcement produce should be for undocumented immigrants. Thus, the causes of immigration are sometimes more strongly related to laws and policies rather than to incentives to immigrate from the origin country or references of potential international migrants. Thus, much of immigration is determined by the process by which immigration laws are passed, and issue of agenda setting and legislative dynamics that is studied by political scientists.

d. Demographic Approach related to Psychological Perspectives Sometimes, psychologist has studied the personality or psychological consequences that result from demographic phenomena. The large proportion of only children resulted from China's fertility limitation one child policy. Also research on the psychological adjustment of older persons has become increasingly relevant in aging populations. And increasing part of research on health and mortality has focused on the role of psychological conditions such as stress or depression.

e. Demographic Approach related to Statistical Perspective Advances in statistics and in computing have long important in demography analysis. Through the 1880 US census, results were tabulated by hand for the 1890 census, punch key tabulating machine developed by Hollerith, first used which speed up and reduced the cost of census tabulation. The resulting company eventually became IBM. Advances in statistical method in combination with improvements in computing power, have continued to be important. Better sampling methods have

NSOU ? GE-SO-21 35 improved the value of surveys. Also, more powerful computing allowed multi-dimensional analysis of very large files, such as individual data from sensors files this development have allowed researchers and policy analysts to answer increasingly complex questions using empirical data. Recent geographical locations have played increasing roles in demographic analysis this has been facilitated by advances in spatial statistical methods and in the availability of low-cost global positioning system (GPS) units show that the location of residences, School and health clinics can be used as variable to analyze the impact of proximity to healthcare, schools, stores, and water sources on outcomes such as infant and child mortality and use of contraception. For example, Szwarcwald and her colleagues used special analysis methods in a study of infant mortality in Rio de Janeiro to show that infant death from 1 to 11 months of age was related to the concentration of poverty in an area, even after the local poverty level had been taken into account. What research about role of geographical location addresses the role of neighborhood effects in health and other outcome?

2.5 Conclusion Demography is often defined as the scientific study of human populations or as the study of the growth and structure of human populations. Demography studies the size and characteristics of populations as well as the processes that lead to population change: fertility, mortality, and migration. Demography is used to help answer scientific and policy questions in a wide variety of areas. Demography can either focus on change in demographic mechanisms at an aggregate level, such as changes in the number of births or in the size of the population, or take a micro-behavioral approach, looking at factors related to the behavioral mechanisms and external influences that lead individuals or households to have a child, to die from a particular cause, or to move to another place. The demographic perspective has become very influential in many fields, including social statistics, the study of the labor force, research on organizations, and the study of marriage and the family. Population theories and policies have been developed over time in response to population phenomena that were seen as important, in need of explanation, or problematic.

NSOU ? GE-SO-21 36 2.6 Summary Demography is an important concept. Demographers study population change across time and place. Its origin was in natural and social sciences, it soon except maturity and emerged as a separate discipline. Quantification is essential for population studies. Population studies and biology are closely related. Broom Schznick treats population as one of the nine principal elements of sociological analysis for the discussion of six topics that is family, city, minorities, industrial sociology, political sociology, and criminal behaviour. Population studies are usually interested in the geographical distribution of the population and its movement between rural and urban areas. The study of population trends an economic growth have come to the forefront in most developing countries. Prof. Chandrashekhar has pointed out that population laws may be defined as that body of law which relates directly or indirectly to the three basic demographic variables of fertility, mortality and migration and their various components. Besides economics and sociology, demographics approach is related to the perspective an influence of history, political science, psychology, anthropology, and statistics are also important. Among the Mercantile writers the most important are N. Machiavelli and Giovanni Botero. Machiavelli was perhaps the first to view population from the modern angel by observing that excessive population would diminish through want and disease. In the sense that he saw the relationship between the population growth and resources. For this reason, he may be considered one of the predecessors of Malthus. Giovanni regarded a large population is a source of strength.

2.7 Questions Answer the following in your own words. G-A (5 Marks each) i. What do you mean by demography? ii. What is the use of studying demography? iii. What are the two different ways to think about population change?

NSOU ? GE-SO-21 37 G-B (10 Marks each) iv. Discuss the influence of economics, history, anthropology, political science, psychology and statistics on demography. v. What is the relationship of population studies with mathematics? vi. State the interrelationship between population and law.

population. The size and growth of population has been viewed as an important factor underlying the development of any country.

The different points of view is expressed by the scholars with respect to population phenomena
NSOU ? GE-SO-21 39 within the socio-economic, political context. In ancient times several statesman and thinkers applied their minds to

90%

MATCHING BLOCK 27/164

W

the question of the desirable size of population and the need for either encouraging or discouraging

population growth. The basis for such concern was mainly practical, covering military, political, social, and economic issues and usually led to the formulation of a specific public policy. These thinking cannot be e taken as any statement of a consistent population theory. In the real sense of the term a population theory can be considered to have emerged only in the 18th century when the great work of Thomas Robert Malthus was published. Although some thought was given to population issues in earlier periods. The traces of some ideas which have gained prominence in recent theoretical writing on population may be noticed in the writings of some ancient thinkers and philosophers. 3.3 Confucius and the Chinese Thinkers The great Chinese philosopher Confucius and those belonging to his school of thought as well as a few other Chinese thinkers had given some thought to the concept of optimum population as it related to agricultural land. They had also considered population growth in relation to the availability of resources and the possible checks on this growth. However, it must be pointed out that the doctrines of Confucius on marriage family and procreation were generally in favour of population increase (united nation p. 33-34). 3.4 Greek Thinkers The population theories and policies of the Greeks may best be understood with reference to their ideas.

97%

MATCHING BLOCK 28/164

W

In the Greek scheme of political life, the individual was only a part of the state and had to play subordinate role to it.

This view was reflected in their thinking on various social institutions. In ancient Sparta marriage was considered as an institution created by the legal and political system to provide the state with inhabitants and citizens. The real purpose of marriage was therefore emphasized as being the production of children. Continual wars, which decrease the population size, demanded a constant supply of men. Therefore, all Spartans were compelled to get married.

NSOU ? GE-SO-21 40 On the other hand, in Athens the rules concerning procreation were somewhat less rigid to Athenian customs and laws also encouraged frequent childbearing. However, it must be remembered that like the Spartans the Athenians were also interested in maintaining and improving the quality of the population from this it is obvious that the Greek were concerned about the size of the population

100%

MATCHING BLOCK 32/164

W

more from the point of view of defense security and

governance than from that of economic resources. Great Greek philosopher Plato was more specific on this. When he stated

that if the highest good was to be achieved the city state should have 5040 citizens

and land houses and property should be equally divided among them. It may be noted that Plato referred only to citizens and did not include women children and slaves in this ideal number of 5040. The total population of such an ideal city state was about 50000. The purpose of this choice of figure in Plato's planned state was simply aid in maintaining an equal division of property. Plato wanted the city state to be large enough to ensure economic self-sufficiency and military defense but small enough to permit a constitutional government. In a nutshell Plato's views on population as expressed in his *Laws*, were based upon his ideal of the city state rather than upon a broad view of human society (Eversley p.1-21,89-121,184-284). Aristotle was of the opinion that an excessive number of people would give rise to poverty and other social evils since it was not possible to increase land and property as rapidly as the size of the population. Aristotle even proposed limit on the number of children each couple should have (Canan p54). Therefore, we can say that the Greeks were interested in maintaining population size which was appropriate for a city state.

3.5 Roman Thought

The Romans viewed the question in the context of their idea of the state involving issues concerning conquest, power, and empire. Therefore, they needed and expanding population. The period of the Renaissance or the revival is known for the rapid changes which took place in several aspects of human life. The old feudal system collapsed, making way for capitalism. This period was also notable for the emergence of such powerful states as England, France, Spain and Portugal. It was inevitable that all these changes should have some impact on the thinking on economy and population.

3.6 The Mercantilist School

In the history of economic thought, mercantilism is considered to be a link between the mediaeval period and the modern period. Almost all the trading Nations adopted this economic policy of mercantilism with a view to increasing national wealth and power by encouraging exports of goods in return of gold. Such policies open resulted in rivalry between Nations give rise to rapid economic growth and full utilization of national resources. For an effective implementation of mercantile policy, the size of the population was an important asset. As stated by Eli Heckscher, "an almost frantic desire to increase population prevailed in all the countries" (Heckscher p. 158). The general opinion at that time was that birth rates should be increased for purposes of economic and political gains by the adoption of such measures as- a) placing various disabilities on celibates; b) encouraging marriages directly; c) encouraging fertility; d) making punishment for illegitimate births less severe or abolishing punishment entirely; and e) encouraging immigration and preventing emigration (Stangeland p. 123-137). Among the early mercantile writers the most important are Niccolo Machiavelli (1469-1527) and Giovanni Botero (1540-1617). Machiavelli was perhaps the first to view population from the modern angle by observing that excessive population would diminish through want and disease. In the sense that he saw the relationship between population growth and resources, he may be considered one of the predecessors of Malthus. Botero, an Italian citizen was also one of the first to study population phenomena in a broad scientific manner. Along with Machiavelli he may be considered one of the predecessors of Malthus. His work contained the basic thoughts of Malthusian doctrines. According to his thought a population after increasing for some time cannot continue to increase at the same rate; it may grow slowly or may even start declining. In his opinion the limitation of the means of subsistence was the reason why population growth had to be limited. Though Botero was convinced that food for subsistence was necessary for any population,

NSOU ? GE-SO-21 42 he still regarded a large population is a source of strength for a country. (Stangeland p.92-93) 3.7 The Physiocratic School The physiocratic school of economic thought emerged in France about the middle of the 18th century. This school of thought was the expression of a reaction against the mercantilist ideas and politics. The mercantilist had neglected agriculture in their thought, on the other hand the basic assumption of the physiocratic school was that land was the source of all wealth and hence it was necessary to emphasize the importance of agriculture and internal tax reforms. As a reaction against mercantilist the physiocrats did not favor population increase at the cost of standards of living. They approved of such increase only if it was possible to expand agricultural production. Quesney (1694-1774), the founder of the physiocratic school maintained that a large population was desirable only if it could be made comfortable. Similarly, Mirabeau, Mercier de la Riviere and Cantillon, and other physiocrats gave same line of thought. (Encyclopaedia Britannica vol. P. 1031) 3.8 Population, Choice, and the State The essayists, historians, and jurists who gave us the first modern theories of the State usually had something to say about a large population as its foundation. This reference went beyond the role of numbers in immediate practical matters (war, labor, tax revenue) to the strength of states as an expression of natural (and, for most authors, divine) order. Two fundamental links between population and choice were noted. The first sense in which individual choice is crucial lies in those decisions by which people choose to band together—decisions that actually make a human aggregate not just a great higgledy-piggledy of people, but a self-governing population or society. Only where the natural rights of individuals were duly observed could people's diverse interests and energies be reconciled and become, literally, a "commonwealth." The various writers noted, however, that individual freedom of choice is observed to greater or lesser extent in different states. The character and

NSOU ? GE-SO-21 43 identity of polities were determined by the extent to which an ideal of balance in the rights and obligations of men—variously described as "the social contract," "Leviathan," "divine right," "micro- and macro cosmos," and so forth—was actually maintained in state policies and their execution. States would only grow and become strong where natural rights and relations were encouraged or at least allowed within the terms of prescribed checks and balances established by the State. The second link follows from this: evidence of balanced population growth and distribution was a sign or test of whether policies did indeed conform to universal order. Many writers continued to understand this test in its Medieval and biblical sense as well, in which natural increase was evidence of divine favor. Except in those writings that regarded kingship as divine right, the State was not itself seen as a natural and divinely inspired entity, but as a contrivance by which men agreed, or were compelled, to cede individual rights to a prince or assembly in the interests of development and peaceable rule. Choice, in other words, always involves an element of compromise. The critique of absolutism, from Machiavelli to Rousseau, gradually established that it is a matter of individual conscious choice to decide which collectivities are deserving of allegiance, and what the principles of group membership are. Hence the population of states, while recognized as based ultimately in procreation, was of more immediate and practical interest as an aspect of the Realpolitik of group affiliation: Which states, and which cities, factions, or other groups within them, could attract and sustain the most, and the most balanced organization of, manpower? This emphasis on membership (see Berki, 1977: 118-119) meant that early modern writers, though often careful to note biblical sanctions promoting fertility, nonetheless gave much more attention to the significance of population composition and distribution. The family is taken for granted as the context of reproduction; its primary significance in these writings was as the model of State membership and authority, and also of the dangers of dissent. This politics of population membership was not viewed in isolation. As we shall see, natural balances were conceived as essential not only in regulating the political rights and responsibilities of individuals, families, and the wider communities to which they belonged, but also in the organization of matters such as trade, agriculture, and defense. A commonwealth that was able to augment, distribute, and deploy its members in ways which enabled it to gain the most favorable balances in military and economic affairs was considered likely thereby to become a greater force than

NSOU ? GE-SO-21 44 its neighbors. Such a desirable outcome made the establishment of an effective polity an even greater priority, since only then would individuals come to see regulating their own actions in ways that preserved and enhanced the State as the best way of furthering their own interests. The importance assigned to population as the foundation and arbiter of State policies might lead us to expect that great impetus would be given to enumeration and quantitative inquiry by early modern writers. It is well known, however, that despite the efforts of Graunt and his followers, the mathematics of population developed very slowly between 1650 and 1800, and the role of states in data collection did not begin in earnest until the end of the period. Such institutional developments presuppose an idea of the State in which a population is not simply part of a ruler's or family's domain, but a unit of self-government guided by legal and social responsibilities to every individual. This presupposes, in other words, a theory of individual choice and the State of the kind that only gradually developed during this period. To begin with, we must ask why and how early modern writers came to see the numbers and composition of people as fundamental to the relationship between individual choice and the State. "Population" was not a common term before the later seventeenth century; its emergence would appear to be in direct proportion to the need for a more critical reference for "the multitude," a term then generally used to refer to the mass of common people as an indiscriminate body. Historical studies of early modern economic (Appleby, 1978) and biological (Jacob, 1974) writings suggest that population was likely to figure prominently in the thought of the period, since reasoning relied upon sixteenth- and seventeenth-century concepts of re- production and production as processes of "generation." This concept, as we shall see, contrasts sharply with subsequent modern fertility concepts; it nonetheless defined a "calculus" of individual choice in relation to population and the State on which later work still rests. Let us look more closely at the sources cited above, and see how they gave rise to the specific questions and measures that characterized the practice and the limitations of political arithmetic. The Generation of a Commonwealth The elementary distinction that Hobbes makes between vital and voluntary human action (n.d.: 31) can serve as our starting point. Hobbes postulated that vital action is "begun in generation" (i.e., from birth) and consists in more or less NSOU ? GE-SO-21 45 unthinking bodily functions (breathing, eating, circulation of the blood, etc.). Volun- tary actions, in contrast, are characterized by speaking and physical movement. While the latter also depend on man's vital endowment, their development is more by virtue of the growth of man's powers of imagination, and hence depends on the nature of his association with other men. The natural rights of individuals-their entitlement to free conscious choice-also derive from generation: men are born equal; birth gives a person possession of his or herself, or in other words, liberty. However, because individual interests are bound to conflict, man's freedom and natural endowments can only develop if men enter voluntarily into lasting and peaceable agreements with one another. In short, they must set up a State, or succumb to the famous Hobbesian image of a society that is "a war as is of every man, against every man." The "generation of a commonwealth" is Hobbes's phrase for the act by which the formation of states is accomplished. It is achieved by voluntary choices to curb and direct vital endowments toward the common good. Hobbes reasons here by analogy to the family: a numerous population is necessary to the development of a strong State in the same way that many offspring assist the power and capacities of a family. But such increase is for not unless the collectivity is well-ordered. A multitude of people only becomes a commonwealth or State by choosing one person or assembly of persons (called Leviathan, or sovereign) in which all authority to maintain natural order is invested. Authority, following the family analogy, is paternal. Most states, Hobbes says, are erected by the fathers of families. "Cities and Kingdoms . . . are but greater families," which unite for security and development. Sovereign power parallels the dominion of a father over his child, but the source of this authority is not "because he beat him." Contrary to Bodin, Filmer, and the divine right of kings, procreation does not legitimize a divinely sanctioned patriarchy. Hobbes, as also Locke, Montesquieu, and Rousseau, accepted that sovereign parental authority enjoys for a time ad- vantages of experience and physical force; but family/State authority rests on the consent of the children/people. Children may choose to leave, or depose the father; and so too, they may choose to leave states or depose their rulers. The overriding desirability of stable order, and the lack of alternatives to legitimate family models, however, led these authors to caution against such extreme action. The analogy between the family and the State thus rested on a concept of generation in which we can recognize two distinct meanings. The State, like the family, was rooted in generation (in the sense of the vital endowment of procreation, which is the ultimate source of population). But the State and the family also rest

NSOU ? GE-SO-21 46 strategically on the generation of their population in a second sense: those more or less voluntary choices to remain members of a collectivity and observe its laws, which effectively constitute and give continuing existence to that collectivity. The original state of nature was generally accepted by early modern authors as having a bounteous surplus of food, land, and the like. However, because the rights that the individual acquired in nature included his or her own person, and hence the right to dispose of personal labor, men thereby possessed rights over property that was the fruit of their labor. In more strictly patriarchal or divine-right approaches, rights over wives and children and their labor accrued to household heads. In either case, rights in persons extended to the disposal of personal property. For Hobbes, all men and women had in the state of nature a right not only over their own person and possessions, but to all of nature, and hence to everyone else's property. Covetousness and differences over property could thus arise long before any absolute resource shortages occurred, and they could be inherited and built up over generations. Or, as Locke preferred to say, where mechanisms such as money and credit increased differences among men, so that increase of population led to a scarcity of land, the need to agree about laws arbitrating the division of property grew. In Montesquieu, laws promoting liberty likewise promoted population and commerce; their development was in contrast to absolutism and the continuing power of the Church (Tomaselli, 1989). Population growth was thus seen as necessary to the development of a strong state; however, states could only develop their demographic and other resources if their populations were well-ordered. The need of States to have enough people was thus an argument for their role as a regulator of individual choice. From the first of the early moderns-Machiavelli and his immediate follower, Botero-it was recognized that limited natural resources must ultimately restrict population growth. If the balance between subsistence and population did not much concern such early writers, it was because the concepts of balance and imbalance, described in the preceding paragraphs, were recognized as prior and as of more immediate practical significance. Indeed, the logic of these writers remains hard to fault in their view, the limits set by men in their relationships with one another become important long before root imbalances between man and nature, such as between the size or structure of a population and its sheer material supports; an imbalance of population and resources, therefore, is determined by the character of the collectivity to which men belong.

NSOU ? GE-SO-21 47 The Symmetry of a Commonwealth Given that imbalances occur, and may be subject to man's control, several questions arise. If a large population is desirable, what sizes or levels are conducive to a strong and balanced State? Can particular forms of demographic organization be determinant of different kinds of State? What are the implications of different population sizes and compositions for maintaining free choice and the exercise of legitimate authority? Then, as now, no precise answer to the question of an optimum population was possible, although once again early modern approaches can be summarized effectively by referring to the concept of generation. As a root value, the "best" size was not so much indeterminate as predetermined: it belonged to the realm of natural and divine order and was consequently beyond human analysis in crucial respects. Second, as a strategic value, the best population size and structure inevitably varied from state to state, as determined by differing arrangements of authority, choice, and their implications for membership and development. Filmer's Patriarcha (1680) gives examples of a concept of State built entirely on root values of generation. The king, as divine patriarch by birth, has indisputable power over the life and death of his subjects and can move them around as he pleases. Hence the strategic issue of population membership in the generation of commonwealths, together with the need to generate manpower for defense, trade, and so forth, is completely determined by the root values given to kings and fathers in procreation. These values cannot be questioned without questioning man's genesis, for legitimate authority is by direct descent from the authority God gave the original patriarch, Adam, over all Creation. Because the question of numbers in the family and the body politic is a matter of unquestioning obedience, Filmer confines himself to citing the biblical injunction to "be fruitful and multiply. Although Patriarcha acquired an important following, it was not an adequate response to the experience of the period in the political domain. Recurring upheavals-exemplified by such events as the Huguenot rebellion in France, successive French, German, and Spanish invasions of Italy, the English Civil War, the mounting struggle to dominate international trade- persuaded even those writers who had expressed republican sentiments, including Bodin, Hobbes, Machiavelli, and Starkey, that since serious conflicts persist, the overriding need for peace and order requires

NSOU ? GE-SO-21 48 some system of absolute princely authority. As I have noted, the development and defense of states meant for these writers that a large population was desirable; but large populations could by definition only accumulate where conflicts did not split them apart. A prince could only build a great state where his authority was accepted, and this meant some system of concessions that allowed individual choice but controlled its fractious tendencies. The systems put forward by early modern authors differed from one another in many respects, but in their treatment of the question of human numbers the issues and positions are remarkably consistent. Balance is achieved by strategies or policies that, by encouraging people to identify their interests with those of the State, keep them as loyal members. Further, policies that enable a State to attract and incorporate other populations were seen as desirable. Machiavelli, in addition to being the earliest modern political theorist to write in this vein, gave these issues the most attention. The cyclic model of history pervading all his major works rests on alternating demographic regimes: one of sustained political, demographic, and military expansion keep a strong state from emerging, or vitiate it, thus leading to its decline (Kreager, 1988b). He duly acknowledges the ideal of "generativa," or vital endowments in human and agricultural fecundity, as the natural source of greatness in all spheres political, economic, moral, and military. But most of his attention is addressed to obtaining strategic advantages by neutralizing potential internal factions and co-opting the populations of other families, cities, and states. In Machiavelli's view, a large native population is preferable chiefly because native troops are more to be trusted; it is, after all, their own families and property they are enlarging or defending. But this does not mean that high fertility is necessary. Florence and Rome were notably deficient in this respect, but by adroit policies they managed to expand through assimilating surrounding peoples into their polities. Machiavelli points also to Venice and Pisa as examples of successful states based on peoples of diverse origins, where the ability of men to band together overcame natural deficiencies in the land available for cultivation. Resources in people and territory are, in short, open to manipulation. There is no best population size. While a small state is preferable, since it is more likely to permit equality of rights and a republican constitution, such states inevitably become the prey of larger ones; to survive, a state must expand. But as the

NSOU ? GE-SO-21 49 number of people increases, government becomes less direct and the opportunity for internal conflict grows; only an absolute prince is likely to be able to control such conflict and then only for a time. Much of what is archetypally "Machiavellian" in Machiavelli's writings concerns what are, in effect, population policies-including the use of conspiracy and fraud-through which the population necessary to the security and development of a state may be built up and efficiently deployed. It is characteristic of Machiavelli, for example, that in writing his *History of Florence*, he often shows us how individuals and heads of families act, willfully in ways contrary to the interests of the population of the state as a whole; and how the outcome of such actions is that individuals, families, and the members of wider factions are forced to leave the community, permanently or temporarily, unless some compromise (or trick) can be effected that will keep them as loyal members. In other words, it is not the actual size and composition of a population that matters, but the effective or strategic size and composition-the numbers available that will act cohesively, or can be contrived to do so. As Hobbes remarks, "the multitude sufficient to confide in for our security is not determined by any certain number, but by comparison with the enemy we fear" (n.d.: 110); and the proof of this is that conflict is likely to ensue only where each side has failed to convince the other of its military, demographic, or other advantage. Similarly, Bodin, in constructing his system of commonwealth, explicitly rejects limiting population growth; this argument occurs, as in so many of these writings, in the context of a discussion of the problem of factions and perceived inequalities. The problem is one of obtaining the right balance of groups and property within the State. Small states, in Bodin's view, are no less prey to these problems than large ones, but the greater complexity of a large population tends to check seditious factions, since "there will be many in an intermediate position between the rich and the poor, the good and the bad, the wise and the foolish" (n.d.: 159). Rousseau likewise affirms that there is no best population size for all states, although a large and increasing population is the surest sign of prosperity. He defines the different kinds of State by the ratio of the size of the governing body to the population. Like his predecessors, Rousseau sees monarchies and aristocracies, in which the number of governors is small in proportion to the number of people, as the only form of state likely to permit large populations. Absolutism provides the necessary centralized management, whereas democracies, although preferable, require small population sizes that leave them vulnerable to conflict within and without, to which no enduring solution seems possible.

NSOU ? GE-SO-21 50 3.9 Conclusion The ascription to pre-Malthusian writers of a cornucopian view of nature needs similarly to be re-examined and the concepts involved clarified. In particular, we must be wary of a modern critical elision – adumbrated in *Candide* and other eighteenth-century expressions of enlightened irreverence – between providential and anthropocentric views of nature, on one hand, and arbitrarily optimistic expectations of natural bounty, or even of anthropogenic transformations of the natural order, on the other. The idea that Creation was a moral drama did not imply that it was a comedy. Malthus attacked the latter suggestion with Voltairean wit; but he shared the former belief in full measure.⁷⁰ This is most obvious in the closing chapters of the 1798 *Essay*, which explicitly set out the divine economy behind the principle of population.⁷¹ But it is no less present – and is indeed more carefully and empirically integrated – in the later editions, which quoted medical arithmeticians such as Short and John Aikin to the effect that epidemics were providential instruments, and recommended the evangelical John Bird Sumner’s comments on the “calculated” link between the people’s need to compete for resources and the “improvement of human virtue”. Malthus explicitly related both the imbalance between human multiplication and the production of food that constituted the “principle of population”, and the oscillation between positive and preventive checks that its operation entailed, to the divine purposes of replenishing the earth, “improving the human faculties”, and furnishing first “admonitions” and ultimately “penalties” for human “disobedience”. This was a much more systematic expression of divine demographic justice and its mechanisms than Durham’s or Short’s works could furnish. But it was not very different in its assessment of nature’s indifference to human feeling or the suitability of nature’s laws for human improvement.

3.10 Summary This unit traces the development of the population theories from Chinese thinkers to that of Roman and Greek thought. Different points of view are expressed by these scholars regarding population problems. Confucius and other Chinese thinkers had given valuable contributions to the concept of population. Confucius was in favour of population increasing. On the other hand, in ancient Sparta marriage was considered as an institution created by the legal and political systems to provide the state with inhabitant and citizen. Therefore, all Spartans were compelled to get marriage, because continual wars decrease the population size and demanded a constant supply of manpower. Like Spartans, Athenians, on the other hand, were also interested in maintaining and improving the quality of the population from the point of view of defense security. The Romans also needed an expanding population. The Mercantilist school tried to link between the medieval period and the modern period. As a Mercantilist thinker Giovanni Betero and M. Machiavelli regarded a large population as a source of strength for a country. Quesnay (1694-1774) the founder of the Physiocratic School maintained that a large population was desirable only if it could be made comfortable.

3.11 Questions G-A (5 Marks each)

- What do you mean by Commonwealth in case of population problems?
- How many links are there regarding population?
- What do you mean by individual choice theory?

G-B (10 Marks each)

- Write a note on the contribution of Chinese Thinkers to the development of population theory.
- What is the contribution of Roman Thought to the development of population theory?
- What is the contribution of Greek Thought to the development of population theory?
- Analyze the contribution of Mercantilist School to the development of population theory.
- Analyze the contribution of Physiocratic School to the development of population theory.

The Malthusian Theory of Population is a theory of exponential population growth and arithmetic food supply growth. Thomas Robert Malthus, an English cleric, and scholar, published this theory in his 1798 writings, *An Essay on the Principle of Population*.

NSOU ? GE-SO-21 54 The 18th century was a period of profound change in intellectual arena. These changes where to have a great influence on social economic as well as population theory. From the middle of the 18th century almost all writings on population contained some reference to the point that population increases more rapidly than food supply, a point which was letter to be elaborated by Malthus and which

100%

MATCHING BLOCK 35/164

SA

Demographic Transition and Development in Indi ...
(D110958861)

came to be known as the Malthusian theory of population.

Many writers anticipated the theory latter elaborated by Malthus. Botero has already been referred to as his first important forerunner. In 1677, Matthew Hale referred to the capacity of mankind to increase in geometrical proportion, doubling in numbers in the course of 34 years or even also referred to corrective checks for controlling human population. Other writers who thought in the same line were Robert Wallace, John Bruckner, James Stewart, and Joseph Townsend. Thomas Robert Malthus was the second and last son in a family of eight. He was born on 14 February 1766. Thomas Robert Malthus was a famous 18th-century British economist known for the population growth philosophies outlined in his 1798 book "An Essay on the Prin- ciple of Population." In it, Malthus theorized that populations would continue expand- ing until growth is stopped or reversed by disease, famine, war, or calamity. He is also known for developing an exponential formula used to forecast population growth, which is currently known as the Malthusian growth model. i. Understanding the Ideas of Thomas Malthus In the 18th and early 19th centuries, philosophers broadly believed that humanity would continue growing and tilting toward utopianism. Malthus countered this belief, arguing that segments of the general population have always been invariably poor and miserable, which effectively slowed population growth. After observing conditions in England in the early 1800s, Malthus penned "An Inquiry into the Nature and Progress of Rent" (1815) and "Principles of Political Economy" (1820), in which he argued that the available farmland was insufficient to feed the increasing world population. Malthus specifically stated that the human population increases geometrically, while food production increases arithmetically. Under this paradigm, humans would eventually be unable to produce enough food to sustain themselves. This theory was criticized by economists and ultimately disproved. Even as the human population continues to increase, technological developments and migration

NSOU ? GE-SO-21 55 have ensured that the percentage of people living below the poverty line continues to decline. In addition, global interconnectedness stimulates the flow of aid from food- rich nations to developing regions. In India, which boasts the world's second-biggest population, the Green Revolu- tion in the state of Punjab helped feed its growing population. In western economies like Germany, which was battered during World War II, population increases did not hamper development. Famous naturalist Charles Darwin partially based his natural selection theory on Malthus' analysis of population growth. Furthermore, Malthus' views enjoyed a resur- gence in the 20th century, with the advent of Keynesian economics. ii. Background of Thomas Malthus On February 13, 1766, Malthus was born into a prominent family near Guildford, Surrey, in England. Malthus was home- schooled before he was accepted to Cambridge University's Jesus College in 1784. There he earned a master's degree in 1791 and became a fellow two years later. In 1805, Malthus became a professor of history and political economy at the East India Company's college at Haileybury.1 Malthus became a fellow of the Royal Society in 1819. Two years later, he joined the Political Economy Club, along with economist David Ricardo, and Scottish philosopher James Mill. Malthus was elected among the 10 royal associates of the Royal Society of Literature in 1824. In 1833, he was elected to both the Académie des Sciences Morales et Politiques in France, as well as Berlin's Royal Academy. Malthus also co-founded the Statistical Society of London in 1834. He died in St. Catherine, near Bath, Somerset in 1834. 4.3 An Essay on the Principle of Population In 1798 Malthus published his first essay on population which was mainly directed against the optimistic view of William Godwin an English writer and philosopher, and against Marie Jean Antonie Condorcet, French mathematician economist and philosopher. The title of the essay was:

78%

MATCHING BLOCK 34/164

W

An Essay on the Principle of Population as at affects the Future Improvement of Society, with Remarks on the Speculations of Mr Godwin, Mr. Clandorcet and

Others. This famous work of Malthus is a landmark in the history of population studies. It has become one of the most famous and one of the most controversial books of modern times. It brought

NSOU ? GE-SO-21 56 great honour to its author as well as abuse and criticism. It is to mention that the year of the publication of this book is determined as a base year for the study of population doctrines. Many ages to come all views on population were classified as pre- Malthusian, Malthusian, anti - Malthusian, and neo-Malthusian. He developed his idea on population in his essay. He was the first to develop a consistent and comprehensive population theory in relation to economic conditions and his writings exercised a great influence on population and economic theory. (Smith p. 4) The first edition of the essay was essentially directed against the utopian writers, William Godwin and Condorcet who had more optimistic views concerning the possibilities of supporting and increasing cause and ardent French revolutionary who was tried in absentia and was sentenced to death. While hiding in a student's boarding house, he wrote his famous treatise on the history of human progress. According to Condorcet, "All inequalities of wealth, of education, of opportunity, of sex, would soon disappear." (Petersen p 32-33) In 1793 that was about the same time Condorcet set went into hiding, Godwin published his book entitled Enquiry Concerning Political Justice. He had optimistic utopian ideas of a perfect society where 30 minutes work per day would fully satisfy the needs of all save draught. The theme of the essay of Malthus was mainly to counter the Utopian view of Godwin and Condorcet. He argued that the tendency of the population to grow faster in relation to its means of subsistence had led to human misery and placed several obstacles in the path of human progress. In 1803 Malthus published second edition of his essay which was a much expanded and changed edition, not merely a reprint. This edition contained substantial statistical data in support of the many arguments put forward and proposed moral constraint as a preventive check on rapid growth. Malthus spent the next five years in studying other authors' writings on population issues, visited continent, collected relevant statistical data and brought out another revised edition. Subsequently four more editions were published. The sixth edition was published in 1826. This edition was entitled An Essay on the Principle of Population or a View of its Past and Present Effects on Human Happiness, with an Inquiry into our Prospects Respecting the Future Removal or Mitigation of the Evils which it Occasions. The final and seventh edition was published after his demise in 1872.

NSOU ? GE-SO-21 57 4.4 Postulates of the Malthusian Theory of Population In the first edition of the essay,

88%

MATCHING BLOCK 36/164

that the power of population is definitely greater than the power in the earth to produce subsistence for man. Population when unchecked increases in

a geometrical ratio. Subsistence increases only in an arithmetical ratio.

A slight acquaintance with numbers will show the immensity of the first power in comparison with the second. (Malthus essay 1798p. 11) In chapter two of the sixth edition of the essay Malthus puts forth the following propositions, "(1) Population is

necessarily limited by the means of subsistence: (2) Population invariably increases where the

89%

MATCHING BLOCK 42/164

SA

BEC-14, Blk -1 MY OWN.docx (D139799522)

means of subsistence increases unless prevented by some very powerful and obvious checks: (3) These checks and the cheques which repress the superior power up population and its effects on a level with the means of subsistence are all resolvable into moral restraint vice and misery." (Malthus

essay 1798 p. 11) Accepting the fact that the factors obstructing the growth up population where constantly in operation Malthus father attempted to investigate what the natural increase in population would be if left unchecked and the rate at which the means of subsistence would be increased. On the basis of these two questions, he framed to office basic prepositions that – population tends to double itself every 25 years, thus increasing in a geometrical ratio while even under the most favourable conditions agricultural produce increases each 25 years only by an equal quantity, thus increasing only in an arithmetical ratio. (Malthus essay 7th edition book 1 chapter 1) Population Growth Food Production Pop. Time Food Time

MATCHING BLOCK 38/164

W

Population and Food Supply Thomas Malthus theorized that populations grew in geometric progression. A geometric progression is a sequence of numbers where each term after the first is found by multiplying the previous one by a fixed, non-zero number called the common ratio. For example, in the sequence 2, 10, 50, 250, 1250, the common ratio is 5. Additionally, he stated that food production increases in arithmetic progression. An arithmetic progression is a sequence of numbers such that the difference between the consecutive terms is constant. For example, in series 2, 5, 8, 11, 14, 17, the common difference of 3. He derived this conclusion due to the Law of Diminishing Returns. From this, we can conclude that populations will grow faster than the supply of food. This exponential population growth will lead to a shortage of food. 4.6

Positive Checks and Preventive Checks According to Malthus population could not continue unchecked. He classified two different types of checks – preventive checks and positive checks of population. Malthus included moral restraint and vice as voluntary checks based on man's reasoning. Further elaborating on these two preventives checks he describes moral restraint as "abstinence from marriage, either for a time or permanently from prudential consideration, with a strictly moral conduct towards the sex in the interval. And this is the only mode of keeping population on a level with the means of subsistence which is perfectly consistent with virtue and happiness". According to Malthus vice was prevention of the birth of children – "short of intercourse which renders some of the women of large towns unprolific", extra marital sexual relations and prostitution. (Malthus A summary view of the principle of population p. 114) Malthus' positive checks Quantity Time

NSOU ? GE-SO-21 59 The positive checks referred in general to all the factors which tended to human life: "Such as unwholesome occupations, severe labour and exposure to the seasons, bad and insufficient food and clothing arising from property, bad nursing of children, excesses of all kinds, great towns and manufactories the whole train of common diseases and epidemics, war, infanticide, plague, famine". Malthus classified these positive checks into two categories the first which were brought about by natural causes and which he labelled as "exclusively misery", the other being that which mankind brought upon itself, such as wars, excesses up all kinds, which wear avoidable but, which were brought about by vice and were the consequences of misery. (ibid 153) It's true that Machiavelli and Botero had earlier stated that population increases faster than the means of subsistence. Many of his arguments had already been put Malthus' negative checks Quantity Time Malthusian Theory of Population Population increases in geometrical progression 1, 2, 4, 8, 16, 32, 64, 128, 256 in 200 years. Food increases in arithmetical progression 1, 2, 3, 4, 5, 6, 7, 8, 9, in 200 years. Imbalance leads to over population Corrected by Preventive checks—late marriage, chastity, moral restraint, etc. Positive checks—vice, misery, war, famine, floods, etc.

Malthusian Trap The Malthusian Trap (or "Malthusian Population Trap") is the idea that higher levels of food production created by more advanced agricultural techniques create higher population levels, which then lead to food shortages because the higher population needs to live on land that would have previously used to grow crops. Even as technological advancement would normally lead to per capita income gains, theorizes Malthus, these gains are not achieved because in practice the advancement also creates population growth. Once the population exceeds what food supplies can support, this supposedly creates a Malthusian crisis with widespread famine as well as rampant disease. This ends up decreasing the population to earlier levels. The reality, however, has been that population growth has not itself created the crisis that Malthus predicted.

Though it is true that the idea of Malthusian theory is based had been prevalent for several years, but Malthus put these ideas in a larger framework and examine the inter relationship between population growth on the one hand and economic and political developments on the other hand. He modestly recognised that his work was not an original doctrine, at the same time pointing out that his presentation of the same ideas was better and some systematic, especially in the proposition that population tends to increase at a geometrical ratio and the means of subsistence at an arithmetical ratio. 4.8 Criticism Malthus's theory of population has been criticized by numerous thinkers, writers, academician, and politician on several grounds. First, Malthus's argument was based on two ratios – the geometrical and the arithmetical. According to his many critics this was the weakest point of his theory Kenneth Smith pointed out that these ratios concerning population growth and the NSOU ? GE-SO-21 61 means of subsistence were based on a very weak foundation and were never really proved.

87%

Malthus concluded that population would double in a period of 25 years was based on the evidence of doubtful American statistics.

It has never been proved empirically. (Smith p.326) Secondly,

88%

MATCHING BLOCK 41/164

W

the classification of checks on population growth into the two categories of preventive and positive also came in for criticism and was cited as an example of "poor classification" for the two do not form "independent categories". It was pointed out that Malthus had not

succeeded in connecting his positive and preventive checks. (Smith p.244) Thirdly, Malthus's theory was based on weak relationship between population and food supply. In fact, the right relationship is between population and total wealth of the country. The argument is that if a country is rich materially and even if it does not produce enough food for its population, it can feed the people well by importing food in exchange for its products or money. Fourthly, Malthus neglected the manpower aspect in population growth. According to Cannon we forgot that "a baby comes to the world

100%

MATCHING BLOCK 43/164

W

not only with a mouth and a stomach, but also with a pair of hands".

Fifthly, Malthus underestimated the importance of industrial and agricultural revolution, and did not take into consideration the faster and more reliable modes of transport. Sixthly, on the other hand Kingsley Davis admitting that doctrine of Malthus where not empirical valid, emphasized that they were nevertheless theoretically significant. (Davis p.256-257) Lastly, Malthus's theory was based on a static economic law at any one time that is the law of diminishing return. 4.9 Is Malthusian Theory Valid Today? We must, however, add that though the gloomy conclusions of Malthus have not turned out to be true due to several factors which have made their appearance only in recent times, yet the essentials of the theory have not been demolished. He said that unless preventive checks were exercised, positive checks would operate. This is true even today. The Malthusian theory fully applies in India. NSOU ? GE-SO-21 62 We are at present in that unenviable position which Malthus feared. We have the highest birth-rate and the highest deathrate in the world. Grinding poverty, ever- recurring epidemics, famine, and communal quarrels are the order of the day. We are deficient in food supply. Our standard of living is incredibly low. Who can say that Malthus was not a true prophet, if not for his country, at any rate for the Asiatic countries like India, Pakistan, and China? No wonder that intense family planning drive is on in India at present. 4.10 Neo-Malthusian Theory of Population

72%

MATCHING BLOCK 44/164

SA

BLOCK I MSO 304.docx (D49764054)

The term neo-Malthusianism was first used in 1877 by Dr. Samuel Van Houten, one of the vice- presidents of the Malthusian League. Neo- Malthusianism was not just a campaign in favour of birth control;

it was particular perspective on the effects of population on human conduct and behaviour. The neo-Malthusian movement, therefore, was different from conventional Malthusian position on two counts: it stressed on birth control methods and also identified the working class with the problem of overpopulation. The overcrowded industrial slums were identified as sites of moral degeneration. This diverted the debate on population from issues of poverty and unequal access to resources, to birth control per se. In fact, the assumption was that access to commons or availability of resources would give the poor little reason to abstain from having more children. Neo- Malthusianism thereby reinforced the ideology of private property, individualism, and capitalism. The neo-Malthusian position found favour with the elite sentiments on the issue of overpopulation. The elite, threatened by the growing numbers of commoners, considered birth control as an important means of checking future conflict over their property. The French delegates tried to maintain a stance of ambivalence though they were wary of contraception on the grounds that it encouraged the idea of seeking sexual pleasure without taking the responsibility of the consequences of the act. According to them, it devalued the institution and sanctity of marriage and family values. For the Catholic Church, birth control was illicit and immoral and went against the basic tenet of Christianity. Till the 1920s, most medical opinion was also against birth control, as it considered it unhealthy and immoral.

NSOU ? GE-SO-21 63 The attitude started changing subsequently, as evidenced by the effort made by the British medical professionals in 1921 to appeal to the Anglican Church to reconsider their position on birth control in the light of existing medical knowledge. In America too, after a court ruling in 1929 that upheld the right of doctors to prescribe contraceptives for health reasons, birth control was included in medical curricula. Birth control clinics were set up in different parts of Europe and America and marked the new phase of the birth control movement. Birth control came to be popularised by taking recourse to the less "offensive" and more "social" terms like "family planning" or "planned parenthood", and the emphasis was on spacing of children and women's health. In its bid to control sexuality and the domestic sphere of a person's life, birth control went against the modern values of individual freedom and the right of an individual to her/his privacy. On the other hand, it also questioned the orthodoxy of the times and presented birth control as an attempt to present a choice to the individual to have a child or not. However, the source of the birth control debate was not whether individual freedom should be protected or not, but on how to control overpopulation, depopulation or under population and its consequent effect on the world. Central to the debate were the issues of migration, availability of labour, conflict over resources, and poverty. The concerns were developmental and political. The erstwhile Soviet Union was the first country whose government attempted to make birth control advice and services freely available. Lenin, a key supporter of family planning, distinguished neo-Malthusian propaganda from what he termed as "the freedom of dissemination of medical knowledge and the defence of the elementary democratic rights of citizens of both sexes". The socialists consistently maintained that the hue and cry over population was a way to divert the focus from the core issues of inequality and class struggle. For the socialists, the real issue was unequal access to resources than rising population. According to them, there was enough for everyone, provided resources are shared equally. The problem lay in the lack of equal distribution, with the bourgeois and the propertied class unwilling to give up the large share of resources under their control. After World War II, the situation altered with a number of newly independent states joining the United Nations. By then the neo-Malthusian demographic transition theory was well accepted. According to this theory, all countries pass through four

NSOU ? GE-SO-21 64 stages of demographic evolution. The first phase is the pre- industrial stage, marked by a high birth and death rate and slow population growth. The second stage is characterised by a population explosion, with improvement in technology and social conditions of life. The death rate is low, but the birth rate remains high leading to a high population growth rate. The third stage marks the beginning of the decline in the birth rate due to socio-economic changes and the fourth stage stabilises this trend and establishes a low and steady population growth rate. The interesting aspect of the theory is that population growth was supposed to reflect the level of economic development of a society. It established a low population rate as a key indicator of an economically developed country. The post-colonies or the countries of the 'third world' stood out in terms of the neo-Malthusian analysis. The countries that break oil of the ditches of colonial rule seemed to be undergoing the second stage of demographic transition, that is, they were experiencing high birth rates and low death rates. With better medical facilities and infrequent famine conditions, population had not only stabilised but also increased at a rapid rate. They were considered as backward, far behind the advanced societies in terms of economic development and technological growth, which was reflected in the persistent high rate of population growth rate. These were a matter of concern for the developed world. Years of colonialism had left these countries poor, with a large population to provide for.

Demographic changes in Kashmir (1991-2011).pdf
(D34797651)

Reduction of population became a priority with the UN. The focus was on raising nutrition levels in developing countries and providing better health facilities to women and children. The proposal to set up the Population Commission came up in 1945, which was opposed by former USSR and Yugoslavia on the grounds that another Commission would only confuse matters, given the proliferation of international bodies within the UN. But the main reason for opposing the Commission was because it focused primarily on "population changes" and the impending doom following the population explosion, rather than on "growth".

It ignored the role of global capitalist development in the production of economic backwardness in developing countries. The Commission was nonetheless formally established in 1946. Although it had no decision-making power, it worked in

NSOU ? GE-SO-21 65 collaboration with the other specialized agencies of the UN such as the International Labour Organization (ILO), Food and Agriculture Organization (FAO) and the World Health Organization (WHO). 4.11 Conclusion Malthus's theory of population may have many limitations but cannot be considered fully irrelevant in human society as a whole. This theory may not be applicable to develop industrialist northern countries of the globe but its influence spreads over the two third of the universe that the agricultural underdeveloped southern countries of the globe. So, we can conclude the topic with the words of John Robinson. He said, "of all economic doctrines, the one most relevant to the under developed countries is that associated with Malthus". 4.12 Summary From the middle of the 18 th Century almost all writings on population contained some reference to the point that population increases more rapidly than food supply. Thomas Robert Malthus sincerely elaborated this which

MATCHING BLOCK 48/164

W

Unlike the Malthusian theory, the optimum theory does not establish relationship between population growth and food supply. Rather, it is concerned with the relation between the size of population and production of wealth. The Malthusian theory is a general theory which studies the population problem of a country in keeping with its economic conditions. Thus, the optimum theory is more realistic than the Malthusian theory of population.

98%

MATCHING BLOCK 49/164

W

The optimum population is the ideal population which combined with other available resources or means of production of the country will yield the maximum returns or income per head.

Given these assumptions,

93%

MATCHING BLOCK 50/164

W

the optimum population is that ideal size of population which provides the maximum income per head. Any rise or diminution in the size of the population above or below the optimum level will diminish income per head. Given the stock of natural resources, the technique of production and the stock of capital in a country, there is a definite size of population corresponding to the highest per capita income. Other things beings equal, any deviation from this optimum-sized population will lead to a reduction in the per capita income. If the increase in per capita income, the country is under -populated and it can afford to increase its population till it reaches the optimum level. On the contrary, if the increase in NSOU ? GE-SO-21 69 population leads to diminution in per capita income, the country is over -populated and needs a decline in population till the per capita income is maximised. 5.3

Optimum Population

W

gradually the idea of population of optimum size for maximum production was accepted. 1 important aspect the concept of optimum population was that it was a reconciliation of the optimistic and pessimistic theories of population because it implied that the growth of population was beneficial up to a certain point after which

any further growth was harmful. The Economist like Carr Saunders considered optimum population as that which produces maximum welfare. On the other hand, Prof. Cannan defined this theory in terms of "return to labour." He remarked, "Knowledge and circumstances remaining the same there is what may be called maximum return when the amount of labour is such that both increase and decrease in it would diminish proportionate return." Similarly, Bounding has rightly observed, "optimum population is that at which standard of living is maximum." Optimum population theory is a landmark in study of demography, sociology and other social sciences. It explains the problems of population in a comprehensive way from the production side. It also explains the relationship between productive efficiency and production. This theory provides more detailed analysis as it considers over and under population and brings out the evils of both.

Car-Saunders defines optimum population as "that population which produces maximum economic welfare".

By optimum population we mean the ideal number of populations that a country should have considering its resources. The optimum size of population is which along with the existing natural resources and a given state of technology, yields the highest income per capita in a country.

81%

MATCHING BLOCK 55/164

W

The optimum, population means the best and the most desirable size of a country's population.

The optimum theory of population is based on two important assumptions. First, it is NSOU ? GE-SO-21 70 assumed that the proportion of working population to total population remains constant as the population of the country increases. Secondly, it is assumed that as the population of a country increases, the natural resources, the capital stock, and the state of technology remains unchanged. As the population of a country increases, the number of workers also increases. At the same time, the average product per man increases, but beyond that point it starts diminishing. Edwin

Cannan says, "at any given time, increase of labour up to a certain point is attended by increasing proportionate returns and beyond that point further increase of labour is attended by diminishing proportionate returns. At that very point where the average productivity of labour

begins to decline, the income per capita is the highest. This is the point of maximum returns or optimum population." The optimum population is liable to change in accordance with the quantitative and qualitative changes taking place in the means of production. The optimum point, therefore, keep shifting upwards or downwards. We cannot fix the optimum population of a country on a permanent basis because its productive factors, techniques keep changing from time to time. Under population – If the population of a country is below the optimum, i.e. below what it ought to be, then the country is said to be under-populated. The number of the people is not sufficient to utilize the resources of the country. The resources are vast, much can be produced, but men are not sufficient. The community will not be able to reap the economies of large-scale production. Under such conditions, an increase in population will be followed by an increase in the per capita income. When the shortage has been made up, the per capita income will reach the maximum and the optimum is reached. Over-population – If the population still goes on increasing and the optimum is exceeded then there will be over-population stage. There will be too many people in the country. The country's resources will not be sufficient to provide gainful employment to all. The average productivity will diminish, per capita income will diminish; standard of living will fall. These are the symptoms of over-population. Food shortage, diseases and death, overstraining resources, increase in dependents, open and disguised unemployment are the economic effects of over population. Both under – population and over-population have disadvantages. It is the optimum population, with the highest per capita output, that is the best for a country to aim at. The concept of optimum population, under-population and over-population comprises the modern theory of population.

NSOU ? GE-SO-21 71 5.4 Under Population Under population is if the actual population in a country is less than the optimum or ideal population, there will not be enough people to exploit all the resources of the country fully. Thus, the population and the per capita income will be lower. In other words, if the per capita income is low due to too few people, the population is then under population. Under population exists when a population is too small, therefore unable to fully utilise the available resource endowments. Under population is also characterised by a situation where the available resources are capable of supporting a much larger population with no reduction in living standards. The situation is found in regions of low technical development such as equatorial Congo, Amazon River basin or the rich Prairie region of North America. Relative under population is more common than absolute under population. Indeed, absolute under population is rarely seen and may be found in completely secluded societies where, the degree of replacement of population is less than unity. Relative under population occurs due to insufficient resource development. In developed economies, rural under population is more visible, whereas in backward countries, under population is linked to high mortality rate. 5.5 Over Population The term 'overpopulation' means too great a population for a given region to support. There may be two causes: (i) population growth exceeds the existing resource base; (ii) existing resources have been depleted. Some authors distinguish absolute overpopulation (where the absolute limit of production has been attained but standards of living remain low) from relative overpopulation (where present production does not support the population but the production can be augmented). The situation of overpopulation displays the following socio-economic characteristics: high unemployment, low-incomes, low standards of living, high population density, malnutrition, and famine.

NSOU ? GE-SO-21 72 Malthus, for the first time, identified the problems related to overpopulation. Later on, the Neo-Malthusians also viewed overpopulation as a major problem. Marxists argue that overpopulation is the result of the maldistribution of resources. Nowadays, some western geographers view overpopulation as the cause of pollution and the increasing migration from the countryside in the western countries of Europe and North America. Overpopulation strikes the lower strata of the society the hardest particularly in developing countries such as India, Nepal, Myanmar etc.

Overpopulation may occur either at national level or at regional level. Regional overpopulation when found in rural areas is attributed to: (i) Rapid increase of rural population, (ii) Skewed distribution of agricultural land, (iii) Agricultural mechanisation, (iv) Lack of development of non- agricultural sector, (v) Low agricultural yield, (vi) Lack of social development, and (vii) Non-resilience of the agricultural sector. Over population is if the actual population is above the level of optimum population there will be too many people to work efficiently and produce the maximum goods and the highest per capita income. As a result, the per capita income becomes poorer than before. This is the stage of over population. In other words, if the per capita income is low due to too many people the population under these circumstances would be over population. According to the founders of the theory the statement of the theory is "Given the natural resources, stock of capital and the state of technical knowledge, there will be a definite size of pollution with the per capita income. The population which has the highest per capita income is known as optimum population." 5.6 Concept of Optimum Population Optimum population has been defined as that size of population enabling per capita output of the maximum orders accompanied by the highest possible standards

NSOU ? GE-SO-21 73 of living under a given set of economic and technological conditions. Therefore, optimum population lies between two extremes, i.e., overpopulation and under- population, although the size of optimum population is not sacrosanct. It is a theoretically perfect situation difficult to estimate or define. The Penguin Dictionary of Geography characterises optimum population as a situation when the number of individuals can be accommodated in an area to the maximum advantage of each individual. Thus, optimum population yields highest quality of life, which means each person has access to adequate food, water, energy and air of highest quality, adequate medical care, recreational facilities, and cultural outlets. In other words, optimum population permits the highest per capita output; therefore, the marginal productivity exceeds the average productivity whereby the rates of growth of total production are the highest. 5.7 Assumptions of the Theory The optimum population theory is based on two important assumptions: i. The proportion of working population to total population remains constant as the population of the country increases. ii. As the population of the country increases, the natural resources, the capital stock and state of technology remain unchanged. 5.8 Diagrammatic Representation of the Theory In the diagram volume of population is shown along OX axis and income per head along OY-axis. OS is the income per head which gives only subsistence wage rate to the population. This level of wages puts the minimum limit to the income per head. The subsistence income per head can prevail with two levels of population: i. When population is too small to exploit the country's resources with maximum efficiency. This is the level of OA population. ii. When population is too large and the efficiency falls to give only a subsistence income to the labour force. This is the level of OC population.

NSOU ? GE-SO-21 74 OB shows optimum population which uses the available resources to give itself the maximum income per head. For a population less than OB, income per head increases with the increase in population. For a population higher than OB, income per head can increase with the decrease in population through preventive checks. The dotted curve in the diagram shows the level of income per head with an improvement in technology or expansion of foreign trade. This will help to raise the income curve and generate population growth until wages are once again equal to subsistence level. 5.9 Dalton's Formula Dalton expresses the theory in the form of a formula which is given below. $A - O M = \dots - O$ Where M-Maladjustment or deviation from optimum population A - Actual population O - Optimum population If M is zero, population is optimum, when M is positive, it is over population, when M is negative, it is under population. Therefore, optimum population is not fixed and a rigid one. It is rather variable and related to resources and technology. Optimum population is not just an economic concept but qualitative in has rightly remarked, "it is being perpetual altered by the progress of knowledge and other changes affecting the economic system. It is thus, a dynamic concept. It may be higher or lower as different methods of production are used." Y S O A B C Income per head Optimum Subsis- tence Wage Under Over Population Population Population

NSOU ? GE-SO-21 75 5.10 Superiority of Optimum Population Theory

over Malthusian Theory The optimum theory of population is superior to the Malthusian theory on the following grounds. i. The Malthusian law is a general study of the population problem because it is applicable to all countries irrespective of their economic conditions. The optimum theory is superior to the Malthusian theory because it studies the population problem in relation to the economic conditions of a particular country. ii. Malthus had a narrow vision. He related the growth of population to food supply. Cannan, on the other hand, had a much wider outlook. He related the problem of population to the total production of the country, both industrial and agricultural. iii. The Malthusian theory is a static concept which applies to a period of time. The optimum theory is a dynamic one because over a period of time the per capita income may rise with the expansion in output due to improvements in knowledge, skill, capital equipment and other elements in production. This may raise the optimum level of population. Thus, the optimum theory is more realistic. iv. The Malthusian doctrine is simply theoretical and is devoid of all practical considerations. It regards all increases in population bad, for they bring untold miseries to the people. Malthus wrote, "The table of nature is laid for a limited number of guests and those who come uninvited must starve." On the other hand, the optimum theory is very practical because it regards an increase in population not only desirable but also necessary for the maximum utilisation of the country's natural resources. v. The Malthusian theory of population is based on the unrealistic assumption of the niggardliness of nature. This belief arises from the operation of the law of diminishing returns in agriculture. But the optimum theory takes a realistic view when according to this the law of diminishing returns does not operate in agriculture immediately but after the optimum point is reached. In other NSOU ? GE-SO-21 76 words, first the law of increasing returns operates up to the optimum point and the law of diminishing returns after it. vi. Malthus was so much obsessed by the fear of over-population that he ignored a fundamental fact that a newly born child 'comes not only with a mouth and a stomach but also with a pair of hands'. The optimum population theory allays all such fears of the Malthusians by stressing the fact that increasing population increases the labour force which helps raise the optimum expansion of the country's natural resources. So long as the actual population is less than the optimum, the increase in population is safe and good. It is only when the actual population exceeds the optimum that the increase in population needs control. Thus unlike the Malthusian theory which necessitates the use of preventive checks all the time for fear of the country being over-populated, the optimum theory is free from all such taboos and is silent about any type of checks to control population. vii. Malthus was essentially a pessimist who portrayed a gloomy picture about the future of mankind which was full of misery, vice, floods, droughts, famines, and other natural calamities. The optimum theory: is superior to the Malthusian theory because it does not suffer from any pessimism, rather it adopts an optimised, and realistic attitude towards the problem of population when it relates population to the wealth of the country. 5.11 Merits of the Theory The theory

is a landmark in the science of demography. Its merits are under noted as follows. i. Comprehensive Approach It explains the problems of population in a comprehensive way from the production side. It also explains the relationship between productive efficiency and production. ii. Qualitative Nature of the Theory Prof. Bye said, "Optimum population is difficult to find because size of population must lead to the fullest development of social and economic life."

NSOU ? GE-SO-21 77 iii. Pragmatic Approach This theory is also pragmatic, i.e. it is concerned with practical results. iv. More Detailed Analysis The optimum theory of population provides more detailed analysis as it considers over and under- population and brings out the evils of both. 5.12 Weakness

of the Theory Despite the superiority of the optimum theory over the Malthusian theory of population, it has serious weaknesses. i. No Evidence of Optimum Level The first weakness of the optimum theory is that it is difficult to whether there is anything like an optimum population. There is no evidence about the optimum population level in any country. In fact, it is impossible to measure it. For optimum population implies a qualitative; well as a quantitative ideal population for the country. The qualitative ideal implies not only physique knowledge and intelligence, but also the best age composition of population. These variables are subject change and are related to an environment. Thus, the optimum level of population is vague.

ii.

98%**MATCHING BLOCK 59/164****W**

Correct Measurement of Per Capita Income not Possible Another difficulty pertains to the measurement of per capita income in the country. It is not an easy task to measure changes in the per capita income. The data on per capita income are often inaccurate, misleading, and unreliable which make the concept of optimum as one of doubtful validity. iii. Neglects the Distributional Aspect of Increase in Per Capita Income Even if it is assumed that per capita income can be measured, it is not certain that the increase in population accompanied by the increase in per capita income would bring prosperity to the country. Rather, the increase in per capita income and population might prove harmful to the economy if the increase in per capita income has been the result of concentration of income in the hands of a few rich. Thus, the optimum theory of population neglects the distributional aspect of increase in the per capita income.

NSOU ? GE-SO-21 78 iv.

91%**MATCHING BLOCK 60/164****W**

Optimum Level not fixed but oscillating The concept of the optimum population assumes that the techniques of production, the stock of capital and natural resources, the habits and tastes of the people, the ratio of working population to total population, and the modes of business organisation are constant. But all these factors are constantly changing. As a result, what may be the optimum at a point of time might become less or more than the optimum over a period of time. AP1 is

the average product

98%**MATCHING BLOCK 61/164****W**

of labour or per capita income curve. Suppose there is an innovation which brings a change in the techniques of production. It shifts the per capita income curve to AP2. As a result, the optimum level of population rises from OP1 to OP2 with the increase in per capita income E from P1M1 to P2M2. If the per capita income rises further due to a change in any of the above assumed factors, the AP2, curve will shift upward. The AP2 or AP1 curve can also shift downward if, for instance, the per capita income falls due to an adverse change in the given factors. If the locus of all such S. points like M1 M2 etc., are joined by a line, we have the PI curve which represents the path of the movement of the optimum population as a result of changes in the economic factors. If, however, the actual level of population is assumed to be OP0 and the optimum level OP1 then the country is over-populated. If OP1 is the optimum level, then the country is under-populated. Thus, the optimum is not a fixed level but an oscillating one. v. Neglects Social and Institutional Conditions The optimum theory considers only the economic factors which determine the level of population. Thus, it fails to take into consideration the social and institutional conditions which greatly influence the level of population in a country. A lower level Size of Population

Per Capita Income
NSOU ? GE-SO-21 79

100%**MATCHING BLOCK 63/164****W**

of optimum population may be justified from the economic viewpoint, but such a level may be harmful keeping into view the defence considerations of the country. For instance, economic consideration may prevent us from having a large population but the danger from foreign aggression may necessitate a very large population to safeguard our territorial integrity. Thus, the optimum theory is imperfect and one-sided. vi. No Place in State Policies The concept of optimum population has no place in the policies of modern states. While fiscal policy aims at increasing or stabilising the level of employment, output and income in a country, no reference is made to the optimum level of population. This theory is, therefore, of no practical use and is regarded as useless. 5.13

Criticism Optimum population theory has its own limitations. So, the theory has been criticized on various grounds by several writers and critics. First, it is extremely difficult to know the optimum population of a country at any time. Many factors like technical knowledge, stock of capital, per capita income, and natural resources etc. have to be taken into account for this purpose. Secondly, the optimum theory is criticized as a static short period theory. It ignores the changes in natural and human resources which affect per capita income. This theory is also silent about the important questions of the determinants of population growth. Thirdly, some critics also argue that this theory has not taken into account the biological and sociological factors which govern the size and growth up population. Precisely it can be said, this theory is not our theory of population. It simply explains the state of population with reference to per capita income. Fourthly, it is pointed out that two assumptions of which the theory has been based are not realistic. So, the practical value of this theory is reduced. Fifthly, the critics also pointed out that the theory takes into account purely economic factors which determine the optimum size of the population of a country. It should also be considered the social, political, and other non-economic factors.

NSOU ? GE-SO-21 80 Sixthly, the theory avoids the distributional aspect of the problem. This theory considers simple population to income per head. This increasing population and national income cannot be useful to a country if the increase national income is not properly and equitable distributed among the different sections of society. Therefore, practicable and useful theory must account for in income distribution as a factor in determining the optimum population. 5.14 Conclusion In spite of various criticism levelled against the optimum population theory, it is to be said that it is an improvement over Malthusian theory. This theory is an important landmark in the science of demography. Although this theory is not a guiding principle to any economic policy, it can be useful by recasting in a dynamic setting. This theory attracts much attention in the 1920s and the 1930s. Sauvey has again discussed this theory at great length and has defined

The debate about the Malthusian theory has continued down to the present. Economists such as J.S. Mill and J.M. Keynes supported his theory whereas others, especially, sociologists, have argued against it. According to them, the widespread poverty and misery of the working-class people was, not due to an eternal law of nature as propounded by Malthus but to the misconceived organization of society. Karl Marx went one step further and argued that starvation was caused by the unequal distribution of

the

89%

MATCHING BLOCK 78/164

W

wealth and its accumulation by capitalists. It has nothing NSOU ? GE-SO-21 83 to do with the population. Population is dependent on economic and social organization. The problems of overpopulation and limits to resources, as enunciated by Malthus, are inherent and inevitable features associated with the capitalist system of production.

The socialist thinkers, writers and reformers gave attention on the class differentiations and the misery of the working class. Thomas More's Utopia (1516) gives a content and egalitarian view for an ideal state and social organisation founded on reason and moral considerations. Early British and French socialists raised strong objection against the capitalist system. The suggested the social reforms and the theories they held concerning the reorganization of society constituted what is known as "utopian socialism." But it was only with the rise of Marxian "scientific socialism" as opposed to the farmer that the working classes acquired a consistent revolutionary theory. Dialectical materialism, Marx's system of philosophy was a continuation of German philosophical thought, English political economy, and French socialist theory of the nineteenth century. According to the theory of historical materialism which is an application of dialectical materialism to social change the history of mankind has been one of continuous class struggle by which less advanced social systems have been replaced by more advanced ones. As the establishment of the bourgeoisie replacing the feudal system, according to this theory, the proletariat, the productive class under capitalism would replace the bourgeoisie and establish a socialist exploitation- free society. (Marx, Communist Manifesto p.6-7) The early socialists who concerned with matters related to population, but their views were far from fully developed. Marx and Engels formulated a consistent approach to the population problem which most socialists later adopted. 6.3 Early Socialist Views Early socialists thought that excessive population growth would be prevented by increased production and better social order. These views were evident in the writings of the British Ricardian socialist, who attended to reject the Malthusian propositions. Thompson believed that population growth could be brought under control in the cooperative indicated that since labour produced all oils production would keep pace with population as long as raw material were available and implied that the numbers of population would be brought under control. Social reformer and

NSOU ? GE-SO-21 84 socialist writer Robert Owen established a model industrial community in which the welfare of workers was a major consideration. One of the early French socialist, Saint Simon tried to show that poverty could be eliminated under the system of collective industrialism by means of greater productivity. He opposed Malthus "moral restraint" because it was incompatible with the workers happiness. While Charles Fourier believed that changes in living patterns in the "socialist state" would bring about population control. Louis Blanc suggested that imprudence was the product rather than the cause of misery and that reorganization of society by removing misery would prevent over thought that he is type of libertarian socialism would strike a balance between population and production. According to Valentei, Malinovsky, was the first Russian author to disagree with Malthus, as later did Chernishevsky and other "revolutionary democracy" but not on the grounds of social considerations. The first representative of utopian socialism in Russia Milytin considered that population was an important factor in the economy, but had a wider social importance which a population law must take into account. 6.4 Marx and Engle's Views on Population In the broader context of historical materialism, Marx and Engels did not formulate a population theory but formulated a set of basic principles which day regarded as governing population and its economic and social correlates. Rejecting the Malthus's "abstract" principle of population, Marx held that there would be no natural and universal law operation; population was rather determined by the social and economic conditions prevailing in the different societies. He insisted that each specific historic mode of production had its own peculiar law of population, historically valid within its limits. In Marx's view, "

80%

MATCHING BLOCK 68/164

W

an abstract law of population exists for plants and animals only, and only in so far as man has not interfered with them. In Capital he outlined the population law "peculiar to the capitalist mode of production",

covering both the relative surplus population, which was primarily a socio-economic concept, and the inverse relationship between family size and wage levels, which reflected demographic and social relationships. Marx maintained the Malthus's "over population" could be ascribed to the capitalist mode of production. During the expansion of the capitalist system, the natural increase in population alone could not satisfy the requirements for readily available labour, would generate the surplus population needed for the functioning of

NSOU ? GE-SO-21 85 the system. Therefore, relative surplus population was inherent in the capitalist system. It was a consequence of the accumulation of capital as well as a condition for the continuation of the system. The "industrial reserve army" had to be sufficiently large to hold the pretensions of the workers in the check, to keep wages and salaries low, and thus to maintain high rates of surplus value and profit. According to Marx, there are three forms of relative surplus population, our on employment - the floating the latent and the stagnant. The floating category consists largely of persons displaced by machinery and structural changes within industry. The latent category is made up of that part of the agricultural population which is on the verge of migrating to the cities, mainly because of the penetration of capital into agriculture. The stagnant category is comprised of workers with highly irregular employment and the lowest levels of living. Different economic and demographic factors specifically contribute to the creation and perpetuation of individual forms of relative surplus population. (Marx, Capital, p. 640-644) Differences in mortality and fertility, both among social classes and within the working class are, according to Marx, determined by social position levels of living work conditions and other social factors. Marx noted that the number of births and deaths, as well as absolute family size, were in inverse proportion wage levels and, hence, to the means of subsistence available two different categories of workers. (Marx, Capital, p. 644-645) Being fully agreed with Marx's analysis, Engels made an additional contribution to Marx's approach to population theory. On the one hand, he maintained that productive power of mankind was unlimited, since productivity in general, and that of land in particular, can increase by application of capital, labour and science. Thus, he rejected the law of diminishing returns which he considered implicit in Malthus's principle of population. On the other hand, he stressed that under capitalism surplus population was always bound by surplus capital. This was a contradiction inheritance in capitalism which could be overcome only by fundamental "social reorganization". Engels also suggested that in the final analysis the decisive factor in history which was dual in nature was "production and reproduction of life itself". One hand there was the production of the means of subsistence. On the other hand, there was the production of man himself. The higher productivity is and the more developed the production of means of subsistence, the more economic and social factors determined the social order.

NSOU ? GE-SO-21 86 What would the population situation be in future socialist society? In this regard Marx did not express anything concretely. Engels believed that a socialist society would have at its disposal a highly developed productive capacity managed by careful planning. He suggested that if at some stage communist society found itself obliged to "regulate the production of human beings", just as it would regulate the production of things, it would be "precisely this society.....Which can carry this out without difficulty". He also said that the kind of reduction in fertility rates that had already been spontaneously achieved in France and lower Austria could also be brought about through planning. The economic and social writings of Marx and Engels contain many observations regarding demographic and socio-economic interrelationships. Population is here conceived of in a dual capacity - as a producer and as a consumer - and the term population is used interchangeable for both labour force and population. (Marx, Capital, vol. 1, p. 316, 322-323, 325-334) 6.5 Marxian theory of Population Growth

100%

MATCHING BLOCK 69/164

W

Marx's contention that food production could not increase rapidly was also debated when new technology began to give farmers much greater fields. French sociologist E. Dupreel (1977) argued that an increasing population would spur rapid innovation and development to solve problems, whereas a stable population would be complacent and less likely to progress.

Karl Marx (1818-1883) was a German philosopher and founder of modern communism. His theory of population was christened as the theory of surplus population. Karl Marx completely rejected the Malthusian Theory. While postulating his general theory of communism and scientific interpretation of history in his book- the Communist Manifesto, and Das Kapital. He gave some ideas about population growth. Karl Marx (1818-1883) is regarded as the Father of Communism. He did not separately propose any theory of population, but his surplus population theory has been deduced from his theory of communism. Marx opposed and criticized the Malthusian theory of population. Karl Marx criticized the capitalist economy had a very different idea about population growth. For Marx, these social problems were not the fault of the poor

MATCHING BLOCK 71/164

W

workers, but of the capitalist system that exploited them. Marx made the scientific interpretation of human history. He said just like there are the scientific explanation for the physical phenomenon, the same are there for social phenomenon. He said the essence of history is change in the modes of production in any society and this change is always progressive. Marx considered that society, especially feudal and capitalist society has two major economic classes viz. ? The Rich ? The Poor The Rich was those who have means of production and earn their profit by exploiting the poor. On the other hand, the poor were those who sell their energy & will to work to these rich people in exchange of wages. The employers earn profit by exploiting the poor, this profit is known as surplus profit. According to Marx in no country of world population increase on account of fertility but it increases only on account of capitalist policies. The capitalist makes labour part of their production and still something out of that. By installing labour-saving machines, a capitalist wants to have the maximum surplus-value of that. As a result of this unemployment spreads, wage declines, and poverty increases. The poor population cannot nourish their children on account of

their poverty thus they try to increase the population by reproduction so that the next generation would also help them to generate extra wages. However due to the increase in the advanced technology and excess labourers the condition of surplus population and Unemployment generates. This is the main cause of misery. He came to the conclusion that the main causes of the surplus population were nothing else but the wrong politics of capitalists. Marx was on the view that in the socialist society reproductive behavior would develop a complete harmony between the individual and the society. Marx suggested that for population control fall of capitalism is the only mean and distributive justice, state control over resources can mitigate the food crisis. Thus, his theory is the socio-economic model of population control. 6.6

Post-Marx Socialist Views on Population Koutsky following Marx more closely in his later writings, he explained relative over population because of the "variable constituent" of capital increasing less rapidly than total capital and the labouring population. From this might ensue an excess of population relative to two variable capitals with the result that wages would be depressed and profits would rise. This situation would disappear upon the collectivisation of the economy. He believed that under socialism conditions more conducive both to the appropriate regulation of numbers population and to the increase of production would develop. (Kautsky, The Economic Doctrines of Karl Marx part 3, chapter 5) Bebel analysed the question of population to the status of women under capitalist conditions and in a socialist society. He said that population was likely to increase more slowly in a socialist society than in a bourgeois society, mainly because of the superior position of women under socialism. Like Marx, Lenin also rejected the Malthusian principle of population. He firmly said that human reproduction depended directly upon the structure of society, and rejected an abstract population law which had no relation to historically different forms of social orders. He said that the overpopulation of agrarian Russia was not the consequence of disparity between human production and means of subsistence, but a result of penetration of capitalism into agriculture. He also denied that the law of diminishing returns applied under conditions of technological progress and improved agricultural methods. Chinese socialist writers also have rejected the population theory of Hung Tian- Tsi, a Chinese predecessor of Malthus, as they rejected the Malthusian principle of population. For a population law pertinent to socialist society, Chang, Mao Gang and Hu maintained that rational utilisation of labour and improvements in living conditions, as well as elimination of differences between town and country and between manual and intellectual labour, are essential to socialism. As for population growth, they have suggested that mortality will gradually reach a minimum physiological level, while fertility after reaching a high level, will decline. (Ma, New Population Theory) None of the Marxist writers considered population growth to be a cause of poverty in the colonies; rather they all maintained that this poverty was mainly due to colonial rule and underdevelopment. According to Rajani Palme Dutt the rate of India's population growth was markedly less than that of almost any European country. He also said that the main reason for the extreme poverty lay neither in any natural cause nor in a non-existent "overpopulation", but in the social and economic conditions existing under imperialist rule. According to Kozlov, colonial expansion contributed to the decline of fertility in some of the former colonies. (Palme Dutt, India Today, p.48-49) Contemporary socialist has continued to be inspired by Marxian historical materialism and its interpretation of the population problem. 6.7 Criticism of Marxist Views

100%**MATCHING BLOCK 73/164****W**

The theory of Marx was criticised on the following grounds– i. An increase in population does not necessarily lead to a decrease in wages. There are many socio-economic factors which are responsible.

ii.

96%**MATCHING BLOCK 74/164****W**

The theory of Marx is applicable only in capitalist society and not in other societies. iii. According to Marx, the higher the wages, the lower the birth rate, but faith and religion may also play a significant role. This he did not consider.

NSOU ? GE-SO-21 90 iv.

97%**MATCHING BLOCK 75/164****W**

It is true to a great extent that in a capitalist society there is a surplus population on account of unemployment. But it is not to presume that under a socialist system there will be no need to check population growth at any stage. v. Even in communist countries, population growth is checked on the plea that no mother should have more children so that their mother so that their health does not deteriorate. vi. In the erstwhile USSR, factory workers were provided contraceptives in their factories so that the birth rate was kept low. vii. If economic inequality is the main cause of the birth rate, then in these countries rates should not differ. Because these inequalities have come to an end. The necessity of family planning is felt in these countries. 6.8

Conclusion Marx's principle of population has been successful in highlighting the urgency to maintain a balanced relationship between population growth and means of subsistence. The critics of Malthus failed to realize that it was because of a large measure of truth in Malthusian principle of population that men today feel the need of resorting to contraception to keep their families within reasonable limits. Another main contribution of Malthus was to give a new line of thinking whereby the dynamics of population growth were viewed in the context of man's welfare. 6.9 Summary Malthusian theory of population had been supported by so many economists like J.S. Mill, J.M. Keynes, after some time had been criticized by many thinkers, specially by the early socialist thinkers, such a Thomas More, Robert Owen, Saint Simon, Charles Fourier etc. Early socialists thought increased production would solve the problem of excessive population growth. They rejected Malthusian theory of population. Rejecting the Malthus's 'abstract' principle of population, Marx held that there would be no natural and universal law operation. Population was rather determined by the social and economic conditions prevailing in the different societies. Marx opposed and criticized the Malthusian theory of population, and the capitalist NSOU ? GE-SO-21 91 economy. To Marx, in no country of the

100%**MATCHING BLOCK 76/164****W**

world, population increase on account of fertility, but it increases only on account of capitalist policies. 6.10

stage, the birth rate starts falling and tends to equal the death rate. The growth rate of population is

very slow. 7.3 Views of Warren S. Thompson and Frank Notestein in The demographic transition theory in its original form was given by W.S. Thompson and Frank W. Notestein who based their statements on the trends in fertility and mortality being experienced by Europe, America, and Australia. There were three distinct parts of the theory: (i) descriptive; (ii) theoretical and (iii) predictive. The first part was concerned with the simple description of the trends in NSOU ? GE-SO-21 94 morality and fertility through time. The second part related to the causal mechanisms that create the pattern of trends described in the first part and hence was purely theoretical. The third predictive part postulated as to what will happen in future. Broadly speaking,

81%

the theory postulates a particular pattern of demographic change from a high fertility and high mortality to a low fertility and low mortality when a society progresses from a largely rural, agrarian, and illiterate society to a dominantly urban, industrial, and literate

society. The three very clearly stated hypotheses involved in the

74%

MATCHING BLOCK 91/164

SA

Demographic changes in Kashmir (1991-2011).pdf
(D34797651)

process are (i) that the decline in mortality comes before the decline in fertility; (ii) that the fertility eventually declines to match mortality; and (iii) that socio-economic transformation of

the society takes place simultaneously with its demographic transformation. However, during this course of progression, all societies experience an intermediate stage when there occurs a wide gap between mortality and fertility giving rise to not only huge increments in population numbers but also to significant changes in their demographic structure.

Demographic changes in Kashmir (1991-2011).pdf
(D34797651)

In the present-day world, as would be true of any point in time, different countries of the world are at different stages of the demographic transition. According to Trewartha, this is largely due to the dual nature of

man. According to him, biologically, man is same everywhere and is engaged in the process of reproduction but culturally man differs from one part of the world to another. It is the cultural diversity of man that gives rise to varying fertility patterns in different areas resulting in different stages in demographic transition. Similarly, since socio-economic and demographic transitions progress simultaneously, different countries in the world would require different time span to complete the process in consonance with their own pace of economic transformation. Moreover, in the present-day world, countries at a low level of advancement can also have an easy access to the medicines being developed by the countries that are at a relatively higher level of technological advancement. Therefore, the demographic transformation in a country is not necessarily in tune with its technological achievements. The demographic transition theory is characterized by conspicuous stages. Note Stein suggested the existence of three stages in the transition (i) high growth potential exists before fertility begins to decline; (ii) population growth slackens once fertility

NSOU ? GE-SO-21 95 decline becomes well established in the transition growth stage; and (iii) incipient decline occurs when fertility falls below the replacement level and when mortality has already stabilized at a low level (Woods, 1979, p.4). The original statements of Thompson and Notestein on the transition theory were subsequently refined and reformulated with the passage of time. A wide variety of literature brought out on the demographic transition theory shows that three to five stages have been assigned to the theory. Generally, a transition theory three-staged model has been identified with pre-industrial, early western, and late western stage. These have also been called as high stationary stage with high fertility and high mortality providing very little natural growth; expanding stage with high fertility and decline in mortality providing explosive population increments; and low stationary stage with fertility and mortality levelling out each other at low level to re-establish a stationary population and, thus, completing the cycle. i. The First Stage In the first stage, the fertility is over 35 per thousand and is almost stable. The mortality in this stage is also high being more than 35 per thousand but its behavior is erratic due to epidemics and variable food supply. This stage, thus, postulates stable and slowly growing population where the people are engaged in wasteful process of reproduction. This stage occurs in agrarian societies where the population densities are low or moderate, general productivity level is low, large families are an asset, life expectancy is low, the development of non-agricultural sector is at its infancy stage, masses are illiterate, technological know-how is lacking and urban development is limited. About 200 years ago, all the countries of the world were at this stage of demographic transition. At present, it may be difficult to ascertain whether any country in the world would still be at this initial stage of the demographic transition because the data pertaining to fertility and mortality for such areas would either be lacking or would not be completely reliable. Moreover, the diffusion of modern technology has also been so fast particularly in the field of medicines, that it is very difficult to find a solitary example of a country which may still be unaffected by the mortality declines taking place all over the world. It is in this context, that the first stage has been called as the pre- industrial and the pre-modern stage.

NSOU ? GE-SO-21 96 ii. The Second Stage The second stage of demographic transition is characterized by a high and gradually declining fertility of over 30 per thousand and a sharply reduced mortality rate of over 15 per thousand. In this expanding stage of demographic transition, while the improvements in sanitation and health conditions, general productivity and distribution system result in sharp declines in the mortality rates, the fertility maintains a high level, at least in the early second stage. As the second stage prolongs, the fertility also shows signs of gradual decline. A distinction has often been made between the early second stage with high fertility and declining mortality and late second stage with slowly declining fertility and sharply declining mortality. In the second stage, as a whole, the population expands, firstly, at a gradually increasing rate and afterwards at a gradually subsiding rate. In the wake of population explosion associated with the widening gap between the two vital rates, the problem of resource mobilization becomes significant. The life expectancy starts improving. The efforts to mobilize resources become more vigorous. The processes of industrialization and urban development become prominent. The large families are no longer an asset. Consequently, the fertility undergoes a gradual decline leading to a gradual squeeze of rate of natural increase at the tail end of the second stage. Most of the less developed countries of the world are passing through this explosive stage of demographic transition because widespread penetration of modern medicines and sanitation measures have drastically reduced their mortality rates whereas their fertility levels are high and obliging. The countries like India, Pakistan, Bangladesh belong to the late second stage where the fertility rates have started declining gradually but since the decline in the mortality rates has been sharper there are large increments in their population numbers. However, they have yet to reach the tail end of the second stage as their fertility rates are not appreciably low. iii. The Third Stage The last stage in the demographic transition is attained when both birth and death rates decline appreciably. The population is either stable or grows only

NSOU ? GE-SO-21 97 slowly. Although populations grow slowly both in the first and the last stage, yet these are the product of contrastingly different situations. Whereas the slow growth of population in the first stage is the result of approximation of mortality and fertility rates at a high level, the slow population growth of the third and final stage is the product of approximation of fertility and mortality rates at a low level. Moreover, while in the first stage the fertility is high and stable, the mortality is high and erratic, in the third stage, the roles are reversed, the mortality is low and stable, and fertility is low but fluctuating. Not only that, the set of socio-economic conditions also associated with the first stage and the third and final stage of the demographic transition completely different. In the first stage, the society is traditional and primarily agrarian whereas in the third stage the population is highly urbanized. The technical know-how is abundant, the deliberate controls on family-size are common, the literacy and education levels are high, and the degree of labor specialization is high. Anglo-America, Europe, the U.S.S.R., Japan, Australia, New Zealand are supposed to have reached this stage of demographic transition. Recently, China seems to have succeeded in bringing down its fertility and mortality rates drastically. Its achievements in the field of containing its natural rate of increase to a level of highly advanced countries in such a short span of time may, in times to come necessitate rethinking on the demographic transition model itself.

7.4 Types of Population according to Frank Notestein In 1945 it was, Frank W. Notestein who presented the theory of demographic transition in an almost complete form with explanations for the changes in fertility. For this reason, Notestein may be called the father of the theory of demographic transition. Main focus point of this theory is "All Nations in the modern era, which have moved from a traditional agrarian based economic system to a largely industrial urbanized base have also moved from a condition of high mortality and fertility to low motility and fertility". (Stolnitz, p. 30)

NSOU ? GE-SO-21 98 Notestein identified that the rapid growth up population during the past three centuries was mainly due to the decline in the death rate resulting from the process of modernization which involved rising standard of living rising incomes and advances in sanitation and in medical knowledge. Throughout the modern West birth rates reached very low levels by the middle of 1930s. This decline or achieved because of the widespread acceptance of contraception under the influence of the new idea of the small family. (Notestein, p. 41) Notestein characterized three types of population according to their stage of demographic evolution. i. Population in the "stage of incipient" decline where fertility had fallen below the replacement level for those approaching this stage. ii. Population in the stage of "

97%

MATCHING BLOCK 89/164

W

transitional growth" where birth and death rates are still high and growth is rapid but the decline of

the birth rate is well established. iii. Populations in the stage of high growth potential where mortality e is high and variable and is the cheap determinant of growth while fertility is high and thus fore has shown no evidence of a downward trend. In these populations rapid growth is to be expected just as soon as technical development make possible a decline in mortality. (Notestein, p. 41)

7.5 Views of C.P. Blacker In 1947 C.P. Blacker attempted to identify the following five phases of the demographic transition: (Blacker,

98%

MATCHING BLOCK 90/164

W

p. 88-101) They are: (i) the high stationary phase marked by high fertility and mortality rates; (ii) the early expanding phase marked by high fertility and high but declining mortality; (iii) the late expanding phase with declining fertility but with mortality declining more rapidly; (iv) the low stationary phase with low fertility balanced by equally low mortality; and (v) the declining phase with low mortality, lower fertility and an excess of deaths over births.

But we shall explain only the three commonly discussed stages combining Blacker's stages (iii) and (iv) as the third stage and leaving his stage (v) which is applicable only in France.

74%

MATCHING BLOCK 92/164

W

In the figure, the time for NSOU ? GE-SO-21 99 different stages is taken on the horizontal axis and annual birth and death rates per thousand on the vertical axis.

Before the 19th century in the first stage, birth rates in Western Europe were 35 per thousand and death rates fluctuated around 30 per thousand. Thus, the growth rate of population was about 5 per thousand. In the second stage, death rates began to decline gradually from 30 per thousand to 20 per thousand from the middle of the 19th century to the end of the century. In the third stage beginning with the 20th century, birth rates began to decline from 35 per thousand and have continued so for about a century now nearing 15 per thousand. Death rates also continued to decline but seem to have stabilized between 12 to 15 per cent in Western Europe. i.

98%

MATCHING BLOCK 93/164

W

The First Stage In this stage, the country is backward and is characterized by high birth and death rates with the result that the growth rate of population is low. People mostly live-in rural areas and their main occupation is agriculture which is in a state of backwardness. There are a few simple, light and small consumer goods industries. The tertiary sector consisting of transport, commerce, banking, and insurance is underdeveloped. All these factors are responsible for low-incomes and poverty of the masses. Large family is regarded as a necessity to augment the low family income. Children are an asset to the society and parents.

There being mass illiteracy, the society is not expected to educate them and thus burden itself.

100%

MATCHING BLOCK 94/164

W

The existence of the joint family system provides employment to all children in keeping with their ages.

Thus, a child becomes an earning member even at the age 5 when he becomes a helping hand to his parents in domestic affairs.

83%

MATCHING BLOCK 95/164

W

More children in a family are also regarded as an insurance against old age by the parents. People being illiterate, ignorant, and superstitious and fatalist are averse to any methods of birth control. Children are regarded as God- given and

preordained. Being childless is regarded as a curse and the parents are looked down upon by the society.

82%

MATCHING BLOCK 96/164

W

All these economic and social factors are responsible for a high birth rate in the country. Along with high birth rate, the death rate is also high due to non-nutritional food with a low caloric value, and lack of medical facilities and of any sense NSOU ? GE-SO-21 100 of cleanliness. People live in dirty and unhealthy surroundings in ill- ventilated small houses. As a result, they are disease-ridden and the absence of proper medical care results in large deaths. The mortality rate is the highest among the children and the next among women of child-bearing age. Thus,

unhygienic conditions, poor diet and the lack of medical facilities are the reasons for a high mortality rate in this stage. This stage continued in Western Europe approximately up to 1840. ii. The

92%

MATCHING BLOCK 97/164

W

Second Stage In the second stage, the economy enters the phase of economic growth. Agricultural and industrial productivity increase and

the

93%

MATCHING BLOCK 98/164

W

means of transport develop. There is greater mobility of labour. Education expands. Incomes increase. People get more and better-quality food products. Medical and health facilities are expanded. Modern drugs are used by the people. All these factors bring down the death rate. But the birth rate is almost stable. People do not have any inclination to reduce the birth of children because with economic growth employment opportunities increase and children are able to add more to the family income. With improvements in the standard of living and the dietary habits of the people, the life expectancy also increases. People do not make any efforts to control the size of family because of the presence of religious dogmas and social taboos towards family planning. Of all the factors in economic growth, it is difficult to break with the past social institutions, customs, and beliefs. As a result of these factors, the birth rate remains at the previous high level. iii. The Third Stage In this stage, the fertility rate declines and

90%

MATCHING BLOCK 99/164

W

tends to equal the death rate so that the growth rate of population declines. As growth gains momentum and people cross the subsistence

98%

MATCHING BLOCK 103/164

W

reduce the birth rate which along with an already low death rate brings a decline in the growth rate of population. The advanced countries of the world are passing through this

last stage and the population is increasing at a slow pace in them. 7.6 Views of Ansley J. Coale and Edger M. Hoover
Ansley J. Coale and Edger M. Hoover have studied the changes in the birth and death rates associated with economic development. They sum up in the following ways: the agrarian present economy is characterized by high death and birth rates. Death rates are high because of poor diet primitive conditions of sanitation and lack of preventive and curative medical and public health programs. The birth rates are high due to the value, norms, customs, social systems, and the structure of the economy prevail in that time. When the agrarian economy starts undergoing it becomes interdependent on other economist has high levels of production and becomes highly industrialized market oriented and urbanized. When it happens, death rates register strikingr eduction because of better and regular supply of food as well as improved medical knowledge and care. The acceptance of the idea of small family size comes about initially in urban groups at the higher end of the socio- economic scale and then spreads to two small cities lower income groups and eventually to rural areas. The decline in the birth rate usually occurs after a substantial time lag as compared to the decline in the death rate. This delayed

NSOU ? GE-SO-21 102 response of the birth rate to economic change comes about because any decline in fertility results only when changes occur in long standing attitudes and customs prevailed in society. Finally, reductions in the death rate become increasingly difficult to achieve the birth rate again approaches the level of the death rate and population grows only at a very slow rate. (Coale and Hoover, p. 9-13) 7.7 Criticism The theory of demographic transition is greatly accepted as a useful tool in describing demographic history. But several questions raised in this context: Can this theory provide theoretical explanation of the forces that caused demographic changes? Has it have any predictive value? Can it be used for predicting the sequence through which developing countries would pass? Search questions lead to a several criticisms of the theory of demographic transition. This is to be noted that this theory is based on the actual experience of the changes in the vital rates in western countries during the various stages of their industrial and economic development. The critics of this theory point out that the experiences of the various European countries why are not uniform in the sense that the sequences of the stages as described in the statement of the theory where not the same. (Glass, p. 8) Another criticism of this theory arises out of defect that it does not provide a theoretical explanation of an important force that is fertility which brought about the demographic transition. Recently demographers have arrived at the conclusion that the decline in fertility in Europe is very complex phenomena which has not yet been fully understood. British demographers David Glass despairingly pointed out that even the English people do not have an adequate knowledge of their own demographic transition. The theory of demographic transition cannot really be called a theory because it does not fulfil an important criterion of any theory, that is, to extract fundamental process from a phenomenon and identify crucial variables. This theory does not provide fundamental explanations of fertility decline. Therefore, it does not have any predictive value.

NSOU ? GE-SO-21 103 The most crucial question to be asked is: Can the theory of demographic transition be applied to developing countries? Will these countries have to wait for economic and social development till they bring down the birth rate and bring about a reduction in the growth rate? It is difficult to maintain any degree of confidence that the theory of demographic transition is also applicable to developing countries and what happened in the West in respect of population growth would be duplicated in developing countries. 7.8 Conclusion

94%

MATCHING BLOCK 104/164

W

The theory of demographic transition is the most acceptable theory of population growth. It neither lays emphasis on food supply like the Malthusian theory, nor does it develop a pessimistic outlook towards population growth. It is also superior to the optimum theory which lays an exclusive emphasis on the increase in per capita income for the growth of population and neglects the other factors which influence it. The

demographic transition theory is superior to all the theories of population because it is based on the actual population growth trends of the developed countries of Europe. Almost all the European countries of the world have passed through the first two stages of this theory and are now in the final stage.

Not only this, the

MATCHING BLOCK 111/164

W

It is on the basis of this theory that economists have developed economic-demographic models so that

under developed countries should enter the final stage and attain the stage of self-sustained growth. Thus, this theory has universal applicability. Although old-age support is a plausible element that may affect the level of fertility, it appears as a minor force in the context of the demographic transition. First, since there are only rare examples in nature of offspring that support their parents in old age, it appears that old-age support cannot be the prime motivation for child rearing. Second, institutions supporting individuals in their old age were formed well before the demographic transition. For instance, evidence suggests that, as early as the sixteenth century, parents in England did not rely on support from children in their old age (Pelling and Smith, 1991; Hindle, 2004). In particular, the Poor Law Act of 1601 was interpreted by the English courts as giving the impoverished parent no claims for assistance from a child, but instead a claim for assistance from the community. The rise in fertility rates prior to the demographic transition, in a period of improvements in credit markets, raises further doubts about the significance of this mechanism. Moreover, cross-sectional evidence shows that in the pre-demographic transition era wealthier individuals, who presumably had better access to credit markets, had a larger number of surviving offspring, increasing the skepticism about the importance of this hypothesis. Thus the decline in the importance of old-age support is unlikely to be a major force behind the significant reduction in fertility – at a rate of 30-50% – that occurred during the demographic transition.

broadly classified as the scientific study of human populations. Major areas studied include broad population dynamics; fertility and family dynamics; health, aging, and mortality; and human capital and labour markets. 8.2

Introduction A population is generally a group of individuals of a particular species occupying a particular area at a specific time. Population is the key component of the society as well as nation. Populations are characterized with such characteristics as dispersion, fluctuation in numbers, sex ratio, birth rate and death rate etc. The population generally arises as a result of reproduction. The data on population, its phenomena, growth, and other things pertaining to population have special significance in sociology. Sociology primarily deals with social relationship along with the study of social structure and social organization. It deals with various facts of social life like social stratification, group cohesion and progress of society. So, the study of population is most significant area of sociology. 8.3 Population Size Population size is expressed as the actual number of individuals in a population. More informative are estimates of population density, which is calculated as population size divided by total land area. Since the patterns of dispersion of population in nature are different it becomes important to distinguish between crude density and specific density. Crude density is the density per unit total space. Specific or ecological density is the density per unit of habitat space, the area that can actually be colonized by the population. Population is changing entity, so, we are not only interested in its size but also in nature of its change. The nature of changing is varying from place to place, population density also varies in time. Population may remain constant; it may fluctuate, or it may steadily increase or decrease.

Population Growth Population growth refers to the increase in number of

inhabitants of an area or a territory over a specific period of time. It has been observed that population of the world has been consistently increasing especially after II world war. Population growths are influenced by several factors of the environment as well as by the characteristics of the individuals of the species itself. Under favorable conditions the group of individuals increase in numbers. Natality and immigration lead to an increase in density, while mortality and emigration lead to a decrease in density. The growth rate of a population is the number of inhabitants added to the population per time. The change in number can be measured in two ways, by absolute numbers or by percentage. It is customary to abbreviate the change in something by writing the symbol Δ (delta) in front of the letter representing the thing changing. Thus, if N represents the number of inhabitant and at the time, then $-\Delta N$ = the change in number of inhabitants. $\Delta N/\Delta t$ = the average rate of change in the number of inhabitants per time. This is growth rate. Another formula to calculate growth rate is $GR = \frac{P_2 - P_1}{P_1} \times C$ Where P_1 = Previous Population, P_2 = Present Population, C = Constant (Like, %). 8.5 Causes of Population Growth The causes of population growth may be shortlisted to the following. i. Fertility: Fertility refers to the occurrence of birth or the reproduction capacity of women. ii. Advanced of science: Especially the modern medical science and health policy of a nation has reduced the rate of mortality. iii. Migration behavior: Any type of migration modifies the ways of life and this may result in demographic change and population growth. iv. The tradition and culture and religious believe of the people motivate people towards having more children are large in numbers. v. Lack of education and poor economic condition also reinforce the population growths.

NSOU ? GE-SO-21 110 Effect of the population growth at macro level can be seen in the economic and social development of the nation. 8.6 Consequences of Population Growth The rapid population growth has both the macro and the micro level effect over the environment. At micro level it affects the individuals at all levels. The factors which affect at micro level may be summarized as food, health, housing, education, employment opportunities and recreation etc. related to individual's life of people. 8.7 Optimum Population Sauy (1966), Tacuba (1970) and Robinson (1964) gave the economic concept of optimum population. The optimum size of population for an area was defined as "The optimum level is that size of population which yields the highest quality of life. The optimum population is a state in which an equilibrium maintained between the population and carrying capacity of the land. Depending upon the quality of land and resources every nation has the limited capacity to provide quality of life. The criteria for computing optimum population are as follows: i. Per capita production ii. Average standard of life iii. Social harmony iv. Per capita food consumption v. Quality in the use of goods vi. Balanced Demography vii. Degree of employment etc. Thus optimum population yields highest quality of life, which means each person has access to adequate food, water, energy and air of highest quality, adequate medical care, recreational facilities and cultural outlets. In other words, optimum population permits the highest per capita output; therefore the marginal productivity exceeds the average productivity whereby the rates of growth of total production are the highest.

NSOU ? GE-SO-21 111 8.8 Over Population The concept of over population is explained by demographers and economist. If the size of population of the country or region exceeded by more than the supporting capacity of the region the area is said be over-populated. In this case available resources and population size are not balanced. If the population size is more than reasonable limits, problems will crop up, where quality of life, social and economic development will hamper. The term 'overpopulation' means too great a population for a given region to support. There may be two causes: (i) population growth exceeds the existing resource base; (ii) existing resources have been depleted. Some authors distinguish absolute overpopulation (where the absolute limit of production has been attained but standards of living remain low) from relative overpopulation (where present production does not support the population but the production can be augmented). Malthus, for the first time, identified the problems related to overpopulation. Later on, the Neo-Malthusians also viewed overpopulation as a major problem. Marxists argue that overpopulation is the result of the mal-distribution of resources. Overpopulation may occur either at national level or at regional level. Regional overpopulation when found in rural areas is attributed to: i. Rapid increase of rural population. ii. Skewed distribution of agricultural land. iii. Agricultural mechanisation. iv. Lack of development of non- agricultural sector. v. Low agricultural yield. vi. Lack of social development, and vii. Non-resilience of the agricultural sector. The situation of overpopulation displays the following socio-economic characteristics: high unemployment, low-incomes, low standards of living, high population density, malnutrition and famine.

NSOU ? GE-SO-21 112 8.9 Causes of Over Population The various causes of over-population may be listed as follows. i. The Decline in the Death Rate At the root of overpopulation is the difference between the overall birth rate and death rate in populations. If the number of children born each year equals the number of adults that die, then the population will stabilize. Talking about overpopulation shows that while there are many factors that can increase the death rate for short periods of time, the ones that increase the birth rate do so over a long period of time. The discovery of agriculture by our ancestors was one factor that provided them with the ability to sustain their nutrition without hunting. This created the first imbalance between the two rates. ii. Agricultural Advancements Technological revolutions and population explosions occur at the same time. There have been three major technological revolutions. They are the tool-making revolution, the agricultural revolution, and the industrial revolution. Agricultural advancements in the 20th century have allowed humans to increase food production using fertilizers, herbicides, and pesticides and yields further. This allowed humans with more access to food that leads to subsequent population explosions. iii. Better Medical Facilities Following this the industrial revolution started. Technological advancement was perhaps the biggest reason why the balance has been permanently disturbed. Science was able to produce better means of producing food, which allowed families to feed more mouths. Besides, medical science made many discoveries, thanks to which they were able to defeat a whole range of diseases. Illnesses that had claimed thousands of lives until now were cured because of the invention of vaccines. Combining the increase in food supply with fewer means of mortality tipped the balance and became the starting point of overpopulation.

NSOU ? GE-SO-21 113 iv. More Hands to Overcome Poverty However, when talking about overpopulation, we should understand that there is a psychological component as well. Poverty is considered as the leading cause of overpopulation. In the absence of educational resources, coupled with high death rates, which resulted in higher birth rates, that is why impoverished areas are seeing large booms in population. For thousands of years, a very small part of the population had enough money to live in comfort. The rest faced poverty and would give birth to large families to make up for the high infant mortality rate. Families that have been through poverty, natural disasters, or are simply in need of more hands to work are a major factor for overpopulation. As compared to earlier times, most of these extra children survive and consume resources that are not sufficient in nature. According to the UN, the forty-eight poorest countries in the world are also likely to be the biggest contributors to population growth. Their estimates say that the combined population of these countries is likely to increase to 1.7 billion in 2050, from 850 million in 2010. v. Child Labour It is no less than a tragedy that child labour is still in practice extensively in many parts of the world. As per the UNICEF, approximately 150 million children are currently working in countries having few child labour laws. The children being seen as a source of income by impoverished families begin work too young and also lose the educational opportunities reflected, particularly when it comes to birth control. vi. Technological Advancement in Fertility Treatment With the latest technological advancement and more discoveries in medical science, it has become possible for couples who are unable to conceive to undergo fertility treatment methods and have their own babies. Today there are effective medicines that can increase the chance of conception and lead to a rise in the birth rate. Moreover, due to modern techniques, pregnancies today are far safer. vii. Immigration Many people prefer to move to developed countries like the US, UK, Canada, and Australia, where the best facilities are available in terms of medical, education, security, and employment. The result is that those people

NSOU ? GE-SO-21 114 settle over there, eventually making those places overcrowded. If the number of people who are leaving the country is less than the number of people who enter, it usually leads to more demand for food, clothes, energy, and homes. This gives rise to a shortage of resources. Though the overall population remains the same, it just affects the density of the population, making that place simply overcrowded. viii. Lack of Family Planning Most developing nations have a large number of people who are illiterate, live below the poverty line, and have little or no knowledge about family planning. Besides, getting their children married at an early age increases the chances of producing more kids. Those people are unable to understand the harmful effects of overpopulation, and lack of quality education prompts them to avoid family planning measures. ix. Poor Contraceptives Use Poor family planning on the part of partners can lead to unexpected pregnancies though contraceptives are easily available in developed countries. As per statistics, 76% of women aged between 16 and 49 in Great Britain used at least one form of contraceptive, leaving a quarter open to unexpected pregnancies. Whereas a study by the World Health Organization (WHO) shows that this figure drops to 43% in underdeveloped countries, which leads to higher birth rates. Nowadays, some western geographers view overpopulation as the cause of pollution and the increasing migration from the countryside in the western countries of Europe and North America. Overpopulation strikes the lower strata of the society the hardest particularly in developing countries such as India, Nepal, Myanmar etc. 8.10 Effects of Over Population Over population can have the following fatal effects. i. Depletion of Natural Resources The effects of overpopulation are quite severe. The first of these is the depletion of resources. The Earth can only produce a limited amount of water NSOU ? GE-SO-21 115 and food, which is falling short of the current needs. Most of the environmental damage seen in the last fifty-odd years is because of the growing number of people on the planet. They include cutting down forests, hunting wildlife in a reckless manner, causing pollution, and creating a host of other problems. Those engaged in talks about overpopulation have noticed that acts of violence and aggression outside of a war zone have increased tremendously while competing for resources. ii. Degradation of Environment With the overuse of coal, oil, and natural gas, it has started producing some serious effects on our environment. Besides, the exponential rise in the number of vehicles and industries has badly affected the quality of air. The rise in the amount of CO₂ emissions leads to global warming. Melting of polar ice caps, changing climate patterns, rise in sea levels are a few of the consequences that we might have to face due to environmental pollution. iii. Conflicts and Wars Overpopulation in developing countries puts a major strain on the resources it should be utilizing for development. Conflicts over water are becoming a source of tension between countries, which could result in wars. It causes more diseases to spread and makes them harder to control. Starvation is a huge issue that the world is facing, and the mortality rate for children is being fueled by it. Poverty is the biggest hallmark we see when talking about overpopulation. All of this will only become worse if solutions are not sought out for the factors affecting our population. We can no longer prevent it, but there are ways to control it. iv. Rise in Unemployment When a country becomes overpopulated, it gives rise to unemployment as there are fewer jobs to support a large number of people. The rise in unemployment gives rise to crime, such as theft, as people want to feed their families and provide them basic amenities of life. v. High Cost of Living As the difference between demand and supply continues to expand due to overpopulation, it raises the prices of various essential commodities, including NSOU ? GE-SO-21 116 food, shelter, and healthcare. This means that people must pay more to survive and feed their families. vi. Pandemics and Epidemics Poverty is linked to many environmental and social reasons, including overcrowded and unhygienic living conditions, malnutrition and inaccessible, inadequate, or non-existent health care, for which the poor are more likely to be exposed to infectious diseases. Further, high densities of population increase the chance of the emergence of new pandemics and epidemics. vii. Malnutrition, Starvation and Famine When the availability of resources is scarce, starvation, malnutrition, along with ill health and diseases caused by diet-deficiency such as rickets become more likely. Famine is typically associated with less-developed regions, and there is a high correlation with poverty levels. viii. Water Shortage Roughly 1% of the world's water is fresh and accessible. Overpopulation is a major issue that creates

29%

MATCHING BLOCK 117/164

SA Archana_Singh GEOG.pdf (D139588912)

immense pressure on the world's freshwater supplies. As per the study, the human demand for freshwater would stand at approximately 70% of freshwater available on the planet by 2025. Therefore, people living in impoverished areas that already have limited access to such water will be at great risk. ix. Lower Life Expectancy

A large proportion of the world's population growth occurs in less developed countries. Therefore, lower life expectancy caused by the booms in population is experienced by less-developed nations. This causes a shortage of resources in these countries resulting

in less access to medical care, freshwater, food and jobs, and ultimately in a sharp fall in life expectancy.

x. Extinction The impact of overpopulation on the world's wildlife is severe. As demand for land grows, the destruction of natural habitats, such as forests, becomes common. Data has also been collected to show a direct link between increases in human population and decreases in the number of species on the planet. If present trends continue, as many as 50% of the world's wildlife species will be at risk of extinction, some scientists warn.

xi. Increased Intensive Farming With the growth of population over the years, farming practices have evolved to produce enough food required to feed a larger number of people. However, this intensive farming methods cause damage to local ecosystems and the land that may pose problems in the future. Furthermore, intensive farming is also contributed to climate change due to the machinery required. If the population continues to grow at its current rate, this effect will likely intensify.

xii. Faster Climate Change Overpopulation forces larger nations, like China and India, to continue to develop their industrial capacities. They now rank as two of the three largest contributors to emissions in the world, other than the United States. According to 97% of the scientific community, human activities are changing global temperatures. If more is not done to reduce individual carbon footprints on a wide scale, larger populations may speed these changes up.

8.11 Solutions to Over Population Following are the incredible solutions to tackle over population.

i. Better Education One of the first measures is to implement policies reflecting social change. Educating the masses helps them understand the need to have one or two children at the most. Similarly, education plays a vital role in understanding the latest technologies that are making huge waves in the world of computing. Families that are facing a hard life and choose to have four or five children should be discouraged. Family planning and efficient birth control can help in women making their own reproductive choices. Open dialogue on abortion and voluntary sterilization should be seen when talking about overpopulation.

ii. Education for Girl Child Currently, over 130 million young women and girls around the globe are not enrolled in school. The majority of these live-in male-dominated societies, particularly in sub-Saharan Africa and South and West Asia, that does not give women equal right to education as men. Entrenched gender norms and child marriage further disrupt their access to education. The girl who receives less education is more likely to have children early and vulnerable to exploitation. Moreover, impoverished families are less likely to enroll their female children in school.

iii. Making People Aware of Family Planning As the population of this world is growing at a rapid pace, raising awareness among people regarding family planning and letting them know about serious after-effects of overpopulation can help curb population growth. One of the best ways is to let them know about various safe sex techniques and contraceptive methods available to avoid any unwanted pregnancy.

iv. Tax Benefits or Concessions The government of various countries might have to come up with various policies related to tax exemptions to curb overpopulation. One of them might be to waive a certain part of income tax or lowering rates of income tax for those married couples who have single or two children. As we humans are more inclined towards money, this may produce some positive results.

v. Knowledge of Sex Education Imparting sex education to young kids at the elementary level should be a must. Most parents feel shy in discussing such things with their kids that results in their children going out and look out for such information on the internet or discuss it with their peers. Mostly, the information is incomplete, which results in sexually active teenagers unaware of contraceptives and embarrassed to seek information about the same. It is, therefore, important for parents and teachers to shed their old inhibitions and make their kids or students aware of solid sex education.

vi. Social Marketing Social marketing has already been started by some societies to educate the public on overpopulation effects. The intervention can be made widespread at a low cost. A variety of print materials (flyers, brochures, fact sheets, stickers) can be distributed in places such as at local places of worship, sporting events, local food markets, and schools and at car parks.

8.12 Population Explosion Population explosion is a term used for excess or uncontrolled increment in population. It is the highest level of over population. Generally, when growth rate of population of a country increased by more than 2% it indicates population explosion. Alarming growth of population has become one of the most formidable problems of developing and underdeveloped countries. Tremendous growth of population loses its balance with the natural ecosystem and poses serious threat towards socio-economic development of a country.

8.13 Causes of Population Explosion Various factors have contributed to the rapid growth of population among which the following can be noted.

i. Excess of Birth over Death Growth of population depends on the excess of births over deaths. Nowadays death rate has been declining rapidly and birth rate is still high. The gap between birth rate and death rate has widened leading to an increase in the population.

ii. Progress of Medical Science Progress of medical science has

88%

MATCHING BLOCK 118/164

W

reduced the death rate. It has help us to control the spread of

diseases and protected the lives of people from the jaws of death. iii. Agrarian Economy In an agricultural economy child find work easily in farms, uncertainty in the field of agriculture have largely been removed with the help of science and technology. Food production has considerably increased. Consequently, in agrarian society children are never considered an economic. The result is that agrarian countries have bigger families on economic grounds. NSOU ? GE-SO-21 120 iv. Certain

100%

MATCHING BLOCK 119/164

W

Social Factors like Universal Marriage Child Marriage and Early Marriage

This factor has also contributed to the population explosion. Countries like India where consider

73%

MATCHING BLOCK 120/164

W

marriage as a social application and almost all marriageable persons are in a married state.

Lifelong bachelor ship is look down. Particularly for women marriage is almost an inescapable obligation. Lower age at the time of marriage is highly responsible for high fertility. v. Longing for Sons The birth of a male child is always welcome because they help and support their parents in old age, and also perform all the religious duties. Besides, the carry on the family name after the death of the father. The greater the numbers of sons, the larger, will be the addition to the family income. Person having two or three daughters do not go for family planning methods till they be get a son. vi. Lack of Conscious Family Planning There is the lack of consensus family planning on the part of the married people. The use of contraceptives is unknown to

80%

MATCHING BLOCK 121/164

W

the illiterate masses. People feel that more children are wanted for economic purposes.

Further, blind faith in faith and the existence of joint family system induces thoughtlessness in the matter of begetting children. vii. Lower Standard of Living The standard of living of country like India is low as compared to their counterparts in well-educated and advanced countries. In backward are as, children are not educated. As soon as they are able to earn something, they are married. Besides, they consider it a means of entertainment. viii. Social Attitudes Social attitudes also favor and increase in population.

100%

MATCHING BLOCK 123/164

W

Poverty, illiteracy, ignorance, absence of recreational facilities, attitudes of conservatism, orthodoxy,

feeling of dependence on God, a sense of resignation towards life, looking up children as old is pension etc. are all responsible for the rapid growth of population.

NSOU ? GE-SO-21 121 ix. The Climatic Condition Favourable climatic condition also very conducive to

77%

MATCHING BLOCK 124/164

W

the growth of population. Montesquieu said that people of farmland are more sex indulgent. Father girls become physically mature at an early age ranging from 11 to 15 years of age.

Immediately after puberty pushed into marriage and they begin to bear children. Child-bearing capacity of women lasts in the tropical places. x. Ignorance and Illiteracy In developing countries literacy rate is very low, where many children are born due to lack of education. People are not aware about the consequences of over population. xi. Migration Factor Migration from one place to another place results change in population growth. The higher rate of migration causes population explosion. 8.14 Effects of Population Explosion If the growth rate of population and equilibrium with the growth rate of resources it will not pose any problem. If the growth rate exceeds the reasonable limits, problems will crop up and that has happened in India.it means population in excess of demand or need troops to be a great liability to the society. Unprecedented growth of population has a series of serious consequences.

50%

MATCHING BLOCK 125/164

W

Some of the main effects of population explanation maybe described here. i. Population and Poverty Poverty and population very often go hand in hand in fact

poverty is both the cause and effect of rapid growth of population. Poverty is one of the most significant product of population explosion. When Population size exceeds the limit, finite resources cannot fulfill the basic need of people. ii. Unemployment and Underemployment It is not easy to create jobs in accordance with the growth of population. Due to tremendous growth of population unemployment and underemployment occurs.

NSOU ? GE-SO-21 122 iii. Low Per Capita Income It has been observed that during the past 50 years of planning, in India the national income of the country has increased by about 3.6% per annum but the per capita income has increased only by 1.5 % per annum, this low per capita income of the people in India is attributed to the rapid growth of population. iv.

Shortage of Food The rapidly growing population led to the problem of shortage of food supply. Due to improper distribution all the people do not get subsequent food to sustain their health. As a result, many people suffering from malnutrition and not getting quantum of energizing food. v. Increased Burden of Social Overheads When there is a

100%

MATCHING BLOCK 126/164

W

rapid growth of population in the country, the government is required to provide the minimum facilities for the people for their comfortable living. Hence it has to increase educational, housing, sanitation, public health, medical, transportation, communication, and other facilities.

81%

MATCHING BLOCK 127/164

W

This will increase the cost of social overheads. Government finds it difficult to find sufficient funds to meet these unproductive expenses.

vi. Degradation of Standard of Living The standard of living denotes the way in which people live. It reflects the quantity and the quality of the consumption of the people. Due to the rapid growth of population standard of living of the people has been adversely affected. vii. Pressure on Land Overpopulation inevitably leads to heavy pressure on land. Since land is limited and fixed in supply, an increase in population can only bring more pressure on it. viii.

100%

MATCHING BLOCK 128/164

W

capital formation. The shortage of capital has restricted investments and contributed to the slow economic growth of the country.

ix. Effects on Public Health Population explosion has effect on public health and nutrition. Due to the rapid growing population size, health related infrastructure is not improving. x.

100%**MATCHING BLOCK 130/164****W**

Increased Unproductive Consumers When there is a rapid growth of population in a country like India, there will be large proportion of unproductive consumers.

In fact, today about 51% of the total population of India is unproductive. Rapid increase in population contributes to an increase in the dependency ratio. xi.

100%**MATCHING BLOCK 131/164****W**

Political Unrest Unmanageable population size may contribute to political instability and unrest. The failure of the government to provide the basic minimum facilities to the people contributes to agitation and unrest among the masses.

xii. Effect on Environment Rapid growth of population loses its balance with the natural ecosystem. People cut forest for making their living commodities and shelter. Excessive growth of population leads human being to interfere imaginatively with nature which exerts adverse effect on the life of the people by degrading the condition of air, soil, and water. 8.15 Conclusion Population study is striking and important phenomena of present time. Population dynamics is the change of population of an area over a period of time. Population growths have direct impact on society building and its development. Uncontrolled population growth inversely affects the healthy and prosperous life of human beings. In all over the world especially developing and under developed countries are suffering due to over population. The population and sociological study analyse the growth rate and fertility rates all over the recognized countries of the world. For this reason, population policies are implemented and studied in relation to human resource development and resource potentialities of the country.

NSOU ? GE-SO-21 124 8.16 Summary In sociology, population refers to a group of human beings with some pre-defined criterion in common such as location, race, ethnicity, nationality, or religion. The total number of people living in a particular area in a particular time is known as the population. The population is one of the important factors which helps to balance the environment, the population should in a balance with the means and resources. Any country needs to know the size and composition of its population- around age and sex structure, among other factors that helps to plan how many schools, clinics, hospitals, and jobs a country need. The main objection is to achieve a stable population at a level consistent with the requirements of sustainable economic growth, social development, and environmental protection. Several policies have been formulated in different five-year plans by the government of India for population control. Demography is the study of a population, the total number of people or organizations in a given area.

Understanding how population characteristics such as size, spatial distribution, age structure, or the birth and death rates change over time can help scientists or governments make decision. The study of population is a most significant area of sociology. Population size, population growth- causes of population growth, consequences of population growth, optimum population, over population, causes of over population. Effects of over-population, solution to over population, population explosion, effects of population explosion- are important and to be discussed. Population growths have direct impact on society building and its development. Uncontrolled population growth inversely affects the healthy and prosperous life of human beings. 8.17 Questions Answer the following questions in your own words. G-A (5 Marks each) i. NSOU ? GE-SO-21 127 9.2 Introduction Fertility is the reproductive capacity of women is a measure of the average number of children of a woman will have during her childbearing years. Fertility, ability of an individual or couple to reproduce through normal sexual activity. About 90 percent of healthy, fertile

60%

MATCHING BLOCK 135/164

SA

Archana_Singh GEOG.pdf (D139588912)

women are able to conceive within one year if they have intercourse regularly without contraception. Normal fertility requires the production of enough healthy sperm

by the male and viable eggs by the female, successful passage of the sperm through open ducts from the male testes to the female fallopian tubes, penetration of a healthy egg, and implantation of the fertilized egg in the lining of the uterus (see reproductive system). A problem with any of these steps can cause infertility. 9.3 Fertility and Fecundity Demographers distinguish between fecundity, the underlying biological potential for reproduction, and fertility, the actual level of achieved reproduction. (Confusingly, these English terms have opposite meanings from their parallel terms in French, where fertility is the potential and fécondité is the realized; similarly ambiguous usages also prevail in the biological sciences, thereby increasing the chance of misunderstanding.) The difference between biological potential and realized fertility is determined by several intervening factors, including the following: i. most women do not begin reproducing immediately upon the onset of puberty, which itself does not occur at a fixed age; ii. some women with the potential to reproduce never do so; iii. some women become widowed and do not remarry; iv. various elements of social behaviour restrain fertility; and v. many human couples choose consciously to restrict their fertility by means of sexual abstinence, contraception, abortion, or sterilization. The magnitude of the gap between potential and realized fertility can be illustrated by comparing the highest known fertilities with those of typical European

NSOU ? GE-SO-21 128 and North American women in the late 20th century. A well-studied high-fertility group is the Hutterites of North America, a religious sect that views fertility regulation as sinful and high fertility as a blessing. Hutterite women who married between 1921 and 1930 are known to have averaged 10 children per woman. Meanwhile, women in much of Europe and North America averaged about two children per woman during the 1970s and 1980s—a number 80 percent less than that achieved by the Hutterites. Even the highly fertile populations of developing countries in Africa, Asia, and Latin America produce children at rates far below that of the Hutterites. The general message from such evidence is clear enough: in much of the world, human fertility is considerably lower than the biological potential. It is strongly constrained by cultural regulations, especially those concerning marriage and sexuality, and by conscious efforts on the part of married couples to limit their childbearing. Dependable evidence on historical fertility patterns in Europe is available back to the 18th century, and estimates have been made for several earlier centuries. Such data for non-European societies and for earlier human populations are much more fragmentary. The European data indicate that even in the absence of widespread deliberate regulation there were significant variations in fertility among different societies. These differences were heavily affected by socially determined behaviours such as those concerning marriage patterns. Beginning in France and Hungary in the 18th century, a dramatic decline in fertility took shape in the more developed societies of Europe and North America, and in the ensuing two centuries fertility declines of fully 50 percent took place in nearly all of these countries. Since the 1960s fertility has been intentionally diminished in many developing countries, and remarkably rapid reductions have occurred in the most populous, the People's Republic of China.

9.4 Procedures to Measure Fertility Rate The following procedures are adopted to measure the fertility rate.

- i. Crude Birth Rate The crude birth rate is statistical value that can be used to measure the growth or decline of population. This is the most common procedure used to

NSOU ? GE-SO-21 129 measure the human fertility. The birth weight is measured by the rate of births population of 1000. It is determined by taking the total number of live births in a population and dividing the value by a number to obtain the rate per 1000. If crude birth rate be CBR and BI stands for live births over a year and P is the estimated mid-year population, then crude birth rate will be- $CBR = BI/P \times 1000$ Birth date is called crude because CBR does not considered the age, marital status, and its composition. It only gives and overall idea about the fertility.

- ii. General Fertility Rate (GFR) It is the number of live births per 1000 females of childbearing age between the ages of 15 to 44 years. If BI denotes live birth in a year, and P stands for number of women in normal childbearing age, then: General fertility rate (GFR) = $BI/P \times 1000$ Here P is the number of women in a normal reproductive age which generally ranges from 15 years to 44 years. This age range may not be always constant, it may vary in different situations. The reproductive rate is higher in the age group 20+ to 29+ Year. It is also depending on health condition of women fit up to 44 years of age and where early marriage is granted.
- iii. Fertility Ratio (FR) It is calculated by using female in the reproductive age group that is 15 to 49 years. It takes into account child women ratio. Calculate the number of children below 5 years of age for 1000 females within the reproductive age ranging from 15 to 49 years of age. Fertility Ratio (FR): $P(0-5)/P(15-49)$ P(0-5) represents the number of children below 5 years. This measure of fertility is important for less developed societies where, but registration system is very poor. It counts for only living children below 5 years.
- iv. Standardized Birth Rate (SBR) To compare the fertility of different populations standardized birth rate are often used to eliminate the effect on the birth weight of certain differences in structure of the population. It measures the number of expected births for

NSOU ? GE-SO-21 130 each specific age groups. It is calculated by total of the expected birth for all age groups is to be divided by the total population and multiplied by 1000.

- v. Total Fertility Rate (TFR) Total fertility rate in simple terms refers to total number of children born or likely to be born to a woman in her lifetime if she were subject to the prevailing rate of age specific fertility in the population. It is measured by something of the age specific birth rates and multiply it by number of mothers in the age interval.

9.5 Reproduction Reproduction, process by which organisms replicate themselves. In a general sense reproduction is one of the most important concepts in biology: it means making a copy, a likeness, and thereby providing for the continued existence of species. Although reproduction is often considered solely in terms of the production of offspring in animals and plants, the more general meaning has far greater significance to living organisms. To appreciate this fact, the origin of life and the evolution of organisms must be considered. One of the first characteristics of life that emerged in primeval times must have been the ability of some primitive chemical system to make copies of itself. At its lowest level, therefore, reproduction is chemical replication. As evolution progressed, cells of successively higher levels of complexity must have arisen, and it was absolutely essential that they had the ability to make likenesses of themselves. In unicellular organisms, the ability of one cell to reproduce itself means the reproduction of a new individual; in multicellular organisms, however, it means growth and regeneration.

9.6 Biological Factors affecting Human Fertility Reproduction is a quintessentially biological process, and hence all fertility analyses must consider the effects of biology. Such factors, in rough chronological order, include:

NSOU ? GE-SO-21 131 i. the age of onset of potential fertility (or fecundability in demographic terminology); ii. the degree of fecundability—i.e., the monthly probability of conceiving in the absence of contraception; iii. the incidence of spontaneous abortion and stillbirth; iv. the duration of temporary infecundability following the birth of a child; and v. the age of onset of permanent sterility. The age at which women become fecund apparently declined significantly during the 20th century; as measured by the age of menarche (onset of menstruation), British data suggest a decline from 16–18 years in the mid-19th century to less than 13 years in the late 20th century. This decline is thought to be related to improving standards of nutrition and health. Since the average age of marriage in western Europe has long been far higher than the age of menarche, and since most children are born to married couples, this biological lengthening of the reproductive period is unlikely to have had major effects upon realized fertility in Europe. In settings where early marriage prevails, however, declining age at menarche could increase lifetime fertility. Fecundability also varies among women past menarche. The monthly probabilities of conception among newlyweds are commonly in the range of 0.15 to 0.25; that is, there is a 15–25-percent chance of conception each month. This fact is understandable when account is taken of the short interval (about two days) within each menstrual cycle during which fertilization can take place. Moreover, there appear to be cycles during which ovulation does not occur. Finally, perhaps one-third or more of fertilized ova fail to implant in the uterus or, even if they do implant, spontaneously abort during the ensuing two weeks, before pregnancy would be recognized. As a result of such factors, women of reproductive age who are not using contraceptive methods can expect to conceive within five to 10 months of becoming sexually active. As is true of all biological phenomena, there is surely a distribution of fecundability around average levels, with some women experiencing conception more readily than others. Spontaneous abortion of recognized pregnancies and stillbirth also are fairly common, but their incidence is difficult to quantify. Perhaps 20 percent of recognized pregnancies fail spontaneously, most in the earlier months of gestation.

NSOU ? GE-SO-21 132 Following the birth of a child, most women experience a period of temporary infecundability, or biological inability to conceive. The length of this period seems to be affected substantially by breast-feeding. In the absence of breast-feeding, the interruption lasts less than two months. With lengthy, frequent breast-feeding it can last one or two years. This effect is thought to be caused by a complex of neural and hormonal factors stimulated by suckling. A woman's fecundability typically peaks in her 20s and declines during her 30s; by their early 40s as many as 50 percent of women are affected by their own or their husbands' sterility. After menopause, essentially all women are sterile. The average age at menopause is in the late 40s, although some women experience it before reaching 40 and others not until nearly 60.

9.6.1. Contraception Contraceptive practices affect fertility by reducing the probability of conception. Contraceptive methods vary considerably in their theoretical effectiveness and in their actual effectiveness in use ("use-effectiveness"). Modern methods such as oral pills and intrauterine devices (IUDs) have use-effectiveness rates of more than 95 percent. Older methods such as the condom and diaphragm can be more than 90-percent effective when used regularly and correctly, but their average use-effectiveness is lower because of irregular or incorrect use. The effect upon fertility of contraceptive measures can be dramatic: if fecundability is 0.20 (a 20-percent chance of pregnancy per month of exposure), then a 95-percent effective method will reduce this to 0.01 (a 1-percent chance).

9.6.2 Abortion Induced abortion reduces fertility not by affecting fecundability but by terminating pregnancy. Abortion has long been practiced in human societies and is quite common in some settings. The officially registered fraction of pregnancies terminated by abortion exceeds one-third in some countries, and significant numbers of unregistered abortions probably occur even in countries reporting very low rates.

9.6.3. Sterilization Complete elimination of fecundability can be brought about by sterilization. The surgical procedures of tubal ligation and vasectomy have become common in diverse

NSOU ? GE-SO-21 133 nations and cultures. In the United States, for example, voluntary sterilization has become the most prevalent single means of terminating fertility, typically adopted by couples who have achieved their desired family size. In India, sterilization has been encouraged on occasion by various government incentive programs and, for a short period during the 1970s, by quasi-coercive measures. 9.7 Determinants of Fertility and Reproduction There are many determinants of fertility. The formidable determinants are as follows. i. Demographic Trends This can be seen in many factors such as postponement of marriage, increasing age of first birth, increasing divorce rates, lower marriage rates, more births outside marriage, and increasing number of women in the labour force, greater level of education for women, a decreasing need for children to support elderly parents, a shift from rural to Urban societies, and government program to encourage or discourage having children. Combination of all these factors has resulted in three major demographic trends that is reduction in infant mortality, increasing life expectancy and decreasing fertility rates. ii. Race A recent study shows that there are interesting reasons as to the differences in fertility rates. United States historical data show that the major difference between white and black fertility is timing that is blacks tend to have their children at early ages than whites. (Current U.S population Reports, 1996, page 27). iii. Education Education is a key factor of fertility. It has been observed that educated people are associated with more prenatal care. The lifestyle and health behaviour during pregnancy are determinantal to the birth outcome. Overall higher female education is universally associated with lower and delayed fertility. Significant differences in fertility are usually found between higher educated women and uneducated women.

NSOU ? GE-SO-21 134 iv. Religion Religion plays an important role in the movement of fertility rates. However, it depends on the religion practiced by the society and many other factors linked with this like the use of contraceptives. v. Contraceptive Use and Abortion The use of contraception and abortion facilitates the prevention of unwanted pregnancies and the planning of desired births. vi. Marriage, Cohabitation and Divorce The family model is now very different compared to past decades. The relationship between men and women have changed. Studies show that there is an increase in the number of young couples that are deliberately choosing childlessness. This trend is supported by an increasing use of contraception, family planning and social equality in sex roles. Another factor that makes fertility rates fall is the decrease in marriage and the rise in divorce rates. vii. Postponement of Age of Marriage Another trend is that the average age at marriage is increasing, couples are getting married at older ages. The postponement of marriage is related to the increase in popularity of living together without marrying which in some cases replaces marriages. This trend decreases the fertility rate. viii. Women in the Labour Force Over the last few decades one of the most important demographic changes has been the constant increase in female labour force participation which has been a generalized tendency around the world. Changing role of women has produced several transformations of the family structure. This trend has impact on childbearing practices, therefore, decreased fertility rates. ix. Government Programs Initiatives taken by the government to control the population have impact on fertility rates. Countries like China, India where population is a great concern of development, government tries to control population by various programs. x. Economic Factors Finally, economic determinants other level of income standard of living and nature of diet in addition of these psychological factors are also important factors for fertility and reproduction rates.

NSOU ? GE-SO-21 135 There exist many factors that affect the decision to have children or not. These factors include the increase in cost of raising a child for the change in the attitude of women towards work. It is a fact that women have increasingly altered their reproductive behavior they can control their fertility with improved birth control methods. The decision to have children is related to the size of a family they want. Now, couples are able to decide whether to have children, when to start, and the space between children. Fertility rates are different in all over the world. It is still at very high levels in Africa and some Arabic countries and Asian countries, followed next by the countries of Central and South America. Lower rates are found in Europe and other industrialized countries like Canada and Japan. 9.8 Foods that can affect Fertility Infertility affects about 9% of married women who are of childbearing age, according to a national survey conducted by the Centers for Disease Control and Prevention. While couples can't control all of the causes of infertility, they can control their eating habits. And nutrition and a healthy body weight for both partners can have a significant impact on the ability to conceive. i. Women and Fertility To prepare for pregnancy and enhance fertility, maintain a healthy weight and choose foods that will create a safe and supportive home for your baby's nine-month stay. This should include sources of folic acid, iron, and other important nutrients. ii. Men and Fertility Men also should try to maintain a healthy body weight and follow a balanced eating pattern, since male obesity may alter hormone levels. Plus, low sperm count, and poor sperm motility are common in men with overweight and obesity. When it comes to food choices, load up on fruits and vegetables, which contain vitamins, minerals and antioxidants that may help create strong sperm.

NSOU ? GE-SO-21 136 iii. Find Your Healthy Weight Increase your chance of leading a balanced life by achieving and maintaining a healthy weight. Weight extremes can alter hormone levels and throw ovulation off schedule. For women who are considered to be overweight or obese, due to a body mass index (BMI) equal to or greater than 25, weight loss may improve fertility. On the other hand, women who are classified as being underweight, with a BMI below 18.5 (18.5 to 24.9 signifies a normal weight), may experience irregular menstrual cycles or stop ovulating altogether. Those who regularly participate in high-intensity exercise—such as gymnastics or dancing, have an eating disorder or follow restricted diets—often are at an increased risk. Avoid going on fad diets, which can deplete your body of the nutrients it needs for pregnancy and find a healthy eating plan that works for you by talking to a registered dietitian nutritionist. iv. Include Adequate Amounts of Iron An eating pattern, rich in iron that comes from vegetables and supplements may lower the risk of ovulatory infertility, according to results from The Nurses' Health Study II, which followed 18,500 female nurses trying to get pregnant. Ovulatory infertility is only one cause of infertility. Vegetarian foods with iron include beans, lentils, spinach, fortified cereals, long-grain enriched rice and whole grains. Add vitamin C from citrus fruits, bell peppers or berries to your meals to enhance iron absorption. v. The "Fertility Diet" Pattern Published by a team of Harvard researchers in 2007, the "Fertility Diet" study—found women with ovulatory infertility who followed this eating pattern had a 66% lower risk of ovulatory infertility and a 27% reduced risk of infertility from other causes than women who didn't follow the diet closely. Women following the "fertility diet" chose:

- Less trans-fat and more monounsaturated fat (from foods such as avocados and olive oil)
- Less animal protein and more vegetable protein
- More high-fiber, low-glycemic carbohydrate-rich foods (including whole grains)

NSOU ? GE-SO-21 137 • More vegetarian sources of iron and fewer meat sources • Multivitamins • High-fat dairy instead of low-fat dairy In general, eating more vegetables and a variety of types, eating healthy monounsaturated fats instead of saturated and trans-fats, making at least half your grains whole, and getting enough calcium-rich foods—including dairy — will help you meet nutrient needs and promote a healthy weight. vi. Don't Forget Folic Acid While it won't make you more fertile, it is crucial that women trying to conceive obtain 400 micrograms per day of folic acid from supplements (if considering taking any supplements, including folic acid, talk to your health care provider first) and include foods such as dark leafy green vegetables and fortified grains. Folic acid is needed to prevent neural tube defects. The neural tube develops into the brain and spine three to four weeks after conception, before most women even realize they're pregnant. For more information on foods for fertility and creating a personalized eating plan one must consult a registered dietitian nutritionist. 9.9 Fertility Rate and Population Growth Fertility rate is the average number of children born to women during their reproductive period. Most important factor for population growth is the total fertility rate (TFR). If overall total fertility rate of an area is 2.1 then the population of that area remains stable, excluding immigration and emigration. TFR 2.1 of area is known as replacement rate. Generally, if total fertility rate of a given area is more than 2.1 then population of that area will increase and when it is less than 2.1, the population of that given area will eventually be decreased considering no emigration and immigration. 9.10 Conclusion Population study is striking and important phenomena of present time. Population dynamics is the change of population of an area over a period of time.

Population

NSOU ? GE-SO-21 138 growths have direct impact on society building and its development. Uncontrolled population growth inversely affects the healthy and prosperous life of human beings. In all over the world especially developing and underdeveloped countries are suffering due to over population. The population and sociological study analyse the growth rate and fertility rates all over the recognized countries of the world. For this reason, population policies are implemented and studied in relation to human resource development and resource potentialities of the country. 9.11 Summary Fertility is the capability to produce offspring through reproduction following the onset of sexual maturity. The fertility rate is the average number of children born to a female during her lifetime and is quantified demographically. In other words, fertility is the capability of an individual or a couple to reproduce offspring through normal sexual activity. Crude birth rate, general fertility rate, fertility ratio, standardized birth rate, total fertility rate- are the procedures to measure fertility. Reproduction is a process by which organism replicate themselves. In a general sense, reproduction is one of the most important concepts in biology; it means making a copy, a likeness and thereby providing for the continuous existence of species. Reproduction is a quite essentially biological process, and hence all fertility analyzes must consider the effects of biology. Most important factor for population growth is the total fertility rate. 9.12 Questions Answer the following questions in your own words. G-A (5 Marks each) i. Differences between fertility and fecundity? ii. Define fertility rate. iii. What is reproduction? iv. How does diet affect fertility? v. What are the biological factors that affect human fertility?

NSOU ? GE-SO-21 139 G-B (10 Marks each) vi. Write a note on contraception, abortion, and sterilization. vii. Discuss various procedures to measure fertility rate. viii. Discuss the determinants of fertility and reproduction. 9.13 Suggested Readings i. Goswami, M.K. (2013) Environmental Education and Population Education, Delhi, Asian Book Pvt. Ltd. ii. The concepts of mortality, morbidity, and health. ? The mortality trends and levels.

NSOU ? GE-SO-21 141 ? The infant mortality rate and its types. ? The reasons for infant mortality rate. ? The major determinants of mortality in India. 10.2 Introduction Mortality is considered to be the outcome of sickness and the population of sick people who die. In order to control mortality, the medical measures to curb illness and other health related issues are very much essential. Mortality is considered to be important for measuring the

71%

MATCHING BLOCK 136/164

SA BLOCK I MSO 304.docx (D49764054)

health risks, improvement in the quality of health care and for comparing the overall health of different groups in the population.

Mortality is one of the major components responsible for bringing changes in human population along with fertility and migration. These variables are associated with factors like age of marriage, the proportion of marriage, contraceptive use, level and types of morbidity, rural urban migration etc. All of these factors are also linked with social factors like levels and distribution of income, levels of education, and position of women in society, religion, and economic development. In order to understand mortality, we have to take into consideration the crude death rate, age specific death rate, infant rate etc. (Singh 2009:93). It has been observed since long time that mortality has played an important role in determining the population growth. Since the seventeenth century, human population increased in the industrial and developed countries mostly due to the fall in death rates rather than the rise in the fertility rate. The demographic transition in developing countries was also facilitated mostly due to mortality. The outcome was the rapid population growth. Mortality is important for studying the demographic conditions of existing human societies and also useful

88%

MATCHING BLOCK 134/164

W

for determining the prospect of potential changes in mortality conditions of the future (

Bhende and Kanitkar 2004:160). Mortality can be studied from various angles, as various biological, social, economic, and cultural factors affect the health condition of members of the society and consequently affect the mortality rate of society. The factors that affect mortality can be classified under three themes namely heredity, constitution, and environment. When mortality is viewed from a demographic standpoint then the changing size and structure of population is given more emphasis than the medical factors. Here, the NSOU ? GE-SO-21 142 genetic factors are not considered. The constitutional and environmental factors provide the grounds for demographic analysis of mortality. The constitutional factors of mortality include physical, physiological, anatomical, and psychological characteristics of human being. The environmental factors include the natural environmental/physical setting of humans and their social, economic, environmental and personal habits. The most important factors for studying mortality are age and sex (Bhende and Kanitkar 2004:160). 10.3 Meaning and Measurement of Mortality The study of mortality is used to understand the effects of death on

89%

MATCHING BLOCK 137/164

SA Demography_Final.docx (D110581594)

population. The United Nations and World Health Organization have defined "Death is the permanent disappearance of all evidence of life at any time after birth has taken place (

post-natal cessation of vital functions without capacity of resuscitation)". A death takes place only after a live birth and the period between birth and death is life (Bhende and Kanitkar 2004: 161). According to Gordon Marshall (2006:432) mortality rate is the death rate that is generally standardized by age and sex in order to make comparisons between areas and social groups. Heer and Grigsby (1992:30) have argued that "an exact comparison of mortality in two different populations can be made by a separate presentation of the death rates in each age-sex group of each population". Mortality is useful for measuring the

71%

MATCHING BLOCK 138/164

SA BLOCK I MSO 304.docx (D49764054)

health risks, improvements in the quality of health care and for comparing the overall health of different groups in the population.

Mortality is used as a very reliable indicator of social and economic change, for comparing living standards and also used by medical scientists for monitoring the death risks from infectious diseases (Marshall 2006:432). Mortality is most commonly measured in crude death rate which is defined as "the ratio of the number of deaths that occur within a given population during a specified year to the size of that population at midyear". However, crude death rates do not provide an accurate indicator of mortality conditions as the age structure affects its measurement. An exact comparison of mortality can be made by analyzing the death rates on the basis of sex and age of the given population (Heer and Grigsby 1992:30).

62%

MATCHING BLOCK 140/164

SA BLOCK I MSO 304.docx (D49764054)

Age standardized death rates are calculated separately for male and females to produce overall Standard Mortality Ratios (SMR) for each sex or sexes combined

together.

NSOU ? GE-SO-21 143 10.4 Mortality Trends and Levels The increase of country's population is related primarily with two biological variables birth and death. The survival rate gives us the net increase in population, that is, the difference between births and deaths. The population problem of India arises particularly because of extremely high fertility along with high mortality which is gradually declining (Madan 2005: 284). India is witnessing a demographic transition with the expansion in population and decline in growth as both fertility and mortality levels have been falling considerably. India's mortality level started declining since 1921 and the Crude Death Rate (CDR) fell from a high 40-45 percent per 1000 population to around 32-33 during the independence in 1947 and further lowered to 15 by 1971. Three distinct stages of mortality history can be traced in case of India. Mortality was high and fluctuating till 1921 due to famines, epidemic and pestilences. In the course of next 30 years, it declined slowly. Development in the field of medical science, implementation of public health policies, control of communicable diseases, malaria eradication program was responsible for lowering the death rates in this period. There was only one major famine after 1921 that is the Bengal famine of 1943. Epidemics and fatal diseases were kept under control. After 1951 mortality has declined in a faster pace. The main reason for the decline was the communicable diseases were monitored and controlled in an effective manner, the famine and epidemics were absent, and the social and medical health infrastructure improved in almost every region of the country. Post-independence there have been a remarkable progress in all the three indicators. Death rate has declined from 32-33 to 9, infant mortality rate declined from 200 to 63 in 2002 and years expectation of life at birth from 32 years to about 63-64 years after 55 years since independence (Majumdar 2013: 280-281). 10.5 Inter-State and Rural-Urban Areas The approach to lower mortality has been uneven in India like in other parts of the world. Mortality rates have been found to be peculiarly higher in rural areas than urban areas. The mortality differences between the rural and urban dwellers are quite

NSOU ? GE-SO-21 144 striking. The life expectancy of urban males and females is almost 6 to 8 years more than that of the people living in the rural areas. The mortality difference between the different states of India is more wider and varying. In almost all the parameters

100%

MATCHING BLOCK 139/164

W

in the South Indian states of Kerala and Tamil Nadu

are ahead of other Indian states. Both fertility and mortality in these two states are low. In case of Kerala the rural and urban mortality difference is minimum. After Kerala, West Bengal too has been capable of narrowing the rural and urban mortality gap. The infant mortality rate of Kerala is phenomenal, that is 13 per 1000 live births and life expectation at birth above 70 years. These two indicators of Kerala are remarkable and can be compared with the developed first world countries. In case of lowering mortality, states like West Bengal, Himachal Pradesh and Punjab have also made significant progress. Orissa, Uttar Pradesh, and Madhya Pradesh continue to have a large urban-rural mortality difference. Despite of having a low urban rural mortality difference in south India their sex differences in mortality stands out to be the highest as compared to other Indian states. Excluding Rajasthan and Bihar the female mortality rate is smaller in most other states than that of male mortality rates. Although the mortality rate has declined over the years, the interstate and regional variations have sustained, and it requires region specific attention and intervention. Some of the major causes for differences in the mortality rates of rural urban regions are as follows: i. The urban people unlike their rural counterparts are more health conscious, with better education and have exposure to better medical and health facilities. ii. A huge proportion of urban people are employed in organized sectors, they receive health allowances, have health insurances from their employers or are entitled to receive reimbursement for certain kind of health expenses. iii. There is more number of public or private health institutions in urban areas. Therefore, the urban people get better medical facilities. In fact, 75 percent of health budget of the government are invested in urban areas where only 28 percent of the total population lives. iv. The urban areas have arrangements for purified drinking water to almost every household while their rural counterparts still lack such facilities.

NSOU ? GE-SO-21 145 v. The waste management, drainage and sanitation facilities are cities are better as compared to that of villages and small towns. Only 31 per cent of India's population has the privilege to sanitation facilities. A comparison of death rates between 1988-1990 and 1998-2000 exhibits that out of 16 large states 15 states have reduced the Crude Death Rate (CDR). In both the urban and rural areas there is a marginal growth in CDR in Kerala. Prof. Mitra argues that while other Indian states were busy in making strategies to control the death rates, Kerala had already revolutionized its health system which helped the state to lower the fertility and mortality rates quickly (Majumdar 2013:280-281). 10.6 Age-Sex Differences According to the demographic point of view two major specific death rates are age and sex specific mortality rates. The gender difference in case of India's mortality condition has been very disturbing. It is observed that young girls are experiencing higher mortality compared to young boys. According to NFHS-2, female mortality rate below 5 was bit higher than male mortality rate (105 per 1,000 live births for females compared to 98 per 1,000 for male births). This kind of trend is present in rural areas and absent in urban areas. As compared to other countries of the world it is found that in India the female mortality rate is very high. The primary reason is that as compared to boys the girls get less medical and health attention and when the females receive medical treatment it is too late or inadequate. The discrimination of girl children in the age group of 5 to 14 is more in rural areas as compared to urban areas. However, it is also astonishing to know that when girls enter the active age group and also gets involved in reproductive tasks and other additional risks like child rearing, home-making or other activities then their death rates is found to be lower than that of their male counterparts. It is found that in all societies the mortality is highest among the infant but as the child crosses the first birthday then there is a sharp decline in their mortality rate. After the child reaches the age of 15 then the mortality rate increases very gradually until they attain the age of 40, after which the age specific death rate increases. When the person reaches 70 years of age then the death rate is almost to that of 0 years. This is applicable in case of both males and females although there may be minor differences.

NSOU ? GE-SO-21 146 It is observed that in all countries that at birth the male babies slightly outnumber female babies. According to SRS in India it is 110 male babies for every 100 female babies. The parity between the male and female babies is reached before they reach their adolescent age and mortality is bit higher among the male babies as against the female babies in the initial years. Till about 1980 females were lagging behind the males in terms of life expectancy. However, after 1980s the female life expectancy has increased at a much faster pace. There was a sharp drop in death rate from around 52 to only 20 in the age group of 0-4 in just 30 years. Although the death rate of India has declined after independence but the inter-state differences of death rate particularly in former years is bewildering. The death rate of the age group of 0-4 in Rajasthan is as high as 39.4 and the lowest is 4.9 in Kerala. The death rate of very young children is very high in almost all the states except Kerala. Although Tamil Nadu and West Bengal have also progressed in lowering the death rate of young children, they are still behind Kerala by about 10 points. In India the infant mortality accounts for 20.5 percent of all deaths in the country. In between the age group of 5 – 59 years total death rate accounts for only 33.5 percent. The old age death proportion to all deaths is as high as 69 percent in Kerala to a lowest of 31 percent in Assam followed by 32.8 percent in Rajasthan and 33.7 percent in Uttar Pradesh. In case of India the dying patients in earlier times received little medical attention. In 1981, 39 percent of all deaths occurred where there was no medical intervention of any type. At present 21 percent of all deaths occurs either at hospitals, nursing homes or health centres and another 66 percent occurs at homes where the dying patients are attended by professional medical professionals. It is argued that most of the dying patients in urban areas get medical treatment and attention but the same cannot be said of rural areas. At the national level only 9.2 percent of dying patients received institutional care before dying in 1981. However, in 2000 it accelerated to 20.9 where it varied from 9.8 percent in Assam and 80.4 percent in Kerala. 65.9 percent of the patients received medical attention in private medical institutions at the time of death and 12.7 did not receive any medical attention. In Orissa 44 percent people died without receiving any medical treatment and it is also shocking to see that more advanced states like in Tamil Nadu and Kerala as many as 36.1 percent and 31.2 percent dying patients did not receive any medical attention. These three states are also in the top list for both the rural and urban deaths without any medical attention. Maharashtra is the only state where almost all the dying people gets at least one time medical attention (Majumdar 2013: 280-281). 10.7

100%

MATCHING BLOCK 145/164

SA CHAPTER.docx (D129895265)

Infant Mortality Rate The infant mortality rate is the number of

deaths within the first year of life divided by the number of live births in the same year times 1000 (Marshall 2006:432). The Infant Mortality Rate (IMR) of a country is used by the demographers to understand the condition of health, hygiene and also the socio-economic development of that particular country. The development of urban facilities, health infrastructure and increasing urban population IMR as an indicator has lost its ground. IMR in developed nations have come down from 22-25 to 6-7 between 1970-1999. The top 30 countries with high human development record have IMR ranging between 3 and 7 in 1999 as against 11-31 in 1970. In developing nation like India IMR fell down from 142 in 1970 to 70 in 1999. In case of China the IMR has declined down from 85 to 33 in between 1970 to 1999. A small country like Sri Lanka has an IMR of 17 in 1999. Bangladesh is ahead of India in case of IMR reduction with 58 in 1999. Since 1921, general mortality rate has declined faster in India primarily due to prevention of diseases like Tuberculosis, Plague, Malaria, Cholera and other water borne and communicable diseases. Along with the development in medical infrastructure the food security measures were also improved which further added towards the lowering of IMR. The IMR of India declined very fast since 1981 and 2001. However, it is also to be noted that the decline has been uneven in different states. The IMR in case of Tamil Nadu, Andhra Pradesh and Haryana has in fact increased during 1981 to 2001. It is also to be noted that the Schedule Castes, Schedule Tribes and Other Backward Classes witnessed much higher IMR as compared to the upper castes and classes. Every year 27 million infants are born in India. About 5 percent of them do not live for another 5 years. India accounts for 25 percent of the over 10 million under five deaths in the world. Proportion of infant mortality to total deaths in India is alarming at 20.5 percent. Infant and child mortality claims 2.2 million lives every year. For every 100 male infants deaths there are 135 female infant deaths in Punjab,

NSOU ? GE-SO-21 148 125 in Assam, 114 in Madhya Pradesh and Gujarat. In case of rural India Punjab 145, Assam 125, Madhya Pradesh 120, Tamil Nadu 115, Gujarat and Uttar Pradesh 110. Few states like West Bengal, Andhra Pradesh, Himachal Pradesh, Karnataka and Orissa the female IMR is less than that of male. In case of Karnataka there are only 72 female babies deaths for every 100 male babies before they reach one years old (Majumdar 2013:280-281). 10.8 Classification of Infant Mortality Bourgeois Pichat (1952) has classified mortality into two causal type, namely (i) endogenous and (ii) exogenous infant mortality rate. Endogenous refers to "those cases in which the child bears within itself, from birth, the cause resulting in its death, whether that cause was inherited from its parents at its conception, or acquired from its mother during gestation or delivery." While the exogenous infant mortality refers "to those cases in which the infant picks up the factors which causes its death in the environment in which it lives." McNamara (1982) considers endogenous death as the death that is caused by "factors such as the congenital malformations, the circumstances of prenatal life, and the birth process." Exogenous infant death is caused by infection, parasitic and respiratory diseases, accidents and other environmental and external causes." Endogenous causes are usually the causes of neonatal death may extend beyond infancy and may cause severe diseases in the later part of life like diabetes, cancer, heart diseases, AIDS etc. Exogenous causes of deaths are avoidable through medicinal preventions, education, medical knowledge, technology, and better nutrition. It is also to be kept in mind that illegitimacy also accounts for factor contributing towards a high infant mortality rate. The illegitimate child is often unwanted by mother and society and the child does not receive much medical attention and nutrition that it needs which further may lead towards the increment of infant mortality (Bhende and Kanitkar 2004: 174). There are also some other age-standardized mortality rates like neonatal mortality rate, perinatal mortality rate and maternal mortality rate. The neonatal mortality rate is the number of deaths within the first four weeks of life divided by the number of live births in the same year times 1000. The perinatal mortality rate is the number

NSOU ? GE-SO-21 149 of still births plus the number of deaths within the first two week of life, divided by total births (still births and live births) in the same year, again times 1000. The maternal mortality rate is the number of maternal deaths divided by total births times 1000 (Marshall 2006: 432). 10.9 Causes of Infant Mortality The Infant and Child mortality Survey in India was conducted by the Registrar General in 1979. It was observed that the infant and child mortality was quite high in case of mothers who were better educated. The survey also reported that the infant and child mortality were closed linked to the living standard of the family. In 1998- 99 the Central Statistical Organisation (CSO) compiled the National Family Health Survey II and it reported that girls were ahead of their male counterparts in child mortality despite of less attention they receive from parents as compared to males. It was also found that illiteracy and young age among mothers play a major role in the infant and child mortality. Studies have highlighted that even few years of schooling for mothers can reduce as much as 40 percent of infant mortality. This finding of CSO contradicts with the findings of the Registrar General. The NFHS II report also suggested that IMR can be lessened if birth took place in medical institutions or under the care of doctors or trained medical staff. Studies have also shown that baby girls are more likely to die in families where there is an older male sibling. It arouses an issue of gender discrimination. Pre-maturity, respiratory infections, diarrhea, anemia, neonatal injuries and birth injuries account to 70 percent infant deaths in India. The major reason for infant deaths (25 percent) is because of pre-maturity, Acute Respiratory Infection (ARI) and pneumonia. One of every three malnourished child lives in India and according to UNICEF almost 50 percent child deaths in India is due to malnutrition (Majumdar 2013: 280- 281). 10.10 Determinants of Mortality in India Mortality is considered to be the outcome of morbidity or sickness and of the case fatality rate that is the proportion of sick person who die. Curative measures in

NSOU ? GE-SO-21 150 the form of medical institutions and medical professionals try to control the morbidity and aims to reduce the case fatality. Preventive measures focus on reducing both morbidity and case fatality. Some instances of preventive measures are providing a required level of nutrition and exercise, upgrading public health infrastructure, implementing immunization programs and doing away with unhealthy behaviours like smoking cigarettes or alcohol consumption. Although malnutrition is not the primary cause for death it makes people susceptible for being infected with severe diseases. Moreover, it takes a longer time for the malnourished people to get healed or recovery from illness (Heer and Grigsby 1992: 33). According to the findings on Survey of Causes of Death 1964-1994 the combined share of fever, digestive disorder and cough was more than half of the total number of deaths in India in 1971. By 1991 their share decreased to 33 percent of all deaths. Cough remains the major killer in India particularly in the states of Uttar Pradesh and Rajasthan. Bronchitis and asthma accounted for 8 percent of the total deaths in India while Tuberculosis accounted for 6.1 percent. Deaths occurring from natural calamities and accidental deaths are gradually rising at an alarming level. Such death rate has increased from 3.9 percent in 1971 to 8.3 percent in 1991. Natural calamities like tsunami, earthquakes, super cyclones and heavy downpours, rail and road accidents along with suicides and homicides and deaths from terrorist attacks mostly in Jammu Kashmir and North eastern states are also responsible as factors of death in India. The provision for the supply of potable water along with liquid and solid waste management is still challenging in the public health sector. Though deaths by gastro-enteritis and dysentery have decreased over the period of time but diarrheal continues to be a major factor for illness and death. The government has also started various programs to cut down the problems of morbidity and mortality. Presently, India and China has become the garbage dumping zone of toxic materials and e-garbage from USA and other advanced countries. The unscientific recycling of mobile phones and other electronic gadgets pollutes the atmosphere with carcinogens. The modern-day competition in terms of gaining success and changing lifestyles are affecting the circulation and nervous system, thereby pushing up the deaths level. World Health Organization (WHO) studies the diseases of different countries. In 1998 halves of the burden of disease for India was

NSOU ? GE-SO-21 151 communicable diseases, maternal and pre-natal conditions, and nutritional deficiencies. Three major diseases which are regarded as changing the causes of mortality are tuberculosis, malaria, and HIV/AIDS. These diseases have been dealt in detail (Majumdar 2013: 314-315). 10.11 Tuberculosis (TB) On average 2 million Tuberculosis cases are reported in India. TB kills almost 0.4 million Indians every year. The number of people killed by TB is less than the number of deaths related to malaria, meningitis, hepatitis, nutritional deficiencies, leprosy, sexually transmitted diseases, and tropical diseases which together accounts for 2,58,000 deaths per year in India according to the WHO report 1999. National Tuberculosis program was launched in India in 1962. Unfortunately, it could not achieve its targets due to many flaws like over dependence on x-rays for diagnosis, lack of systematic records and low treatment completions. The revised national tuberculosis program was again implemented in 1993. The WHO recommended Directly Observed Treatment Short Course (DOTS) was undertaken. This program was one of the largest public health policies and was fairly successful. The curative success rate was 89 percent in 2001. However, the emergence of HIV/AIDS problematized the health scenario in India. Those affected by HIV was more likely to develop TB. About 7 percent of HIV patients were affected by TB in India. Among the communicable diseases' asthma, bronchitis, TB, and pneumonia are more prominent. The dependence for wood for cooking fuel with lack of proper ventilator was responsible for bronchitis and asthma among the women of rural areas. The prevalence of TB is about 131 per 1,00,000 in India while the world average is only 60. TB happens to be one of the major killers in rural India. The stigmatization of the disease, lack of awareness and detection was one of the reasons for the failure of reducing the number of TB infected people in the country. It is reported that more women aged 30 years and older people suffer from TB. 10.12 Malaria According to the malaria eradication report malaria has increased from 9.72 in 1972 to 35.5 percent in 1995. Although the number of people dying from malaria is

NSOU ? GE-SO-21 152 comparatively less as compared to HIV but the impact of malaria over morbidity and economic productivity is remarkable. With the greater urbanization and industrialization malaria has found ways in the urban areas mostly as well as other non-rural ecological regions. In 1953, the National Malaria Control Program (NMCP) was introduced. Then 75 million cases of malaria were reported per year out of which 800,000 ended up in deaths. The NMCP was reinforced with the new name, National Malaria Eradication Program and by 1965 malaria was totally controlled by using the DDT spray. Then after, 1,00,000 malaria cases were reported with zero deaths. Unfortunately, again from 1970s onwards malaria has re-emerged as a death taking diseases. The worst malaria affected Indian states in 1970s were Bihar, Madhya Pradesh, Rajasthan, Uttar Pradesh, Orissa, Karnataka, and Pondicherry. At present malaria is mostly found in poor and densely populated areas of Uttar Pradesh, Bihar, and Bengal. 2.01 million cases of malaria were reported in 2001 in India. 10.13 HIV/AIDs In the last 30 years new deadliest diseases have been discovered. Out of the many dangerous diseases HIV/AIDS is one of the deadliest diseases. Human Immunodeficiency Virus is lentivirus. A person with HIV can live a long normal life until the fully develop Acquired Immunodeficiency Syndrome (AIDS) starts to affect the health system. This disease can be spread rapidly through sexual relations. HIV is a retrovirus. It converts the genetic materials from RNA to DNA. The first case of HIV/AIDS in India was reported from Tamil Nadu in early 1986. In the same year another person was detected with the same in Mumbai. After 1994 it has rapidly spread in the country. In 2003 the number of people living with HIV/AIDS reached 5.1 million. Out of which 26 percent were females and 74 percent males. Almost 60 percent of the reported cases were from rural areas. 86 percent of HIV/AIDS cases were because of the unprotected heterosexual sex about 2.4 percent is transmitted from blood or products related to blood and about 2 percent by sharing of injection needles and syringes associated with intravenous drug use. HIV/AIDS is spreading like a fire in India in Maharashtra 3 percent of the commercial sex workers were infected with HIV/AIDS North-Eastern in 1987 but the figure has rouse to 70 percent in 1997. The number of HIV/AIDS infected people is found more in southern states

NSOU ? GE-SO-21 153 of India. In case of Manipur, the northeastern state HIV/AIDS is spreading rapidly due to intravenous drug use. Tamil Nadu has the largest share of reported HIV/AIDS cases followed by Maharashtra, Andhra Pradesh, Gujarat and Karnataka. These five states account for about 80 percent of total reported HIV/AIDS cases in India. a separate body for HIV/ AIDS has been set up by the national government, the National AIDS Control Organization to control the diseases with the help from state health departments. Electronic and other forms of media are used vigorously to spread awareness among the people. Every year 0.6 million people in India are reported have affected by HIV/ AIDS. Adults between the age group of 25 to 40 are mostly vulnerable to HIV/AIDS. Human Development Report of India 1999 stated that there are more than 33 million people living with HIV/AIDS in India. The number increased to 42 million in 2002. More than 5.1 million populations in India are affected by HIV/AIDS (Majumdar 2013: 314-318). Despite of various challenges, problems and tensions growing from different emerging diseases the mortality rate has been kept in control up to a certain level by the government, medical professionals, and civic body members by adopting certain measures. Some major factors responsible for low death rates are as follows: i. Elimination of Famines During the British rule India witnessed several famines which resulted in loss of many lives. However, after independence the country has improvised the food security measures and famines are the things of the past. Government has very effectively handled the famine situation. ii. Control of Epidemics Many Indians in earlier days died because of epidemic diseases. At present times the government has routed out the dreaded diseases. Cholera, smallpox two major life taking diseases have been effectively controlled. This has resulted in bringing down the death rate of the country. Moreover, Government has also launched special programs for eliminating diseases like polio, malaria, tuberculosis etc. iii. Better Health Care Programmes Various health care programmes have been launched by the government to reduce child deaths and care of pregnant women. Increase in number of

NSOU ? GE-SO-21 154 health care centres, implementation of national rural health mission program and other progressive health care policies has helped in cutting down the death rates in the country. Adequate attention has been given for sanitation, hygiene, supply of pure drinking water. Immunization programmes for bringing down death rates from several diseases has also shown positive results. 10.14 Conclusion What sense can we make of all of these disparate accounts in different contexts, and what can we expect for the path of mortality in the future? There is no consensus on these issues. Here, we hazard our own best guess, recognizing that the evidence is weak or missing for many of the links in our argument. Knowledge, science, and technology are the keys to any coherent explanation. Mortality in England began to decline in the wake of the Enlightenment, directly through the application to health of new ideas about personal health and public administration, and indirectly through increased productivity that permitted, albeit with terrible reversals, better levels of living, better nutrition, better housing, and better sanitation. Ideas about the germ theory of disease were critical to changing both public health infrastructure and personal behavior. However, changes in knowledge, science and technology will often increase the gradient in health, at least for a time. There was no health gradient between English aristocrats and ordinary people prior to the Enlightenment, but one developed soon thereafter, so that average life expectancy and the gap between rich and poor rose together. There was no gradient in infant mortality between the children of physicians and non-physicians prior to an understanding of the germ theory of disease. More educated people quit smoking faster after the health consequences were understood. The incentives for research and discovery are much weaker or absent for the diseases, such as malaria or tuberculosis that are largely confined to the poor of the world. Even when treatment is available in rich countries, there is no guarantee that it can be made available elsewhere, as we have learned during the AIDS pandemic and indeed from the several million people who die each year from vaccine-preventable

NSOU ? GE-SO-21 155 diseases. Steepening gradients within and between nations are likely to provoke much soul-searching, and it is clearly an appropriate aim of public policy to improve equality of access for everyone to new, life-saving technologies. Yet, if we are right, increases in the gradient also have a silver lining. They indicate that help is on the way, not only for those who receive it first, but eventually for everyone. 10.15 Summary Mortality is one of the major components for bringing changes in human population along with fertility and migration. These variables are associated with factors like age of marriage, the proportion of marriage, contraceptive use, level, and types of morbidity, rural urban migration, etc. Mortality is important for studying the demographic condition of existing human societies. Mortality can be studied from various angles as various biological, social, economic, and cultural factors that can be classified into three themes namely heredity, constitution, and environment. Mortality is used as a very reliable indicator of social and economic change, and mortality is useful for measuring the health risk, improvement in the quality of healthcare. An exact comparison of mortality can be made by analyzing the death rates on the basis of sex and age of the given population. The population problems of India arise particularly because of extremely high fertility along with high mortality. Mortality was high due to famines, epidemic, and pestilences. After 1951 mortality declined in a faster pace. The main reason for the decline was the communicable diseases were monitored and controlled. The famine and epidemics were absent, the social and medical health infrastructure improved in almost every region of India. In post-independent India there have been a remarkable progress in following three indicators: i) As per capita income rises, life expectancy rises. ii) Nutritional status affects mortality. The ability to fend off disease is directly linked to nutrition. iii) Public health issues, things like access to a clean water supply and effective waste removal, are also determinants of mortality.

NSOU ? GE-SO-21 156 10.16 Questions Answer the following questions in your own words. G-A (5 Marks each) i. What do you understand by the term mortality? ii. What is infant mortality rate? iii. How is mortality measured? iv. Discuss the reasons for infant mortality rate. v. Explain the types of mortality. vi. Examine the age-sex mortality difference in India. G-b (10 Marks each) vii. Briefly discuss the mortality trends and levels in India. viii. Discuss the mortality condition of age and sex in India. ix. Discuss the major determinants of mortality in India. x. Examine the inter-state and rural-urban mortality condition of India. 10.17 Suggested Readings i. Abella, M.I. and Atal, Y. NSOU ? GE-SO-21 159 11.1 Objectives The purpose of this unit is to discuss the following: ? The relationship between health and society. ? The historical background of human health system. ? The development of health system and sanitation. ? Health condition in India and factors affecting it. 11.2 Introduction Health is regarded as an important factor for enhancing progress in any society. It implies the measure of energy and productive capacity of the human beings. Bad health affects the efficiency and production system in the human society. Health does not only mean the absence of sickness or disease but the adaptive potential of humans in the physical and social environment. It is only in a good state of well-being that humans can develop physical and mental capacities. Thus, health does not only include medical factors but also involves social, economic and educational factors (Madan 2005: 286). The World Health Organisation (1946: 3) has defined health as "

83%

MATCHING BLOCK 141/164

W

a state of complete physical, mental, and well-being." Health is not

only a personal choice or biological issue but the state of well-being and illness are grounded on the organisation and functioning of society (Macionis 2006: 552). The Health Survey and Development Committee states "the term health implies more than absence of sickness in the individual and indicates a state of harmonious functioning of the body and mind in relation to his physical and social environment so as to enable him to enjoy life to the fullest possible extent and to reach his maximum level of productive capacity" (Health Survey and Development Committee Report 1946: 7). The statistic on good health is quite difficult to obtain but the negative side of health can be understood by considering the statistics of mortality and average expected life. In most cases the vulnerable group in any community are children, women during reproductive stage and old people. Almost 40 per cent death of the total deaths takes place among children under 10 years and half of the death takes

NSOU ? GE-SO-21 160 place in the first year after being born. In 1951, maternal mortality was about 20 per thousand. Most of the deaths were caused by epidemic diseases such as cholera, smallpox, plague and other diseases like fever, diarrhea, dysentery, and tuberculosis.

11.3 Health and Society

Health is shaped by society in many ways. Some of the major ones are listed below.

- Health is defined by cultural patterns The level of health varies from society to society. In Sub-Saharan Africa, centuries ago yaws, a skin disease was common to people and people considered it normal. People in America eat healthy food and many people suffer from overweight. For people what is healthful is also something morally good. In America competition is considered a virtue but it may cause heart problems and other sickness. Therefore, ideas related to health also arise from the social values and conformity.
- Cultural value of health changes over time In the early part of the twentieth century doctors claimed that women should not undertake higher education as it stressed the brain. Masturbation was considered to have negative impact on health. Both these understandings are now considered to be false. In the mid nineteenth century doctors advocated the dangers of cigarette smoking or standing in scorching sun to be harmful for health. These principles are still followed and accepted today. Similarly, the basic idea of sanitation also changes or evolves over time. For instance, in 1950's only 30 per cent of the Americans took bath everyday while at present almost 75 per cent of Americans take bath on everyday basis.
- Health is also affected by society's technology In America during 1950's the major reasons for death were influenza, pneumonia, stomach, heart disease, kidney disease, cerebral hemorrhage, cancer, accidents among others. With the development in medical science the deaths occurred by these diseases have been lowered. The poor sanitation condition and lack of proper medical facilities have been considered as the major reason for deaths in poor countries.

NSOU ? GE-SO-21 161

- Health is also affected by social inequality The resources of society are distributed unequally. The rich and the powerful people have better access to health facilities while the poor people do not receive equal amount of health attention (Macionis 2006).

11.4 Historical Background of Human Health System

The human society began from the hunting and gathering communities. They had little technology or knowledge about their health. With minimum wisdom of health, they could only progress a bit in the health sector. Many children were left by their parents due to the food scarcity and many died while infants. As society progressed people started to cultivate food. In this agricultural phase food become plentiful but social inequality also increased. The rich and powerful enjoyed better food and health conditions. The poor people often lived in crowded, unhygienic conditions and lacked proper food or diet. In medieval Europe the human waste was piled up in streets and this led to the emergence of infectious diseases and plague became widespread. Due to poverty, there is a problem of food shortage and many people in poor countries dies even before reaching their teens. In poverty-stricken Africa the average life expectancy is 50 years while in developed countries like Japan it exceeds beyond 80 years. World Health Organization has reported that about one billion people i.e., one person out of six, suffers from serious sickness due to poverty. Many people die because of eating same food or due to lack of food. Malnutrition kills people of all ages and is more popular among the children. In low-income countries many people also die due to improper sanitation. People do not have safe drinking water and unsafe water carries properties of infectious diseases like pneumonia, influenza, and tuberculosis. These diseases have been major killers in the poor countries. The medical facilities are also very limited in low-income countries. It is said that many people in central Africa have never attended a physician. In such countries 10 per cent of the children die in the first year of their birth, half of the children never reach adulthood and those who survive are mostly sick and get entrapped in the circle of poverty. Until and unless a proper medical support and provision is given to them their health and well-being may not improve.

NSOU ? GE-SO-21 162 Industrial revolution of 17th century transformed the western societies. It pulled the people from rural areas to move to cities for job opportunities. Very soon it was found that the industrial cities were overcrowded and affected the health and serious sanitation problems. Factories produced smoke that affected the air and accidents in the workplace became common phenomena. Industrialization slowly changed the health system of the industrialized European and American societies by providing better nutrition and safer housing or accommodations. The medical science also developed at the same time physicians as Jenner, Snow, Lister, Fleming discovered many remedies for infectious diseases. By the beginning of 20th century death rate had fallen sharply in the industrial developed countries (Macionis 2006). 11.5 Development in Health System and Sanitation English barrister, Charles Chadwick has discussed the casual relationship between sanitation and disease. He argues that government should allocate every local unit with at least one health officer. John Snow, a British physician argues that cholera was primarily caused due to the low-quality drinking water. William Budd, another British doctor is also of the opinion that typhoid fever was due to unhygienic water. Apart from pure drinking water medical facilities, use of antibiotics, pesticide use for killing mosquitoes and other death causing insects, fire safety, proper transportation system, improved food delivery system are all important for preventive and curative reasons. In 1771, Edward Jenner started the immunization against certain diseases like smallpox. Louis Pasteur, Robert Koch, and others developed the bacteriological and viral theory of disease. They successfully invented vaccines for rabies. Since then various types of vaccines have been developed for fighting against various forms of diseases. Mass immunization has also helped the developed and developing countries to cut the death rate from infectious diseases. It is also to be noted that unhealthy habits also lead to infectious and degenerative diseases. Improving personal hygiene like bathing, washing hands, laundering and hygiene living places also helped in curtailing the mortality rate. In twentieth century, public health education on dangers of cigarette smoking, alcohol consumption and other life taking drug addiction has also been initiated. Another important lifestyle in the modern world is carrying out physical exercise for reducing the cardiovascular diseases.

NSOU ? GE-SO-21 163 Joseph Lister developed antiseptics which helped in reducing the risk of infection during and after surgery. In 1928, Alexander Fleming invented penicillin, a major antibiotic that helped in death reduction arising from wounds and other diseases like tuberculosis, bubonic plague, typhoid, and typhus. Moreover, many medical technologies have developed over the time like medication for hypertension, diabetes, cardiac therapy, kidney dialysis, organ transplant angioplasty, open heart surgery and so forth. The treatment for many types of cancer has also improved over the period of time. Advancements have also been made in the use of surgery, chemotherapy and radiation. All these factors have positively enhanced the health system and mortality rate of human population (Heer and Grigsby 1992). 11.6 Health Condition in India In 1946, the Health Survey and Development Committee surveyed the reasons for low state of health in India and argued the followings as major reasons: i. Lack of proper medical care—curative and preventive. ii. Lack of hygienic environment conducive to healthful living, i.e. lack of safe water supply and sanitation, and absence of proper removal of human waste. iii. Low resistance due to lack of adequate diet and poor nutrition. iv. Lack of general and health education. v. Lack of proper housing. Apart from the above reasons there are also other factors such as school health, mental health and food adulteration. These reasons have been discussed in detail below. 11.7 Medical Care and Public Health Prior to independence there was a major crisis of medical facility in India particularly in the rural belts. The number of medical personnel's and provision was very much limited then. In 1951, there was one hospital for fifty thousand people in rural areas and one hospital for twenty thousand people in urban areas. 75 per cent of the doctors lived in cities and only 25 per cent inhabited in rural areas. In order

NSOU ? GE-SO-21 164 to narrow the gap of medical provision in urban and rural areas many initiatives were promoted through the Five Years Plans. Some of the steps taken were integration of public health with hospital services, hospitals were transformed to health centres that were to function in the full sense of the term. The rural areas were to have primary health centres at the block level and secondary health units in the tehsil and district levels. The main of the primary health centres was to give personal health services, control of transmissible diseases, water supply, sanitary improvements, family planning and health education to the public. The mobile dispensary facilities were introduced to the primary health centres. Special provisions for controlling malaria, tuberculosis, communicable diseases, leprosy, cholera, smallpox were given importance. There was a significant development in the health sector during the third five-year plan as diseases like malaria, tuberculosis, leprosy among others were curbed and controlled to a great extent. The health condition of children and women in India is highly vulnerable. The maternity mortality rate and the infant mortality rates are very high. In order to overcome this problem maternity programs and child health centres were opened in rural areas as a part of primary and secondary health units. The provision for a women doctor having specialized training along with two medical experts for training the dais and midwives for maternity cases was also implemented in the secondary units. The aim of the government was to provide one maternity health care unit for a population of 10,000 to 12,000.

11.8 Water Supply and Environmental Sanitation Public health depends upon a favorable environment. Diseases like cholera, typhoid fever and dysentery have almost vanished in countries with proper water supply and waste management. The need for adequate and safe water supply was recommended by the Environmental Hygiene Committee in 1946. The committee had suggested the issue to be enacted through the five-year plans of the government. Unfortunately, the reality shows a different picture, the problem of water supply remains unsolved. However, the government is trying its best to tackle the crisis. In the rural areas the government aims to provide safe water supply to all the villages within a definite time period. Considering, the issue of sanitation simple latrines which do not need technical servicing has also been constructed. Water supply and

NSOU ? GE-SO-21 165 latrine construction projects have been initiated by the government on a subsidized basis. 11.9 Health Education Public health education is one of the most important features required for acquiring a good health program. Most of the diseases originate and spread due to lack or ignorance of hygienic laws. In order to implement public health education the Central Health Bureau was formulated in 1956 by the Directorate General of Health Services. Various states have also set up their own departments with regarding to the mission for public health education. The major aspect of public health education includes personal hygiene, environmental sanitation, prevention of communicable diseases, nutrition, physical exercise, marriage guidance, pre-natal and post-natal care maternity, and child health. The personals at health centres were given the task of spreading the message of public health. Children are educated in the lines of public health in schools. The significance of public health was also delivered through various mediums like adult education, literature, radio, televisions, cinemas, health exhibitions in fairs and so forth. 11.10 Nutrition Nutrition is one of the most pertinent elements for maintenance and resistance of disease. The productive capacity of humans depends upon the nutrition that they consume. Cereals, pulses, carbohydrates, proteins along with other foods like milk, meat, vegetables, eggs and fish contains good nutrition. In India the level of under- nutrition and malnutrition is enormous. The deficiency of productive foods has resulted in a defective diet of the people. The Joint Committee of the Indian Council of Medical and Agriculture has prescribed a regular requirement of food per adult per day which suggests cereal 14 oz, pulses 3 oz, green leaf, and vegetables 4oz, root vegetable 3 oz, vegetable oil and ghee 2 oz, fish, and meat 3 oz and one egg. Unfortunately, in most parts of the country the food is composed of cereals but the productive foods such as milk, meat, egg, vegetables, and fruits are lacking. Food deficiency primarily affects the growing children and the poor sections of the society.

NSOU ? GE-SO-21 166 Other factors like wrong method of food preparation or processing, lack of transport and refrigeration facilities of perishable items also lowers the nutrition of food. Under such circumstances, there is a need to educate the public about food nutrition and also reach out the nutritional food to the economically vulnerable groups of people. The lessons on food nutrition can be imparted through demonstrations and voluntarily organizations in the villages as a part of community development programs. The medical experts along with educators should also be given trainings in nutrition. The expecting and nursing mothers, infants and children are most vulnerable groups that the most attention. The government's initiative of mid-day meal programme has been quite successful in limiting the problem of nutrition to school going children. Such programmes for expectant and nursing mothers in health centres, maternity and childcare centres could also help in curbing the problem of nutrition. Sadly, the education in nutrition has not been seriously considered.

11.11 Other Health Problems Three major health problems have been discussed by Madan (2005: 291). They are the school health, mental health and food adulteration.

i. School Health With the increase in number of schools the number of children going to the school has also increased significantly. The health care of children in school is very vital. The School Health Committee has argued that sickness among school going children was primarily due to malnutrition and lack of preventive measures. The Committee suggested that minimum health care facilities should be provided in the schools. Some of the recommendations were: (a) clean drinking water and sanitary facilities, (b) arrangement for medical inspection, (c) follow up services in association with the primary health unit in the development block and (d) instruction of teachers in health education (Third Five Year Plan, 1961).

ii. Mental Health An Advisory Committee on Mental Health was constituted by the central government. The Committee recommended the need of mental health services programs for the well-being of public and medical amenities. Factors like

NSOU ? GE-SO-21 167 rapid industrialization and movement of people from rural areas to urban areas invites problems like tensions and maladjustments. In order to overcome such challenges mental health service should be made available in hospitals.

iii. Food Adulteration In both towns and villages food adulteration has become very common. Adulteration in daily consumable items like oil, ghee, spices, flours pulses etc has become very common. The Central Council of Health organized various seminars and various suggestions have come forward. The proposals include punishment for food adulteration under the Prevention of Food Adulteration Act, 1954, strengthening agencies to strictly inspect food products and food testing laboratory facilities. Despite of various suggestions and actions the food adulteration has not stopped in India.

11.12 Control of Population The drastic increase of population in the country has compelled the policy makers of the nation to think about family planning policies and population control. India stands second in population ranking after China. The national welfare and planning are severely affected by the national population. In India the birth rate has remained fairly constant, and the death rate has lowered due to the introduction and advancement of medical science. Demographers, economists, and other social scientists have suggested three methods to fight the population problem. They are (i) family planning method (ii) migration outside the country or redistribution of population within the country by shifting people from densely populated areas to less densely populated regions and (iii) increase the industrial and agricultural production in a massive scale to generate double national income in short span of time. This suggestion given by the policy makers have failed to work out as second and third options have limitations. The only option left is family planning method.

11.13 Migration A country with a high population faces the problem of proper resource management and distribution of welfare services. Due to population growth various problems arise

NSOU ? GE-SO-21 168 like the imbalance between population growth and means of subsistence, growing unemployment, low standard of living and low per capita income and so on (Singh 2009:96). All these factors affect the health and sanitation of the nation. One probable alternate solution can be relocation of the population. The people from high population density areas can move to regions that are scarcely populated or vacant. In this regard Dr. R.K. Mukherji has strongly suggested for a policy of mass migration of Indians in empty spaces across the world. This would help in overcoming the population and health barriers of India. However, the western demographers and policy makers does not easily accept the viewpoint of Dr. Mukherji. They view that it would be a threat to the world as it would signal the growth of Hindu imperialism across the world. It is also to be noted that western scholars do accept emigration as one of the solutions for population and health management, but it is only accepted and applicable when westerners or white people emigrate to other countries. When the Chinese and Indians, the countries whose population stands highest in the world considers emigration as a strategy for their population distribution and health improvement then it is not accepted by the western thinkers. Moreover, the relocation of population also invites problems related with inter-state envy due to linguistic and provincialism (Madan 2005: 293). 11.14 Sanitation Sanitation affects the health status in both rural and urban areas. Sanitation primarily deteriorates due to population pressure (density). In addition, sanitation also reflects the level of development of a country. In fact, level of sanitation is very unsatisfactory in most of the developing countries unlike the developed countries. The level of sanitation reflects the development of a country. It can be argued that sanitation is better in developed countries than in the developing nations. However, rapid urbanization and industrialization adversely affected sanitation in most of the metropolitan cities even in the developed countries. Due to education and modernization, sanitation has improved in the developed countries, but it has remained very low in developing countries because of the low social development of the population in these countries. The level of sanitation indicates the development of a country. Developed countries have better sanitation than the developing nations. It is also to be noted that

NSOU ? GE-SO-21 169 sanitation also reflects the cultural diversity of the population because beyond development, sanitation is also conditioned by the culture of the society. For instance, sanitation is of a higher level in Kerala particularly among the Kurichia tribe in the Malabar region and also among certain sects of educated Brahmins. A similar case is also seen in many Asian countries particularly in Thailand, China, and South Korea. Sanitation facilitates the health status of the people. How to facilitate consciousness on health and sanitation should be one of our major concerns today because sanitation negatively affects the well-being of the population which may lead to several common diseases. Diseases like cholera and several other transmissible diseases can be controlled only when sanitation is enhanced. Asian countries like South Korea and China lead with better sanitation which is not there in all other Asian countries except Japan. Next to them is Thailand. It has progressed considerably in the promotion of better environmental sanitation. India and Bangladesh are in the bottom level with very poor sanitation facilities as compared to other Asian countries. Thus, the improvement of sanitation is a major challenge for India. While most of the population in developed nations tends to have multiple urban centres the developing countries have a different trend. Large number of people in developing economies lives in one large urban center. The growth of population in these urban areas poses a serious threat to infrastructure, transportation and sanitation on physical environment and also increases the problem of pollution of varying types. It is argued that growth of population in urban areas will continue to increase in these developing nations (Heer and Grigsby 1994). 11.15 Impact of Industrialisation and Urbanisation Industrialization is not only a mechanical process but a social process as well. It is not only about technology and mass production but also a way of life or culture. Therefore, industrialization affects the environment physically as well as socio- culturally. The impact of industry and urbanization has both positive and negative impacts. It brings about population together, enhances the transport and communication system, power supply, dwelling units and so on. At the same time, it also brings the problems related with sanitation like air pollution, water contamination, proliferation of slums, depletion of environment etc. As industrialization and urbanization has spread in a global level it has brought in various threats related with health and sanitation. There are issues of creation of waste which cannot be disposed or

NSOU ? GE-SO-21 170 recycled. Global warming has become an international issue. There are indications that even in poles the temperature is rising. Due to excessive emission of carbon dioxide and other polluting gases the natural environment is degrading day after day which is sure to affect the health and sanitation of the world. The industrial and urban waste is being diverted to rivers and sea thus polluting the water. Anthony Giddens is of the view that environment has been damaged irreparably by the process of industrialization. He claims that if the economic growth is to be fostered through industrialization, then there is a need to develop new institutions to cope up with the new emerging environmental challenges, directly or indirectly influencing the health and sanitation condition. Industrialization and urbanization does improve the living standards and medical facilities but it also creates new threats for health (Macionis 2006: 552). 11.16 Morbidity Morbidity or sickness and the case fatality rate that is the proportion of sick person who die contributes to the mortality rate of any society. Curative and preventive measures in the form of medical institutions and medical professionals try to control the morbidity and aims to reduce the case fatality. Preventive measures focus on reducing both morbidity and case fatality. Some instances of preventive measures are providing a required level of nutrition and exercise, upgrading public health infrastructure, implementing immunization programs and doing away with unhealthy behaviour like smoking cigarettes or alcohol consumption. The Government of India started the Universal Immunization Programme (UIP) since 1986, with the aim of lowering the mortality and morbidity among children by immunization of all eligible children and pregnant women, against the common and dangerous infectious diseases by the year 2000 A.D. The programme was implemented in the rural areas through the existing infrastructure of primary health centres through the multipurpose health workers, trained dais. The vaccine and the other equipment are distributed from the District Health Authorities. Although malnutrition is not the primary cause for death it makes people susceptible for being infected with severe diseases. Moreover, it takes a longer time for the malnourished people to get healed or recovery from illness.

NSOU ? GE-SO-21 171 According to the findings on Survey of Causes of Death 1964-1994 the combined share of fever, digestive disorder and cough was more than half of the total number of deaths in India in 1971. By 1991 their share decreased to 33 percent of all deaths. Cough remains the major killer in India particularly in the states of Uttar Pradesh and Rajasthan. Bronchitis and asthma accounted for 8 percent of the total deaths in India while Tuberculosis accounted for 6.1 percent. Deaths occurring from natural calamities and accidental deaths are gradually rising at an alarming level. Such death rate has increased from 3.9 percent in 1971 to 8.3 percent in 1991. Natural calamities like tsunami, earthquakes, super cyclones and heavy downpours, rail and road accidents along with suicides and homicides and deaths from terrorist attacks mostly in Jammu Kashmir and Northeastern states are also responsible as factors of death in India. The provision for the supply of potable water along with liquid and solid waste management is still challenging in the public health sector. Though deaths by gastro-enteritis and dysentery have decreased over the period of time but diarrheal continues to be a major factor for illness and death. The government has also started various programs to cut down the problems of morbidity and mortality. Presently, India and China have become the garbage dumping zone of toxic materials and e-garbage from USA and other advanced countries. The unscientific recycling of mobile phones and other electronic gadgets pollutes the atmosphere with carcinogens. The modern-day competition in terms of gaining success and changing lifestyles are affecting the circulation and nervous system, thereby pushing up the deaths level. World Health Organization (WHO) studies the diseases of different countries. In 1998 half of the burden of disease for India was communicable diseases, maternal and pre-natal conditions, and nutritional deficiencies. Three major diseases which are regarded as changing the causes of mortality are tuberculosis, malaria, and HIV/AIDS (Majumdar 2013:314-315). These diseases have been dealt in detail below. 11.17 Tuberculosis (TB) On average 2 million Tuberculosis cases are reported in India. TB kills almost 0.4 million Indians every year. The number of people killed by TB is less than the number of deaths related to malaria, meningitis, hepatitis, nutritional deficiencies,

NSOU ? GE-SO-21 172 leprosy, sexually transmitted diseases, and tropical diseases which together accounts for 2,58,000 deaths per year in India according to the WHO report 1999. National Tuberculosis program was launched in India in 1962. Unfortunately, it could not achieve its targets due to many flaws like over dependence on x-rays for diagnosis, lack of systematic records and low treatment completions. The revised national tuberculosis program was again implemented in 1993. The WHO recommended Directly Observed Treatment Short Course (DOTS) was undertaken. This program was one of the largest public health policies and was fairly successful. The curative success rate was 89 percent in 2001. 11.18 Malaria According to the malaria eradication report malaria has increased from 9.72 in 1972 to 35.5 percent in 1995. The impact of malaria over morbidity and economic productivity is remarkable. With the greater urbanization and industrialization malaria has found ways in the urban areas mostly as well as other non-rural ecological regions. In 1953, the National Malaria Control Program (NMCP) was introduced. Then 75 million cases of malaria were reported per year out of which 800,000 ended up in deaths. The NMCP was reinforced with the new name, National Malaria Eradication Program and by 1965 malaria was totally controlled by using the DDT spray. Then after, 1,00,000 malaria cases were reported with zero deaths. Unfortunately, again from 1970s onwards malaria has re-emerged as a death taking diseases. The worst malaria affected Indian states in 1970s were Bihar, Madhya Pradesh, Rajasthan, Uttar Pradesh, Orissa, Karnataka, and Pondicherry. At present malaria is mostly found in poor and densely populated areas of Uttar Pradesh, Bihar, and Bengal. 2.01 million cases of malaria were reported in 2001 in India. 11.19 HIV/AIDS In the last 30 years new deadliest diseases have been discovered. Out of the many dangerous diseases HIV/AIDS is one of the deadliest diseases. Human Immunodeficiency Virus is lentivirus. The first case of HIV/AIDS in India was reported from Tamil Nadu in early 1986. After 1994 it has rapidly spread in the NSOU ? GE-SO-21 173 country. In 2003 the number of people living with HIV/AIDS reached 5.1 million. Out of which 26 percent were females and 74 percent males. Almost 60 percent of the reported cases were from rural areas. HIV/AIDS is spreading like a fire in India. The number of HIV/AIDS infected people is found more in southern states of India. In case of Manipur, the Northeastern state HIV/AIDS is spreading rapidly due to intravenous drug use. Tamil Nadu has the largest share of reported HIV/AIDS cases followed by Maharashtra, Andhra Pradesh, Gujarat, and Karnataka. These five states account for about 80 percent of total reported HIV/AIDS cases in India. A separate body for HIV/ AIDS has been set up by the national government, the National AIDS Control Organization to control the diseases with the help from state health departments (Majumdar 2013: 314-318). 11.20 Conclusion The health and sanitation condition in India has developed over a long period of time. The development of medical facilities advanced in a minimum scale since the time of hunting and gathering societies and reached an advanced level in the industrial society. Historically, mortality in India was primarily because of famines, plagues and epidemics but after independence such events have not occurred. Moreover, many infectious diseases which were detrimental earlier have been resolved by the progress in medical science, proper nutrition, and life styles in the developed nations. After independence there has been a remarkable progress in mortality as there is a decline in death rate and infant mortality rate and an increase in year's expectation of life after the independence. Age and sex are considered to be major elements for studying mortality. The gender difference in case of India's mortality condition has been very disturbing. It is observed that young girls are experiencing higher mortality compared to young boys. It is also observed that the mortality is highest among infants but as the child crosses the first birthday then there is a sharp decline in their mortality rate. Mortality has been found to be higher in case of rural areas in comparison with urban areas. The mortality difference between the different states of India is wider and varying. In almost all the parameters

100%

MATCHING BLOCK 142/164

W

in the South Indian states of Kerala and Tamil Nadu

are ahead of other Indian states. Both fertility and mortality in these two states are low.

NSOU ? GE-SO-21 174 Sanitation level and morbidity rate in developed nations have improved after the twentieth century. Unfortunately, the developing country like India is facing lot of crisis in health sector mostly due to lack of proper health facilities, overpopulation, industrialization and unhealthy life styles. The lack of pure drinking water, use of antibiotics, pesticide use for killing mosquitoes and other insects, fire safety, proper transportation system, improved food delivery system are all important for preventive and curative reasons. Despite of advancement in medical field the health situation is critical and challenging among the people living in rural areas. The major problems of health in India are primarily due to lack of proper medical care, lack of hygienic environment conducive to healthful living, proper water supply and sanitation, and absence of proper removal of human waste, low resistance due to lack of adequate diet and poor nutrition, lack of general and health education and lack of proper housing. The main diseases in contemporary India include tuberculosis, malaria and HIV/AIDS. The government has taken strong initiatives to eradicate these health problems by initiating various medical programmes and free medical services. 11.21 Summary Health is the most important value for the individual person and for society. Health is a positive concept emphasizing social and personal resources as well as physical capacities.

100%

MATCHING BLOCK 143/164

W

Health is a state of complete physical, mental, and social

wellbeing. For a healthy life cycle a person needs to have a balance diet and has to regularly exercise. Bad health affects the efficiency and production system in the human society. Health does not only mean the absence of sickness or disease but the adaptive potential of humans in the physical and social environment. Social health is more than just the prevention of mental illness and social problems. Being socially healthy means increased degree of happiness. Including sense of belonging and concern for others. As we grow, social ties start building their place in our lives. We should focus on keeping people healthy not just treating the sick. Access to jobs, safe housing, clean water, food, education and transport-are key to health. A healthy society is about more than just preventing injuries and reducing the death toll from disease. It is also about having access to safe neighborhoods and

NSOU ? GE-SO-21 175 affordable housing, broadening job opportunities and reducing income inequality, designing walkable towns and fostering cohesion. Apart from these medical facilities, use of antibiotics, pesticides use for mosquitos and other death causing insects, fire safety, proper transportation system, improved food delivery system-are all important for preventive and curative reasons. Demographers, economist, and other social scientists suggested three methods to fight the population problem. They are - family planning methods, migration outside the country or redistribution. 11.22 Questions G-A (5 Marks each) i. Write a short note on morbidity? ii. How does health shape the society? Discuss briefly. iii. Write a short note on nutrition. iv. Discuss the relationship between sanitation and health. G-B (10 Marks each) v. Write a note on the development of health system. vi. Elaborate the major health problems in India. vii. Critically analyse the major reasons for low health condition in our county. viii. Write a note on the need on sanitization in society. 11.23 Suggested Readings i. Lama, M.P. (2003): "Poverty, Migration and Conflict: Challenges to Human Security in South Asia," P.R. Chari and S. NSOU ? GE-SO-21 177 Module V: Migration Unit 12 ? Migration: Types and Problems Structure 12.1 Objectives 12.2 Introduction 12.3 Definition and Meaning of Migration 12.4 Theoretical Approaches of Migration 12.5 Types of Migration 12.6 Migration in the International Context 12.7 Migration in India 12.8 Problems of Migration 12.9 Conclusion 12.10 Summary 12.11 Questions 12.12 Suggested Readings 12.1 Objectives The purpose of this unit is to discuss the following: ? The concept of migration. ? The theoretical background of migration. ? The different types of migration. ? Migration in international context and in India. ? The problems of migration. Migration has been taking place since time immemorial. It is regarded as one of important factors for demographic change. Various economic, political, socio-cultural, and environmental factors lead to migration. Migration can be of different types, NSOU ? GE-SO-21 178 primarily within or outside the national boundary. The causes and consequences have been enormous and endangering. 12.2 Introduction Since the very beginning of human existence people have migrated. Migration is one of the major components of population change along with mortality and fertility. Unlike, mortality and fertility migration does not operate purely within the biological framework which is partially influenced by the socio-economic and political factors as well. Migration is an important factor responsible for population change along with fertility and mortality, but migration is not a biological variable unlike fertility and mortality but a product of social, cultural, economic, and political or physical circumstances (Bhende and Kanitkar 2004). The main cause for migration is mostly related with the economic reasons but socio-political, environmental, and geographical factors have also resulted in migration. The emerging new markets, attraction towards urban lifestyles, advancement in communication and transportation system and a need of economic independence enables people to migrate irrespective of their socio-economic backgrounds (Jha and Singh 2006). 12.3 Definition and Meaning of Migration The United Nations Multilingual Demographic Dictionary has

89%

MATCHING BLOCK 144/164

W

defined migration as "Migration is a form of geographical mobility or spatial mobility between one geographical unit and another involving a change in residence from the place of the origin or departure to the place of destination or arrival. Such migration is called permanent migration and should be distinguished from other forms of movement which do not involve a permanent change of residence" (

Bhende and Kanitkar 2004 : 357). Haq (2007: 157) argues "migration as an important demographic process" which is "concerned with the movement of people from one place to another." Castles and Miller (2009: 20) has viewed migration as "a collective action arising out of social change and affecting the whole society in both sending and receiving areas". Bhende and Kanitkar believe that the change of milieu that implies environment NSOU ? GE-SO-21 179 along with the change in the dwelling place is an important indicator of migration. The nomadic people or groups who do not have a permanent and fixed residence or seasonal movement of people who have two or more places of residence during a year should be eliminated from the concept of migration. Chandna (2009) is of the standpoint that when migration occurs, in whatever form, it affects the area of origin, the area of destination and affects the way of life of the migrants as well. In India only 3.5% of the total population has out-migrated to other states although the percentage of migration flows is small the effects on the place of origin and the place of destination will be fairly large (Weiner 2004). The concept of fertility or mortality involved only one aspect, either additive or separative, but the process of migration involves the social consequence of both the additive and separative processes (Haq 2007). Bhende and Kanitkar (2004) viewed migration as a major indicator of social change. The process of migration has been very predominant since the very beginning of human history. Various countries, civilizations and cultures have emerged and developed and expired through the very process of in and out-migration. Sociological studies of migration have been diverse and mostly related with kinship, social networks, and economic development (Marshall 2006). Various reasons associated with agricultural production, war, epidemics and exploitation, displacement and degradation of the environment etc. have been regarded as the prime factors for human migration. However, economic and geographical compulsion and the notion of human development have been analogous with migration since the very ancient times, whether the nature of migration was forced or voluntary (Ketkar 2005). Migration is also facilitated by other socio-cultural practice such as rules of marriage, residence after marriage and inheritance (Palriwala and Uberoi 2008). In case of India, most of the female out-migration is associated with marriage. Almost 50 per cent of female migration in India is related with marital reasons (Haq 2007). 12.4 Theoretical Approaches of Migration There are multiple theories of migration. Most popular theories of migration are associated with economic factors. Bilton et. al., (1997) argues that the economic and

NSOU ? GE-SO-21 180 political inequalities may have shaped patterns of migration. ... studies are the oldest system of analysis of human movement. Migration studies was founded in the late nineteenth century by focusing on economy, geography, and historical demography. Research into progress and decline of early empires, and geographical determinism had a significant impact on the foundations of migration studies. In later decades, migration studies developed primarily on the basis of economics, with their main area of research being the analysis of the determinants of voluntary human mobility. A German-English geographer, Ernst Georg Ravenstein is considered the founder of contemporary migration studies. In his classic publication titled 'The Laws of Migration', published in two volumes in 1885 and 1889, Ravenstein argued that bad or oppressive laws, heavy taxation and unattractive climate, uncongenial social surroundings, and even compulsion (slave trade, transportation) produce flows of migrants, but none of these flows can be compared in volume with that which arises from the desire inherent in the most men to better themselves in material aspects. Ravenstein's theory of migration has empirically generalized and mathematically verified the general patterns of migration. The primacy of economic categories established by Ravenstein strongly dominated the study of migration throughout the twentieth century and continues even in present day. Almost all influential migration theories, such as neoclassical theories, the Hicks model (1932), the Harris-Todaro model (1970), Wilbur Zelinsky's mobility transition model, or the push-pull theory of Everett Lee, are based on economic categories (Terminski 2013: 5-6). Everett S. Lee's theory of migration has stressed on the push and pulls factors of human movement. M.P. Todaro has designed the cost and benefit model of migration and John Harris has observed the economic reasons for migration and impacts of migration (Bhende and Kanitkar 2004). Although these theories do focus on the socio-cultural aspects their implications have been circumscribed. According to Anthony Giddens (2005) the famous 'push and pull' theory of migration has been disapproved for providing a mere and an average explanation of multifarious and complex phenomena of migration. According to Haq (2008) "economic factors of migration which look apparently economic are actually the responses of the social structure of the society in which economic opportunities grows or declines resulting in migration". Migration is also

NSOU ? GE-SO-21 181 one of the incorporated components of the society and an inherent element of the larger social system. "Thus, the movement of population becomes an institutionally and normatively or culturally determined phenomenon" (Haq 2008). Narrowing human migration only to economic factors fails to grasp the relevant and immeasurable social aspects, not to mention environmental and climate determinants which were completely marginalized by migration theorists for the whole of the twentieth century. According to some scholars the marginalization of environmental factors within migration theories was associated with Marxist dialectical materialism, which strongly influences social sciences in democratic as well as communist countries. The impact of labour migrations on population growth was one of the fundamental themes of migration studies (Terminski 2013). Scholars of migration have started to categorise migration as a product of the interaction between the macro and the micro levels of social system. Macro level implies political situation of the region, laws and rules controlling immigration and emigration or change in the economic system while micro level indicates resource, knowledge and rationality of the migrants (Giddens 2005). 12.5 Types of Migration Migration apart from birth and death is the third major factor for population growth or decline. It is the third basic demographic process in which people of one geographical area of residence moves to another region (Denisoff and Wahrman 1975:374). The term migration refers to permanent movement of individuals or groups within the purpose of changing their place of residence. It may either be external that is between countries or internal that is between regions. When people leave country permanently it is called emigration and the reciprocal process that is when they enter the country it is called immigration. Migration can be categorised into two types of namely group migration (example migration of nomadic tribes moving from one place to another in pre-industrial times) and individual or family migration (example movement of people from rural areas to cities). The movement of migration can also be classified on the basis of underlying causes. People or groups moves from one habitat to another either because of some force or situations (push factors) or due to some sort of attraction

NSOU ? GE-SO-21 182 in the new habitation (pull factor). It is common that both push and pull factors to a certain degree or magnitude decides the volume and direction of migration streams. For instance, in discussing the 'Great Atlantic Crossing' of nineteenth century were almost 20 million people migrated from Europe to the United States of America, one can sense a significant role of the push factor in the sending countries. Some probable factors would include religious and political discrimination, economic unsteadiness, over population in rural areas and reduction of farm labour force due to the advancement of agricultural technology. The exertion of such push factors was balanced by the strong pull factors developed by the United States. The pull factors may include political and religious freedom, rapid economic advancement, availability of lands, high wage jobs in the industries of the USA. Population movement can also be looked from the lens of voluntary and involuntary migration. Most of the migration that took place in the ancient times was involuntary in nature as people moved primarily because of environmental exhaustion and food producing potential. The involuntary migration is associated with the push factors of migration. The voluntary migration is mostly due to the positive pull factors. Apart from certain exceptions like the migration of war refugees in South East Asia most migration occurring in the world today are individual and voluntary and is highly influenced by the positive pull factors (Denisoff and Wahrman 1975: 374). Migration as social phenomena is a fairly complex and occurs due to several factors. The demarcation of push and pull factors responsible for migration is regarded as the conventional method in the analysis of population movement. International migration alters the place of residence across the national boundaries. International migration has been regarded as an important force for redistributing the world population. Immigration in case of United States of America and Britain has been responsible for population growth. Another way of categorising migration is in terms of whether it takes place between different countries or within the national boundaries of a country. Internal migration refers to the movement of the people within the national boundary of a particular country and international migration takes place outside the national boundary. Most migration in the contemporary world is internal migration – internal, voluntary migration of individuals who are attracted by the pull factors of countries offering greater opportunities if various types. The internal and international types of migration are considered as the major classification of migration (Denisoff and Wahrman). Myron Weiner (2004) has classified internal migration in India into several categories. They are as rural to urban migration, rural to urban migration and inter-state migration. Although the urban growth is drastic in India but urbanisation rate (the number of people living in cities) has been gradual in India as compared to USA or European countries. About 13 million people have moved from rural to urban areas in India. The low rate of rural to urban migration in India is a signal that rapid growth of rural population, expanded rural density, rural unemployment, low wages and poverty has not compelled the rural population to push towards the cities. It also indicates that urban areas are not growing rapidly as they are not economically potential to provide employment to all categories of labour from the rural areas. Among the migrants from rural areas to cities every third migrant has lived in cities for less than three years and 15 percent of the male migrants living in rural areas have lived in cities. Many rural Indians migrates to cities and move out for short-term employment. The Census of India has reported that 30 percent of the rural inhabitants are migrants. The rate of rural-to-rural migration has higher proportion than the rural to urban migration. The number of female migrants is high in rural areas. The reason is they migrate to join their husbands or related with marriage. The caste endogamy along with exogamy results in women to change their residences. Marriage's migration in most cases involves movement of women to near by villages within the district or state. About 33 percent of rural male migrants move to another village of another state and one out of four to villages of the same state. The most crucial time of rural-to-rural migration is during the cultivation and harvest time where large number of agricultural workers from one rural area to another. Almost 95 per cent of people live in the state that they are born, and most have not lived outside their district. Inter-state migration is numerically low in case of India as a whole. Few Indian states do have migrants from other states like Maharashtra, Assam, Punjab, West Bengal, and Delhi. Chain migration can be traced in states where the migrant community has established itself (Weiner 2004). In present day India many people from small towns and other bigger cities are found migrating to cities like Bangalore, Delhi, Mumbai, Hyderabad, Kolkata and so forth. According to UNO Report June 2006, about 191 million people live outside

NSOU ? GE-SO-21 184 their country of origin and migration is recognised as a feature of international life. In the global level, most people migrate to advanced and developed nations like the United States of America, Canada, and countries of Western Europe. It is reported that 75 million people have moved to developing countries. Migration offers both positive benefits for the host nation as well as the country of origin. However, the pace of migration has declined recently due to the global factor of economic recession (Rawat 2015:305-306). Bhende and Kanitkar (2004) in their book Principles of Population Studies have classified internal migration as out-migration and in- migration. Out-migration refers to the movement of the individual or population 'out of a particular area' while in-migration is the 'movement into the particular area'. Premi (2003) has categorized internal migration into three types. Firstly, intra district migration comprised of people who were enumerated at different place but were born in and moved within the district. Second category was the inter district migration where the people were enumerated in a district but were born in and moved in another district within the state and lastly, in the inter-state migration the people who were enumerated in the state but were born in and move in other states. Another type of migration is seasonal. Other types of migration within the country can be

87%

MATCHING BLOCK 146/164

SA BLOCK I MSO 304.docx (D49764054)

rural to rural, rural to urban, urban to urban and urban to

rural. Migration is also classified on the basis of its determinants such as economic migration, social or environmental migration etc (Chandna 2009). In the present era migration is mostly for economic reasons. The poor people migrate for economic reasons primarily for survival and the rich section of the population mostly migrate with economic motives. Abella and Atal (1986) argues that migrants aspire to enhance their existing economic conditions and they are pulled towards the regions with better economic opportunities and remunerations. Migration from rural to urban areas most of the people migrate from their villages due to crisis of unemployment and under employment along with the decrement of available land resulting from increasing population. 12.6 Migration in the International Context One of the foremost waves of migration was that of the nomadic people towards Europe to Central Asia during the period when the Roman Empire was gradually

NSOU ? GE-SO-21 185 diminishing. The Europeans and Africans started to migrate to North and South America and Oceania after Columbus's voyage to America. The migration from Africa to America was mostly due to forced slavery. The first slaves from Africa were brought to Virginia in 1619 and it continued till 1808. Almost four lakhs slaves were brought to America during that period and 1,79,020 of them were of African origin. As industrialisation began to take place in Europe between 1800 and 1925 many people were pushed off the land and they migrated to countries like Argentina, Australia, Canada, New Zealand, and the United States of America. In the first decade of twentieth century the immigration from Europe to America was 9.2 per thousand people while the emigration rate from Europe to America was about 2 per thousand people. World War I resulted in massive migration from European nations to the United States of America where the American government had to come up with a law restricting immigration. Human migration reached maximum before the World War II. The world's largest gross interchange of population occurred in 1947 when the British India was partitioned into India and Pakistan. By 1950s, international migration had become global as more people started to migrate from one country to another (Heer an Grigsby 1994: 63-65). The first recorded emigration from India was to Sri Lanka in the last phase of the first millennium BC. These migrants were believed to have moved from north- eastern India, developed their Indo-Aryan language known as Sinhalese and became Buddhists. Tamils from south India also migrated to Sri Lanka but they retained their language, their Hindu religion and caste system. These two communities ruled the different parts of the island's nation, in certain cases they were intermixed, the consequence was the emergence of divided society comprising of migrant communities namely, Sinhalese and Tamils with their distinct language, religion, social structure and distinctive identity. It was not until the nineteenth century that there was a remarkable population movement of emigrants from India. The most important reason was the beginning of indentured labour system. After the abolition of slavery system, the British planters in the colonies faced shortage in labour therefore they started to look towards British for low wage labourers. It is argued that between the years 1830 to 1916 approximately one million Indians went abroad as indentured labourers to work in the British colonies like Mauritius, Natal, Malay, Caribbean, Fiji and East Africa. Most of the

NSOU ? GE-SO-21 186 workforce came from highly unemployed and famine affected areas like Uttar Pradesh and Bihar. The contract was mostly for five years but most of the labourers preferred to stay abroad and earn there even after the lapse of the contract. The percentage of out migrants from India was small in scale but in the receiving countries their population was high. By the end of British Raj these migrants had become shopkeepers, salaried workers and professionals, and their number started to surge in the British colonies. Migrants of Indian origin at that point of time formed the highest majority in three countries namely, Mauritius, Fiji and Guyana. Post-independence three new migration streams have been traced from India namely to countries like Great Britain, United States of America and the oil producing countries of the middle east. All the migration in these three countries was made possible through the migration policy of the receiving countries. In every case it was found that migration chain was established which helped the relatives and friends of these overseas migrants.

12.7 Migration in India

Migration started in South Asia since the middle of the second century BC and it continues in the present times. Migration has altered the social structure, culture and political system of the Indian sub-continent. The Aryans migrated to India around 1500 BC (Weiner 2004; Nehru 2004) and the Muslims came as conquerors from north India or as 'traders, travellers, and missionaries' from the south India. Saint Thomas arrived to Kerala in the first century A.D. in the 6th century the Jews came to India after fleeing persecution in Babylonia. Similarly, in the 8th century the Zoroastrians migrated from Persia due to Islamic domination migrated to India (Tharoor 2007). These instances are some of the recognised historical facts about migration in India. It was not just a human migration but also the movement of various civilizations and cultures as well. American sociologist and demographer Kingsley Davis was one of the pioneer researchers to study the case of migration in India. He argues that there was a low migration rate in India owing to the prevalence of caste system, lack of education, linguistic and cultural diversity, joint family system, presence of agriculture and semi feudal system (Abraham 2008). Davis advocated that with the development of the

NSOU ? GE-SO-21 187 education, transportation and communication system initiated the transformation of agrarian to industrial societies and this ultimately paved the way for population movement (Davis 1951). In between the year 1981 and 1991, 13 million people from rural areas migrated to the cities Weiner (2004). India's urban population has increased by 138 million since 1980's and today several Indian cities are among the world's largest like Mumbai with 12.6 million people, Kolkata with 10.9 million and Delhi with 8.4 million (Sharma 2008). Yogendra Singh by analysing the study carried out by Donald J. Bogue and K.C Zachariah on rural to urban migration came to a conclusion that 'migration has progressed to the point where residents of almost every village has some relatives or fellow villager who lives in the city' (Singh 2011). It was only in 1961 Census of India that people's last residence and the duration of their stay in the place of enumeration was recorded. The Indian Census from 1961 to 1991 shows that the migration pattern has been changing very slowly in the country (Majumdar 2013: 319). In case of India a small section of population inhabits outside their place of birth or that of their spouses. Most of the Indians are locally born and not migrants. In between 1981 and 1991, 13 million people from rural areas migrated to metropolitan cities which accounted to only 2 percent of the total population of India. The rural to urban migration is modest in India. About 3.5 percent of the population lives in another state and people born in other countries accounts to less than 1 percent. In case of south Asia only a small population of between 1 and 2 percent lives outside their countries (Weiner 2004: 156). Women in India constitute a good share of internal migrants. The reason behind this is the village exogamy still practised in many parts of rural India (Majumdar 2013: 319). Although the percentage of migration is quantitatively small but the impact of migration on both the sending and receiving societies are substantive and the issue of migration gets amplified in the political discourse and India's external relations. For an instance the Maharashtra government had made a proposal to deny the entry for migrants of other states. The governing political parties in Assam demanded closing the border with Bangladesh and threatened secession if the union government did not intervene to stop illegal immigration. The Bhartiya Janta Party (BJP) proposed for constitutional amendment to cancel the law relating to restrictions on purchase of land for non-Kashmiris in Kashmir (Weiner 2004: 156).

NSOU ? GE-SO-21 188 The Census of India in 1981 address that almost 8 million people, born in other countries were living in India. Majority of this people were young or middle aged. Both Hindus and Muslim migration from Bangladesh to India is still prevalent. Illegal migration into West Bengal and other northeastern states have become phenomenal. The proportion of illegal migrants in India was about 3.89 percent. India has attracted large number of migrants owing to her sufficient resources. Moreover, the trade relation of India with many other countries has facilitated both immigration and emigration in a massive scale. If we compare the first and the ninth Census of India, then the net migration rate is not very significant. The partition of India and Pakistan has compelled people from both the countries to migrate in a large proportion, but that migration was also a balanced one. Almost 7 million population migrated from both sides. Migration rate both immigration and emigration, from and to the neighbouring South Asian countries like Nepal, Sri Lanka and Bhutan have been very nominal. The 1971, Census of India reported that about 9.4 million people in India were born in other countries. In 1971, after the Bangladesh's liberation war almost 5.64 migrants of the total immigrants came to India. They comprised 1.7 percent of the total population of India. Post liberation war of Bangladesh the absolute immigration rate has dropped. The high percentage of immigration was due to 1965 war with Pakistan. The trans-boundary movement from Bangladesh to India has never stopped primarily because of the political unrest and ill treatment of Hindus in Bangladesh. In between 1971 and 1981 almost 1.8 million people were forced to migrate to India from East and West Pakistan. Only 0.07 percent of immigrants were from Nepal, Malaysia, Sri Lanka and Myanmar (Majumdar 2013).

12.8 Problems of Migration Out of the three demographic processes (birth, death and migration), the most significant in sociology is the human migration. The major reason behind this is migration brings together diverse group of people into contact and creates the problem of assimilation. Assimilation is the process through which the belief, customs, and behavioural patterns of one group is compounded with that of another group which is generally larger in size. The problems of assimilation are observed

NSOU ? GE-SO-21 189 through the presence of ethnic ghettos, marginal men who are trapped between the conflicting values of two communities or culture and higher degree of deviant behaviour among the migrants. Although not all the bad incidents occur because of separation from the old primary association or groups. The importance of leaving behind the familiar environmental surroundings for new habitation or often strange environment often results in personal and social disorganisation. Therefore, in many cases migrants are more prone to delinquent characteristics, mental sickness, adult crime, prostitution, divorce, and other social problems. Although migration does bring different people with various skills, beliefs, customs, and technology into contact with one another and foster positive influence on the progress of human civilisation. However, at times the consequences of such interactions have been adverse. For instance, the destruction caused by the Mongols while entering the Europe (Denisoff and Wahrman 1975). The consequences of migration have been diverse. The immigration of the Aryans into India during the 1500 B.C directly affected the socio-religious and cultural practices of the Dravidians because the Aryans brought with them their own divinities which subsequently became the important figures of worship among the Hindus and Sanskrit which was the language of Aryans and their holy text Rig Veda became the major foundation for the development of the Indo-Aryan languages in the Northern India (Weiner 2004). Aryans were followed by other migratory tribes such as the Medians, Iranians, Greeks, Shakas or Scythians, Khusans, Turks, Turco- Mongols and others etc who migrated in small and large groups found a 'home in India' (Nehru 2004). In 1947, India gained independence from the British and the nation was partitioned into theocratic Pakistan and secular India. Partition of India and Pakistan resulted in migration of Muslims from India to Pakistan and Hindus from Pakistan to India (Castles and Miller 2009), the event was characterized as "the most violent carnage in the region's history, in which nearly half-a-million people were massacred" (Srinivas 2011). Migration also creates the problem of resource scarcity which gradually takes the shape of a political issue and conflict. At times migration is also a main source security risk (Lama 2003). Migration can also emerge as an important factor for social construction of identity and source of social conflict (Weiner 2004).

NSOU ? GE-SO-21 190 In Assam in the Northeast Region of India, the major conflict is related to migration and migrants. In the early 1980's, the All-Assam Student Union started a violent movement against foreigners (Lama 2010). Due to the growth of population through migration there are cases of increasing problems of unemployment and the subsequent degradation of the environment. As such migration can become an issue of security concern (Ketkar 2005). Migration can also be basis of spread of contagious diseases like HIV/AIDS (Sundas 2011) challenging the human health security. In India the major issue of concern in present times is the demographic changes caused by migration. The northeastern states of India have more than 500 ethnic communities owing to migration and invasions. India under the British rule during the 20th century facilitated massive scale of migration in Assam, North Bengal and Tripura. This trend continued even after the independence of India. In 1971, again large number of people moved to West Bengal and northeast India from East Bengal due to the Indo-Pak war. These people never returned to the country of origin. These incidents led to the anti-migration movement in Assam but due to the vote bank politics, the migration trend has not completely stopped even till today. The effect of immigration is clearly visible in Tripura which comprised of tribal majority in 20th century. At present the tribals have become minority in their own homeland. This has resulted in the emergence of insurgent movements. The northeastern tiny state of Sikkim now has Nepalese majority. Almost 80 percent of Sikkimese population is said to be constituted by the Nepalese. In Assam about 40 percent immigrants of which 30 percent is believed to have migrated from Bangladesh and the remaining from the state of West Bengal, Bihar, Uttar Pradesh, and Rajasthan. This has resulted in the materialisation of ULFA, Bodo, Karbi and Dimasa movements. The emigration rate from India is not clear. During the British raj many Indians left the country to work in foreign lands on contractual assignments. A sizable amount of Indians settled down in those countries and did not return to their homeland. They have been living for long time, but their exact number is still not available. Many Indians at present are also going to countries like America, Canada, United Kingdom, and other western countries to pursue higher education and employment opportunities. Many of them have obtained citizenship in those countries. The orphans and destitute children are also being sent to their adopted parents in

NSOU ? GE-SO-21 191 Europe and other developing countries by missionaries running orphanages. These countries have strict migration policies to curtail illegal migration. The economic globalisation has also encouraged highly educated and skilled personals to migrate to developed countries. The developing countries have become the employment destination of many skilled, scientific, and technical experts mostly from India and China. There are hardly any universities or research institutes in United States of America and United Kingdom where we don't find Indians. In United Kingdom the number of Indian doctors has sidelined the British doctors. Many aeronautical engineers and computer experts are working in NASA and other big corporate organisations across the world. Indian scientists, engineers and information technology experts are in demand all over the world. Although the Indians are dominating the global job market scenario in one hand, on the other hand there is a brain drain from the country. The government has failed to tap or capture the potential of those migrating skilled labour force for the welfare and development of one's own nation. The brain drain has escalated more after the Indians have proved to be extraordinarily good in software technology. The government has been trying to stop the colossal loss of brainpower. However, the Indian skilled labour force is purchased in heft prices by USA, UK, Canada or Australia. North America and the Middle East is attracting lot of Indians to migrate to their countries. The decision for international migration depends upon several factors like foreign returns vis-a-vis domestic returns to work. The wages offered by the destination country discounted by the cost of living in the place of living or sending and destination countries, domestic and foreign market conditions and so forth. The massive out migration of skilled labour force has negative affected the labour sending countries. The Gulf countries are a major destination for different types of skilled, semi-skilled and unskilled labourers. Large numbers of immigrants in the Gulf countries are from the Indian state of Kerala. The highly skilled population moves to America, UK and other developed countries while majority of the semi-skilled and unskilled labour force goes to Gulf countries. The primary reason for migration to these developed economies is for better pay, improvement of one's skill and better recognition in the global level. Unfortunately, the movement of labourers of different types to developed countries will surely have an adverse effect on the national labour

NSOU ? GE-SO-21 192 force, production activities and generation of better national income (Majumdar 2013). In India cities are characterised by enormous squatters of settlement, high rates of unemployment, soaring level of pollution of different types, sanitation problems, scarcity of drinking water, towering cases of disease, malnutrition and infant mortality, low literacy rate and high rate of child labour. Migration to a certain extent is responsible for the rise of such social problems and challenges (Weiner 2004: 164). 12.9 Conclusion Migration of people is mostly associated with the economic reasons but socio- political, environmental, and geographical factors are also involved in it. In case of India, it was only after the 1961 Census that the data on migration has been recorded. Migration pattern in India has been changing very slowly. Although the percentage of migration is quantitatively small but the impact of migration on both the sending and receiving societies are substantive. India has attracted large number of migrants owing to her sufficient resources. Similarly, many Indians also migrate to other countries mostly for employment opportunities and the trend has increased after independence. Many highly educated and skilled professional from India are migrating to advanced countries like America, Europe, and Australia. This has resulted in 'brain drain' of skilled people from India. 12.10 Summary Migration is one of the important factors for demographics change along with fertility and mortality, but migration is not a biological variable unlike fertility and mortality, but a product of social, cultural, economic and political or physical circumstances.

BLOCK I MSO 304.docx (D49764054)

Migration refers to the movement of people from one location to another.

Migration is a way to move from one place to another in order to live and work. Movement of people from their home to another city, state or country for a job, shelter or some other reasons is called migration. Migration from rural areas to urban areas has increased in past few years in India.

NSOU ? GE-SO-21 193 There are two basic types of migration studied by demographers: 1. Internal Migration: This refers to a change of residence within national boundaries, such as between states, provinces, cities, or municipalities. An internal migrant is someone who moves to a different administrative territory. 2. International Migration: This refers to change of residence over national boundaries. An international migrant is someone who moves to a different country. International migrants are further classified as legal immigrants, illegal immigrants and refugees. Legal immigrants are those who move with the legal permission of the receiver nation, illegal immigrants are those who move without legal permission, and refugees are those who crossed an international boundary to escape persecution. Jay Weinstein and Vijayan Pillai (2001) denote a third classification: Forced migration. Forced migration exists when a person is moved against their will (slaves) or the move is initiated because of external factors (natural disaster or civil war). Migration in India: Most of the Indians are locally born and not migrants. A small section of population inhabits outside their place of birth or that of their spouses. The Indian census from 1961-1991 shows that the migration pattern has been changing very slowly in the country. The rural to urban migration is modest in India. 12.11 Questions Answer the following questions in your own words. G-A (5 Marks each) i. What is migration? ii. Differentiate between immigration and emigration. iii. Discuss the different types of migration. iv. Write a note on migration in context of India. v. Critically examine the problems of migration. G-B (10 Marks each) vi. What are the various approaches to the study of migration? vii. Explain migration as a process in the international context. viii. List the consequences of migration.

In this unit the learner should gain primary knowledge of migration followed by its opportunities and challenges. ? The unit focusses on the politics of migration. 13.2 Introduction Changes in attitudes towards migration are disconnected from economics. There are no obvious relationships, for example, between changes in public attitudes towards migrants, and those countries that, economically, may have an interest in accepting migrants. Misconceptions around migration abound. Migration is thought to be both more extensive, and less productive, than in reality. Attitudes towards

NSOU ? GE-SO-21 196 migration have changed somewhat in recent years, though such changes have often been concentrated among specific subgroups, rather than aggregates. Attitudes towards migration can be distilled down to two sets of factors. First is solidarity. This changes slowly, and characterises the degree to which people self-identify and empathise with others of different nationalities. Second are perceptions of aggregate scarcity, and the degree to which key economic resources, such as public services and jobs, are seen as under pressure. The origin of mankind in the Rift Valley of Africa marks the history of human migration. This occurred about 5000 BC. The movement of 1.5 million human beings from Africa gradually spread into Europe and later into other continents (Koser 2007: 1). Throughout history, human migration has been responsible in drawing the route map of human civilization. The very occurrence of migration has germinated the roots of various civilizations and culture. In the ancient world Greek colonisation and Roman expansion depended on migration. Outside Europe Mesopotamian, Inca, Indus and Zhou civilisations also witnessed migration. Then after, we see the European expansion. The British, Dutch, French and Spanish colonisers promoted settlement of people abroad in their colonies. This resulted in the movement of people in the end of 19th century. After this major mass migration, we see the rise of America as an industrial power whereby many migrants were pulled into that nation. After the end of World War II, labour was required to sustain the booming economies like Europe and North America. The outcome of this was migration of people from Turkey to Germany, North Africa to France and Belgium. In the same time period one million British moved to Australia and this migration is often referred to as 'Ten Pound Pows'. Their passage and a grant of ten pound were paid by the Australian government in its endeavour to attract the new settlers (Koser 2007). As the civilization developed human societies underwent a transformation from simple to complex societies and from homogenous to heterogeneous societies. The transformation from 'mechanical' to 'organic' society was not a continuous process. The shift from 'traditional' to 'modern' societies involved a transformative phase of 'social pathology' characterized by social, economic, and political disturbances which led to movement of people. The challenges of pathological phase were confronted by the masses against the people possessing power and authority through

NSOU ? GE-SO-21 197 social protests and demonstrations demanding certain objectives like socio-economic and political stability, equality, social upliftment, liberty, and so forth. In an Indian setting migration is not something new. The coming of the Aryans into India around 1500 BC (Weiner 2003; Nehru 2004) or the coming of the Muslims as conquerors from north India or as 'traders, travelers and missionaries' from the southern part, along with the coming of Saint Thomas in the first century A.D to Kerala or the Jews fleeing persecution in Babylonia in 6th century and the Zoroastrians running away from Islamic domination in Persia in the 8th century and finding a refugee in India (Tharoor 2007) are some of the well-recognised historical facts about migration in India. It was not just a human migration but the movement of various civilizations and cultures as well. Subsequently, there had also been 'assimilation', 'clash of civilization' and cooperation and conflict of cultures. The independence of India in 1947 led to the partition of the nation into Theocratic Pakistan and Secular India and also involved migration of Muslims from India to Pakistan and Hindus from Pakistan to India (Castles and Miller 2009), which was characterized as "the most violent carnage in the region's history, in which nearly half-a-million people were massacred" (Srinivas 2009). Migration creates the problem of resource scarcity, it becomes a political issue and at times migration is also a major security risk (Lama 2003). Migration can also be attributed as an important factor for social construction of identity and also creates social conflict (Weiner 2003). In the present-day India, continuous demand for separate statehood autonomy such as Gorkhaland for the Nepalis settled in India and Uttarakhand for the hill people of Uttar Pradesh are the reflections of people's search for identity and the decline of the integrative forces of the Indian society (Singh 2006). The conflict dynamics in Assam in the Northeast Region of India is related to migration and the migrants have been the major issue of conflicts in the north-east state of Assam in the early 1980's where the All Assam Student Union spearheaded a violent movement against foreigners (Lama 2010). Due to the growth of population increasing instances of unemployment and the subsequent degradation of the environment, migration can become an issue of security concern (Ketkar 2005). Out migration can also be regarded as a dangerous phenomenon in the spread of contagious diseases such as HIV/AIDS (Sundas 2011) which can be a concern for human security.

NSOU ? GE-SO-21 198 The volume of migration has increased in present times than ever before, and it is certain to expand in the foreseeable future. There is no country in this world that has not been affected by migration. It is to be noted that migration is associated with revolutions, wars, rise and fall of empires, significant change, economic expansion, nation building, political transformation, problems, conflict, persecutions, and dispossession. Migration has mattered throughout history and continues to matter today (Koser 2007). Migration is an acute and highly political topic in contemporary societies all over the world. There are currently heated discussions over work-based migration, refugee quotas in European countries, and border enforcement measures taken and planned by the EU in the Mediterranean. Migration trends and policies were among the most- discussed topics in national elections in Europe in Spring 2015, with anti-immigrant parties in a number of countries, such as Finland, Denmark, and the UK, gaining increased attention and support. In the US, the issues of undocumented migrants and family detention have been the subject of debate and protest. In addition to debates in Europe and North America there are, according to UNHCR, currently more than 51 million displaced people in the world. Most of these people, 86%, are in less developed countries and around half of the displaced population are children and young people. These different types of movements of people are political by their very nature. This claim does not only apply to national or transnational political fields of governing movement, but also to the banal, everyday life practices and struggles of several precarious groups such as undocumented migrants and refugees.

13.3 The Changing Political Geographies of Migration

By looking at the substance of the articles published in *Political Geography*, we identify two major shifts in scope over the last 30 years. First, the scalar focus has changed from the politico-territorial regulation of nation-state policies on immigration to supranational migration frameworks and transnational practices and experiences. Second, the theoretical framing has moved from geopolitics to bio-politics. Authors discuss the globally structured and governed micro-politics of lived migration and the creation of permanent spaces of politico-administrative limbos such as camps, detention centres and the legal traps experienced by undocumented people.

NSOU ? GE-SO-21 199 These discussions draw heavily from the broader philosophical tradition of authors such as Agamben, Derrida and Foucault. We discuss these two major shifts through three cross-cutting themes. The first theme considers the political regulation of migration through a focus on national and supranational organisations and policies. The second highlights borders, paying particular attention to the growing interest in border enforcement and biometric bordering. The third theme highlights the various spatiality of migrant experiences in a range of contexts, from North America to China.

13.4 Regulating Migration: From National Mandate to Supranational Scope

During the 1980s, the marked increase in the number of migrants and asylum-seekers from Asia and Africa started a development which has led to several restrictive national legislations in Europe and North America. Wood (1989) stressed that nation-states tried to predict migration flows through push and pull factors, but noted that intervening forces, such as the worsening of the local economy, were often not considered. These control efforts started to build geo-economic fortresses and ever stricter boundaries between wealthier and developing countries. Already in the late 1980s Wood predicted that changes to national policies and the creation of bilateral agreements would eventually lead to growing numbers of rejected asylum-seekers migrating from one country to another. Wood argued that Melander's (1987) scenario of the "orbiting refugee" who is seeking protection and assistance from several national authorities might be too harsh a prediction. However, in 2015 we are living in a world where the precarious refugee is the main target of the globalised logic of migrant detention and deportation practices. Due to several geopolitical, geo-economic and environmental reasons, the categories of migrants and their legal statuses have become more varied than ever before (Gamlen, 2008; Kofman, 2002; Reuveny, 2007). Simultaneously, the scalar focus of migration policies has shifted from national to supranational. In the last decades, several trans-governmental agreements on territorial migration policies, citizenship and migrant rights have emerged (Kofman, 2002). The complex reality of migrant categories produces very different experiences of being a migrant. For

NSOU ? GE-SO-21 200 example, diasporic communities with extra-territorial ties to homeland are not governed by the same set of rules as refugees fleeing from generalized conflicts. Interestingly, as argued by Reuveny (2007), climate change-induced migration is also a major reason for generalized conflicts in areas receiving migrants, and requires international co-operation in mitigation plans and practices. These wide-scale ecological shifts create even more pressures to understand the effects of migration as a globally lived process and shared responsibility (both in originating and receiving areas). Thus, we argue that durable solutions beyond the strategies of restrictive national and international policies need to be explored. This means that experiences of migrants should be more central in understanding the politics of migration and in the contemporary "humanitarian" discourse on border enforcement.

13.5 Tracing the Spatiality of Migrant Experiences

Published work on the spatialities of migrant experiences is particularly useful for demonstrating the changing scalar focus. While the nation-state remains an important actor, its role and significance vary, and other scales of analysis are incorporated, often in an intersectional way. In an early article, Jackson (1992) discusses Caribana, an annual Caribbean festival in Toronto that began in 1967 and continues to the present day. Jackson's focus, influenced by the cultural turn, is identity politics: this includes the localized politics of space evident in the struggles over the placing and composition of the festival; the national politics of state multiculturalism in Canada; and the broader transnational identity politics of an Afro-Caribbean diaspora. The state plays a more central role in Fan's (2004) article on internal migration in China. The hukou system of population registration, introduced in the 1950s, significantly limited rural to urban migration in China. From the 1990s onwards, hukou controls were relaxed in order to provide a supply of temporary labour to rapidly expanding cities in China. Many of these migrants are young, female and single, so-called "maiden workers". Fan uses qualitative data from household surveys in rural Sichuan and Anhui provinces to provide insights into the role of the Chinese state: as a recruiter of migrant labour, and as a facilitator of the exploitation of migrant workers through its refusal to address working conditions. As Fan comments, NSOU ? GE-SO-21 201 "the silence of the state is not an accident but is rather a prescribed attribute of the migrant labour regime" (2004: 300). However, with its explicitly feminist approach, the paper also insists on the importance of women's voices and experiences as narrated in first-person accounts and frames those accounts in the broader context of local, national, and transnational gender ideologies and capitalist exploitation. In this way, though not the central focus, Fan's paper also demonstrates the shift from geopolitics to bio-politics, with its discussion of the embodied experiences and regulation of migrant workers in China. This shift is also evident in Squire's (2014) article, which discusses humanitarian activists in the Sonoran Desert. While her paper can also be read as a commentary on the geopolitical border between Mexico and the US, her main focus is on the way in which the category "human" is bordered. Using a "material discursive" approach, Squire shows how humanitarian activists transform desert trash, such as water bottles and backpacks discarded by migrants crossing the desert, into items of value. In this process, Squire foregrounds "'the human' as a political stake in contemporary struggles over migration and mobility" (2014: 12).

13.6 Opportunities of Migration

Migration has been a constant and influential feature of human society. It has supported the growth of economies of countries, contributed to the formation of nations and societies and also enriched many cultures and civilisation. It is to be noted that the migrants have been amongst the most dynamic and entrepreneurial members of society, they are basically the people who have taken the risk of leaving their homes to create new opportunities for themselves and their children. The history of America's economic growth for an example is in many ways a history of migration. In the present world migration continues to play an important role although not acknowledged but plays a crucial role in the national, regional and global affairs. In many developing countries the migrants send money to their homes is a major source of income. In certain developed countries the entire economy is dependent on migrant workers and would collapse overnight if the labourers would be withdrawn. Migrants and migration not only contribute towards economic growth but its impact

NSOU ? GE-SO-21 202 is felt keenly in the social and cultural spheres of life. Across the world people of different nation speaks different languages, they have different customs and traditions, varying religion, ways of living are coming together due to migration. Whether it is accepted or not but there exists at least a degree of diversity among the members of such modern societies. It is also to be noted that the largest concentration of migrants is found in global cities like Hong Kong, London, or New York. Dynamic, innovative, and highly cosmopolitan urban centres enable people, places, and cultures in different parts of the world to become increasingly interconnected. 13.7 Challenges of Migration There are many challenges of migration. Perhaps the most talked about is the linkage between migration and security. Particularly after 9/11 there has been a perception of a close connection between migration and terrorism. This has been compounded by more recent attacks in Madrid and London. Irregular migration which is also growing at an alarming rate in many countries is often regarded by many politicians and public as a threat to the national sovereignty and security. In many destination countries, the host societies have become very much fearful about the coming of the migrants in their country, particular the migrants from unfamiliar cultures that comes from the extremist and violent part of the world. It is also to be noted that there has been too much attention paid to the challenges posed by the migration in the destination societies, but less attention has been paid to the societies from where the migrants come from and the people they leave behind. 13.8 Politics of Migration Migration is an important dimension of various global issues, and it is embedded in changes in the global economic and social structures. Growing developmental, demographic, and democratic disparities provide powerful incentive to move on, as does the global job crisis affecting large parts in the developing countries. The segmentation of labour markets in the richer countries is creating demand for migrant workers there. Communication revolution has facilitated growing awareness of disparities and opportunities for would-be migrants, while transportation transformations have made mobility cheaper and more accessible. Migration networks

NSOU ? GE-SO-21 203 have extended rapidly and further facilitate migration. New individual rights and entitlements allow many people to cross border and settle abroad. One of the most debatable issues in contemporary world is the concern over the impact of migration on destination societies. Large numbers of migrants are entering into the advanced countries during the time when these societies are undergoing immense structural changes. These include economic, demographic, and technological changes that are transforming society, labour market and community. Amongst their outcome have been painful changes in social safety despite the need for growing physical infrastructural demands and brewing social and cultural crisis. The wider context of global economic uncertainties and heightened the sense of insecurity. Migrants pose a tangible and a visible explanation for the problems of modern society. This is one reason as why there is a rising support for the far right across many industrialised societies. The realities of migration which may vary over time and period like the migrants possessing new skills and capacities required for the labour market. It reflects that it is very difficult to isolate the effect of migration on change and separate it from the other aspects which also attract popular protest such as trade liberalisation and privatisation. It also suggests that the impact of migrants vary significantly according to the wide range of factors including the characteristics of migrants, their geographical location in host societies and the underlying labour and social relations. Furthermore, it is hard to quantify the cost and benefit of the non-economic impacts of migration on politics, society, and culture. Across Western Europe, Muslim's migrants and second and third generation are affected by disproportionate unemployment rates, which for many are compounded by education and housing problems. These underlying socio-economic tensions, it has been suggested, have been compounded in recent years by highly politicised identity issues related, for example, to the Rushdie affair in the United Kingdom, the 'war on terror' and the invasion of Afghanistan and Iraq. One outcome according to Stephen Castels and Mark Miller in *The Age of Migration* is that: "While in the vast majority of Muslim immigrants eschewed fundamentalism, Western Europe certainly was affected by the upsurge in religious fervours that swept the Muslim world." A rise in fundamentalism, however, is just one aspect of a much wider literature concerned with the political impacts of migration in host societies. Another intersection between immigration and politics has been the growth of anti-immigrant extremism.

NSOU ? GE-SO-21 204 Anti-immigrant political movements have developed across most of Europe in the last decade. Perhaps foremost among these is the Front National in France, whose leader Le Pen shocked Europe by gaining one-fifth of the votes in the first-round of 2002 presidential elections, defeating the socialist candidate, Lionel Jospin. Support for the Flemish Vlaams Blok in Belgium has increased considerably. Jorg Haider's anti-immigrant Freedom Party formed a government in Austria with the People's Party, although Haider himself resigned as a party chairman in 2000. A backlash against immigration figured significantly in the fortunes of the Northern League, Forza Italia party, and the neo-fascist National Alliance in Italy. The rise of Pim Fortuyn and his anti-immigrant party in the Netherlands in 2001 took many observers by surprise. Outside Europe, Pauline Hanson's One Nation party scored a notable political victory in Queensland, Australia in 1998, attracting almost 25 per cent of the vote and winning 11 seats in the state election, although she has since resigned from the party and is now an independent. Some scholars have suggested, furthermore, that the emergence of right-wing parties has had an anti-immigrant effect across the political spectrum. It has been argued, for example that French socialist stand on immigration shifted to the right of as support for the Front National increased. Whether or not this is an accurate analysis (others scholars refute it) it is clear that the success of such parties has been an important reason for the rise of immigration on political agendas across the industrialised world. Besides fostering new parties and new issues, the academic literature identifies at least two other ways that immigration can impact on politics and political system in destination countries. There is a vigorous debate, especially in Belgium, France and the Netherlands about political participation and representation for immigrants and their descendants where they are excluded from citizenship. During the 1970's and 80's they tend to mobilise outside the normal channels of political representation from which they were often excluded, for example, through involvement in industrial strikes, protest movements, hunger strikes and urban riots. In recent years increasing number of European countries have granted certain political rights to immigrants, including that of voting and standing for office in local (but not national) elections. Another potential impact on politics in the destination societies is through the formation of ethnic voting blocs among citizens of immigrant

NSOU ? GE-SO-21 205 origins. Perhaps the best example is soviet Jews in Israel, who comprise of about 15 per cent of the Israeli electorate and have decisively affected the outcomes of every general election since 1992. Quebec's immigrant population voted against the independence to influence the 1996 referendum on the future of Quebec in the Canadian Federation. In the tight 2002 German elections, the 3,50,000 Germans of Turkish origin also emerged as an important voting bloc. As a result of such potential impacts, political parties have increasingly appealed to the immigrant-origin electorate, for example in the UK and USA. The potential of the Latino voting bloc in certain states in the USA possess a particular dilemma for politicians. On the one hand, there is considerable political currency in taking a strong stand against migration from Mexico. On the other hand, the Latino votes needs to be wooed. Excluding Puerto Ricans, some 42 million Latinos live in the USA—around 14 per cent of the population. The Latino vote can be critical in state such as California and Colorado and it has been suggested that at a national level it may even determine control of the House of Representatives. Furthermore, as one-third of Latinos in the USA are under the age of 18, their vote is likely to become even more important in the future. Various studies on migration have also shown that social movements and conflicts are inseparable. For an instance Guha (2007) has highlighted the instance of Jewish diaspora and their support for the creation of their homeland Israel. In some cases, migrants have also initiated social movement for recognition, identity, citizenship and security like in the case of the Hispanics in America. Likewise, Tatla (1999) has analysed a link on Sikh emigration and the Khalistan movement and Gupta (1996) and Weiner (2003) has observed the emergence of social movement in Maharashtra and Assam against the migrants in the early 1980's. 13.9 Immigration into North-East Assam The colonial Assam, which was then constituted most part of northeast region of India, came into increasing contact with the colonial Bengal after being incorporated into the British colonial empire. This naturally brought a significant transformation in the society, economy, and polity of Assam as well as other part of the region. Initially, the skilled manpower from Bengal was recruited to assist the colonial

NSOU ? GE-SO-21 206 officers in running the day-to-day administration, whereas previously only some artisans, weavers and scholars came there. Then since the demand for labour was high due to the rapid expansion of tea plantation, coal mining and oil exploration, the labour recruitment from other part of the empire was also started. In addition, the territorial boundary of colonial Assam was altered. It was administered as a part of Bengal from 1826 to 1873, subsequently became a province after the integration of the Bengali-populated areas of Cachar, Sylhet and Goalpara respectively in 1874. The twin provinces of Bengal and Assam were again reorganised in 1905 to facilitate the formation the provinces of (1) East Bengal and Assam, and (2) Bengal respectively. This was annulled in 1912. The integration of Cachar, Sylhet and Goalpara into Assam along with the prominence role played by the educated Bengalis in the colonial administration helped create conditions favorable for the expansion and consolidation of the Bengali language in Assam. It became the court language and then the language of education, from 1837 to 1874. This happened much against the wishes of the Assam's largest linguistic group, the Assamese. Subsequently, the Bengali language was replaced by the Assamese language. When the colonial rule came to an end the empire was divided and the territories were allocated along religious lines in which a part of Bengal became the eastern part of Pakistan. This was not a smooth affair, the territorial disputes and communal riots caused forced migration of refugees between the divided territories. Thus, when great powers allocated territories and permitted the creation of new states hundreds, and thousands of people (about 14.5 million Muslims and Hindus) were forced to become immigrants and refugees. In the 1960s, the alleged religious persecutions and the construction of Kaptai hydroelectric dam in Pakistan (East) forced many Chakmas to flee towards India. Further, during the Bangladesh liberation war against Pakistan (the war ended with the liberation of Bangladesh on 16 December 1971), hundreds of thousands of refugees moved towards East and Northeast India. Many of them settled down in India after the war. In addition, there has been considerable movement of people from Pakistan (East)/Bangladesh into India in the hope of improving their livelihoods. However, neither India nor Bangladesh maintained any reliable records of the movement of people.

NSOU ? GE-SO-21 207 One wonder, why it was, and has been mostly one-way movement of immigrants and refugees. With a total population of about 142 million in 2011, Bangladesh is one of the most densely populated countries in the world having a population density of about 964 persons per sq km. The land-man ratio in 2010 was .06 ha. The country is also a poor country. Further the country is highly prone to natural disasters such as flash flood, riverbank erosion and landslide. As a result, many people were left homeless each year due to the natural disasters. For instance, flooding has been a regular feature destroying lives and properties almost every year. One-fifth of the country used to be flooded every year and in extreme years, two-thirds of the country (Agrawala et al 2003: 9-70). Thus, almost all arable land is being used with little scope for any significant expansion of cultivation into new areas, and the landholdings are small and fragmented with 88.5 per cent of farms less than 1.0 hectare (ha) occupying 60 per cent of the farmland area (Asian Development Bank 2005: 1-6). Further, the country is surrounded by India, sharing about 4096.7 km long land border. On the other hand, India is also a poor country, yet it is over 22-times the area of Bangladesh, and it has an average population density of 382 persons per sq km in 2011, far below that of Bangladesh. The density of population is further less in the northeast region. Moreover, the people of the northeast region are not so familiar to work in new residential areas and communities. They are also not so used to menial and low paid works. The immigrants usually do such odd works. Thus, when a significant number of immigrants were recruited into such occupations, they became socially undesirable for the native workers. The latter will be less incline to do such occupations. Migration can therefore, change the social definition of work, causing a certain occupation to be defined as stigmatizing and viewed as culturally inappropriate for the native workers. This stigma came from the presence of immigrants, not from the characteristics of the occupations (Bohning 1974: 155-163). In such situation the main assets the immigrants bring to the destination places are cheap labour, willingness to work harder and loyalty. In short, the immigrants, largely poor and illiterate, are ready to do jobs the local residents rejected. The migrants work in the agricultural fields, in homes, as rickshaw pullers and manual labourers. They are preferred by the local contractors because they provide cheap labour. Further, the shared culture and history of the two countries also provide social

NSOU ? GE-SO-21 208 networks for migration. The aforementioned factors naturally encouraged immigration into the north-east region of India. 13.10 Conclusion The concerns of citizens need to be listened to and the real underlying concerns regarding stagnating incomes and opportunities addressed by our political and business leaders. The unit shows that the economic impact of migration depends almost entirely on the policies that are put in place to ensure that migrants are able to be productive and the extent to which individuals and communities experience the benefits associated with migration. Currently, cross-national attitudes towards migration bear little resemblance to the economic necessities, but instead the power of perceived economic and cultural threat. Countries that are most in need of migration due to collapsing fertility and tight labour markets (such as Poland) are often most against it. Recent changes in both attitudes and migration's political debate have been heavily influenced by the stitching together of a new cultural and values-based discourse by politicians. These pose real economic risks; the race to the bottom by politicians to show how tough they are on immigration could cause substantial aggregate damage. 13.11 Summary Migration is an acute and highly political topic in contemporary societies all over the world. The politics of migration explores the opportunities and tensions posed by migration today and makes a series of strong, workable proposals for managing it effectively. An exploration of the opportunities and tensions posed by migration today. Migration is an economic, geographical, social, and political process that affects those who move, those who stay behind, and the places where they go. (Hugo) It covers issues such as the rise of the far right, the international politics of refugees, the impact of migration on labour markets and welfare states, citizenship, public opinion, and the integration of Muslims in Europe. Political migration is any migration motivated primarily by political interest. Typically, Political migration is in one of two classes, private or government

NSOU ? GE-SO-21 209 depending on who encourages the migration. Political migration differs from other migrations by attempting to change aspects of a political system. Political factors relate to how the government intervenes in the economy. Specifically, political factors have areas including tax policy, labour law, environmental law, trade restrictions, tariffs, and political stability, economic factors include economic growth, exchange rates, inflation rate, and interest rates. They typically reduce the quality of goods and services that can be imported. Such trade barriers take the form of tariffs or taxes and Tariffs. Migration increased the slum areas in cities which increase many problems such as unhygienic conditions, crime, pollution etc. Sometimes migrants are exploited. Migration is one of the main causes of increasing nuclear family where children grow up without a wider family circle. 13.12 Questions G-A (5 Marks each) i. What do you mean by migration? ii. When does migration occur? iii. What are the opportunities that migration provides? G-B (10 Marks each) iv. Write a note on the challenges of migration. v. Discuss how migration is politicised in the urban and rural societies. 13.13 Suggested Readings i. Castles, S. and Mark, J.M. (2009) *The Age of Migration*, London: Palgrave Macmillan. ii. Ketkar, P. (2005) 'Non-Military Challenges to Security: Migration a Source of Insecurity', in P.R. Chari et al. (ed.), *Alternative Approaches to Security National Integration, Governance, Non-Military Challenges*, New Delhi: Samskriti.

NSOU ? GE-SO-21 211 Unit 14 ? Migration, Integration, and Assimilation: Issues and Problems Structure 14.1 Objectives 14.2 Introduction 14.3 Migration 14.4 Integration 14.5 Modes of Integration 14.6 Problems of Integration 14.7 Assimilation 14.8 Stages in the Process of Assimilation 14.9 Obstacles and Aids to Assimilation 14.10 Problems of Migration 14.11 Conclusion 14.12 Summary 14.13 Questions 14.14 Suggested Readings 14.1 Objectives The purpose of this module is to discuss the following: ? The concepts of migration, integration, and assimilation. ? The different modes of integration. ? The problems associated with integration. ? The various stages in the process of assimilation. ? The obstacles and aids to assimilation.

NSOU ? GE-SO-21 212 The movement of population is also associated with integration and assimilation. When people move from their place of origin to new destinations then there are challenges of integration and assimilation. The integration and assimilation of the individual or group with the host community depends upon many factors. 14.2 Introduction Human migration has been taking place since time immemorial. According to the Oxford dictionary of sociology "migration involves the (

more or less) permanent movement of individuals or groups across symbolic or political boundaries into new residential areas and communities" (

Marshall 2006:415). Francis Abraham (2015:256) has defined migration as "the movement of population from one geographical region to another." Migration is one considered to be one of the major components of population growth or change along with mortality and fertility. However, unlike mortality and fertility migration does not operate purely within the biological framework. 14.3 Migration Migration is a product of social, cultural, economic and political, physical or environmental circumstances (Bhende and Kanitkar 2004). Haq (2007: 157) argues "migration as an important demographic process" which is "concerned with the movement of people from one place to another." Castles and Miller (2009: 20) has considers migration as "a collective action arising out of social change and affecting the whole society in both sending and receiving areas". Bhende and Kanitkar are of the opinion that the change of milieu implies environment along with the change in the dwelling place is an important indicator of migration. The nomadic people or groups without permanent and fixed residence or seasonal migrants with two or more places of residence during a year should be eliminated from the concept of migration. Chandna (2009) argues that when migration occurs, in whatever form, it affects the area of origin, the area of destination and affects the way of life of the migrants as well. It should be noted that the term migration is a multi-dimensional term and it also includes movement of refugees, displaced persons and uprooted people, labour

NSOU ? GE-SO-21 213 migrants and economic migrants. Bhende and Kanitkar (2004) viewed migration as a major indicator of social change. Basically, there are two types of migration namely, immigration and emigration. Immigration means in-migration. It occurs when population enters into a particular place from another region. Emigration refers to out-migration and occurs when the population leaves the area and moves into a new locality. The difference between immigration and emigration is known as net migration. Sociologists use the term immigration for movement of population outside the national border. The population movement within the national border is called internal migration or in-migration. Kerala is witnessing a massive emigration towards Gulf countries and at time same time it is also experiencing a wave of internal migration of people from Tamil Nadu to work in its plantation and construction projects. Most of the countries do not favour immigration but countries like America, Australia and Canada have majority of immigrant population (Bhusan and Sachdeva 2008). 14.4 Integration Society is a constellation of groups, organisations, institutions, ecological collectivities and so on and it functions in an interconnected manner. Every individual living in a society is bound together and dependent upon one another in a system of interconnection. This interconnection makes up the overall functional structure of the system. Although every entity of any society is interconnected and dependent yet at times their interconnection or continuity is broken down to a certain degree, a situation which Merton has termed "a strain towards anomie." The degree of anomie may vary from s small confusion or slight contradiction to a serious deterioration or disintegration. However, it should also be kept in mind that along with strain towards anomie" we also have "strain towards consistency". The "strain towards consistency" implies to integration process. According to Bhusan and Sachdeva (2008) integration is the harmonising or unifying process whereby the various structural components of the society are properly organised. Integration does not involve similarity of various structural parts. What is essential for integration is the certain values must be accepted as common and the different institutional agencies should preserve and promote these values. When there is a basic social change through technological use

NSOU ? GE-SO-21 214 in the economic sector then the old values start to become inadequate and the structures serving these values stop to function effectively. The new altered values may develop and the newly formed social forms or the old, readjusted forms may serve the changed values. Such development helps in maintaining integration. Integration along with assimilation, co-operation, competition, and conflict are all forms of social interaction and they are termed as socio-cultural processes. Social processes are those ways of interaction which can be observed when individuals and groups meet and create social relationships, of what happens when changes disturb the already existing modes of life. According to Ginsberg social processes mean the various modes of interaction between individuals or groups including cooperation or conflict, social differentiation and integration, development arrest and decay. The important elements of social processes are sequence of events, repetition of events, relationship between events, continuity of events and special results. Social processes are important because it is through these socio-cultural processes that human beings interact and develops human relationship. They are forms of behaviour that are often repeated in our social life. According to Talcott Parsons in the Essays of Sociological Theory "integration is the mode of relation of the units of system by virtue of which, on one hand, they act so as collectively to avoid disrupting the system and making it impossible to maintain its stability and, on the other hand to co-operate to promote its functioning as a unity" (Singh 2009: 28). Social integration is the principle through which the individuals or actors are related to one another in a society. Similarly, system integration is the relationship between parts of society or social system. Social and system integration can invite both order and conflict. According to Max Weber social stratification found is status-based societies are more likely to bring harmonious forms of social integration and class-based societies can lead to conflictive form of social integration. Integration can be consequence of differentiation or specialisation. The increasing structural differentiation and functional specialisation the need of integration also increases for the maintenance of social order. The objective of integration is to develop harmonious and active relationship between the different structural parts of the society. It does not only help in moving the society forward but also generates meaning and rationale in the lives of people

NSOU ? GE-SO-21 215 so that they feel the need to be part of the intelligible and pleasant social life. Integration is thus a process of developing a society in which all social and ethnic groups can equally take part in cultural and economic life, the extent to which an individual experiences a sense of belonging to a social group by virtue of sharing its norms, values, beliefs and so on. The major objective of integration is to maintain harmonious and efficient relationship between the various parts of the social system. It does not only help in maintaining the active growth of the society but also imparts meaning and purpose to the lives of the members of the society that they are a part of the society and how to live a comprehensible and harmonious social life. Various structures of the society perform functions in relation to the social values. For examples, family endorse sexual relationship between the married couples, socialisation process of the children, education, protection, recreation and so forth. However, in contemporary society many functions of the family are performed by the newly emerging agencies like schools, colleges etc. In order to cope up with such changes taking place within the functions of different structural units of the society, integration becomes an important process for keeping the society alive and active. Therefore, we can argue that integration is the consequence of differentiation and specialisation. If there had been no specialisation and differentiation of functions of structural parts, then there would have been no integration. When there is more specialisation and differentiation of functions of the parts of the society then there would be more need of integration. The modern society with diverse field of specialisation in every sector and complex institutional patterns have made the task of integration very difficult. Integration helps the different institutions, organisations, and other institutional of society to harmonise and organise so that they can come together to serve the need of the society and develop the social entity in an orderly fashion. 14.5 Modes of Integration Social integration takes place in different ways. In case of authoritarian or totalitarian forms of governance the social life is highly controlled according to the ideologies and goals of the concerned government. Thus, schools, economic organisations, religious institutions, and all other manifestations of collective behaviour

NSOU ? GE-SO-21 216 are under the control of the policies of the government. A single political party controls the nation including the family. The communication system and all the agencies are regulated through the direction of the concerned official. Any form of challenge to the government is not accepted or tolerated. In such kind of situation, the integration is achieved through the use of force, power, or threat. Such kind of integration is known as "closely woven" type of integration. The second kind of integration is known as "loosely woven" kind of integration. In such cases there is a variation not only in individual behaviour but also in case of national behaviour. However, it does not mean that society is not integrated or poorly integrated. It means that there are an absence of rigid social norms and people have a wide range of alternative behaviour open to them. There is no clear-cut group relationship and the social norms are leniently followed. In order to take off strain towards anomie and make the society efficient integration is crucial. Generally, the members of the society carry out their daily activities in a normative manner. Their activities support the folkways, norms, and other institutional patterns. Beyond the reinforcement of integration through normative activities, deliberate efforts are also made for bringing integration. Therefore, ameliorative programs are carried out for bringing down the cases of delinquency, for educating the voters, to support the underprivileged section of society, to improve the educational, housing medical recreational and administrative infrastructures. These initiatives attempt to bring improvements in the existing social structure without affecting the basic structure of the society in an enormous way. Many people view integration as not only a social reform but also a social reconstruction. Such people form radical organisations and try to completely abolish the existing social structure and replace it with new structure. They do not accept the idea of halfway measures but seeks to focus on the root of the matter and transform the society in a fundamental manner. For example, despite of removing capitalism and its evils they want to completely uproot and destroy the system by bringing in new social order. For them reintegration means the new order. In between the ameliorative and radical programs, we have social movements. These movements include the movements for abolition of bonded labour, labour movement, education movement, environment movement etc.

NSOU ? GE-SO-21 217 Both integration and reintegration programs, to be activated needs social planning. Social planning involves research, decision, and action. In India planning is regulated and implemented by Planning Commission. It is often argued by scholars that in the hands of Planning Commission the economic issues are given more priority than the social issues. It is also to be noted that planning is more difficult task in a democratic country than in a totalitarian nation. However, planning is considered to be one of the most effective methods for achieving reintegration in a complex and more rapidly changing social system. 14.6 Problems of Integration Integration is also a difficult and a complex process. It has severe complexities like the disparity in the structure of the society makes it very difficult to integrate all its parts and socialize the humans in a smooth manner. The problems of integration are more intricate in complex or multicultural societies than in simple societies. The presence of multi-ethnic or multi-lingual societies also complicates the problems of integration. In the fast-changing society new elements are introduced in an extraordinary manner which at times may increase stress and strain in the system. Under such cases integration maintenance becomes a difficult task. The problems of integration are discussed in detail below. Firstly, the difficulty in integration depends upon the complex and large size of modern society. In case of simple and small societies the problem of integration is not a complicated task. But in a complex and large society the task to bring harmony and unity is a challenging task. The second problem is the cultural heterogeneity of the society. The social system characterised by multi-ethnic, racial, and linguistic origins are marked by class, religious, and occupational differentiation. The prevalence of various sub- cultures within a single society increases the problem of integration. This is very much applicable in case of our Indian society. The multi-caste and multi-linguistic society have affected the sentiments of the people and these factors have strongly influenced the social structure. The instance of Hindi language as an official national language of India is facing resistance from the southern part of India.

NSOU ? GE-SO-21 218 The third factor is the speed of social change. At present times the new elements are entering into the social structure in an unprecedented scale. Numerous cultural lags has resulted in heightened stress and strain in different parts of the social system. Lastly, integration is exemplified by the tendency of dilgence found in structural form. At times the social system tends to become very rigid and does not prefer to adapt to change or transformation. When vested interested or authoritarianism develops around the structure, it does not allow the system to change. Thus, in industrial societies the capitalists oppose the economic transformation, or the priest becomes rigid in the caste based social system.

14.7 Assimilation Assimilation is a social process where the culture of two social groups fuse together to form a new one. It is a procedure in which the minority group adapts to the rules and patterns of behaviour of majority or host group ultimately being absorbed in the socio-cultural system of the majority group. There can be an exchange of cultural trait whereby, one group tends to inculcate the cultural of another group. The case of 'Americanisation' is a good example where the immigrant groups contribute some of their cultural traits and they in turn adopted the core- culture of the Americans. It should also be noted that assimilation does not only mean that foreigners assimilate into the culture of host community. It is the process whereby individuals and groups acquire the culture of other groups in which they come to live by taking the attitudes and values, its patterns of thinking and behaving. In short it is a way of life (Bhusan and Sachdeva 2008: 183). Some of the important definitions of assimilation are as follows: i. Park and Burgess "Assimilation is a process of interpenetration and fusion in which persons and groups acquire the memories, sentiments, attitudes of other persons or groups and by sharing their experience and history are incorporated with them in a cultural life." ii. Lundberg "Assimilation is a word used to designate a process of mutual adjustment through which culturally different groups gradually obliterate their differences to the point where they are no longer regarded as socially significant or observable." iii. Bogardus "Assimilation is a process whereby attitudes of many persons are united and thus develop into a united group. iv. Horton and Hunt "The process of mutual cultural diffusion through which person and groups come to share a common culture is called assimilation." v. Nimkoff "Assimilation is the process whereby individuals or groups once dissimilar become similar and identified in their interest and outlook" (Singh 2009: 26-27). Fairchild argues that assimilation involves both the process of nationalization and re-nationalization. Assimilation involves the modification of social attitudes. When two different cultures come into contact, there is a prominent tendency of sentiment of mutual conflict but gradually both the cultures assimilate elements from each other. In case of assimilation two groups do not merely compromise or agree to live side by side with one another but they become much like one another, their distinguishable character as separate groups slowly fades away, making them difficult to distinguish from one another. Assimilation is both social and a psychological process. According to Hayes, assimilation is a result of interaction rather than an interactive process (Bhusan and Sachdeva 2008: 184). It is also to be noted that assimilation is not limited to a single field of study. The best cases of assimilation are those where the foreigners come into contact with the culture of the host group, takes up their culture and gives up their own culture. Assimilation does not end here. Assimilation takes in different cases and conditions. For an example, children learn the ways of life as they grow up and enter into the adulthood. Foster children learn the new culture from their foster-parents sometimes so completely that their old traces of earlier home influence are totally eradicated. At times married couples from dissimilar or different socio-cultural backgrounds may develop a strong sense of unity of interest and purpose. In religious sphere people of one religion may be converted to other religion through religious conversions. Since assimilation is a social process, it is a characteristic of human group life in general and not limited to only a certain kind of group or people.

NSOU ? GE-SO-21 220 14.8 Stages in the Process of Assimilation It is assumed that assimilation is a gradual and a slow process. The process of assimilation involves certain stages. It takes a certain amount of time for the dissimilar individual or groups to become similar. The dissimilar people and groups take time to become identified in their interest and outlook with one another. Acculturation is the stage where one cultural group which is in contact with another appropriates or borrows from it certain cultural elements and incorporates them into their own culture, thus modifying it. When two cultural groups come into contact with one another their interaction affects both of them. However, it is the weaker group that borrows more cultural elements from the bigger or the host group. For example, the American Indians borrowed the culture of the whites with whom they came into contact, the whites appropriated some cultural elements from the American Indians. Therefore, assimilation has two stages or phase. The first part is the suppression of the parent culture, and the second phase is the acquisition of new ways, language and so forth. It may be noted that at times two may overlap. The adaptation of the dominant social cultural practices by another cultural group makes the way for the absorption of the new cultural group into the dominant group. Some cultural elements are readily adopted even if the two groups are only slightly in contact. For instance, the American Indians quickly learnt the use of firearms and intoxicants from the whites and the early American settlers learnt to consume food stuffs like potato, maize from the American Indians. Likewise, the migrants in America and Europe began to put on American and European clothing styles very quickly. Therefore, it can be argued that social contacts that are established finally yields in assimilation. The pace of assimilation purely depends upon the nature of contacts. If the contacts are primary in nature than assimilation takes place naturally and more quickly. Likewise, if the contacts are secondary or indirect or superficial then the result is accommodation and not assimilation.

NSOU ? GE-SO-21 221 14.9 Obstacles and Aids to Assimilation Like integration, assimilation is also complex process. There are certain factors that smoothens the assimilation process and others which blocks it. The assimilation rate is dependent upon whether the facilitating or retarding factor predominates. The factors that block assimilation process are isolating conditions of life, attitude of superiority on the part of the dominant group, excessive physiological, cultural, and social differences between the groups and discrimination of the minority by the majority groups. According to Gillin and Gillin, factors that encourage assimilation are toleration, equal economic opportunity, sympathetic attitude on the part of dominant group towards the minority, exposure to dominant culture, similarities between the culture of minority and dominant group and amalgamation or inter-marriage among the minority and dominant groups. On the other hand, the factors affecting assimilation are isolating, conditions of life, attitudes of superiority on the part of superior groups, excessive psychological, cultural, and social differences between the groups and persecution of the minority groups by the majority groups. Maclver has given the list of factors which facilitates and obstructs the process of assimilation. They are as follows: i. The level of development of the host society The immigrant's reception in the new land is dependent largely on the existing condition of the host society at the time of their entry. For example in America before 1880s all kinds of migrants with diverse skills and potentials were welcomed and accepted in developing the new land and enhancing the growth of industries. Those who migrated to America after 1880s were not accepted in the similar manner. Those who moved to America after 1933 were seen as economic threat to the natives of America. ii. Level of occupational skills The migrant with working skills and capacities that is in demand in the new country has better advantage. For example, the worker with industrial skills is accepted more easily in industrial countries and the person with better agricultural skills has more advantage of being easily accepted in the agrarian economy countries.

NSOU ? GE-SO-21 222 iii. The numbers involved It has been noted that the nature of a host group towards the immigrant group tends to be tolerant until the number of immigrants is less in number. For example, a single Indian or Japanese family in a community may be highly respected if the individuals are personally acceptable. If their number increases then the situation may not be the same. The larger proportion of new immigrants results in greater resistance of the host group for integration. Morena in his book titled "Who Shall Survive" has clearly highlighted that the increase in resentment in some cases have been due to the increase in number. iv. Physical Differences The difference in physical appearance, facial profile, complexion, skin colour etc. may also affect the process of assimilation. Physical features affect assimilation because one may set aside one's culture, but skin or other physical attributes are clearly visible without even mentioning it. The discrimination of blacks by whites was found across the world. However, the adjustment problems are much easier for groups whose physical appearances are similar to the people of the host land. It may also be noted that physical features alone do not produce hostility between people and groups like in the case of Southeast Asia or Latin America, but other factors operate to produce group antagonism, physical attributes becomes relative to inferiority and undesirability. v. Cultural differences The main constituents of culture are religion and language. If the immigrants have same religion or language to that of the people of the new land, then the process of assimilation is easier. In America the English-speaking immigrants do not find it tough to integrate to that society. However, for a non-English speaking person or group the assimilative process becomes challenging. Customs and beliefs are other cultural factors which helps are hinder the assimilation. vi. The role of semi-community At times the immigrant group that comes in great number develop their own colonies and practice their own native culture instead of participating in the

NSOU ? GE-SO-21 223 culture of the new land. Such semi-communities play an important role in the assimilative process. It helps the new immigrants of the same semi-community to easily settle down and adjust in the new land. At the same time such group is viewed by majority or the people of the host community as alien and distasteful. Apart from these factors Maclver has also pointed out that prejudice may also obstruct assimilation. If the dominant group prejudices those groups set apart neither the member of that group or the dominant group as a whole can assimilate easily. Prejudice may also hinder the assimilation of the constituent elements of the society. Religious groups often allow the social distance created by prejudice to maintain their separateness. Prejudice may be the result of distasteful experience, fear of losing superior status, fright for economic loss or form of collective phobia. Assimilation may be considered as a matter of degree. In big and complex societies complete assimilation is theoretical or hypothetical rather than realistic in nature. The minority or the assimilating groups not only contributes to the culture of the dominant or host group but also retains its cultural practices. Consequently, cultural pluralism emerges which implies incomplete assimilation. Should the minority or the immigrant be forced to assimilate with the majority becomes a polemic question. Some argues that it is essential for every individual to share some common ideals and values to participate in the sentiment common to the whole nation. There are also others who views that existence of minority cultural groups produces a richer culture. They believe in cultural pluralism and also uphold that cultural pluralism can solve the problem of prejudice. For instance, India has a rich cultural heritage because of the long-established tradition of cultural pluralism. However, it should also be kept in mind that certain incidents like that of Ayodhya of recent times are seemingly posing a threat to multi-cultural and plural Indian society.

14.10 Problems of Migration The process of migration is intrinsically conflictual in nature. Generally, migration occurs within and across nations mostly for employment opportunities, higher life chances, for better income and livelihood. At the same time migration also results in conflicts between the local and the outsider, among ethnic or religious groups. At times people are compelled to migration due to factors like government's decision for land acquisition, domination of territory by outsiders or due to environmental problems. Although migration takes place mostly for economic reasons the consequences of migration may lead to social and political conflict. The migrants may take up the jobs which the locals do not want to perform, they may bring in new skills and technology, take up the waste lands and make them more productive and may also capture the job market and make the locals unemployed. Migrants may also over crowd the place of destination, speak languages and practice socio-cultural or religious beliefs that are alien or offensive to the actual inhabitants of the land. Migrants may also encroach lands and properties. As such the migrants may be viewed as xenophobic, racist, and communal. All these activities of the migrants may result in conflict between them and the locals. The south Asian experience of migration has witnessed that while analyzing migration it is not only the economic determinants and consequences that has to be considered but the socio-cultural and political forces which can create coercion and conflict in sending and receiving areas are also to be noted (Weiner 2004: 170). Migration brings together people of different groups into contact and creates the problem of assimilation. The problems of assimilation can be seen through the presence of ethnic ghettos, people who are entrapped between the conflicting values of two communities or culture and higher degree of deviant behaviour among the migrants. Migration often results in personal and social disorganisation when people have to live their places and settle in new areas. Therefore, in many cases migrants are found to be more prone to delinquent characteristics, mental sickness, adult crime, prostitution, divorce, and other social problems. Although migration does bring different people with various skills, beliefs, customs, and technology into contact with one another and foster positive influence. However, at times negative consequences arise out of such interactions. For instance, the destruction caused by the Mongols while entering the Europe (Denisoff and Wahrman 1975). Migration at times may also be responsible for resource scarcity which gradually becomes the prime cause for political issue and conflict. Migration can also surface as an essential factor for social construction of identity and source of social conflict

NSOU ? GE-SO-21 225 (Weiner 2004). In Assam, the major conflict is associated with migration and migrants. Due to the migration induced population growth there are cases of lack of employment opportunities and the subsequent environmental degradation. As such migration can become an issue of human and environmental security (Ketkar 2005). 14.11 Conclusion In present day India one of the major issues is the demographic changes due to migration. Due to migration and invasions the northeastern states of India have more than 500 ethnic communities. India in 20th century India under the British rule massive scale of migration took place in Assam, North Bengal, and Tripura. This trend continued even after the independence. Again in 1971, large number of people migrated to West Bengal and northeast India from the then East Bengal and present- day Bangladesh, due to the Indo-Pak war. These incidents led to the anti-migration movement in Assam. The effect of migration can be clearly observed in Tripura which had a tribal majority in 20th century. Now the tribals have become minority in their own homeland. This has resulted in the emergence of social movements like ULFA, Bodo, Karbi and Dimasa movements. Although the Indians are dominating the global job market scenario in one hand, on the other hand there is a brain drain from the country. The government has failed to tap or capture the potential of those migrating skilled labour force for the welfare and development of one's own nation. The brain drain has escalated more after the Indians have excelled in software technology. The government has been trying to stop the colossal loss of brainpower. However, the Indian skilled labour force is bought in hefty prices by developed nations like USA, UK, Canada or Australia. The massive out migration of skilled labour force has negative affected the labour sending countries. Such migration will surely have an adverse effect on the national labour force, production activities and generation of better national income (Majumdar 2013). According to Weiner (2004: 164) migration to a certain extent

NSOU ? GE-SO-21 226 is responsible for the rise of social urban problems like squatters of settlement, high rates of unemployment, soaring level of pollution of different types, sanitation problems, scarcity of drinking water, growing cases of disease, malnutrition and infant mortality, low literacy rate and high rate of child labour. 14.12 Summary Out of the three demographic processes (birth, death, and migration), the most significant is the human migration in sociology. Migration is one of the important factors for demographic change along with fertility and mortality. But, migration is not a biological variable unlike fertility and mortality, but a product of social, cultural, economic and political, or physical circumstances.

SA BLOCK I MSO 304.docx (D49764054)

Migration refers to the movement of people from one location to another.

It is a way to move from one place to another in order to live and work. Movement of people from their house to another city, state, or country for a job, shelter or some other reasons is called migration. Migration from rural to urban areas has increased in the past few years in India. Integration occurs in the public and private, realms across generation and at the individual, family, community, and national levels. Integration is the act of bringing together smaller components into a single system that functions as one. These links usually are established between the components of the process and central layers of each system to promote the free flow of a data across systems. How does the integration come into existence? i) The act/process of uniting different things ii) The practice of uniting people for different races in an attempt to give people equal rights. In sociology, the concept of social integration refers to the ways that different groups come together to form a whole in society. It might refer to cases when minority groups become part of mainstream society or when groups of individuals come together to make a cohesive whole. National integration is the bond and togetherness between people regardless of their caste, creed, religion, or gender. It is the feeling of oneness, brotherhood, and NSOU ? GE-SO-21 227 social unity under communities and society in a country. National integration helps keep the country unified and strong from within despite the diversities. So, the importance of national integration can be from the fact that the nation which remains integrated. It will always progress on the track and development and integrity. 14.13 Questions Answer the following questions in your own words G-A (5 Marks each) i. What is migration? ii. What is integration? iii. Briefly explain the different modes of integration. iv. What do you mean by the term assimilation? v. What is the major objective of integration? vi. Highlight the problems of integration. G-B (10 Marks each) vii. Write a note on the problems of integration. viii. Discuss the various stages involved in assimilation. ix. Examine the problems of migration. x. Elaborate the factors that assist and obstruct the assimilation. 14.14 Suggested Readings i. NSOU ? GE-SO-21 229 Unit 15 ? Displacement and Rehabilitation: Problems and Policies Structure 15.1 Objectives 15.2 Introduction 15.3 Rehabilitation 15.4 Background of Displacement in India 15.5 Displacement and Rehabilitation Policies 15.6 Problems of Displacement and Rehabilitation 15.7 Conclusion 15.8 Summary 15.9 Questions 15.10 Suggested Readings 15.1 Objectives The purpose of this unit is to discuss the following: ? The meaning of displacement and rehabilitation. ? Displacement in India. ? Displacement and rehabilitation policies in India. ? The problems of

displacement and rehabilitation. Migration has been taking place since time immemorial. It is regarded as one of important factors for demographic change. As a result of migration, the integration and assimilation of the individual or group with the host community depends upon many factors. Post-independence development projects have been one of the factors for migration and displacement and the rehabilitation of the displaced people are still under process.

NSOU ? GE-SO-21 230 15.2 Introduction Among various issues that have drawn the attention of the scholars, social scientists and researchers in the present times, the most popular ones are the issues relating to development, displacement, and rehabilitation. The United Nations Universal Declaration on Human Rights has proclaimed that right to housing is a basic human right. Most of the displacements in India have resulted due to land acquisition by the government for various reasons. The Government of India under the Land Acquisition Act of 1894 started to acquire lands for public interest and for companies. The acquired land could be used for purposes like establishment of multi-purpose irrigation dams, canals, national parks, sanctuaries, forest reserves, and mining and for construction of highways and communication system. According to the Ministry of Rural Development, 1996 until 1985 almost 15.5 million people were displaced. Social activists concerned with displacement gives a larger figure and argue that about 20 to 30 million people were displaced. Forced displaced people differ from migrants in a sense that they are forced by the law to migrate to other places as their properties and lands are acquired by the state for public interest. Displaced people also include the tenants, sharecroppers, landless labourers and others engaged in the acquired land or region. Traditionally government used to pay compensation to the people whose properties had been acquired but not to large number of people who have been affected by the land acquisition. It is also argued that in most cases the compensation was not sufficient for rehabilitation. Consequently, the displaced people also faced problems in finding employment (Weiner 2004: 168-169). The term "displaced persons" was developed by a Russian-American sociologist Eugene M. Kulischer, the author of *The Displacement of Population in Europe*. Kulischer has used the term to all categories of forced mobility in Europe during the war periods (Montreal 1943 quoted in Terminski 2013:6). However, the contemporary meaning of the term "displaced persons" differs from its earlier meaning, which is limited mostly to the issue of internal mobility. Research related with displacement and resettlement was limited to cases relating to the social consequences of economic development in peripheral countries. The processes of decolonization introduced many policies resulting in forced internal migrations (Terminski 2013: 6-7). According to the Social and Human Science website, the displacement of people refers to the forced movement of people from their locality or environment and occupational activities. Displacement can lead to a geographic shift in households, which may

NSOU ? GE-SO-21 231 preserve or increase economic and racial segregation throughout an area. In regard to population displacement resulting from development, there are typically two types: Direct Displacement, which leads to the actual displacement of people from their locations and Indirect Displacement, which leads to a loss of livelihood. Forced to leave the home region to which they are attached, and for which they have the knowledge and opportunity to make a living most effectively, displaced populations often become impoverished. The displacement of people, as a result of development projects, policies and processes, therefore constitutes a social cost for development (Panigrahi 2018: 79-80). Various Indian anthropologists, sociologists and social activists have reported the consequences of displacement. For instance, Cernea (1996: 1518) is of the opinion that displacement results in landlessness, homelessness, unemployment, subjugation, food crisis, separation from the access to use common properties, high rate of deaths and illness and social disarticulation. According to Fernandes and Thakural (1989) most of the displaced people in the last four decades are tribals. The displacement of tribals is severe because they have common landholdings, depends mostly on forests, non-commercial or non-monetized forms of economy and they also lack skills for other job opportunities. The first studies on the social impacts of development-induced displacement were carried out by anthropologists like Elizabeth Colson, Thayer Scudder and Robert Fernea. Studies of development-induced displacement had already begun by the mid-fifties and early sixties, in the context of such projects as the Great Dam of Aswan, the Kariba Dam on the Zambezi and the Akosombo Dam on Lake Volta in Ghana. During the fifties and sixties anthropological studies on resettlement in other parts of the world also began. A study on urban relocation in Boston was undertaken in the early sixties by American sociologist Hubert Gans. The first more advanced analysis of forced migrations due to long-term environmental disruptions started during the nineteen-seventies. The problem of population pressure due to environmental problems and declining resources was done in the nineteen forties in the context of the Dust Bowl or the problem of overpopulation by an American ecologist William Vogt. It was only in the seventies that research in the areas of displacement and rehabilitation became more advanced when international institutions such as UNEP became involved in the issue of displacement and rehabilitation. Prolonged natural disasters like cyclones in Bangladesh and drought in the Sahel region had strongly affected the

NSOU ? GE-SO-21 232 dynamics of internal and transnational forced migration in those countries. The significance on the study of the impact of population growth, effect of natural disasters and declining resources in the most populated countries of Asia began to develop. In 1980 the first World Bank guidelines of involuntary resettlement were adopted. The first half of the eighties was a period of progress in the studies on development-induced displacement and resettlement (DIDR). The book *Putting People First: Sociological Variables in Rural Development* edited by Michael M. Cernea and published by the World Bank initiated the importance of more advanced studies in this area. It was in the mid and late eighties that the term "development-induced displacement and resettlement" (DIDR) first started to appear in scientific writings and publications. In recent years, the scientific community has given stress on all causes of displacement, occurring mostly due to the rapid development. Terms such as dam-induced displacement, hydropower induced displacement, mining-induced displacement, conservation-induced displacement, and oil-induced displacement have emerged in the scientific discourse. Recently studies on displacement has focused on the following issues, i. Analysis of the causes and consequences of displacement, ii. Relations between this issue and areas of security, human rights, and development studies, iii. Gender and ethnic dimensions of displacement, iv. Analysis of ways to minimize negative consequences of displacement, together with mechanisms of humanitarian assistance for affected people, v. Integration of displaced persons within host communities and their lives within closed structures such as camps for displaced people (IDP camps), vi. The relations between displacement and stability, conflict, and post-conflict peace building, and vii. Analysis of several categories of actors involved in displacement. Equally important areas of displacement discourse include research on the psychological consequences of displacement for individuals affected by this problem, and on the interrelations of conflict, displacement and security. The dominant classifications of displacement are of four types. They include conflict-induced

NSOU ? GE-SO-21 233 displacement, environmentally induced displacement, disaster-induced displacement, and development-induced displacement. According to the most common understanding of the term, conflict-induced displacement refers to people who are forced to leave their habitual place of residence because of current escalation of internal violence. Such a narrow understanding of the problem is therefore similar to the overall meaning of the term "internally displaced persons" (IDPs). Internally displaced people are mainly associated with victims of internal violence who are forced to move to another place. It is estimated that the current population of conflict-induced displaced people comprises more than 20 million people worldwide. But the annual growth rate in the number of people forced to leave their places of residence as a result of current internal conflicts amounts to only a few million people. The term "conflict-induced displacement people" may also refer to a much broader population than only those individuals forced to leave their homes following internal armed conflicts. The most fundamental cause of displacement is the presence of dynamic conflict among several categories of actors within a static and limited territory. The desire to take control over a certain territory and its resources becomes a cause of conflict which forces its residents to leave their current homes. Each of the already mentioned causes of displacement involves certain antagonisms. The kind most visible and easy to analyze are displacements associated with conflict over resources or antagonisms based on ethnic background. In the case of development-induced displacement or conservation-induced displacement, territory becomes an arena of specific conflicts between the interests of the public or private sector and the requirements of people displaced or affected by development decisions. Development-caused displacement is often associated with conflict over resources which have led to landlessness and consequent problems like joblessness, homelessness, food insecurity, and social disarticulation.

15.3 Rehabilitation

When it comes to rehabilitation as a subject of discussion, it has political, economic, and social implications. The post-independence model of development in India has been largely accountable for the deprivation of a significant section of the population in the name of the national interest. The developments issues are also

NSOU ? GE-SO-21 234 often validated on the grounds that some should sacrifice for the greater interest of national development. This very explanation has violated the fundamental human rights of many people who mostly belong to the lower rungs of the society. The most affected among these people are the tribals and the indigenous people. They have been the worst sufferers of development not just in India but also throughout the world. In India, about 8.08 per cent of the population has been recognised as tribes. When such matters of development, displacement and rehabilitation are discussed regarding to the tribal communities then they gain greater significance. What is more paradoxical is that the rehabilitation of these affected people is hardly given importance that it deserves. The term displacement can be understood in two ways. i. First, it may refer to eviction of people from their habitation without adequate compensation, guarantees or mechanisms of social support, or ii. Second, to the initial phase of a process of resettlement (associated with physical relocation of people from their homes). Displacement in this sense may be a distinct, negative phenomenon related to violation of fundamental human rights, or the first step in the rehabilitation process. Thus, the term "resettlement" therefore implies to physical, pre-planned relocation, combined with appropriate support mechanisms, including social support in the new place or location. Robert Chambers (1969) has stated that "resettlement has two characteristic features. i. First, it is a population movement and ii. Second, as an element of planning and control." Other sources claim that resettlement is defined as "the process by which individuals or a group of people leave spontaneously or un-spontaneously their original settlement sites to resettle in new areas where they can begin new trends of life by adapting themselves to the biophysical, social and administrative systems of the new environment." (Woube 2005: 19) According to the Encyclopedia of World Environmental History, resettlement may be defined as "the process through which populations displaced from their habitat and/or economic activities relocated to another site and re-establish their productive activities, services, and community life." (Krech et. al. 2004: 1046). This definition has strongly emphasised that

NSOU ? GE-SO-21 235 resettlement is a combination of physical relocation (displacement) with subsequent attempts to restore the displaced people's livelihood in the new place. 15.4 Background of Displacement in India Since the mid-nineteenth century, various Indian tribes began to organise protests and rebellions against British colonial laws like the Forest Act of 1876. This act prevented the use of the forest lands on which the tribals were dependent upon. Although India became independent in 1947, the history of displacement began with the colonial rule and it continues even in the post-Independence period in the name of development, progress, national self-sufficiency, industrialism, and large development projects. The numbers of people displaced by such programs and projects under the banner of national, regional, and local development are substantial (Patwardhan 2000). Approximately 10 million people per year are being displaced throughout the world over the last two decades (Cernea 2000). In India about 25 million people were displaced from 1947 to 1997 (Mahapatra 1999). After Independence, development projects under India's Five-Year plans have roughly displaced about 5,00,000 persons each year. They are removed from their lands by direct administrative actions of government. It is estimated that the total number of those displaced by development projects after independence is high as 40 million. India is one of the largest dam building nations in the world. There are 4291 dams in India. 3596 have been built and 695 are under construction (Patwardhan 2000). Soon after the independence, many large dams were planned and built on some of the major rivers in India. These dams had an objective to solve the problems of hunger and starvation by providing adequate irrigation system and boosting food production, controlling floods, and providing much required electricity for industrial purpose. Dam building in India has been viewed as the sole responsibility of engineers and technical professionals. As such, the social aspects of large dams, like the large-scale displacement it induced, were always ignored. One of the sad facts about dam building in India is the lack of reliable database on the performance and consequences of large dams. People's movements and researchers have played a pivotal role in bringing the social, ecological, and political impacts of large dams in the limelight. However, the participation of people in the planning and decision-making process of developmental projects is still considered to be irrelevant.

NSOU ? GE-SO-21 236 The World Bank has recently showed interest in renewing funding to large hydropower projects in India in its draft India Country Assistance Strategy (CAS) for 2005-2008. The bank has not endorsed any new loans for large hydro projects in India since 1991, when it had sanctioned a loan for the NathpaJhakri Hydropower Project on the Sutlej River in the northern Indian state of Himachal Pradesh, the loan was terminated in 2002 before completion of the project due to non-implementation of environmental guidelines, plan, cost and time overruns and poor safety records leading to huge damages in 1993 and 2000. Earlier, the bank was compelled to pull out of the controversial Sardar Sarovar Project in 1993 amid agitation, independent review, and unsatisfactory social and environmental performance. It is to be noted that none of the large hydropower projects in the pipeline has been able to meet the standards achieved by both the Sardar Sarovar Project and the NathpaJhakri Project (Thakkar 2004). India's motive to open itself to the global economy and rely more on market forces after 1990's has accelerated the rate of displacement. It has been pointed out by various scholars that the hydroelectric and irrigation projects are the largest source of displacement and destruction of human settlement. Other major sources of displacement include mines, thermal and nuclear power plants, industrial complexes, military installations, weapons testing grounds, railways, roads, and the expansion of reserved forest areas, sanctuaries, and parks. Among the World Bank projects that involved displacement, 63% of the people displaced were caused by dam constructions. Although there are variations of figures in different reports, there is a general conception that dams are considered to be one of the major causes of displacement. Dams are responsible for about 75% to 80% of the total displacement. Almost one lakh sixty four thousand to four crores persons have been displaced by dams after independence. These numbers are substantial by any standards. On the other hand, only twenty-five per cent of those displaced by development projects have been rehabilitated and millions of people, almost 3 out of 4, have not been rehabilitated (Patwardhan 2000). 15.5 Displacement and Rehabilitation Policies The Indian state has the right and power to forcibly acquire private land for development projects without the consent of the landowner. The only prevailing law relating to involuntary displacement which covers the whole of India is the colonial

NSOU ? GE-SO-21 237 Land Acquisition Act of 1894 (LAA). Other such laws (without direct relevance to big dams) include the Coal Bearing Areas (Acquisition and Development) Act 1957, the Forest Act 1927 and the Army Manoeuvres and Practice Act, 1938. The most important principle of the LAA and related Acts is the doctrine of 'eminent domain', which means that the state enjoys ultimate power over all land within its geographical area. Accordingly, the state has the right to invoke this right for the public good. The compulsory acquisition of land cannot be challenged in the court of law or resisted by any citizen or community. In India, the only national law regarding displacement is the LAA, which places no legal obligation on either the project authorities or the state, beyond a limited conception of adequate compensation. Displacement of people for the construction of dams and barrages under the LAA was common in the pre-Independence era in India, but the concept of rehabilitation was absent then. The displaced were only granted compensation under the LAA for the land acquired. The idea of rehabilitation slowly came into existence when it was realized that compensation for land and property acquired was not enough to make good the loss of the displaced people. This idea was changed into reality through rehabilitation policies and packages in the context of projects like the Narmada Valley and the Tehri Dam (Khaitan and Priya 2009). In the mid-1980s, a draft of a rehabilitation policy, applicable for construction of all future dam projects, industrial, mining, and other development related projects was compiled. It was altered many times for about two decades. The draft rehabilitation policy by N.C Saxena in the 1990s was not executed although it had many constructive points. The issue was slowly forgotten until 2003 when the draft National Rehabilitation Policy was notified by the NDA government. This policy came into effect in February 2004 as the National Policy on Rehabilitation and Resettlement for Project Affected Families. The National Advisory Council (NAC), was not satisfied with this policy and it sent its own revised policy draft to the government. The policy makers then introduced a revised version of the 2003 Policy in the year 2006 which came to be known the National Rehabilitation and Resettlement Policy of 2007. The policy has been criticized enormously, and one major positive outcome of these criticisms is that now the government is considering a National Rehabilitation Act rather than another rehabilitation policy. The Ministry of Rural Development is still in the process of drafting a bill to that effect. It has been almost NSOU ? GE-SO-21 238 seven decades that we became independent, and the absence of a national policy on rehabilitation is one of our great failures (Khaitan and Priya 2009). The National Rehabilitation and Resettlement Policy was notified on the 31st of October 2007. The objectives of the National Rehabilitation and Resettlement Policy 2007 are as follows: i. To minimize displacement and to promote, 'as far as possible, non-displacing or least-displacing alternatives; ii. To ensure adequate rehabilitation package and expeditious' implementation of the rehabilitation process with the active participation of the affected families; iii. To ensure that special care is taken for protecting the rights of the weaker sections of society, especially members of the Schedule Castes and Scheduled Tribes, and to create obligations on the State for their treatment with concern and sensitivity; iv. To provide a better standard of living, making concerted efforts for providing sustainable income to the affected families; v. To integrate rehabilitation concerns into the development planning and implementation process; and vi. Where displacement is on account of land acquisition, to facilitate harmonious relationship between the requiring body and affected families through mutual cooperation (Ministry of Rural Development 2007). The National Rehabilitation and Resettlement Policy 2007 has also been sternly criticized for carrying the capacity to cause further conflicts in land acquisitions and leading to human rights abuses. i. First, the policy, despite of concerning on its main aim of minimizing displacement, is unvoiced on the procedure to be followed to enforce the same. The absence of clear-cut guidelines gives enough space for evading responsibility by the project authorities. Since such an objective is achievable only at the project conception stage when it could lead to the change in the choice of technology and project size, the absence of such directions would defeat the objective itself.

NSOU ? GE-SO-21 239 ii. Second, the Policy while providing for land-for-land compensation declares that this is subject to the availability of government land in resettlement areas. Also, preference for employment in the project for at least one member in the nuclear family is subject to the "availability of vacancies and suitability of affected person". Such qualifying words only help and promote the interest of the project developers so that they can evade responsibility. Also, deleting the 2006 draft provision which specified that the emergency provisions of Section 1716 of the Land Acquisition Act, 1894, should be 'used rarely' and only after providing 'full justification' for the proposed project, is yet another benefit in disguise to the project developers who are waiting to bypass their duty to relocate the affected people. Another clause in the policy (7.18) implies that land can be acquired by the state under Section 17 of the LAA, 1894, by keeping the affected families in "transit and temporary accommodation, pending rehabilitation and resettlement scheme or plan". This could direct the project authorities ignoring the rehabilitation of the displaced and the latter losing the medium of enforcing their rights. Even though the Preamble of the 2007 Policy states that it will apply to all cases of involuntary displacement, clause 6.1 proclaims that the appropriate government has the authority to declare which regions are affected depending on the number of people being displaced, such that a particular locality will not be declared affected if the number of families being displaced is below four hundred in plain areas and below two hundred in hilly areas. This means that the Policy will not be applicable even if the number of families is just below the specified numbers. In spite of the assurance that there will be active participation of the affected persons in the process of resettlement and rehabilitation, the affected people are denied rights to participate in any informed decision-making process as regards the use of their lands by the project developers. Also, the Policy does not make it obligatory to establish the achievability of the resettlement before proceeding with the project. All these loopholes must have to be corrected and just national rehabilitation legislation has to be introduced soon if the anguish of the displaced are to be lowered, if not completely cured. Thus, it is seen that the law has failed to effectively address the issue of rehabilitation of the displaced persons and needs to be reformed to better its current loopholes. Under such conditions, it becomes important to analyse the

NSOU ? GE-SO-21 240 position taken by the judiciary to gauge whether the courts could correct the discrepancy in the legal provisions to protect the rights of the people displaced owing to developmental projects (Khaitan and Priya 2009).

15.6 Problems of Displacement and Rehabilitation Majority of people depends upon agriculture in India. Primarily for this reason, large irrigation projects constructions are important for the over-all development of the country (Reddy 1988). Since the very time of independence, efforts were made right from the First Five Year Plan by Commissioning of irrigation and power projects in India (Tribal Research Bulletin 1986). Projects carried out for development have been considered as a major cause of population displacement (Mathur 1995). Various big development projects have been constructed in tribal areas or on lands owned by them. Tribals are viewed as simple people, with specific life-style, customs, and tradition. Displacement of these people disturbs their way of life, which leads to the degeneration of their social, cultural, religious, and economic values. These groups of people have been dependent on the common property primarily on forestland for their livelihood and survival. Many tribals and other forest dwellers falls under the forest laws, but the laws do not give them the right to ownership of lands despite of habiting and cultivating in these forest lands for several generations (Fernandes and Thukral 1989). According to the present law, they are not entitled to any compensation. Thus, in the name of development, there is a disparity between the group of people that takes the benefits from the developmental project and those who suffers (Mahapatra 1999). Again, just compensation of homes does not mean that they get compensated for the loss of their livelihood since the village is scattered and not reconstructed as a unit. After the implementation of planned development programs that started off from 1950-51, the economy of India witnessed undertaking of a large number of projects which may be grouped as: i. Irrigation and power projects, ii. Industries projects, iii. Mining projects, and iv. Forest and wildlife projects.

NSOU ? GE-SO-21 241 The planners are concerned with the growth of GNP and NNP with the hope that benefit of economic growth would trickle down to the poor community. But this has disturbed the traditional resource-utilization pattern and existing mode of production encounters with an advanced mode of production. The interaction of these two processes has given rise to losers and gainers in development (Nath 1998). Displacement of persons from their settlements when their lands are acquired for infrastructure projects is an inevitable process. No infrastructure project has been completed without displacing people. If development is one side of a coin, displacement is the other side (Ramesh 1998). Most of the displacement has been due to irrigation, power, and mining projects. These projects are taken up in areas rich in natural resources like water, minerals and ores and forests. These areas mostly inhabited by tribal people. The Working Group on Development and Welfare of Schedule Tribes during Eighth Five Year Plan (1990-95) reports that out of the 16.94 lakhs person displaced by 110 projects studied, 8.14 lakhs were tribal (Thukral 1992). Till 1990 Fernandes (1994) estimates that 2,13,00,000 people were displaced by development projects in India. Vast numbers of them are tribals. Out of a total of 74,10,000 tribal people displaced, only 24.9% have been rehabilitated and a staggering 75.1% still await rehabilitation (Fernandes 1991). The most negative outcomes of economic development are seen in dictatorial countries where there is a presence of great social inequality, and a large group of people are in most cases completely excluded from the economy. An advanced country characterised by a democratic form of government, with freedom of expression, and extended participation of people in the decision-making processes, cannot afford to implement socially costly development projects which would lead to mass displacement. Much resistance is observed worldwide due to a direct consequence of exclusion from planning, decision-making and monitoring of involuntary resettlement. In almost all the developed democratic countries the cause of population displacement may be due to development projects for public purposes. However, even in case of Western Europe, we can find cases of developmental projects that have led to large- scale rehabilitation. For instance, it is reported that during the twentieth century lignite mining in Germany led to the displacement of almost 30,000 to 100,000 people. More problems and challenges are observed in less developed countries or those implementing an intensive model of economic development, detached from the principles of sustainable development. The largest scale of development-induced displacement and resettlement is seen in the world's most densely populated countries

NSOU ? GE-SO-21 242 like China and India. According to the Chinese National Research Center for Resettlement, over 45 million people have been displaced in China following development projects initiated in between 1950 and 2000, fifty two percent of this number owing to urban development projects (Stanley 2002: 4). The problem of displacement is equally high in the twentieth-century India. According to Paranjpye (1988) construction of dams had compelled the involuntary resettlement of at least 21.6 million people up to that date. According to Taneja and Thakkar (2000), the establishment of dams alone recorded the displacement of 21 and 40 million people in India. Mahapatra argues that development might have displaced 25 million people in India during the second part of the twentieth century, from 1947 to 1997. These figures seem to have been underestimated. According to Nalin Singh Negi and Sujata Ganguly (2011), over 50 million people in India have been displaced over the last 50 years. Dr Walter Fernandes of the Northeastern Social Research Centre (NESRC) has estimated that at least sixty million people have been displaced and affected by development projects in India. An Indian government statement of 1994 gives the number of over 10 million development-induced displaced people in the country who are still "awaiting rehabilitation" (quoted in Terminski 2013). It is also apparent that project authorities do not consider the problems of displacement and rehabilitation as important parts of the project. The primary concerns are engineering specifications and electricity and irrigation benefits. In this event, concerned authorities seldom undertake detailed and systematic surveys of the population to be displaced (Thakural, 1992; Patwardhan 2000; Cernea 2000). Researchers have reported that after the 1990s the percentage of project displaced persons has increased to 50% of the total number. The tribal communities are socially, economically, and politically the weakest and the most deprived communities in India. Independent India was committed to give them an equal status through its constitutional protection. While the social, economic, and educational development of these communities has been recognized as one of the important national objectives, these communities have been harmed in the process of national development. They have been uprooted from their ancestral land, often forced to migrate to urban slums in search of employment or become landless labourers. These communities have to suffer for development of the urban areas and large farmers, by providing irrigation and electricity. In an unequal society like India, dams have served to take away two most important natural resources for the benefit of the advantaged class. The two

NSOU ? GE-SO-21 243 resources being water and land are taken away from less powerful communities like Adivasis. Natural, self-sufficient economies of tribal people are sustained and nurtured through close proximity to forest, river, and mountains. These areas are rich in terms of resource. These areas are most likely to be dammed or mined. Many tribal recognised as development sites best suited for building large multi-purpose river valley projects like mines, thermal power stations, or paper factories. Geographic location of tribal habitats is one major reason why such large numbers of Adivasis have been displaced. Displacement has aggravated the process of alienating small and marginal farmers and Adivasis from their natural resource base. The indigenous peoples live in vulnerable ecosystems, in very poor social and economic conditions because of which they have to suffer from problems of basic health and education, leading to high infant mortality, low life expectancy, and high illiteracy rate along with large-scale unemployment (Terminski, 2013). On the other hand, the abundant resources in the tribal territories has become harmful for them, which is paradoxical (Dutta, 2007). The tribals, who are already socially marginalized, are further distressed by the projects that displace them. Displacement cannot be a prerequisite for the tribal people to get access to basic public facilities like health care, education, or transport. It is their right as citizens of the nation and to get these facilities wherever they live in. Besides, the last 50 years of experience has demonstrated that despite protective legislation and special constitutional provisions for tribal people, increased contact with the mainstream has alienated them from their natural resource base and its impact on tribal communities has been devastating (Patwardhan 2000). In a study conducted in 2006 by Walter Fernandes and his team on development- induced displacement in West Bengal between 1947 and 2000, it has been reported that 70 lakhs people had been adversely affected by projects; 39 lakhs of them had been physically displaced out of which only about three lakhs had been resettled by the projects. Thirty-six lakhs people have had to fend for themselves following displacement. Tribals make up 20 per cent of this and Dalits 30 per cent. Almost thirty-one lakhs lost their land or livelihood without being physically relocated. At the same period, in Assam, the study estimates that around 25 lakhs people have been deprived or dislocated by the development projects (Ramanathan 2006). A Report brought out in November by the South Asia Network on Dams, River and People (SANDRP) has given a clear picture of the extent of rehabilitation. According to it, the government has not met even the basic requirements of a rehabilitation process.

NSOU ? GE-SO-21 244 For instance, it does not have a database on the number of people affected and their incomes and livelihood patterns. Nor does it have a comprehensive policy that considers all aspects of displacement, the availability of suitable land, and the need to settle village communities as social entities that are intact (Rajalakshmi 2002). This was the condition before the coming of the National Rehabilitation and Resettlement Policy, 2007. 15.7 Conclusion Various policies for rehabilitation for displaced people began to be drafted since mid-1980s, in 1990's under N.C. Saxena and in 2003 under the NDA government. In 2004 the National Policy on Rehabilitation and Resettlement for Project Affected Families was implemented but the National Advisory Council (NAC), was not satisfied with this policy and it sent its own revised policy draft to the government. In 2006 the National Rehabilitation and Resettlement Policy of 2007 was introduced but it was heavily criticized. The Ministry of Rural Development is still in the process of drafting a rehabilitation bill. It has been more than seven decades that the country became independent, and the absence of a firm national policy on rehabilitations is one of the great failures. 15.8 Summary The major issues related to displacement and rehabilitation is as follows: a) Tribals are usually the most affected amongst the displaced that are already poor. Displacement further increases their poverty due to loss of land, home, jobs, food insecurities, loss of access to common property assets, increased morbidity, and mortality and, social isolation. b) Break up of families in an important social issue arising due to displacement in which the women are the worst affected. And they are not even given cash/ land compensation. c) The Tribal are not familiar with the market policies and trends even if they get cash compensation, they get alienated in the modern economic setup. d) The land acquisition laws ignore the communal ownership of property, which is an inbuilt system amongst the tribal. Thus, the tribal lose their communitarian

NSOU ? GE-SO-21 245 basis of economic and cultural existence. In this way, they feel like fish out of water. e) Kinship systems, marriages, social and cultural functions, their folk songs dances and activities vanish with their displacement, even when they are resettled, it is individual based resettlement, which totally ignores communal settlement. f) Loss of identification of individuals and the loss of connection between the people the environment is the greatest loss in this process. The indigenous knowledge that they have regarding the wild life and the herbal plants are lost. Objectives of rehabilitation: The following objectives of rehabilitation should be kept in mind before the people are given an alternative site for living: i) Tribal communities should be allowed to live along the lives of their own patterns and others should avoid imposing anything on them. ii) The displaced people should be given employment opportunities. iii) Villagers should be taken into confidence at every stage of implementation of the displacement and they should be educated. Each year, millions of people around the globe are forcibly relocated and resettled away from their homes, lands, and livelihoods in order to make way for largescale development projects such as dams, reservoirs, powerplants, roads, plantations, urban, renewal, and oil, gas, and mining projects. This forced relocation is known as Development-induced Displacement and Resettlement, or DIDR, develop- ment and destruction go hand in hand, while a country develops, it is always at the cost of something or someone. 15.9 Questions Answer the following questions in your own words. G-A (5 Marks each) i. What do you understand by the term displacement? ii. Briefly discuss the major reasons for displacement in India. iii. Write a note on development induced displacement.

NSOU ? GE-SO-21 246 G-B (10 Marks each) iv. Evaluate the displacement and rehabilitation policies of India. v. Discuss the problems of displacement and rehabilitation. 15.10 Suggested Readings i. NSOU ? GE-SO-21 248 Module VI: Population, Development and Environment Unit 16 ?Population growth, Environment and Sustainable Development: The Inter- relationship Structure 16.1 Objectives 16.2 Introduction 16.3 Environment 16.4 Development and Environment Degradation 16.5 Environmental Protection 16.6 From Un-sustainable to Sustainable Development 16.7 Sustainable Development—The Core Idea 16.8 Sustainable Development—Environment Linkage 16.9 Population—Environment Linkage 16.10 Burden of Population on Environment 16.11 Rural Population and Environment 16.12 Urban Population and Environment 16.13 Environment Protection—A Necessity 16.14 Conclusion 16.15 Summary 16.16 Questions 16.17 Suggested Readings 16.1 Objectives The objective of the unit is to acquaint the students with the interrelationship between environment and development as well as between population and environment.

NSOU ? GE-SO-21 249 The objective is to show how both the process of development and the population growth affect the environment adversely. Learners will get the idea how adversely they are affecting the environment and the policy measures adopted in this behalf. 16.2 Introduction Idea of sustainable development has become increasingly popular in contemporary world. It has become a buzzword being used in too many contexts today. Sustainable development is the meeting of needs and aspirations

100%

MATCHING BLOCK 149/164

W

of the present without compromising the ability of future generations to meet their own needs.

In view of the environmental degradation and population growth the concept has earned greater importance for last few decades. In fact, growth of population in the world is unprecedented in the human history, particularly in the developing nations. Rapidly growing population in developing countries is likely to put great strain on the resources and natural reserves of the world. Hence sustainable development would balance the needs of society, the economy and the environment. 16.3 Environment By the term 'environment' we mean the physical, chemical and biological surroundings in which an organism exists. Environment, therefore, at least initially, was the gift of nature. Prior to 20th century there was no major evidence of human influence on environment. Environmental degradation up to this period was mainly due to natural disaster. However, this does not mean that up to that period natural resources are neither use nor wasted by men. But what happened was that these were not used beyond their regenerating capacity. Therefore, what was used was regenerated. But once the population of this planet exceeded the carrying capacity of the mother earth, the situation started changing. The nature could not get to compensate its resources loss due to over-consumption by the humans. In course of time these led to serious environmental degradation behind which there lies the need and greed of humankind. 16.4 Development and Environment Degradation Human activity in general and the process of rapid industrialization in particular have been causing massive environmental damage all over the world. Most of the NSOU ? GE-SO-21 250 environmental and ecological damage is irreversible leading to widespread concerns among the environmentalists regarding the sustainability of the present rates of economic growth. Some even question the blind pursuit of such growth. Although quantitative and monetary estimation of environmental degradation is not possible, some estimates for various countries have been attempted in recent years. As far as India is concerned, the latest estimate is for the year 2009 presented in World Bank's report India: Diagnostic Assessment of Select Environmental Challenges released in June 2013. This report estimates the total cost of environmental degradation in India at about 3.75 trillion annually, equivalent to 5.7 per cent of GDP in 2009. In addition to this, India has experienced some damages from natural disasters (floods, landslides, tropical cyclones, and storms). These are not included in the above figures. According to the Report, over the period 1953-2009 damages from natural disasters stood at Rs. 150 billion a year on average and took the form of loss of life and injury, losses to livestock and crops and losses to property and infrastructure. In this context, the following comments by Dreze and Sen on environmental degradation in India are also pertinent, "In India, we have huge reasons to be worried about our treatment of the environment and its implication for the lives people can lead in this increasingly polluted and environmentally devastated country. Indeed, the acceleration of economic growth in recent decades has coincided with unprecedented environmental plunder. Groundwater has been extracted with abandon, leading to sharp fall in water tables in many areas. Majestic rivers have been reduced to a trickle or to sewage drains. Mining activities (often illegal) have spread with few safeguards, destroying forest and displacing communities. Air pollution has risen so far that India is now rated as the most polluted among 132 countries for which comparable data are available. India's natural wealth is estimated to have shrunk by about 6 percent in value terms between 1990 and 2008. And all this might be no more than just a harbinger of things to come: many types of environmental damages are likely to accelerate in the near future, with, for instance, hundreds of dams being planned on the Ganges River and its tributaries alone." 16.5 Environmental Protection During the last few decades, many experts have drawn attention to the close links between environment and development. The mad rush for industrial growth has, over

NSOU ? GE-SO-21 251 the years, led to environmental degradation on a large-scale accompanied by massive resource depletion. In their study *The Limits to Growth* published in 1972, D.H. Meadows, D.L. Meadows and R. Randers drew attention to the fact that there are a number of non-renewable resources whose present levels of consumption are such that the known reserves will be exhausted in not-so-distant future. Many later studies have also highlighted the danger of environmental degradation. Thus, the focus has now shifted to 'environmental protection'. According to the World Development Report (WDR) 1992, environmental problems can undermine the goals of development in two ways: "First, environmental quality—water that is safe and plentiful and air that is healthy—is itself part of the improvement in welfare that development attempts to bring. If the benefits from rising incomes are offset by the costs imposed on health and the quality of life by pollution, this cannot be called development. Second, environmental damage can undermine future productivity. Soils that are degraded, aquifers that are depleted, and ecosystems that are destroyed in the name of raising incomes today can jeopardise the prospects for earning income tomorrow." Therefore, environmental protection should form a part of any comprehensive programme of industrial development. In this context, the social scientists now emphasise the concept of sustainable development.

16.6 From Un-sustainable to Sustainable Development Man is part of the nature, and he is bound to obey the laws of nature. He depends on his environment for food, water, air, space, and shelter. His intervention has made more significant changes in the natural environment for his developmental activities like agriculture, urbanization, industrialization mining, transportation, and technology. More developmental activities are adopted in order to increase the quality of life. For that he uses the available resources. The earth has a limited supply of resources and renewable resources. This is all to be managed in a scientific manner so that the generations to come can avail it. Hence developmental activities are to be taken with more care about the environment and its protection. Over the past three decades the World Commission on Environment and Development (WCED) has come to understand the necessity of developing a linkage between meeting the needs of people for natural resources and conserving for protecting the natural resources and the environment. This linkage has been identified NSOU ? GE-SO-21 252 and named as 'sustainable development'. The WCED's report in 1987 provided a commonly accepted definition for sustainable development that was reaffirmed at the Earth Summit in 1992. Sustainable development is defined clearly in the Brundtland Report *Our Common Future* (1987) in the following words: "

68%

MATCHING BLOCK 150/164

W

sustainable development seeks to meet the needs and aspirations of the present without compromising the ability of future generations to meet their own needs."

Sustainable development must balance the needs of society, the economy, and the environment. In the year 1992 the United Nations Conference on Environment and Development (UNCED) held at Rio de Janeiro, recognized the pressing environment and development problems of the world. It produced a global program of action for sustainable development into the 21st century by adapting Agenda 21. According to the Agenda 21 the countries should adopt national strategies for sustainable development, which should provide a balance in the needs of plans and policies of society, the economy, and the environment of the country. The first principle of Rio declaration is the sustainable development. The Rio declaration states that, "human beings are at the centre of concern for sustainable development. They are entitled to a healthy and productive life in harmony with the nature. Every generation should leave air, water and soil resources without any pollution as pure as it came to the Earth". The three important components of sustainable development are: i. Economic development like industrial development getting job opportunities utilisation of natural resources for developing the quality of life. ii. Community development providing food shelter cloth education and others essential for the human beings. iii. Environmental protection providing clean air water and environment for the present and future generations and utilisation of resources in a sustainable manner.

16.7 Sustainable Development—The Core Idea The term, "Sustainable development" was coined by the Brundtland Commission which observes "living standards that go beyond the basic minimum sustainable only if consumption standards everywhere have regard for long-term sustainability".

NSOU ? GE-SO-21 253 Sustainable development is defined as balancing the fulfillment of human needs with the protection of the natural environment so that these needs can be met not only in the present, but in the indefinite future. Sustainable development is a pattern of resource use that aims to meet human needs while preserving the environment. The field of sustainable development is conceptually divided into four general dimensions: social, economic, environmental, and institutional. The first three dimensions address key principles of sustainability, while the final dimension addresses key institutional policy and capacity issues. Thus sustainability, is a process which ensures the development of all aspects of human life affecting sustenance. It means resolving the conflict between the various competing goals, and involves the simultaneous pursuit of economic prosperity, environmental quality and social equity famously known as three dimensions with is the resultant vector being technology. Hence it is a continually evolving process. The journey (the process of achieving sustainability) is of course vitally important, but only as a means of getting to the destination (the desired future state). However, the 'destination' of sustainability is not a fixed place in the normal sense that we understand destination. Instead, it is a set of characteristics of a future society. Sustainable development is an eclectic concept, as a wide array of views fall under its umbrella. Different conceptions also reveal a strong tension between eco- centrist and anthropocentrism. Sustainable development ties together concern for the carrying capacity of natural systems with the social challenges facing humanity. As early as the 1970s 'sustainability' was employed to describe an economy in equilibrium with basic ecological support systems. Ecologists have pointed to the limits of growth and presented the alternative of a steady state economy in order to address environmental concerns. The field of sustainable development can be conceptually broken into three constituent parts: environmental sustainability, economic sustainability, and sociopolitical sustainability. Sustainable development cannot ignore any of the three. If we ignore the social dimension, the development process may be viable, if we ignore the environmental dimension, the development process may be equitable and if we ignore the economic dimension, the development process may be bearable, but not sustainable. In other words, the search for equity neglects environmental aspects, and the search for viability neglects social dimension and search for bear ability ignores economic efficiency. Thus, sustainable development process is that trajectory which is the synergy of efficiency, equity and acceptability.

NSOU ? GE-SO-21 254 16.8 Sustainable Development—Environment Linkage Sustainable development integrates the imperatives of developmentalism and environmentalism. It highlights the long-term doomsday scenario and puts emphasis on economic-ecological integration and regional scale. It consists of all the objectives, (Efficiency, growth, production, more consumption, more quantity etc.) of narrow economic system. Ecological sustainability requires economic efficiency. But an efficient use of resources need not be a sustainable one. It shows a compassionate concern for the posterity and for the world as a whole. It contends that environment and growth are not contradictory or incompatible. Healthy environment and sound resource base are rather prerequisites for sustainable development which is defined as the progress that seeks to meet the needs and aspirations

100%

MATCHING BLOCK 151/164

W

of the present without compromising the ability of future generations to meet their

requirements. This reconciles the need for conservation with the need for development at one stroke. Sustainable development is based on a broader economic system which fulfils intergenerational equity criteria. Its objectives are future quality, protection, conservation etc. The environmental and natural resources directly affect the standard of living or quality of life of people. The welfare of the individual is ultimately dependent upon the viability of life supporting system. An apparently efficient development path may not be sustainable. Sustainable development reconciles the need for environmental conservation and developmental thrust at one stroke. It is based upon a broader economic system, which includes all activities that affect the environment and energy base. An analysis of the capability of the economic system for resolving economic problems of allocating scarce resources to different and competing ends must include both the flow of natural and environmental resources into the production process and the flow of wastes from the production and consumption activities back to the environment. Sustainability necessitates the maintenance of the level of well-being so that it improves, but at least never allows a decline through time. Trends continued cannot be simply assumed. The implications for valuation are quite different, necessarily more stringent than what is implied by consideration of efficiency alone. The broad economic system should emphasise on green growth and green GNP.

NSOU ? GE-SO-21 255 Economic development adversely affects the environment, which undermines the health and reduces the quality of life. It eventually slows down the process of economic development. On the contrary sustainable development improves and conserves the environment, which encourages the development process. Development with sound environment and ecological balance improves the health and quality of life which eventually maintains the sustainable development. Sustainable development can be achieved only if the environment is conserved and improved. Moreover, a development path is sustainable if and only if the stock of overall capital assets remains constant or rises over time. This implies keeping the stock of natural capital at least constant. More strictly, the requirement is for non-negative change in the stock of natural resources and environmental quality. In basic terms, the environment should not be degraded further but improvements would be welcome. The argument quite simply is that the resource base of a country and the quality of its air, water, and land represents a common heritage for all generations. To destroy that endowment in the pursuit of short-term economic gains compromises the gains of future generations and is thus undesirable. Therefore, government must incorporate some form of environmental accounting into its policy decisions. This requires that, the preservation or loss of valuable environmental resources should be factored into estimates of economic growth and human well-being. Alternatively, policymakers may set a goal of no net loss of environmental assets. In other words, if an environmental resource is damaged or depleted in one area, a resource of equal or greater value should be regenerated elsewhere.

16.9 Population—Environment Linkage

Much of the concern over environmental issues arises from the fear that we may reach a limit to the number of people whose needs cannot be met by the earth's finite resources. Some experts have however argued that this fear is unfounded as technological innovations and progress can fulfill the needs of the growing population. For instance, during the 1950s and 1960s, it was widely believed that the developing countries - particularly China, India, and Indonesia - would not be able to feed their rapidly growing populations. However, thanks to introduction of high yielding varieties in agriculture, the doomsday scenario of famines and starvations did not

NSOU ? GE-SO-21 256 materialise in these overpopulated, developing countries. In the 1960s and 1970s, the Club of Rome and many other groups forecast that the Earth would rapidly run out of key natural resources. However, this has not happened so far as changes in technology and preferences have allowed the substitution of new resources in place of the existing ones. Nevertheless, all social scientists and environmentalists agree that the rate at which environmental degradation is taking place in the present carries a serious risk and jeopardises the ability of the present and future generations to meet their own needs. A slowing down of population growth rates would help in easing the intensification of many environmental problems.

16.10 Burden of Population on Environment

During the last fifty years, the world's population increased by more than 3.5 billion and 85 per cent of this increase was in the developing and transition economies. The number of people living in fragile rural areas in developing countries doubled posing a serious threat to the rural environment. There was a sharp increase in the urban population of these countries as well because of natural increase of population as a result of excess of births over deaths on the one hand, and migration from rural areas the other hand. Both, pull factors and push factors have operated together to swell the flow of people from rural areas to urban areas. The pull factors include the promise of better employment opportunities in urban areas, better income, better education, and health facilities, and in general a better lifestyle. The push factors include low levels of agricultural productivity in rural areas, widespread open and disguised unemployment, and wide disparity between urban and rural levels of income. As a result of all these mutually dependent and mutually reinforcing factors, the growth of population in urban areas has increased considerably putting severe pressure on urban facilities and resulting in environmental degradation in the form of water pollution, air pollution, noise pollution, increased accumulation of solid wastes, garbage, polythene bags, chemicals, toxic elements, etc., in urban areas. According to World Development Report 2003, in the next 30 to 50 years, the world population is expected to increase by 2 billion to 3 billion and this increase will almost be exclusively (97 per cent) in developing and transition economies. Moreover, this entire increase is expected to be in urban areas. The Report estimates that as

NSOU ? GE-SO-21 257 many as 2 billion people will live in two areas that are difficult to manage: fragile rural areas and mega cities. 16.11 Rural Population and Environment In overpopulated developing countries, there is a large rural population living in extreme poverty and destitution. This 'pressure' of rural population has led to more and more conversion of land to agricultural uses. This extensive cultivation has encroached upon the forest lands as large areas have been cleared for carrying on agriculture. Land-hungry farmers have even resorted to cultivating unsuitable areas - steeply sloped, erosion prone hillsides, arid and semi-arid land. Not only this, more and more intensive use of the existing agricultural land is being undertaken to meet the requirements of the increasing rural population. In many cases, farming has been intensified through shorter fallow periods rather than through the use of better inputs or techniques because of the poverty of the farmers. The 'shortening' of the fallow period lowers fertility as the soil does not get enough time to regenerate itself. It also leads to soil degradation. In those cases where the farmers have resorted to increased use of new agricultural techniques adoption of better seeds, fertilisers, pesticides, etc., agricultural production and productivity has undoubtedly increased. However, there are limitations of this technique as overexploitation of land and excessive use of fertilizers, pesticides lead to soil degradation and deterioration in the quality of land. It is widely reported that soil erosion, salinisation, compaction, and other forms of soil degradation affect 30 per cent of the world's irrigated lands, 40 per cent of rain fed agricultural lands, and 70 per cent of range lands. Cumulative global productivity loss due to land degradation over three decades has been estimated at 12 per cent of total production from irrigated land, rain fed cropland, and rangeland. This yields an average annual rate of productivity loss of 0.4 per cent." Since the 1950s, as much as 2 million hectares of land has been degraded worldwide. Along with soil degradation, deforestation is proceeding at a fast pace. One-fifth of all tropical forests have been cleared since 1960. According to Food and Agriculture Organization of the United Nations (FAO), deforestation has been concentrated in the developing world, which lost nearly 200 million hectares between

NSOU ? GE-SO-21 258 1980 and 1995. One of the important reasons of this rapid deforestation, as stated above, is the expansion of subsistence farming as increasing population has forced man to encroach upon forests in a bid to increase area under agricultural cultivation. 16.12 Urban Population and Environment Urban living poses environmental hazards, which affect the current population (especially poor people) through immediate, local impacts on health and safety. It also causes environmental degradation, with longer term, wider area and intergenerational consequences. As the population of urban areas has swelled over the years, an increasing number of poor people have been compelled to live in slums which are plagued by problems of overcrowding, sub-standard housing, poor access to safe water and sanitation and deplorable sewage disposal systems. The drainage facilities in slums are inadequate to deal with the increased strains on the system. The open drains often serve as depositors for road sweepings and human wastes. In rainy season water overflows and spreads into streets presenting a dingy view, promoting unhygienic conditions, and causing outbreak of numerous infectious diseases. A large number of families living in slums depend on public water stand posts and often more than 100 families use one tap. Heavy rush for water creates tension and often results in quarrels. Generally, only 5 to 10 per cent of the population in slums has private lavatory facilities either on their own or in common with others. Often more than one-third of the population of the slums uses public latrines. Approximately, 150 to 200 persons use one public lavatory. Consequently, people must stand in queue, sometimes, for more than half an hour to avail of lavatory facilities. Moreover, most of these latrines are in extremely dilapidated condition. Because of these factors, many slum dwellers are forced to defecate in the open or anywhere near their basti. Their excreta cause foul odour, uncleanliness and hence flies, mosquitoes, and diseases such as dysentery and cholera. All these factors lead to high rates of infant mortality. According to Human Development Report 2003, an estimated one-third of the developing world's urban population lives in slums. The position is particularly bad in South-Central Asia and Sub-Saharan Africa. In 2001, more than 70 per cent of the urban population in Sub-Saharan Africa lived in slums.

NSOU ? GE-SO-21 259 Box-1: Population and Environment Linkage ? During the last 50 years, world population increased by more than 3.5 billion and 80 percent of this increase has been in the developing countries. ? In developing countries, the number of people in rural areas doubled posing a serious threat to rural environment. ? The growth of population in urban areas has been putting severe pressure on urban facilities and has resulted in environmental degradation in the form of water pollution, air pollution, noise pollution, increased accumulation of solid waste, garbage, polythene bags, chemicals, toxic elements etc. ? Over exploitation of land and excessive use of pesticides has led to soil degradation and deterioration in the quality of land. It is widely reported that soil erosion, salinisation, compaction and other forms of soil degradation have affected 30 percent of the world's irrigated lands and 40 percent of rainfed agricultural lands. ? Along with soil degradation, deforestation is proceeding at a fast pace. ? One-third of the developing world's population lives in slums. Problems of slum dwellers worsen their living in cities and make them more vulnerable. ? The main problems faced by slum dwellers in urban areas are as follows: ? Sanitation ? Drainage ? Solid waste management ? Air-pollution ? Water supply contamination World Development Report 2003 classifies cities into four categories—low- income cities, lower-middle income cities, upper-middle income cities and high income cities. Particularly worrisome are the environmental problems plaguing the low-income and lower-middle income cities. The WDR specifically points out the following problems: i. Waters supply service. In low-income cities, the coverage of water supply service is low, there is high bacteria contamination, and there is high risk of

NSOU ? GE-SO-21 260 food contamination and infectious diseases due to inadequate quantity of water supply for hygiene. In the case of lower-middle income cities, poor residents and informal neighbourhoods have low access to water supply service. ii. Sanitation. In low-income cities, there is very low coverage due to low ratio of public toilets to residents resulting in open defecation in some neighbourhoods. As a result, there is a high risk of diarrheal diseases. The lower-middle income cities have somewhat better coverage of latrines and public toilets, but they are poorly maintained and there is low sewerage coverage. iii. Drainage. Storm drains in low-income cities are very inadequate and whatever drains are there, are poorly maintained. This results in frequent flooding, creating high risk of water-related disease vectors (mosquitoes). Situation in lower-middle income cities is somewhat better. iv. Water resources. In low-income cities, there is mixed sewerage and storm water run-off to water bodies causing bacterial pollution and silting. In lower-middle income cities, there is risk of groundwater contamination from poorly maintained latrines and untreated sewage. The situation in upper- middle income cities is also a cause of concern as private wells are drawing down groundwater. Moreover, industrial, and municipal discharge results in severe pollution. v. Solid waste management. There is little organised collection of solid waste in low-income cities and frequently open dumping or burning of mixed wastes is resorted to. All these result in high exposure to disease vectors (rats, flies, etc.). In lower-middle income cities, there is moderate coverage of collection services. However, there is little separation of hazardous waste and there are many uncontrolled landfills. vi. Air pollution. In low-income cities, there is indoor and ambient air pollution from low quality fuels for household uses and power generation. In all the other three types of cities, there is ambient air pollution from industrial and vehicular emissions. vii. Land management. Due to large-scale migration from rural areas and fast increasing population of urban areas, there is a situation of chaos in land

NSOU ? GE-SO-21 261 management particularly in low-income and lower-middle income cities. In low-income cities, there is uncontrolled land development due to intense pressure from squatter settlements on open sites. In lower-middle income cities, there are ineffective or inappropriate land-use controls. These push new settlements toward urban periphery and there is continued high population growth. From the above discussion, it is clear that many residents in cities at low levels of development face environment risk. In low-income cities, less than half of the households are connected to water and sewerage, and per capita water consumption is half that of cities with lower-middle income rankings. Moreover, less than one-third of solid waste in the poorest cities is disposed of properly. Partly reflecting environmental risks, the average mortality of children under five in the poorest cities is more than twice than that in the next city-income category, and 20 times than those in richest cities. 16.13 Environment Protection—A Necessity Rapid environmental degradation that has been taking place all over the world in recent decades has alarmed social scientists and environmentalists alike. Most of the economists are now convinced that unless strong steps are taken to preserve environment, the future is sure to spell havoc. The danger in developing countries is that communities may inadvertently, because of ignorance or economic necessity, destroy or exhaust those very resources on which they depend for survival. Rising pressures on environmental resources in developing countries can have severe consequences for self-sufficiency, income distribution, and future growth potential in the developing world. Damage to the environment has three potential costs to present and future human welfare: (1) it harms human health, (2) it reduces economic productivity, and (3) it leads to loss of 'amenities'—a term that describes the many other ways in which people benefit from the existence of an unspoiled environment. i. Environmental degradation harms human health. As noted by World Development Report 1992, human welfare is reduced by ill health and

NSOU ? GE-SO-21 262 premature mortality caused by degradation of air and water quality and by other environmental risks. Pollutants can cause health problems through direct exposure or indirectly through changes in the physical environment- the effects of which range from increased solar radiation to lower nutrition. ii. Environmental degradation reduces economic. Impaired health may lower human productivity, and environmental degradation reduces the productivity of many resources used directly by people. Water pollution damages fisheries, and water logging and salinisation of the soil lowers crop yields. iii. Environmental degradation leads to loss of amenities. Amenities include values that range from those associated with recreation to those associated with deeply held spiritual views about the intrinsic worth of the natural world. Amenities are hard to measure than costs to health and productivity but must be valued just as highly. There is absolutely no doubt that a clear vista or a clean and quiet neighbourhood adds to the quality of life. Environmental assets are often valued even by people who never enjoy them directly but who cherish the thought that they exist and the prospect that future generations will enjoy them too. The above clearly brings out the necessity of protecting environment. Accordingly, most of the developing economists are now veering around to the view that environment costs associated with various economic activities should form a part of policy initiatives. As correctly pointed out by Todaro and Smith, damage to soil, water supplies, and forests resulting from unsustainable methods of production can greatly reduce long-term national productivity but will have a positive impact on current GNP figures. Therefore, it is very important that the long-term implications of environmental quality be considered in policy analysis. In fact, experts now emphasise the concept of sustainable development. Sustainable development can be achieved by keeping the stock of natural capital at least constant. As stated earlier in this chapter, the resource base of a country and the quality of its air, water, and land represents a common heritage for all generations. To destroy that endowment in the pursuit of short-term economic gains compromises the gains of future generations and is thus undesirable.

NSOU ? GE-SO-21 263 16.14 Conclusion Environment is defined as the physical, chemical, and biological surroundings in which an organism exists. It has a clear linkage with the process of development as well as population growth. The mad rush for industrial growth has, over the years, led to environmental degradation on a large-scale accompanied by massive resource depletion. This has led to the policy makers to widen the horizon still further—from sustainable economic development to sustainable human development. The latter would imply that future generations should be afforded at least the same capacity for human well-being as the present generation. This means that we should ensure that the ecological and environmental limits are not violated—especially because we do not know the long-term implications disturbing many natural systems. During the last fifty years, the world's population increased by more than 3.5 billion posing a serious threat to the environment, particularly in the developing nations. Rising pressures on environmental resources in developing countries can have severe consequences for self-sufficiency, income distribution, and future growth potential. So, protection and conservation of environment is of dire need for ensuring sustainable world for the future generation. 16.15 Summary A population is the number of living people that live together in the same place, usually population refers to the number of members in a certain area. Demography is the study of a population, the total number of people or organisations in a given area (

100%

MATCHING BLOCK 156/164

SA

CHAPTER.docx (D129895265)

the whole number of people or inhabitants in a country or region, the

total of individuals occupying an area or making up a whole). Understanding how population characteristics such as size, special distribution, age structure, or the birth and death rate change over time can help scientists or governments make decisions. Sociologists focus on the socio-cultural factors that influence population rates and trends. They study fertility, mortality, and migration. These variables are profoundly affected by the norms, values, practices and social patterns of a social. The population affects our chances of finding a job and a spouse. Rapid population

NSOU ? GE-SO-21 264 growth is likely to reduce per-capita income growth and well being which tends to increase poverty. More people means an increased demand for food, water, housing, energy, healthcare, transportation, and more. From the time of Malthus onwards, economist, demographers, and other social scientists have been debating whether and how fertility and rapid population growth affect economic outcomes and vice versa. Since the earliest times humans have sought to understand the relationship between population dynamics and the environment. The environment directly affects health status and plays a major role in quality of life, years of healthy life lived, and health disparities. Poor air quality is linked to premature death, cancer, and long-term damage to respiratory and cardiovascular systems. Five important global scale environmental indicators are biological diversity, food production, average global surface temperature and atmospheric concentrations, human population and resources depletion. More people require more resources, which means that as the population increases, the earth's resources deplete more rapidly. As a result, loss of biodiversity is seen as humans strip the earth for resources to accommodate rising population numbers. The impact of so many humans on the environment takes two major forms, (i) consumption of resources, such as land, food, water, air, fossil fuels, minerals, etc, (ii) waste products as a result of consumption such as air and water pollutants, toxic materials and green house gases.

16.16 Questions Answer the following questions in your own words. G-A (5 Marks each)

- What do we mean by environment?
- What is the burden of population on environment?
- How does urban population impact the environment?
- Why is environment protection necessary? Discuss briefly.
- Discuss the population-environment linkage.

NSOU ? GE-SO-21 265 G-B (10 Marks each)

- Write a note on conventional process of development and environmental degradation.
- Write a note on rural population and environment.
- Elucidate the linkage between sustainable development and the environment.
- Why did the idea of Sustainable Development crop up? Discuss its core concept.
- Discuss the aspects of urban population and environment.

Unit 17 ? Human Development Index

Structure 17.1 Objectives 17.2 Introduction 17.3 Human Development 17.4 Why Human Development? 17.5 Essential Components of Human Development 17.6 The Human Development Index 17.7 Construction of Human Development Index 17.8 Creating the Dimension Indices 17.9 Calculating HDI from Dimension Indices 17.10 Features of HDI 17.11 Significance of HDI 17.12 HDI for India 17.13 Inequality—Adjusted HDI 17.14 Conclusion 17.15 Summary 17.16 Questions 17.17 Suggested Readings

17.1 Objectives The objective of the unit is to acquaint the students with the interrelationship between environment and development as well as between population and environment. Learners will get the idea how adversely they are affecting the environment and the policy measures adopted in this behalf. Learners will also be familiar with the idea of human development and the construction of human development index with the help of three indicators thereof.

17.2 Introduction Along with sustainable development the concept of human development has also

NSOU ? GE-SO-21 267 been a much-talked issue for last few decades. Human development is the process of enlarging people's choices. Human development paradigm embraces the entire society not just the economy. The political, cultural and social factors are given as much importance as the economic factors. According to the Human Development Index (HDI) has rightly incorporates three indicators: longevity, educational attainment and standard of living. The first two indicators are the social indicators and the last one is an economic indicator.

17.3 Human Development

In recent years the search for an alternative to GNP as a measure of economic development has led to computation of the Human Development Index (HDI). The United Nations Development Programme (UNDP) introduced the HDI in its first Human Development Report prepared under the able stewardship of Mahbub Ul Haqq and published in 1990. The measure has been enlarged and refined over the years and many related indices of Human Development like Gender-related Development Index (GDI), Gender Empowerment Measure (GEM), Gender Inequality Index (GII) Human Poverty Index (HPI) and Multidimensional Poverty Index (MPI) have been developed in subsequent Human Development Reports published annually by the UNDP. Since its launch in 1990, the Human Development Report has defined human development as the process of enlarging people's choices. The most critical ones are to lead a long and healthy life, to be educated and to enjoy a decent standard of living. Additional choices include political freedom, other guaranteed human rights and various ingredients of self-respect. These are among the essential choices the absence of which can block many other opportunities. Human development is thus a process of widening people's choices as well as raising the level of well-being achieved. Thus, as noted by Paul Streeten, the concept of human development put people back at center stage, after decades in which a maze of technical concept had obscured this fundamental vision. According to Mahbub Ul Haqq, "the definite difference between the economic growth and the human development schools is that the first focuses exclusively on the expansion of only one choice- income- while the second embraces the enlargement of all human choices- whether economic, social, cultural or political." It is sometimes suggested that the expansion of income can enlarge all other choices as well. This may happen but generally, does not on account of a variety of reasons. First, income may be unevenly distributed within a society. The choices of those people who have either no access to income or a very limited access are very much limited. Thus, economic growth does not trickle-down. Second, and more importantly the national priorities chosen by the society or its ruler and the political structure prevalent in the society may not allow the income expansion to enlarge human options. As emphasised by Mahbub Ul Haqq, 'use of income' by a society is just as important as generation of income itself as would be clear from the fact that income expansion leads to much less human satisfaction in a virtual political prison or cultural void, than in a more liberal political and economic environment. Accumulation of wealth may not be necessary for the fulfillment of several kinds of human choices. In fact, many choices do not require any wealth at all. For instance, a society does not have to be rich to afford democracy. A family does not have to be wealthy to respect the rights of each member. A nation does not have to be affluent to treat women and men equally. Valuable social and cultural traditions can be and are maintained at all levels of income. There are many human choices that extend far beyond economic wellbeing. Knowledge, health, a clean physical environment, political freedom and simple pleasures of life are not dependent on income. Accumulation of wealth can expand people's choices in these areas, but this is not necessary. It is the use of wealth and not wealth itself that is decisive. Haqq thus, rightly warns, "Unless societies recognise that their real wealth is their people, an excessive obsession with creating material wealth can obscure the goal of enriching human life."

17.4 Why Human Development?

According to Paul Streeten, human development is necessary on account of the following reasons: i. Human development is the end while economic development is only a means to this end. The ultimate purpose of the entire exercise of development is to treat men, women and children-present and future generations-as ends, to improve the human condition to enlarge people's choices.

NSOU ? GE-SO-21 269 ii. Human Development is a means to higher productivity. A well-nourished, healthy, educated skilled, alert labour force is the most important productive asset. Thus, investments in nutrition, health services and education are justified on grounds of productivity. iii. It helps in lowering the family size by slowing human reproduction. It is the experience of all developed countries that improvement in education levels particularly of girls, better health facilities and reduction in infant mortality rates leads to lowering of the birth rates. While improve education facilities make people aware of the benefits of a small family in terms of higher income level, better standards of living etc., reduction in infant mortality rates reduces the incentive of having large families as fewer child deaths are now feared. iv. Human Development is good for physical environment. Deforestation, desertification, and soil erosion decline when poverty decline. How population growth and population density affect the environment is a subject of controversy. The conventional view is that they have a detrimental effect. However, Paul Streeten cites recent research to show that rapid population growth and high population density, particularly if combined with secure land rights, can be good for soil and forest conservation. v. Human development and reduced poverty contribute to a healthy civil society, increased democracy, and greater social stability. Moreover, human development can help in reducing civil disturbances in a society and in increasing political stability. The above discussion shows that human development paradigm embraces the entire society not just the economy. The political, cultural and social factors are given as much importance as the economic factors. What is more, a careful distinction is maintained between ends and means. While people are regarded as the end of development the means are not forgotten. In this context, the expansion of income becomes an essential means for expanding many human options. However, the character and distribution of economic growth are measured in terms of enriching the lives of people. People do not just remain the instruments for producing commodities but acquire the centre

NSOU ? GE-SO-21 270 stage. Production processes are not treated in an abstract vacuum but acquire 'human' context.

17.5 Essential Components of Human Development According to Mahbub Ul Haqq

there are four essential components in the human development paradigm: equity, sustainability, productivity, and empowerment.

i. Equity If development is to enlarge people's choices people must enjoy equitable access to opportunities. Equity in access to opportunities demands a fundamental restructuring of power in many societies and changes along the following lines: (i) change in the distribution of productive assets especially through Land Reforms: (ii) major restructuring in the distribution of income through progressive fiscal policy, aimed at transferring income from the rich to the poor. It is the redistribution of income from rich to poor; (iii) overhauling of the credit system so that the credit requirements of the poor people are satisfactorily met; (iv) equalization of political opportunities through voting rights reforms, campaign finance reform and other actions aimed at limiting the excessive political power of a feudal minority; and (v) undertaking steps to remove social and legal barriers that limit the access of women or of certain minorities or ethnic minorities to some of the key economic and political opportunities.

ii. Sustainability The next generation's right to enjoy the same well-being that we enjoy now makes sustainability an essential component of the human development paradigm. At times the concept of sustainability is confused with the renewal of natural resources which is just one aspect of sustainable development. As emphasised by Mahbub ul Haq "it is the sustainability of human opportunities that must lie at the centre of our concerns." This, in turn, requires sustaining all forms of capital-physical, human, financial and environmental. Sustainability is a matter of distributional equity- of sharing development opportunities between present and future generations and ensuring intra- generational and intergenerational equity in access to opportunities. However,

NSOU ? GE-SO-21 271 as cautioned by Haq, "sustainability does not mean sustaining present levels of poverty and human deprivation. If the present is miserable and unacceptable to the majority of the world's people, it must be changed before it is sustained. In other words what must be sustained are worthwhile life opportunities, not human deprivation". But sustainability also means that wide disparities in lifestyles within and between nations must be re-examined and efforts to be undertaken to reduce them. This is due to the reason that an unjust world is inherently unsustainable- both politically and economically. It may be environmentally unsustainable as well. iii. Productivity An essential part of the human development paradigm is productivity which requires investments in people and an enabling macroeconomic environment for them to achieve their maximum potential. Economic development is therefore a subset of human development models- an essential part but not the entire structure. Many East Asian economies like Japan and the Republic of Korea have accelerated their growth through tremendous investments in human capital. In fact, most of the development literature has focused on the productivity of human in the world. Many recent models of development are based primarily on human capital. However, as correctly pointed out by Haq, this approach treats people only as a means of development and obscures the centrality of people as ultimate end of development. Therefore, it is better to treat productivity only as one part of the human development paradigm-with equal importance given to equity, sustainability, and empowerment. iv. Empowerment Human development paradigm envisages full empowerment of the people. Empowerment means that people are able to exercise choices of their own free will. It implies a political democracy in which people can influence decisions about their lives. It requires economic liberalism so that people are free from excessive economic controls and regulations. It means decentralization of power so that real governance is brought to the doorstep of every person. It means that all members of civil society, particularly non-governmental organisations, participate fully in making and implementing decisions. The empowerment of people requires action on various fronts: (i)

NSOU ? GE-SO-21 272 it requires investment in education and health of the people so that they can take advantage of market opportunities; (ii) it requires ensuring an enabling environment that gives everyone access to credit and productive asset so that the playing fields of life are more even; and (iii) it implies empowering both women and men so that they can compete on an equal footing. 17.6 The Human Development Index The above discussion shows that the concern of developing economy in recent years has shifted from economic development to human development. For too long, the recurrent question was how much is a nation producing? Increasingly now the question that is being asked is, how are its people faring? The main reason for this shift in focus is the growing recognition that

76%

MATCHING BLOCK 153/164

W

the real objective of development is to enlarge people's options. Income is

only one of the options-

96%

MATCHING BLOCK 154/164

W

and an extremely important one but it is not the total of human

life. Education and literacy, health, physical environment, equality of opportunities to all people irrespective of sex, caste and creed, political freedom etc., may be just as important as income. However, while human development is indeed the 'end' of all activity, its measurement is not an easy task. While economic growth has traditionally been measured in terms of national income, it is difficult to decide how human development is to be measured particularly in view of its various dimensions as pointed out earlier. The search for a comprehensive measure that could capture the various dimensions of human development leads to the definition and formulation of Human Development Index (HDI) by the United Nation Development Programme (UNDP) in Human Development Report (HDR) published in 1990. It is of course agreed that the concept of human development is much wider and richer than what can be caught in index or set of the indicators. However, such indexes are useful in focusing attention and simplifying problems. They have considerable political appeal. They have a stronger impact on the mind and draw public attention more powerfully than a long list of indicators combined with the qualitative discussion. As noted by Streeten, the strongest argument in favour of such indexes is that they show up the inadequacies of other indexes, such as GNP. They redirect our attention from one set of items to others- in the case of the HDI, to the social sectors: nutrition education and health.

NSOU ? GE-SO-21 273 HDI does not replace GNP but as considerably to an understanding of the real position of a society in many respects as would be clear from the following discussions. i. Beside income the HDI measures education and health and is thus multidimensional rather than one dimensional; ii. It focuses the attention of the policymakers on the ultimate objective of development not just the means; iii. It is more meaningful as a national average than GNP because there are much greater extremes in income distribution than in the distribution of the life expectancy and literacy; iv. Any upward movement in HDI can be regarded as an improvement; v. Whereas high incomes for some can cause relative deprivation for others, this is not true for human development. If anything improving the health and education of anyone benefits the entire community; vi. It shows that human development gaps between nations are more manageable than the ever-widening disparities in income. Since 1960 average life expectancy had increased by 16 years, adult literacy by 40 percent and nutritional levels by more than 40 percent and child mortality rates have been halved. The international gap in these indicators is closing while in the case of GNP per capita it is widening. While average income per head in the Southern countries of the world is 6 percent of that in the Northern countries of the world, life expectancy is 80 percent, literacy 60 percent and nutrition 85 percent; vii. The HDI can be disaggregated by gender, ethnic group or geographical region and many other ways- to present relevant policy measures and the 'danger points' of explosion. The principles that have guided the search for HDI are as follows: i. First, the new index would measure the basic concept of human development to enlarge people's choices. Those choices covered the desire to live long, to acquire knowledge, to have a comfortable standard of living, to be gainfully employed, to breathe clean air, to be free, to live in a community. Obviously, all these cannot be quantified or measured. The basic idea was to measure at least some more

NSOU ? GE-SO-21 274 choices besides income and to reflect them in a methodically sound composite index. ii. Second, to keep the index simple and manageable it was decided to include only a limited number of variables. For instance, HDR 2009 chose life expectancy at birth as an index of longevity, adult literacy rate (two-third weight) and combine primary, secondary and tertiary enrollment rates (one-third weight) as an index of knowledge, and GDP per capita as an index of access to a multiplicity of economic choices, in other words, a decent standard of living. HDR 2010 made important changes in these definitions. iii. Third, it was decided to construct a composite index rather than a plethora of indexes. However, this posed several problems. Unlike GDP, for which money serves as a 'common measuring rod', there was no such common currency for measuring socio-economic progress. Life expectancy is measured in years, adult literacy in percentage of adults, and real income in purchasing power parity (PPP) adjusted dollar. How to reduce these indicators to a common denominator? To tackle this question, it was decided to measure the actual progress in each indicator as relative distance from a desirable goal. The maximum and minimum observed values for each variable were reduced to a scale between 0 and 1: each country was at some point on the scale. As far as the question of weightage is concerned, it was agreed to assign equal weights to the three variables on the simple premise that all the choices were very important and that there was no a priori rationale for giving a higher weight to one choice rather than to another. iv. Fourth, it was decided to cover both economic and social choices in HDI. A mistake in the past had been to construct separate measure for economic progress (GNP) and for social progress (such as physical quality of life index, or PQLI). Such a formulation missed the synergy between social and economic progress. The truth of the matter is that economic growth increases the resources and options available for social progress, where as social progress creates a conducive environment for economic growth. Thus, both move hand-in-hand. The real GDP per capita or GNP per capita is economic indicator and like expectancy and education entertainment the social indicators in HDI.

NSOU ? GE-SO-21 275 17.7 Construction of Human Development Index As stated above, HDI is a

100%

MATCHING BLOCK 155/164

W

summary measure of Human Development. It measures the average achievements in

a country in three basic dimensions of human development: a long and healthy life, access to knowledge and a decent standard of living. Since 2010, HDI is being defined in HDR as the geometric mean of normalised indices measuring achievements in each dimension (prior to HDR 2010, simple arithmetic means of the three-dimension indices used to be taken). Graphical presentation of calculating the Human Development Index (HDI) Human Development Index (HDI) Human Development living Index (HDI) DIMENSION INDICATORS Long and healthy life Life expectancy at birth Knowledge Means years of schooling Expected years of schooling A decent standard of GNP per capita (PPP US\$) DIMENSIONS INDEX Life expectancy Index Education Index GNP Index In HDR 2010, the ability to enjoy a long and healthy life is defined in terms of life expectancy at birth which is the same as in earlier Reports. However, changes in definition of the 'knowledge dimension' and 'standard of living dimension' have been carried out. In the earlier Reports, GDP per capita in PPP dollars was used as a measure of standard of living while in HDR 2010 it has been replaced by GNP per capita in PPP dollars. This is due to the reason that in a globalised world, differences are often large between the income of a country's residents and its domestic production. While GDP represents the country's gross domestic production, GNP, in addition, captures the country's income receipts from abroad as well. As far as the knowledge dimension is concerned, mean years of schooling replaces literacy, and gross enrollment is recast as expected years of schooling- the years of schooling that a child can expect to receive given current enrollment rates. According to HDR 2010, mean years of schooling is estimated more frequently for more countries and can discriminate better among countries, while expected years of schooling is consistent with the reframing of this dimension in terms of years.

NSOU ? GE-SO-21 276 17.8 Creating the Dimension Indices The first step is to create sub-indices for each dimension. Minimum and maximum values (goalposts) need to be set to transform the indicators into indices between 0 and 1. HDR 2013 takes the maximum values as the highest observed values in the time series (1980-2012). The minimum values can be appropriately conceived of as subsistence values. The life expectancy minimum is taken as 20 years (based on long run historical evidence). Education minimum (for both variables) is taken as zero as societies can subsist without formal education. Minimum income (Per capita gross national income) is taken as \$100. The low value of income can be justified by the considerable amount of unmeasured subsistence and non-market production in economies close to the minimum, not captured in the official data. The goalposts taken in HDI 2013 are as follows: Table-1: Goalposts for Calculating the HDI according to HDR 2013 Dimension Observed Maximum Minimum Life expectancy 83.6 20.0 (Japan, 2012) Means years of schooling 13.3 0 United States, 2010 Expected years of schooling 18.0 0 (Capped at) Combined education index 0.971 0 (New Zealand, 2010) Per Capita Income (PPP \$) 87478 100 (Qatar, 2012) Having defined the minimum and maximum values, the sub-indices are calculated as follows: Actual Value-Minimum Value Dimension Index = ----- (1) Maximum Value-Minimum Value For education, equation (1) is applied to each of the two sub-components, then a geometric mean of the resulting indices is created. For calculating income index, log of income continues to be taken as before.

NSOU ? GE-SO-21 277 17.9 Calculating HDI from Dimension Indices HDR 2011 defined HDI as the geometric mean of the three dimension indices: $(\sqrt[3]{\text{Life} \cdot \text{Education} \cdot \text{Income}})$ (2) Prior to 2010, Simple Arithmetic mean of the dimension indices used to be taken. Some economics had criticized this methodology as linear aggregation formula implied perfect substitutability across dimensions. Use of geometric mean acknowledges the fact that there is imperfect substitutability among the 3-dimension indices. Moreover, as a basis for comparisons of achievement, this method is also more respectful of the intrinsic differences in the dimension than a simple average is.

17.10 Features of HDI HDI is a composite of three indicators. i. Longevity (or life expectancy at birth); ii. Educational attainment; and iii. Standard of living (or per capita income). The first two indicators are the social indicators. Life expectancy, a much-desired objective of human beings, reflects the progress made in such fields as health, infant and child mortality and nutrition. The educational attainment is comprised of adult literacy, and a combined primary, secondary and tertiary enrolment ratio. The per capita income, an economic indicator, is used as a proxy measure for satisfaction derived from a bundle of basic goods and services. It is also assumed to reflect employment levels of people. The HDI, unlike other indices which measure absolute levels, ranks countries in relation to each other. For this the current minimum value and the maximum desirable value in respect of each of the three elements of the index are taken note of. For example, for life expectancy the current value is 25 years, and the maximum desirable value is 85 years. In the case of the educational attainment the minimum and the maximum values are 0 per cent and 100 per cent. The index then takes the distance travelled (or progress made) from the minimum towards the maximum.

NSOU ? GE-SO-21 278 This is expressed in percentage terms. The same exercise is repeated in respect of the third component of income index. The distance travelled in each case has been used as the basis for combining the three indices. This gives a common denominator to rank countries on a uniform scale. Another novel feature of the HDI is the weight assigned to income which tapers off sharply beyond the threshold income regarded as sufficient for human survival. This means that as the income goes beyond the cut-off point, it becomes increasingly less important, on the valid assumption that the rise in income beyond a certain point is subject to diminishing returns. Therefore, the other two indicators become more influential in determining the index. 17.11 Significance of HDI The index is useful and meaningful, especially for the less-developed countries. It is much better than other non-income indices. It includes income which is the single most important factor in determining the well-being of the poor in the less developed countries. While it gives importance to income, it does not do so unduly. The decline in its weightage after a certain point, automatically raises the importance of social indicators. This incorporates the present concern of many nations with human development rather than with mere economic growth. Equally importantly, the inclusion of social indicators, the HDI stresses the importance of the quality of life. This brings in the government expenditure which, with some restructuring, can be helpful in providing more resources for health and education. The index, by highlighting the distance yet to be covered by the less-developed countries brings into limelight, factually and sharply, the wide disparities that exist in the levels of human development between them and the developed countries. The index is of special importance as it has the quality of a dynamic index. With changes in the data in respect of its three components including changes in the minimum and the maximum values, the HDI will also change and thereby measures progress along the right lines. Thus, it becomes a measure of movement towards desired objectives.

NSOU ? GE-SO-21 279 17.12 HDI for India In India, GNI(Gross National Income) per capita in 2012 was \$3285, life expectancy at birth in 2012 was 65.8 years, mean years of schooling in 2012 were 4.4 years, and expected years of schooling in 2012 were 10.7 years. Dimension indices are then obtained as follows: $65.8 - 20$ Life expectancy index = $\frac{65.8 - 20}{83.6 - 20} = 0.720$ $4.4 - 0$ Means years of schooling index = $\frac{4.4 - 0}{13.3 - 0} = 0.331$ $10.7 - 0$ Expected years of schooling index = $\frac{10.7 - 0}{18 - 0} = 0.594$ $18 - 0$ Education index = $\frac{0.720 \times 0.594 \times 0.516}{0.971 - 0} = 0.456$ $0.971 - 0$ $\log 3285 - \log 100$ Income index = $\frac{\log 3285 - \log 100}{\log 87478 - \log 100} = 0.516$ $\log 87478 - \log 100$ Human Development Index = $3 \times 0.456 \times 0.516 = 0.720 \times 0.456 \times 0.516 = 0.554$ Table-2: Human Development Index 2012 for selected countries HDI rank Life Adult GDP Human country expect- literacy per Develo- ancy at age 15 Gross enrolment ratio (%) capita pment birth and 2005 Index years above PPP (%) ----- US \$ 2012 2005-10 Primary Secondary Tertiary 2011 2012 2002-11 2002-11 2002-11

Niger 55.1 28.7 71.0 13.0 1.5 642 0.304 Source: UNDP, Human Development Report 2013 In Table-2, Human Development Index for 2012 for selected countries as reported in HDR 2013 is presented. Countries have been grouped under three categories: (i) Countries in the HDI range 0.8 and above are in the Very High Human Development group; (ii) Countries in HDI range 0.7 to 0.8 are in the High Human Development group; (iii) Countries in the HDI range 0.5 to 0.7 are in the range of Medium Human Development group, and (iv) Countries in the HDI range less than 0.5 are in the Low Human Development group. The data has been collected for 187 countries. Among them 47 countries were in the Very High Human Development range, 47 countries were in High Human Development range, 47 countries were in Medium Human Development range and 46 countries were in Low Human Development in range. In terms of human development, Norway with HDI value of 0.955 ranks first and Australia with a HDI value of 0.938 ranks second. India which was at No. 138 in HDI in 1994, had improved its position to No. 128 in 2005, but in 2012 its position has slipped to 136

NSOU ? GE-SO-21 281 in terms of human development out of the 187 countries for which Human Development Report 2013 calculated the index. Democratic Republic of Congo and Niger with a HDI value of 0.304 occupy the last place in HDI ranking. It may be discerned from HDI table that countries with similar per capita income may have different HDI values, and countries with different per capita income may have similar HDI values. Thus, the HDI ranking of countries may differ significantly from their ranking by per capita income. If a country's GDP rank is higher than its HDI rank, it implies that the country has further potential for improving the standard of living of its people. But it has been less successful in converting its economic prosperity into better lives for its people. On the other hand, if a country's HDI rank is higher than its GDP rank, it implies that the country has effectively made use of its income to improve the lives of its people.

17.13 Inequality—Adjusted HDI HDR 2010 introduced three new measures- the Inequality-adjusted Human Development Index (IHDI), the Gender Inequality Index (GII) and the Multidimensional Poverty Index (MPI). As far as IHDI (Inequality-Adjusted Human Development Index) is concerned, it considers not only a country's average human development, as measured by health, education, and income indicators but also how it is distributed. Differentiating between HDI and IHDI, HDR 2010 states, "We can think of each individual in a society as having a 'personal HDI'. If everyone had the same life expectancy, schooling, and income, and hence the average societal level of each variable, the HDI for each society would be same as each personal HDI level and hence the HDI of the 'average person'." In practice, of course, there are differences across people, and average HDI differs from the personal HDI levels. The IHDI accounts for inequalities in life expectancy, schooling, and income, by discounting each dimension's average value according to its level of inequality. The IHDI will be equal to the HDI when there are no inequalities across people, but falls below the HDI as inequality increases. In this sense, HDI can be viewed as an index of 'potential' human development (or the maximum IHDI that could be achieved if there were no inequality), while the IHDI is the actual level of human development (accounting for inequality). The difference between the HDI and the IHDI measures the 'losses in potential human development due to inequality'.

NSOU ? GE-SO-21 282 17.14 Conclusion During the last fifty years, the world's population increased by more than 3.5 billion posing a serious threat to the environment, particularly in the developing nations. Rising pressures on environmental resources in developing countries can have severe consequences for self-sufficiency, income distribution, and future growth potential. So, protection and conservation of environment is of dire need for ensuring a sustainable world for the future generation. For few decades, the concern of the policy makers has shown a clear shift from mere economic development to human development. Human development is a process of widening people's choices as well as raising the level of well-being achieved. The Human Development Index (HDI) is an alternative measure of development which supplements rather than supplants the GNP measure of economic development. The index stresses on human development which puts people at the centre stage. Mere rise in per capita income does not ensure human development which means a process of enlarging people's choices. There are many human choices that extend far beyond per capita income or any other measures of economic well-being. Knowledge, health, a clean physical environment, political freedom, and simple pleasure of life are not dependent on income. It is the use of wealth and not wealth itself that is important for human development. The HDI is the right step against the misconception of economic development. It must be admitted that the HDI is more plausible than the per capita income as an index of economic development. It stresses on human development, not merely on economic development and economic well-being. The HDI focuses the attention on the ultimate objective of development, not just the means of development.

17.15 Summary The word 'development' is widely used to refer to a specified state of advancement or growth. It could also be used to describe a new and advanced idea or product or an event that constitutes a new stage under changing circumstances. Generally, the term development describes good change.

NSOU ? GE-SO-21 283 Human Development is a lifelong process of physical, behavioural, cognitive, and emotional growth and change. Human development refers to the physical, cognitive, and psychological development of humans through out the life span. What types of development are involved in each of these domains or areas, of life? Physical development involves growth and changes in the body and brain, the senses, and health and wellness. Cognitive development involves learning, reasoning, and creativity. Psychological development involves emotions personality and social relationships. HD is a branch of psychology. It is a multidisciplinary study of the psychological, biological, and sociological factors that impact people from infancy through adolescence to adulthood. Human Development defined as the process of enlarging people's freedom and opportunities improving their benefits. HD is about the real freedom ordinary people have to decide who to be, what to do, and how to live. HD is a process of widening people's choices as well as raising the level of well-being. Its important elements are —long and healthy life, education, and standard of living. The study of HD came to prominence in the 1970s. The Human Development Index was created as an alternative to measure nations by their GDP. The HDI includes health, education, income. The concept of human development was introduced by Mahbub Haq. He described human development as development that broadens people's choices and improves their lives. Moreover, people are central to all development under this concept. More popular as man of vision and compassion Pakistani economist Dr. Mahbub Haq created the Human Development Index in 1990. According to him development is all about enlarging people's choices in order to lead long, healthy life with dignity. Further, the United Nation's development programme has adopted Dr. Haq's concept of HDI to publish the human development report annually since 1990. HDI illustrates what has been achieved in the key areas of human development. The HDI and the Human Poverty Index are the two important indices to measure human development used by the United Nation's Development Programme. The idea of HDI is supported by the concepts of equity, sustainability, productivity, and empowerment. The HDI is a summary of measure of average life, being knowledgeable, and have decent standard of living. The HDI is the geometric mean of normalized indices

NSOU ? GE-SO-21 284 for each of the three dimensions: 1) The health dimension, 2) Education dimension, and 3) The standard of living dimension. The HDI was created to emphasize that people and their capabilities should be the ultimate criteria for assessing the development of a country, not economic growth alone. The HDI simplifies the captures only part of what human development entails. It does not reflect on inequalities, poverty, human security, empowerment, etc Human Development Report (HDR) 2010 introduced the three new measures: i) Inequality-adjusted Human Development Index (IHDI), ii) the Gender Inequality Index (GII) and iii) the Multidimensional Poverty Index (MPI). As per the UNDP Report Norway topped the index, followed by Ireland, Switzerland, Hongkong, and Iceland. India ranks 131 (December 17, 2020). 17.16 Questions Answer the following questions in your own words. G-A (5 Marks each) i. Briefly state the concept of Human Development. ii. What is the significance of HDI? iii. Write note on Inequality-Adjusted HDI. iv. Briefly state why Human Development is necessary. v. Discuss the principles that have guided the search for HDI. vi. Discuss the method of constructing HDI. G-B (10 Marks each) vii. What are the features of HDI? viii. What is HDI? Discuss the superiority of HDI over GNP as a measure of development. ix. Discuss the essential components of Human Development. x. What are the components of HDI?

NSOU ? GE-SO-21 286 Module VII: Population Dynamics and Development Unit 18 ? Population as Constraints and Resources for Development Structure 18.1 Objectives 18.2 Introduction 18.3 India's Population: Size and Growth Trends 18.3.1 Size of Population 18.3.2 Rate of Population Growth 18.4 Population and Economic Development 18.4.1 Population Growth—As Constraints 18.4.2 Population Growth—As Resources 18.5 Towards a Consensus 18.6 Conclusion 18.7 Summary 18.8 Questions 18.9 Suggested Readings 18.1 Objectives The objective of the unit is to ? Acquaint the students with issue of population. ? To mainly focus on the population growth, the policy dimension, and the impact of women empowerment on it. ? To get the idea how the population growth acts as retarding as well as encouraging factor for development. 18.2 Introduction India and many other Third World countries are now passing through the phase of population explosion. It is being argued that this situation has arisen because economic development in these countries has failed to maintain pace with population growth. The thrust of this argument is that since rapid growth of population causes poverty and proves to be a barrier to development, these countries should take care

NSOU ? GE-SO-21 287 of their population growth if they seriously wish to solve their poverty problem and put their economy on the path of economic development. 18.3 India's Population: Size and Growth Trends 18.3.1 Size of Population As far as the size of population is concerned, India ranks second in the world next only to China. India's landscape is just 2.4 per cent of the total world area, whereas its population is nearly 17.5 per cent of the world population. In fact, the population of India at 121.02 crore in 2011 is almost equal to the combined population of USA, Indonesia, Brazil, Pakistan, Bangladesh, and Japan put together which is 121.43 crore (in this context, it may also be pointed out that USA is the third largest country in terms of population size). These facts clearly indicate that the pressure of population on the land in this country is very high. How alarming is the situation in this country can be easily followed from the fact that the national income of India is presently even less than 1.2 per cent of the total world income! India's population according to the Census of 2011 is 121.02 crore. According to the Census of 1901, the population of the country was 23.83 crore. Since then, in a period of 110 years, the population of the country has increased by more than 97 crores. This, if viewed in the context of a relatively slow economic growth, is really an alarming situation. However, the population has not increased in this country at a uniform rate. This is obvious from the population figures given in Table 18.1. Table 18.1 Growth of India's Population Census Year Population in Decadal Average Density of Crore Growth Annual Growth Population (per cent) Rate (per cent) (per sq.km.) 1901 23.83 — 0.18 77 1951 36.11 13.31 1.25 117 1961 43.92 21.64 1.96 142 1971 54.82 24.80 2.20 177 1981 68.33 24.66 2.22 216 1991 84.64 23.87 2.16 267 2001 102.87 21.54 1.97 325 2011 121.02 17.64 1.64 382 Source: Indian Economy, Puri and Mishra, 2014

NSOU ? GE-SO-21 288 18.3.2 Rate of Population Growth Since Independence, there has been a rapid decline in the mortality rate, particularly due to control of epidemics and improved medical facilities. The magnitude of fall in the mortality rate is far greater than what was expected in the early 1950s. The Planning Commission and the Census Commissioner had envisaged a continuation of the 1941-51 trend in 1951-61. Therefore, when the actual rate of population growth turned out to be about 1.96 per cent in 1951-61, the planners were taken by surprise. This unexpected development caused great anxiety to the government. The rate of population growth was 2.20 per cent per annum during 1961-71 which was still higher than that in the preceding decade. The 1981 Census indicated that the rate of population growth during the 1970s remained more or less the same as it was during the 1960s. Even the 1991 Census indicated that the annual rate of population growth during the 1980s was 2.16 per cent. Thus, the expectations that the rate of population growth would decline significantly in response to the family planning programme of the government did not come true. Registrar General's Population Projections for 1996-2016 had suggested that the rate of population growth would decline to 1.84 per cent per annum during the 1990s. However, these projections turned out to be incorrect. According to the Census of 2001, the rate of population growth remained as high as 1.97 per cent per annum during the 1990s. This has come down to 1.64 per cent per annum during the decade 2001 to 2011. The decadal growth during this decade was 17.64 percent - slowest rate of growth during the past century. Although the country continues to remain in the second stage of Demographic Transition, this slowing of growth rate of population raises the hope that the country might soon enter the third stage of demographic transition. 18.4 Population and Economic Development In India, the overwhelming view is that the country's existing population is an obstacle to economic development considering the available utilizable resources and the level of technological progress. Further, growth in population will result in additional burden on the economy in the sense that it will make larger demand on resources for it unproductive consumption, leaving little for productive purposes.

NSOU ? GE-SO-21 289 Hence, population in India is the major constraint on its economic development. However, there are certain social scientists who argue that population growth is not an obstacle. We examine both points of view below.

18.4.1 Population Growth – As Constraints The reasons why population growth is regarded as an obstacle to economic development are divided into the following categories: Population growth and the declining Land-man ratio, Population growth and capital formation, and other adverse effects of population growth.

i. Population Growth and the Declining Land-man Ratio. In the first place, it is asserted that the pressure of population on land has been steadily increasing and with it land-man ratio is becoming increasingly adverse. This, in turn, is proving to be a serious obstacle to development. According to the 2011 Census, the density of population in the country is 382 per sq.km. as against 117 per sq.km. in 1951. This increase in density of population may look alarming, if one makes the assumption that over the years neither the utilisable resources have increased, nor the technological knowledge has grown. Had nothing of this sort happened, the population growth would indeed have been disastrous for the country. However, population growth should always be seen in relation to the development of productive forces. In an economy where productive forces remain arrested due to retrogressive socio-economic relations, favourable land-man ratio will be of little help. The near stagnation in India during the British period in spite of lower density of population, clearly proves this point. Since Independence though the country has recorded a rate of population growth which is unprecedented for the subcontinent, and the density of population in isolation looks quite alarming, yet the country has not only succeeded in breaking the low-level equilibrium trap but has also made some advance on the path of development. A lot of evidence on development from other densely populated countries further confirms that there is no negative correlation between density of population and underdevelopment. But in India's case, it must be admitted that some of the gains of economic growth have been wasted on supporting the growing population. Had India's

NSOU ? GE-SO-21 290 population growth been modest, the country's development performance would have looked far more impressive. Some other experts follow a different line of argument. Their main contention is that due to rapid growth of population over the years, its pressure on agricultural land has increased and cultivable land per capita has declined. In their opinion, this situation is hardly conducive to development. The growing pressure of population on land has also resulted in subdivision and fragmentation of holdings. On these fragmented holdings, there is not much scope for raising the farm productivity.

ii. Population Growth and Capital Formation. The other argument which finds extensive support in academic as well as non-academic circles is that rapidly growing population makes increasing demands on resources for unproductive purposes and thus hinders capital accumulation. And since growth is assumed to be a function of capital accumulation, it is quite logical to infer from the fact that in a country like India, where rate of population growth continues to be high, and much development would not materialise. This argument though not entirely wrong misses two basic points having great relevance for any backward economy, including India. In the first place, savings in such an economy are done mostly by the people in relatively higher income brackets. From whatever limited information is available about birth rates among various sections of people, it is clear that the birth rate is far lower among the relatively well-off people than the overall birth rate for the country. Therefore, the overall high birth rate in a country like ours does not erode the saving potential of the country. Secondly, for the poor people an additional child is not a liability, as they hope to derive greater benefit from him in terms of income, services and security than the cost they would be required to incur on his upbringing. Even if their expectations prove to be incorrect, the country's savings would not be affected; the only thing that might happen then would be that their personal consumption would fall. Under these circumstances, many of these people will find themselves being pushed below the poverty line. Thus, in spite of the fact that rapid population growth may not necessarily adversely affect the capital formation and also the rate

NSOU ? GE-SO-21 291 of economic growth, the well-being of the people particularly of those in the lower income category, will receive a severe knock. India's case clearly proves this point. iii. Other Adverse Effects of Population Growth. In addition to the above arguments, it has been asserted that rapid population growth adversely impacts employment situation, poverty, environment, and standard of living. It also results in food shortage and import of food grains and usually prevents change in occupational distribution of a backward economy. a. Adverse Impact on Employment Situation. The rapidly increasing population of the developing countries has resulted in large-scale unemployment and underemployment. Because of the failure of the secondary and tertiary sectors to expand employment opportunities at a fast enough rate, more and more people have to fall back on agriculture to eke out a living. The pressure on agriculture increases leading to the problem of disguised unemployment. In a labour surplus economy like India, disguised unemployment is said to have assumed serious proportions with the result that the marginal productivity of labour falls to very low levels and may even touch zero. b. Adverse Impact on Per Capita Income and Standard of Living. Rapid growth of population developing countries has made it difficult to raise the level of per capita income and the standard of living of the masses. As noted above, the pressure of population on land has increased leading, in turn, to low agricultural productivity and large-scale disguised unemployment. Naturally, these result in low per capita income and low standard of living. The dependency burden in the developing countries is greater than in the developed countries since the working force in the former is required to support almost twice as many children as they do in the latter countries. This also results in a lower standard of living in the developing countries. c. Food Problem. Increased population means more mouths to feed which, in turn, creates pressure upon available stock of food. This is the reason,

NSOU ? GE-SO-21 292 the under-developed countries with rapid growing population are generally faced with a

100%

MATCHING BLOCK 157/164

SA

BEC-14, Blk -1 MY OWN.docx (D139799522)

problem of food shortage. Despite all their efforts for raising agricultural production, they

are not able to feed their growing population. Food scarcity effects economic development in two respects. Firstly, inadequate supply of food leads to undernourishment of the people which lowers their productivity. It further reduces the production capacity of the workers, Secondly, the deficiency of food compels to import food grains which places an unnecessary strain on their foreign exchange resources. Ever since Malthus wrote his celebrated Essay on Population attention was focused on the problem of population versus food supply. There is no doubt that per capita cultivated area is gradually on the decline in India. Between 1921 and 2001, the cultivated area per capita dropped from 1.11 acres to 0.32 acres, indicating a fall of 71 per cent. To compensate for this fall in cultivated land-man ratio, it is imperative that efforts be made to raise productivity. Table 18.2 Output of Food Grains and Per Capita Availability of Food Grains Census Year Population in Output of food Per capita Per capita Crore grains output of availability (Million tone) cereals and of cereals pulses and pulses (in grams) (in grams) 1961 43.92 82.0 512 469 1971 54.82 108.4 547 469 1981 68.33 129.6 520 455 1991 84.64 176.4 571 510 2001 102.87 196.8 524 419 2011 121.02 235.0 532 NA Note: Net availability includes net domestic production plus net imports plus change in government stocks. Net production has been taken as 87.5% of the gross production, 12.5% being provided for feed, seed requirements and wastage. Source: Datt & Sundaram Indian Economy, Datt & Mahajan, 2013

NSOU ? GE-SO-21 293 From Table 18.2, it is clear that between 1961 and 2011, total output of food grains (cereals and pulses) increased from 82 million tone to 235 million tones, showing an increase of 187 per cent. But during the same period, population also increased from 439 million to 1210 million, showing an increase of 176 per cent. Consequently, though per capita output of food grains in grams did show an increase, but only marginally from 512 to 532 grams during this period. It may be noted here that actually it cannot be considered as per capita availability of food grains for the people, net availability includes net domestic production plus net imports plus change in government stocks. Net production has been taken as 87.5 per cent of the gross production, 12.5 per cent being provided for feed, seed requirements and wastage. Since a major part of the increase in population takes place in the rural areas, it also signifies that the share of family consumption in total food production will increase and much less will be left over as marketable surplus. These are gloomy forebodings which stress the necessity of family limitation.

d. Issues of Import of Food Grains & Food Subsidy. Because of their rising population, the demand for food in many developing countries is increasing rapidly. However, because of low agricultural productivity, the supply of food grains has failed to keep pace with their increasing demand. This has led to serious food crises in many developing countries pushing a number of persons in them to the verge of starvation at times. This has forced these countries to resort to large-scale imports of food grains off and on. Because their export earnings are limited, such imports of food grains have created serious balance of payments crisis for the developing countries. Their programmes of industrialization have also suffered a setback because foreign exchange resources which could have been used to import capital goods to speed up the pace of industrialization are used up for the imports of food grains. With rapidly growing population, it becomes necessary for the government to arrange for adequate surplus of food grains for the growing masses. Thus, price incentives must be provided to farmers to encourage them to produce more. At the same time, it becomes necessary to provide ample quantity of food grains at low prices to many people whose incomes are very low. As a result, the burden of food subsidy increases to very high levels and the resources that could have been used for

NSOU ? GE-SO-21 294 increasing production and productivity levels in the economy are used up just to provide for the consumption needs of the population.

e. Prevents Change in Occupational Distribution of Population. Rapid population growth prevents change in occupational distribution of population in a backward economy as long as employment creation important goal of economic policy. Since most low-income economies cannot afford to risk large-scale unemployment rapid population growth in these countries postpones the transformation of traditional economy into one dominated by the manufacturing sector. This is not only because of the agricultural requirements of growing numbers but also because of the relative investment costs of job creation in agriculture and manufacturing.

f. Population and the Burden of Education, Medical Care and Housing. A welfare state like India is pledged to meet social needs of the people adequately and for this, the government has to spend a lot on providing basic facilities like education, housing, medical aid, water, and sanitation. In other, words, it requires colossal investment to build up a commensurate social overhead. But rapid increase in population make burden all the heavier. Rising population increases the number of children and hence demands higher expenditure on education. There is no doubt that expenditure on education can be viewed as social investment in human beings that ultimately enhances the productivity of the labour force, but it may be emphasized that the time-lag in this respect is quite long and hence the direct effect in raising output per unit of investment is very low. India's public expenditure on education was 3.7% GDP in 2005. This is considered to be low, because the Education Commission (1964-65) stipulated to increase it to 6% of GDP in 1984-85. Obviously, it impacts on creating educational institutions at the primary, secondary and tertiary level to meet the needs of the growing knowledge economy. The onset of the computer revolution also necessitates higher expenditures on skill and training so as take advantage of new and emerging technologies. Moreover, India spent only 0.9 percent of its GDP on public health expenditure. This is much below the level required for achieving the goals of removing malnutrition

NSOU ? GE-SO-21 295 and control of diseases. The poor are specially affected because they cannot incur higher out-of-pocket private expenditure on health. The burden of raising public health expenditure to 2-3 percent of GDP indicates the need to improve medical facilities. Not only that, the burden of providing housing to additional population also requires additional resources. If population growth could be reduced, some of these resources could then be diverted to other projects. Coale and Hoover had shown that if India could reduce its population growth by half between 1956 and 1981, the country could save as much as Rs.60-65 billion during the thirty-year period of 1956-86, from housing and education alone.

g. Adverse Effect on Environment. Another problem associated with population growth, which might lead to a decrease in economic growth, is the problem of environmental degradation and resource scarcity. Earth is comprised of 75 percent water, the rest is comprised of land, with a majority of it used for agriculture. According to Malthus, population growth of a nation is detrimental to economic growth, primarily due to the factor of finite resources in an economy. With a rise in the number of people, a nation can expect a decline in the natural resources and in the end a lowering of the production of goods.

Rapid population growth leads to the environmental change. Rapid population growth has swelled the ranks of unemployed men and women at an alarming rate. Due to this, a large number of people are being pushed in ecologically sensitive areas such as hill sides and tropical forests. It leads to the cutting of forests for cultivation leading to several environmental change. Besides all this, the increasing population growth leads to the migration of large number to urban areas with industrialization. This results in polluted air, water, noise and population in big cities and towns.

h. Impact on Poverty. Rapid growth of population is largely responsible for the perpetuation of vicious circle of poverty in underdeveloped countries. On account of rapid growth of population people are required to spend a major part of their income on bringing up their children. Thus, savings and rate of capital formation remain low accompanied by reduction in per capita income, no improvement in agricultural and industrial technology, shortage of essential commodities, low standard of

NSOU ? GE-SO-21 296 living, mass unemployment etc. As a result, the entire economy of an underdeveloped country is surrounded by the vicious circle of poverty. 18.4.2 Population Growth—As Resources It is true that population growth often acts as a major impediment of the development of an economy. At the same time there are theories stating that population increase, and growth help a nation's economy by stimulating economic growth and development. Cases of population growth as resources can be documented in the following way: i. Increased Innovation and Impact on Trade. Population growth opponents often have decried the burden on resources. However, Danish economist Ester Boserup has argued that growing populations pressure society to innovate in order to better serve the masses. For instance, high-yield crops were developed to increase food production largely in response to growing populations. In India, government resorted to introduction of high yielding varieties in 1960's with a view to meeting up the rising demand for food of the teeming population. Another sign of prosperity from population growth can be seen by countries improving their trade structures. Countries that have higher populations also have more people working and most of all, innovating. If we consider the case of China, we see that China has had a massive population growth, and today, the country has one of the biggest sharing economies in the world and thus one of the top exporters. ii. Manpower. One of the benefits of a surging population growth means that the country can conscript more people into its armed forces and should be in a better position to protect itself. On the other hand, the nation can put the extra manpower to good use, from using them to develop and build infrastructure to ensuring that they all pay tax on time, thereby ensuring that they get more in terms of tax receipts. with more skilled manpower being available, there should be no shortage of essential manpower across various industries. More to the point, the government would be able to utilize this ready-made manpower across various industry verticals. With cheap labor being available, companies should be able to save big by hiring the same. NSOU ? GE-SO-21 297 iii. Demographic Dividend. In consideration of the population growth as resource of development the question of demographic dividend is a major to be taken care of.

Demographic dividend as defined by the United Nations Population Fund means- the economic growth potential that can result from shifts in a population's age structure, mainly when the share of the working-age population is larger than the non-working age share of the population.

While studying the population, it is customary to classify the population into three age groups. Population in the age-group below 15 years is considered as child population. The working age pertains to 15-64 years - productive age group. Age group 65 & above comprises of old persons. Both the child population and old population are dependent on the productive age group for their maintenance and sustenance. Hence, the dependence ratio is the number of dependents in the population divided by the number of working age people. According to the Technical Group on Population Projections constituted by the National Population Commission, annual growth rate of population is expected to gradually decline from 1.6 percent in 2001 to 0.9 percent in 2026. Consequently, India's population which was 1,029 million in 2001 as per the 2001 census is expected to increase to 1,400 million by 2026. But there is a structural change expected in the population. About 60 percent of the population was in the working age group in 2001, this is expected to increase gradually and will be 68.4 percent in 2026. Demographic Dividend is likely to manifest in the gradual increase in the working age group of 15- 64 years. Table 18.3 Population Projections in Millions 2001 2006 2011 2016 2021 2026

	2001	2006	2011	2016	2021	2026
Total	1029(100)	1112(100)	1193(100)	1269(100)	1340(100)	1400(100)
Below 15 years	365(35.5)	357(32.1)	347(29.1)	340(26.8)	337(25.1)	327(23.3)
15-64 years	619(60.1)	699(62.9)	780(65.4)	851(67.1)	908(67.8)	957(68.4)
Above 65 years	45(4.4)	56(5.0)	66(5.5)	78(6.1)	95(7.1)	116(8.3)

NSOU ? GE-SO-21 298 Present demographic data show that India is enjoying the demographic dividend which will last for up to 2055. An improvement in the dependency ratio due to the demographic dividend leads to the hypothesis that the increase in the working age population would lead to acceleration in growth. But is there a concerted effort to build human capital to take advantage of the demographic dividend on the part of policymakers? Since the production structure of the Indian economy is also undergoing a transformation from agriculture to industry and services, there would be a strong need to develop new skills so that the economy can absorb the growing working age group population in newly emerging areas of development. The benefits of the demographic dividend can be reaped only if sufficient investments are made for basic infrastructure, health, educational attainment, and skill upgradation of the workforce, apart from the creation of sufficient numbers of suitable jobs to provide employment to the burgeoning workforce. This is because the available workers would not be absorbed spontaneously to deliver high growth. So,

77%

MATCHING BLOCK 160/164

SA

BEC-14, Blk -1 MY OWN.docx (D139799522)

the capacity of the economy to harness the growing working age population in productive activities will determine the

actual realization of the demographic dividend. iv. Population Growth-not an Obstacle. There are some social scientists who believe that that population growth should not be considered an obstacle to development. They argue in the following manner: a. It is often argued that underdevelopment and not population is the real problem. Population growth should always be seen in relation to development of productive forces. In an economy where productive forces remain arrested due to retrogressive socioeconomic relations, favourable land-man ratio will be of little help. The inability to increase food supplies as fast as the population grows is no longer a bottleneck. This argument put forward by Malthus and his followers was proved to be wrong long ago in Europe. It evinces lack of faith in the capabilities of mankind and the technological progress. Economists such as Kuznets, Spengler and Houthakker have convincingly dispelled all doubts about mankind's ability to cope with scarcity of natural resources. As far as India is concerned, yields per hectare of most of the crops are very low vis-à-vis many developed and developing countries. This shows that a considerable scope exists for increasing the production of many crops. Accordingly, larger population can be easily supported if yield levels increase.

NSOU ? GE-SO-21 299 Some economists of the Third World have pointed that developed countries having only one-fourth of world's population consume almost 80 per cent of the world's resources. Therefore, an average consumer of the developed countries uses up almost sixteen times as much of the world's food, energy and material resources as his counterpart in the Third World countries. This shows that the addition of another child in the developed countries is worth the addition of sixteen children in the developing countries. Therefore, it is the rich nations who need to curb their overconsumption. The low levels of living in the developing countries are due to this overconsumption by the rich. Thus, this combination of rising affluence and extravagant consumption habits in rich countries and among rich people in poor countries, and not population growth should be the major world concern. b. Population growth is a false issue deliberated by dominant rich-country agencies and institutions to keep the less developed countries in their underdeveloped and dependent condition. It is argued that the cry of overpopulation is raised by the rich countries in order to hold down the development of the poor countries and maintain the international status quo for their own special self-interest. By blaming the poor countries for their own poverty, the rich nations get an easy escape for their own 'misdeeds' and 'imperialist policies' which have been responsible historically, to a large extent, for the underdevelopment of the poor countries. c. For many developing countries and regions population growth is, in fact, desirable. There are some sparsely populated underdeveloped countries where development has been held back due to deficiency of aggregate demand. A number of countries in Africa and Latin America has small populations. In all of them, it is 'under-population' that is holding back growth because it leads to non-utilisation of cultivable land, low demand for industrial goods resulting in low industrial production, etc. 18.5 TOWARDS A CONSENSUS Recent years have seen the emergence of a consensus among the social thinkers who have so far held opposite positions on the relationship between population and economic development. Now, all agree that the world at large would be much better off if population were to grow more slowly. The consequences of rapid population

NSOU ? GE-SO-21 300 growth should neither be exaggerated nor minimised. The essential components of the intermediate or consensus opinion are as follows: i. Population growth is not the primary cause of low levels of living, inequalities in income and wealth, or the limited freedom of choice that characterise most of the developing countries. The fundamental causes of these problems must be sought, rather, in the 'dualistic' nature of the world economic order and the inability of the economic planning processes in the developing world to create jobs and income for poor families, especially women. ii. The problem of population is not simply a question of numbers but involves the questions of quality of life and material well-being as well. Therefore, instead of viewing the problems of the developing countries within the framework of their own indigenous resources, one must view them in conjunction with developed-country affluence in relation to the quantity, distribution, and utilisation of world resources. iii. Nevertheless, rapid population growth intensifies the problems of underdevelopment and makes prospects for development that much more difficult. Therefore, the developing countries must undertake serious efforts to control the population growth. iv. Many of the real problems of population arise not due to its overall size, but from its concentration in urban areas (especially in large metropolitan areas) as a result of accelerated rural-urban migration. The swelling population of large urban areas leads to the large-scale emergence of slums where conditions of living area, to say the least, inhuman. The slums have no sewer systems, no proper drainage facilities, no sanitation, and no proper roads and other civic amenities. The heavy pressure of population on urban areas also creates many other problems (like mental diseases, crime, prostitution, alcoholism, drug addition, social unrest, etc.), insufficient health and medical care facilities, unwholesome environment, pressure on administrative services and urban infrastructure, etc. A more rational and more efficient spatial distribution of national population thus becomes an alternative, in some countries, to the slowdown of overall population growth. 18.6 Conclusion Overpopulation is a growing problem throughout the world at this stage in time. What does this do to the status of nations' economies? There are two different views

NSOU ? GE-SO-21 301 in this behalf. One group of experts argues that population increase, and growth help a nation's economy by stimulating economic growth and development while other group bases their arguments on Malthus' findings. It is very much true that population growth has retarding impact on the overall development of the economy. The theoretical elements suggest that more population retard the growth by reducing output per worker. Apart from this, in the short run population growth creates a few numbers of problems including scarcity of food, poverty, unemployment and environmental degradation. However, population growth, in the long run, leads to new developments, through advancement in technology that leave countries better off. With the increased populace, economies are blessed with a large labour force, making it cheaper as well, due to its immense availability. An increase in labour availability and a low cost for labour results in a huge rise in employment as businesses are more inclined to the cheap labour. Thus, it generates demands for goods and results in overall economic growth. For example, India, has become one of the world's fastest growing economies, primarily due to the rise in population growth creating a positive effect on its long run economic growth. 18.7 Summary Population is the resource of labour force. The larger the size of population, the larger will be the labour force. Labour alone cannot produce anything. If other resources are not available in sufficient quantities, then large labour force can become an obstruction to faster economy growth. Some countries particularly the developing countries have fast growth rate of population. In this unit, we have tried to highlight how the fast growth of population affects the economic development of the country like India and have suggested some measures to control population explosion so that economic development may not be hindered. Population is growing rapidly in India and increasing population is constraint for development. Population growth hampers the economic development in many ways. Over population in putting an incredible strain on our environment. One of the largest environmental effects of population growth is the population of global warming.

NSOU ? GE-SO-21 302 With the increase in population the depletion of natural resources (sunlight, atmosphere, water, land i.e., all minerals) will also increase. Deforestation causes the decrease in rainfall and the amount of firewood. High growth rate of population has slowed down the pace of economic development in the developing countries like India. So, the correlation between population growth and economic development could be favourable only when increasing population is proportionate to resources available in the country and resources are to be exploited in its full capacity in effective and efficient manner by the skillful, talented human resources in the countries like India. 18.8 Questions Answer the following in your own words. G-A (5 Marks each) i. Write a note on demographic dividend. ii. Discuss size and growth trends of India's population. iii. Discuss the adverse impacts of population growth. iv. Discuss why population growth should be regarded as resource for development. G-B (10 Marks each) v. Evaluate the relation between the population growth and the declining land- man ratio. vi. What arguments have been put forwarded by social scientists in view of population growth not an obstacle to development? 18.9 Suggested Readings i. Agrawal, A. N. NSOU ? GE-SO-21 305 19.2 Introduction In India, there has been serious concern about the population growth since independence among the policy makers. So, the country resorted to family planning since very inception of planning process. In a country like India where overall literacy in general and female literacy in particular are very high, exclusive reliance on family planning may not prove to be very effective. Moreover, it is rather difficult to implement family planning programme both due to poverty and low level of consciousness. Nevertheless, family planning has been incorporated in the population policy of the government. Despite various limitations, the facts remains that it has helped in keeping growth of population under check to a large extent. The adhoc Consultative Group of Experts on Population Policy, set up by the Population Commission of the United Nations Economic and Social Council, has included in the Population Policy "measures and programmes designed to contribute to the achievement of economic, social, demographic, political and other collective goals, through effective critical demographic variables, namely, the size and growth of population, its demographic distribution (national and international) and its demographic characteristics." It has also been suggested that it should include measures and programmes that are likely to affect critical demographic variables as well as those specifically designed to do so, thus covering both direct and indirect measures affecting these variables. Of particular importance, in the context of population policy, are three components of population change- fertility, mortality and migration- because all demographic variables are influenced only through them. While considering the population policy of India, it is necessary to concentrate on fertility as the single most importance factor contributing to population change. Of the other two components of population change, mortality and migration, the latter does not warrant serious consideration in the context of population policy of India. As for international migration, the volume of such migration is not very large and as for migration within the country, it is a constitutional privilege and the question of any special policy in this regard does not arise. An important development relating to mortality- influencing policy of the country is the National Health Policy adopted in 1981 which has been updated later for several times. This mortality dimension of population policy is not so much considered in this chapter. The chapter will basically devote only to the fertility aspect of population policy of the country.

NSOU ? GE-SO-21 306 19.3 Family Planning Programme Importance of the family planning programme as a device to control population explosion is now universally recognised. In China, for example, the State has approved of one-child norm and has thus succeeded in bringing down the birth rate to 12 per thousand as against 22 per thousand in India in 2009. The factor which has contributed most to China's success on this front is widespread use of contraception. According to UNFPA's State of World Population Report 2012, 85 per cent of married women of child-bearing age in China used contraception during the period 1990-2011 as against 55 per cent in India 26 Even Sri Lanka has done better than India in this regard where 68 per cent women use contraceptives, and as a result birth rate has come down to 18. It is, thus, clear that in India (with the exception of the States of Kerala, Tamil Nadu, and Goa), the masses are not presently aware of the need of family planning. The decision-makers in the government, however, recognise its importance at this critical juncture. The following aspects of the family planning programme in this country deserve particular mention: i. Public Information Programme(PIP): Under PIP couples in the reproductive age are explained the usefulness of family planning. This is considered necessary for raising the level of consciousness of the people without which they will not accept any family planning programme. Hence the govt has decided to use all media of publicity, including cinema, radio, television, posters, and newspapers to publicise the importance of family planning. Once the idea of family planning catches up the imagination of the people, they will themselves voluntarily start practising it. ii. Incentives and disincentives: The government has introduced various schemes under which incentives are being given to those who accept family planning. The system of cash prizes has given some inducement to the people to go in for sterilisation. Since family planning is completely voluntary in this country, coercive methods have been generally avoided. During the emergency some excesses were

NSOU ? GE-SO-21 307 committed and forcible sterilisation were done. This caused widespread resentment among the people and there was setback to voluntary family planning. Under the exiting situation, if small cash prizes fail to provide incentive to people to accept family planning, the government can take decision that preference for employment will be given to the people who accept small family norm. Moreover, those who reject family planning may be denied certain facilities. iii. Family Planning Centres: Establishment of family planning centres is an integral part of any family planning programme. Some attention has been given to this aspect of the programme in India. These centres provide various clinical facilities needed for family planning. In addition to these clinical centres a large number of contraceptive distribution centres should also be located in both urban and rural areas. iv. Research: Research in the field of demography, communication action, reproductive biology and fertility control must be given a high priority in any family planning programme. Generally, this aspect is ignored in underdeveloped countries and undue reliance is placed on family planning devices more suitable for developed countries. The Government of India, however, realizes the importance of research to obtain maximum results within the constraints of resources allocated to the family planning programme. 19.4 Population Policies The policy to control population growth was adopted by the government as far as back as 1952. Initially it was taken up in a modest way. It gathered momentum after 1961 census which showed a higher growth in population than anticipated. Since then, the family planning became the "kingpin" of the population-policy. 19.4.1 Family Planning under Five Year Plans: The Earlier Phase During the first decade of economic planning, family planning programme was taken up on a modest scale with clinical approach. The emphasis was mainly on NSOU ? GE-SO-21 308 research in the field of demography, physiology, reproduction, motivation, communication and establishing Central and State organisations in providing clinical services. In pursuance of this policy, 549 and 1100 family planning centres were opened in the urban and rural areas respectively. In addition to these clinical facilities were provided in hospitals and health centres. Although in this way a beginning was made in the field of family planning but considering the size of the country many demographers rightly believed that the family planning programme on this scale was of little consequences. An urgency with regard to family planning was felt after the publication of the 1961 Census results which showed a higher rate of population growth than anticipated. The Third Plan stated clearly that the objective of stabilising the growth of population should be the central feather of planning and the family planning programme has to be adopted as the principal measure to realise this objective. Experts thought that the clinical approach was not enough, and the government thus decided to supplement it by the extension approach. The allocation of funds to the family planning programme was also increased but looking at the dimension of the problem total outlay (Rs. 24.86 crore) was not adequate. A full-fledged Department of Family Planning was created in 1966 in the Ministry of Health, Family Planning and Urban Development. The administrative structure included the State family planning department which operated through a machinery at the district level. A series of service points aided by an extension system of male and female family planning workers was required to provide alternative contraceptive methods. Since family planning was voluntary, the acceptors had the freedom to choose any of the contraceptive methods offered. This has been known as the 'cafeteria approach'. To increase the motivational effect, mass media campaign was also organised. During the period 1966-69 the family planning programme was made target oriented and more funds were allocated to it, yet the results were far from satisfactory. The Fourth Five Year Plan provided a high priority to the family planning programme and allocated Rs. 330 crores to it. The programme aimed at reducing birth rate from 39 per thousand to 25 per thousand population within the next 10-12 years. In order to attain this objective a concrete programme was carried out for creating facilities for the couples in their reproductive period. The emphasis in the programme was on group acceptance of a small family norm, personal knowledge NSOU ? GE-SO-21 309

62%

MATCHING BLOCK 162/164

SA CHAPTER.docx (D129895265)

about family planning methods, and ready availability of supplies and services. The basic approach of the

government, however, did not change, as it continued to follow clinical approach aided with extension services. There was a significant shift in the strategy of the government under fifth Five Year Plan. In the first place, the government decided to carry forward the family planning programme in an integrated manner along with health, maternity and child health care, and nutrition services at all levels. With this perspective, a decision was taken to convert vertical programmes' workers into multipurpose workers who were required to pay special attention to family planning work. Secondly, keeping in view the bold measures envisaged in the 1976 National Population Policy to restrict the rate of population growth, the Fifth Plan made a provision of Rs. 497.36 crore for the family planning programmes.

19.4.2 National Population Policy, 1976

The National Population Policy was announced on April 16, 1976. It was completely at variance with the earlier population policy of the government. In the past the importance of development and education had been recognised for restricting the rate of population growth, though the government's own programme was confined singularly to family planning. Until the declaration of the Population Policy, 1976 the family planning was entirely voluntary; the government's role was restricted to motivating the people to accept the family planning and to providing clinical facilities and other services to its acceptors. The government, however, gave up this approach in 1976. Rejecting the view that development and family planning go hand in hand, it declared that rapid population growth was thwarting economic development and thus a more positive approach was needed to check it. This change in approach was clearly reflected in the policy statement of the government-to wait for education and economic development to bring about a drop in fertility is not a practical solution. The very increase in population makes economic development slow and more difficult of achievement. The time factor is so pressing, and the population growth so formidable, that we must get out of the vicious circle through a direct assault upon this problem as a national commitment. The policy statement reaffirmed the government's commitment to bring down the birth rate to 25 per thousand by the end of the Sixth Plan period. On the basis of the past experience it was obvious that this objective could not be attained by placing reliance entirely on voluntary family planning. Therefore, some more direct measures

NSOU ? GE-SO-21 310

were conceived and announced. Raising the legal minimum age of marriage to 21 years for males and 18 years for females was a welcome measure, but its implementation was a doubtful proposition from the very beginning. Similarly, introducing population values in the education system and increasing the monetary incentive for sterilisation were certainly desirable measures, but in a conservative society like ours, these were not expected to contribute much to the success of family planning drive. The government thus rightly involve the Zilla Parishads and Panchayat Samities, cooperatives, teachers, workers' organisation and a number of voluntary agencies including women and youth organisations. The questionable measures were drawing of all government departments into the motivation of citizens to adopt responsible reproductive behaviour, and permission to State legislatures to pass legislation for compulsory sterilisation. In an authoritarian political system, the corrupt administrative machinery invariably misuses its powers if it is drawn into the implementation of some social programme. In India this actually happened during emergency. In this period, in spite of the impressive figures of the persons covered under the family planning programme, the use of coercive methods discredited the entire family planning programme. Thus, the experience of the government to pursue the so-called bold measures for lowering down the birth rate in a relatively short period ended in a fiasco.

19.4.3 Family Planning during the Eighties

The experience during the emergency once again proved that the family planning programme cannot be a substitute for development and any attempt to force its pace without ameliorating the economic condition of the poor and changing the consciousness of the people by educating them will have little chance of success. The Planning Commission in the Sixth Plan admitted the fact that this programme did not inspire the confidence of the people who viewed it as a government activity. Therefore, the need for projecting family planning programme as a people's programme was felt. On the recommendation of the Working Group on Population Policy set up by the Planning Commission, the long-term demographic goal of lowering down the net reproductive rate from the prevailing level of 1.67 to 1 by 1996 in the country as a whole and by 2001 in all the States was adopted. Keeping in view this goal, efforts

NSOU ? GE-SO-21 311 were made to raise the proportion of eligible couples protected with family planning from 22 percent at the beginning of the Plan to 41.2 percent in 1984-85. This was certainly an ambitious target and could not be realised. In 1984-85 out of estimated 126.7 million couples, 45.1 million couples were protected from conception. They constituted 35.6 percent of the eligible couples. This failed to make any significant impact on crude birth rate which remained stuck at 33.5 per thousand. The government, as indicated in the Sixth Plan, wanted population programme to be accepted as a national programme of all people, and for this purpose considered it necessary to develop national consensus on this subject. In order to bring about a fall in fertility rate the Plan, however, did not envisage the use of coercive methods. As explained above, nothing significant happened during Sixth Plan period and the crude birth rate did not register any decline. But undaunted, the health policy fixed the target of the net reproduction rate of 1 by the year 2000 A.D. The Planning Commission, however, felt that this goal could be reached only by the period 2006- 11. In order to make an advance towards this target at the desired rate during the Seventh Plan period, 42 percent couples in the reproduction group should have accepted family planning methods, and this could have enabled crude birth rate to come down to 29.1 per thousand by the year 1990. Interestingly the Seventh Plan target of achieving couple protection rate of 42 percent was achieved, but the crude birth rate remained marginally higher at 29.9 per thousand. 19.4.4 The New Strategy Restricting population growth was one of the most important objectives of the Eight Plan. The Plan had aimed at bringing down the birth rate from 29.9 per thousand in 1990 to 26 per thousand by 1997. This was a modest target and was realisable provided the government had succeeded in carrying out its strategy. Under the Eight Plan, for population control there was stress on decentralized planning and implementation. The advantage of area specific strategy is that it allows scope for flexibility of approach. Under the Ninth Plan the Central government's role is being limited to general policy planning and providing technological inputs. Thus, the approach of the government is to make family planning programme as one of "people's operation with government cooperation". Another important aspect of the strategy is to make

NSOU ? GE-SO-21 312 the younger couples, who are productively most active, the focus of attention. This has become necessary because under the Seventh Plan while target of couple protection rate was achieved, it was not matched by a commensurate decline in the birth rate, possibly because of the lower coverage of the younger couples. The younger couples will now have to be prepared to accept small family norm as a social responsibility. In the future, targeted reduction in the birth rate will be the basis of designing and implementing the family planning programme against the existing approach of couple protection rate. From this point of view, the out-reach and quality of family planning services will be improved. So far the system of cash incentives to adopters of sterilisation programme has failed to make any impact on population growth. Therefore, the entire package of incentives and awards has to be restructured to make it more meaningful. The possibilities of introducing certain disincentives to the non-adopters of family planning programme, the role of education, information and communications is widely recognised. These are now being considered as critical inputs by the planners and will thus be strengthened and explained in the coming years. The research and development of methods aimed at regulation of fertility both in males and female will also be given a new thrust. 19.4.5 National Population Policy, 2000 The policy to control the rapidly growing population and to stabilize it at a reasonable level has been there since the early 1950's, with some variations in it. The latest in the series is the National Population Policy. National Population Policy, 2000 is a comprehensive document that for the first time in the post-Independence history of the country, addresses itself to the problem of population growth not in isolation but in integration with all such related issues as child survival, maternal health, women empowerment & employment, and contraception. As in any policy statement, the features of the National Population Policy, (NPP) can be explained in terms of its objectives and the means to achieve them. Objectives: The National Population Policy, 2000 has specifically outlined immediate, medium-term and long-term objectives. i. The immediate objective is to provide for facilities to meet the unmet needs for contraception, health care infrastructure and health personnel, and an integrated service delivery for basic reproductive and child health care.

NSOU ? GE-SO-21 313 ii. The medium-term objective is to bring the Total Fertility Rate, (TFR), i.e., the average number of children per woman in the reproductive age-group, to replacement level by 2010. iii. The long-term objective is to achieve a stable population by 2045, at a level consistent with the requirements of sustainable economic growth, social development, and environmental protection. In pursuing these objectives, the policy stipulates the fulfilment of the following goals (or quantified targets) by 2010. The growth of population is to be reduced so that it could reach a size of 1107 million (110 crores) in 2010, as against projected size of 1162 million (116 crores) at the current rates of births and deaths. A smaller size of population is to be achieved through a reduction in the birth rate from 27.2 in 1997 to 21.0 in 2010; in the infant Mortality Rate from 71 (per one thousand) in 1997 to 42 in 2010; and in the Total Fertility Rate, from 3.3 in 1997 to 2.1 in 2010. Apart from this, the national population policy, 2000 also aims at the following : i. Reduce maternal mortality ratio to below 100 per one lakh live births. ii. Reduce infant mortality rate to below 30 per one thousand live births in the long run. iii. Achieve universal immunisation of children against all vaccine preventable diseases. iv. Achieve universal access to information/counselling and services for fertility regularisation and contraception with a wide basket of choices. v. Promote delayed marriage for girls not earlier than age 18 and preferably after 20 years of age. vi. Prevent and control communicable diseases. vii. Promote the small family norm to achieve replacement levels of total fertility rates. viii. Bring about convergence in implementation of related social sector programmes to make family welfare a people centred programme. Means; To achieve these objectives, the policy lays down several means. One set of means identifies 12 themes (or tasks) and the measures to put them through. It is provided that the preparation and execution of programmes should be decentralized

NSOU ? GE-SO-21 314 by entrusting this work to the Panchayats and Nagar Palikas. The policy also seeks the help of non-government organizations, as also the private sector, including the private medical practitioner. Provision has also been made for the use of Indian systems of medicine and Homeopathy. The policy takes care of the hitherto under-served population (urban slums, tribal communities etc.) Emphasis has also been laid on the need to make up the deficiencies in respect of the services related to population-control such as contraceptives, health personnel etc. The policy aims at providing services in an integrated manner. Women are also to be empowered through an increase in the opportunities of employment, as also in respect of their health and nutrition. Contraceptive technology and research in reproductive and child health are to be encouraged. The policy also provides for the spread of the message of small family through dissemination of information, education and communication. To ensure coordination of work between the Panchayats and Nagar Palikas with the governments of the states and centre, as also between the various departments, the policy has provided for new structures, like the National Commission on Population & similar commission at the level of States and Union Territories. A coordination cell for the same purpose has also been set up in the Planning Commission. To enhance performance, particularly in the states with the below average socio-demographic indices, a Technology Mission in the Department of Family Welfare has been set up. The policy is also to seek public support in favour of the small family norm through demonstration and personal example by political community, business, profession, and religious leaders, media, and film stars etc. The policy also promises adequate funding of the programme, as also subsidies for preventive and promotive services. There are then incentives described as promotional and Motivational Measures, for popularizing the Small Family Norm. These consist of payments in cash, in kind, and in the form of Insurance-benefits, besides the public applause. These are to be given to the acceptors, motivators, and organizers of small family programmes. Quite a significant part of the incentives is meant for families with one or two girls, for couples, those below the poverty-line, who marry late, and for those who bear children late, and for those who adopt a terminal method after the birth of a second child. As a motivational measure, the freeze on the number of seats to the Lok Sabha on the basis of 1971 census, valid till 2001, has been extended to 2026 so that the state governments fearlessly pursue the agenda for population-stabilization.

NSOU ? GE-SO-21 315 19.5 Appraisal of the Population Policy In India there is need for an imaginative population policy to deal with the present population problem. Unfortunately, the government has failed to formulate such a policy. Nowhere in the world, rate of population growth has declined without the spread of education among the masses and substantial improvement in their standard of living, and yet in India these aspects have been very much ignored in the government's drive to bring about a fall in the fertility rate. Greater reliance on family planning programme to realise this objective in a social environment which is non-receptive to the programme, clearly betrays the understanding of the problem. To be more specific, three major defects in the approach of the government are as follows: i. Overemphasis on contraceptives. According to B.R. Sen, the population problem has not been correctly understood in India. The programmes which were formulated in the country to restrict the population growth from time to-time were invariably based on the assumption that by increasing the supply of contraceptives and popularising their use, the problem could be solved. No one ever seriously thought of raising the standard of living of the mass of the people in the countryside to bring about a fall in the rate of population growth. B.R. Sen rightly asserts that poverty of these people provides them an inducement to have more children and perhaps this is the major cause of our population problem. Therefore, if population problem is to be solved in this country, frontal attack has to be made on poverty, particularly in rural areas. This will require extra developmental efforts in the countryside. Kerala, Tamil Nadu, and Goa, among the States in India, have successfully brought down the birth rates from 35 to about 20 per thousand in a period of 25 years. Attitudinal changes to health and family size in these States reducing the birth rates became possible largely due to spread of literacy, especially among women and their better health care. On the basis of Kerala- Goa demographic experience, T.N. Krishnan has thus rightly stressed, "Both in Kerala and Goa, their demographic transitions were preceded by health and educational transitions." The governments in most of the States have refused to draw any lessons from the experiences of these two States.

NSOU ? GE-SO-21 316 ii. Inappropriateness of coercive methods. No one disputes the urgency of restricting population growth in this country. In fact, people belonging to various strata of the society and subscribing to different ideologies now favour that on the question of population control, national consensus must be evolved. But there is less agreement on measures. There are many experts who believe that development is the only effective measure to restrict population growth. Some others would like to continue family planning drive with developmental efforts. However, most of the demographers and economists who favour pursuit of a vigorous family planning programme do not approve of the coercive methods which the government had adopted in 1976. The experience in respect of forced sterilisation clearly suggests that coercive methods hurt the dignity of people and are counter productive. iii. Ad hocism and shifting family planning approach. Analysis of the family planning programme during the period of planning reveals very clearly that the objective of bringing down the birth rate to a sustainable level remains as elusive as it was three decades before. This is particularly true because of the arbitrary, uninformed, and unimaginative nature of the decision-making at the highest level of organisation. D. Banerji has rightly attributed the failures of the family planning programme to the lapses in the decision making which got compounded by a succession of blunders by successive decision-makers. Box-1 Population Policy of the Government of India ? In India, the government has not relied on economic and social measures to control the size of population. ? Its entire reliance is on family planning programme. ? Pravin Visaria, a noted Indian demographer, has pertinently argued that, but for family planning programme, the rate of growth of India's population could have risen sharply, as has happened in several countries of Africa. ? In the earlier phase of economic planning, the government felt the need for family planning programme only after the publication of 1961 Census results which showed a higher rate of population growth than anticipated.

NSOU ? GE-SO-21 317 ? The government in the earlier phase pursued an ad hoc policy under which first it pursued clinical approach, then extension approach and finally the cafeteria approach. ? Since this policy did not show impressive results, the government decided to pursue a 'bold national population policy' in 1976. ? Under this 'bold policy', the government pursued questionable measures particularly involving government departments and motivating citizens to adopt responsible reproductive behaviour. ? In an authoritarian political system, the corrupt administrative machinery misused its powers during the emergency that was proclaimed by the government. ? The use of coercive methods discredited the entire family planning programme and the experiment of the government to pursue the so-called bold measures for lowering down the birth rate in a relatively short period ended in a fiasco. ? Restricting population growth was one of the main objectives of the Eighth Plan. ? Under the Eighth Plan for population control there was stress on decentralized planning and implementation. ? The National Population Policy of 2000 has outlined immediate, medium-term, and long-term objectives. ? The immediate objective of this policy is to meet needs of health infrastructure and health personnel. ? The medium-term objective is to lower down fertility rate to the replacement level by 2010. ? The long-term objective is to achieve stable population by 2045. In the early 1950s, following the Planned Parenthood movement of the Western countries, the "clinic approach" was adopted. This approach did not work as the conditions in India were quite different from those in European countries and the United States. On discovering that the clinic approach would not advance family planning movement, the decision makers switched over to "the extension approach". The idea of extension approach was imported from the United States and like any other policy imported from the West was assumed to be an answer to the problem. Having discovered the failure of even this approach, the concern about human dignity and the individual's right to take decisions about one's own family got mellowed. At this stage, thinking in official circles started favouring introduction of an element of coercion in family planning programme. Naturally, there was once

NSOU ? GE-SO-21 318 again a change in approach. The new policy was characterised as the "camp approach", which in practice meant herding a large number of motivated persons into camps by offering them cash incentives or compensation. Its ugliest form was seen in this country during the emergency when, backed by authoritarian methods, its implementation proved to be disastrous for the entire family planning movement. In India, the family planning programme, in all its limitations, has made some impact in the urban areas. Total fertility has declined in all States early 1970s. By the late 1990s, total fertility declined to 1.8 births in Kerala and 2.0 births in Andhra Pradesh. However, replication of the experience of Kerala and Tamil Nadu elsewhere in the country, particularly in the four large States in North India, was a formidable task. Nevertheless, as noted by Tim Dyson, "Continuing attention to the provision of high quality family planning and reproductive health care services will benefit the poor- and especially women... Faster, rather than slower, fertility decline will make it easier to bring education of better quality to all people. It will reduce urban population increase, and growth of the labour force-making it easier to provide better living conditions in the urban sector and better employment prospects. It will reduce pressure on environmental resources, and it may also enhance economic growth." According to Pravin Visaria, a noted Indian demographer, for lowering down the total fertility rates in the country, policy shifts are essential. He particularly suggests the following measures: a. A well-designed programme of increasing the efficacy of the large body of health workers for the difficult task of persuading their clientele to modify their reproductive behaviour. b. A shift from family planning method specific targets to an emphasis on the evaluation of the change in the birth rates and mortality rates. c. The adoption of a scheme of incentives and disincentives to delay marriage and to limit the number of children after marriage. These measures if adopted earnestly will change the reproductive behaviour of the people. The people will learn the advantages of a small family and for limiting the number of children will voluntarily use one method or the other on family planning. This strategy in turn will lower down to fertility rate and arrest the population growth of the country in the long run.

NSOU ? GE-SO-21 319 19.6 Conclusion In India, there has been serious concern among the policy makers about the population growth since independence. So, the family planning programmes were initiated since very inception of planning process. However, even after almost the seventy years of family planning programme, it is felt that in India there is need for an imaginative population policy to deal with the present population problem. Apart from designing a programme for increasing the efficacy of the large body of health workers for the difficult task of persuading their clientele to modify their reproductive behaviour, it is necessary to take initiative for the spread of education among the masses and substantial improvement in their standard of living. Government should create jobs and income for poor families, especially women. It is also necessary to adopt scheme of incentives and disincentives to delay marriage and to limit the number of children after marriage. 19.7 Summary As far as the population is concerned, India ranks second in the world next only to China. India and many other third world countries are now passing through the phase of population explosion. Rapid population growth is likely to reduce per-capita income growth and welling which tends to increase poverty. More people mean an increased demand for food, water, housing, energy, healthcare, transportation, and more. All that consumption contributes to ecological degradation, increased conflicts and higher risk of large-scale disasters like pandemics. Population policy and the five years plans since 1951 in India are reviewed and evaluated in terms of limiting population growth. India is the first country in the world to begin a population control programme in 1952. It emphasized the use of natural devices for family planning. Population policies formulated to address the unmet needs for contraception, healthcare infrastructure, and health personnel, and to provide integrated service delivery for basic reproductive and child healthcare. The main objective is to achieve a stable population at any cost in an overpopulated country like India.

NSOU ? GE-SO-21 320 19.8 Questions Answer the following questions in your own words. G-A (5 Marks each) i. What is the New Strategy of India's population policy? ii. Write a note on National Population Policy, 1976. iii. Discuss the National population policy 2000. G-B (10 Marks each) iv. What Family Planning measures were taken during the 1980's? v. Discuss the different aspects of the family planning programme in India. vi. Critically evaluate population policy of India. 19.9 Suggested Readings i. Agrawal, A. N. NSOU ? GE-SO-21 323 20.2 Introduction In recent time, empowerment of women has emerged as an important issue in our society. Generally speaking, empowerment is a redistribution of power and control of resources in favour of women through positive intervention. Women empowerment has a considerable impact on the demography. Women social empowerment in terms of education and the economic empowerment rigorously affect the demographic and social variables such as fertility, mortality, and marriage. 20.3 Empowerment—The Concept In recent time, empowerment of women has emerged as an important issue in our society. The concept of empowerment was first brought at the International Women's Conference in 1985, at Nairobi. The conference maintained that empowerment is a redistribution of power and control of resources in favour of women through positive intervention. In broader sense, empowerment, means individuals acquiring the power to think and act freely, exercise choice, and to fulfil their potential as full and equal members of society. In defining empowerment the United Nations Development Fund for Women (UNDFW) includes the following factors: i. Acquiring knowledge and understanding of gender relations and the ways in which these relations may be changed; ii. Developing a sense of self-worth, a belief in one's ability to secure desired changes and the right to control one's life. It's true that the term empowerment has gained popularity and wide usage in the recent time, but there is not any concrete or authoritative definition of it. In different literature it is defined from varied angles. Very often the term empowerment is used to describe a process whereby the powerless or disempowered gain greater control of resources and decision making. This is because the most crucial feature of the term empowerment is that it contains within it the word power. So, empowerment basically is about power and about changing the balance of power. Mosedale identifies four aspects which seem to be generally accepted in case of empowerment. i. Firstly, to be empowered one must have been disempowered. When we talk of empowering women it is accepted that they are disempowered relative to men.

NSOU ? GE-SO-21 324 ii. Secondly, empowerment cannot be bestowed by a third party, it is to be gained. So, the role of development agencies is to create conditions conducive for empowerment and facilitate women empowering themselves. iii. Thirdly, definitions of empowerment generally include a sense of people making decisions on matters which are thought to be important in their lives and being able to carry them out. Therefore, reflection, analysis and action are involved in this process which may happen on individual or a collective level. iv. Finally, empowerment is not like reaching a destination rather a continuous process or unending journey. It cannot be taken as an absolute phase. People are empowered relative to others or relative to themselves at a previous time. So, empowerment can be briefed as a process by which women gain greater control over material and intellectual resources which helps them increase their self-reliance and emboldens them to claim their independent rights and challenge the patriarchal ideology and the gender-based discrimination against them. It also enables them to organise themselves to achieve their autonomy to make decisions and choices, and ultimately eliminate their own subordination in all the institutions and structure of society. 20.4 Need for Women Empowerment Women constitute half of any country's human endowment. Women are in a sense the social conscience of a country. But in contrary, if we look around in our society, it is obvious that women are enclosed and brought up in the culture of silence, their life starting, continuing, and ending up in this darkness of silence. They have control over neither resource around them whether it is physical resources; human resources; intellectual resources; financial resources and the self nor over ideology. Therefore, empowering of women presupposes a drastic, dynamic, and democratic change in the perception of and expectation from men and women in our society. As the women comprise almost half of the population, without their development and progress there cannot be true development in the world. It is also obvious that greater gender inequality undermines the process of economic development of the developing and the backward countries. So, it is of dire need for equality and

NSOU ? GE-SO-21 325 empowerment of women in the society. To achieve the goal of women's equality and empowerment, they must be provided with wholesome opportunities and rights. Gender sensitisation is required at every level for men and women. They are to be provided with all the accesses so that they can live a life of dignity. All the discriminatory socialisation process and oppressive social structural forces that obstruct such access are to be confronted and reversed.

20.5 Dimensions of Women Empowerment

Women empowerment is a multi-faceted concept involving varied dimensions. Women issues should be viewed from five different angles, all of which are related to the status of women, namely political recognition, access to education, access to employment, legal recognition, and cultural recognition. Women need to be empowered in almost all of them; otherwise, they will not get their rightful share of the productive resources or participate in the decisions that affect their lives. Women having all of these recognitions and accesses can be branded as 'empowered'. So the concept of empowerment can be broadly classified into five dimensions such as, political, social, economic, legal and cultural.

20.5.1 Political Empowerment of Women

The most important aspect of women's empowerment is their active participation in the political process of the country. Gender equality—political and social—is enshrined in the Fundamental Rights the Constitution together with equality of opportunity to employment and appointment to office. Political equality includes not only the equal right to franchise but also the more important right to gain access to the formal institutionalized centres of power. Therefore, political empowerment of women is nothing but giving women the capacity to influence the decision-making process by integrating them into the political system. Despite their fast numerical strength, women occupy a marginalized position in society because of several socio-economic constraints. This has inhibited effective participation of women in political processes and the institutional structure of democracy. Even after several decades of the grant of political equality, statistics have over the years revealed that while there is an acceptable visible manifestation of gender equality at the voter level, gender visibility within the power structures show cause for women concern.

NSOU ? GE-SO-21 326 However, with the Panchayati Raj Institutions getting Constitutional status by way of the 73rd Amendment Act, it is hoped that the women will have greater participation in the political process and decision-making capacity as the Act made such a role mandatory and universal in the whole of India. But it must be remembered that a change cannot be brought about overnight. Women have been subjected to exploitation for ages and thus cannot break free of all the shackles of illiteracy, poverty, and tradition at one stroke. Even today, most of the women are uneducated, have little or no property and live in a traditional-bound society. In such case, the politically powerful can make them contest elections for their own political gains. Another problem is that women, especially in rural areas would not come forward to fight the elections. In case they do come forward it would be along the patriarchal whip, under the command and guidance of the males, as proxies and assigning or stamping on the dotted lines. But it is a fact that a breakthrough has been made. Gender Empowerment strategies under these circumstances require structural systematic change and basic attitudinal and value change. The real empowerment of women requires a thorough going renewal of the political process on a democratic basis. Unless women are equipped with the necessary skill in political decision-making, their increased representation in the local bodies may not alter the existing setup. It is therefore necessary to sensitize the women in the women's perspective, not in the narrow feminist sense, but in the sense of honorable co-existence with men for this will enable women to exercise their 'will' and advance towards their complete emancipation. This, of course, requires sensitizing men as well, as they are currently the holders of power. Besides, the success of the Panchayati Raj institutions largely depends on the collective participation. They are at a take-off point, where the basic indicators are positive and the women who will be elected in the election have a challenging and an onerous task ahead. And thus, there is a need to extend greater affirmative action from the Panchayat level to the state and national level and political conscious raising and supportive action by women's organisations at the voter level to enhance self-potency and political efficacy. If these measures are followed political participation of women will open new vistas of development, which will automatically result in the political empowerment of women in the society.

NSOU ? GE-SO-21 327 20.5.2 Social Empowerment of Women Coming to the social aspect of empowerment of women, nobody could deny the role of education, as it is a powerful instrument since it enables women to gain more knowledge about the outside world, skills, self-image, and self-confidence. Education is a major force in redefining women's role and status, and it is an important aspect for increasing and bettering the chances of women employability and empowering women to think for themselves, become confident in also develop the capability of recognizing more accurately the area of exploitation. It is often argued that education is a powerful tool in the emancipation and empowerment of women. Indeed, the different organs of the United Nations (e.g., UNICEF) and experts on women's liberation argue for women's education as the basic step in women's equality. It has been reported as a crucial factor for development of women as it not only helps women to gain knowledge but also provides the necessary courage and inner strength to face the challenges of life. It will also enable them to procure a job and supplement the income of family and achieve social status. Education, especially of woman, has a major impact on health and nutrition, and is the key of developing a sustainable strategy for population control. Moreover, educated women could play an equally important role as men in nation building. Thus, there is no denying the fact that education empowers women. One of the recommendations of the National Policy on Education (1986) by the Government of India is to promote "empowerment" of women through the agency of education and it is considered to be a landmark in the approach to women's education. Women's education has assumed special significance in the context of planned development as education was included in the Sixth Five-Year Plan as a major programme for the development of women. There is a need for encouraging more women to participate not only in general education but also in vocational, technical, and professional education. Women's education should be treated as a special priority in all programmes of development. The government can open more places in schools for girls, lessen the financial burdens of education for women, reform curricula and educational system, in order to encourage girls to formulate non-traditional career goals and centralize the educational system to ensure greater equivalence of educational experiences for girls. Besides, education for women must be practical and well adapted to their needs, especially in relation to health, nutrition, and legal rights.

NSOU ? GE-SO-21 328 20.5.3 Economic Empowerment of Women If it is aimed at changing the life of women, it is the economic independence that should be given the first priority for such a change. When a woman attains economic independence, she naturally becomes the author of her own decisions, and no one can use her for their pleasure and benefit. A scientific perception of women's needs is essential for the process, which leads to empowering. Job centered socio-economic development would provide self-respect to women and initiate and strengthen the empowerment process. Economic independence or access to an inherited or self-generated income is considered to be the major means of empowerment of women. And the contribution of employment to the improvement of women's position is largely contributed by the modern sector and they enable women to move out of their homes to an extended plane, express their ideas, exchange their problems, and evaluate their position vis- a-vis men in many areas of social life. This would result in an awareness of their position in society and an urge to do something about it. Full employment of a woman assures her a better, more enriching and rewarding life and human relationship. The government has taken certain positive steps in full employment of women and payment of equal remuneration to them. The Equal Remuneration Act, 1976 (India) was a major step towards protective legislation and establishing the principles of equality, as it provides for equal remuneration to men and women workers and prevention of discrimination against women in the matter of employment. In addition, to enabling women to stand on their own legs, the Government of India and the Indian States have introduced a several number of women-oriented income generation programmes. The recognition of national responsibility towards the economic empowerment of women cannot be anything but to the advantage of women. But there seems to be a little link between the level of economic development and women's economic opportunities. In India, the labour force participation of women is very low. One of the major hurdles to the development of employment opportunities for women is the lack of adequate training. Women should have the access to productive resources such as land, building, credit, housing, and skill development. Supporting service provisions would make women more functional and productive by reducing their drudgery and provide them with more time for employment. Programmers for women, consisting of skill building and skill upgrading

NSOU ? GE-SO-21 329 can be more fruitful for enhancing their economic status and make them to have a superior bargaining power as far as employment is concerned. Therefore, it is crucial for raising the female earning power to increase the effective demand for education, health and family planning services, which are necessary for improving the status of women to a great extent.

20.5.4 Legal Empowerment of Women

Laws empower women. They provide legal redressal in cases where conciliation fails. And, it is important machinery at all levels, as it has an ability to sensitize women to fulfill their needs. The concept of gender equality was accepted in principle by the great Indian political leaders of the twentieth century. With the adoption of the Constitution in India, there has been a spate of legislation to protect women and to give them an equal status. A lot of legislations have been enacted which are women-specific and women-related to protect women against social discrimination, violence, and atrocities and also to prevent social evils like child marriages, dowry, rape, practice of sati, etc. Legal rights of women in India are of very high order and in certain respects more than what is available for women in other countries. But seldom are these laws followed. Violations are the order of the day than adherence to these laws. For many of the laws, which reinforce equality between men and women, social acceptance is yet to come. Personal Laws are the laws, which govern marriage, divorce, inheritance, succession, and adoption. Personal Laws do vary based on the religion practiced. So legislation is an important instrument towards social change, but experience has shown that statutory change alone is not adequate. Moreover, legislation in itself has only a limited impact and cannot be carried out in isolation. A change in social attitude is a must. Legal equality without social or economic equality is meaningless and women have been socially, morally, economically, and physically exploited in the name of tradition, religion or by social sanctions. This should come to an end. Women have been defined by the sex and until this social attitude changes there will be no change in the status of women. Besides awareness and knowledge of women's rights to equality must to be created not only among women but also in the society at large. Moreover, women should become aware of their legal rights and demand their unbiased implementation. In addition, women must themselves be involved in a much bigger way in the judicial and the law enforcement process as judicial officers, lawyers, or police. The constitutional vision of gender justice can be realized only by a set of multiple strategies, which include more affirmative action. Women's movement, therefore, could play a vital role in such a context and perhaps that could be the most effective instrument in achieving the legal empowerment of women.

20.5.5 Cultural Empowerment of Women

The most basic factor which inhibited women from being empowered till recently was the attitude of society towards a woman's role and her place in society. These social values and attitudes get reflected in the education and socialization of girls, and in the institutional arrangements of society. Traditionally, a woman's reproductive role was considered as her primary role and her role as producer secondary, unless as in the low-income classes, economic necessity forced a woman to support the family. Coupled with this was the idealized image of the woman as the one who subordinated self to the family. Women were socialized into accepting these role definitions, and expectations through stories from mythology, epics, and folklore, which glorified women who conformed to the ideal image. Thus, women were conditioned to sacrifice their own goals and ambitions, deny themselves their legitimate space and surrender any resources, which might have contributed to their independence. They were told to always adjust, accept, and accommodate. This was hardly conducive to the development of self-confidence, self-image, and initiative for willingness to take risks, characteristics essential for empowerment. These values and attitudes also meant that girls were often given less education than boys, and even when girls were educated up to school or beyond, the aspirations of the parents and even of the girls themselves were lower both as to educational attainments and future prospects. For a young girl marriage and children were considered the only lifelong activity and education was imparted either to make her a better wife and mother or to secure a better husband, since husbands preferred educated wives. So, it is not enough if women empower themselves through education, employment, and participation in decision-making. There should be cultural empowerment of women. To make this a reality, there should be social recognition, which requires attitudinal change. Freedom is necessary for women. It does not mean breaking away from home and tradition, but it means searching for one's own identity and making the people around her to accept her as a human person.

NSOU ? GE-SO-21 331 Moreover, there is a necessity of "conscious raising" or "awareness creation" for the achievement of cultural empowerment of women. This can be done through powerful means of communication, mobilization and organization of both men and women by helping them to think about themselves, identify the oppressive forces working against their improvement and enjoy a feeling of "oneness" and identification with the rest of the members of their group. The mobilization process could be successfully carried out by the non-governmental organizations working for the development of women. Thus, creating awareness among women about their freedom is invaluable. In addition, unless patriarchal values die and principles of justice are enshrined in the minds of each individual in the society, it is impossible to reap the fruits of empowerment of women.

20.6 Demographic Consequences

Women empowerment has a considerable impact on the demography. Women social empowerment in terms of education and the economic empowerment have some effects on the demographic and social variables such as fertility, mortality, and marriage.

i. Women's Education and Childbearing Throughout many parts of the developing economies, girls generally receive less schooling than boys. The educational gender gap is usually widest after primary school, and it is not uncommon for fewer than half as many girls as boys to be enrolled in secondary school. And even in countries where functional literacy levels are quite low for both sexes, many fewer women than men know how to read and write. The schooling gap affecting many girls in developing countries is of particular concern because a woman's educational level is usually associated with the key factors that influence the number of children she will have and the number who will survive to adulthood. These factors include her views (and those of her community) about the importance of marriage and childbearing, the age at which she marries or starts having sexual relation, her use of birth control methods, and her breastfeeding and child-care practices. More educated women want fewer children than less educated women. There are many possible reasons for this well-established relationship :

NSOU ? GE-SO-21 332 a. Women who have acquired the ability to think and reason for themselves are less likely to defer unquestioningly to prevailing community and cultural beliefs about the ideal family size. They are less likely, for example, to believe, as many women in traditional settings do, that the number of children they bear is "up to God"; b. The more educated a woman is, the less likely she is to think that her only value comes from having children, and the less likely she is to believe that having boys confers more prestige than having girls. In societies with strong preferences for male children, women tend to have children until at least one son is born, which, in turn, elevates fertility levels; c. Better-educated women probably have higher expectations for their children and so plan to have fewer children and to invest more in each child's food, shelter, health care and education; d. In very poor families (those in which women are likely to have little schooling), each new child represents an additional potential worker, and the more hands the better. But educated women who can hope to educate their children are likely to perceive that having a few skilled, well-schooled children will better serve the family's interests than having many unskilled and unschooled ones.

ii. Women's Education and Marriage Women with little schooling tend to marry earlier and start having children sooner than women with more education. The younger a woman is when she marries and has her first child, the more years of exposure to pregnancy she has ahead of her, and the more likely she is to have a large number of children before her reproductive years are over. There are various ways through which increased education can lead a woman to marry at a later age: a. Education empowers women to develop as individuals, not just as appendices to a husband or as low-ranking members of an extended family. It gives them the confidence and the practical basis to believe that marriage at a young age to obtain the support and protection of a husband is not their only option in life; b. In parts of the world in which arranged marriages are customary, the choice of a spouse is considered an important indication of social class or caste. Because a girl without much education will be unable to make a good

NSOU ? GE-SO-21 333 marriage, parents with ambitions for their daughters to marry well have a strong incentive to keep them in school; c. Educated daughters probably have a greater say about arranged marriages in general, and about whom and when they will marry. They are more likely to insist on a certain basic level of compatibility with a prospective husband. Meeting these more stringent standards can take time; d. Girls who understand that staying in school will improve their life prospects are less likely to want their educational careers to be interrupted, or their broader life opportunities derailed, by marriage; e. Girls whose education helps them obtain work once they leave school are likely—as their parents—to find the prospect of earning their own money more attractive than the prospect of early marriage. iii. Women's Education and Child Mortality Many of the same factors that influence the number of children a woman has also determine whether those children live or die, and this is particularly true of her educational level. In addition, high birth rates and high child mortality rates are closely connected phenomena. Women living in countries where large numbers of babies routinely die in infancy are often believed to want a lot of children to ensure that at least a few will survive. The perception that infants have only a fragile hold on life deters some women from practicing birth control. In this way, prevailing infant mortality rates, or expectations of the likelihood of death in the first months or years of a baby's life, can indirectly influence people's views about what constitutes an ideal family size. In addition, women who begin having children at a very young age, who do not space their pregnancies and who have frequent pregnancies are more likely to have low birth weight or sickly babies. Such babies are at high risk of dying in their first year of life. For these reasons, high infant mortality levels are often both a conditioning factor and a consequence of high fertility. Not surprisingly, the more years of schooling a woman has, the less likely she is to experience the death of a child. In fact, researchers have characterized this "pervasive and persistent" relationship between a mother's longer schooling and her child's lessened risk of dying as inverse. Studies found that each additional year of schooling a woman has results in a 7-9 per-cent decline in infant and child mortality. Following are the specific correlates of longer schooling accounting for its consistent relationship with improved child survival.

NSOU ? GE-SO-21 334 a. Because more educated women start childbearing at a later age, space their pregnancies more widely apart and have fewer children, their children are less likely to die than the children of less well educated women; b. Moderately educated women are more aware than uneducated women of ways to improve family health and hygiene, household sanitation, the treatment and prevention of illness, and are aware of the importance of correct infant feeding. They are also less likely to accept illness as the will of the supernatural, and more likely to do something about it; c. More educated women can take more responsibility for decisions regarding the health of their children. Their greater self-assertiveness and confidence in dealing with the outside world and their greater chance of having an outside income that they can spend on their families also contribute to the improved health and survival of children; d. The more education a woman has, the more likely she is to be able to identify appropriate sources of medical care for a sick child, and to persist in obtaining accurate diagnoses and treatment; e. Better educated women are considerably more likely than less educated women to use modern preventive and curative health services, to do so early enough for these to take effect, to demand a higher quality of medical care, and to continue treatment correctly and with greater persistence; f. Because better educated women tend to be better off economically and probably have smaller families, they can spend more money and more time caring for each child. iv. Women's Employment and Childbearing Even though most poor women in developing countries have always been responsible for growing food for the family, fetching water and firewood, cooking, cleaning, caring for children and for the old, and working in the fields, they rarely received any monetary compensation for their efforts. Until the early 1960s, women's likelihood of being in the labour market or working for pay was typically quite limited. However, with increasing urbanization, industrialization, and modernization, and in response to growing economic hardship in many parts of the world, women in developing regions are joining the ranks of the employed in ever-increasing numbers.

NSOU ? GE-SO-21 335 There are millions of women in developing countries who are formally employed or self-employed, although they often work for very low levels of pay, and often under difficult and oppressive conditions. And in some societies, women have paying work but little control over the money they bring home. Nevertheless, a woman who earns a small amount each week is no longer totally dependent for survival on her parents, on a man, or on marriage. This can mean that the old rules of submission to senior members of the family, or sexual favours given in exchange for economic support, start to change or cease to apply. Even some small degree of financial autonomy means that women can begin to make decisions about sexual relation, marriage and childbearing on their own. Thus, through its potentially empowering impact, paying work is another aspect of women's status believed to have important implications for the number of children they want and have. There are two major reasons to explain why women who earn an income from their work might be expected to have fewer children than those who do not. a. Although most women want children at some point in their lives, because their incomes decline when they give up or reduce paid work to bear and raise children, and because it is difficult for a woman to combine child-rearing with work outside the home, to reduce this incompatibility between the two roles women will often choose to have fewer children. Economists refer to this trade-off, familiar to many women, as being based on a realistic calculation of the "opportunity costs" of having children; b. Women who earn their own money acquire both the financial means and the increased personal confidence to be able to decide for themselves both when to marry and have children and whether to practice family planning. So, it appears that socially empowered women having higher education usually marry later, marry more educated men, are more likely to practice family planning and have greater access to and understanding of the value of health care treatments and services than less educated women. For these, they have smaller families and experience fewer infant and child deaths which usually has high bearing on the demography of an economy. Similarly, if a woman is empowered economically, it lends high impact on her age at marriage and childbearing and rearing. More educated women with better earning potential are likely to value their time more highly and to appreciate the high opportunity costs of having a large family. These also affect the demographic dimension of a country.

NSOU ? GE-SO-21 336 20.7 Conclusion In India, there has been serious concern among the policy makers about the population growth since independence. So, the family planning programmes were initiated since very inception of planning process. However, even after almost the seventy years of family planning programme, it is felt that in India there is need for an imaginative population policy to deal with the present population problem. Apart from designing a programme for increasing the efficacy of the large body of health workers for the difficult task of persuading their clientele to modify their reproductive behaviour, it is necessary to take initiative for the spread of education among the masses and substantial improvement in their standard of living. Government should create jobs and income for poor families, especially women. It is also necessary to adopt scheme of incentives and disincentives to delay marriage and to limit the number of children after marriage. Here lies the need of empowerment of women. It appears that socially empowered women having higher education usually marry later and are more likely to practice family planning than less educated women. They have smaller families and experience fewer infant and child deaths which usually has high bearing on the demography of an economy. Similarly, if a woman is empowered economically, it lends high impact on her age at marriage and childbearing and rearing. More educated women with better earning potential are likely to value their time more highly and to appreciate the high opportunity costs of having a large family. These also lead to fall in fertility rate which in turn affects the population growth of a country. 20.8 Summary Global Empowerment of women is a new concept. Since the second half of the twentieth century, the issue of women's empowerment has gained importance among scholars of universities and in national and international platforms. Women empowerment refers to increasing the spiritual, political, social, educational, gender or economic strength of individuals and communities of women Women's

NSOU ? GE-SO-21 337 empowerment in India is heavily dependent on many different variables that include geographical location (urban/rural), educational status, social status (caste and class) and age. Women empowerment is the process and the outcome of the process by which women challenge gender based discrimination in every institution and structures of the society. It means freedom of women from the vicious grips of social, economic, political, caste and gender-based discrimination. It means granting women the freedom to make life choices. Women's empowerment has five components— Why need of women empowerment? Women are worshiped as goddess in India, but not given her true position. The main problems that were faced by women in the past days (and still today up to some extent). Gender discrimination, women education, female infanticide, dowry, marriage in same caste and child marriage (still existing), atrocities on women, raped, kicked, killed, subdued and humiliated almost daily. Ways to empower women: Promoting education, training and professional development for women. Providing self-employment and self-help groups; providing minimum needs like nutrition, health, sanitation, housing; in other words, six 'S' for women empowerment i.e. Shiksha/education, Swastha/health, Swavlamban/Self-reliance, Samajik Nyay/ justice, Samvedan/Sensitivity and Samata/Equality to be established. Other than these, society should change the mentality towards the word "women". Role of Government and NGOs: Just a few years after Independence, the Government set up the Central Social Welfare Board, an apex body of the voluntary sector that aids more than 10000 NGOs across the country helping women stand on their own through such Programme as socio-economic programme, And Non- Governmental Organisations are also playing a significant role in the empowerment of women. A programme of Support to Training -cum-Employment for Women (STEP) was launched in 1987 to strengthen and improve the skills for employment opportunities for women below the poverty line.

NSOU ? GE-SO-21 338 20.9 Questions Answer the following questions in your own words. G-A (5 Marks each) i. What do you mean by women empowerment? ii. What are the aspects of empowerment? iii. What is the need of women empowerment? iv. Give the idea of political empowerment. v. Write a note on economic empowerment. vi. Write a note on cultural empowerment. G-B (10 Marks each) vii. Elucidate the role of education for social empowerment of women. viii. How social empowerment of women affect demography? ix. Discuss the various dimensions of women empowerment. x. Discuss the demographic consequences of women empowerment. 20.10 Suggested Readings i. Batliwala, S. (1994): "The Meaning of Women's Empowerment: New Concepts From Action", in G. Sen, A. Germain & L. C. Chen (Eds.), Population Policies Reconsidered, Health, Empowerment and Rights. Cambridge, MA: Harvard University Press ii.

Population and Food Supply Thomas Malthus theorized that populations grew in geometric progression. A geometric progression is a sequence of numbers where each term after the first is found by multiplying the previous one by a fixed, non-zero number called the common ratio. For example, in the sequence 2, 10, 50, 250, 1250, the common ratio is 5. Additionally, he stated that food production increases in arithmetic progression. An arithmetic progression is a sequence of numbers such that the difference between the consecutive terms is constant. For example, in series 2, 5, 8, 11, 14, 17, the common difference of 3. He derived this conclusion due to the Law of Diminishing Returns. From this, we can conclude that populations will grow faster than the supply of food. This exponential population growth will lead to a shortage of food. 4.6

Malthusian Trap The Malthusian Trap (or "Malthusian Population Trap") is the idea that higher levels of food production created by more advanced agricultural techniques create higher population levels, which then lead to food shortages because the higher population needs to live on land that would have previously used to grow crops. Even as technological advancement would normally lead to per capita income gains, theorizes Malthus, these gains are not achieved because in practice the advancement also creates population growth. Once the population exceeds what food supplies can support, this supposedly creates a Malthusian crisis with widespread famine as well as rampant disease. This ends up decreasing the population to earlier levels. The reality, however, has been that population growth has not itself created the crisis that Malthus predicted.

Reduction of population became a priority with the UN. The focus was on raising nutrition levels in developing countries and providing better health facilities to women and children. The proposal to set up the Population Commission came up in 1945, which was opposed by former USSR and Yugoslavia on the grounds that another Commission would only confuse matters, given the proliferation of international bodies within the UN. But the main reason for opposing the Commission was because it focused primarily on "population changes" and the impending doom following the population explosion, rather than on "growth".

over Malthusian Theory The optimum theory of population is superior to the Malthusian theory on the following grounds. i. The Malthusian law is a general study of the population problem because it is applicable to all countries irrespective of their economic conditions. The optimum theory is superior to the Malthusian theory because it studies the population problem in relation to the economic conditions of a particular country. ii. Malthus had a narrow vision. He related the growth of population to food supply. Cannan, on the other hand, had a much wider outlook. He related the problem of population to the total production of the country, both industrial and agricultural. iii. The Malthusian theory is a static concept which applies to a period of time. The optimum theory is a dynamic one because over a period of time the per capita income may rise with the expansion in output due to improvements in knowledge, skill, capital equipment and other elements in production. This may raise the optimum level of population. Thus, the optimum theory is more realistic. iv. The Malthusian doctrine is simply theoretical and is devoid of all practical considerations. It regards all increases in population bad, for they bring untold miseries to the people. Malthus wrote, "The table of nature is laid for a limited number of guests and those who come uninvited must starve." On the other hand, the optimum theory is very practical because it regards an increase in population not only desirable but also necessary for the maximum utilisation of the country's natural resources. v. The Malthusian theory of population is based on the unrealistic assumption of the niggardliness of nature. This belief arises from the operation of the law of diminishing returns in agriculture. But the optimum theory takes a realistic view when according to this the law of diminishing returns does not operate in agriculture immediately but after the optimum point is reached. In other NSOU ? GE-SO-21 76 words, first the law of increasing returns operates up to the optimum point and the law of diminishing returns after it. vi. Malthus was so much obsessed by the fear of over-population that he ignored a fundamental fact that a newly born child 'comes not only with a mouth and a stomach but also with a pair of hands'. The optimum population theory allays all such fears of the Malthusians by stressing the fact that increasing population increases the labour force which helps raise the optimum expansion of the country's natural resources. So long as the actual population is less than the optimum, the increase in population is safe and good. It is only when the actual population exceeds the optimum that the increase in population needs control Thus unlike the Malthusian theory which necessitates the use of preventive checks all the time for fear of the country being over- populated, the optimum theory is free from all such taboos and is

over the Malthusian Theory: ADVERTISEMENTS: The optimum theory of population is superior to the Malthusian theory on the following grounds. (1) The Malthusian law is a general study of the population problem because it is applicable to all countries irrespective of their economic conditions. The optimum theory is superior to the Malthusian theory because it studies the population problem in relation to the economic conditions of a particular country. (2) Malthus had a narrow vision. He related the growth of population to food supply. Cannan, on the other hand, had a much wider outlook. He related the problem of population to the total production of the country, both industrial and agricultural. (3) The Malthusian theory is a static concept which applies to a period of time. The optimum theory is a dynamic one because over a period of time the per capita income may rise with the expansion in output due to improvements in knowledge, skill, capital equipment and other elements in production. This may raise the optimum level of population. Thus the optimum theory is more realistic. ADVERTISEMENTS: (4) The Malthusian doctrine is simply theoretical and is devoid of all practical considerations. It regards all increases in population bad, for they bring untold miseries to the people. Malthus wrote, "The table of nature is laid for a limited number of guests and those who come uninvited must starve." On the other hand, the optimum theory is very practical because it regards an increase in population not only desirable but also necessary for the maximum utilisation of the country's natural resources. (5) The Malthusian theory of population is based on the unrealistic assumption of the niggardliness of nature. This belief arises from the operation of the law of diminishing returns in agriculture. But the optimum theory takes a realistic view when according to this the law of diminishing returns does not operate in agriculture immediately but after the optimum point is reached. In other words, first the law of increasing returns operates up to the optimum point and the law of diminishing returns after it. (6) Malthus was so much obsessed by the fear of over-population that he ignored a fundamental fact that a newly born child 'comes not only with a mouth and a stomach but also with a pair of hands'. The optimum population theory allays all such fears of the Malthusians by stressing the fact that increasing population increases the labour force which helps raise the optimum expansion of the country's natural resources. So long as the actual population is less than the optimum, the increase in population is safe and good. It is only when the actual population exceeds the optimum that the increase in population needs control Thus unlike the Malthusian theory which necessitates the use of preventive checks all the time for fear of the country being over-populated, the optimum theory is

silent about any type of checks to control population. vii. Malthus was essentially a pessimist who portrayed a gloomy picture about the future of mankind which was full of misery, vice, floods, droughts, famines, and other natural calamities. The optimum theory: is superior to the Malthusian theory because it does not suffer from any pessimism, rather it adopts an optimised, and realistic attitude towards the problem of population when it relates population to the wealth of the country. 5.11 Merits of the Theory The theory

free from all such taboos and is silent about any type of checks to control population. ADVERTISEMENTS: (7) Malthus was essentially a pessimist who portrayed a gloomy picture about the future of mankind which was full of misery, vice, floods, droughts, famines and other natural calamities. The optimum theory; is superior to the Malthusian theory because it does not suffer from any pessimism, rather it adopts an optimise and realistic attitude towards the problem of population when it relates population to the wealth of the country. Its Criticisms: Despite the superiority of the optimum theory over the Malthusian theory

Correct Measurement of Per Capita Income not Possible
 Another difficulty pertains to the measurement of per capita income in the country. It is not an easy task to measure changes in the per capita income. The data on per capita income are often inaccurate, misleading, and unreliable which make the concept of optimum as one of doubtful validity. iii. Neglects the Distributional Aspect of Increase in Per Capita Income Even if it is assumed that per capita income can be measured, it is not certain that the increase in population accompanied by the increase in per capita income would bring prosperity to the country. Rather, the increase in per capita income and population might prove harmful to the economy if the increase in per capita income has been the result of concentration of income in the hands of a few rich. Thus, the optimum theory of population neglects the distributional aspect of increase in the per capita income.

Correct Measurement of Per Capita Income not Possible:

of labour or per capita income curve. Suppose there is an innovation which brings a change in the techniques of production. It shifts the per capita income curve to AP2. As a result, the optimum level of population rises from OP1 to OP2 with the increase in per capita income E from P1M1 to P2M2. If the per capita income rises further due to a change in any of the above assumed factors, the AP2, curve will shift upward. The AP2 or AP1 curve can also shift downward if, for instance, the capita income falls due to an adverse change in the given factors. If the locus of all such S. points like M1 M2 etc., are joined by a line, we have the PI curve which represents the path of the movement of the optimum population as a result of changes in the economic factors. If, however, the actual level of population is assumed to be OP0 and the optimum level OP1 then the country is over- populated. If OP1 is the optimum level, then the country is under- populated. Thus, the optimum is not a fixed level but an oscillating one. v. Neglects Social and Institutional Conditions The optimum theory considers only the economic factors which determine the level of population. Thus, it fails to take into consideration the social and institutional conditions which greatly influence the level of population in a country. A lower level Size of Population

workers, but of the capitalist system that exploited them. Marx made the scientific interpretation of human history. He said just like there are the scientific explanation for the physical phenomenon, the same are there for social phenomenon. He said the essence of history is change in the modes of production in any society and this change is always progressive. Marx considered that society, especially feudal and capitalist society has two major economic classes viz. ? The Rich ? The Poor The Rich was those who have means of production and earn their profit by exploiting the poor. On the other hand, the poor were those who sell their energy & will to work to these rich people in exchange of wages. The employers earn profit by exploiting the poor, this profit is known as surplus profit. According to Marx in no country of world population increase on account of fertility but it increases only on account of capitalist policies. The capitalist makes labour part of their production and still something out of that. By installing labour-saving machines, a capitalist wants to have the maximum surplus-value of that. As a result of this unemployment spreads, wage declines, and poverty increases. The poor population cannot nourish their children on account of

Modern drugs are used by the people. All these factors bring down the death rate. But the birth rate is almost stable. People do not have any inclination to reduce the birth of children because with economic growth employment opportunities increase and children are able to add more to the family income. With improvements in the standard of living and the dietary habits of the people, the life expectancy also increases. People do not make any efforts to control the size of family because of the presence of religious dogmas and social taboos towards family planning. Of all the factors in economic growth, it is difficult to break with the past social institutions, customs, and beliefs. As a result of these factors, the birth rate remains at the previous high level. iii. The Third Stage In this stage, the fertility rate declines and</p>		<p>means of transport develop. There is greater mobility of labour. Education expands. Incomes increase. People get more and better quality food products, medical and health facilities are expanded. Modern drugs are used by the people. All these factors bring down the death rate. But the birth rate is almost stable. People do not have any inclination to reduce the birth of children because with economic growth employment opportunities increase and children are able to add more to the family income. With improvements in the standard of living and the dietary habits of the people, the life expectancy also increases. People do not make any effort to control the size of family because of the presence of religious dogmas and social taboos towards family planning. Of all the factors in economic growth it is difficult to break with the past social institutions, customs and beliefs. As a result of these factors, the birth rate remains at the previous high level. With the decline in the death rate and</p>

	Rapid population growth leads to the environmental change. Rapid population growth has swelled the ranks of unemployed men and women at an alarming rate. Due to this, a large number of people are being pushed in ecologically sensitive areas such as hill sides and tropical forests. It leads to the cutting of forests for cultivation leading to several environmental change. Besides all this, the increasing population growth leads to the migration of large number to urban areas with industrialization. This results in polluted air, water, noise and population in big cities and towns.
